

## Guidelines for Products that can be mixed together

### Column One

Insecticides:

Pyola  
Oil Away Supreme  
Bulls-eye  
Surround  
Greenstep

### Column Two

Fungicides (Disease control)

Soap Shield  
Plant Guardian Biofungicide  
Surround  
Shield-all II

### Column Three

Plant boosters

BioBoost  
Foliar Fertilizers  
Liquid kelp  
Lawns Alive Foliar Fertilizer

You can mix one item from Column One and one item from Column Two. You can then mix in plant boosters or foliar fertilizers (Column Three) .

When mixing products, do not increase the amount of water.

Bulls-Eye can be mixed with another insecticide because it is not an oil. It is treating different insects..

Rose and Ornamental Plant Spray is for insects and disease.

Ingredients: Sulfur with pyrethrins. This is an insecticide (Column One) with a fungicide (Column two).

You can add an item from Column Three.

DO NOT mix Weather Shield Spreader Sticker with Soap-Shield or Surround

Note: DO NOT mix Pyola or Oil-Away Supreme with Sulfur Guard. This could make the leaves of the plant fall off.

Notes for using Soap-Shield - Liquid Copper Fungicide

1. Soap-Shield may cause copper toxicity in some rose varieties. Copper toxicity appears as purple spots and is more likely to occur outdoors than in greenhouses.

2. If used frequently, Soap-Shield may cause leaf burn. If leaf burn develops, discontinue use.

3. It is NOT recommended to use Soap-Shield on stone fruit (peaches, apricots, nectarines) after the leaves are on the trees. This may cause them to lose their leaves.

Additional notes for application of sprays:

When spraying a plant that you are not sure will be sensitive to the spray, try testing the spray on an inconspicuous part of the plant.

It is very important that you DO NOT spray plants in the heat of the day when temperatures are over 90 F. Morning and evening are the best times to apply sprays.
