Sap mobile platform agentry client

Plan to upgrade your existing SMP03 SP03 PL02 platform (runtime server) to SMP03 SP07 PL02, which has about 25 native applications and 3 SAP workmanager applications All native applications build with SDK version SMP03 SP03 SAP Workmanager application SDK version SDK is SMP03 SP03 Can you confirm after updating the SMP platform, all native & SAP workmanager application SDK version must be upgraded to SDK version to SMP03 SDK SP08? or the same version of the SMP03 SP03 SDK (client agentry) will support the runtime server from SMP03 SP07 PL02? The SAP Mobile Platform (SMP) Agentry component is a tool for designing, deploying, and managing the lifecycle of mobile projects. Previously, agentry standalone platform is now integrated with SMP 2.3 and SMP 3.0. Therefore, installation and configuration have changed in several key areas. This document is designed to help experienced developers quickly accelerate on the components of the new platform, as well as provide an explanation of what has changed. For detailed installation and configuration instructions, refer to the product documentation. Installation files Installation files The installation files used to configure an application running on SMP are different from files used to configure agent 6.x or previously based on the system. The installation files needed to configure the SMP 3.0 agent environment are as follows: SMP Mobile Platform installer SDK installer Product installers All installers are found in software downloads | SAP Support Portal > Installation and Upgrades -> A-Z Installation Process At a very high level, the installation process now consists of the following steps: Install mobile platform SMP Create agent application in SMP management cockpit Run application installers to configure the application and create a Zip file Deploy the application zip file to the SMP mobile platform via the admin cockpit Install SMP Mobile Platform SDK to access agentry development tools and client installers Details about SMP components, as well as the differences between agentry 6.x landscape and agentry landscape and SMP agents are explained below. Agent Server Agent Server is no longer a stand-alone server. It is installed as a component of the SMP mobile platform. Starting with SP04, you can run multiple agent applications from a single SMP server. The SMP server itself is not agent-specific, except for the agent server component, it also contains servers for hybrid and native applications. They are not used in deployments but can be used to create additional applications are running on the same SMP server. Product installers When you run a product installer such as SAP Work Manager, SAP CRM Service Manager, etc., you do not install the server. You fill in the ini and product configuration files with installation-specific information (such as backend connection information, java paths, etc.) and create a zip file that is used to deploy application definitions to the application definition created in the SMP mobile platform. Production definitions are deployed through the SMP management dashboard, the developer server must be configured manually. Detailed instructions are here:Configure the SMP agent development environment Each agent application you create will have its own directory in the \MobilePlatform\Server\configuration\ directory. The configuration and SQL files in the application instance directory above will replace the generic agent files in the \com.sap.mobile.platform.server.agentry\ directory. The Mobile Platform SMP SMP SDK Agent clients, test environment, editor plug-ins, and developer SDK are now distributed through the AgentryToolkit component in the SMP mobile platform SDK. This SDK also includes development tools for Capsules, Native Development, SMS, and other SMP components. They are not used for agentry, but can be used to create additional mobile apps. Agentry Toolkit The agent toolkit is located in the \MobileSDK\AgentryToolkit\ directory and contains the following development tools: AgentryClients - These are standard client installers for Windows, Android, WPF, and WinCE devices. iOS customers must be downloaded from the Apple App Store, as in previous versions of the agent. AgentryEditors - Contains the Eclipse plugin for agentry that is used to create agent applications, as well as a Jar file containing agent class files and a document file that contains JavaDocs Agents. The editor now requires a 64-bit environment. AgentrySDK - This is the development kit used to create Active X controls only for win32 and Windows Mobile clients. Newer agent clients (Android, iOS, and WPF) use the open UI sdk to provide similar functionality. AgentryTestEnvironment - This is the client used to create and troubleshoot problems. It provides tools for debugging and controlling data, as well as the ability to mimic supported client platforms. Starting with SP06, the agentry test environment is attached to the agentry plug-in editor and is based on the WPF agent client. You no longer need to install ATE separately. BrandingSDK - Agent clients, like those that come with the SAP mobile platform® are branded based on SAP standards. Customers can align the customer with the brand to suit their needs. This directory contains a branding sdk for Windows Mobile clients OpenUI SDK – The OpenUI API API allow you to create custom controls for the agent client. It is available for Android, iOS, and WPF cleint devices, and controls are created using the native language of the target device client. The OpenUI SDK also includes agent client structures for Android and iOS that can be used to deliver branded clients for these platforms. This website uses cookies. By continuing to browse or log in to this website, you consent to the use of cookies. Learn more. The current SAP Mobile Platform (SMP) protocol supports SMP version 2.3. Streamline the protocol to add support for SMP version 3.0.x and agent client applications. Examples of environments to be supported are: SMP: 3.0.16.2 WM: 6.5.6 Agentry Client: 71.3.4.4 SMP SDK: 3.1 The opinions expressed above are personal opinions of the authors, not Micro Focus.
