READING TIME: 2 MINUTES

INTELLIGENCE-SOFT software engineers and web developers have a great deal of expertise in the development of custom web applications and corporate portals based upon DotNetNuke / Evoq™ Content technology.

What is DotNetNuke?

DotNetNuke (some time ago renamed to Evoq™ Content) is the Web application framework intended for the development of web projects such as commercial websites, corporate intranets and extranets, online document management or publishing portals and custom vertical applications.

DotNetNuke / Evoq™ Content is based on the Microsoft ASP.NET technology thus providing excellent performance and highest level of security and reliability.

DotNetNuke architecture

Important feature of DotNetNuke / Evoq™ Content is its extensibility. It has a basic core which can be extended using pluggable modules and providers that enable additional functionality; the look and feel of individual sites (or even individual pages within one web site) can be customized using skins.

Interfaces for modules, providers and skins are well documented and supported with programmer's manuals thus giving a chance for third party developers to create their own custom components. About thirty basic modules are included with the core DotNetNuke distribution, and further modules can be downloaded from the official store.

DotNetNuke / Evoq™ Content skinning architecture provides a clear separation between design and content, enabling a web designer to develop skins without requiring any specialist knowledge of development in ASP.NET: only a knowledge of HTML and an understanding of how to prepare and package the skins themselves is required. Skins consist of basic HTML files with placeholders for content, menus and other functionality, along with support files such as images, stylesheets

and Javascript, packaged in a Zip file. Like modules, skins can be uploaded and automatically installed through the administration pages.

Our DotNetNuke portfolio

We use DotNetNuke for custom web sites and applications for more than 15 years. Our engineers and designers successfully completed a number of projects based upon DotNetNuke technology. Visit [INTELLIGENCE-SOFT website](#) to see [examples of completed projects](#).
