

Composing and Decomposing Numbers	
<p>Student</p> <p>___ and ___ is the same as ____. Example: 3 and 2 is the same as 5.</p> <p>___ and ___ is the same value as ____. Example: <u>60</u> and <u>20</u> is the same value as <u>80</u>.</p> <p>___ and ___ and ___ is the same as ____. 100 and 100 and 47 is the same as 247.</p> <p>___ and ___ is ____. Example: 4 and 1 is 5.</p>	<p>Teacher</p> <p>Avoid using 4 and 1 “makes” 6. When students hear “makes” they assume they need to complete an action. Also the term “makes” doesn’t translate to the definition of equal: 4 and 2 makes 3 and 3 is not accurate. Whereas, 4 and 2 is the same as 3 and 3 describes the relationship as equal.</p>
Place Value & Comparing Numbers	
<p>Student</p> <p>There are ___ tens and ___ ones. Example: There are 2 tens and 8 ones.</p> <p>The digit ___ is in the ___ place. Example: The digit <u>7</u> is in the <u>hundred thousands</u> place.</p> <p>The digit ___ represents ____. The digit <u>7</u> represents <u>700,000</u>.</p> <p>___ is the same as ____. Example: 15 is the same as 15.</p> <p>___ is greater than ____. Example: 127 is greater than 49.</p> <p>___ is less than ____. Example: 4.75 is less than 5.23.</p> <p>___ is 10 more than ____. Example: 40 is 10 more than 30.</p> <p>___ is 10 less than ____. Example: 30 is 10 less than 40.</p>	<p>Teacher</p> <p>Work to maintain your place value language as you talk about addition, subtraction, multiplication and division. For example, when adding 53 and 29. <i>Fifty and twenty is seventy. Three and nine is twelve. So, seventy and twelve is eighty-two.</i></p> <p>When teachers remove their place value language, students see mathematics as procedures and lose number sense (see subtraction).</p> <p>103 is read as “one hundred three.” The word “and” is used for fractions and decimals such as “Four and seventy-five hundredths.”</p>

Addition	
<p>Student</p> <p>___ and ___ is the same as ____.</p> <p>Example: 35 and 22 is the same as 57.</p> <p>___ and ___ is the same value as ____.</p> <p>90 and 10 is the same value as 100.</p> <p>___ and ___ is ____.</p> <p>Example: 4 and 1 is 5.</p>	<p>Teacher</p> <p>Avoid the term “carry.” We want student to think about what is happening with the numbers. Instead use the term regroup or rename as an alternative.</p>
Subtraction	
<p>Student</p> <p>The difference between ___ and ___ is ____.</p> <p>Example: The difference between 9 and 7 is 2.</p>	<p>Teacher</p> <p>When teachers remove their place value language, students see mathematics as procedures and lose number sense. Notice when students try and regroup when solving:</p> $\begin{array}{r} 14 \\ -7 \\ \hline \end{array}$ <p>Although this answer is in finger range or can be solved with a derived fact (7+7), some students will still try to regroup to solve.</p> <p>Avoid the term “borrow.” Student need to see that we are renaming, regrouping or ungrouping to solve.</p>
Multiplication	
<p>Student</p> <p>___ groups of ___ is ____.</p> <p>Example: 6 groups of 4 is 24.</p> <p>___ rows of ___ is ____.</p> <p>Example: 7 rows of 3 is 21.</p>	<p>Teacher</p>  <p>2 groups of 3 is 6.</p>  <p>2 rows of 3 is 6.</p> <p>Avoid the term “bring down the zero.” This again is about the mathematical procedure and avoids the importance of place value language:</p> $\begin{array}{r} 26 \\ \times 42 \\ \hline 12 \text{ (2x6)} \\ 40 \text{ (2x20)} \\ 240 \text{ (40 x 6)} \\ \underline{800 \text{ (40 x 20)}} \\ 1,092 \end{array}$

Division	
<p>Student</p> <p>___ shared equally with ___ is ___</p> <p>Partitive Division Example: 12 shared equally with 3 is ___.</p> <p>Quotative/Measurement Division Example: 12 shared equally with ___ is 4.</p>	<p>Teacher</p> <p>The term “shared equally” applies to division and fractions. Avoid the term “goes into,” as in 3 goes into 12 how many times. Using “goes into” negates the idea of equal sharing which later relates to fractions.</p> <p>Use the term “remainder,” instead of leftover. As students learn about fractions, they can connect to the remainder as a fractional part.</p>
Fractions	
<p>Student</p> <p>___ equal parts of ____.</p> <p>Example: 3 equal parts of 4.</p> <p>___ equal pieces of ____.</p> <p>Example: 2 equal pieces of 3.</p> <p>___ parts of ____.</p> <p>Example: 4 parts of 5.</p>	<p>Teacher</p> <p>Avoid using the term “out of.” When students hear “out of” they think that the equal part of the whole/set is missing or gone.</p>
Measurement	
<p>Student</p> <p>The ___ is longer than the ____.</p> <p>The ____ is shorter than the ____.</p> <p>The ___ is the same as the ____.</p> <p>The ___ is taller than the ____.</p>	<p>Teacher</p>
Geometry	
<p>Student</p> <p>A ___ has ___ sides and ___ vertices. Example: A triangle has 3 sides and 3 vertices.</p> <p>An example would be ____.</p> <p>A non-example would be ____.</p> <p>These two shapes are similar because ____.</p> <p>These two solids are different because ____.</p>	<p>Teacher</p> <p>Using correct geometric terms and vocabulary is essential in the classroom. Using visuals helps students connect the definition and properties. Frayer Models can support students in showing examples and non-examples.</p>

Data Analysis

Student

_____ **has the greatest.**

Example: Chocolate ice cream has the greatest number of votes on the graph.

_____ **has the least.**

Example: Strawberry is the least favorite flavor.

_____ **has** _____ **fewer than** _____.

Example: Vanilla has 4 fewer than Chocolate.

_____ **has** _____ **more than** _____.

Example: Chocolate has 4 more than Vanilla.

Teacher

Math Discourse/Number Talk

Student

I wonder _____.

I notice _____.

I agree with _____ because _____.

I disagree with _____ because _____.

I predict _____.

I estimate _____ because _____.

My strategy is _____.

I did _____ because _____.

I tried _____.

I noticed a connection between _____.

A question I have is _____.

I don't understand _____.

I'm still thinking about _____.

I'm still not sure about _____.
