

RE: Sebsilk

Trainers: J Warren & D Krongold

On the 27th December 2021 I examined and ultrasounded this horse's right foreleg suspensory ligament. The leg was swollen and the suspensory was reactive to palpation.

The Ultrasound confirmed the presence of a moderate core lesion in the right suspensory ligament. (photos attached) This is a significant injury, the horse will need a prolonged rest from racing and has a guarded prognosis for returning to racing.
