LIVING SECTION

Our proposal aligns residents' aspirations and needs, housing them in a celebration of the city's cultural and social fabric. Like human and building in the same area, the city's architectural form adapts to the urban context, the residents' needs, and the natural environment, shaping a unique architectural experience.

The house is a small building unit, designed to fit into the urban fabric. The design is inspired by the traditional architecture of the area, incorporating elements that reflect the local culture and history.

The lower level is a public space, with a community center and a library, providing residents with access to cultural and educational resources. The upper levels are residential, with apartments designed to maximize natural light and views of the city.

The project includes a green roof, which not only enhances the aesthetics of the building but also provides environmental benefits, such as reducing energy consumption and improving air quality.

The design also incorporates sustainable features, such as energy-efficient appliances and solar panels, contributing to a greener and more sustainable living environment.

Through the integration of nature and urban life, the building fosters a sense of community and connection, offering residents a unique living experience that respects the city's cultural heritage and promotes social well-being.
