A Word from my Sponsors...

- Board Member of the California Mathematics Council South (CMC-S). Equity and Empowerment Chair
- West Regional Director of the Benjamin Banneker Association (BBA); affiliate of NCTM. Represent Alaska, California, Hawaii, Idaho, Montana, Nevada, Oregon, Utah, Washington, Wyoming, and Western Canada
- National Society of Black Engineers Jr (NSBE), Southern California Chapter Advisor

Benjamin Banneker Association

California Mathematics Standards (CCSS)

- **3.OA.2** This standard focuses on two distinct models of division: partition models and quotative models. For example, describe a context in which a number of shares or a number of groups can be expressed as $56 \div 8$.
- **4.OA.3** Solve multistep word problems posed with whole numbers and having whole-number answers using the four operations, including problems in which remainders must be interpreted...Assess the reasonableness of answers using mental computation and estimation strategies including rounding.
- **5.NF.B.3** Interpret a fraction as division of the numerator by the denominator ($a/b = a \div b$). Solve word problems involving division of whole numbers leading to answers in the form of fractions or mixed numbers, e.g., by using visual fraction models or equations to represent the problem. For example, If 9 people want to share a 50-pound sack of rice equally by weight, how many pounds of rice should each person get? Between what two whole numbers does your answer lie?

Did you know?

- Only **19%** of African-Americans were proficient on the 2017 California's State Mathematics testing, **16%** in 2016 (grades 3rd-11th)?
- By the eighth grade, **less than one-third** of African-American students nationwide are proficient in math and science. (Joint Center for Political and Economic Studies.)

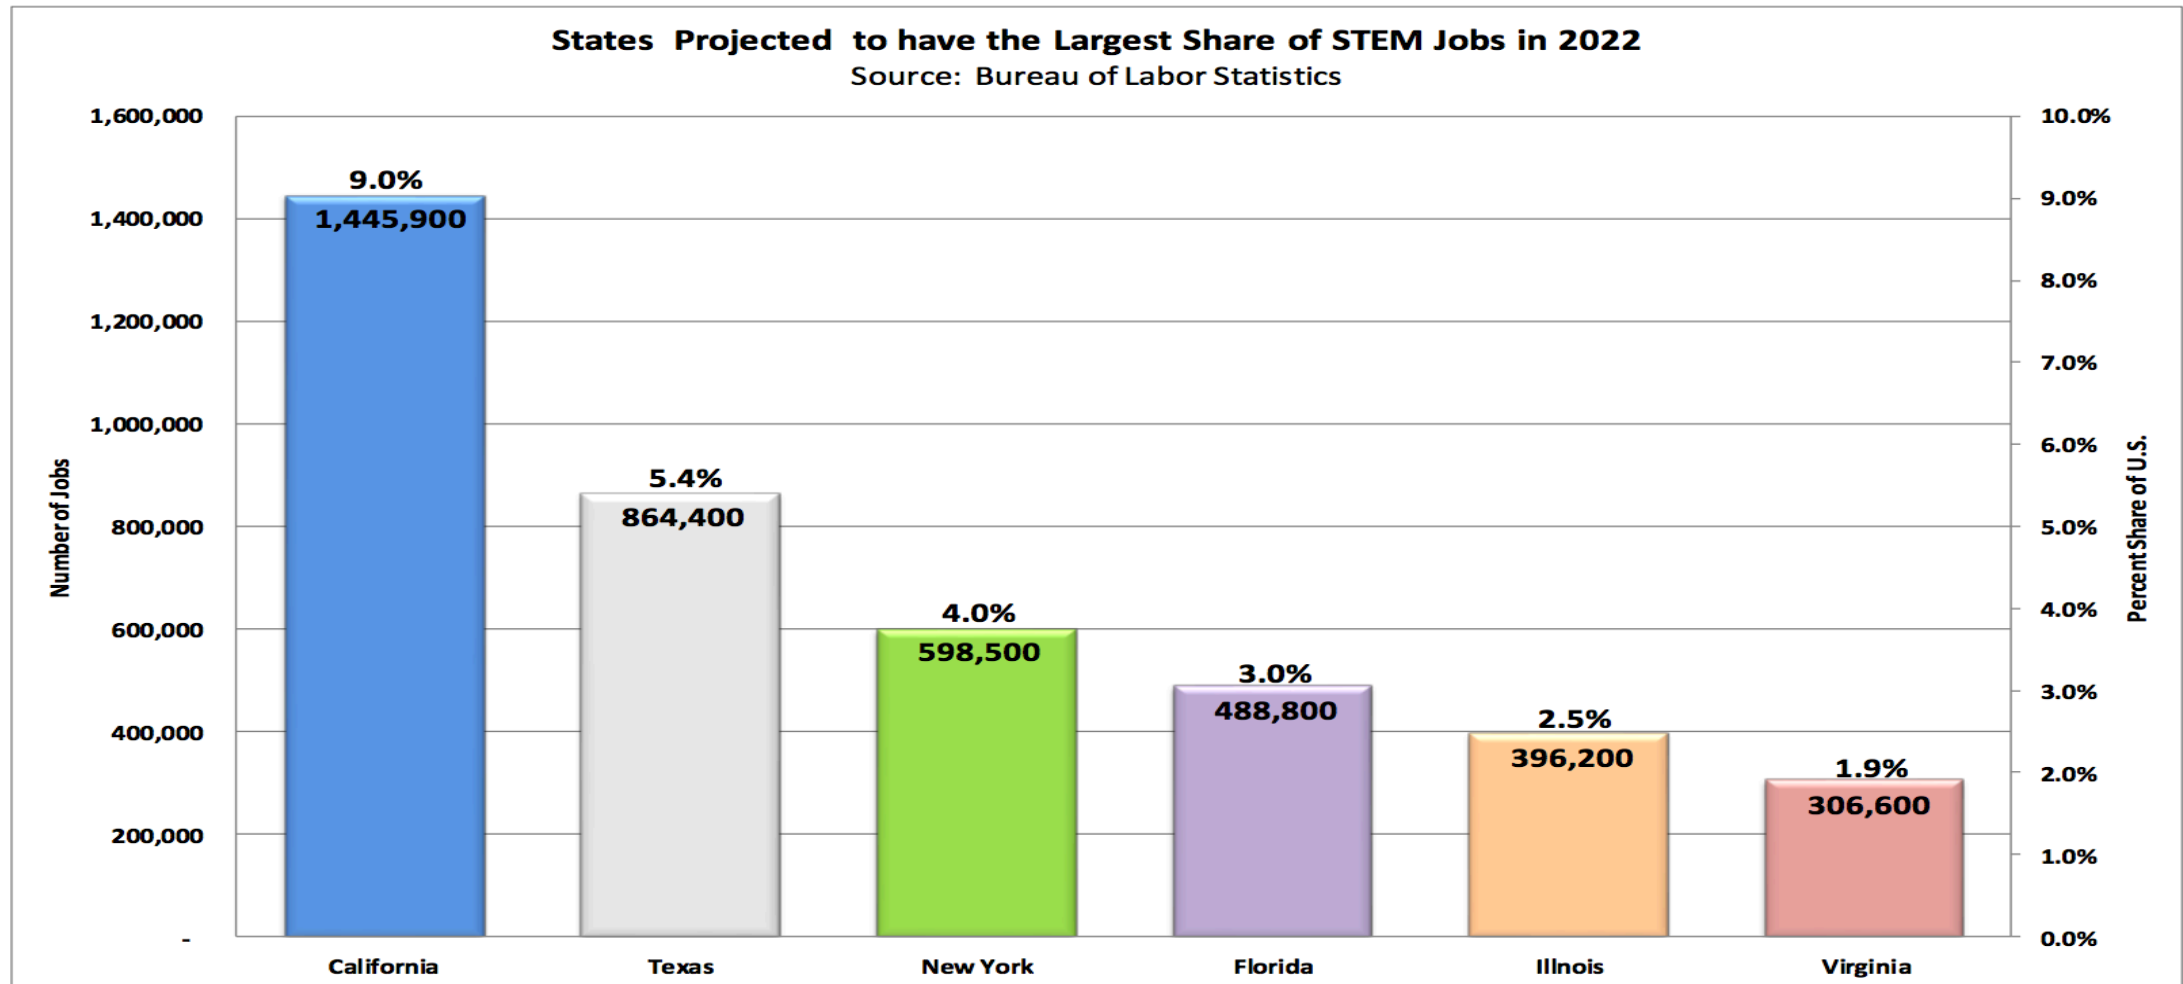

Student Groups - Race/Ethnicity	Number of Students Tested with Scores 2017	Percent of Students Who Exceeded Standard in 2017	Percent of Students Who Met Standard in 2017	Percent of Students Who Nearly Met Standard in 2017	Percent of Students Who Did Not Meet Standard in 2017	Percent Point Change of Students Who Met or Exceeded Standard 2016–2017	Percent Point Change of Students Who Met or Exceeded Standard 2015–2017
Asian	300,380	49.42	23.27	16.11	11.20	0.69	3.69
Black or African American	175,068	5.92	13.10	25.48	55.50	1.02	3.02
Latin@x	1,752,405	8.31	16.89	29.10	45.70	1.20	4.20
White	752,059	26.81	26.04	25.59	21.56	-0.15	3.85

- African-Americans received just **7.6%** of all STEM bachelor's degrees and **4.5%** of doctorates in STEM.

(https://nces.ed.gov/programs/digest/d14/tables/dt14_318.45.asp) 2013

- Even in the most diverse Silicon Valley tech firms, only **2%** of the technology jobs are held by African-Americans

Attributes of Science, Technology, Engineering, and Mathematics (STEM) Jobs⁴

Why do students struggle with
mathematics?

Why is mathematics a gatekeeper
instead of a gateway?

Other Possible Misconceptions

- ❖ Primary experiences revolved around saying and writing numbers rather than counting and cardinality, understanding magnitudes and number relationships.
- ❖ **NO CONTEXT**; just computation, algorithms were introduced to them before they were developmentally ready.
- ❖ They lack strategies.
- ❖ They lack thinking tools to organize their thinking
- ❖ Seen as the sum of their deficits, not their strengths

The image shows a handwritten multiplication problem on a piece of paper. The title is "Turtlehead Multiplication". The problem is 27×65 . The numbers are written in a way that forms a turtle's head and neck. The number 27 is written inside a green outline of a turtle's head. The number 65 is written below it, with a red line under the 5. The multiplication is shown as follows:

$$\begin{array}{r} 27 \\ \times 65 \\ \hline 135 \\ + 1620 \\ \hline 1,755 \end{array}$$

There are some additional markings: a red checkmark above the 43, a red circle around the 5 in 65, and a red circle around the 0 in 1620. To the right of the multiplication, there are five numbered steps:

1. Draw turtle's head.
2. Multiply by the # in its neck 5×7 then 5×2 .
3. 3 steps:
 - check off carried #
 - draw a collar
 - lay an egg
4. Multiply by the other # 6×7 then 6×2 .
5. Add !

*NCTM, April 25, 2018
Opening Keynote*

Agnosia-The ability to not make sense of what is right in front of you.

When natural intuitive knowledge is perceived as not being mathematical...You rob them of the opportunity to claim their place in math and science.

Make their knowledge privilege

Wounds imposed – inflicted by the pedagogy

If I'm always viewed as less than. If the math is not connected to my context...I have a phobia of the content.

Thesis:

- Algebra is the gateway to higher mathematics. Algebra is dependent on multiplicative reasoning and proportional relationships. Lack of multiplicative reasoning is a major reason students are failing algebra.
- The Ratio Table is a powerful tool for young students to shift from additive thinking to multiplicative, master the distributive property, partial products/quotients, and proportional reasoning; by exploring real world problems, crafting multiple solutions within contexts, and provide proofs of their own thinking.

How do we change the data?

“Our work is driven by the desire to transform classrooms into communities of mathematicians: places where children explore interesting problems and like mathematicians, engage in crafting solutions, justifications, and proofs of their own making”.

–Cathy Twomey Fosnot

Contexts for Learning Mathematics

Ratio Table: A **thinking tool** learners can use to organize their thinking which enables them to **strategically solve** problems. MP5

- Multiplication – whole number, find partial products
- Division – find partial quotients & develop proportional reasoning
- Fractions, decimals, percents

Task Model 4

DOK Levels
2, 3

Target D:
Interpret
results in the
context of a
situation.

Task Expectations: Students need to link their answer(s) back to the problem's context. This might include a judgment by the student of whether to express an answer to a division problem using a remainder or not based on the problem's context.

Example Item 1 (Grade 4):

Primary Target 4D (Content Domain OA), Secondary Target 1A (CCSS 4.OA.A), Tertiary Target 4A, Quaternary Target 1A (CCSS 4.OA.3)

A group of 137 students and 15 adults go to a museum. The students and adults have to take the elevator up to the 6th floor.

- The elevator can hold a maximum of 12 people.
- At least one adult must ride with each group of students on the elevator.

Part A:

What is the **fewest** number of elevator trips it will take to get all of the students and adults to the 6th floor? Enter your response in the first response box.

Part B:

What is the **fewest** number of people on the final elevator trip? Enter your response in the second response box.

12 on an Elevator

Trips/Adults	Students
1	11
2	22
4	44
8	88
12	132
(4+8=12)	(44+88=132)

12 trips will have 12 adults 132 students

Adults $15-12=3$ Students $137-132=5$

1 trip will have 3 adults 5 students

**Part A: Fewest number of trips
13 trips**

**Part B: Fewest number of people on the final trip
8 on the last trip (3 adults/5 students)**

Catherine Fosnot

The ratio table will show the partial products and will lead eventually to the algebra of, again, another example of the use of the **distributive property**, which is the big idea that partial products gets you to. The **doubling and halving** gets you to **tripling and thirling**, **quadrupling and quartering**, really what you're doing is just associating a factor differently, and that leads to the **associative property**. This is the, this landscape that I'm talking about, is the foundation of the development of algebra, and this is what we need to be focused on in the elementary school.

Fractions

Justine likes to make pillowcases. It takes $\frac{2}{3}$ of a yard of material to make a pillowcase. How many yards of material would it take to make 15 pillowcases?

Ratio Table

- Doubling
- Using Partial Products (place value understanding)
- Distributive Property over addition
- Number greater than a whole

1	$\frac{2}{3}$
2	$\frac{4}{3}$
3	$\frac{6}{3} = 2$
6	$\frac{12}{3} = 4$
12	$\frac{24}{3} = 8$
$12 + 3 = 15$ pillows	
$8 + 2 = 10$ yards	

Grade 4 Mathematics

The ratio table is a powerful tool...

- Additive Thinking: Distributive Property of Multiplication Over Addition and Partial Products
- Subtractive Thinking: Distributive Property of Multiplication over Subtraction and Using Friendly Numbers
- Multiplicative Thinking: Ratio and Proportional Reasoning
- Algebra

Strategies and thinking tools lay the foundation for algebraic thinking...

Strategy:

“Algebra is the more generalized mathematical application of strategies students should have been taught K-6.”

–Fosnot

Doubles Doubles +1

Additive Thinking

$(n + n)$ $(n + n) + 1$
