AREA INLET PROTECTION

GENERAL NOTES:
1. Any erosion and sediment control measures intended to control erosion of an earth disturbance operation shall be installed before any earth disturbance operations take place.
2. The contractor shall report the land disturbance site after each significant rainfall event within 24-hour period and assure that all erosion and sediment control measures are in condition prior to any forecasted rainfall. Sediment removal and all necessary repairs shall be completed and all sediment control measures installed within 48 hours after rainfall. After installation, sediment control measures shall be removed once it reaches half of the installed height of measure.
3. The contractor shall maintain all erosion and sediment control measures during all phases of construction until owner accepts work as complete. The contractor shall provide temporary seating, parking, 4x4 fence, sediment traps or other means to prevent sediment from reaching streams, public right-of-way or adjacent property.
4. Sediment and erosion control measures shall be removed once 70 percent of the permanent measures are completed.
5. The contractor shall temporarily seed and mulch all disturbed areas if there has been no construction activity on them for a period of 14 calendar days. If the engineer determines that a site has a potential for erosion, stabilization of soil may be required. Temporary vegetation shall be approved by the engineer or as follows:
   - Application Rate: 320 lbs per acre
   - Replants and reseeding shall be performed by the contractor at the direction of the engineer at no additional cost to the owner. If vegetation measures are not effective, non-vegetation option may be required.

CURB INLET SEDIMENT PROTECTION

NOTES:
1. Other approved curb inlet sediment filters may be used.
2. Immediately following inlet construction, inlet construction and slope protection for at least the next 30 days shall be required. The option for additional control measures is allowed.
3. Contractor to clean out sediment after each significant rainfall event.
4. If sediment control measures fail, they shall be replaced prior to stabilization.
5. Any sediment or gravel deposited in inlet shall be removed promptly.
