contaminated with pathogenic microbes directly through pollution or indirectly through adulteration. A large number of diseases may thereby be conveyed through milk. The problem of producing, handling, transporting and distributing milk in a clean and fresh state is one of the most difficult and intricate problems, which the sanitarian has to tackle. The following points have therefore to be considered:-

1. Improvement of milch cattle.
2. Feeding.
3. Housing and breeding of cattle.
4. Collection, preservation, transportation and distribution of milk.
5. Educational measures and
6. Legislative control.

1. Breed:- The quality and quantity of milk vary with the breed of the cattle and luckily here in Sind, we have already two very fine breeds of milch cattle viz. 1. Red Sindhi and 2. Thari. With little systematic effort the milk producing qualities of these animals can easily be improved.

2. Feeding:- The quantity and quality of milk are largely dependent on the amount and class of food given to the cattle. The supply of an adequate amount of good fodder at a low cost and an abundant supply of water are essential for rearing of cattle on economic lines.

3. Housing and tending:- Housing and tending are important factors on which the quality of milk produced depends. The animals should be housed in sanitary stables with an efficient drainage and pure abundant water supply. As far as possible the cattle should be shifted to the suburban village preferably near the railway line rather than be stabled in the city. The advantages of such an arrangement would be :-

1. More economical, natural and healthy surroundings.

2. Possible to raise one's own fodder.

3. Manure can be utilized for intensive farming.
