Java in the (Amazon) Cloud at CodeMash

2012-01-07 16:55:38

Nathan and Chris did a fantastic job of explaining how to deploy Java applications to the Amazon Web Service (AWS) cloud.

What is cloud computing?

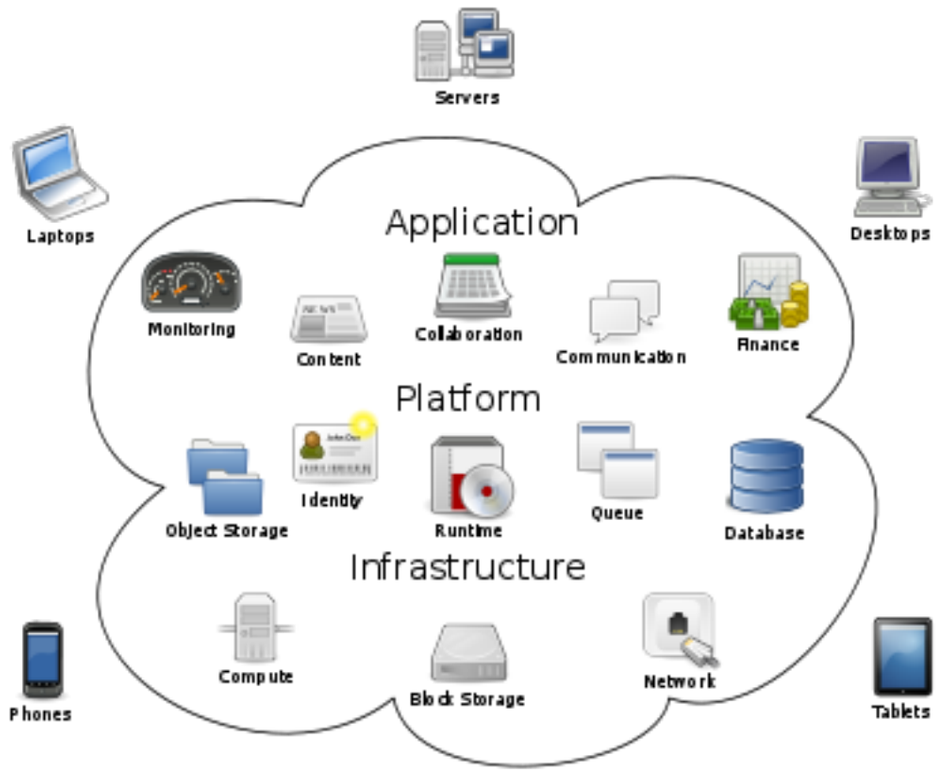
How do I get started?

How is different from what I am doing today?

Will I get a raise?

Cloud Computing

Cloud computing is the delivery of [computing](#) as a [service](#) rather than a [product](#), whereby shared resources, software, and information are provided to computers and other devices as a metered [service](#) over a [network](#) (typically the [Internet](#)).



Cloud Computing

WIKIPEDIA
The Free Encyclopedia

Software as a service (SaaS) - “on-demand” software

Platform as a service (PaaS) - solution stack

Infrastructure as a service (IaaS) - virtual computing infrastructure

PaaS

IaaS

⬇ flexibility ⬆

⬇ complexity ⬆

⬇ cost ⬆

DevOps

an emerging set of principles, methods and practices for communication, collaboration and integration between software development (application/software engineering) and IT operations (systems administration/ infrastructure) professionals. It has developed in response to the emerging understanding of the interdependence and importance of both the development and operations disciplines in meeting an organization's goal of rapidly producing software products and services.

Activating your account...

We are in the process of activating your account so that you can begin using AWS.

We will notify you by e-mail at **aws@juddsolutions.com** once the verification is complete. You will then be able to begin using all AWS Infrastructure Services. For most customers, this process only takes a couple of minutes (but can sometimes take a few hours if additional account verification is required). As part of the account activation process, a $1 authorization will be placed on the payment method (normally, a Debit or Credit Card) to make sure your payment method is valid. **This authorization is not a charge**, but your bank may hold the authorized funds as unavailable until the authorization expires

Protect your account with AWS Multi-Factor authentication (MFA)

AWS MFA is a feature that is available at no extra cost that greatly enhances your account's security. In addition to your username and password, AWS MFA requires a one-time code from your MFA device when signing in to AWS web properties.

Activate MFA > Learn more

Sign Up For AWS Support

AWS Support is a one-on-one, fast response support channel to help you build and run applications on AWS. With pay-by-the-month pricing and an unlimited number of support cases, you are not constrained by long-term support contracts or limited support privileges.

EC2

A **virtual machine (VM)** is a software implementation of a machine (i.e. a computer) that executes programs like a physical machine. Virtual machines are separated into two major categories, based on their use and degree of correspondence to any real machine. A system virtual machine provides a complete system platform which supports the execution of a complete operating system (OS). In contrast, a process virtual machine is designed to run a single program, which means that it supports a single process. An essential characteristic of a virtual machine is that the software running inside is limited to the resources and abstractions provided by the virtual machine—it cannot break out of its virtual world.

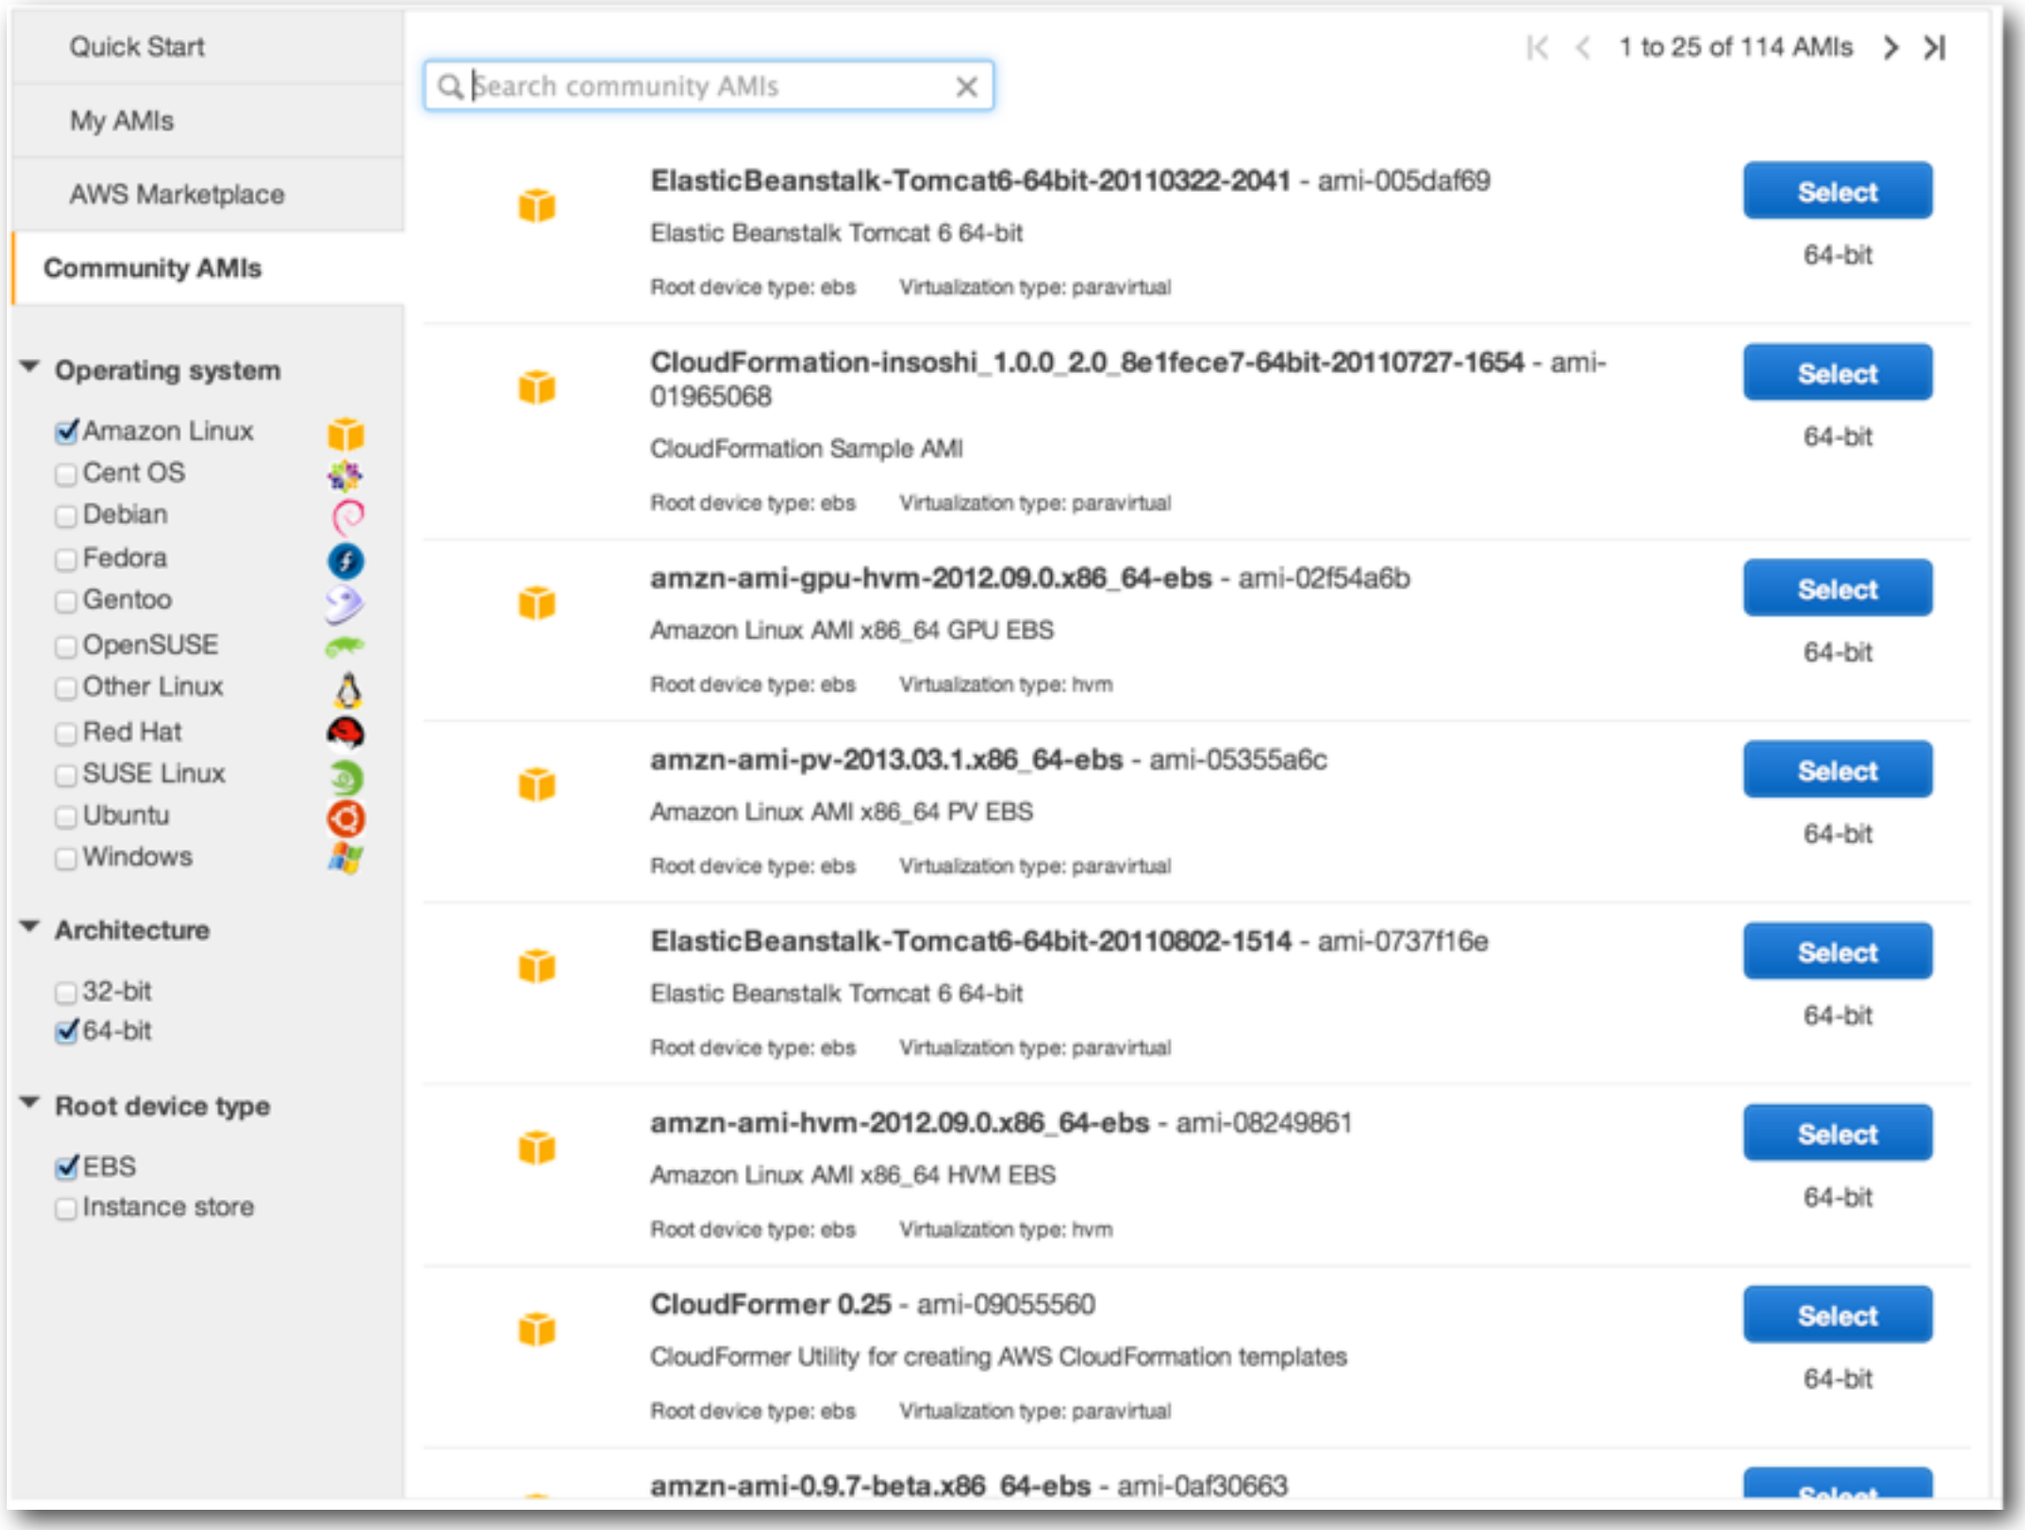
Amazon Elastic Compute Cloud (Amazon EC2) is a web service that provides resizable compute capacity in the cloud. It is designed to make web-scale computing easier for developers.

- Elastic
- Completely Controlled
- Flexible
- Reliable

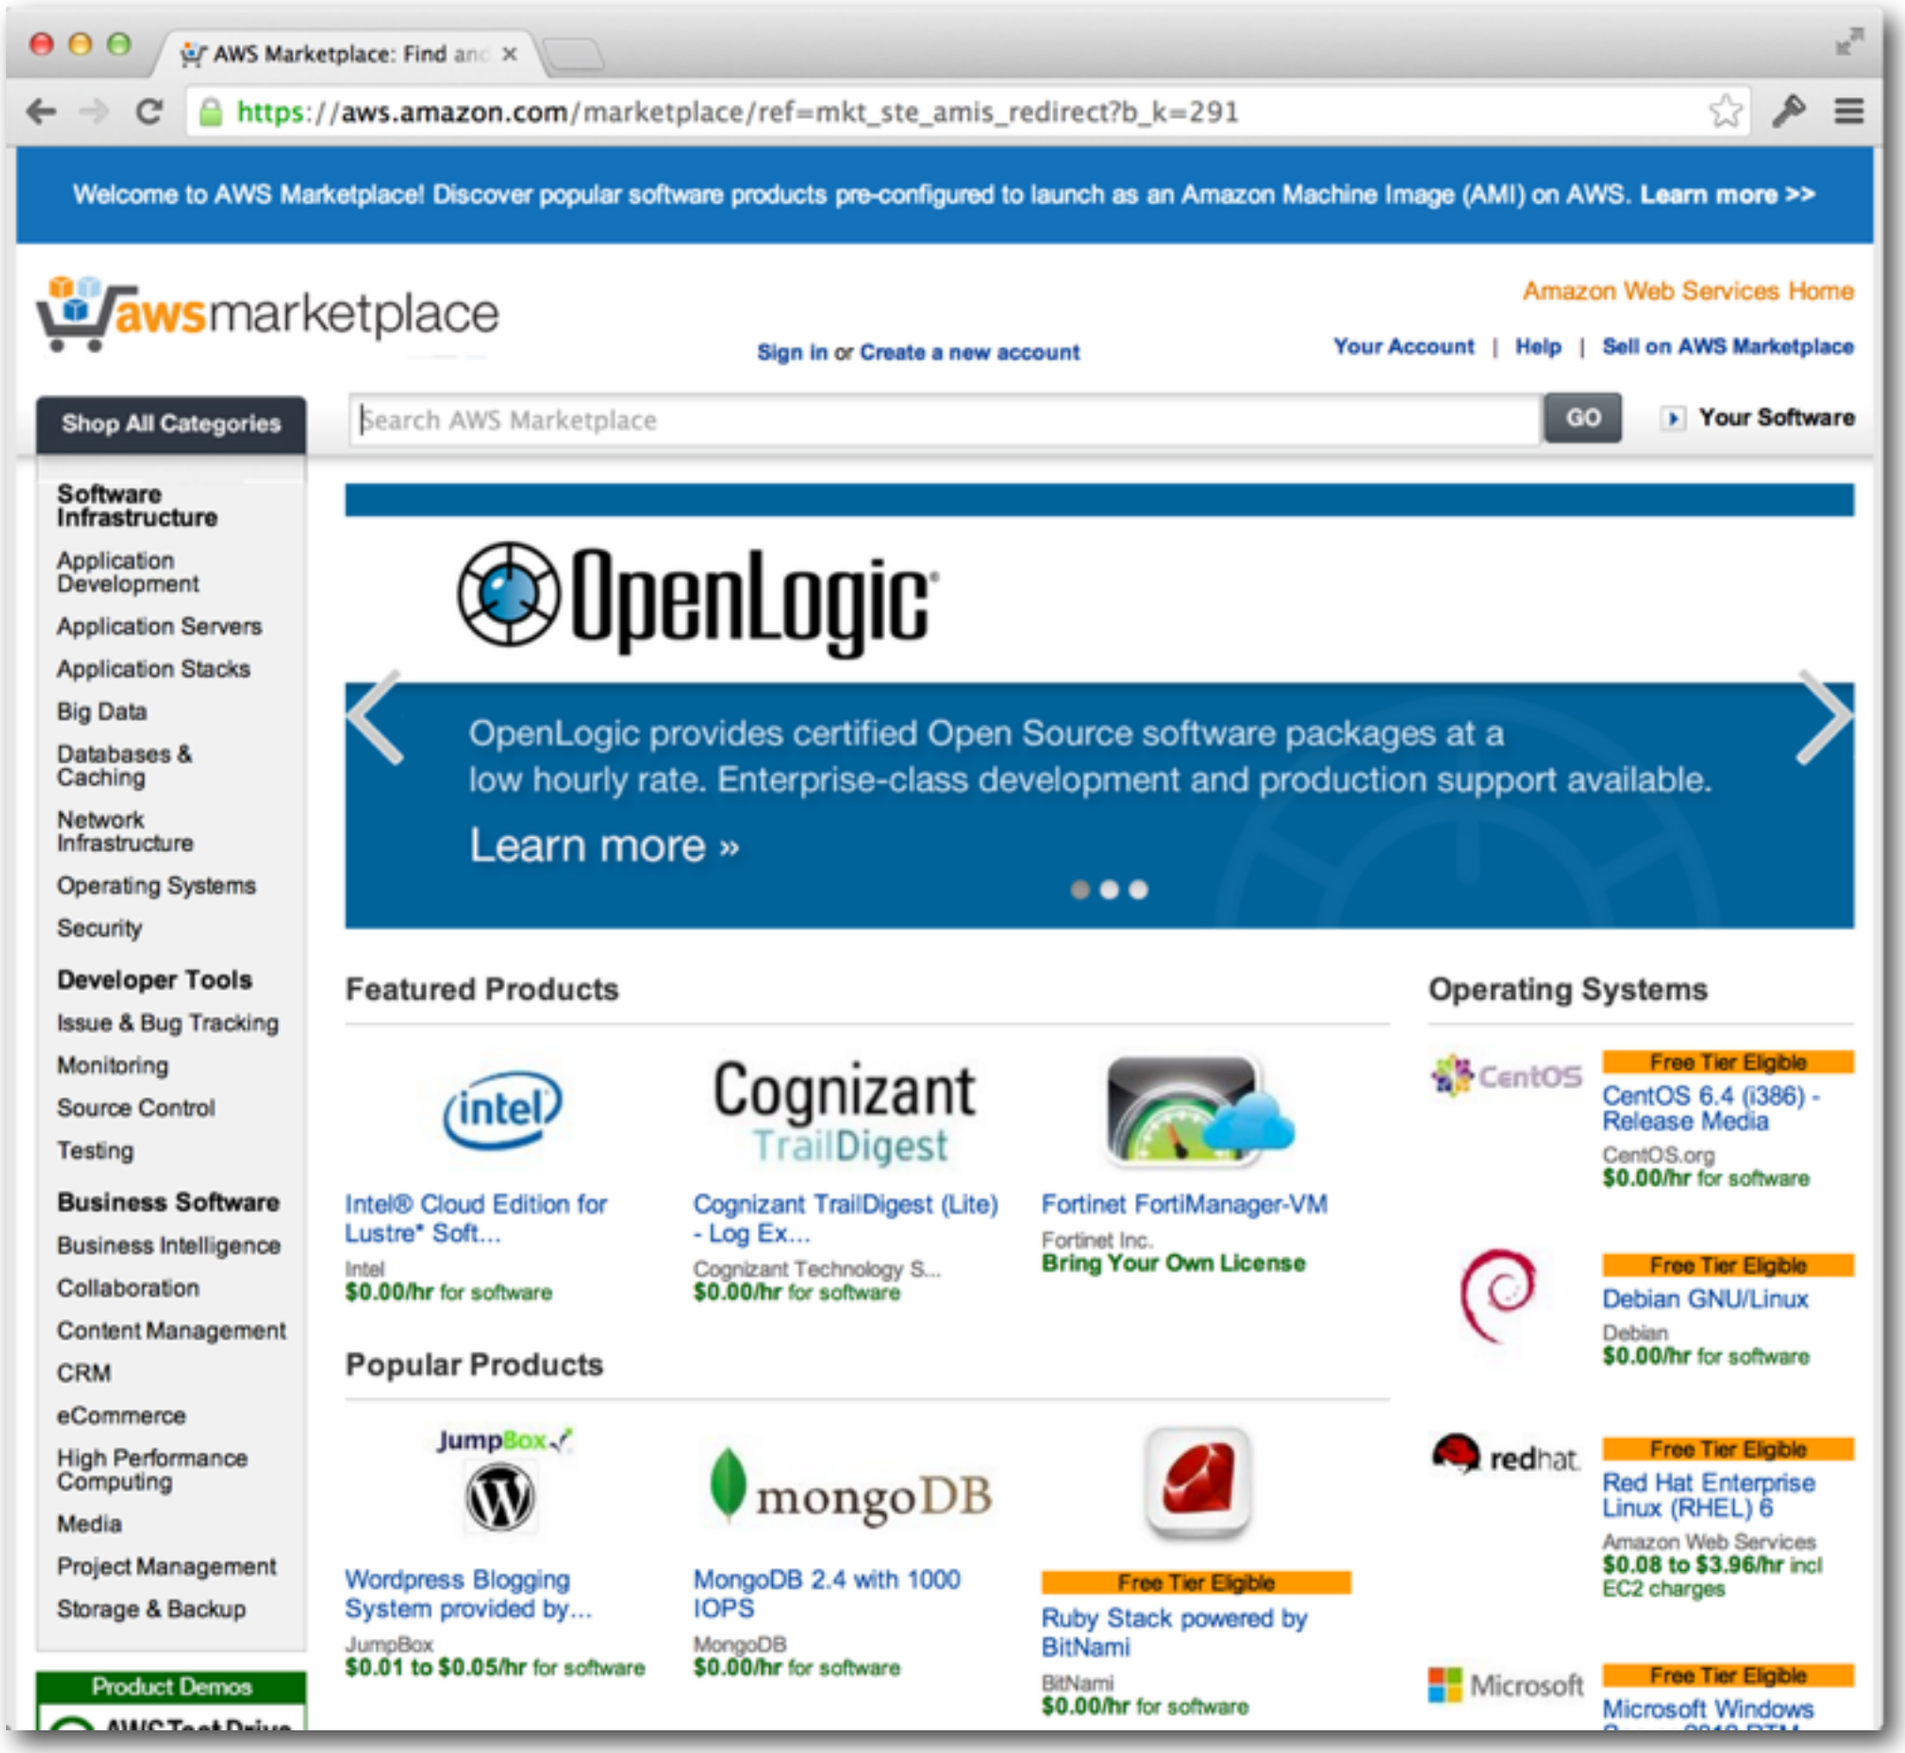
AMIs (Amazon Machine Images)

Public AMIs

8180 of them and counting



http://aws.amazon.com/amis



https://aws.amazon.com/marketplace/

That's awesome....

All I have to do is find what I need and off I go.
Someone else created it, maintains it....

But there could be some issues with using these.....

AWS AMIs

Amazon Linux AMI 2013.09.1 - ami-83e4bcea (64-bit) / ami-cde4bca4 (32-bit)

Amazon Linux — Free tier eligible

The Amazon Linux AMI is an EBS-backed, PV-GRUB image. It includes Linux 3.4, AWS tools, and repository access to multiple versions of MySQL, PostgreSQL, Python, Ruby, and Tomcat.

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

Red Hat Enterprise Linux 6.4 - ami-a25415cb (64-bit) / ami-7e175617 (32-bit)

Red Hat — Free tier eligible

Red Hat Enterprise Linux version 6.4, EBS-boot.

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

SUSE Linux Enterprise Server 11 - ami-e8084981 (64-bit) / ami-b60948df (32-bit)

SUSE Linux — Free tier eligible

SUSE Linux Enterprise Server 11 Service Pack 3 basic install, EBS boot with Amazon EC2 AMI Tools preinstalled; Apache 2.2, MySQL 5.5, PHP 5.3, and Ruby 1.8.7 available

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

Ubuntu Server 12.04.3 LTS - ami-a73264ce (64-bit) / ami-a53264cc (32-bit)

Ubuntu — Free tier eligible

Ubuntu Server 12.04.3 LTS with support available from Canonical (http://www.ubuntu.com/cloud/services).

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

Ubuntu Server 13.10 - ami-ad184ac4 (64-bit) / ami-a9184ac0 (32-bit)

Ubuntu — Free tier eligible

Ubuntu Server 13.10: Ubuntu Server version 13.10, with support available from Canonical (http://www.ubuntu.com/cloud/services).

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

Amazon Linux AMI (HVM) 2013.09.1 - ami-d1bfe4b8

Amazon Linux

The Amazon Linux AMI is an EBS-backed, HVM image. It includes Linux 3.4, AWS tools, and repository access to multiple versions of MySQL, PostgreSQL, Python, Ruby, and Tomcat.

Root device type: ebs Virtualization type: hvm

Select — 64-bit

Red Hat Enterprise Linux 6.4 for Cluster Instances - ami-3218595b

Red Hat

Red Hat Enterprise Linux version 6.4 is an EBS-backed, HVM image for use with Amazon EC2 Cluster Instances.

Root device type: ebs Virtualization type: hvm

Select — 64-bit

Don't be discouraged....

Step 1: Choose an Amazon Machine Image (AMI)

Cancel and Exit

An AMI is a template that contains the software configuration (operating system, application server, and applications) required to launch your instance. You can select an AMI provided by AWS, our user community, or the AWS Marketplace; or you can select one of your own AMIs.

Quick Start

My AMIs

AWS Marketplace

Community AMIs

Free tier only

Amazon Linux AMI 2013.09.1 - ami-83e4bcea (64-bit) / ami-cde4bca4 (32-bit)
Amazon Linux
Free tier eligible
The Amazon Linux AMI is an EBS-backed, PV-GRUB image. It includes Linux 3.4, AWS tools, and repository access to multiple versions of MySQL, PostgreSQL, Python, Ruby, and Tomcat.
Root device type: ebs Virtualization type: paravirtual
Select
64-bit 32-bit

Red Hat Enterprise Linux 6.4 - ami-a25415cb (64-bit) / ami-7e175617 (32-bit)
Red Hat
Free tier eligible
Red Hat Enterprise Linux version 6.4, EBS-boot.
Root device type: ebs Virtualization type: paravirtual
Select
64-bit 32-bit

SUSE Linux Enterprise Server 11 - ami-e8084981 (64-bit) / ami-b60948df (32-bit)
SUSE Linux
Free tier eligible
SUSE Linux Enterprise Server 11 Service Pack 3 basic install, EBS boot with Amazon EC2 AMI Tools preinstalled; Apache 2.2, MySQL 5.5, PHP 5.3, and Ruby 1.8.7 available
Root device type: ebs Virtualization type: paravirtual
Select
64-bit 32-bit

Ubuntu Server 12.04.3 LTS - ami-a73264ce (64-bit) / ami-a53264cc (32-bit)
Ubuntu
Free tier eligible
Ubuntu Server 12.04.3 LTS with support available from Canonical (http://www.ubuntu.com/cloud/services).
Root device type: ebs Virtualization type: paravirtual
Select
64-bit 32-bit

Ubuntu Server 13.10 - ami-ad184ac4 (64-bit) / ami-a9184ac0 (32-bit)
Ubuntu
Free tier eligible
Ubuntu Server 13.10: Ubuntu Server version 13.10, with support available from Canonical (http://www.ubuntu.com/cloud/services).
Root device type: ebs Virtualization type: paravirtual
Select
64-bit 32-bit

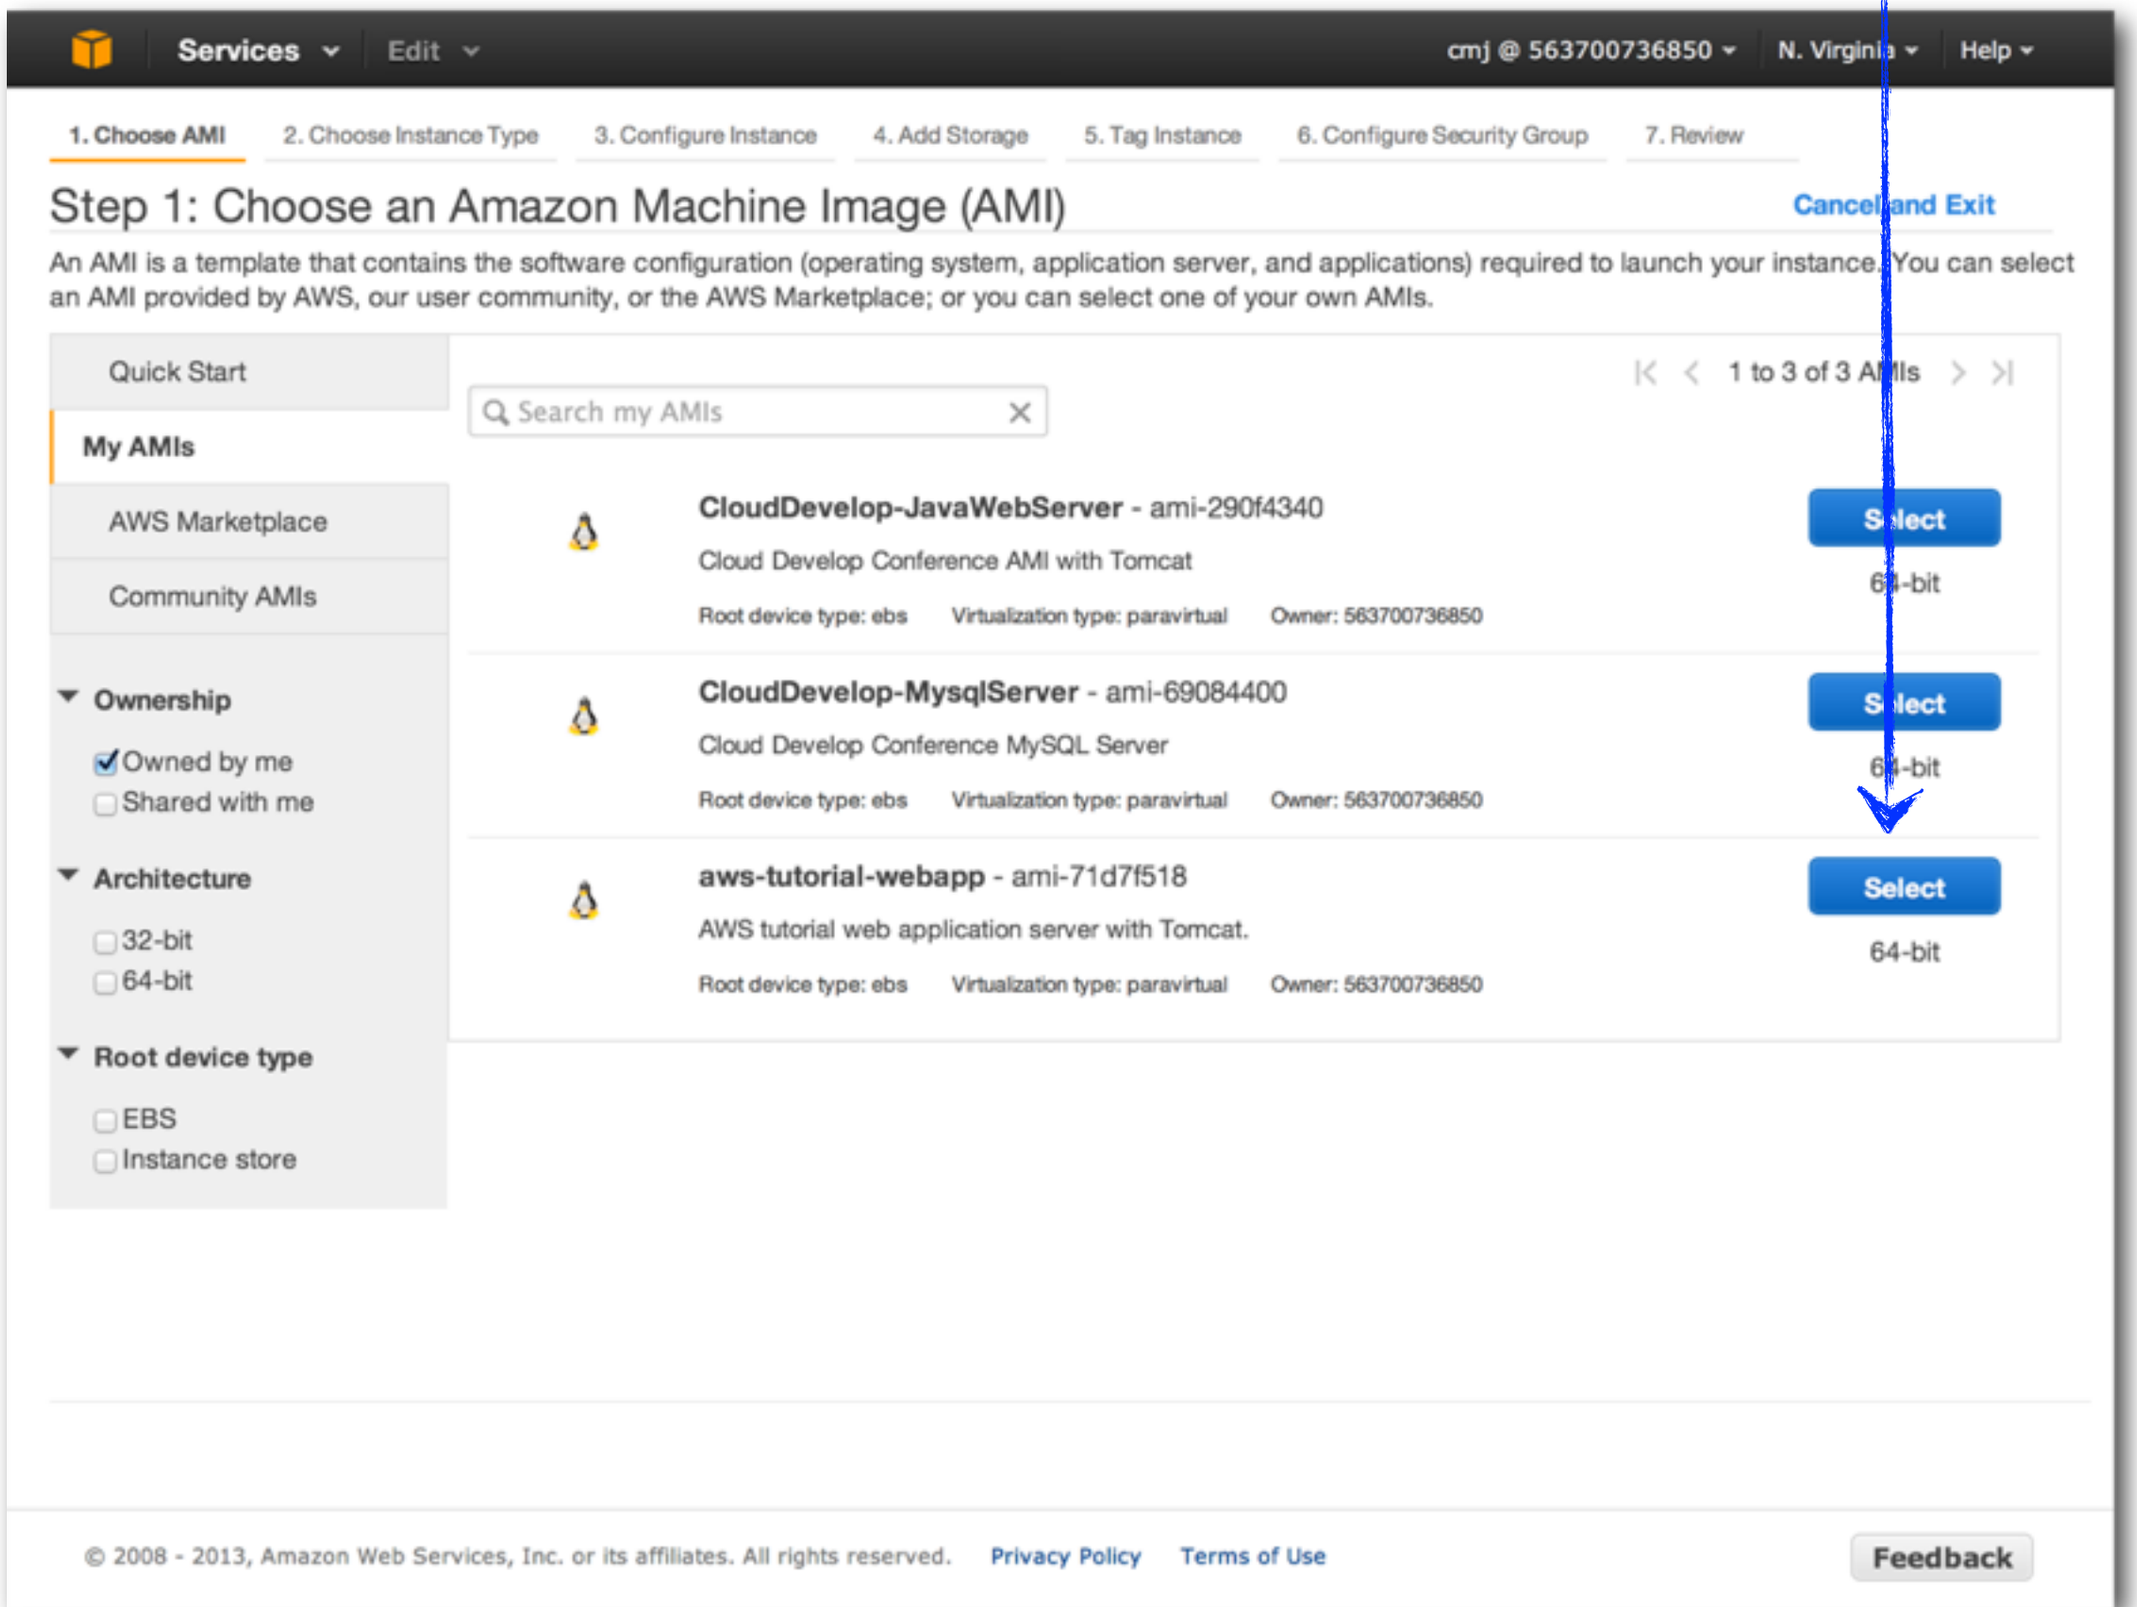
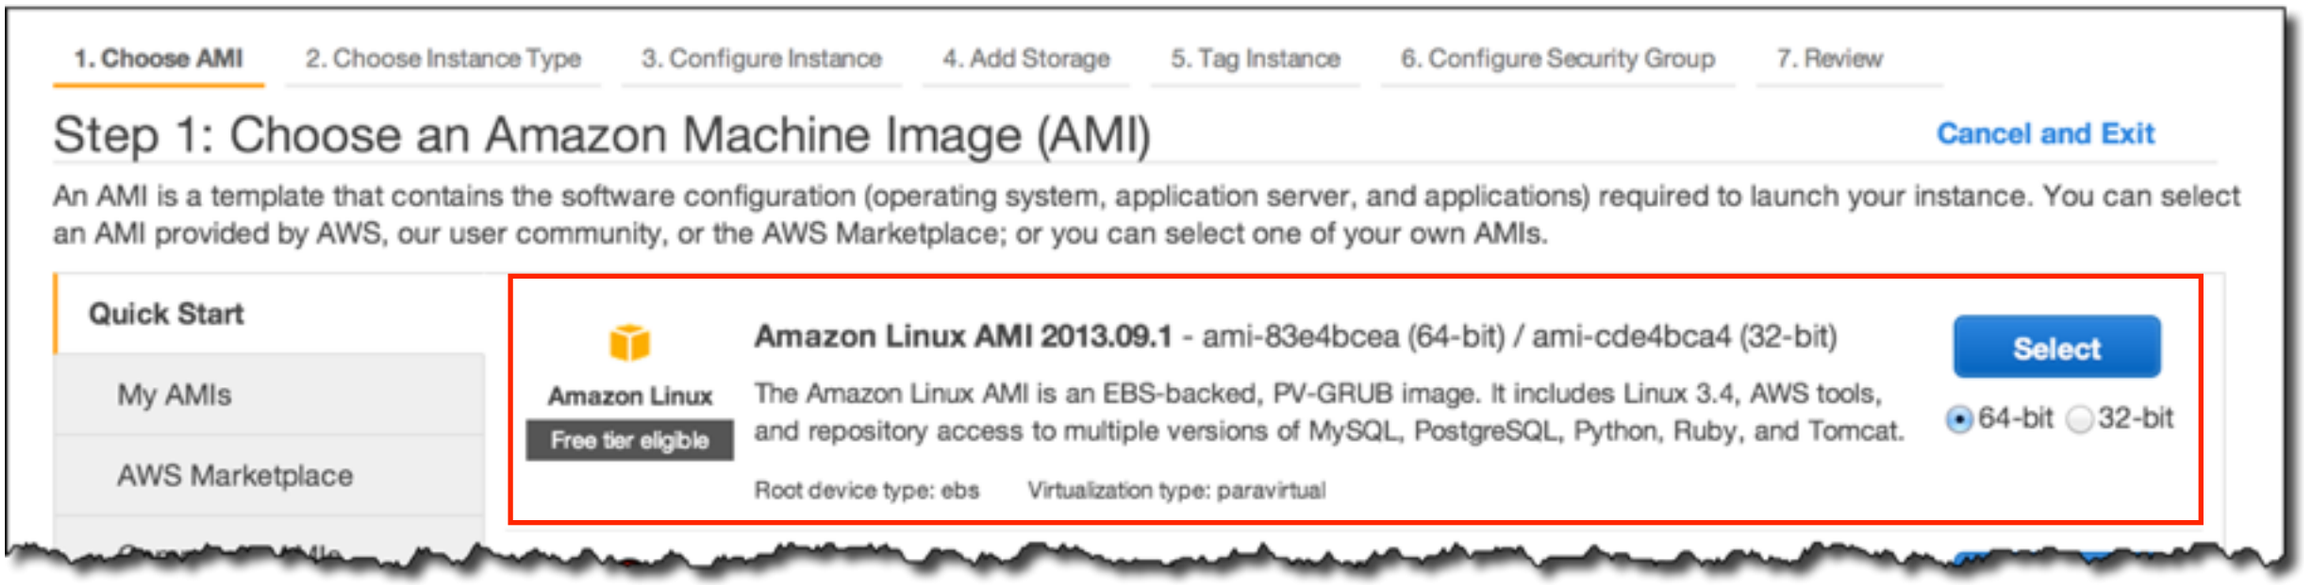
select aws-tutorial-webapp AMI



Apache Tomcat 7.x

aws-tutorial-webapp AMI



```
sudo yum update

sudo yum install java-1.7.0-openjdk.x86_64
sudo yum install java-1.7.0-openjdk-devel.x86_64
sudo alternatives --config java

sudo yum install tomcat7.noarch
sudo yum install tomcat7-webapps.noarch
sudo yum install tomcat7-admin-webapps.noarch
sudo service tomcat7 start
sudo chkconfig --level 345 tomcat7 on

sudo yum install git.x86_64
git clone https://github.com/zendern/nuez.git

wget http://dist.springframework.org.s3.amazonaws.com/release/GRAILS/grails-2.0.0.zip
unzip grails-2.0.0.zip
export GRAILS_HOME=~/grails-2.0.0
export PATH=$PATH:$GRAILS_HOME/bin
```

select m1.small type

Services | Edit | cmj @ 563700736850 | N. Virginia | Help

1. Choose AMI | 2. Choose Instance Type | 3. Configure Instance | 4. Add Storage | 5. Tag Instance | 6. Configure Security Group | 7. Review

Step 2: Choose an Instance Type

Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instances are virtual servers that can run applications. They have varying combinations of CPU, memory, storage, and networking capacity, and give you the flexibility to choose the appropriate mix of resources for your applications. Learn more about instance types and how they can meet your computing needs.

Currently selected: m1.small (1 ECUs, 1 vCPUs, 1.7 GiB memory, 1 x 160 GiB Storage Capacity)

- **All instance types**
- Micro instances
- General purpose
- Memory optimized
- Storage optimized
- Compute optimized

All instances

Select an instance type to suit your requirements

Size	ECUs	vCPUs	Memory (GiB)	Instance Storage (GiB)	EBS-Optimized Available	Network Performance
t1.micro	up to 2	1	0.613	EBS only	-	Very Low
m1.small	1	1	1.7	1 x 160	-	Low
m1.medium	2	1	3.7	1 x 410	-	Moderate
m1.large	4	2	7.5	2 x 420	Yes	Moderate
m1.xlarge	8	4	15	4 x 420	Yes	High
m3.xlarge	13	4	15	EBS only	Yes	Moderate
m3.2xlarge	26	8	30	EBS only	Yes	High
m2.xlarge	6.5	2	17.1	1 x 420	-	Moderate
m2.2xlarge	13	4	34.2	1 x 850	Yes	Moderate
m2.4xlarge	26	8	68.4	2 x 840	Yes	High

Cancel | Previous | Review and Launch | Next: Configure Instance Details

 Privacy Policy | Terms of Use | Feedback

Services | Edit | cmj @ 563700736850 | N. Virginia | Help

1. Choose AMI | 2. Choose Instance Type | 3. Configure Instance | 4. Add Storage | 5. Tag Instance | 6. Configure Security Group | 7. Review

Step 3: Configure Instance Details

Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot Instances to take advantage of the lower pricing, assign an access management role to the instance, and more.

Number of instances	1
Purchasing option	Request Spot Instances
Network	Launch into EC2-Classic — Create new VPC
Availability Zone	No preference
IAM role	None
Shutdown behavior	Stop
Enable termination protection	Protect against accidental termination
Monitoring	Enable CloudWatch detailed monitoring Additional charges apply.

▸ Advanced Details

Cancel | Previous | Review and Launch | Next: Add Storage

 Privacy Policy | Terms of Use | Feedback

Step 4: Add Storage

Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. Learn more about storage options in Amazon EC2.

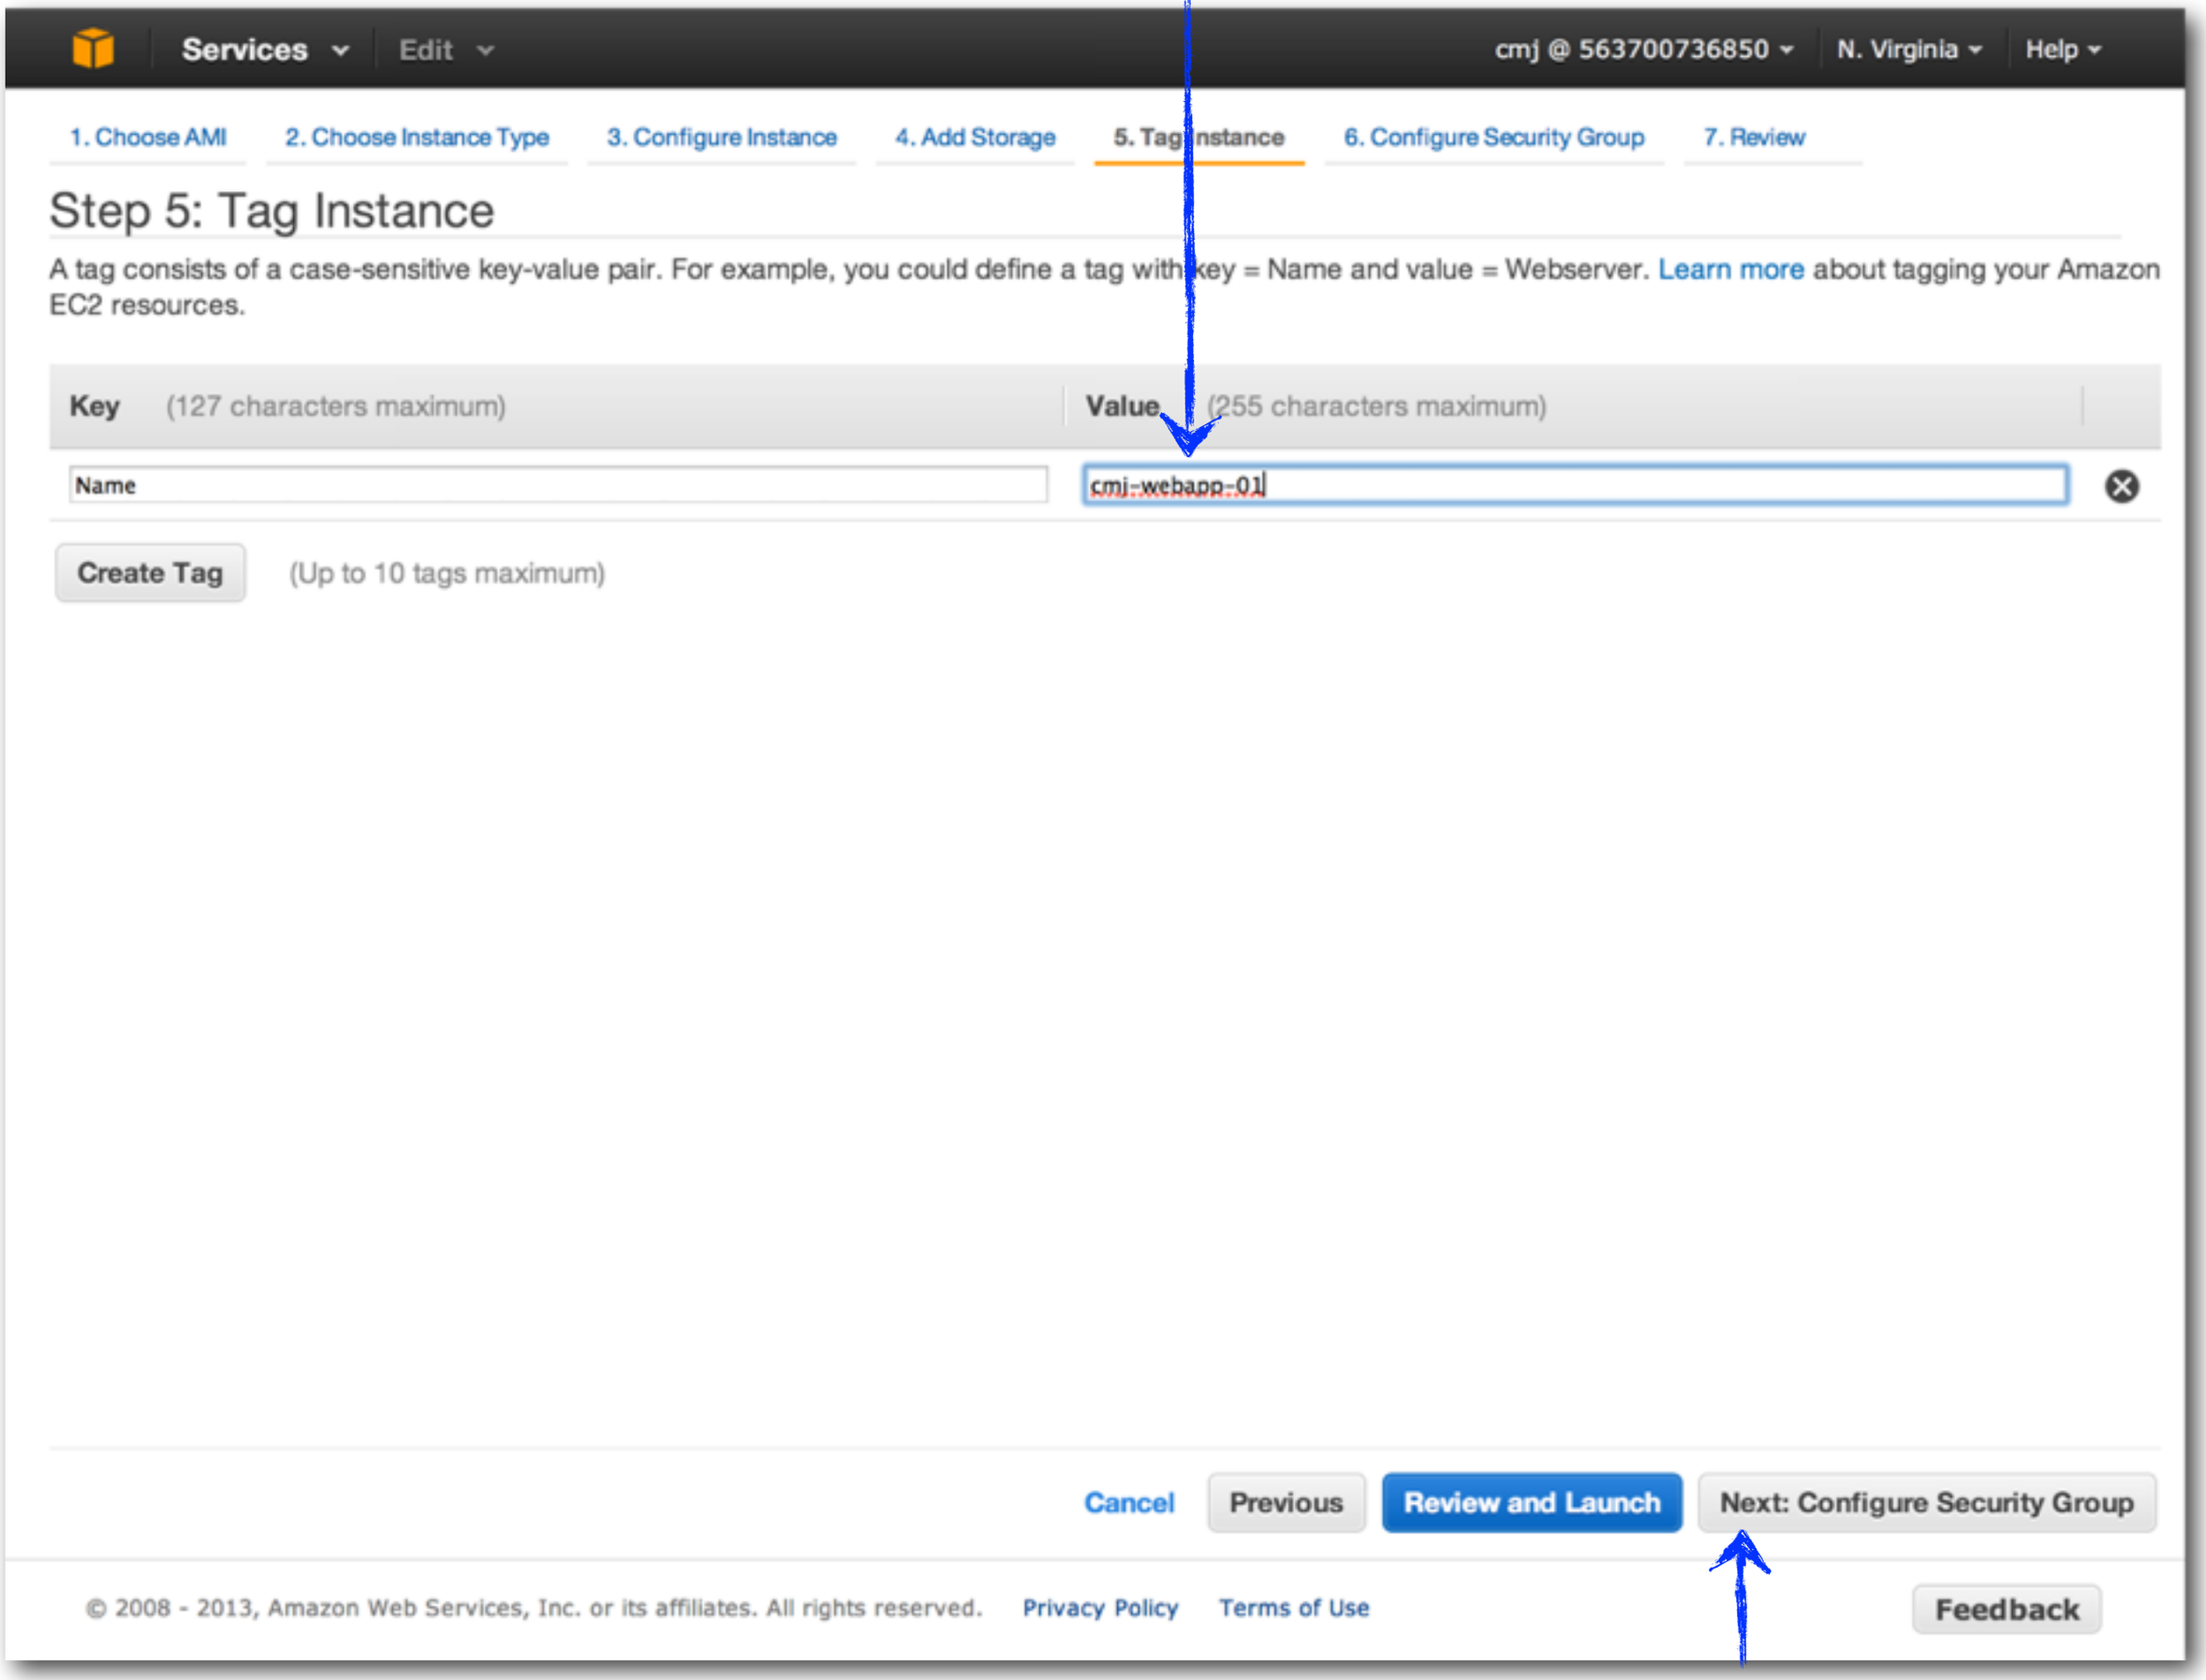
Type	Device	Snapshot	Size (GB)	Volume Type	IOPS	Delete on Termination
Root	/dev/sda1	snap-33d50829	8	Standard	N/A	☑

Add New Volume

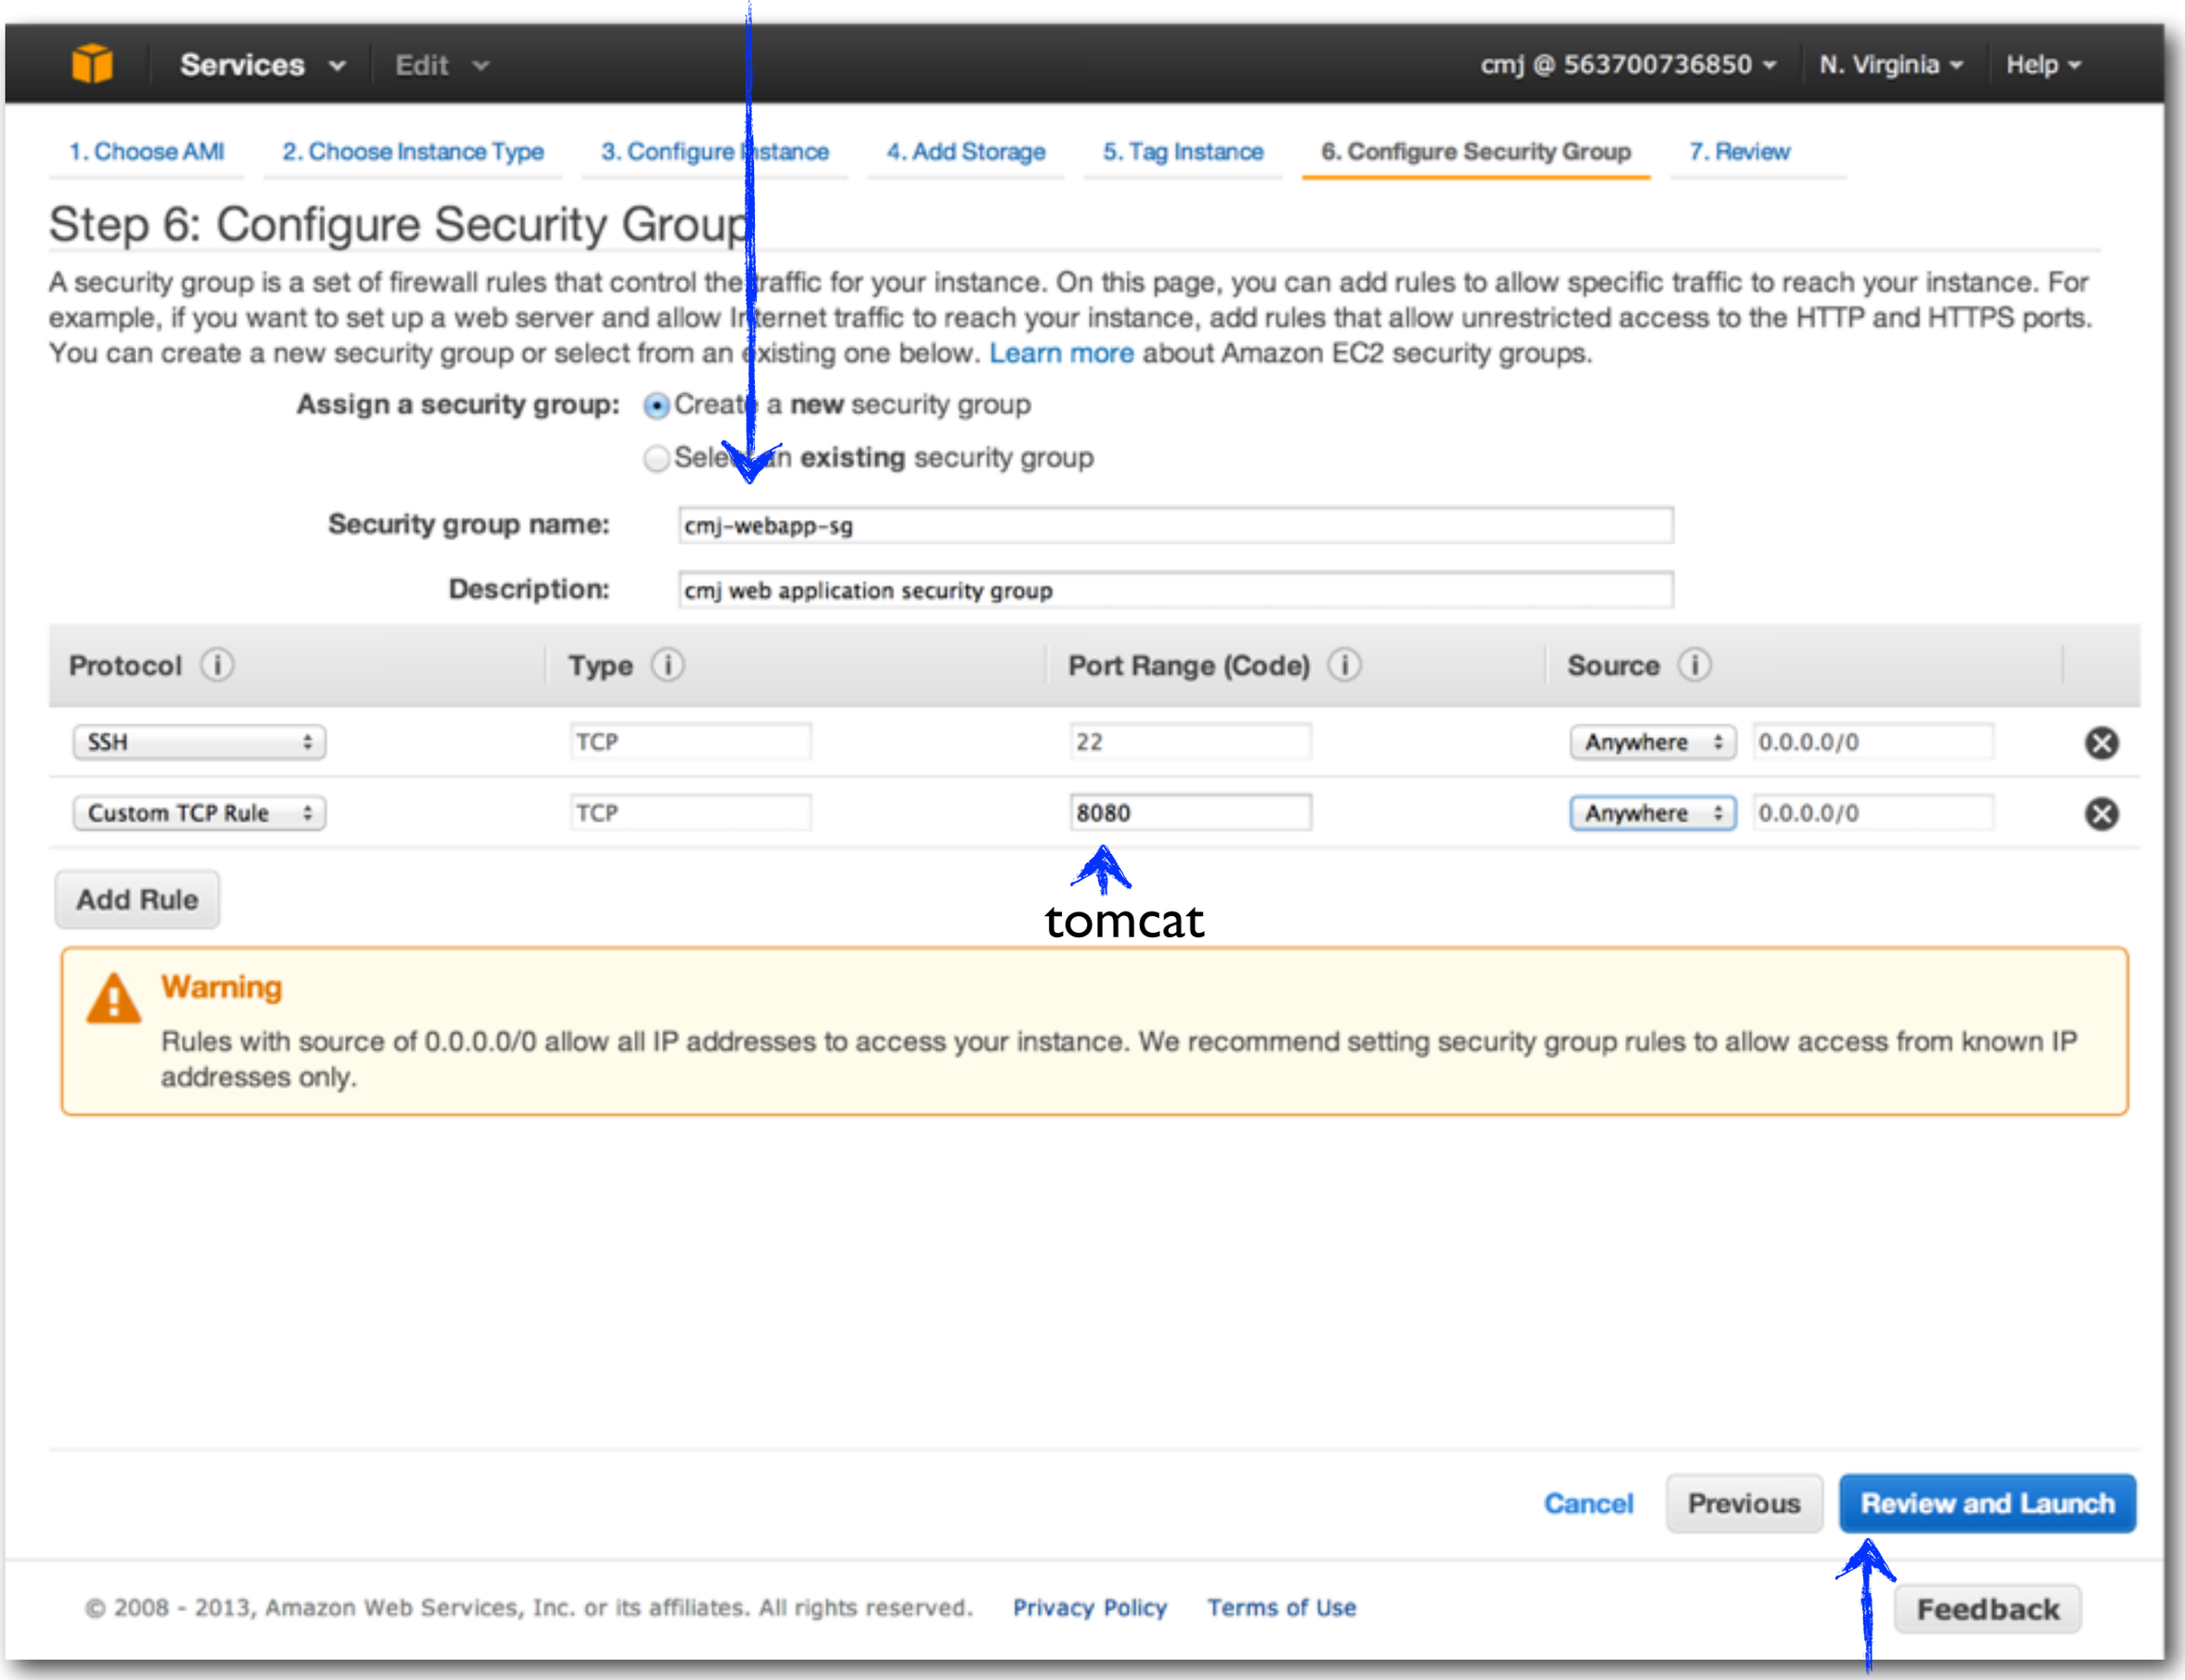
Free tier eligible customers can get up to 30 GB of EBS storage. Learn more about free usage tier eligibility and usage restrictions.

Cancel | Previous | Review and Launch | Next: Tag Instance

name instance with naming convention



name group with naming convention



Step 7: Review Instance Launch

Please review your instance launch details. You can go back to edit changes for each section. Click **Launch** to assign a key pair to your instance and complete the launch process.

Improve your instance's security. Your security group, cmj-webapp-sg, is open to the world.

Your instance may be accessible from any IP address. We recommend that you update your security group rules to allow access from known IP addresses only.
You can also open additional ports in your security group to facilitate access to the application or service you're running, e.g., HTTP (80) for web servers.
Edit security groups

Your instance configuration is not eligible for the free usage tier x

To launch an instance that's eligible for the free usage tier, check your AMI selection, instance type, configuration options, or storage devices. Learn more about free usage tier eligibility and usage restrictions.

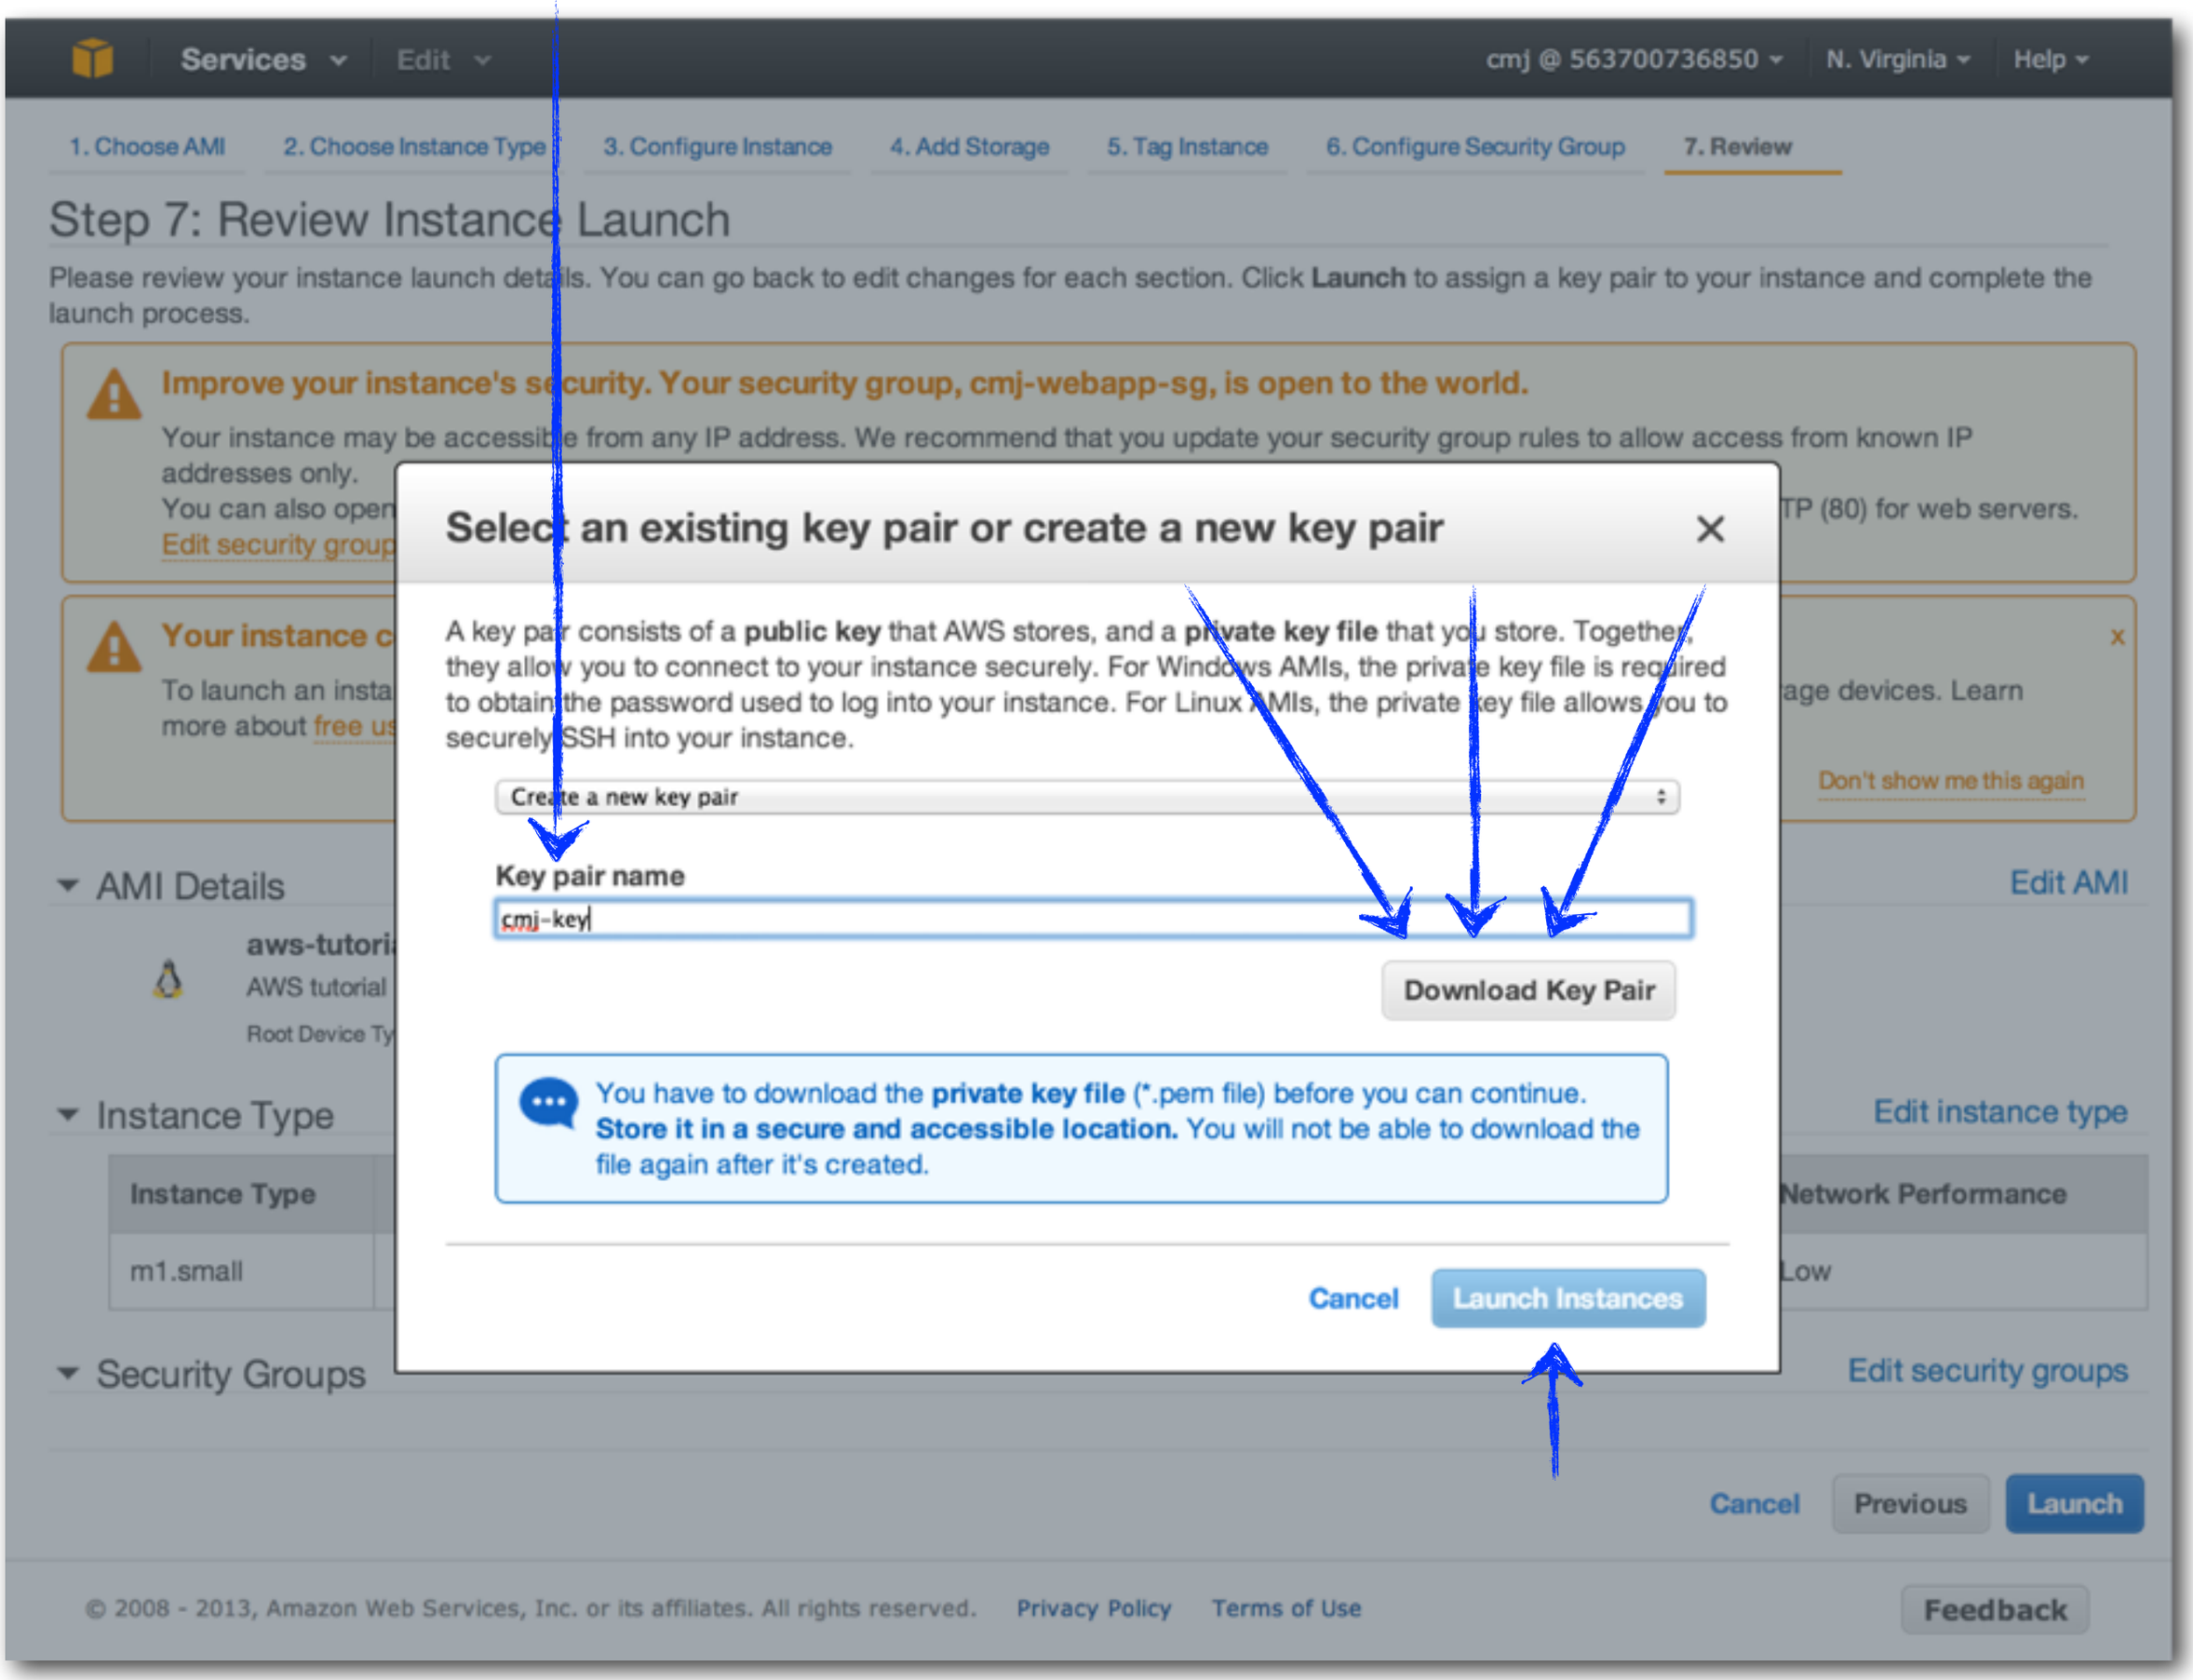
name key with naming convention



Launch Status

Your instance is now launching

The following instance launch has been initiated: i-25054a5d View launch log

Get notified of estimated charges

Create billing alerts to get an email notification when estimated charges on your AWS bill exceed $0.0 (in other words, when you have exceeded the free usage tier).

How to connect to your instance

Your instance is launching, and it may take a few minutes until it is in the **running** state, when it will be ready for you to use. Usage hours on your new instance will start immediately and continue to accrue until you stop or terminate your instance.

Click **View Instances** to monitor your instance's status. Once your instance is in the **running** state, you can **connect** to it from the Instances screen. Find out how to connect to your instance.

Here are some helpful resources to get you started

- How to connect to your Linux instance
- Learn about AWS Free Usage Tier
- Amazon EC2: User Guide
- Amazon EC2: Discussion Forum

While your instances are launching you can also

Create status check alarms to be notified when these instances fail status checks. (Additional charges may apply)
Create and attach additional EBS volumes (Additional charges may apply)
Manage security groups

View Instances

Feedback

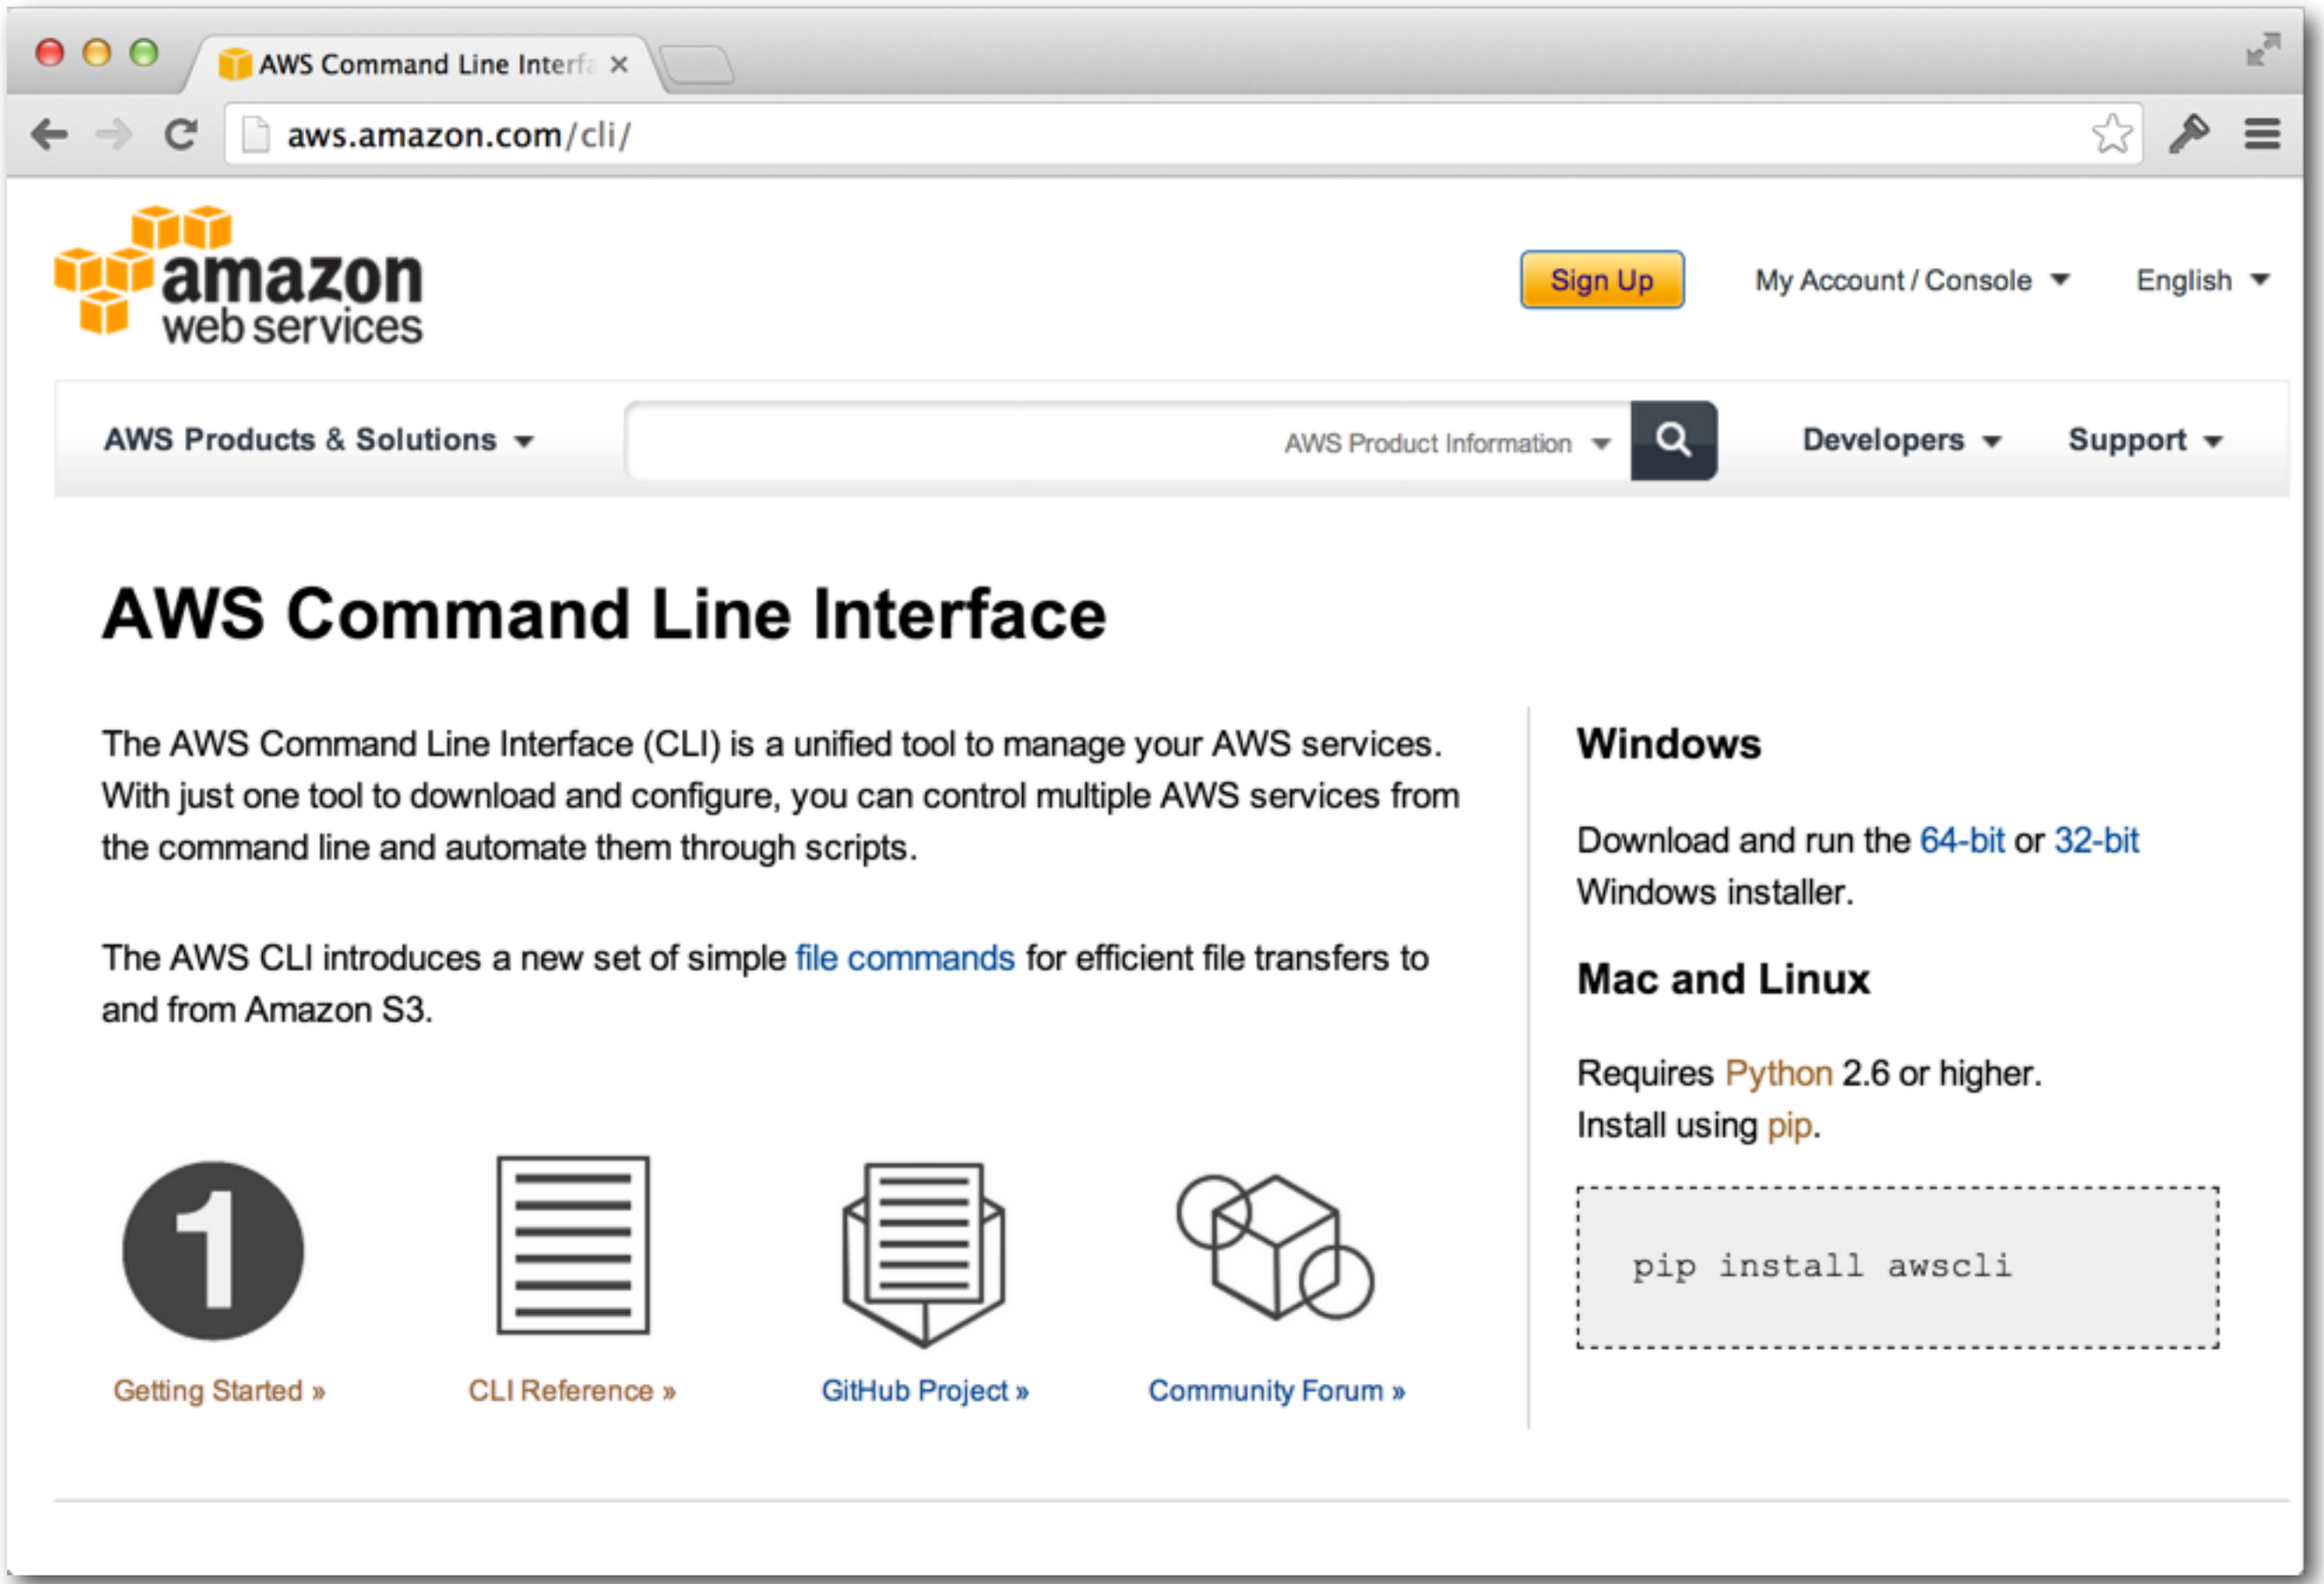
EC2 with Command Line

Console Environment Setup



http://aws.amazon.com/cli/

Console Environment Setup

```
sudo python ez_setup.py
sudo python get-pip.py
sudo pip install awscli
aws configure
AWS Access Key ID [None]: AKIAI6ZZCGHYRQGEAYJQ
AWS Secret Access Key [None]: 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
Default region name [None]: us-east-1
Default output format [None]:
```

Console Usage

```
aws [options] <command> <subcommand> [parameters]
aws ec2 describe-images --owner self
aws ec2 run-instance --image-id <image id>
                     --key-name <key name>
                     --security-group-ids <security group id>
aws ec2 describe-instances
ssh -i <key-pair-pem-file> ec2-user@<server name>
aws ec2 stop-instance <instance id>
aws ec2 terminate-instance <instance id>
```

EC2 WITH JAVA SDK

Letting AWS know who you are

Using Java SDK

```
//SETUP CREDENTIALS
AWSCredentials creds = new
PropertiesCredentials(this.getClass().getResourceAsStream("/awsCredentials.properties"));

//CREATING EC2 CLIENT
AmazonEC2 ec2 = new AmazonEC2Client(creds);
```

Creating a New Key Pair

Using Java SDK

```
CreateKeyPairRequest createKeyPairRequest = new CreateKeyPairRequest();

String keyName = "testKeyPair-fromjava";
createKeyPairRequest.withKeyName(keyName);

CreateKeyPairResult createKeyPairResult = ec2.createKeyPair(createKeyPairRequest);

KeyPair keyPair = createKeyPairResult.getKeyPair();
File pemFile = new File(keyName + ".pem");

BufferedWriter out = new BufferedWriter(new FileWriter(pemFile));
out.write(keyPair.getKeyMaterial());
out.close();
```

Creating a Security Group

Using the Java SDK

```
CreateSecurityGroupRequest r1 = new CreateSecurityGroupRequest("webserver-group", "Sec
Group for My Web Servers");
ec2.createSecurityGroup(r1);

AuthorizeSecurityGroupIngressRequest r2 = new AuthorizeSecurityGroupIngressRequest();
r2.setGroupName("webserver-group");
IpPermission permission = new IpPermission();
permission.setIpProtocol("tcp");
permission.setFromPort(80);
permission.setToPort(80);
List ipRanges = new ArrayList();

//use CIDR notation, see http://en.wikipedia.org/wiki/CIDR_notation
ipRanges.add("0.0.0.0/0"); permission.setIpRanges(ipRanges);

List permissions = new ArrayList();
permissions.add(permission);
r2.setIpPermissions(permissions);
ec2.authorizeSecurityGroupIngress(r2);
```

Creating the EC2 Instance

Using the Java SDK

```
// CREATE EC2 INSTANCES
RunInstancesRequest runInstancesRequest = new RunInstancesRequest()
    .withInstanceType("micro")
    .withImageId("ami-4bb96d22")
    .withMinCount(1)
    .withMaxCount(1)
    .withSecurityGroupIds("webserver-group")
    .withKeyName("testKeyPair-fromjava");

RunInstancesResult runInstances = ec2.runInstances(runInstancesRequest);
```

Giving the Instance Metadata

```
// TAG EC2 INSTANCES WITH USER METADATA
List<Instance> instances = runInstances.getReservation().getInstances();
for (Instance instance : instances) {
  CreateTagsRequest createTagsRequest = new CreateTagsRequest();
  createTagsRequest.withResources(instance.getInstanceId())
           .withTags(new Tag("Name", "MyFirstEC2Instance"));
  ec2.createTags(createTagsRequest);
}
```

Stopping/Terminating EC2 Instance

```
StopInstancesRequest stopInstanceRequest =
                                        new StopInstancesRequest().withInstanceIds(instanceIds);
ec2.terminateInstances(stopInstanceRequest);
```

```
TerminateInstancesRequest terminateInstanceRequest =
                                      new TerminateInstancesRequest().withInstanceIds(instanceIds);
ec2.terminateInstances(terminateInstanceRequest);
```

EBS

	Unstructured Data			Structured Data		
	Amazon EC2 Instance Storage	**Amazon EBS Volumes**	**Amazon S3**	**Amazon SimpleDB**	**Other Relational DB (on EC2 and EBS)**	**Amazon RDS**
Performance	High	High	Moderate (single thread) to Very High (multiple threads)	Moderate to High (batched Puts / Gets)	High	High
Durability	Low	Moderate	High	High	High	Moderate
Cost	Included in EC2 cost	Provisioned per GB/Month	Stored per GB/Month	Provisioned First GB free, then per GB/Month	Provisioned (same as EBS)	Provisioned per GB/Month (5 GB minimum)
Availability	Low	Moderate to High (using EBS snapshots)	High	High	Moderate to High	High
Elasticity / Scalability	No	Manual (adding more volumes)	Automatic	Automatic	Manual	Manual (one command to modify DB Instance)
Size Limits	160 GB to 1.6 TB (larger instances have both larger volumes and more volumes)	1 GB to 1 TB per volume (can use multiple volumes or striping for larger capacities)	Effectively Unlimited (5 TB per object, unlimited objects per bucket)	10 GB/domain 100 domains (more domains available upon request)	(same as EBS)	5 GB to 1 TB per DB Instance
Persistence Across Instantiations	No	Yes	Yes	Yes	Yes	Yes
Interfaces	Block Device, access via OS / file system on EC2	N/A, access through EC2 OS / file system	HTTP, REST or SOAP	REST or SOAP	MySQL or JDBC libraries	MySQL or JDBC libraries
Security (encryption at-rest)	Run Encrypted FS	Run Encrypted FS	Encrypt using 256-bit AES	Encrypt using 256-bit AES		
Security (encryption in-transit)	N/A	N/A	SSL (HTTPS)	SSL (HTTPS)	SSL (HTTPS)	SSL (HTTPS)
RDBMS Platforms Supported	MySQL, SQL Server, Oracle, DB2, etc.	MySQL, SQL Server, Oracle, DB2, etc.	N/A	N/A	MySQL, SQL Server, Oracle, DB2 etc.	MySQL 5.1
Model (relational or otherwise)	Block	Block	Object	Non-relational, flexible schema, entity store	Relational	Relational
Degree of Automation	None	Auto-mirroring	Auto-replication, Versioning	Indexing, replication, provisioning, patching	Depends on DB	Automated backups, software
Degree of Redundancy	Not redundant	Redundant within an Availability Zone	Highly redundant across multiple data centers	Maintain multiple, geographically diverse copies of all user data	None (asynchronous replication available)	Offer both single DB Instance (one AZ) and Multi-AZ options
Cross-Instance Access (i.e., shareability)	No	No	Yes	Yes	Yes	Yes
Management and Administration	Manual	Manual	Auto	Auto	Manual	Auto

S3 Pricing

Storage Pricing

Region: US Standard

	Standard Storage	Reduced Redundancy Storage	Glacier Storage
First 1 TB / month	$0.0300 per GB	$0.0240 per GB	$0.0100 per GB
Next 49 TB / month	$0.0295 per GB	$0.0236 per GB	$0.0100 per GB
Next 450 TB / month	$0.0290 per GB	$0.0232 per GB	$0.0100 per GB
Next 500 TB / month	$0.0285 per GB	$0.0228 per GB	$0.0100 per GB
Next 4000 TB / month	$0.0280 per GB	$0.0224 per GB	$0.0100 per GB
Over 5000 TB / month	$0.0275 per GB	$0.0220 per GB	$0.0100 per GB

Request Pricing

Region: US Standard

	Pricing
PUT, COPY, POST, or LIST Requests	$0.005 per 1,000 requests
Glacier Archive and Restore Requests	$0.05 per 1,000 requests
Delete Requests	Free †
GET and all other Requests	$0.004 per 10,000 requests
Glacier Data Restores	Free ‡

Data Transfer Pricing

The pricing below is based on data transferred "in" to and "out" of Amazon S3.

Region: US Standard

	Pricing
Data Transfer IN To Amazon S3	
All data transfer in	$0.000 per GB
Data Transfer OUT From Amazon S3 To	
Amazon EC2 in the Northern Virginia Region	$0.000 per GB
Another AWS Region or Amazon CloudFront	$0.020 per GB
Data Transfer OUT From Amazon S3 To Internet	
First 1 GB / month	$0.000 per GB
Up to 10 TB / month	$0.120 per GB
Next 40 TB / month	$0.090 per GB
Next 100 TB / month	$0.070 per GB
Next 350 TB / month	$0.050 per GB
Next 524 TB / month	Contact Us
Next 4 PB / month	Contact Us
Greater than 5 PB / month	Contact Us

EBS Pricing

Amazon EBS General Purpose (SSD) volumes

- $0.10 per GB-month of provisioned storage

Amazon EBS Provisioned IOPS (SSD) volumes

- $0.125 per GB-month of provisioned storage
- $0.10 per provisioned IOPS-month

Amazon EBS Magnetic volumes

- $0.05 per GB-month of provisioned storage
- $0.05 per 1 million I/O requests

Amazon EBS Snapshots to Amazon S3

- $0.095 per GB-month of data stored

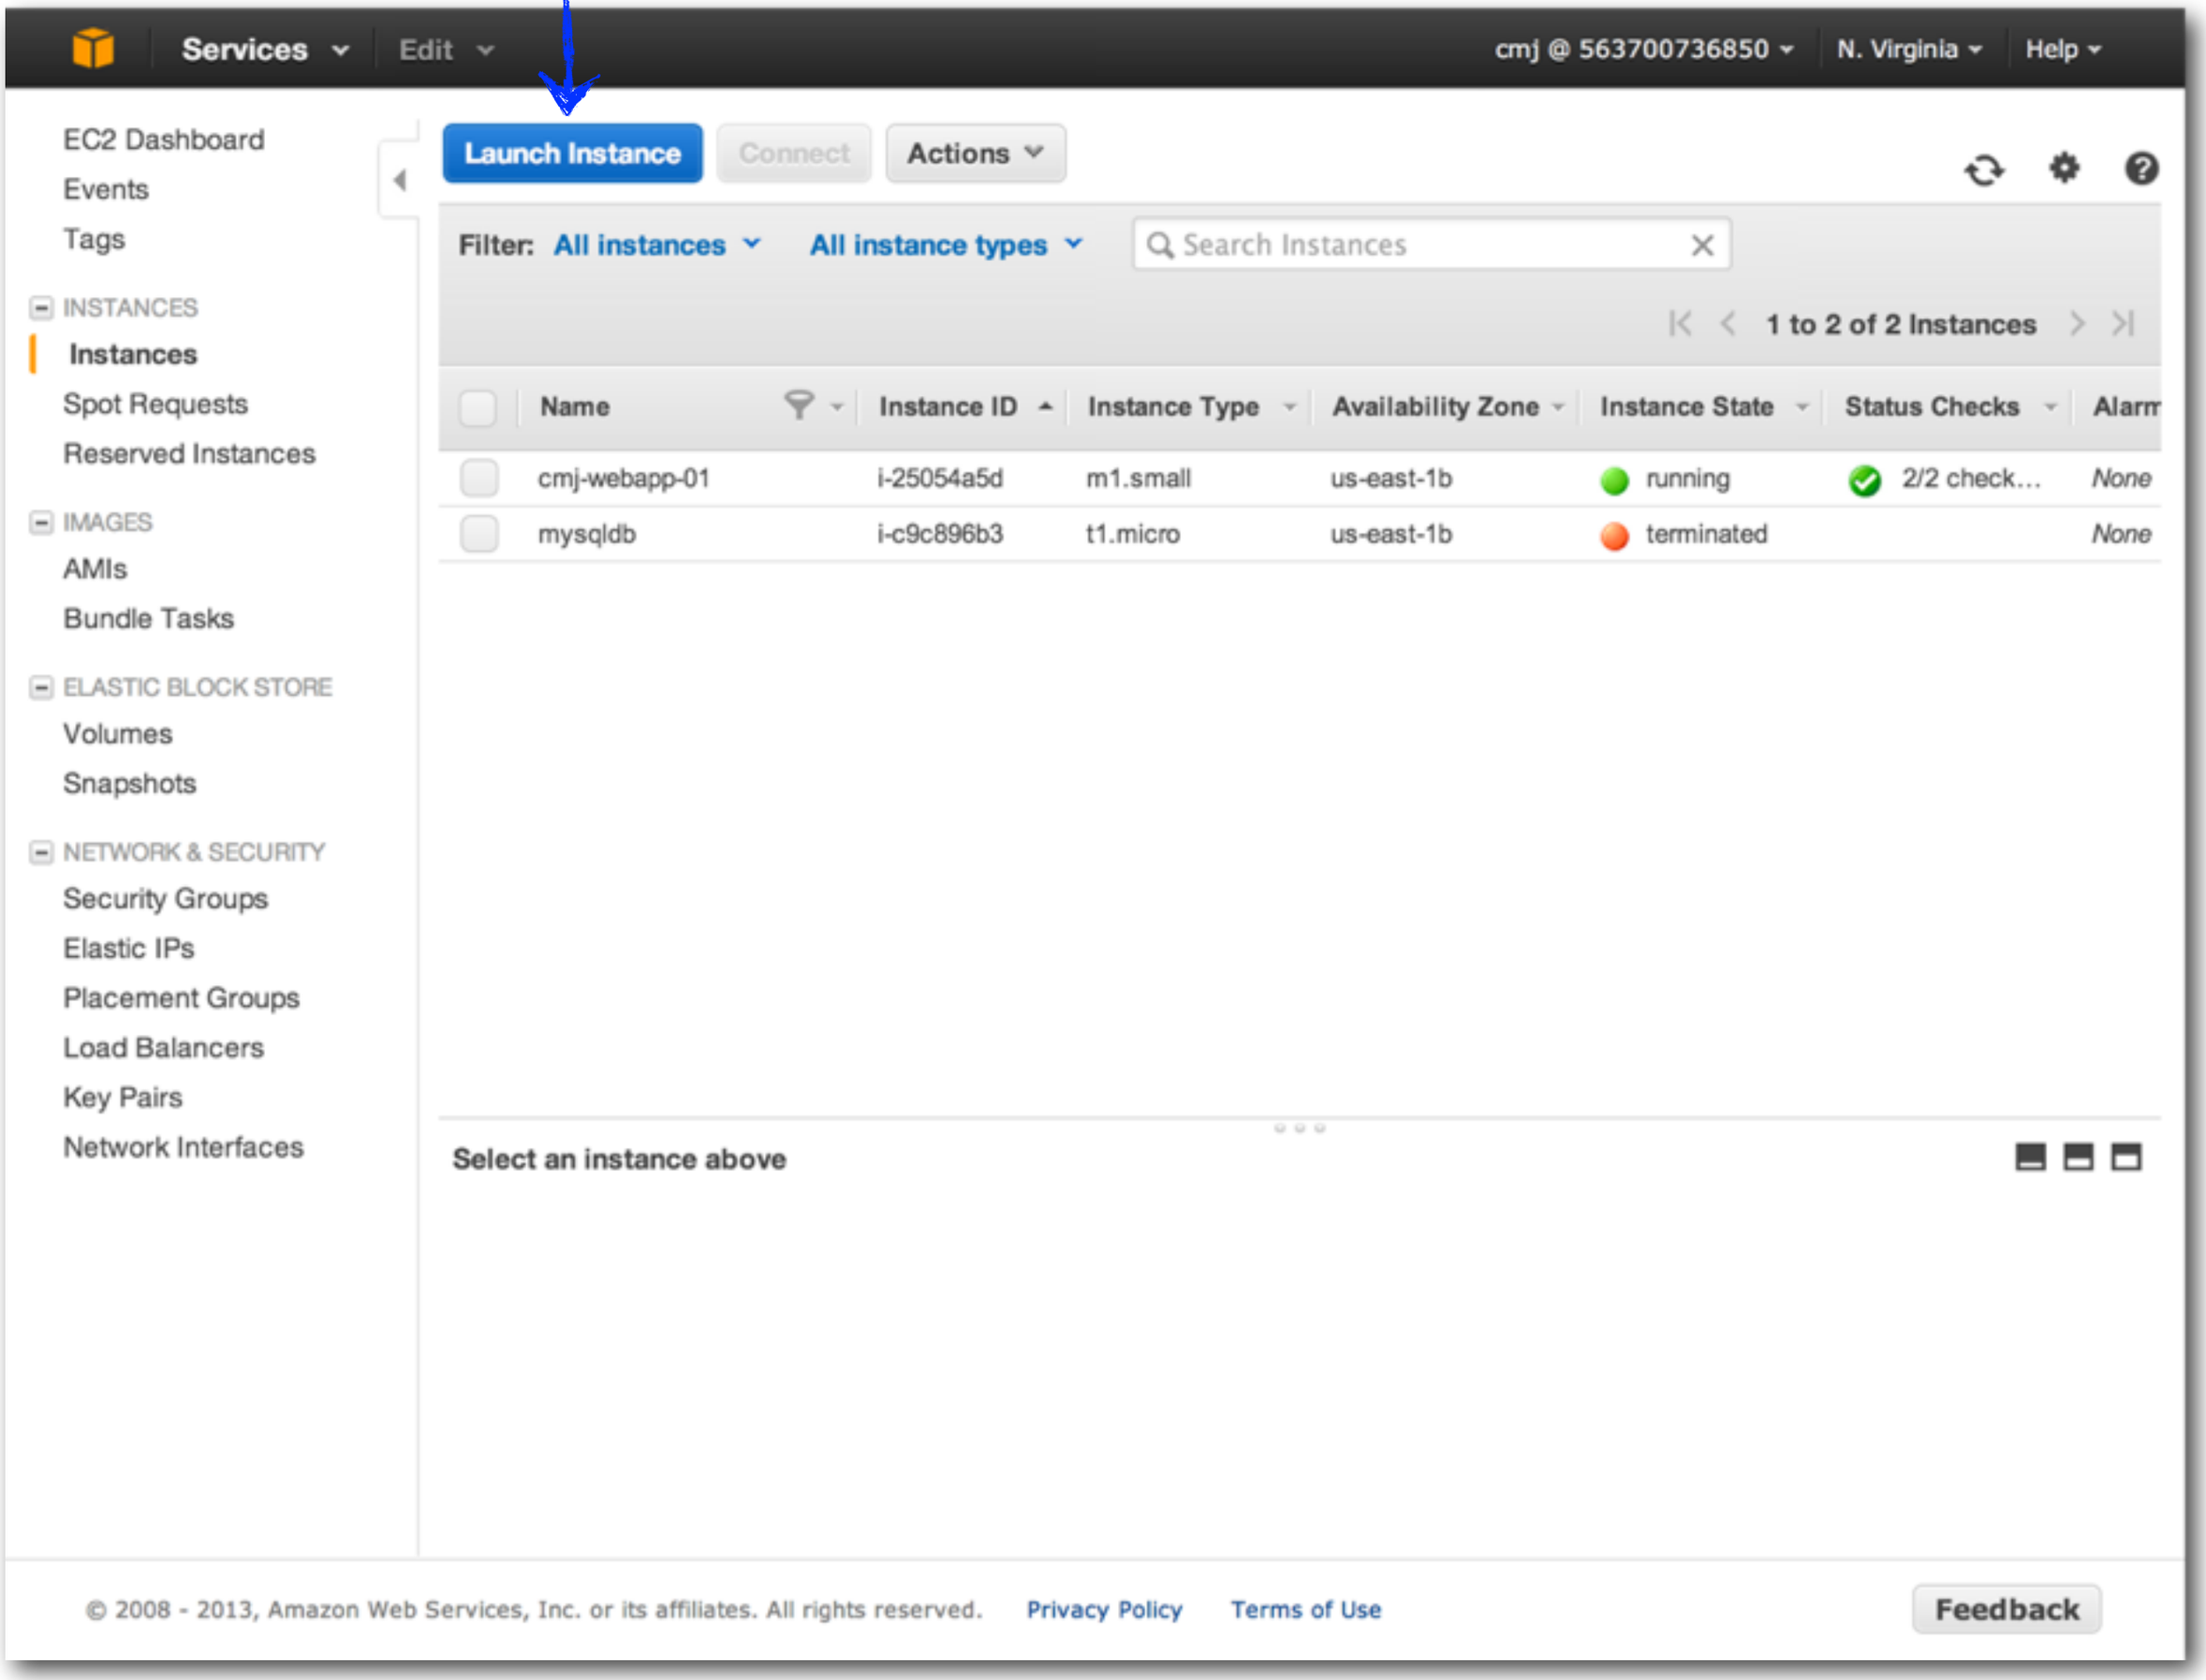
launch new mysql server instance



Step 1: Choose an Amazon Machine Image (AMI)

Cancel and Exit

An AMI is a template that contains the software configuration (operating system, application server, and applications) required to launch your instance. You can select an AMI provided by AWS, our user community, or the AWS Marketplace; or you can select one of your own AMIs.

Quick Start

My AMIs

AWS Marketplace

Community AMIs

Free tier only

Amazon Linux — Free tier eligible

Amazon Linux AMI 2013.09.1 - ami-83e4bcea (64-bit) / ami-cde4bca4 (32-bit)

The Amazon Linux AMI is an EBS-backed, PV-GRUB image. It includes Linux 3.4, AWS tools, and repository access to multiple versions of MySQL, PostgreSQL, Python, Ruby, and Tomcat.

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

Red Hat — Free tier eligible

Red Hat Enterprise Linux 6.4 - ami-a25415cb (64-bit) / ami-7e175617 (32-bit)

Red Hat Enterprise Linux version 6.4, EBS-boot.

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

SUSE Linux — Free tier eligible

SUSE Linux Enterprise Server 11 - ami-e8084981 (64-bit) / ami-b60948df (32-bit)

SUSE Linux Enterprise Server 11 Service Pack 3 basic install, EBS boot with Amazon EC2 AMI Tools preinstalled; Apache 2.2, MySQL 5.5, PHP 5.3, and Ruby 1.8.7 available

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

Ubuntu — Free tier eligible

Ubuntu Server 12.04.3 LTS - ami-a73264ce (64-bit) / ami-a53264cc (32-bit)

Ubuntu Server 12.04.3 LTS with support available from Canonical (http://www.ubuntu.com/cloud/services).

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

Ubuntu — Free tier eligible

Ubuntu Server 13.10 - ami-ad184ac4 (64-bit) / ami-a9184ac0 (32-bit)

Ubuntu Server 13.10: Ubuntu Server version 13.10, with support available from Canonical (http://www.ubuntu.com/cloud/services).

Root device type: ebs Virtualization type: paravirtual

Select — 64-bit 32-bit

select aws-tutorial-mysql AMI

```
sudo yum update
sudo yum install mysql55.x86_64
sudo yum install mysql55-server.x86_64
sudo service mysqld start
mysql -u root -e "create database nuez;"
mysql -u root -e "CREATE USER 'codemash'@'%' IDENTIFIED BY 'codemash';"
mysql -u root -e "GRANT ALL PRIVILEGES ON *.* TO 'codemash'@'%'"
sudo chkconfig --level 345 mysqld on
```

select t1.micro

Services | Edit | cmj @ 563700736850 | N. Virginia | Help

1. Choose AMI | 2. Choose Instance Type | 3. Configure Instance | 4. Add Storage | 5. Tag Instance | 6. Configure Security Group | 7. Review

Step 2: Choose an Instance Type

Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instances are virtual servers that can run applications. They have varying combinations of CPU, memory, storage, and networking capacity, and give you the flexibility to choose the appropriate mix of resources for your applications. Learn more about instance types and how they can meet your computing needs.

Currently selected: t1.micro (up to 2 ECUs, 1 vCPUs, 0.613 GiB memory, EBS only)

- All instance types
- **Micro instances**
- General purpose
- Memory optimized
- Storage optimized
- Compute optimized

Micro instances

Micro instances are a low-cost instance option, providing a small amount of CPU resources. They are suited for lower throughput applications, and websites that require additional compute cycles periodically, but are not appropriate for applications that require sustained CPU performance. Popular uses for micro instances include low traffic websites or blogs, small administrative applications, bastion hosts, and free trials to explore EC2 functionality.

Size	ECUs	vCPUs	Memory (GiB)	Instance Storage (GiB)	EBS-Optimized Available	Network Performance
t1.micro	up to 2	1	0.613	EBS only	-	Very Low

Micro instances are eligible for the AWS free usage tier. For the first 12 months following your AWS sign-up date, you get up to 750 hours of micro instances each month. When your free usage tier expires or if your usage exceeds the free tier restrictions, you pay standard, pay-as-you-go service rates.

Learn more about free usage tier eligibility and restrictions

Cancel | Previous | Review and Launch | Next: Configure Instance Details

 Privacy Policy | Terms of Use | Feedback

Step 3: Configure Instance Details

Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot Instances to take advantage of the lower pricing, assign an access management role to the instance, and more.

Number of instances (i) 1

Purchasing option (i) ☐ Request Spot Instances

Network (i) Launch into EC2-Classic  Create new VPC

Availability Zone (i) No preference

IAM role (i) None

Shutdown behavior (i) Stop

Enable termination protection (i) ☐ Protect against accidental termination

Monitoring (i) ☐ Enable CloudWatch detailed monitoring
Additional charges apply.

▸ Advanced Details

Cancel | Previous | Review and Launch | Next: Add Storage

 Privacy Policy | Terms of Use | Feedback

Services | Edit | cmj @ 563700736850 | N. Virginia | Help

1. Choose AMI | 2. Choose Instance Type | 3. Configure Instance | **4. Add Storage** | 5. Tag Instance | 6. Configure Security Group | 7. Review

Step 4: Add Storage

Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. Learn more about storage options in Amazon EC2.

Type	Device	Snapshot	Size (GB)	Volume Type	IOPS	Delete on Termination
Root	/dev/sda1	snap-425a8358	8	Standard	N/A	☑

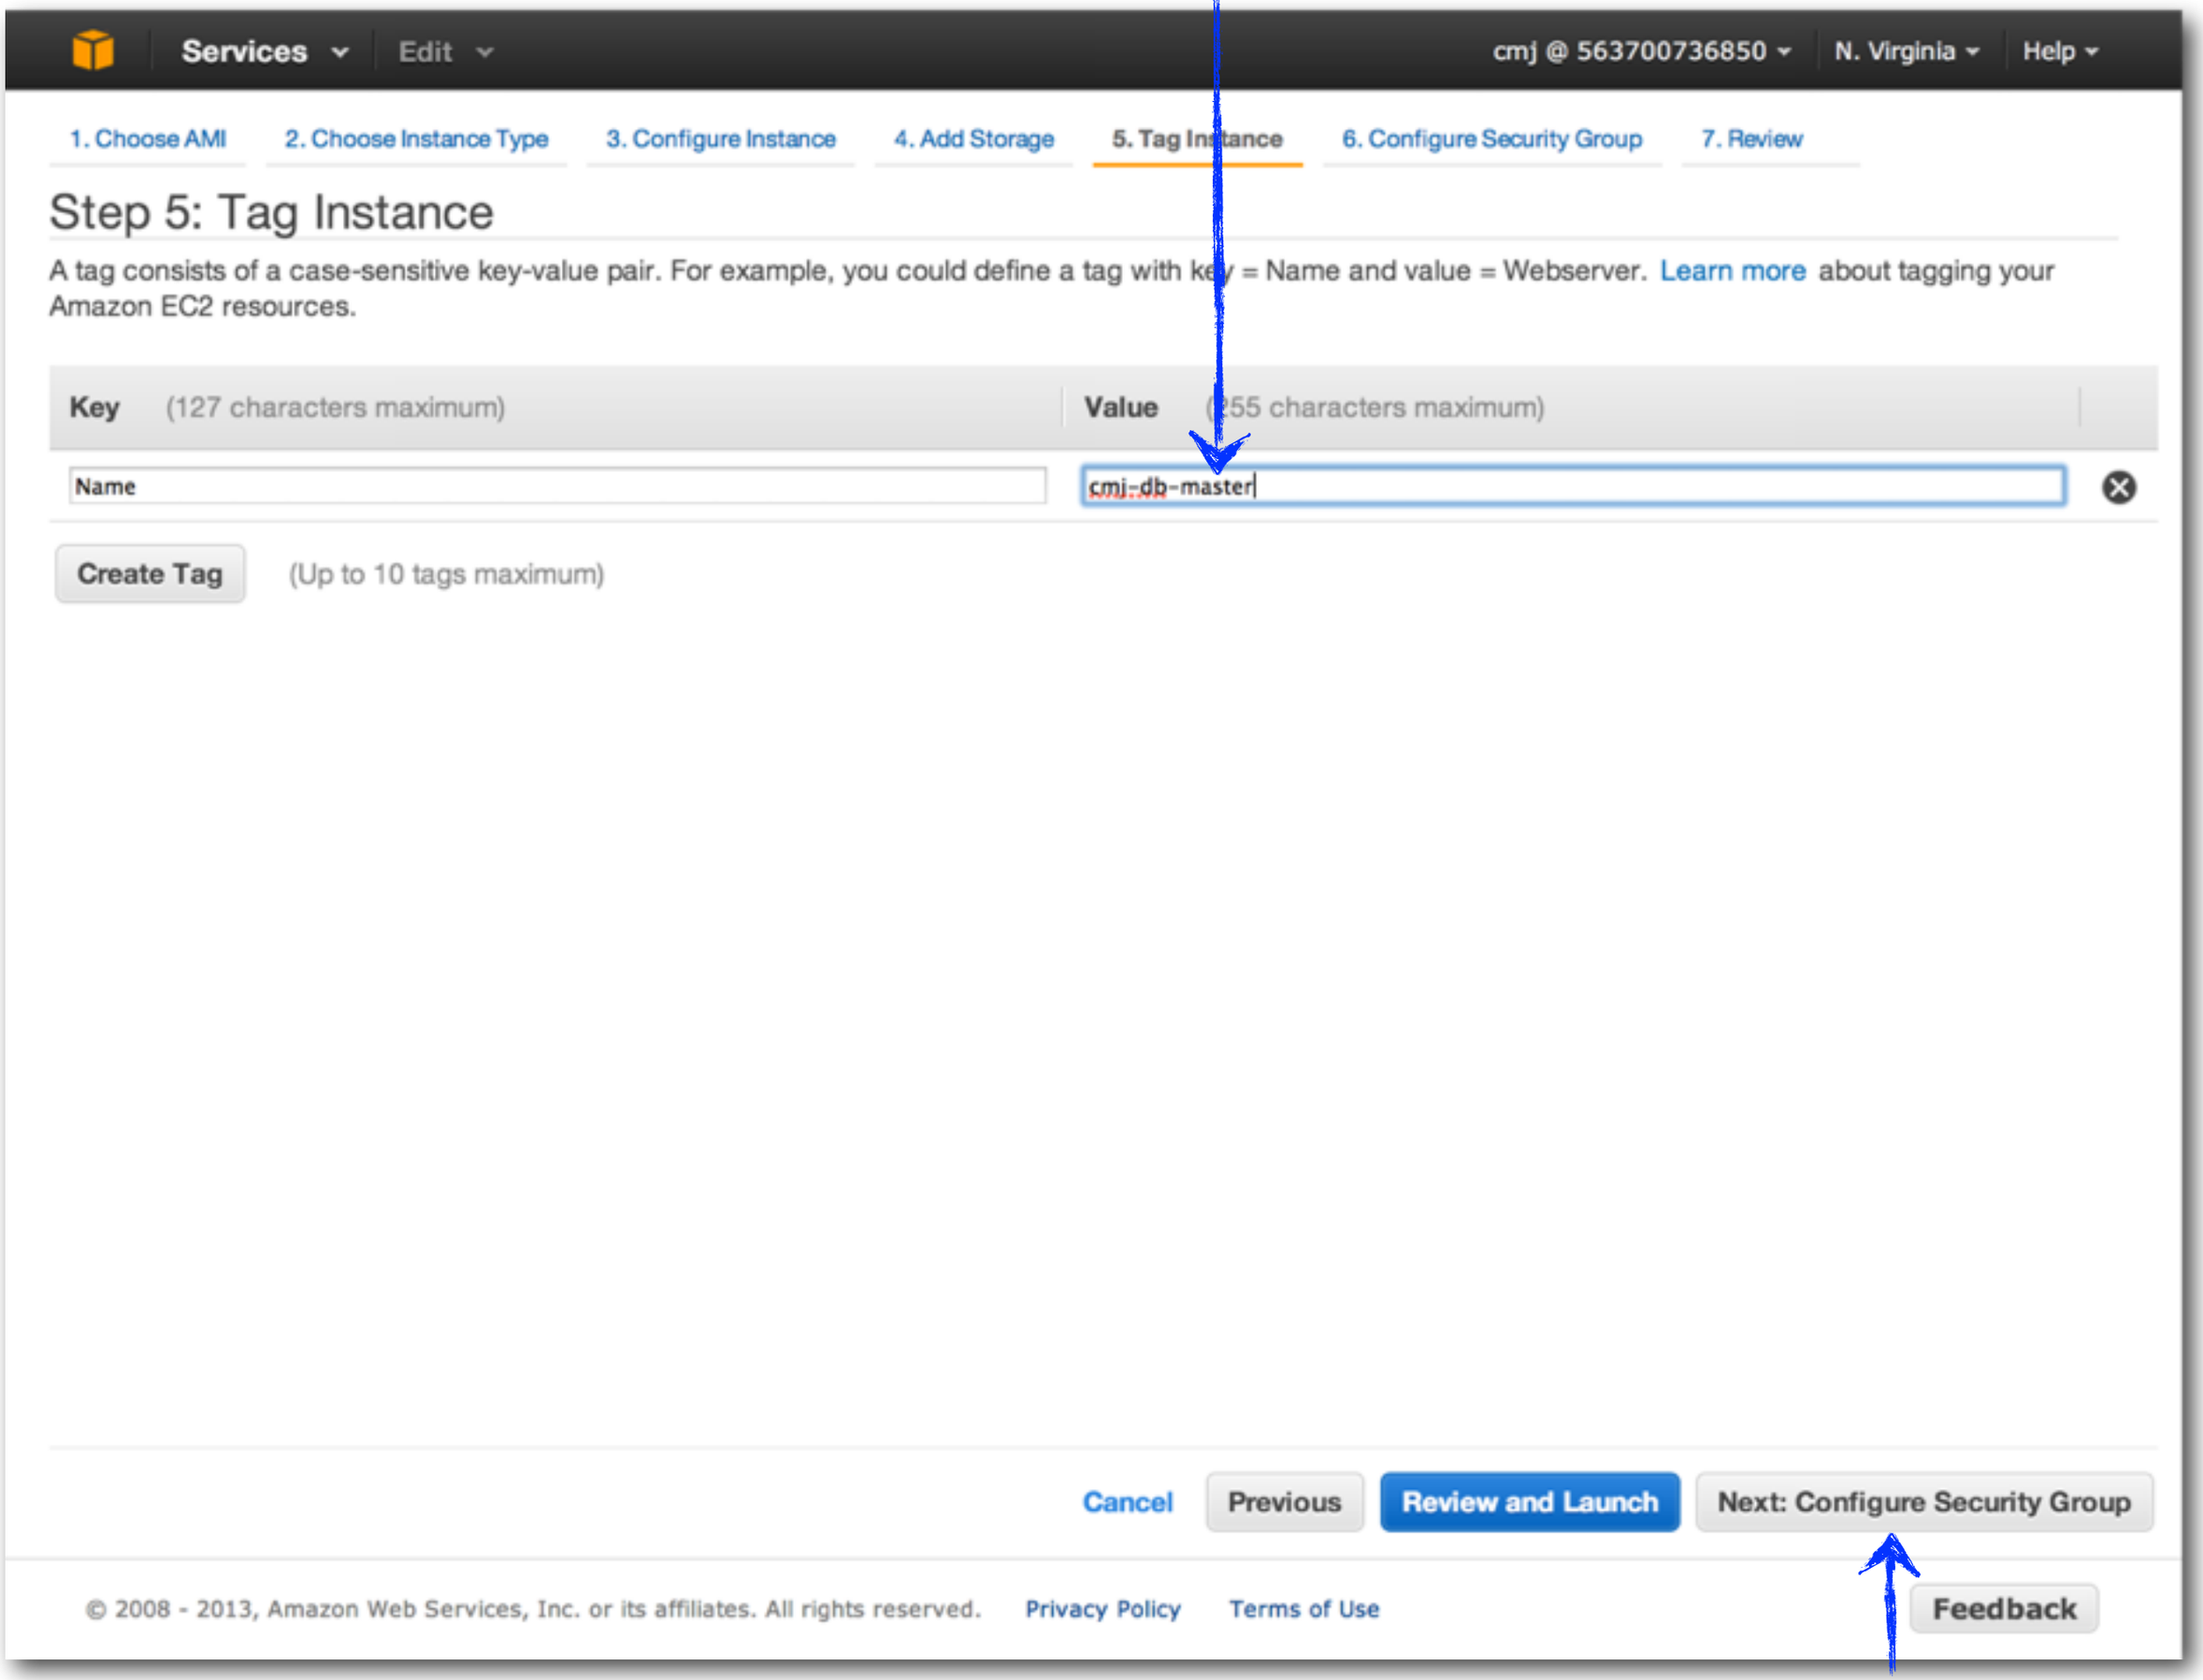
Add New Volume

Free tier eligible customers can get up to 30 GB of EBS storage. Learn more about free usage tier eligibility and usage restrictions.

Cancel | Previous | Review and Launch | Next: Tag Instance

 Privacy Policy | Terms of Use | Feedback

name instance with naming convention



Services | Edit | cmj @ 563700736850 | N. Virginia | Help

1. Choose AMI | 2. Choose Instance Type | 3. Configure Instance | 4. Add Storage | 5. Tag Instance | 6. Configure Security Group | 7. Review

Step 6: Configure Security Group

A security group is a set of firewall rules that control the traffic for your instance. On this page, you can add rules to allow specific traffic to reach your instance. For example, if you want to set up a web server and allow Internet traffic to reach your instance, add rules that allow unrestricted access to the HTTP and HTTPS ports. You can create a new security group or select from an existing one below. Learn more about Amazon EC2 security groups.

Assign a security group: (•) Create a **new** security group

( ) Select an **existing** security group

Security group name: cmj-db-sg

Description: cmj Mysql database security group

Protocol	Type	Port Range (Code)	Source	
SSH	TCP	22	Anywhere	0.0.0.0/0
MYSQL	TCP	3306	Custom IP	sg-0dffa666
MYSQL	TCP	3306	My IP	64.135.17.66/32

Add Rule

Warning

Rules with source of 0.0.0.0/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.

Cancel | Previous | Review and Launch

 Privacy Policy | Terms of Use | Feedback

Select an existing key pair or create a new key pair

A key pair consists of a **public key** that AWS stores, and a **private key file** that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance.

Choose an existing key pair

Select a key pair

cmj-key

☑ I acknowledge that I have access to the selected private key file (cmj-key.pem), and that without this file, I won't be able to log into my instance.

Cancel | Launch Instances

Launch Status

Your instance is now launching

The following instance launch has been initiated: i-bc83d5da View launch log

Get notified of estimated charges

Create billing alerts to get an email notification when estimated charges on your AWS bill exceed $0.0 (in other words, when you have exceeded the free usage tier).

How to connect to your instance

Your instance is launching, and it may take a few minutes until it is in the **running** state, when it will be ready for you to use. Usage hours on your new instance will start immediately and continue to accrue until you stop or terminate your instance.

Click **View Instances** to monitor your instance's status. Once your instance is in the **running** state, you can **connect** to it from the Instances screen. Find out how to connect to your instance.

Here are some helpful resources to get you started

- How to connect to your Linux instance
- Learn about AWS Free Usage Tier
- Amazon EC2: User Guide
- Amazon EC2: Discussion Forum

While your instances are launching you can also

Create status check alarms to be notified when these instances fail status checks. (Additional charges may apply)
Create and attach additional EBS volumes (Additional charges may apply)
Manage security groups

DEFINE LOAD BALANCER | ADD EC2 INSTANCES | REVIEW

Your load balancer will automatically perform health checks on your EC2 instances and only route traffic to instances that pass the health check. If an instance fails the health check, it is automatically removed from the load balancer. Customize the health check to meet your specific needs.

Configuration Options:

health check

Ping Protocol: HTTP

Ping Port: 8080

Ping Path: /nuez/about/index

Advanced Options:

Response Timeout:	5 Seconds	Time to wait when receiving a response from the health check (2 sec - 60 sec).
Health Check Interval:	0.5 Minutes	Amount of time between health checks (0.1 min - 5 min)
Unhealthy Threshold:	2	Number of consecutive health check failures before declaring an EC2 instance unhealthy.
Healthy Threshold:	10	Number of consecutive health check successes before declaring an EC2 instance healthy.

Load Balancer Name	DNS Name	Port Configuration	Availability Zones
cmj-nuez-lb	cmj-nuez-lb-420752541.us-east-1.elb.amazona	80 (HTTP) forwarding to 8080 (HTTP)	us-east-1b

Here is the base url to access the load balancer

1 Load Balancer selected

Load Balancer: cmj-nuez-lb

Description | Instances | Health Check | Monitoring | Security | Listeners

DNS Name:
cmj-nuez-lb-420752541.us-east-1.elb.amazonaws.com (A Record)
ipv6.cmj-nuez-lb-420752541.us-east-1.elb.amazonaws.com (AAAA Record)
dualstack.cmj-nuez-lb-420752541.us-east-1.elb.amazonaws.com (A or AAAA Record)

Note: Because the set of IP addresses associated with a LoadBalancer can change over time, you should never create an "A" record with any specific IP address. If you want to use a friendly DNS name for your LoadBalancer instead of the name generated by the Elastic Load Balancing service, you should create a CNAME record for the LoadBalancer DNS name, or use Amazon Route 53 to create a hosted zone. For more information, see the Using Domain Names With Elastic Load Balancing

Scheme:	internet-facing
Status:	0 of 2 instances in service
Port Configuration:	80 (HTTP) forwarding to 8080 (HTTP) Stickiness: Disabled **(edit)**
Availability Zones:	us-east-1b

Services | Edit | cmj @ 563700736850 | Global | Help

CloudFront > Create Distribution

Step 1: Select delivery method

Step 2: Create distribution

Select a delivery method for your content. Learn More

- (•) Web
- ( ) RTMP

Create a web distribution if you want to:

- Speed up distribution of static and dynamic content, for example, .html, .css, .php, and graphics files.
- Distribute media files using HTTP or HTTPS.
- Add, update, or delete objects, and submit data from web forms.
- Use live streaming to stream an event in real time.

You store your files in an origin — either an Amazon S3 bucket or a web server. After you create the distribution, you can add more origins to the distribution.

Tags

Add tags to your RDS resources to organize and track your Amazon RDS costs. Tags represent your business dimensions, consist of a case-sensitive key/value pair, are stored in the cloud and are private to your account. As an example, you could define a tag with key = Staging and value = LocationDB. You can add up to 10 unique keys to each resource along with an optional value for each key. For more information, go to Using Tags in the RDS User Guide

```
mysql -h aapxsrh0evoxx2.c5txmmp6pqtb.us-east-1.rds.amazonaws.com -u codemash -pcodemash
create database nuez;
```

Update Nuez with RDS Connection

```
// environment specific settings
environments {
    development {
        dataSource {
            dbCreate = "update"
            url = "jdbc:h2:mem:devDb;MVCC=TRUE"
        }
    }
    test {
        dataSource {
            dbCreate = "update"
            url = "jdbc:h2:mem:testDb;MVCC=TRUE"
        }
    }
    production {
        dataSource {
            driverClassName = "com.mysql.jdbc.Driver"
            dialect = "org.hibernate.dialect.MySQL5Dialect"
            username = "codemash"
            password = "codemash"
            dbCreate = "update"
            url = "jdbc:mysql://aapxsrh0evoxx2.c5txmmp6pqtb.us-east-1.rds.amazonaws.com:3306/ebdb"
            pooled = true
            properties {
                maxActive = -1
                minEvictableIdleTimeMillis = 1800000
                timeBetweenEvictionRunsMillis = 1800000
                numTestsPerEvictionRun = 3
                testOnBorrow = true
                testWhileIdle = true
                testOnReturn = true
                validationQuery = "SELECT 1"
            }

Container Options

The following settings control container behavior and let you pass key-value pairs in as OS environment variables. Learn more.

Initial JVM heap size: 512m
Specify the initial size of the memory allocation pool. This value must be a multiple of 1024 greater than 1MB. Use k or K for kilobytes, or m or M for megabytes. The default is 256m.

Maximum JVM heap size: 512m
Specify the maximum size of the memory allocation pool. This value must a multiple of 1024 greater than 2MB. Use k or K for kilobytes, or m or M for megabytes. The default is 256m.

Maximum JVM permanent generation size: 128m
Size of the permanent generation. The default is 64m.

JVM command line options:
Arbitrary JVM options string.

Log Options

The following settings control the log publication behavior.

Instance profile:
User: arn:aws:iam::563700736850:user/cmj is not authorized to perform: iam:ListInstanceProfiles on resource: arn:aws:iam::563700736850:instance-profile/
The instance profile grants your environment specific permissions under your AWS account. Learn More.

Enable log file rotation to Amazon S3. If checked, service logs are published to S3.

Pricing

pay as you use

use small EC2 instance for one hour and pay $0.044

- On-Demand - pay by hour no long-term commitment
- Reserved - one-time payment and discounted hourly rate
- Spot - bid for unused capacity

Example:

On-Demand - $385.44 ($0.044/hr)

Light Reserved - $358.84 ($0.034/hr + $61)
Medium Reserved - $232.40 ($0.015/hr + $101)
Heavy Reserved - $210.60 ($0.01/hr + $123)

* small instance for one year

AWS Free Usage Tier (Per Month):

Elastic Compute Cloud (EC2)

- 750 hours of Amazon EC2 Linux† Micro Instance usage (613 MB of memory and 32-bit and 64-bit platform support) – enough hours to run continuously each month*
- 750 hours of Amazon EC2 Microsoft Windows Server‡ Micro Instance usage (613 MB of memory and 32-bit and 64-bit platform support) – enough hours to run continuously each month*
- 750 hours of an Elastic Load Balancer plus 15 GB data processing*
- 30 GB of Amazon Elastic Block Storage, plus 2 million I/Os and 1 GB of snapshot storage*

Simple Storage Service (S3)

- 5 GB of Amazon S3 standard storage, 20,000 Get Requests, and 2,000 Put Requests*

DynamoDB

100 MB of storage, 5 units of write capacity, and 10 units of read capacity for Amazon DynamoDB.**

Relational Database Service (RDS)

- 750 hours of Amazon RDS Single-AZ Micro DB Instances, for running MySQL, Oracle BYOL or SQL Server (running SQL Server Express Edition) – enough hours to run a DB Instance continuously each month*
- 20 GB of database storage
- 10 million I/Os
- 20 GB of backup storage for your automated database backups and any user-initiated DB Snapshots

Amazon CloudFront

- 50 GB Data Transfer Out, 2,000,000 HTTP and HTTPS Requests of Amazon CloudFront*

Simple Workflow (SWF)

- 1,000 Amazon SWF workflow executions can be initiated for free. A total of 10,000 activity tasks, signals, timers and markers, and 30,000 workflow-days can also be used for free**

Simple Queue Service (SQS) and Simple Notification Service (SNS)

- 1,000,000 Requests of Amazon Simple Queue Service**
- 1,000,000 Requests, 100,000 HTTP notifications and 1,000 email notifications for Amazon Simple Notification Service**

Amazon Elastic Transcoder

- 20 minutes of SD transcoding or 10 minutes of HD transcoding**

CloudWatch

- 10 Amazon Cloudwatch metrics, 10 alarms, and 1,000,000 API requests**

Data Transfer

- 15 GB of bandwidth out aggregated across all AWS services*

Data Pipeline

- 3 low frequency preconditions running on AWS per month*
- 5 low frequency activities running on AWS per month*

ElastiCache

- 750 hours of Amazon ElastiCache - enough hours to run a Cache Node continuously each month.*

AWS Architecture Center

The AWS Architecture Center is designed to provide you with the necessary guidance and best practices to build highly scalable and reliable applications in the AWS Cloud. These resources will help you understand the AWS platform, its services and features, and will provide architectural guidance for design and implementation of systems that run on the AWS infrastructure.

SHAW MEDIA

Read Shaw Media Case Study "Our average uptime increased rapidly from 98.8% to 99.9% without re-architecting applications"

AWS Reference Architectures

The flexibility of AWS allows you to design your application architectures the way you like. AWS Reference Architecture Datasheets provide you with the architectural guidance you need in order to build an application that takes full advantage of the AWS cloud. Each datasheet includes a visual representation of the architecture and basic description of how each service is used.

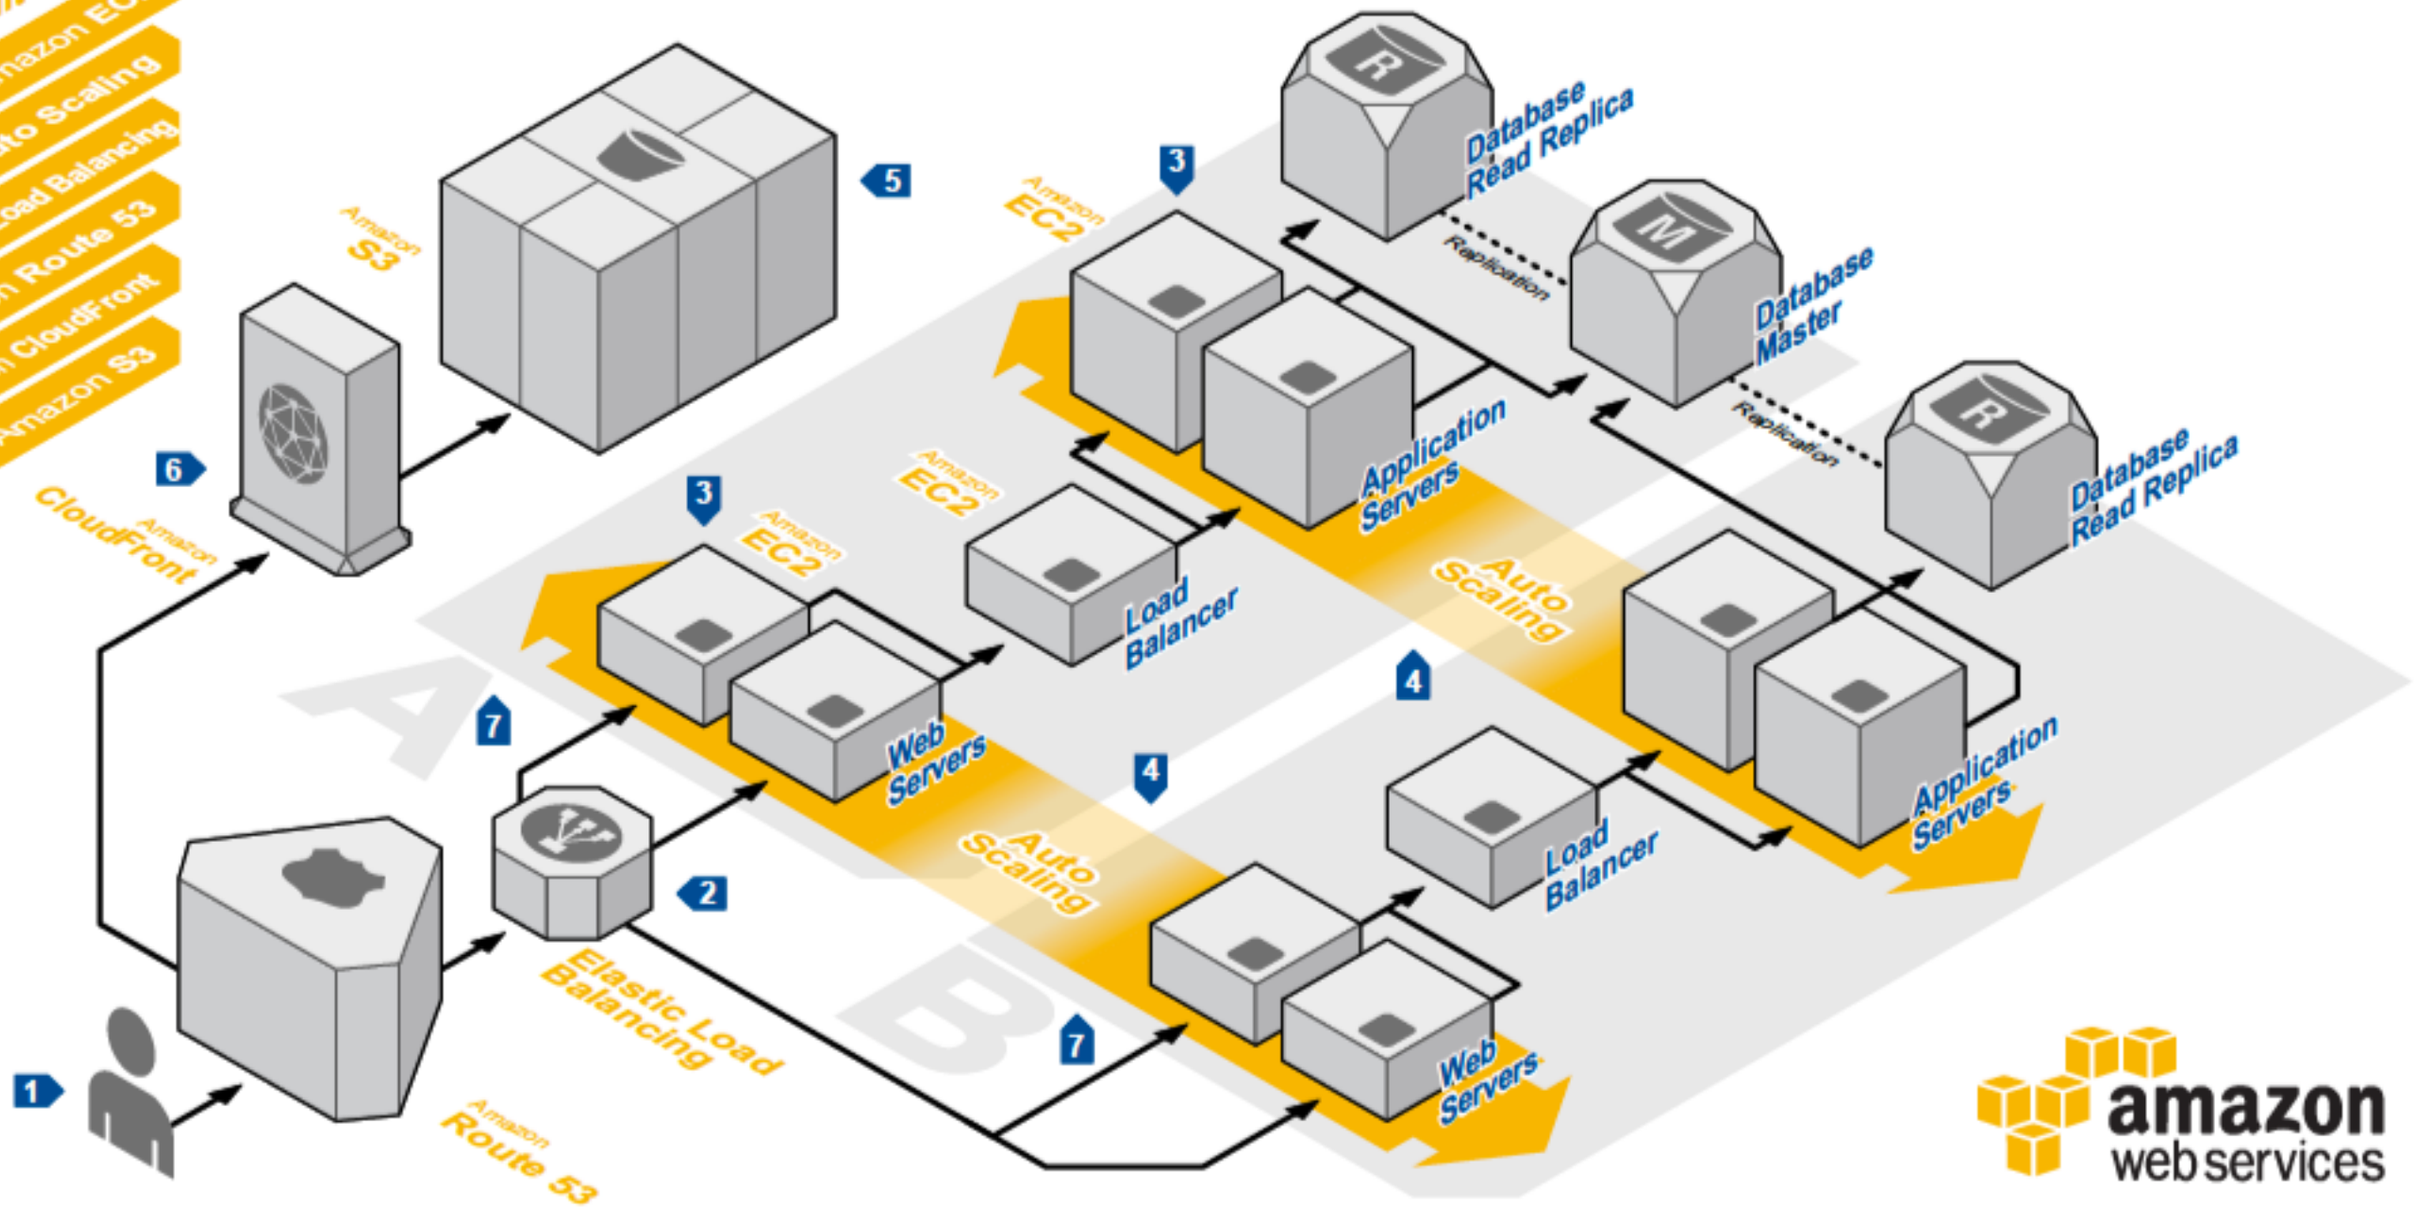
WEB APPLICATION HOSTING

Highly available and scalable web hosting can be complex and expensive. Dense peak periods and wild swings in traffic patterns result in low utilization rates of expensive hardware. Amazon Web Services provides the reliable, scalable, secure, and high-performance infrastructure required for web applications while enabling an elastic, scale out and scale down infrastructure to match IT costs in real time as customer traffic fluctuates.

AWS Reference Architectures

- Amazon EC2
- Auto Scaling
- Basic Load Balancing
- Amazon Route 53
- Amazon CloudFront
- Amazon S3



amazon web services

System Overview

1 The user's DNS requests are served by **Amazon Route 53**, a highly available Domain Name System (DNS) service. Network traffic is routed to infrastructure running in Amazon Web Services.

2 HTTP requests are first handled by Elastic Load Balancing, which automatically distributes incoming application traffic across multiple **Amazon Elastic Compute Cloud (EC2)** instances across Availability Zones (AZs). It enables even greater fault tolerance in your applications, seamlessly providing the amount of load balancing capacity needed in response to incoming application traffic.

3 Web servers and application servers are deployed on **Amazon EC2** instances. Most organizations will select an **Amazon Machine Image (AMI)** and then customize it to their needs. This custom AMI will then be used as the starting point for future web development.

4 Web servers and application servers are deployed in an **Auto Scaling** group. Auto Scaling automatically adjusts your capacity up or down according to conditions you define. With Auto Scaling, you can ensure that the number of **Amazon EC2** instances you're using increases seamlessly during demand spikes to maintain performance and decreases automatically during demand lulls to minimize costs.

5 Resources and static content used by the web application are stored on **Amazon Simple Storage Service (S3)**, a highly durable storage infrastructure designed for mission-critical and primary data storage.

6 Static and streaming content is delivered by **Amazon CloudFront**, a global network of edge locations. Requests are automatically routed to the nearest edge location, so content is delivered with the best possible performance.

7 **Availability zones (AZs)** are distinct geographic locations that are engineered to insulate against failures in other AZs. Multiple AZs are combined into a region. Here, the entire web application is deployed in two different AZs for high availability.

Summary

Adrian Cockcroft discusses the advantages of running Netflix services in Amazon's cloud, comparing the old data center solution against the new cloud architecture implemented to offer faster, more scalable, more available, and more productive services across the enterprise.

Bio

Adrian Cockcroft is an architect at Netflix leading the Cloud Systems group. He authored Sun Performance and Tuning, Resource Management and Capacity Planning for Web Services while being a Distinguished Engineer at
