Algebraic Procedures in Need of a Conceptual Makeover

Karen McPherson
NCTM 2018
Identify a real number that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a number.
Identify a real number that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a number.
Identify a real number that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a number.
Identify a real number that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a number.
Identify a real number that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a number.
Identify a real number that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

2(□ - 3)^2 + 1

Thumbs up when you have a number.
Describe the value that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a description.
Explain how to identify the number that when placed into the blank will produce the smallest possible value.

Describe the value that when placed into the blank will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a description.
Describe the value of \( x \) that will produce the smallest possible value.

What is the smallest possible value?

Thumbs up when you have a description.
Vertex Form of a Quadratic

Identify the vertex of the quadratic given the quadratic expression

\[ a \ (x - h)^2 + k \]

Describe the conditions for when the vertex is a minimum and when it is a maximum.
Instructional Shifts in Mathematics

Focus strongly where the standards focus

Coherence think across the grades and link to major topics within the grade

Rigor in major topics pursue with equal intensity:
  ❖ conceptual understanding,
  ❖ procedural skill and fluency, and
  ❖ application
Mathematics Teaching Practices

❖ Establish mathematics goals to focus learning.
❖ Implement tasks that promote reasoning and problem solving.
❖ Use and connect mathematical representations.
❖ Facilitate meaningful mathematical discourse.
❖ Pose purposeful questions.
❖ Build procedural fluency from conceptual understanding.
❖ Support productive struggle in learning mathematics.
❖ Elicit and use evidence of student thinking.
So I began to wonder...

- How do you pursue the three aspects of rigor with equal intensity?
- What are the concepts that need to be understood?
- What are the procedures that build from those understandings?
- What is does it mean to be procedurally fluent?
- How do you build procedural fluency from conceptual understanding?
Procedural Fluency Defined

Accurate
correct solutions

Efficient
selecting and implementing an appropriate strategy quickly

Flexible
adapting strategies and applying to different problems / context
WARNING: 
a rush to fluency neglects students’ development of reasoning strategies 
& undermines students’ confidence and interest in math
Writing the Equation of a Line

Traditional Procedure

Write the equation of the line that passes through the points (-1,2) and (7, 6).

\[ m = \frac{6 - 2}{7 - (-1)} = \frac{4}{8} = 0.5 \]

- Use the slope formula to find m.

\[ y = mx + b \]

\[ 6 = 0.5 \times 7 + b \]

- Use the formula \( y=mx+b \) and substitute slope for m and one of the points for (x, y).

\[ 6 = 3.5 + b \]

- Solve for b.

\[ 6 - 3.5 = b \]

\[ 2.5 = b \]

- Substitute m and b back into the equation.

\[ y = 0.5x + 2.5 \]
Writing the Equation of a Line

Prior Understandings

❖ Defining characteristics of a linear relationship are the constant rate of change (slope) and the initial value (y-intercept)

❖ Connections between how the slope and y-intercept are represented among mathematical representations (graph, table, description and symbols)
Intentionally building informal reasoning strategies

Series of problems where students are given time to reason and develop strategies. Each problem is followed up with discussion of strategy and additional practice before moving on.
Write the equation of a line that passes through (4,3) and (8,1).

<table>
<thead>
<tr>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>8</td>
<td>1</td>
</tr>
</tbody>
</table>

**Analyze the Strategy**

- Understanding the y-intercept is the y value when $x=0$.
- Using the $\Delta x$ and $\Delta y$ separately to find the y-intercept.

**Writing the Equation of a Line**

**Strategy: Using a Table**
Write the equation of a line that passes through (3,1) and (9,5).

### Strategy: Using a Table

<table>
<thead>
<tr>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>9</td>
<td>5</td>
</tr>
</tbody>
</table>

#### Analyze the Strategy
- Adjusting the $\Delta x$ and $\Delta y$ by taking half of each
- Using the $\Delta x$ and $\Delta y$ separately to find the $y$-intercept

Writing the Equation of a Line
Write the equation of a line that passes through (3,7) and (8,27).

<table>
<thead>
<tr>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>7</td>
</tr>
<tr>
<td>8</td>
<td>27</td>
</tr>
</tbody>
</table>

Analyze the Strategy

❖ Adjusting the $\Delta x$ and $\Delta y$ so that $\Delta x=1$ and relate to slope

❖ Using the $\Delta x$ and $\Delta y$ separately to find the $y$-intercept

❖ Connect to using the slope three times and relate to the $x$ value
Write the equation of a line that passes through (14,23) and (23,77).

### Analyze the Strategy

- **Calculate the slope**
- **Start with a y value, subtract the slope fourteen times and relate to the x value**

<table>
<thead>
<tr>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>23</td>
</tr>
<tr>
<td>23</td>
<td>77</td>
</tr>
</tbody>
</table>
Write the equation of a line passing through the points (-1, 2) and (7,6).

What do the points look like in a table?
What is the slope of the line?
What calculations produce the $y$ value for when $x = 0$?

**Analyze the Strategy**
- Calculate the slope (adjusting the $\Delta x$ and $\Delta y$ so that $\Delta x = 1$)
- Start with a $y$ value and subtract the slope $x$ number of times
- Express the strategy $y$ value $- (\text{slope})(x \text{ value})$
How do the two procedures compare?

Traditional Procedure
- Use the slope formula to find $m$.
- Use the formula $y=mx+b$ and substitute slope for $m$ and one of the points for $(x, y)$.
- Solve for $b$.
- Substitute $m$ and $b$ back into the equation.

Procedure with a Conceptual Makeover
- Calculate the slope (adjusting the $\Delta x$ and $\Delta y$ so that $\Delta x=1$).
- Start with a $y$ value and subtract the slope $x$ number of times.
- Write the equation.
Solving Exponential Equations Using Logarithms

Traditional Procedure

Solve $5(2^x) = 240$

$2^x = 48$

$\log_2 48 = x$

$x = \frac{\log 48}{\log 2}$

$x \approx 5.585$

❖ Isolate the exponential part of the expression

❖ Convert the equation to logarithmic form

❖ Use change of base rule since 48 is not a rational power of 2

❖ Evaluate the expression using calculator
Solving Exponential Equations Using Logarithms

Prior Understandings

❖ Writing an expression into equivalent forms reveals properties of the quantity it represents.
❖ Power to a Power property for exponents \((b^m)^n = b^{mn}\)
Express each of the numbers as a Power of 10. You can find exact values for some of the required exponents. Others might require some calculator exploration.

a. 100 \( 10^2 \)
b. 1,000 \( 10^3 \)
c. 10,000 \( 10^4 \)
d. 2 \( 10^{0.3} \)
e. 500 \( 10^{2.7} \)
f. 4,782 \( 10^{3.68} \)
g. 0.01 \( 10^{-2} \)
h. -0.001 \( \text{not possible} \)
i. 0.0023 \( 10^{-2.64} \)
j. 3.45 \( 10^{0.54} \)
k. 34.5 \( 10^{1.54} \)
l. 345 \( 10^{2.54} \)

Solving Exponential Equations Using Logarithms
Use your results from rewriting numbers as a *Power of 10* to solve each of the following equations.

a. \(10^x = 100\)  
b. \(10^{x+2} = 1,000\)  
c. \(10^{3x+1} = 10,000\)

d. \(3(10)^{x+3} = 300\)  
e. \(10^{2x} = 500\)  
f. \(2(10)^x = 6.90\)

Solving Exponential Equations Using Logarithms

Seeing Structure
$\log_{10} a = b$ if and only if $10^b = a$
Without the use of a calculator, find each of the following logarithms.

a. \( \log 10^{2.5} \)  
b. \( \log 100 \)  
c. \( \log 10,000 \)  
d. \( \log 3.45 \)  
e. \( \log 500 \)  
f. \( \log -0.001 \)
Use what you know about logarithms to help find the exact solution to these equations.

a. \(10^x = 15\)  
b. \(5(10^{2x}) = 60\)  
c. \(3(10)^{x+4} = 21\)

d. \(3^x = 729\)  
e. \(5(2^x) = 240\)  
c. \(3(5^x + 12) = 60\)
Solving Exponential Equations Using Logarithms

Procedure with a Conceptual Makeover

Solve $5(2^x) = 240$

$2^x = 48$

$10^{x \cdot \log 2} = 10^{\log 48}$

$x \log 2 = \log 48$

$x = \frac{\log 48}{\log 2}$

$x \approx 5.585$

❖ Isolate the exponential part of the expression
❖ Rewrite each expression into a common base
❖ Same structure and base so exponents are equivalent
❖ Divide both sides by $\log 2$
❖ Evaluate the expression using calculator
Solving Exponential Equations Using Logarithms

How do the two procedures compare?

**Traditional Procedure**

Solve $5(2^x) = 48$

\[
2^x = 48 \\
\log_2 48 = x \\
x = \frac{\log 48}{\log 2} \\
x \approx 5.585
\]

**Procedure with a Conceptual Makeover**

Solve $5(2^x) = 48$

\[
2^x = 48 \\
10^{x \cdot \log 2} = 10^{\log 48} \\
x \cdot \log 2 = \log 48 \\
x = \frac{\log 48}{\log 2} \\
x \approx 5.585
\]
WARNING:
a rush to fluency neglects students’ development of reasoning strategies & undermines students’ confidence and interest in math.
Here’s the Challenge

- When you are teaching a procedure
  - approach it through the perspective of a student
  - focus on why and when
  - make connections explicit
  - compare procedures and problems
  - reach out to colleagues & do this work together
