

IGOR 5.1.0 RELEASE NOTES

September 20th, 2019

Jaryd Sunstrom
jaryd@igor-tech.com

General

- Online/Offline event history has been added to node detail pages.
- Zones now have a new test “play” button on the parent space detail page.
- Users can now modify the Additional Filters input box on the device list page to include spaces, switch IP addresses, and tags.
- Added a message when modifying emergency light level to indicate that changes may take up to 10 minutes before they are reflected in the gateway.

New Features and Enhancements

- **Scheduling**
 - Support for executing schedules at sunrise and sunset has been added. In addition, positive and negative offsets from sunrise and sunset can be provided.
 - Sunrise and sunset times will automatically use a default location based on the time zone of the server. Users can specify exact latitude and longitude in Settings for better accuracy.
 - New Daily, Monthly, and Advanced scheduling options have been added.
 - Built-in support for “working days” within daily schedules without the need to specify Monday through Friday.
 - Time formats have changed from 24-hour format to 12-hour AM/PM.
- **Tags**
 - Tag support has been added for spaces, space groups, and devices to allow for arbitrary grouping of objects.
 - Users can associate and create tags on-the-fly in batch from the device or space list pages.
 - Go to the new Tags section to manage and view all tags and objects used by tags.

Bug Fixes

- Ctrl+Clicking on a node in a node chain map now properly opens a new tab to that node detail page.
- Ctrl+Clicking a device row when in ID mode now properly opens a new tab to that device detail page.
- Copying an action set on a page past the first in the list now behaves as expected.
- Fixed an issue that could sometimes cause the space detail page to not load.
- Deleting a device from an offline node now correctly removes the device.
- Renaming a light sensor from a node page now works as intended.
- Node power reporting on node detail pages now displays correctly.
- Fixed an issue that could cause breadcrumbs to disappear after performing a global search.
- Play button on subsequent pages after the first on action sets now behaves correctly.
- Modal dialogs should no longer close when dragging your mouse off the modal in most cases.
- Fixed an issue that was preventing temperature data from being uploaded to the cloud.
- Fixed a display issue when deleting web hooks.
- Fixed an issue that was causing offline nodes to delay device event resubscriptions.

- Actuator events should no longer be duplicated.
- Edit gesture modal should no longer automatically close if it encounters an error.
- Fixed some alignment issues with Copy to Clipboard icons.
- Users should no longer be able to edit system created action sets unintentionally.
- Decrement CCT value on the decrement action should no longer highlight with a validation error when a value greater than 100 is entered.
- Fixed some display and usability issues with the space diagnostic page on iPad.
- Sampling service should now be correctly updated with device IP addresses when they change.
- Fixed an issue with new logging that was preventing some logs from being created as expected.
- Fixed the activity widget on dashboard display to display correct times.
