

Bulbs Alive!®

4 - 4 - 2

All Natural Plant Food

For spring-flowering bulbs like tulips, daffodils, hyacinths, and crocuses: Fall is by far the most important time to fertilize since most root growth occurs during fall and winter. **It is vital to fertilize bulbs** in order to optimize bulb regeneration and encourage showy spring bloom. For summer-flowering bulbs like irises, lilies, glads, cannas, dahlias, and tuberous begonias: Use at planting so Bulbs Alive!® can quickly provide benefit.

Apply 1 lb. per 20 sq. ft. at time of planting. When planting bulbs individually, use 1/2 cup per bulb and mix thoroughly with soil around planting hole before placing bulb in. For best response, apply again at the same rate as early as possible in spring, when spring-flowering bulbs emerge. Fertilize tulips no later than 4 to 6 weeks before bloom. For summer-flowering bulbs, apply again when flower buds form.

Do not fertilize any bulbs after flowers open, as late fertilization encourages bulb rot. To feed already planted bulbs, sprinkle Bulbs Alive!® over the soil surface and mix with soil as thoroughly as possible.

All ingredients are derived from plant and animal by-products.
