161 A 2 O-T

4. In epidemics, isolation of cattle is easier.
5. Scientific breeding can be undertaken.
6. Cheaper to maintain dry animals and raise young stock.

4. Production and collection:- For the production and collection of clean milk scrupulous attention must be paid to the process of milking to avoid the admittance of any dust, dirt or bacteria. The animal must not be milked in the same place where it is tethered but in a special platform or in a clean, well lighted sanitary milk shed. Each animal must be washed thoroughly before milking, specially the udders, tails and surrounding parts. The hands and clothing of the milker must be quite clean so also the milk vessels, pails, cans etc. In short greater the care at the time of milking, the longer the milk will last

5. Distribution and marketing of milk:- The problem of distribution of milk is, if any thing more difficult than that of production. The milk trade in the province represents an outlay of a considerable amount of capital. The total production per annum is 2,65,91,165 maunds and at the wholesale rate of Rs. 4/- per maund the value of the milk would be Rs. 10,63,64,660/- Considered from a financial point of view there are great possibilities if the milk trade in this province was organised along economic and scientific lines. Improvement of the milch cattle alone would result in a considerable increase in the net income. The number of milch cattle (cows and buffalows only) ~~is taken at~~ is taken at 8,25,532 and if these animals could be improved to give on the average, say Rs. 2/- worth more milk per month, this would mean an additional income of more than Rs. 1,97,12,768 per annum without much initial expense. From the Sanitary, Economic, and Administrative points of view it would be easier to control a few large concerns e.g., Co-operative Societies or large private concerns than petty venders. The milkmen should be induced to leave the city and shift their cattle to sanitary stables in suburbs where milk can be produced under
