

## HART Test System

### HART Protocol Conformance Testing

#### Description

The HART® Test System is a complete testing tool produced on the Linux operating system that includes the test automation, application layer and analysis software for the verification of a device's conformance to the HART Communication standard. The system automates device testing and verifies compliance to all revisions of the HART Protocol standard. It plays an integral part in the HART Device Registration program and ensuring device interoperability of both wired and WirelessHART-enabled devices. The system acts as the core component for all wired and wireless testing.

#### Features

- Standardized Linux based test appliance
- Compatible with Registered RS232 HART modems
- Compatible with HART over UDP (Gateway Interface Standard)
- HART Menu system added to simplify operation
- HSniffer for capturing message stream

#### General Hardware Requirements

- Two RS232 HART-Registered modems  
(not included in the kit)

#### Part Warranty

- 1 year parts warranty against manufacture defect

## Kit Components

| Qty | Item   | Rev. No.                         |
|-----|--|----------------------------------|
| 1   | Test Applications:<br>Data Link Layer HTest Scripts (TP20083)<br>Universal Command Test Software (TP20084)<br>Common Practice Command Test Software (TP20085)<br>Data Link Layer Post Processing Executables (TP20086) | 3.6<br>3.4<br>1.15<br>2.6<br>3.4 |
| 1   | HART-IP Server (TP10300)   | 3.6                              |
| 1   | HART-IP Token Passing Master (TP10301)   | 3.6                              |
