Delaware Coastal Program
January 29, 2013

Purpose

- ① Develop optimal growth range for *Spartina alterniflora* salt marshes in Delaware
 - Most common Halophyte in Delaware's marshes
- ① Develop means to evaluate status of short-form *Spartina alterniflora* marshes
 - Standardized means of data collection and analysis
- ① Method to evaluate marsh vulnerability, determine relative timelines for collapse, setting priorities for potential restoration, and developing engineering criteria for restoration (i.e. restore marsh to this level).

Marsh "Organs"

Smooth Cordgrass or Saltmarsh Cordgrass

- Marsh surface and tidal surface elevation relationship is one of the ultimate controls in dictating wetland flooding frequency, length of inundation, available and potential suspended sediment concentrations, and type and density of vegetation cover (Morris et al., 2002).
- “The Relationship of Smooth Cordgrass (*Spartina alterniflora*) to Tidal Datums: A Review” states that *S. alterniflora* tend to grow in relation to Mean High and Mean Low Water (McKee and Patrick, 1988)
 - Elevation of marsh platform within watersheds are dependant upon tidal datums

Why does organic matter production ...matter?

Accretion in Natural and Impoundment Wetlands

Organic Cumulative Mass in Natural and Impoundment Wetlands

Methods

◎ Biomass Sampling

- Three cores per site
- Collect both above and below ground biomass samples
- Sort and separate dead and alive plant matter
- Perform simple statistics
- Determine a “health correlation factor” for each watershed
- Sampling methods utilized from MidTRAM

◎ Real-Time Kinematic (RTK) Survey

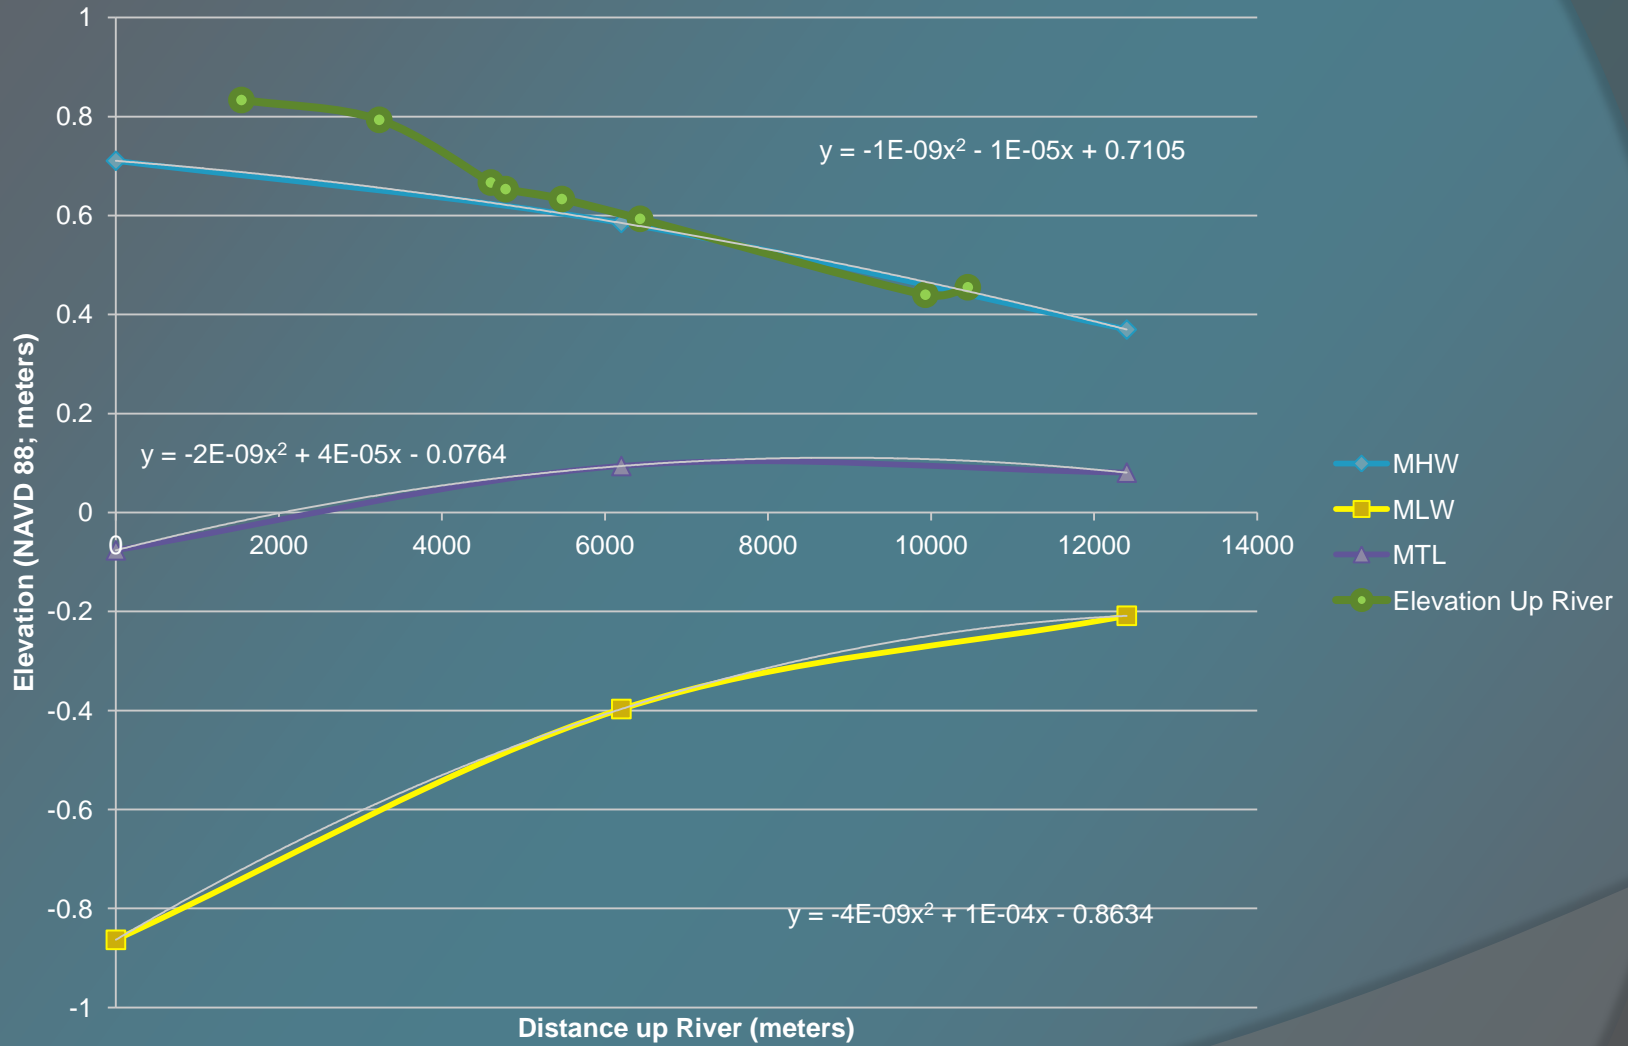

- Provide elevation data for biomass sampling sites and additional *S. alterniflora* monotypic stands
- Collect elevation data to help in correction of LiDAR vegetation error

MLLW	-0.82

Elevation Relative to MHW

Spartina alterniflora

Spartina alterniflora

Spartina alterniflora

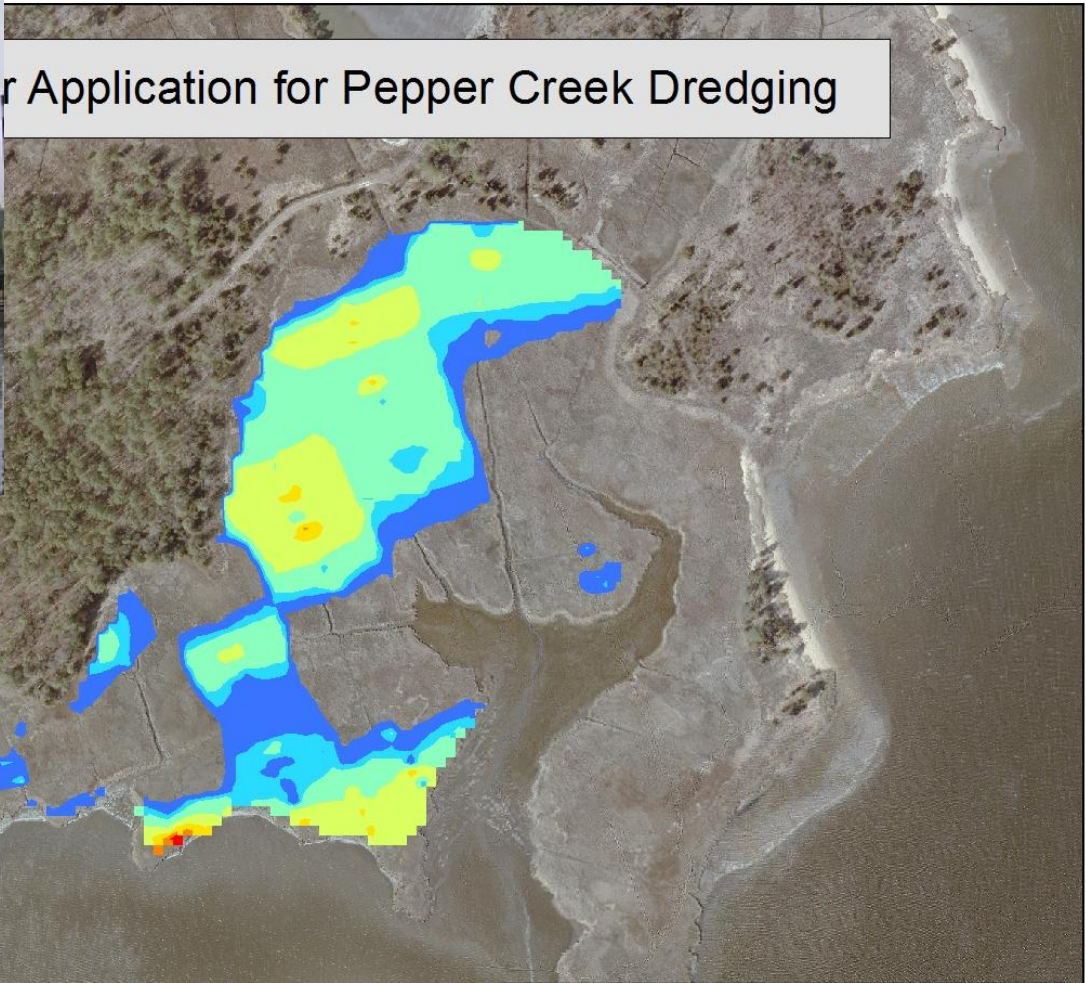

Optimal Growth Range: -0.1m to 0.2m Mean High Water

How are we utilizing these relationships?

- ① Evaluate “health” or resiliency of *Spartina alterniflora* marshes on site specific bases.
- ① Identify and prioritize marshes in greatest need of additional anthropogenic involvement.
- ① Remove guess work out of what is the proper elevation in restoring marsh elevation.

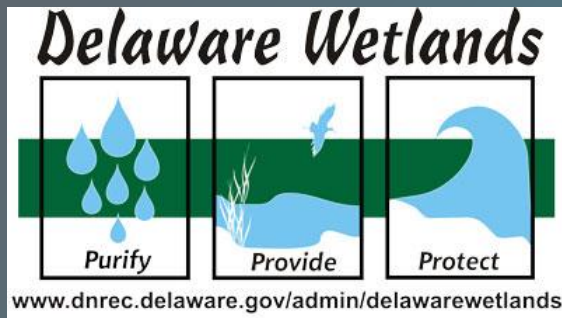

Application for Pepper Creek Dredging

Legend
Proposed Thickness of Thin Layer Application

Red	6 or More Inches
Orange	5 Inches
Yellow	4 Inches
Light Green	3 - 4 Inches
Green	2 - 3 Inches
Cyan	2 Inches
Blue	1 Inch
White	Not Needed
