

Integration

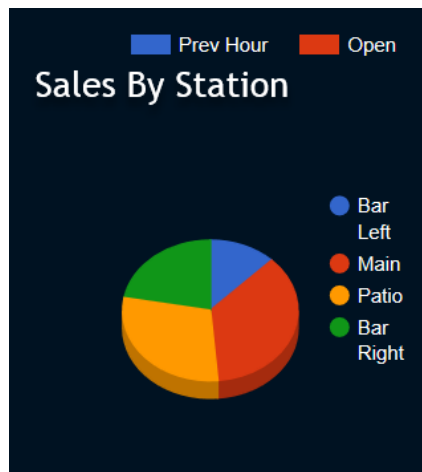

2TouchPOS software has capabilities that go above and beyond comparative software packages. We recognized several years ago that our software is fantastic with data gathering, results recording, time keeping, and inventory countdown. We provide you with a way to capture data and work with your customers seamlessly. A few of our establishments asked us to move into areas that were not our area of expertise. Lets' take payroll processing for example; we are experts with our point of sale system time keeping and employee designations. However, we are not experts at determining proper payroll deductions, classifications, and tax amounts. Most of our establishments use another software package for this purpose. It is prudent to say 2TouchPOS leaves off at time keeping; and another integration specialist picks up at payroll processing.

It is up to each customer whether they are satisfied with how far our system delves into organizational processes like inventory management, customer venue development, human resources, and scheduling. For some of our customers what we offer works; for others they want more. We CAN do more.

Our development team rolled out DataKey a couple of years back. A few of our customers started using it right away. Others are just beginning to realize the full potential. *Application Programming Interface* or API's allow different software systems to communicate with one another. The problem for most communications is that something needs to connect the systems. For example; 2TouchPOS and your payroll company, this is where DataKey comes in. DataKey exists to connect different software applications so that data is shared. Once our establishments get DataKey they have access to source codes that allow the distribution of data. Then the data that is collected in the 2TouchPOS System is distributed to the integration specialists who need it.
