

IGOR 5.6.0 RELEASE NOTES

11/09/2020

New Features and Enhancements

- Support for IPv6 is now available.
 - IPv6 support requires firmware version 9.0.0 or higher

General

- Made improvements to the discovery process so that it will properly ignore responses from devices that are not Igor nodes.
- Made improvements to the installer to reserve ports that the Gateway will be using.
- Made improvements to logs to catch certain classes of errors that previously were not being included.
- Minor wording changes on certain text fields for clarity.
- Option for “Add all devices on chain” now available from node context menu in device list.
- Added a clarifying message within network information in the devices list when no network information is present.

Bug Fixes

- Fixed an issue where timing with resubscriptions was causing device events to be missed.
- Fixed an issue where log messages were not being displayed after changing the sidebar filter.
- Fixed a timing issue where downstream nodes would sometimes remain offline.
- Fixed an issue that was preventing the “add all on chain” option for network nodes from adding devices.
- Fixed a display issue with the error message when creating application keys with the same name.
