## STEP BY STEP: ADD .EXE TO CURRENT PROFILE
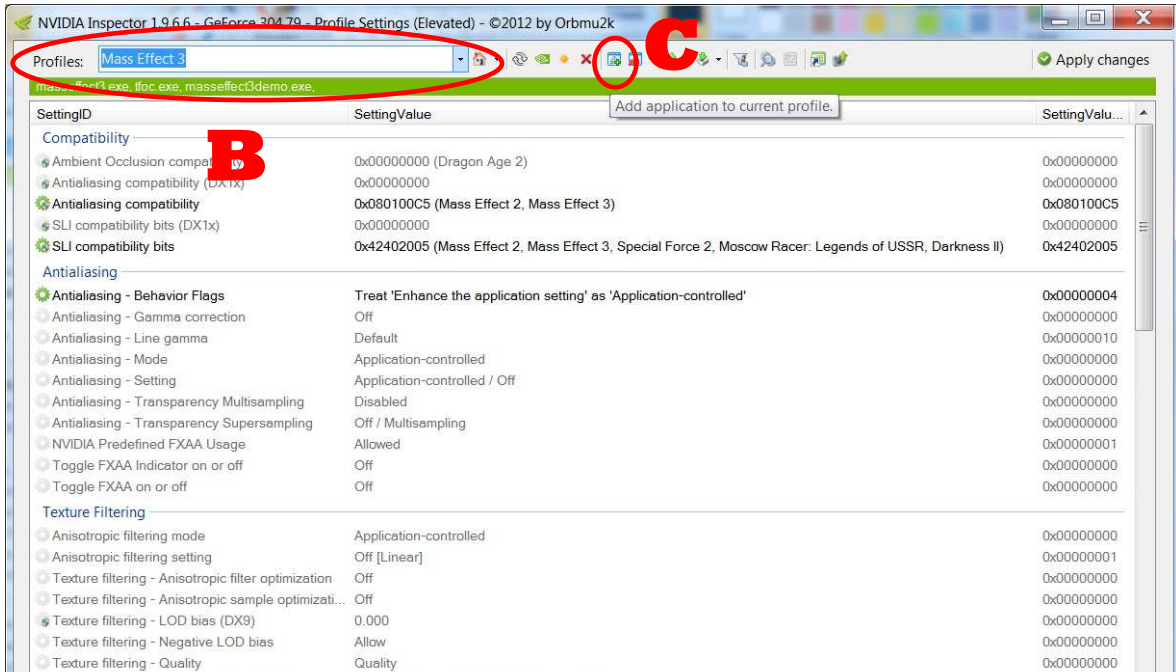

I made this step by step because there are some games that works better with others games profile, and many people don't know how to do it.

1. **Download and Install Nvidia Inspector**
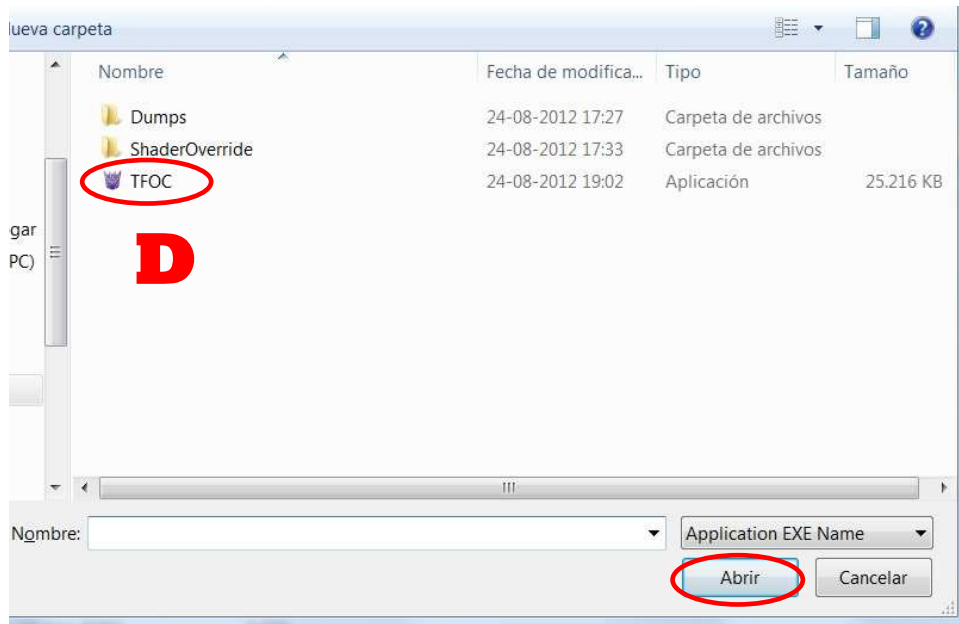

2. **Open Nvidia Inspector**

A. **Click** ⚒ **to open Nvidia's Profile settings windows.**

B. **Select the profile you want to add, in this example is the Mass Effect 3 Profile.**

C. **Press** **"Add aplication to current profile" button. This button will open a "Open location/file..." windows:**

D. **Find the location where the game is installed and select the .exe you want to add the Mass Effect 3 Profile, in this example is TFOC.exe (Transformers Fall of the Cybetron). So, select TFOC.exe anc click open.**

3. **Nvidia Inspector add the Mass Effect 3 Profile to TFOC.exe (for this example).**

4. **Click "Apply Changes", close Nvidia Inspector and Run the game (TFOC.exe for this example).**

Note: **you can test it when the game start in 3D (press CTRL+ALT+INS if the Nvidia message don't show), the Nvidia profile message now shows "Mass Effect 3" (for this example)**

Note 2: **If you get a message in STEP "D" that the profile is already in use or something like that. Select in the combo box the game profile (in this example TFOC.exe profile) and delete it (✖ : Delete profile). DON'T DELETE THE MASS EFFECT 3 PROFILE.**
