Getting Started With Docker

By Christopher M. Judd

ABOUT DOCKER

Almost overnight, Docker has become the de facto standard that developers and system administrators use for packaging, deploying, and running distributed applications. It provides tools for simplifying DevOps by enabling developers to create templates called images that can be used to create lightweight virtual machines called containers, which include their applications and all of their applications' dependencies. These lightweight virtual machines can be promoted through testing and production environments where sysadmins deploy and run them.

Docker makes it easier for organizations to automate infrastructure, isolate applications, maintain consistency, and improve resource utilizations.

Similar to the popular version control software Git, Docker has a social aspect, in that developers and sysadmins are able to share their images via [Docker Hub](https://hub.docker.com/).

Docker is an open-source solution that runs natively on Linux but also works on Windows and Mac using a lightweight Linux distribution and VirtualBox. Many tools have also grown up around Docker to make it easier to manage and orchestrate complex distributed applications.

DOCKER ARCHITECTURE

Docker utilizes a client-server architecture and a remote API to manage and create Docker containers built upon Linux containers. Docker containers are created from Docker images. The relationship between containers and images are analogous to the relationship between objects and classes in object-oriented programming.

Docker Images	A recipe or template for creating Docker containers. It includes the steps for installing and running the necessary software.
Docker Container	Like a tiny virtual machine that is created from the instructions found within the Docker image originated
Docker Client	Command-line utility or other tool that takes advantage of the Docker API (https://docs.docker.com/reference/api/docker_remote_api) to communicate with a Docker daemon
Docker Host	A physical or virtual machine that is running a Docker daemon and contains cached images as well as runnable containers created from images

- 📌 infrastructure automation
- 📌 sandboxing/isolation
- 📌 maintain consistency
- 📌 better resource utilization
- 📌 easy experimentation

infrastructure automation

Run the following commands

1. `apt-get mysql` unless you are on CentOS
2. `vim /etc/timezone`
and add `America/New_York`
3. `vim /etc/mysql/my.cnf`
and add `federated`
and add `lower_case_table_names = 1`

infrastructure automation

```
FROM mysql:5.5.45
```

```
COPY my-custom-entrypoint.sh /
```

```
COPY docker-entrypoint-initdb.d /docker-entrypoint-initdb.d/
```

```
RUN echo America/New_York | tee /etc/timezone
```

```
&& dpkg-reconfigure --frontend noninteractive tzdata
```

```
RUN echo "federated" >> /etc/mysql/my.cnf
```

```
RUN echo "lower_case_table_names = 1" >> /etc/mysql/my.cnf
```

```
ENTRYPOINT ["/my-custom-entrypoint.sh"]
```

```
CMD ["mysqld"]
```

SETUP DOCKER

Docker Toolbox

[Getting Started Guide \(Mac\)](#) | [Getting Started Guide \(Windows\)](#) | [Contribute to Toolbox](#)

 [Download \(Mac\)](#)

[Download \(Windows\)](#)

Compatible with Mac OS X 10.8+ and Windows 7+

<https://www.docker.com/toolbox>

- Enable Virtualization
 - <https://docs.docker.com/engine/installation/windows/>
- Turn Off Hyper-V
 - `bcdedit /set hypervisorlaunchtype off`
 - restart
- Install latest version of Virtual Box (5.0.12)
- Install Docker Toolbox
 - uncheck “Install Virtual Box” checkbox

`bcdedit /set hypervisorlaunchtype auto`

Supported installation

Docker supports installation on the following:

- Amazon EC2 Installation
- Arch Linux
- Microsoft Azure platform
- Installation from binaries
- CentOS
- CRUX Linux
- Debian
- Fedora
- FrugalWare
- Gentoo
- Google Cloud Platform
- Install on Joyent Public Cloud
- Mac OS X
- Oracle Linux
- Rackspace Cloud
- Red Hat Enterprise Linux
- IBM SoftLayer
- openSUSE and SUSE Linux Enterprise
- Ubuntu
- Windows

For more information about this image and its history, please see [the relevant manifest file](#)

(`3 images (tomcat)`). This image is updated via pull requests to [the docker](#)

How to use this image.

Run the default Tomcat server (CMD ["catalina.sh", "run"]):

```
$ docker run -it --rm tomcat:8.0
```

You can test it by visiting `http://container-ip:8080` in a browser or, if you need access outside the host, on port 8888:

```
$ docker run -it --rm -p 8888:8080 tomcat:8.0
```

You can then go to `http://localhost:8888` or `http://host-ip:8888` in a browser.

The default Tomcat environment in the image for versions 7 and 8 is:

```
CATALINA_BASE:  /usr/local/tomcat
CATALINA_HOME:  /usr/local/tomcat
CATALINA_TMPDIR: /usr/local/tomcat/temp
JRE_HOME:       /usr
CLASSPATH:      /usr/local/tomcat/bin/bootstrap.jar:/usr/local/tomcat/bi
```

The default Tomcat environment in the image for version 6 is:

```
CATALINA_BASE:  /usr/local/tomcat
CATALINA_HOME:  /usr/local/tomcat
CATALINA_TMPDIR: /usr/local/tomcat/temp
JRE_HOME:       /usr
CLASSPATH:      /usr/local/tomcat/bin/bootstrap.jar
```

The configuration files are available in `/usr/local/tomcat/conf/` . By default, no user is included in the "manager-gui" role required to operate the "/manager/html" web application. If you wish to use this app, you must define such a user in `tomcat-users.xml` .

License

View [license information](#) for the software contained in this image.

This image is officially supported on Docker version 1.8.3.

Support for older versions (down to 1.6) is provided on a best-effort basis.

Please see [the Docker installation documentation](#) for details on how to upgrade your Docker daemon.

User Feedback

Documentation

Documentation for this image is stored in the `tomcat/` [directory](#) of the `docker-library/docs` [GitHub repo](#). Be sure to familiarize yourself with the [repository's README.md file](#) before attempting a pull request.

Issues

If you have any problems with or questions about this image, please contact us through a [GitHub issue](#).

You can also reach many of the official image maintainers via the `#docker-library` IRC channel on [Freenode](#).

Contributing

You are invited to contribute new features, fixes, or updates, large or small; we are always thrilled to receive pull requests, and do our best to process them as fast as we can.

Before you start to code, we recommend discussing your plans through a [GitHub issue](#), especially for more ambitious contributions. This gives other contributors a chance to point you in the right direction, give you feedback on your design, and help you find out if someone else is working on the same thing.

```
docker run -it --rm -p 8080:8080 tomcat:7.0-jre7
```

docker ps

CONTAINER ID	IMAGE	COMMAND	STATUS	PORTS	NAMES
bf861403270c	tomcat:7.0-jre7	"catalina.sh run"	Up 2 seconds	0.0.0.0:8080->8080/tcp	reverent_pasteur

docker ps

CONTAINER ID	IMAGE	COMMAND	STATUS	PORTS	NAMES
bf861403270c	tomcat:7.0-jre7	"catalina.sh run"	Up 2 seconds	0.0.0.0:8080->8080/tcp	reverent_pasteur

docker ps

CONTAINER ID	IMAGE	COMMAND	STATUS	PORTS	NAMES
bf861403270c	tomcat:7.0-jre7	"catalina.sh run"	Up 2 seconds	0.0.0.0:8080->8080/tcp	reverent_pasteur

Lab 3

1. Run Tomcat 7.0-jre7 container
2. Validate you can see the Tomcat home page
3. Determine the name & id of your container
4. Shut the container down

Hint: you might want to use two command prompts to do this

CREATING IMAGES

- Run container and manually install software
- Dockerfile

- ~~Run container and manually install software~~
- Dockerfile

Dockerfile

```
FROM mysql:5.5.45
```

```
RUN echo America/New_York | tee /etc/timezone && dpkg-reconfigure --frontend noninteractive tzdata
```

```
RUN echo "lower_case_table_names = 1" >> /etc/mysql/my.cnf
```

```
ENTRYPOINT ["/entrypoint.sh"]
```

```
CMD ["mysqld"]
```

Instruction	Description
FROM	This is must be the first instruction in the Dockerfile and identifies the image to
MAINTAINER	Provides visibility and credit to the author of the image.
RUN	Executes a Linux command for configuring and installing.
ENTRYPOINT	The final script or application used bootstrap the container making it an
CMD	Provide default arguments to the ENTRYPOINT using a JSON array format.
LABEL	Name/value metadata about the image.
ENV	Sets environment variables.
COPY	Copies files into the container.
ADD	Alternative to copy.
WORKDIR	Sets working directory for RUN, CMD, ENTRYPOINT, COPY and/or ADD
EXPOSE	Ports the container will listen on.
VOLUME	Creates a mount point.
USER	User to run RUN, CMD and/or ENTRYPOIN instructions..

```
docker build -t nuez-db .
```

docker build -t nuev-db .

Sending build context to Docker daemon 35.33 kB

```

Lab 4

1. Create a nuev-db image with MySQL
2. Run nuev-db container as a daemon

LINKING TO CONTAINER

```
mysql -h 192.168.99.102 -u root -proot+1 nuev
```

or

```
docker run -it --link nuev-db:mysql --rm mysql:5.5.45 bash
```

```
mysql -h $MYSQL_PORT_3306_TCP_ADDR -u $MYSQL_ENV_MYSQL_USER -p$MYSQL_ENV_MYSQL_PASSWORD $MYSQL_ENV_MYSQL_DATABASE
```

```
mysql -h 192.168.99.102 -u root -proot+1 nuev
```

or

```
docker run -it --link nuev-db:mysql --rm mysql:5.5.45 bash
```

```
mysql -h $MYSQL_PORT_3306_TCP_ADDR -u $MYSQL_ENV_MYSQL_USER -p$MYSQL_ENV_MYSQL_PASSWORD $MYSQL_ENV_MYSQL_DATABASE
```

```
HOSTNAME=05f85a8745c2
MYSQL_ENV_MYSQL_DATABASE=nuev
MYSQL_ENV_MYSQL_ROOT_PASSWORD=root+1
TERM=xterm
MYSQL_VERSION=5.5.45
MYSQL_PORT_3306_TCP_PORT=3306
MYSQL_PORT_3306_TCP=tcp://172.17.0.28:3306
PATH=/usr/local/sbin:/usr/local/bin
MYSQL_ENV_MYSQL_USER=nuev-app
PWD=/
MYSQL_ENV_MYSQL_PASSWORD=nuev+1
MYSQL_ENV_MYSQL_VERSION=5.5.45
HOME=/root
SHLVL=1
MYSQL_PORT_3306_TCP_PROTO=tcp
MYSQL_NAME=/elated_franklin/mysql
MYSQL_MAJOR=5.5
MYSQL_PORT_3306_TCP_ADDR=172.17.0.28
MYSQL_ENV_MYSQL_MAJOR=5.5
MYSQL_PORT=tcp://172.17.0.28:3306
_=/usr/bin/env
```

Lab 5

- I. Run a mysql command-line in a container and connect to the nuev-db.

```
// remove for brevity
```

```
docker {  
  dataSource {  
    dbCreate = "update"  
    url = "jdbc:mysql://${System.getenv()[ 'MYSQL_PORT_3306_TCP_ADDR' ]}:${System.getenv()[ 'MYSQL_PORT_3306_TCP_PORT' ]}/${  
System.getenv()[ 'MYSQL_ENV_MYSQL_DATABASE' ]}"  
    driverClassName = "com.mysql.jdbc.Driver"  
    username = System.getenv()[ 'MYSQL_ENV_MYSQL_USER' ]  
    password = System.getenv()[ 'MYSQL_ENV_MYSQL_PASSWORD' ]  
    pooled = true  
    properties {  
      maxActive = -1  
      minEvictableIdleTimeMillis=1800000  
      timeBetweenEvictionRunsMillis=1800000  
      numTestsPerEvictionRun=3  
      testOnBorrow=true  
      testWhileIdle=true  
      testOnReturn=true  
      validationQuery="SELECT 1"  
    }  
  }  
}  
// remove for brevity
```

The diagram consists of four red arrows originating from a single point on the right side of the image. These arrows point to specific placeholders in the code: the first points to `{System.getenv()[ 'MYSQL_PORT_3306_TCP_ADDR' ]}`, the second points to `{System.getenv()[ 'MYSQL_PORT_3306_TCP_PORT' ]}`, the third points to `{System.getenv()[ 'MYSQL_ENV_MYSQL_DATABASE' ]}`, and the fourth points to `{System.getenv()[ 'MYSQL_ENV_MYSQL_PASSWORD' ]}`. This visualizes how these placeholders are resolved to environment variables at runtime.

Dockerfile

```
FROM tomcat:7.0-jre7
```

```
RUN rm -rf $CATALINA_HOME/webapps/ROOT
```

```
RUN rm -rf $CATALINA_HOME/webapps/ROOT.war
```

```
RUN rm -rf $CATALINA_HOME/webapps/docs
```

```
RUN rm -rf $CATALINA_HOME/webapps/examples
```

```
RUN rm -rf $CATALINA_HOME/webapps/manager
```

```
RUN rm -rf $CATALINA_HOME/webapps/host-manager
```

```
ENV CATALINA_OPTS -Dgrails.env=docker
```

```
ADD https://s3.amazonaws.com/cmj-presentations/docker-clouddevelop-2015/nuez-0.1.war  
    $CATALINA_HOME/webapps/ROOT.war
```

```
CMD ["catalina.sh", "run"]
```

```
docker build -t nuez .
```

```
docker run -d --name nuev --link nuev-db:mysql -p 80:8080 nuev
```

or

```
docker run -it --rm --name nuev --link nuev-db:mysql -p 80:8080 nuev
```

```
docker exec -it nuev bash
```

```
docker diff nuev
```

Lab 6

1. Create a nuez image containing Tomcat 7 and Java 7
2. Run the container
3. Test the container
4. Look at the Tomcat log files

SHARE IMAGES

DOCKER API

[Support](#)[Training](#)[Docs](#)[Blog](#)[Docker Hub](#)[Get Started](#)[Products](#)[Customers](#)[Community](#)[Partners](#)[Company](#)[Open Source](#)[Install](#)[Docker Fundamentals](#)[Use Docker](#)[Manage image repositories](#)[Extend Docker](#)[Command and API references](#)[Docker run reference](#)[Dockerfile reference](#)[Remote API client libraries](#)[Using the command line](#)[docker.io accounts API](#)

Docker Remote API

Docker's Remote API uses an open schema model. In this model, unknown properties in incoming messages are ignored. Client applications need to take this behavior into account to ensure they do not break when talking to newer Docker daemons.

The API tends to be REST, but for some complex commands, like attach or pull, the HTTP connection is hijacked to transport STDOUT, STDIN, and STDERR.

By default the Docker daemon listens on `unix:///var/run/docker.sock` and the client must have `root` access to interact with the daemon. If a group named `docker` exists on your system, `docker` applies ownership of the socket to the group.

The current version of the API is v1.21 which means calling `/info` is the same as calling `/v1.21/info`. To call an older version of the API use `/v1.20/info`.

Use the table below to find the API version for a Docker version:

On this page:

[Docker Remote API](#)[Authentication](#)[Using Docker](#)[Machine with the API](#)[Docker Events](#)[Version history](#)[v1.21 API changes](#)[v1.20 API changes](#)[v1.19 API changes](#)[v1.18 API changes](#)[v1.17 API changes](#)[v1.16 API changes](#)[v1.15 API changes](#)[v1.14 API changes](#)

Docker Registry HTTP API V2

Introduction

The *Docker Registry HTTP API* is the protocol to facilitate distribution of images to the docker engine. It interacts with instances of the docker registry, which is a service to manage information about docker images and enable their distribution. The specification covers the operation of version 2 of this API, known as *Docker Registry HTTP API V2*.

While the V1 registry protocol is usable, there are several problems with the architecture that have led to this new version. The main driver of this specification these changes to the docker the image format, covered in [docker/docker#8093](#). The new, self-contained image manifest simplifies image definition and improves security. This specification will build on that work, leveraging new properties of the manifest format to improve performance, reduce bandwidth usage and decrease the likelihood of backend corruption.

For relevant details and history leading up to this specification, please see the following issues:

On this page:

Production-Grade Container Orchestration

Automated container deployment, scaling, and management

[Try Our Hello World](#)

Kubernetes is an open-source system for automating deployment, scaling, and management of containerized applications.

It groups containers that make up an application into logical units for easy management and discovery. Kubernetes builds upon [15 years of experience of running production workloads at Google](#), combined with best-of-breed ideas and practices from the community.

3. Find VPC ID
4. Create AWS machine
5. Add port to Security Group
6. Terminate EC2 instance

EC2 Container Service

Amazon EC2 Container Service (ECS)

Amazon ECS makes it easy to deploy, manage, and scale Docker containers running applications, services, and batch processes. Amazon ECS places containers across your cluster based on your resource needs and is integrated with familiar features like Elastic Load Balancing, EC2 security group, EBS volumes and IAM roles.

Get started

[Learn more about Amazon ECS](#)

Run containers at scale

Amazon ECS makes it easy to use containers a

Getting Started with Amazon EC2 Container Service

Step 1: Welcome to Amazon ECS

Step 2: Create Task Definition

Step 3: Schedule Tasks

Step 4: Configure Cluster

Step 5: Review

Welcome to Amazon ECS

This wizard will guide you through the process to get started with Amazon ECS. You will:

- **Create a task definition**
Describe the components of your application such as the Docker containers to run, the resources they will use, and how they link together.
- **Schedule tasks**
Reference the number of task definitions to run as tasks or start a service that can use Elastic Load Balancing to route traffic to the containers.
- **Configure the cluster**
Set options for the logical grouping of **container** instances used to run the tasks.

To get started, select a sample task definition or create a custom task definition:

- ☐ Amazon ECS sample
Create a task definition using amazon-ecs-sample image.
- ☒ Custom
Register a custom task definition.

Getting Started with Amazon EC2 Container Service

[Step 1: Welcome to Amazon ECS](#)[Step 2: Create custom Task Definition](#)[Step 3: Schedule Tasks](#)**Step 4: Configure Cluster**[Step 5: Review](#)

Configure Cluster

Before you can run tasks in your Amazon ECS cluster, you must launch container instances into it. An Amazon ECS container instance is an Amazon EC2 instance with the Amazon ECS Container Agent running on it. The agent makes calls on your behalf by using an IAM role configured for Amazon ECS.

Cluster* default

Number of Instances*

Instance Type*

t2.micro

Key pair name*

None

You will not be able to SSH into your instances without selecting a key pair.

Security Group

Your instances may be accessible from any IP address. We recommend that you update the below security group ingress rule to allow access from known IP addresses only. ECS automatically opens up port 80 to facilitate access to the application or service you're running. Additionally, we open port 80 for Elastic Load Balancer access.

Security Ingress CIDR*

0.0.0.0/0

IAM Role Information

The IAM role for EC2 refers to an IAM role that grants your EC2 instances permissions to access AWS resources it needs, including the ability to connect with the ECS service to manage your tasks. The IAM role for ECS Service grants the necessary permissions for ECS to interact with resources such as Elastic Load Balancing. Clicking on the button below will open a new tab to the IAM role creation one click wizard

Launch status

Your container instances are launching, and it may take a few minutes until they are in the running state, and ready to access. Usage hours on your new container instances will start immediately and continue to accrue until you stop or terminate.

ECS Instances status

Your instances are up and running.

Launching the requested resources using AWS CloudFormation. This may take a few AWS::EC2::InternetGateway... 15 of 15 Resources Created minutes. [Click here to view the CloudFormation stack.](#)

ECS Status

Waiting for ECS instance to launch...

This may take a few minutes

DNS Name: EC2Contai-EcsElast-X6Z2SFTDEBFQ-1151271941.us-west-2.elb.amazonaws.com (A Record)

Note: Because the set of IP addresses associated with a LoadBalancer can change over time, you should never create an "A" record with any specific IP address. If you want to use a friendly DNS name for your load balancer instead of the name generated by the Elastic Load Balancing service, you should create a CNAME record for the LoadBalancer DNS name, or use Amazon Route 53 to create a hosted zone. For more information, see [Using Domain Names With Elastic Load Balancing](#).

Status: 0 of 0 instances in service

Welcome to nginx!

If you see this page, the nginx web server is successfully installed and working. Further configuration is required.

For online documentation and support please refer to nginx.org.
Commercial support is available at nginx.com.

Thank you for using nginx.

Getting Started With Docker

By Christopher M. Judd

ABOUT DOCKER

Almost overnight, Docker has become the de facto standard that developers and system administrators use for packaging, deploying, and running distributed applications. It provides tools for simplifying DevOps by enabling developers to create templates called images that can be used to create lightweight virtual machines called containers, which include their applications and all of their applications' dependencies. These lightweight virtual machines can be promoted through testing and production environments where sysadmins deploy and run them.

Docker makes it easier for organizations to automate infrastructure, isolate applications, maintain consistency, and improve resource utilizations.

Similar to the popular version control software Git, Docker has a social aspect, in that developers and sysadmins are able to share their images via [Docker Hub](#).

Docker is an open-source solution that runs natively on Linux but also works on Windows and Mac using a lightweight Linux distribution and VirtualBox. Many tools have also grown up around Docker to make it easier to manage and orchestrate complex distributed applications.

Docker Images	A recipe or template for creating Docker containers. It includes the steps for installing and running the necessary software.
Docker Container	Like a tiny virtual machine that is created from the instructions found within the Docker image originated.
Docker Client	Command-line utility or other tool that takes advantage of the Docker API (https://docs.docker.com/reference/api/docker_remote_api/) to communicate with a Docker daemon.
Docker Host	A physical or virtual machine that is running a Docker daemon and contains cached images as well as runnable containers created from images.
