All three legs should be the same length to provide a level platform for the telescope.

Locate the equatorial mount and place the base of the mount through the hole in the center of the tripod mounting platform.

Your PowerSeeker 60EQ includes: optical tube; tripod with center leg brace; equatorial mount; latitude adjustment screw; star diagonal; 2 eyepieces; a 3x barlow lens, 1.5x erect image eyepiece; finderscope; 5 lb. counterweight; counterweight bar; two slow motion cables; eyepiece accessory tray; The Sky Level 1 software, documentation including an owner’s manual.

To set up the tripod, spread the legs outward until they are fully extended and push down center leg brace. Extend the center portion of each of the three tripod legs down 6-8”.

Properly assembled, the accessory tray should appear as pictured above.

Place the accessory tray on top of the tripod's center leg brace. Thread the tray into the threaded hole in the center of the leg brace.

Thread the latitude adjustment screw into the equatorial mount until it is touching the inside of the mount.

From underneath the tripod mounting platform, thread the attached mounting bolt into the hole on the bottom of the equatorial mount.

10 Locate the counterweight bar and counterweight. Slide the counterweight half way down the counterweight bar and tighten the wingnut to secure in place.

11 Thread the threaded end of the counterweight bar into the Dec axis of the equatorial mount.

12 Slide the chrome end of the slow motion control cable onto equatorial mount gear shaft and tighten set screw to secure in place.

13 The longer cable should attach to the Right Ascension axis and the shorter cable attaches to the Declination axis -- tighten set screw to secure in place.

14 Before mounting the tube, remove the two wingnuts on the tube.

15 Place the tube on the mount by lining up the screws with the mounting holes on the mount.

16 Reattach both wingnuts and tighten to secure in place. The front of the tube should be positioned over the counterweight assembly.

17 Locate the finderscope and remove plastic caps on front and back of lens. Remove the knurled nuts at the focuser end of the telescope tube.

18 Orient the finderscope so that the glass window is facing towards the front of the tube. Place finderscope over the holes on the tube and replace the knurled nuts to secure.

19 Loosen the set screw on the focuser so that it does not obstruct the inner diameter of the focuser. Insert the chrome barrel star diagonal into the focuser and tighten the set screw.

20 Insert the chrome barrel of the 20mm eyepiece into the star diagonal and tighten the set screw.

21 Remove the lens cap from the front of the telescope. To observe, look through the eyepiece as shown above.

22 For additional magnification, you can use the included 3x barlow. Place the barlow in the focuser in place of the eyepiece - remove the cap from the barlow.

23 Place the eyepiece into the barlow and tighten the set screw to secure in place.

For detailed usage information please consult your owner’s manual.
