

# Release Notes for Eclipse V3.51

## ***Version 3.51 Release Notes***

This is a maintenance release with a small number of bug fixes and improvements, related to remote control of system and effects bypass.

### **Improvements:**

- The remotes for both main and effect bypass now have a “SENSE” control, allowing the user to select between “NORMAL” and “REVERSED”, allowing control by limited-function pedalboards. In the REVERSED position, the bypass will be OFF when the remote is driven, rather than ON as normal.
- Remote control of both main and effect bypass is now absolute, rather than being based upon the current setting.

### **Fixes:**

- Remote control of the main bypass did not work.

## ***Version 3.5 Release Notes***

This is an intermediate release with a number of useful improvements and bug fixes. This full release replaces the previous beta versions. An updated version of the User Manual and pullout sheets is available online.

### **Improvements:**

- Faster operation, with 50% lower MIDI latency
- Twice as many external control sources allowed (Ext #9-16 added)
- Support for E-Control plugin (H8000 compatible MIDI remote functions)
- Remote control for A, B machine bypass under SETUP/EXTERNALS

### **Fixes:**

- Missing hotkeys added to Preset #163
- AES status bits set properly when sample rate changed
- T\_RATE value could load wrongly with certain presets
- An audio problem with systems manufactured after 08/2005 has been fixed
- If a unit is powered up in DSP bypass and then taken out of BYPASS, the output will be 100% dry until the wet/dry ratio is adjusted.
