The first watering of newly installed turfgrass sod is the most important. Begin watering sod within 30 minutes after installation of the new turfgrass. The first watering establishes how well the grass will perform for years to come. The first watering should apply at least 1 inch of water soaking the sod and the soil underneath to a depth of 2 to 4 inches. Maintain sod and soil moisture for three weeks after installation with daily 1/4 inch waterings (more during dry and hot periods and less in cool wet conditions). After three weeks decrease frequency of water and increase the amount of watering applied per application with a regular watering schedule.
