EXECUTIVE SUMMARY

Remedy monitoring and actions performed at Operable Unit 6 (OU 6) in Fiscal Year 2024 (FY 2024) included: annual groundwater monitoring at 69 locations in the surficial aquifer and 46 locations in the confined aquifer, operations, maintenance, and monitoring (OM&M) of the sub-slab depressurization system (SSDS) at Building 151, in situ bioremediation (ISB) performance monitoring at 15 locations in the OU 1 area (Figure 3-1). Annual monitoring included long-term monitoring (LTM) for potential leaching of non-volatile organic compound (VOC) constituents from soil to groundwater from OUs 1, 2, and 3 and surface water sampling at three established stations at No Name Creek (Section 3).

The new optimized monitoring network for groundwater implemented at OU 6 in 2021-2024 has refined delineations of plume areas and allows for enhanced monitoring of bioremediation progress and assessment of stability of plume areas in the surficial and confined aquifers.

VOC Plume Characterization

VOC plumes occur in the surficial aquifer (Eastover) and confined aquifer (Aquia-Potomac) within the northern and southern areas of OU 6. Primary constituent of concern (COC) plumes that have concentrations ≥ MCLs include tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene (cDCE), and vinyl chloride (VC). The lateral extent of the VOC plumes in the surficial aquifer is within the installation area except in an isolated area around a single well in the area between the installation fence line at OU 3 and No Name Creek. For the confined aquifer, discontinuous plume areas of PCE and TCE occur in the northern area of OU 1 and OU 2. In the southern area of OU 6, a VOC plume consisting of PCE, TCE, cDCE, and VC extends from the central OU 3 area into the undeveloped offsite area east of the installation (Section 4.7). The installation has an environmental easement in the offsite area of OU 6 that includes a network of monitoring wells and surface water stations in No Name Creek.

Bioremediation Assessment

Anaerobic biodegradation screening performed of the monitored plume areas for 2022-2024 found strong evidence for these processes (Table 5-1). For the established 2021 ISB treatment area in the northern area (surficial aquifer), the presence of microbial communities in groundwater combined with observed generation of ethene and ethane confirms a complete degradation pathway from PCE to ethane. Mean total organic carbon (TOC) concentrations in the ISB treatment areas for 2022-2024 exceeded the threshold of 20 milligrams per liter (mg/L) that provides an enhanced energy source for microbial degradation processes (EPA 1998, 29). In the southern area, the screening process identified reductive geochemical conditions and the presence of degradation by products along the complete reaction pathway from PCE to ethane (Section 5.3).

Northern Area VOC Plume Trends

For the northern area, ISB actions performed in Oct-Nov 2021 targeted a residual source zone in the surficial aquifer beneath the northern OU 1 area (Figure 5-1). Performance monitoring has indicated a reduction of contaminant mass in this source zone from pre-injection baseline levels in October 2021. Maximum concentrations reported for the surficial aquifer in the northern area have decreased by 88 percent (%) for PCE/TCE and decreased by 42% for cDCE. VC maximum concentrations detected have increased by 42% from baseline levels. Plume area reductions from 2021 to 2024 have occurred for TCE (-11%) and cDCE (-32%) with increases for PCE (3%) and VC (15%). As of May 2024, trend tests show decreasing trends for COCs at 6 of 8 wells for treatment area TA-1 and at 3 of 3 locations in treatment TA-2 with concentrations > MCLs. COC concentrations at the monitoring location in treatment area TA-3 are < MCLs (Sections 5.4 and 5.5).

For the northern area, limited vertical migration of PCE and TCE from the surficial aquifer to the confined aquifer has occurred compared to the southern area. A disaggregated and diffuse plume is present beneath OU 1 with a limited plume area around a single well in the OU 2 area (Section 4.11).

Southern Area VOC Plume Trends

For the southern area, ISB actions consisting of injections in fixed-based injection wells occurred in the surficial and confined aquifers in Jul-Aug 2015. For the surficial aquifer, VOC plume distribution metrics evaluated for 2018-2024 indicate transition to VC predominance over time as measured by percentage of

detects, maximum concentrations, measures of central tendency (mean/median), and number of detections greater than the MCL. Trend tests indicated a decreasing trend for maximum concentrations of cDCE. For 2021-2024, plume areas in the surficial aquifer decreased for PCE (-70%), TCE (-41%), and cDCE (13%). The VC plume area increased by 8% from 2021 to 2024. Plume metrics for the surficial aquifer in the southern area indicate continued plume degradation with the plume area remaining within the installation area (Section 5.4 and 5.5).

For the confined aquifer, VOC plume distribution metrics evaluated for 2018-2024 indicate cDCE predominance over time as measured by percentage of detects, maximum concentrations, measures of central tendency (mean/median), number of distribution outliers. For 2021-2024, the plume areas in the confined aquifer decreased for PCE (-38%) and increased for TCE (20%), cDCE (46%), and VC (41%) with the VC plume area predominating. The new monitoring network has detected apparent TCE, cDCE, and VC plume expansion/movement for the period 2021-2024 with an increase in concentrations and plume area in the offsite area (Section 5.4 and 5.5).

Long-Term Monitoring

Annual LTM performed in 2024 at OU 6 evaluated potential leaching of non-VOC constituents from soil to groundwater in the OU 1, 2, and 3 areas. Constituents detected in 2024 included 19 metals, eight (8) PAHs, and one SVOC (1,4-dioxane). No LTM locations had constituent concentrations > MCLs. The number of detections reported for 2024 is lower than the previous three years that reported detections of 16 PAHs, five SVOCs, and five pesticides. The low detection frequency of organic constituents and lower concentrations of metals < MCLs does not indicate significant potential leaching of non-VOCs from soil to groundwater at OUs 1, 2, and 3 (Sections 4.8 and 5.7).

The annual LTM surface water results at No Name Creek had low-level VOCs detections in the surface water samples with detected concentrations < MCLs and ecological screening benchmarks. Surface water sampling performed in 2024 confirmed continued remedy protectiveness with respect to surface water at No Name Creek (Sections 4.9 and 5.8).

Operation of the SSDS and air monitoring at Building 151 has indicated continued remedy protectiveness for workers in Building 151. Five-year air and subsurface vapor sampling performed at Buildings 54, 85, and 150 in 2023 indicated continued remedy protectiveness for workers in these building and did not indicate vapor intrusion into these buildings (Sections 4.10 and 5.9).

Planned Actions

DLA will continue implementing adaptive remedial strategies and optimizations at OU 6 based on the data collected for annual monitoring, supplemental ISB performance monitoring, LTM, and corresponding updates to the CSM.

Planned activities for FY2025 will include additional ISB actions for groundwater at OU 6 and completion of a site optimization evaluation with report. A remedial action work plan (addendum) will identify areas targeted for additional ISB actions and describe planned activities.

1. Introduction

This document is the Fiscal Year 2024 (FY 2024) Annual Report for Operable Unit 6 (OU 6) at Defense Supply Center Richmond (DSCR) prepared under Contract W912DR22C0045 awarded by the United States Army Corps of Engineers (USACE) Baltimore District on September 19, 2022, to Meadows CMPG, Inc. (Meadows). Meadows and teaming partner AECOM have prepared this Annual Report in accordance with the contract Performance Work Statement and requirements of Contract Line-Item Number 0011.

DSCR is the headquarters for Defense Logistics Agency (DLA) Aviation and home to a variety of other DLA, Department of Defense, and other federal organizations. The installation is eight miles south of the City of Richmond in Chesterfield County, Virginia. The United States Environmental Protection Agency (EPA) placed DSCR on the National Priorities List (NPL) in 1987. Since 1990, DLA has implemented an environmental restoration program at DSCR under a Federal Facility Agreement (FFA) with the United States Environmental Protection Agency (EPA) Region 3 and the Virginia Department of Environmental Quality (DEQ). OU 6 designation is the impacted groundwater beneath and downgradient of OU 1 (Open Storage Area), OU 2 (Area 50 Landfill), and OU 3 (National Guard Area, NGA) in the central portion of the Installation.

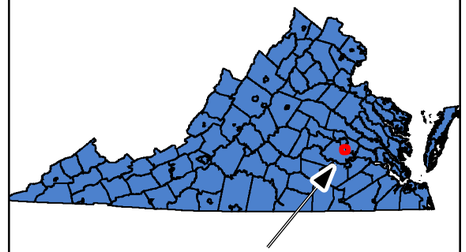

Figure 1-1 has the layout of DSCR and OU locations. This report presents the results for site monitoring for FY 2023 (October 2022 through September 2023) and uses the monitoring data to evaluate site conditions and remedy performance. DSCR has implemented a remedy at OU 6 to address volatile organic compounds (VOCs) in groundwater.

2. Background

Section 2 has background information for OU 6 including a site description, site history, and environmental setting.

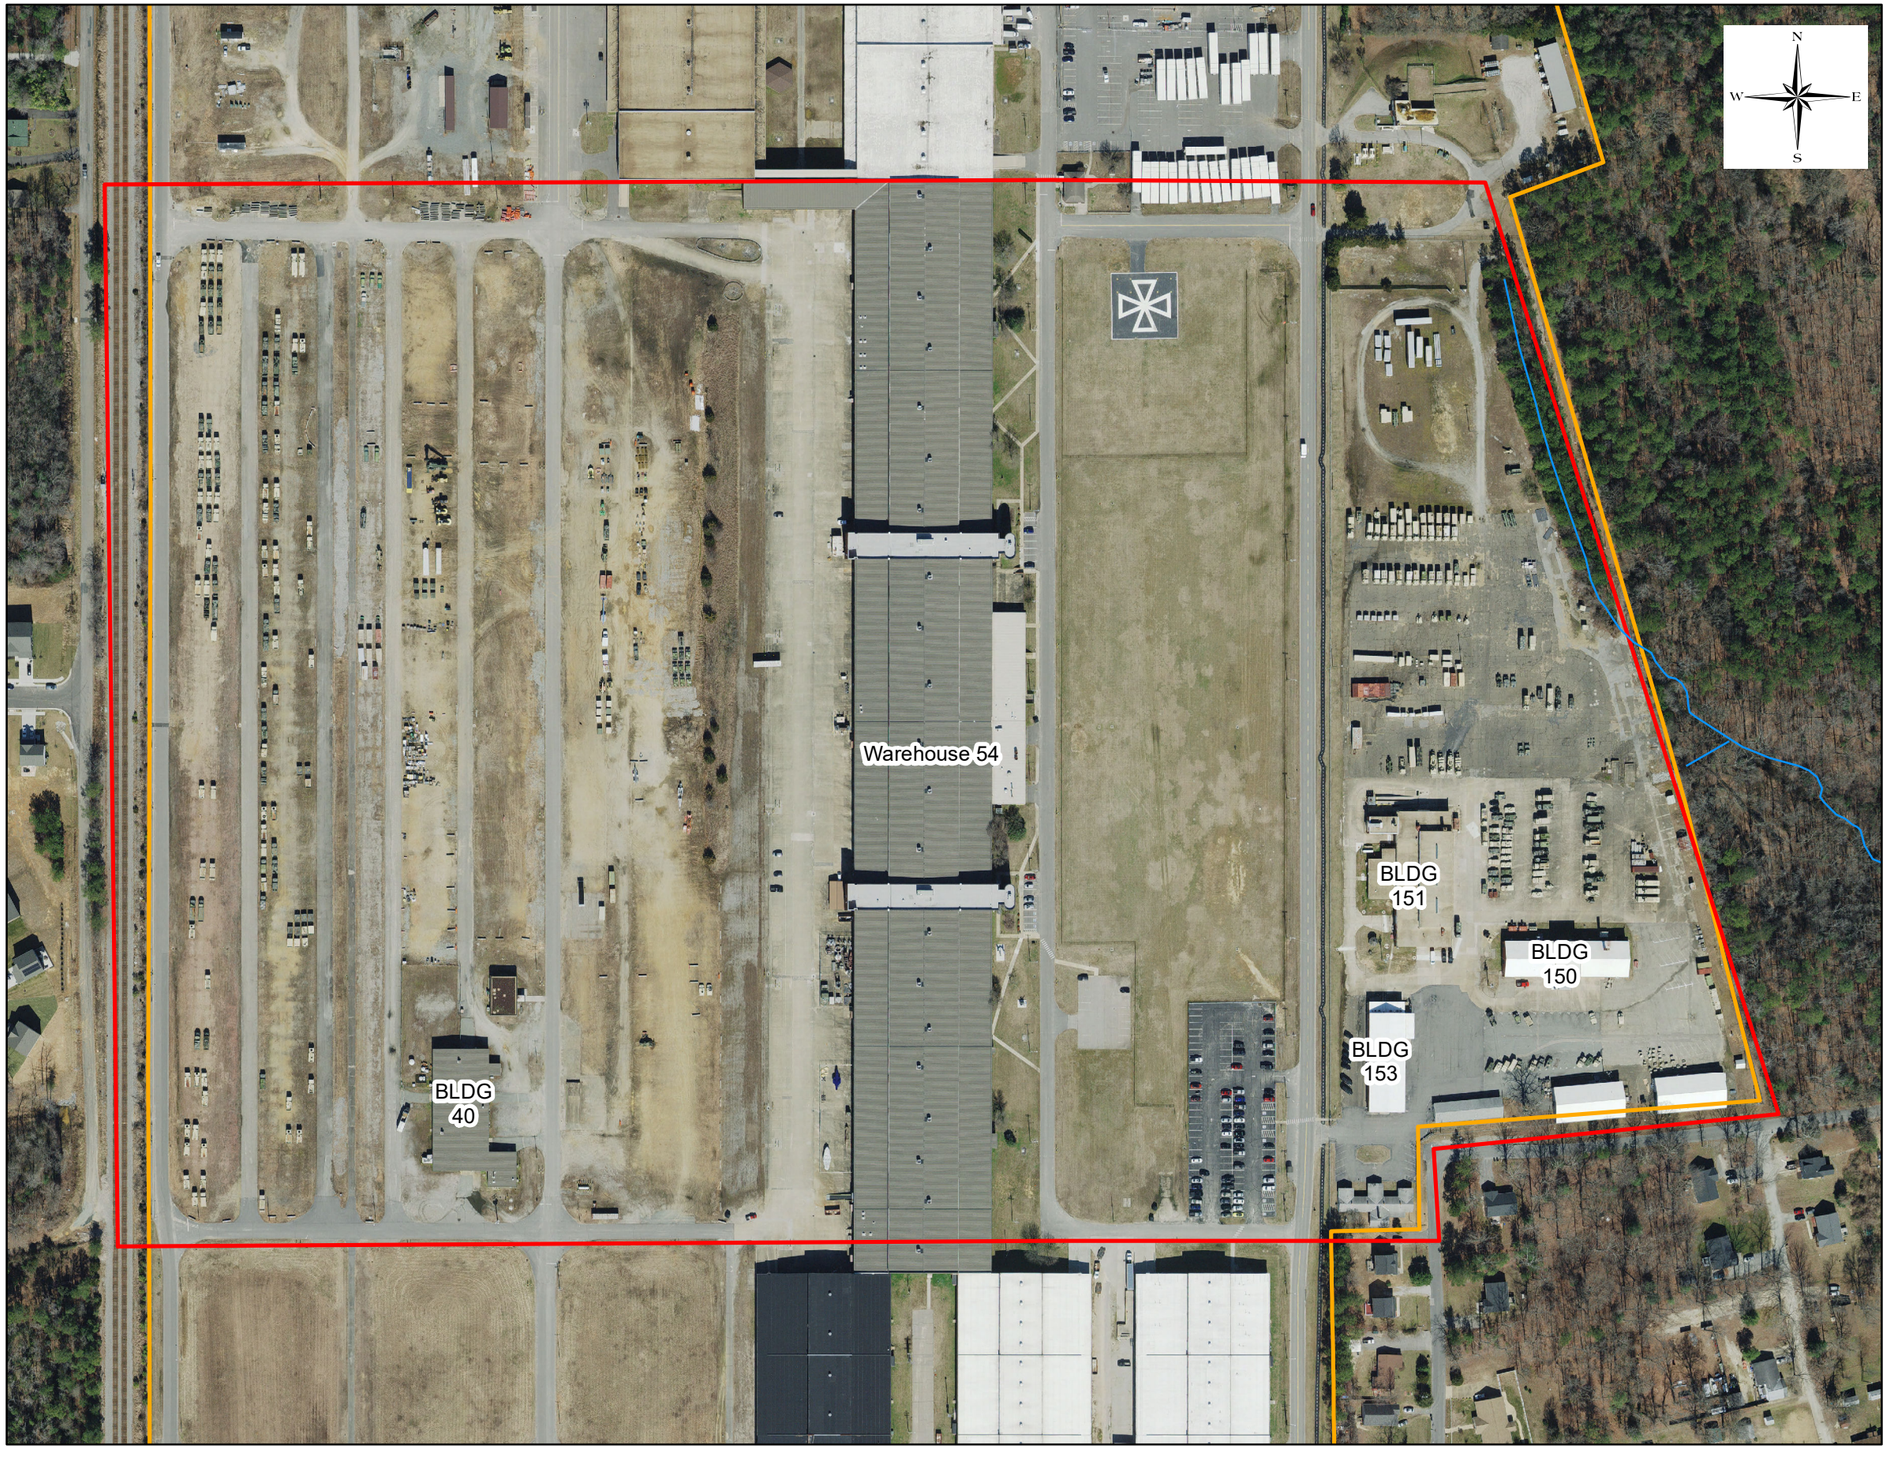
2.1 OU 6 Description

OU 6 consists of impacted groundwater beneath and downgradient of OU 1 (OSA), OU 2 (Area 50 Landfill), and OU 3 (NGA) in the central portion of the Installation. Figure 2-1 (page 2-2) shows the location and the layout and features of the OU 6 area, which has large open areas bisected by Building 54 with several buildings in the developed NGA. OU 6 extends offsite to the east into an undeveloped woodland area where a VOC plume mostly occurs in the confined aquifer. No Name Creek begins at the northeast corner of OU 6 and flows south parallel to the Installation boundary and then southeast into the offsite area.

2.2 OU 6 Site History

The OSA is a 43-acre fenced area and formerly consisted of an unpaved storage area for bulk drummed chemicals (primarily petroleum, oil, and lubricants), the recouping of liquids from leaking drums, and the repair/replacement of damaged containers. Storage activities in the OSA began in 1942 and drum recoupment activities occurred between the early 1960s and late 1970s (Dames & Moore 1989).

Area 50 Landfill consisted of a disposal site for waste, contaminated and outdated chemicals, and construction debris from the late 1950s until the early 1970s. The area landfill originally consisted of a ravine approximately 200 feet x 300 feet x10 feet that contained wet soils and vegetative cover. Dumping occurred in various areas of the ravine and by 1975 previously used areas had been graded to current elevations and revegetated (Dames & Moore 1989). A fence surrounds the former landfill area separating it from the OSA and NGA.

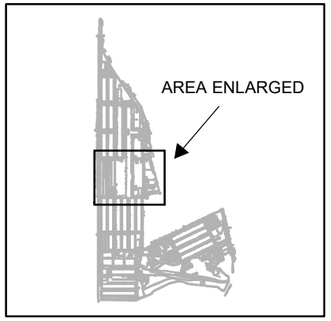


The NGA is located on a 15-acre area leased from DSCR and contains a number of maintenance shops and administrative buildings. Since the late 1940s, the primary function at the NGA is vehicle maintenance operations. In the past, underground and aboveground tanks contained fuels, oil, and solvents, and reportedly disposal of some waste solvents occurred in the site's storm sewer system or on an unpaved area.

2.2.1 1981 Installation Assessment

The United States Army Toxic and Hazardous Materials Agency completed the first environmental assessment at DSCR and their installation assessment report indicated possible groundwater impacts from the Area 50 Landfill and the NGA (CSL 1981).

2.2.2 U.S. Army and USGS Investigations



Remedial investigations began in the OU 6 area before the DSCR final listing on the NPL in 1987. Initial investigations completed by the United States Army Environmental Health Agency (AEHA) occurred in and around the Area 50 Landfill and NGA in 1982 and 1983 (AEHA 1982, 1983). These investigations detected VOCs in the upper and lower aquifers beneath the site. The United States Geology Survey (USGS) completed investigations east of the NGA in 1984 to delineate the extent of offsite migration of VOCs in the upper and lower aquifers. USGS found that No Name Creek acted as groundwater flow boundary for the upper aquifer preventing further VOC migration beyond the creek. Groundwater monitoring conducted by USGS indicated VOC impacts throughout the bulk matrix of the lower aquifer (Potomac Formation) with detected trichloroethene (TCE) concentrations as high as 1,700 micrograms per liter (µg/L) (USGS 1987, 1990).

2.2.3 1989 Remedial Investigation

Dames & Moore completed a remedial investigation (RI) for OUs 1, 2, and 3 from 1985 to 1988 that included completion of soil borings, installation of monitoring wells, and sampling of soil, groundwater, sediment, and surface water. A 1989 RI Report (Dames & Moore 1989) summarized the results of these investigations along with a benthic macroinvertebrate survey, and human health risk assessment (HHRA). RI findings indicated impacts to groundwater within the OUs 1, 2, and 3 source areas and downgradient of the installation east of the NGA. Primary constituents included VOCs with semi-volatile organic compounds (SVOCs) also detected in OU 2 soil. RI sampling of No Name Creek indicated low levels of VOCs present in surface water potentially from contaminated surface water runoff and/or contaminated groundwater discharge. HHRA results identified off-installation groundwater users, recreational users of No Name Creek, and onsite workers conducting excavation in the Area 50 Landfill as potential receptors. The RI recommended remediation of impacted groundwater in the upper and lower water bearing units (WBUs) and remediation of contaminated soil within OU 2 (Dames & Moore 1989).

2.2.4 1993 Focused Feasibility Study

A Draft Focused Feasibility Study (FFS) issued in 1993 incorporated the results of a revised baseline HHRA and established remedial action objectives to prevent potential exposure to impacted groundwater and surface water of No Name Creek, and to prevent migration of groundwater to surface water of No Name Creek at concentrations exceeding ambient water quality criteria. The FFS identified in situ bioremediation as the preferred remedial alternative for OU 6 groundwater (Law 1993).

2.2.5 OU 9 Interim Remedial Action

Implementation of an interim remedial action occurred in 1996 (identified as OU 9) with the installation of a groundwater extraction and treatment system at the installation boundary in the NGA. Stated objectives of this remedial measure included reducing the migration of contaminated groundwater, reduction of toxicity, mobility, and volume of contaminants in groundwater, and collection of data related to aquifer and contaminant responses to remedial measures to support design of a final remedy for OU 6.

This system included 17 extraction wells in the surficial aquifer and 5 extraction wells in the confined aquifer with a treatment system designed for 100 gallon per minute flow. Performance evaluations of the system after startup indicated that the system did not achieve the stated objectives because of low well yields and mass removal rates, limited lateral influence of the system, operational issues, and cost (Earth Tech 2007). Operations of the system ceased in January 2006 and decommissioning occurred by December 31, 2008. Decommissioning included conversion of system extraction wells to monitoring wells (Earth Tech 2009).

2.2.6 1999 Pilot Tests at OU 3

Law performed pilot tests in 1999 in the NGA to determine the feasibility and effectiveness of using dual phase extraction (DPE) as a groundwater remedy for OU 6. Separate test locations in the NGA evaluated areas of elevated VOCs in the surficial aquifer and confined aquifer. The results indicated low well yields, low air flows, and minimal mass removal with the pilot test report recommending no further consideration of the DPE technology for groundwater at OU 6 (Law 2000b).

2.2.7 2000 MNA Evaluation Report

Law issued a Final Natural Attenuation Studies Report for OU 6 in June 2000. This report included an analysis of natural attenuation processes for the “lower aquifer” using data collected in 1997 from onsite and offsite monitoring wells. The analysis followed the 1998 EPA technical protocol for evaluating natural attenuation of chlorinated solvents in groundwater and used the EPA BIOCHLOR attenuation modeling tool to evaluate USGS data from 1985 to 1992. The study used six onsite AEHA wells screened across the Aquia and Potomac Formations, three ‘lower aquifer’ extraction wells screened across the entire thickness of the Potomac Formation, and seven offsite USGS wells screened at various discrete depth intervals within the Potomac Formation. The report also included a performance evaluation of the OU 9 interim action groundwater extraction and treatment system (Law 2000a).

The report indicated that analysis of the USGS data from 1985 to 1992 combined with BIOCHLOR modeling demonstrated destruction of contaminant mass by biodegradation prior to operation of the OU 9 system. Another conclusion reached by the report indicated a favorable geochemical environment with the 'lower aquifer' for biodegradation and also cited the presence of degradation products such as cis-1,2-dichloroethene (cDCE), chloride, and carbon dioxide as evidence of biodegradation. The report recommended further consideration of monitored natural attenuation (MNA) as a viable remedy for the 'lower aquifer' at OU 6 and also recommended implementation of a monitoring program to collect additional data (Law 2000a).

2.2.8 Creeks Monitoring Program

MACTEC implemented a three-year creek monitoring program that included an assessment of No Name Creek. This included performance of a HHRA in 2006 that concluded no further action required for No Name Creek for human health-based risks (MACTEC 2006c). A screening level ecological risk assessment completed in 2001 for No Name Creek indicated risks low in magnitude and limited in spatial scale.

2.2.9 2006 Supplemental Feasibility Study

MACTEC issued a Final Supplemental Feasibility Study in 2006 that presented results for geophysical surveys, membrane interface probe (MIP) screening with cone penetrometer testing (CPT), soil and groundwater sampling, piezometer installation, meteorological and soil moisture monitoring, No Name Creek discharge evaluations, and slug testing (MACTEC 2006a,b). The installation-wide, conceptual site model (CSM) completed by MACTEC in 2006 incorporated the FFS data (MACTEC 2006d).

2.2.10 2011 Revised HHRA and Focused Feasibility Study

A HHRA completed as part of the Revised FFS in 2011 evaluated risks from potential exposures to contaminated groundwater at OU 6. The FFS evaluated remedial alternatives based on the results of the revised HHRA supported by an in-situ bioremediation treatability test conducted in September 2007. This treatability study evaluated the effectiveness of enhanced in situ bioremediation (ISB) using organic substrates for degradation of chlorinated VOCs in OU 6 groundwater (AECOM 2011).

The bioremediation treatability tests involved injection of 1,000 gallons of six percent edible oil emulsions in each injection location including two injection wells in the surficial aquifer and monitoring well AEHA-30B screened across the Aquia Formation and uppermost interval of the Potomac Formation. Injections occurred into monitoring well AEHA-30B after determining that the injection well installed in the Potomac Formation would not accept injectate.

Treatability results indicated favorable conditions for ISB targeting reductive dechlorination of chlorinated solvents in the upper aquifer and lower aquifer. Pre-injection and post-injection samples analyzed for microbes indicated an increase in microbial populations following injections. An identified constraint included optimizing substrate distribution in the surficial aquifer to address variable subsurface conditions including increasing injection pressures and appropriate screening of wells (AECOM 2011).

2.2.11 ROD

The Record of Decision (ROD) document for OU 6 finalized in September 2013 identifies OU 6 as groundwater underlying and downgradient from the OSA (OU 1), Area 50 Landfill (OU 2), and NGA (OU 3). It also identifies discharge of surficial aquifer groundwater to No Name Creek as a component of OU 6. Separate remedial actions have addressed OUs 1, 2, and 3 identified as the source materials that impacted OU 6 groundwater (DSCR 2013).

The selected remedy in the ROD consists of the following elements:

- ISB to treat constituents of concern (COC) in the upper aquifer and lower aquifer source areas and downgradient portions of the groundwater plumes.
- MNA that involves monitoring of COCs and geochemical conditions in the upper aquifer and lower aquifer to document that MNA is reducing chemical mass and concentrations over time.

- Annual long-term monitoring (LTM) of the upper aquifer for a minimum of five years to monitor for potential leaching of SVOCs, polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), pesticides, and metals from OUs 1, 2, and 3 soils to groundwater and also includes annual monitoring of surface water of No Name Creek until COCs in the surficial aquifer have reached cleanup levels established in the ROD.
- Institutional controls (ICs) described in the ROD included groundwater use restrictions, land use restrictions, control exposure to contaminated groundwater and implementation of institutional controls for future buildings within groundwater plume areas.
- Air sampling (indoor air and subsurface vapor monitoring) every three and five years for Building 151 and every five years for other buildings over the OU 6 surficial aquifer plume.

Table 2-1 presents the cleanup levels established in the ROD for the COCs in OU 6 groundwater. As described in the ROD, the selected remedy satisfies the statutory requirements of CERCLA. Since this remedy will result in hazardous substances, pollutants, or contaminants remaining on site above levels that allow for unlimited use and unrestricted exposure, a statutory review will occur within 5 years after initiation of the remedial action, and at a subsequent frequency of at least once every 5 years, to ensure that the remedy is, or will be protective of human health and the environment. Protectiveness reviews will continue until site conditions enable unlimited use and unrestricted exposure.

Table 2-1 OU 6 COCs and Cleanup Levels

Contaminants of Concern	Maximum Contaminant Level (MCL) (micrograms per liter, µg/L)
Upper Aquifer	
Bromochloromethane	(1)
Carbon Tetrachloride	5
Chlorobenzene	100
Dibromomethane	(1)
1,2-Dichloroethane	5
Dichlorodifluoromethane	(1)
1,4-Dichlorobenzene	75
1,1-Dichloroethene	7
cis-1,2-Dichloroethene	70
Methylene chloride	5
Naphthalene	(1)
Tetrachloroethene	5
Toluene	1000
1,2,4-Trichlorobenzene	70
1,1,2-Trichloroethane	5
Trichloroethene	5
1,2,4-Trimethylbenzene	(1)
Vinyl Chloride	2
Chloroform (2)	80
Lower Aquifer	
1,2-Dichloroethane	5
cis-1,2-Dichloroethene	70
1,4-Dioxane	(1)
bis(2-Ethylhexyl)phthalate	6
3-& 4-Methylphenol	(1)
Tetrachloroethene	5
Trichloroethene	5
Vinyl Chloride	2

Notes: (1) There is no Federal MCL for drinking water for this constituent. For groundwater COCs that do not have MCLs, the remedy will continue until the concentrations have reached acceptable risk levels (non-carcinogenic hazard index of 1 and carcinogenic risk of 1E-04 for on-installation and 1E-06 for off-installation receptors). The risk levels will be confirmed via a future risk assessment, which shall assume that people, both on- and off-site, will use the Upper and Lower WBUs for potable water. The goal is to restore both WBUs to their potential beneficial use as potable water sources. This risk assessment is recommended to be performed after groundwater COCs (that have MCLs) have reached their cleanup levels. (2) Chloroform was identified as a risk driver in the OU 6 HHRA. Based on communication with EPA Region III, the trihalomethane MCL was applied to chloroform and chloroform was added as a COC for OU 6.

2.2.12 2015 Remedial Action

AECOM implemented remedial actions for the selected remedy at OU 6 in 2015, as generally detailed in in the OU 6 Injection Technical Memorandum that documented completed activities (AECOM 2016). A Final Revised Remedial Design/Remedial Action Work Plan (RD/RAWP) for OU 6 detailed the proposed remedial actions (AECOM 2015).

ISB treatment areas targeted higher concentration areas and mid plume areas at OUs 1, 2, and 3. ISB actions focused on the surficial aquifer at OU 1 and both the surficial aquifer and confined aquifer at OUs 2 and 3. The ISB process options implemented included emulsified vegetable oil (EVO) as the carbon substrate pressure injected into injection wells designed for the specific treatment areas. Adaptation of the injection processes occurred in the field based on observed injection rates relative to design, where some wells received greater injection volumes to compensate for other wells in the treatment area that did not accept design injection volumes. Injection wells in area No. 6 located in OU 3 across the fence line (targeting Eastover) and near the fence line (targeting Potomac) accepted approximately 50 percent of the design volumes. Additional injection occurred at monitoring wells AEHA-27B and AEHA-31B screened across the Aquia and the uppermost portion of the Potomac to reach 50 percent of the design volume. Gravity feed injections occurred in monitoring wells in the surficial aquifer and confined aquifer in the OU 3 and offsite area to use available EVO for treatment of targeted zones (AECOM 2016).

Remedy verification performed as part of the remedial actions included quarterly remedy verification monitoring of groundwater for two years beginning three months after initial injections followed by semi-annual monitoring of treatment areas for ISB effectiveness. Since 2015, annual MNA monitoring of the surficial aquifer and confined aquifer has occurred with annual LTM for leachability at select wells in the surficial aquifer and annual LTM surface water monitoring of No Name Creek in accordance with the ROD. Post-injection monitoring of soil vapor occurred around Buildings 54 and 151 and indoor air sampling occurred at site buildings at the frequency specified by the ROD. ICs implemented at OU 6 are in accordance with the site-wide land use control remedial design.

2.2.13 2018 Building 151 Sub Slab Depressurization System

Arcadis implemented engineered measures at Building 151 located within the NGA in OU 6 in 2018 as detailed in the Operation, Maintenance, and Monitoring Plan, Building 151 Sub Slab Depressurization System (Arcadis 2018b). This building houses vehicle maintenance bays, sub-grade service pits, offices, a breakroom, tool room, and other facilities.

Installation and startup of a sub slab depressurization system (SSDS) occurred in 2018 with the objective of addressing the presence or potential presence of VOCs beneath the building floor slab. The SSDS has two vapor extraction points including one in the tool room and the other in the break room. Quarterly field monitoring of the SSDS is performed to verify effectiveness of the engineered control measure.

2.2.14 2019 Pre-Design Investigations

Pre-design data collection activities occurred at OU 6 in 2019 to update the CSM and obtain data to support remedy optimization, as detailed in the 2019 Annual Report for OU 6 (AECOM-Meadows 2021a). The scope of these activities included:

- Expansion of the 2019 annual sampling event from 91 to 162 monitoring well locations.
- Completion of vertical profile sampling at six stations in No Name Creek to evaluate the groundwater to surface water migration pathway including VOC sampling of surface water, sediment porewater, and groundwater beneath the creek.
- Completion of high-resolution site characterization (HRSC) investigations at OU 1, OU 2, OU 3, and the offsite area east of OU 3 (OU 6).

The 2019 Annual Report presents a detailed update of the CSM that includes a digital 3D model of the OU 6 site area.

2.2.15 Remedial Action Work Plan Addendum

A RAWP Addendum prepared in 2021 described proposed remedy optimizations for OU 6 (AECOM-Meadows 2021c). The RAWP contained the following proposed actions:

- Targeted ISB injections in the residual source zone beneath OU 1.
- Implementation of an optimized monitoring well network at OU 6 including the installation of 61 new monitoring wells.
- Remedy performance monitoring and MNA actions.
- Planned future abandonment of wells no longer used or needed for monitoring.

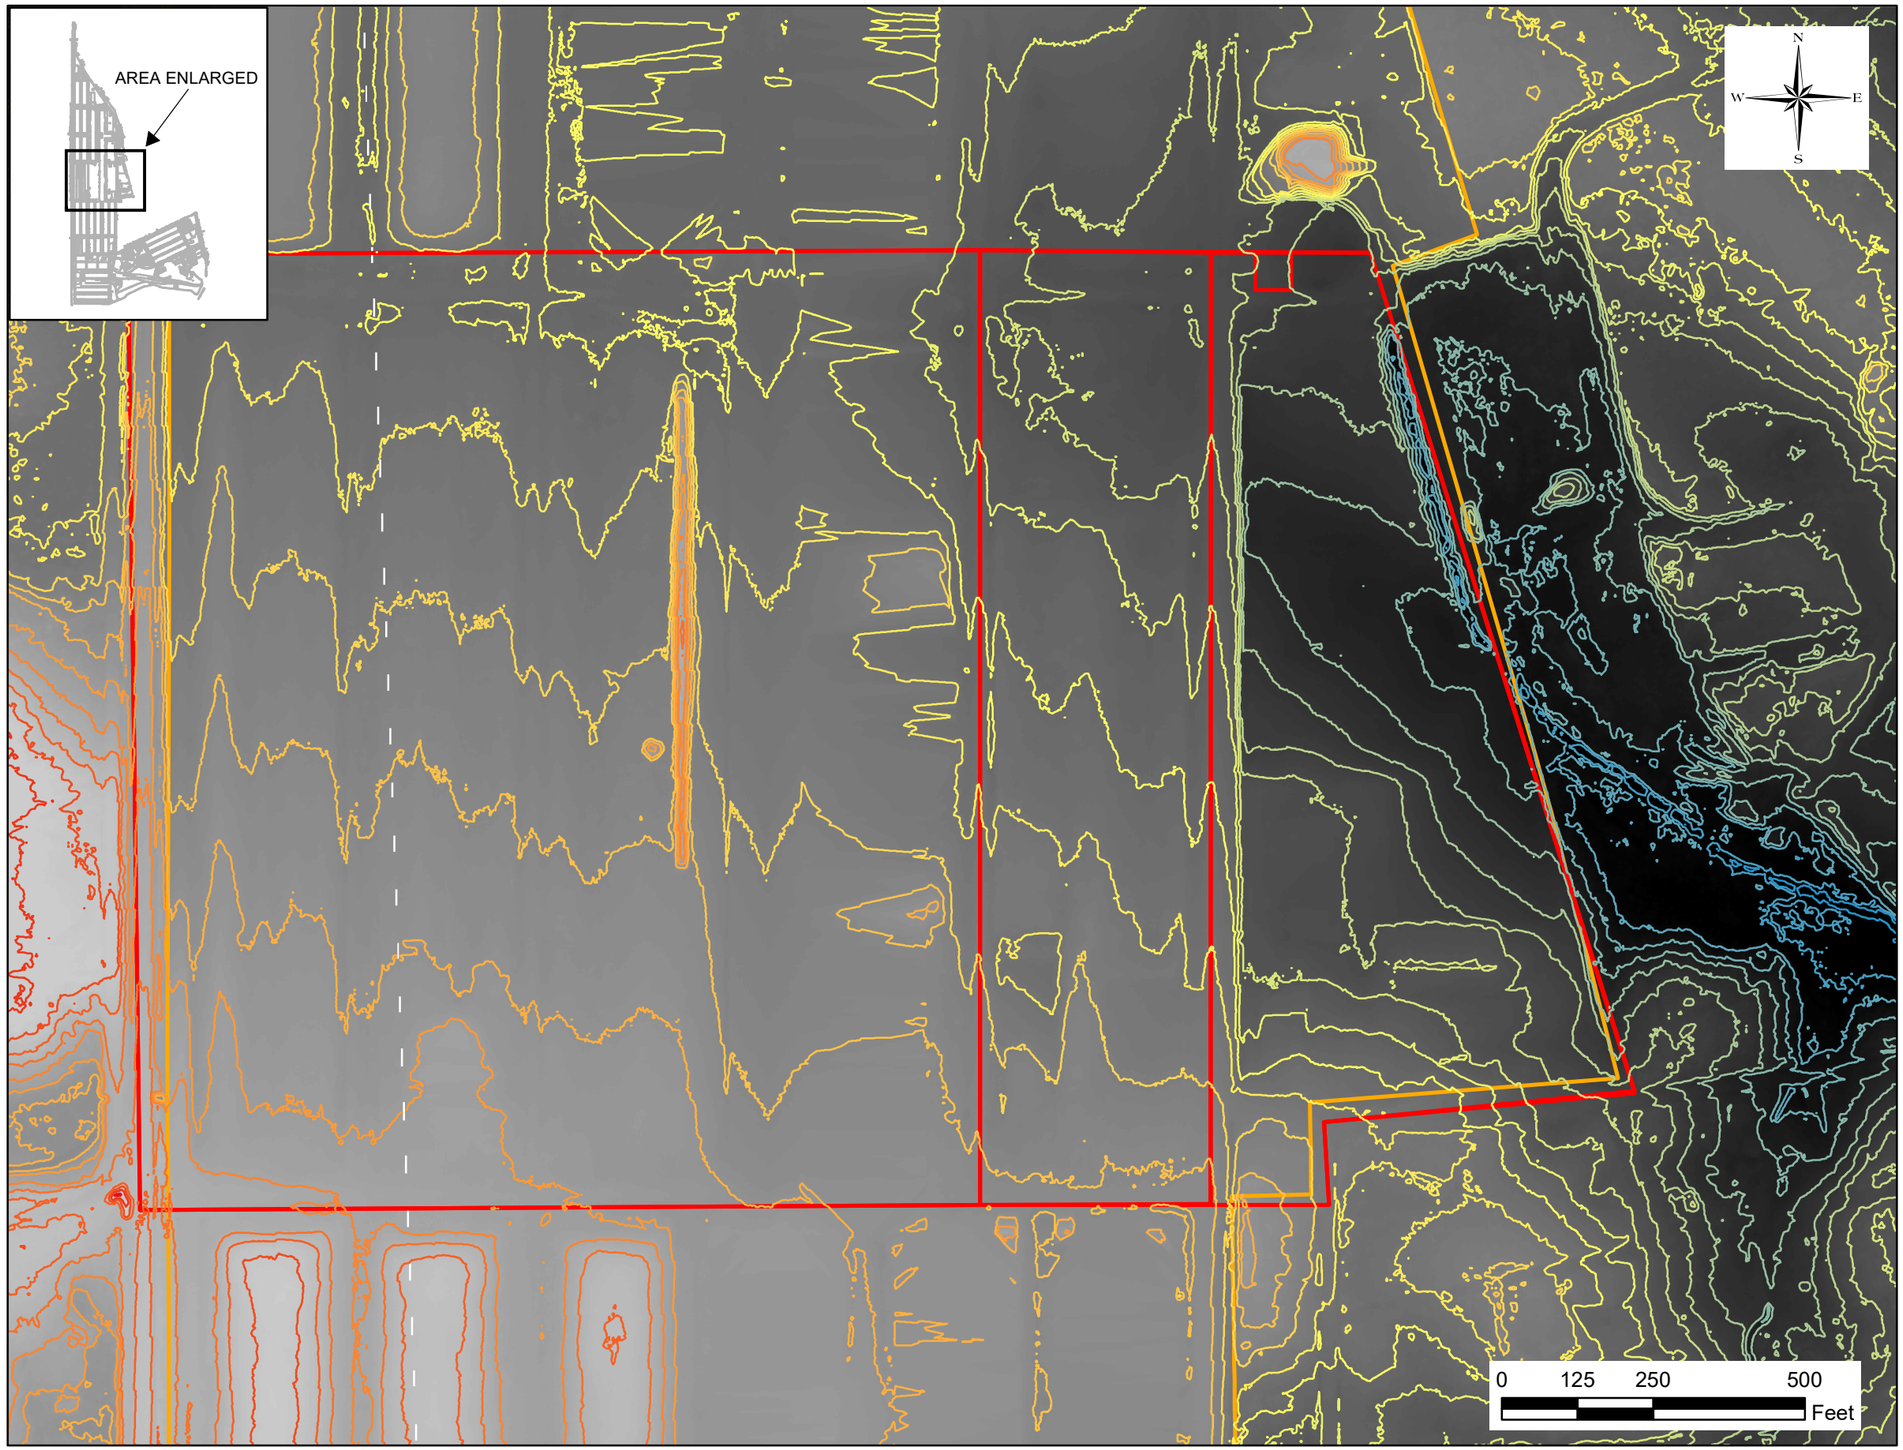
2.2.16 Monitoring Well Installation and Optimized Monitoring Network

Implementation of the RAWP Addendum included the installation of 61 new monitoring wells in August and September 2021. Implementation of a new optimized network for remedy performance monitoring, MNA, and LTM occurred in December 2021 and included 66 monitoring wells screened in the surficial aquifer, 44 monitoring wells screened in the confined aquifer, and 3 surface water stations at No Name Creek. The optimized monitoring network excluded wells used for gravity feed EVO injections in 2015 and 2016.

The annual monitoring network for OU 6 in 2022 added existing well DMW-8A to refine plume delineations in the surficial aquifer in the OU 1 area. In December 2022, EPA and DEQ approved the installation of four additional monitoring wells (MW-298, MW-299, MW-300, and MW-301) for incorporation into the 2023 annual monitoring network for remedy performance and MNA evaluations. These well installations occurred in the first quarter of 2023.

2.2.17 ISB actions and Performance Monitoring

Implementation of the RAWP Addendum included optimized ISB injections targeting the residual source zone beneath OU 1. Field implementation of the injections occurred from October 25 through November 17, 2021. ISB injections used direct push technology (DPT) with EVO as the carbon amendment with bioaugmentation and included three treatment areas with 80 injection points injecting more than 5,160 gallons of EVO.



A pre-injection baseline monitoring event for groundwater occurred at 15 monitoring wells in the OU 1 area in October 2021. One year of quarterly ISB performance monitoring of groundwater occurred at 15 monitoring wells in the OU 1 area followed by semi-annual monitoring to evaluate injection performance and treatment progress. The analytical parameters for performance monitoring included VOCs, geochemical parameters, field water quality parameters, and select samples for microbial analysis.

2.3 Environmental Setting

Section 2.3 describes the environmental setting for OU 6.

2.3.1 Site Topography

Historical site activities and development have altered the land surface and topography of the OU 6 area. A former ravine existed in the OU 2 area before landfilling and realignment of No Name Creek to the eastern installation boundary occurred as part of the initial development of DSCR. Figure 2-2 (page 2-8) has a digital elevation model (DEM) for OU 6 showing site topography. Overall topographic slope is toward the northeast with elevations ranging from a maximum of approximately 134 feet (ft.) North American Vertical Datum of 1988 (NAVD88) in OU 1 to a minimum of approximately 106 ft. NAVD88 in the OU 3.

AECOM

Figure 2-2
OU 6 Topographic Map

Defense Supply Center Richmond
Richmond, VA

Prepared By: DBC	Reviewed By: JOS
Scale: 1" = 250'	Date: September 03, 2024

C:\Users\david.copen\AECOM\DSCR FY2024 Annual Reports - General\OU6 FY2024 Annual Report\Figures\Figure 2-2 OU6 Topo Map.mxd

The open area of OU 1 has gravel and soil ground cover with Building 85 located between OUs 1 and 2. Grass covers most of the former landfill area at OU 2 except for two parking areas and a heliport located at the southern and northern ends of OU 2, respectively. Tarmac (concrete and asphalt) covers the southern two thirds of OU 3 with the remaining area covered by gravel and grassland vegetation. Building development in the southern portion of OU 3 includes eight buildings associated with NGA operations (Figure 2-1).

2.3.2 Surface Water and Wetlands

No Name Creek originates near the northeast corner of OU 3 and flows south along the eastern boundary of the installation turning southeast into off installation area and flowing in a southeasterly direction away from the installation. The former creek alignment passed through the northern end of OU 2, north of the helipad and the Area 50 landfill. Creek realignment of up to 450 ft. east occurred in the northern portion of OU 3 as part of DSCR development. This involved placement of up to 15 ft. of fill in the creek valley to attain current surface grades at OU 3 (MACTEC 2006d).

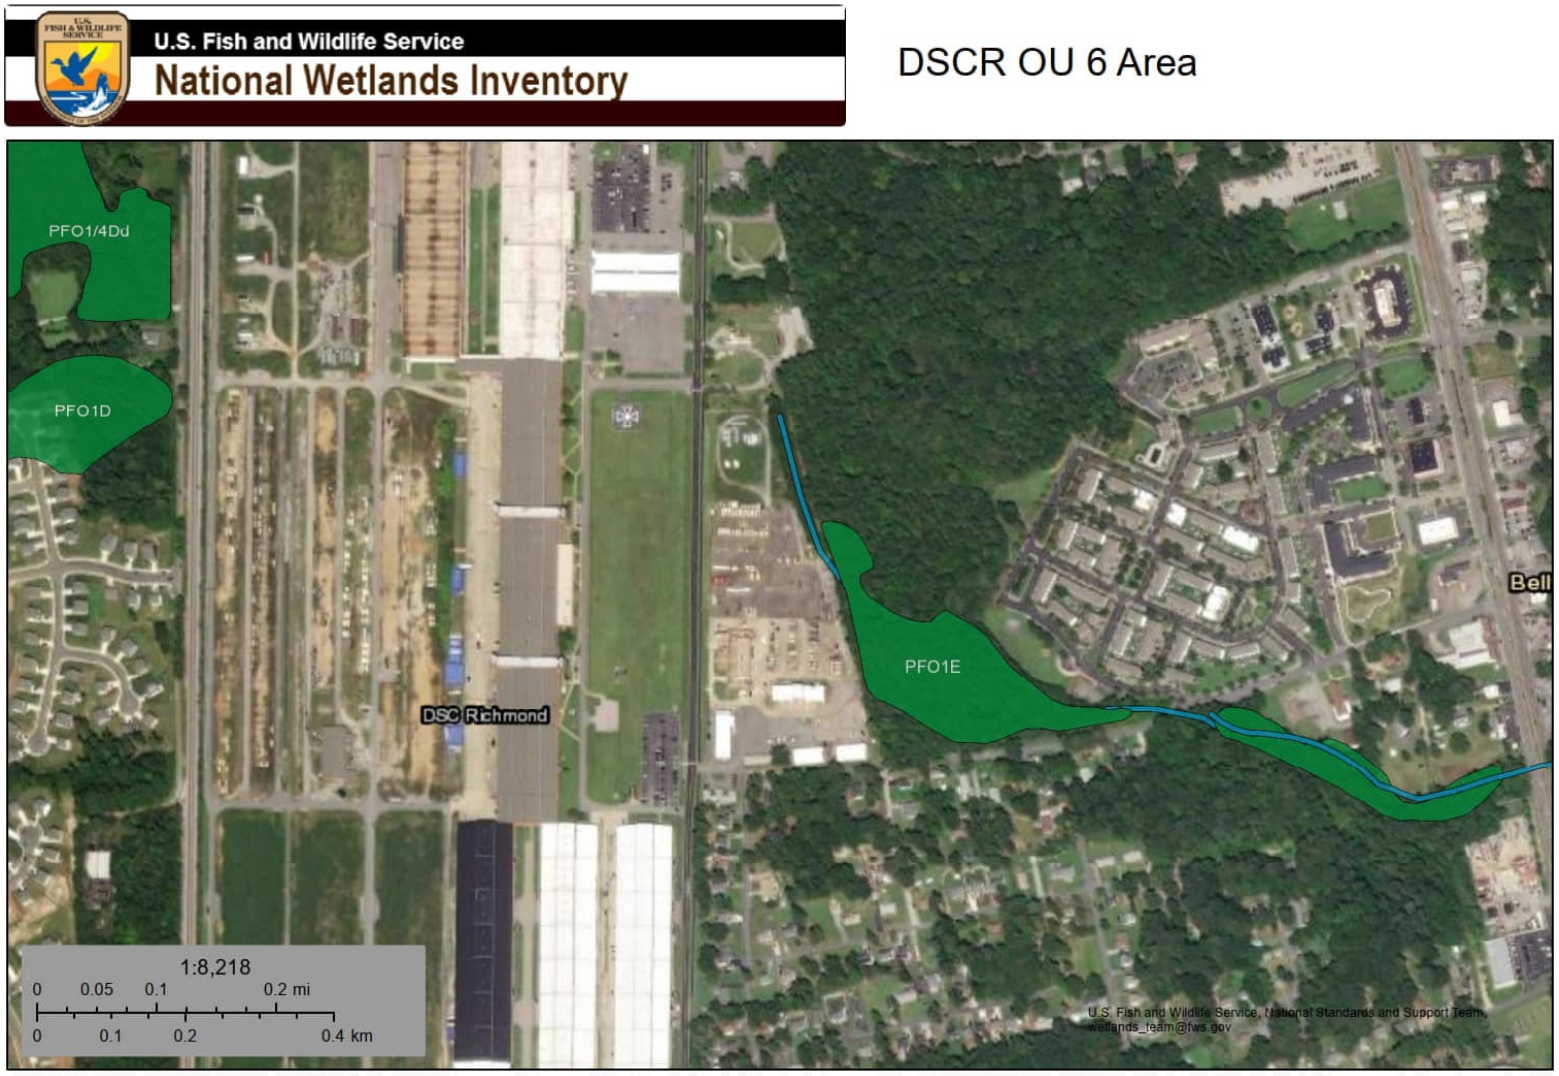
Surface water in the OU 6 area drains through a storm sewer drainage system with outfalls into No Name Creek. The southern portion of OU 3 including the areas of Buildings 150 and 151 drains through a storm sewer that extends to an undesignated outfall at a ditch that flows east to No Name Creek outside of the installation boundary.

There are no wetlands located within the installation area comprising OU 6. A freshwater forested/shrub wetland area (6.07 acre) is mapped in the undeveloped No Name Creek area located east of the installation according to the United States Fish and Wildlife Service's National Wetlands Inventory wetlands mapper included as Figure 2-3 (page 2-10).

2.3.3 Soils

The United States Department of Agriculture (USDA) web survey accessed at https://websoilsurvey.sc.egov.usda.gov/App/WebSoilSurvey.aspx identifies the soil mapping unit at OU 6 as made land reflecting disturbance and development of the area. USDA defines made land as areas where soil material has been removed or reworked by machinery, varies in consistency, and ranges from loamy sand to clay. East of the installation at OU 6 the USDA survey identifies sandy loam, loam, and loamy sands derived from marine terraces and flood plan soils in the No Name Creek area.

2.3.4 Site Geology



DSCR lies near the western edge of the Virginia Coastal Plain. General stratigraphy found beneath OU 6 includes four coastal plain formations present above bedrock from top down: the Eastover Formation, Calvert Formation, Aquia Formation, and Potomac Formation. A weathered saprolite zone is typically present above competent bedrock. Table 2-2 provides general stratigraphy information for the OU 6 area.

Table 2-2 OU 6 Stratigraphy

Geologic Formation	Age	Origin	Approx. THK (ft.)	Primary Lithology Types
Eastover	Pliocene	Alluvial	6-32	(a) Clay (CL), clayey sand, and silty sand (SM) (b) Poorly graded sand with gravel (SP) (c) Clay (CL)
Calvert	Miocene	Marine	6-10	Clay (CH) and organic sand silt (OL)
Aquia	Paleocene Early Eocene	Marine	6-12	Silty sand (SM)
Potomac	Cretaceous	Alluvial	20-30	(a) Clayey sand with gravel (SC) (b) Clayey sand with gravel, elastic silt with sand (MH), clayey sand with gravel (SC)
Petersburg Granite	Mississippian	Bedrock	--	(a) Saprolite (b) Granite to Granodiorite Bedrock

Notes: ft. = feet.

Figure 2-3 Wetlands Mapper in OU 6 Area

The digital 3D CSM developed for the OU 6 area has a geologic model developed using multiple lines of data and geostatistical methods (kriging) in Earth Volumetric Studio (EVS). This involved review of original data sources collected for the period 1982-2019 and selection of the highest resolution/data quality available for model development. Data types reviewed for model inputs included geological and hydrogeological publications, site boring data, lithologic logs, geophysical logs and surveys, physical test data from soil cores, CPT data, and HRSC hydraulic profile tool (HPT) and sonic coring data collected in 2019.

Figure 2-4 (page 2-12) has a site-wide geologic cross-section (A-A') from west to east across the OU 6 area extending east of the installation area at the NGA. Figure 2-5 (page 2-13) has a geologic cross-section (B-B') across the fence-line area at the NGA.

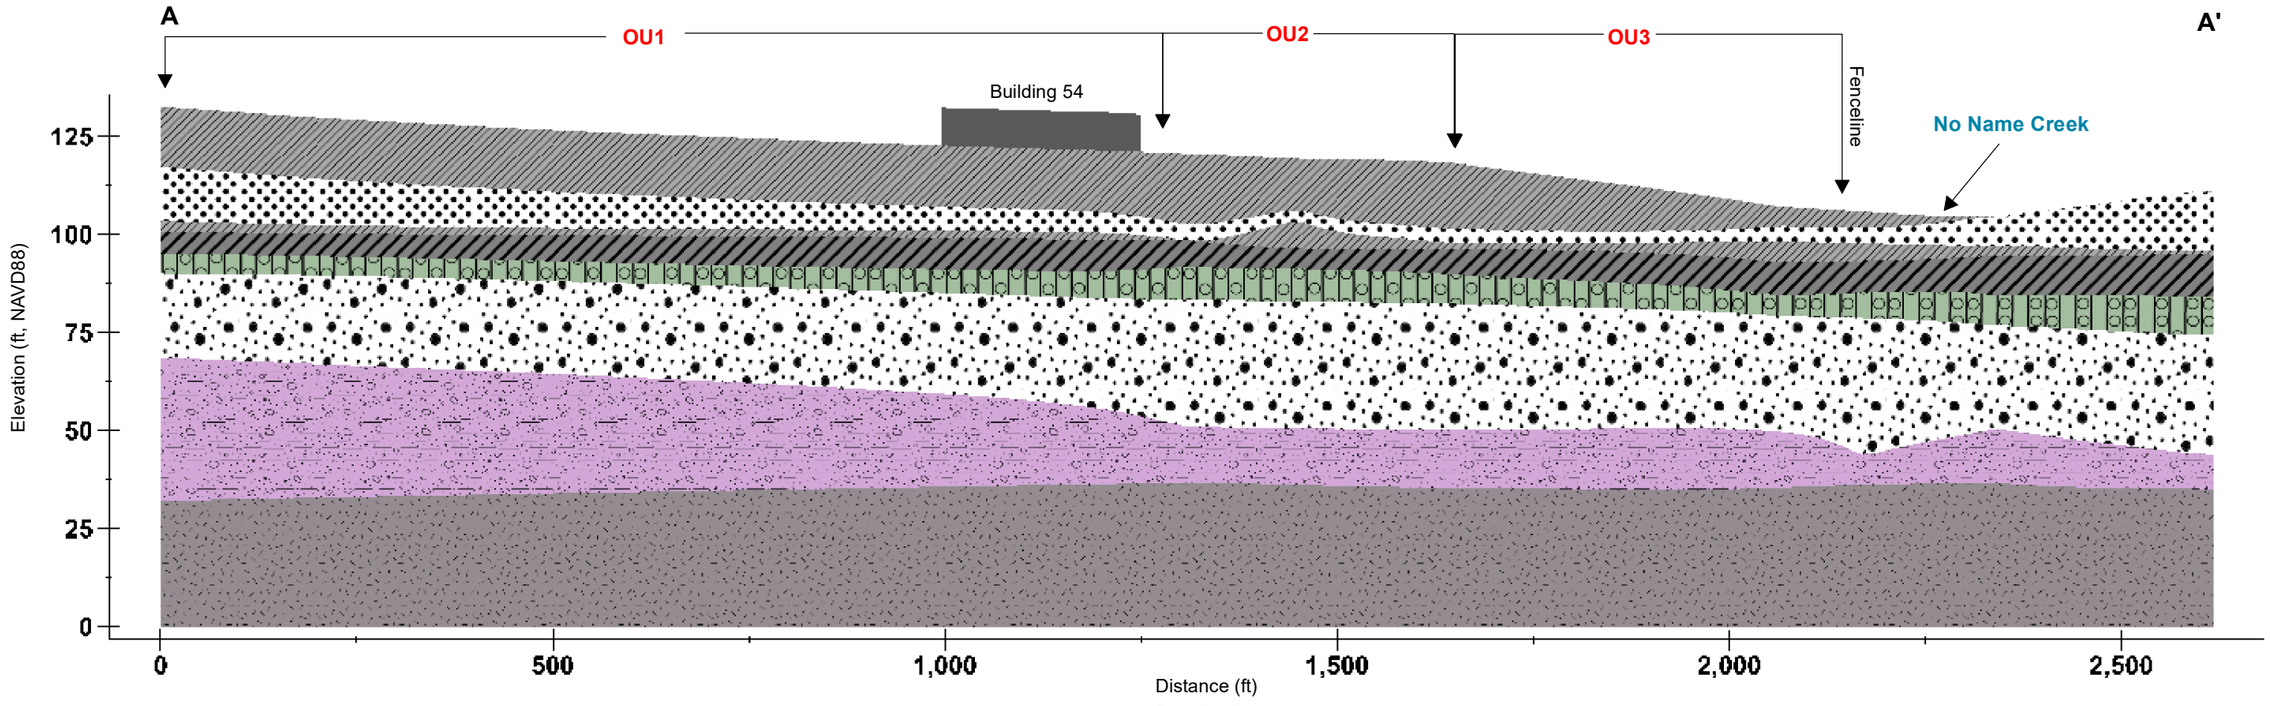
Eastover Formation

The lithology and thickness of the Eastover Formation varies across the OU 6 area (approximately 6 to 32 ft.) as illustrated in Figures 2-4 and 2-5. In general, the Eastover has three distinct lithologic zones from top down:

- Clay with variable mottling and interbeds, clayey sand, and silty sand
- Poorly graded sand with variable gravel
- Soft clay with laminations

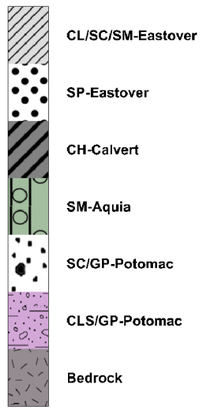
At OU 1, HRSC boring data indicate 3D variability in the thickness of the poorly graded sand with gravel zone (0 to 10 ft.) within the OU 1 groundwater source zone. Substantial fill overlies the Eastover in OU 2 in the former ravine area containing the Area 50 landfill. The clay zone beneath the fill material includes an organic rich clay layer and mottled clay and silt. The poorly graded sand with gravel zone is thinner and discontinuous across the OU 2 area where the lithologic zone consists of a variable clay and sand with some gravel. The thickness of the Eastover decreases toward the east and No Name Creek where elevations are lower than in the western portion of OU 6. A soft clay with laminations occurs at the base of the Eastover Formation and generally ranges from 1 to 4 ft. thick.

Calvert Formation

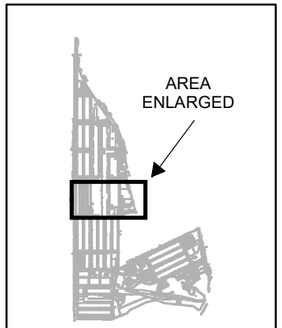


The Calvert Formation is a dark gray highly plastic clay and organic sandy silt with a dry consistency. The Calvert Formation generally ranges from 5 to 10 ft. thick with the top of the formation elevation generally sloping toward the northeast and east (Figures 2-4 and 2-5). A core sample tested by the USGS indicated a total organic carbon content of 32,700 milligrams per kilogram (mg/kg) with a sieve analysis indicating 57 percent finer by weight for the No. 200 sieve (USGS 1987). Physical testing analysis contained in the RI Report for two core samples of the Calvert Formation indicated a fat clay (CH) classification with No. 200 sieve analysis showing 69 and 86 percent finer by weight (Dames & Moore 1989).

Aquia Formation



The Aquia Formation is a fining-upward, well sorted, dark green, glauconitic silty sand with a basal gravel stratum. This formation thickness generally ranges from 6 to 12 ft. with an average thickness of 10 ft. in the study area. A core sample tested by the USGS indicated a classification of silty sand (SM) with sieve analysis results indicating 16.42 percent fines by weight for the No. 200 sieve (USGS 1987). Physical testing analysis contained in the RI Report for a core sample of the Aquia Formation indicated the same classification with No. 200 sieve analysis showing 19 percent fines by weight (Dames & Moore 1989).



Potomac Formation

Potomac Formation sediments generally consist of an upper lithologic zone of greyish-green clayey sand with gravel (SC) ranging in thickness from approximately 20 to 35 ft. and a lower lithologic zone of grayish-green, clayey sand with gravel (SC) with a texturally finer basal layer varying from elastic silt with sand (MH) to clayey sand (SC). The thickness of the lower lithologic zone ranges from approximately 25 ft. in the western portion of OU 6 to 12 ft. or less at the installation fence line at OU 3. The top of the Potomac Formation elevation generally slopes toward the east (Figure 2-4).

The above lithologic descriptions and associated Unified Soil Classification System classifications are based on physical testing of core samples collected from discrete intervals of the Potomac Formation at PDI-14 and PDI-18 boring locations at the OU 3 fence line.

Petersburg Granite

Bedrock in the study area is the Petersburg Granite described by the USGS as chlorite rich granodiorite that has a weathered saprolite of variable thickness that grades into unweathered rock (USGS 1987). A boring BR-1 completed by the USGS near No Name Creek encountered saprolite, decomposed rock at a depth of 67 to 71 ft. and penetrated hard bedrock from 71 to 96 ft. below ground surface (BGS).

2.3.5 Hydrostratigraphy

The digital 3D CSM developed for the OU 6 area includes a refined hydrostratigraphy model developed by integrating the geologic model with existing hydrogeologic data and HRSC data obtained in 2019. A key aspect of the refined hydrostratigraphy is the semi-continuous measurement of hydraulic properties of the four unconsolidated geologic formations and integrated this data with other lines of data such as laboratory testing for physical properties. Table 2-3 summaries the refined hydrostratigraphy for OU 6 and associated hydraulic properties defined in the 3D model.

The HRSC HPT used to characterize hydrostratigraphy at OU 6 is a logging tool that measures the pressure required to inject a flow of water into the soil as the probe is advanced into the subsurface. This injection pressure log is an indicator of formation permeability. HPT generally has an inverse relationship to permeability with HPT maximum pressure data that scales up to 110 pounds per square inch (PSI). The HPT can measure hydrostatic pressure under the zero flow condition, which allows for the development of an absolute piezometric pressure profile for the log and prediction of the position of the water table. The piezometric profile can be used to calculate the corrected HPT pressure. This data along with the flow rate can then be used to calculate an estimate of the horizontal hydraulic conductivity (K_h) in the saturated formation. Estimates can be provided in the 1 to 100 feet per day (ft./day) range.

Table 2-3 OU 6 Hydrostratigraphy

Hydrostratigraphic Unit	Type	Description	Relative Permeability	Estimated K (cm/sec)
Eastover	Aquifer	Unconfined, discrete zones, highly variable, perched water	Low-High	<1.0E-04 to 3.5E-02[2] 1.52E03 to 9.12E-03[4]
Calvert	Confining Zone	Leaky unit	Very Low	4.8E-08 to 1.8E-06[1]
Aquia	Aquifer	Semi-confined, bulk matrix of formation	Low-High	<1.0E-04 to 3.5E-02[2] 1.76E-06 to 1.55E-05[1]
Potomac	Aquifer	Semi-confined, bulk matrix of formation	Very Low-Moderate	4.9E-03[5] 2.3E-07 to 3.5E-05[3]
Bedrock	Aquifer	Confined in fractures	Not determined	

Notes [1] Laboratory core testing (vertical), [2] Field testing with HPT, [3] Laboratory core testing (horizontal), K= hydraulic conductivity, cm/sec = centimeters per second, [4] Field slug tests at wells at OU 6.,[5] USGS pumping test at OU 8 (USGS 1987)

Eastover

This hydrostratigraphic unit corresponds to the Eastover Formation and groundwater within this unit is an unconfined water table. Some localized discontinuous perched water zones exist within the Eastover including the OU 2 area. Depth to groundwater is greater than (>) 10 ft. in the western portion of OU 6 and < 5 ft. at the OU 3 fence line. The thickness of the Eastover saturated zone decreases toward the east corresponding to the lower surface elevations and reduced thickness of the Eastover Formation. Because of the textural variation of the Eastover saturated zone, the hydraulic conductivity can vary by more than two orders of magnitude as illustrated in Table 2-3 and is highest in the poorly graded sand containing variable gravel. HPT data within this lithologic zone at OUs 1 and 2 indicated estimated K_h values in the 1.0E-02 to 3.5E-02 cm/sec range.

Calvert

This hydrostratigraphic unit corresponds to the Calvert Formation and is a leaky confining zone that ranges from approximately 5 to 10 ft. thick. It has a low vertical hydraulic conductivity (K_v) based on

laboratory testing (Table 2-3) and high HPT pressures (100-110 PSI). The Calvert separates the overlying Eastover hydrostratigraphic unit from the underlying Aquia and Potomac hydrostratigraphic units. Some vertical groundwater flow through the Calvert is implied by the apparent vertical migration of site COCs from source zones present in the Eastover to the underlying Aquia and Potomac hydrostratigraphic units that exist under semi-confining conditions.

Aquia

This hydrostratigraphic unit corresponds to the Aquia Formation and is a semi-confined zone of groundwater that averages 10 ft. thick. HPT profiling indicates that the K_h of the Aquia varies by more than two magnitudes (Table 2-3) with discrete zones having K_h values > 1.0E-02 cm/sec. K_v determined for the USGS and RI are 3 to 4 orders of magnitude lower. Horizontal groundwater flow patterns and hydraulic gradient within the Aquia are likely similar to the underlying Potomac. Some vertical groundwater flow from the Aquia into the Potomac is implied by the apparent vertical migration of site COCs from the source zones in the Eastover to the Potomac.

Potomac

This hydrostratigraphic unit corresponds to the Potomac Formation and is a semi-confined zone of groundwater with moderate to very low permeability and high density. The thickness of this unit varies as described in Section 2.3.4. HPT profiling and testing indicates consistent maximum pressure responses of 110 PSI. Clean water injection testing in the northern and southern areas of the OU 3 fence line confirmed these pressure profiles and indicated zero flow into the bulk matrix. Table 2-3 shows the range of laboratory tested K_h results for a series of vertical profile cores completed at two locations along the OU 3 fence line that provides an additional confirming line of evidence on bulk matrix characteristics.

USGS in their 1986 study investigated temporal changes in water levels in the USGS B well cluster (Eastover and Potomac wells) in response to precipitation (USGS 1987). The data collected demonstrated response of each hydrostratigraphic unit to recharge by precipitation and provided evidence of hydraulic interconnection of these units. Responses of water levels to precipitation differed between the Eastover (immediate) and Potomac (more subdued).

Bedrock

This hydrostratigraphic unit corresponds to the Petersburg Granite with an expected confined or semi-confined condition based on the overlying stratigraphy. Groundwater within unweathered bedrock will occur primarily in fractures.

3. Field Activities

Section 3 describes the scope of field activities performed at OU 6 in FY 2024.

3.1 Annual Monitoring

A component of remedy implementation at OU 6 is site-wide monitoring of groundwater to evaluate the effectiveness of active remedies and to monitor the progress of MNA. The RD/RAWP finalized in May 2013 specified annual groundwater monitoring at OU 6 for the near term (5 years) with potential adjustments made to the monitoring frequency based on the COC concentration reductions observed (AECOM 2015).

The scope of FY 2024 annual monitoring completed at OU 6 includes 69 monitoring wells screened in the surficial aquifer, 46 monitoring wells screened in the confined aquifer, and 3 surface water stations at No Name Creek (Table 3-1).

Table 3-1 OU 6 FY 2024 Annual Groundwater and Surface Water Monitoring Program

Schedule	Surficial Aquifer[5]	Confined Aquifer[6]	No Name Creek SW	VOCs[1]	Field WQP[2]	Geochemical[3]	Microbial qPCR[7]	Leachability[4]
May 2024	69	46	3	118	118	85	8	10

Notes: SW = surface water, [1]VOCs = Target analyte list volatile organic compounds, [2]field WQP = field water quality parameters pH, temperature, specific conductance, dissolved oxygen, oxidation-reduction potential, and turbidity, [3]Geochemical parameters, include total organic carbon, chloride, sulfate, nitrite, nitrate, total alkalinity, ferrous iron, manganese, sulfide, dissolved gases ethane, ethene, methane, and carbon dioxide, [4]leachability parameters include target analyte list semi-volatile organic compounds, target analyte list metals, polycyclic aromatic hydrocarbons, target analyte list polychlorinated biphenyls, and target analyte list pesticides,. [5]Surficial aquifer = Eastover, [6]Confined aquifer = Aquia-Potomac Formation.[7]qPCR = quantitative polymerase chain reaction Dehalococcoides (DHC), Trichloroethene Reductase (tceA), Vinyl Chloride Reductase (BVC), Vinyl Chloride Reductase (VCR), Quantities listed under VOCs, field WQP, geochemical, leachability are number of normal samples collected per sampling event.

Figure 3-1 (page 3-2) shows the monitored locations at OU 6 for FY 2024. Table 3-2 (page 3-3) has a detailed summary of the groundwater and surface monitoring program implemented in FY 2024. The scope of sampling and analysis of site monitoring included VOCs by SW-846 Method 8260D and field water quality parameters at each monitored location and MNA geochemical parameters at monitoring well locations where constituent concentrations exceed MCLs. MNA parameters monitored at OU 6 included:

- Total organic carbon (TOC) by SW-846 Method 8260D.
- Inorganic anions by SW-846 Method 9056A - chloride, sulfate, nitrate, and nitrite.
- Dissolved gases by RSK Method 175 – ethene, ethane, and methane.
- Carbon dioxide by Standard Method SM4500-CO2 D.
- Sulfide by Standard Method SM4500-S2 F-2011.
- Sulfide as Hydrogen Sulfide (H2S) by Standard Method SM4500-S2 F-2011.
- Alkalinity by Standard Method SM2320B-2011 – alkalinity as calcium carbonate (CaCO3), bicarbonate alkalinity as CaCO3, carbonate alkalinity as CaCO3.
- Manganese by SW-846 Method 6020A.
- Ferrous Iron by Method 8146 (field).

Field water parameters measured for each sample included pH, temperature, dissolved oxygen (DO), oxidation reduction potential (ORP), specific conductance (SC), and turbidity.

The monitoring network has 10 monitoring well locations to evaluate potential leaching of non-VOC constituents from OU 1, OU 2, and OU 3 soils to the surficial aquifer including:

- Target analyte list SVOCs by SW-846 8270D.
- PAHs by SW-846 Method 8270ESIM.

Notes: NNC = No Name Creek, MNA = monitored natural attenuation, OU 1 = Open Storage Area, OU 2 = Area 50 Source Area, OU 3 = National Guard Source Area, A = Annual Monitoring, LTM = long-term monitoring, VOCs = volatile organic compounds, Anions = chloride, sulfate, nitrate, and nitrate, DG = dissolved gases including ethene, ethane, and methane, CO_2 = carbon dioxide, Mn = manganese, $Fe+^2$ = ferrous iron (field), WQP = water quality parameters: temperature, pH, dissolved oxygen, oxidation reduction potential, specific conductance, and turbidity, qPCR = quantitative polymerase chain reaction Dehalococcoides (DHc), Trichloroethene Reductase (tceA), Vinyl Chloride Reductase (BVC), Vinyl Chloride Reductase (VCR), PAHs = polycyclic aromatic hydrocarbons, PCBs = polychlorinated biphenyls

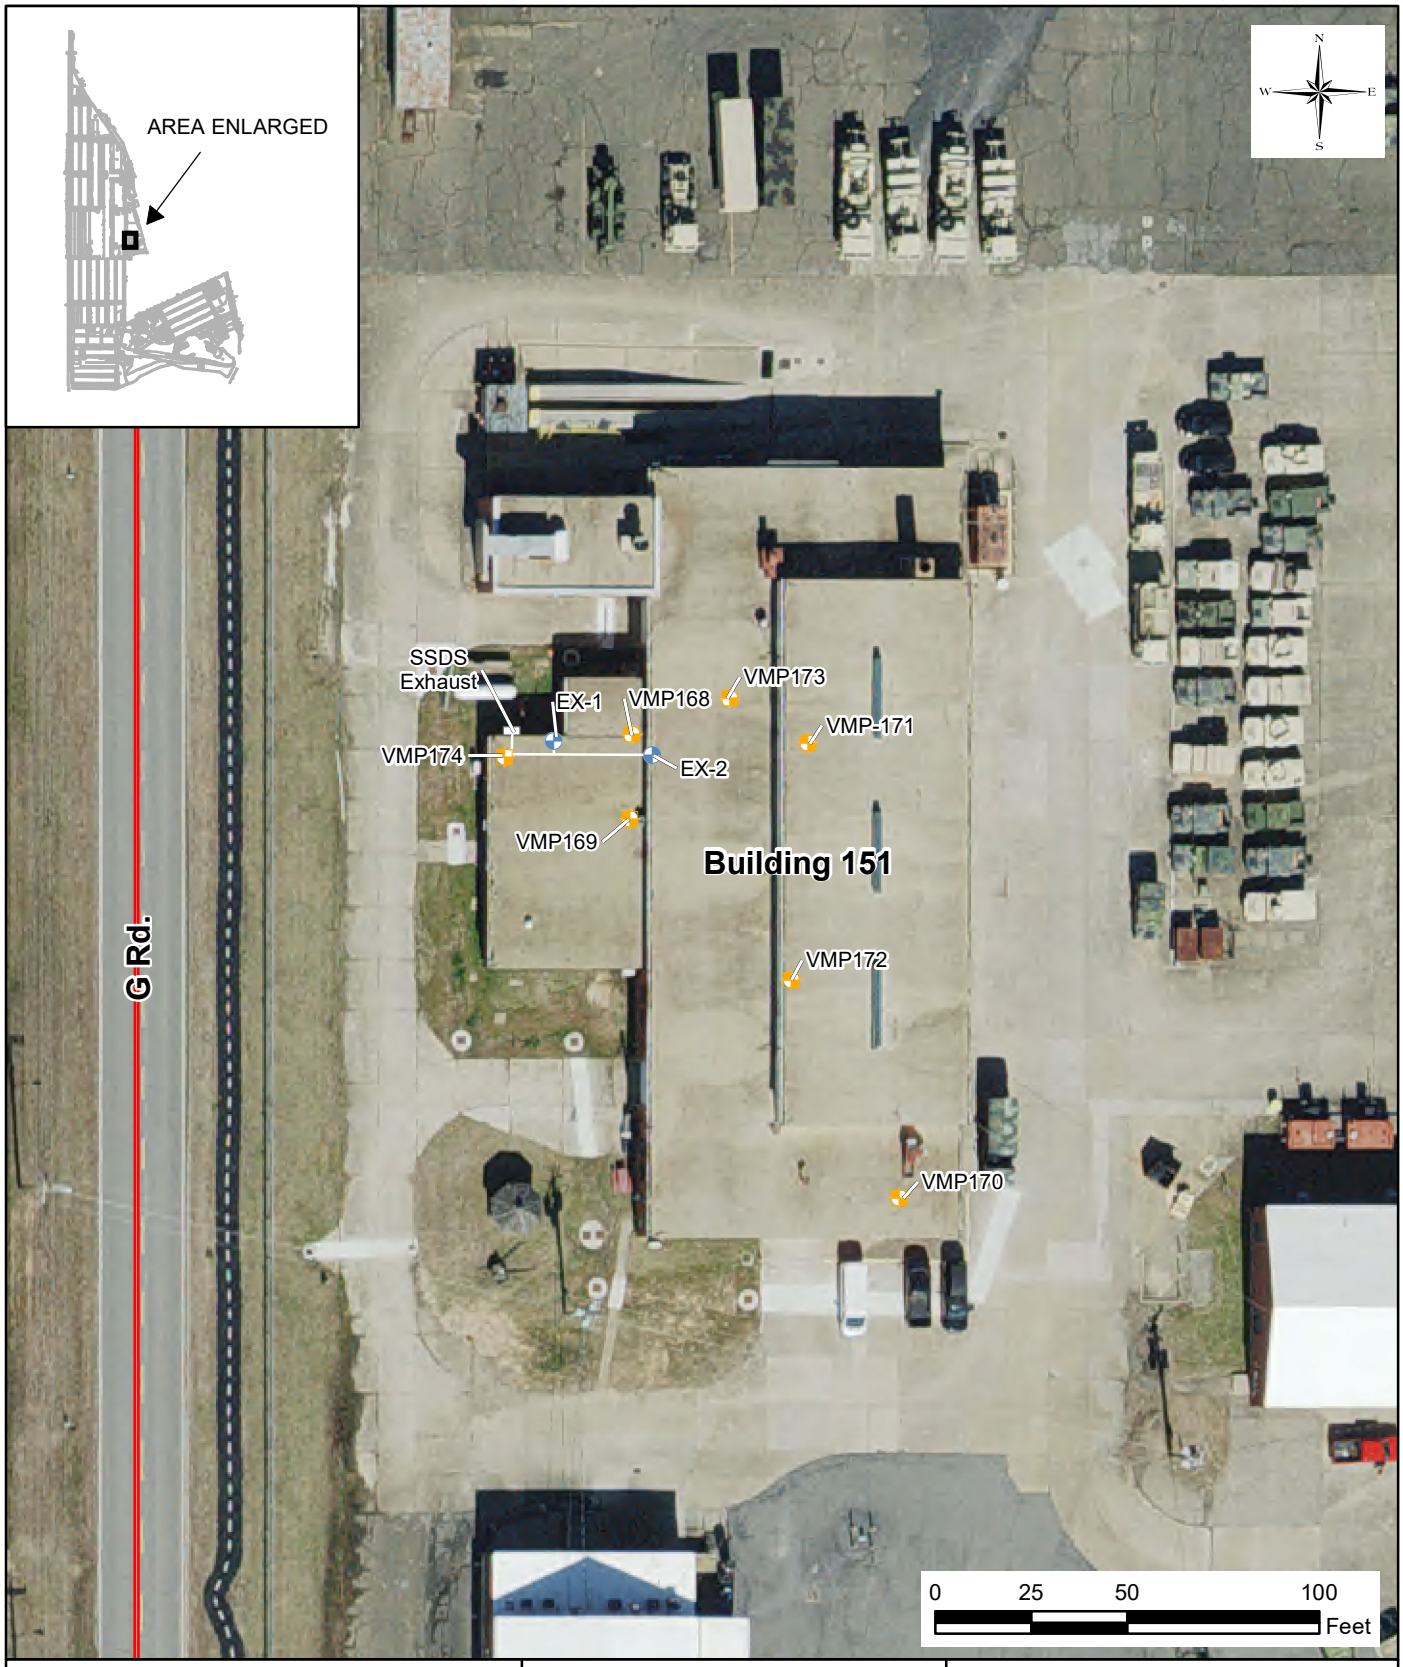
- Pesticides by SW-846 Method 8181B.
- PCBs by SW-846 Method 8280A.
- Target analyte list metals by SW-846 Methods 6020A and 7470A.

Meadows performed the annual monitoring event from May 13 to 29, 2024 with resampling of wells MW-168, MW-287, and MW-291 on June 12, 2024 for field water quality measurements. Resampling occurred because of an electronic record keeping error that resulted in loss of field water quality measurement data. Appendix A.2 has field forms and documentation from the May 2024 annual monitoring event and June resampling event. Eurofins Savannah Laboratory (Savannah Georgia) provided analytical services following the Department of Defense (DoD) Quality Systems Manual 5.4. The laboratory maintains the following certifications: DoD Environmental Laboratory Accreditation Program (ELAP) in accordance with the requirements of QSM 5.4, National Environmental Laboratory Accreditation Program (NELAP), and Virginia Environmental Laboratory Accreditation Program (VELAP).

3.2 ISB Performance Monitoring

ISB injections completed in the northern area of OU 6 surficial aquifer in October-November 2021 targeted a residual chlorinated VOC source zone in the surficial aquifer beneath OU 1. ISB performance monitoring occurred in FY 2024 at 15 monitoring locations in and around the injection areas. Table 3-3 identifies the 15 performance monitoring locations and analytical parameters. Table 3-3 has an overall summary of the ISB performance monitoring performed on November 20 and 21, 2023. Figure 3-1 has a location map of monitoring wells sampled for FY 2024 including performance monitoring locations. Microbial analysis completed by Microbial Insights, Inc. (Knoxville, Tennessee) for four monitoring locations included quantitative polymerase chain reaction (qPCR) for dechlorinating bacteria: *Dehalococcoides* (DHC) and functional genes tceA Reductase, BAV1 Vinyl Chloride (BVC), and Vinyl Chloride Reductase (VCR).

Table 3-3 OU 6 ISB Performance Monitoring Program (November 2023)



Schedule	Surficial Aquifer[4]	VOCs[1]	Field WQP[2]	Geochemical[3]	Microbial qPCR[5]
November 2023	15	15	15	15	4

Notes: [1]VOCs = Target analyte list volatile organic compounds, [2]field WQP = field water quality parameters pH, temperature, specific conductance, dissolved oxygen, oxidation-reduction potential, and turbidity, [3]Geochemical parameters, include total organic carbon, chloride, sulfate, nitrite, nitrate, total alkalinity, ferrous iron, manganese, sulfide, dissolved gases ethane, ethene, methane, and carbon dioxide, [4]Surficial aquifer = Eastover, [5]qPCR = quantitative polymerase chain reaction Dehalococcoides (DHC), Trichloroethene Reductase (tceA), Vinyl Chloride Reductase (BVC), Vinyl Chloride Reductase (VCR), Quantities listed under VOCs, field WQP, geochemical, are number of normal samples collected per sampling event.

Meadows performed ISB performance groundwater monitoring at 15 monitoring wells on November 20 and 21, 2023. Appendix A.1 has the field forms and documentation.

3.3 Building 151 SSDS OM&M

Installation and startup of an SSDS occurred at Building 151 in 2018 with the objective of reducing vapor beneath the building slab and reducing the potential for VI into the building (Arcadis 2018b). The SSDS has two vapor extraction points including one in the tool room and the other in the break room. Seven VMPs in Building 151 allow for monitoring of the SSDS depressurization field and sub-slab vapor conditions. Figure 3-2 (page 3-6) has the SSDS layout and monitoring locations. For FY 2024, Meadows performed operations, maintenance, and monitoring events on October 10, 2023, January 16, 2024, April 16, 2024, July 1, 2024, August 19, 2024, and August 28, 2024. Appendix A.3 has field forms and documentation for the OM&M performed in FY 2024. Table 3-7 (page 3-7) has the scope of OM&M activities performed in FY 2024 including field inspections, measurement, and maintenance.

Type	Sample Type	Sample ID	Reading Type
System Differential Pressure	Field	[Loc ID]-[yyyy-mm-dd]	Gauge Pressure
VMP Differential Pressure	Field	[Loc ID]-[yyyy-mm-dd]	Manometer Pressure
VMP Sub-Slab Vapor	Field	[Loc ID]-[yyyy-mm-dd]	Direct reading instrument

Field Inspection, Tests, and Measurements

Task	Frequency/Schedule	Locations
Differential Pressure Gauge Measurements (inches of water column)	Quarterly Oct, Jan, Apr, Jul	Exhaust Fan (OU6-BLDG-151-Exhaust), Extraction Point 1 (OU6-BLDG-151-EX1), Extraction Point 2 (OU6-BLDG-151-EX2)
Sub-Slab Differential Pressure Micromanometer (in w.c.)	Quarterly Oct, Jan, Apr, Jul	OU6-VMP-168, OU6-VMP-169, OU6-VMP-170, OU6-VMP-171, OU6-VMP-172, OU6-VMP-173, OU6-VMP-174
Field Parameter Measurements PID 10.6 eV; VOCs (ppmV) Gas analyzer: Carbon dioxide (%), Methane (%), Oxygen (%)	Quarterly Oct, Jan, Apr, Jul	OU6-VMP-168, OU6-VMP-169, OU6-VMP-170, OU6-VMP-171, OU6-VMP-172, OU6-VMP-173, OU6-VMP-174
System Components Inspection	Quarterly Oct, Jan, Apr, Jul	Exhaust fan operation, operating lights for extraction points 1 and 2, exterior piping, extraction point risers, interior piping, fan conditions (unusual noises, vibrations, or odors), condition of fittings, piping, and sample ports (damage check)
Low Vacuum Alarm Test	Annually Apr.	Turn off exhaust fan and verify function of alarms at Extraction Point 1 and Extraction Point 2

Notes: PID = photoionization detector, ppmV = parts per million by volume, % percent by volume, in w.c. = inches water column

3.4 Variances and Non-Conformances

The discrepancies for the FY 2024 OU6 sampling events are detailed below.

2023 ISB Performance Monitoring

The following variances occurred for sampling of 15 ISB performance groundwater monitoring in November 2023:

- Insufficient well recharge and water volume at monitoring well OU6-MW-126 to collect and analyze for microbial and geochemical parameters. The project team collected a microbial sample from nearby location OU6-MW-245 for microbial analysis as a substitute location and used geochemical data from surrounding wells in the ISB treatment zone to evaluate geochemical conditions for this performance monitoring event.
- The project team used microbial data from the May 2023 sampling event to evaluate microbial and bioremediation conditions at location OU6-MW-126.

2024 Annual Monitoring

The following variances occurred for annual monitoring performed in May 2024:

- An electronic record keeping error resulted in the loss of field water quality measurement data for wells MW-168, MW-287, and MW-291. Resampling of these wells occurred on June 12, 2024 to obtain field water quality measurements for these locations.
- The samples collected from DMW-9A, OU6-MW-126, OU6-MW-239, OU6-MW-244, OU6-MW-286, OU6-MW-259 did not have a ferrous iron measurement in the field because of a field sampling error. The assessments performed at OU 6 used group and area distribution data for geochemical and biodegradation assessments thereby attaining assessment objectives.
- At OU6-MW-272, field sampling error resulted in the duplicate sample analysis omitting non-VOC parameters for leachability assessment.
- Sample measurements for the following locations had a negative turbidity reading after initial positive readings: CSMPZ-3, DMW-8A, DMW-9A, OU6-MW-169, OU6-MW-223, OU6-MW-242, OU6-MW-243, OU6-MW-244, OU6-MW-245, OU6-MW-247, OU6-MW-251, OU6-MW-266, and OU6-MW-276. These samples had a clear appearance with no sediment indicating attainment of sample quality objectives.

4. Monitoring Results

Section 4 presents and summarizes monitoring results for FY 2024. Data groupings for the results are by monitoring area and by monitoring zones of groundwater. The northern monitoring area includes the OU 1 area and the north portions of OU 2 and OU 3. Monitored groundwater zones at OU 6 include the surficial aquifer corresponding to the Eastover Formation and the confined aquifer corresponding to the Aquia and Potomac Formations. Section 5 has a detailed assessment of the results and remedy performance.

4.1 Potentiometric Surface Evaluation and Groundwater Flow

Appendix A.2 has a table summarizing depth to groundwater measurements and calculated groundwater elevations for site-wide measurements obtained on May 13, 2024, before annual groundwater sampling.

4.1.1 Surficial Aquifer

Figure 4-1 (page 4-2) has a potentiometric surface elevation contour map (May 13, 2024) for the surficial aquifer developed by geostatistical analysis (kriging) in Earth Volumetric Studio (EVS) using site-wide groundwater elevation data for wells screened in the surficial aquifer (Eastover). Groundwater flow direction is generally toward the east-northeast and No Name Creek. This creek represents a flow boundary for the surficial aquifer in the off-installation area. Equation 1 calculates the approximate horizontal velocity range of groundwater flow within the surficial aquifer using a form of Darcy's velocity equation:

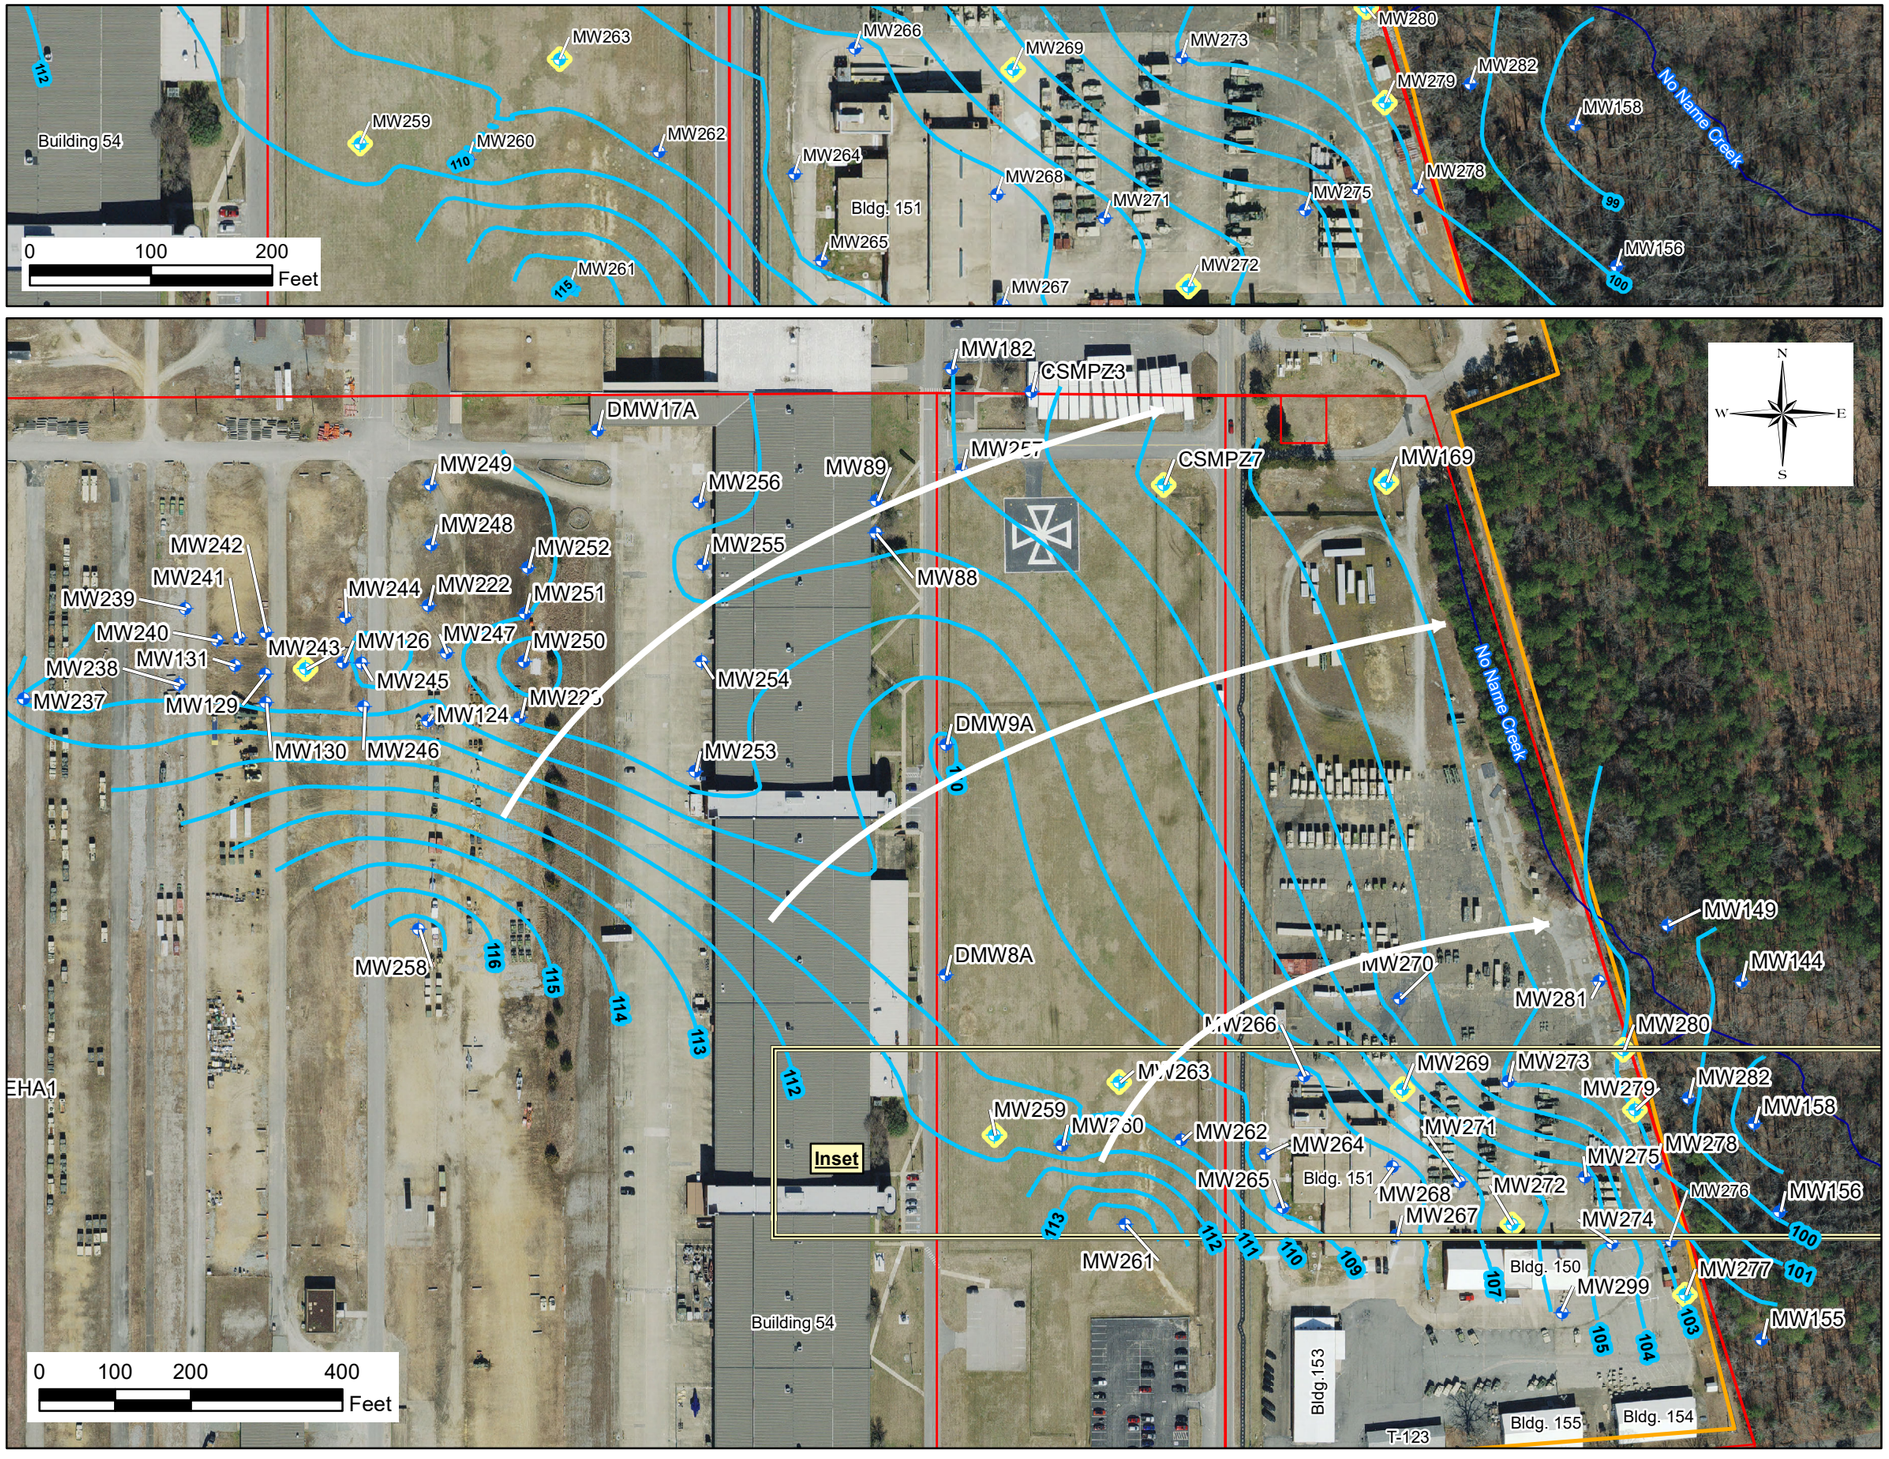
(1) $$V = Ki / n_e$$

Where:

V = groundwater flow velocity (ft./yr)
K = hydraulic conductivity (feet per day [ft/day])
i = hydraulic gradient (ft/ft)
n_e = effective porosity (unitless)

Input values for Equation 1 for the surficial aquifer include:

- K of 15.56 ft/day (average for RI slug tests from Dames & Moore 1989)
- Assumed effective porosity of 0.30 for wells screened interval in the poorly graded sand
- Average hydraulic gradient of 0.0056 for the May 2024 sampling event across OU 1/OU 2 (Figure 4-1).
- Average hydraulic gradient of 0.010 for the May 2024 sampling event across OU 2/OU 3 (Figure 4-1).



The estimated horizontal groundwater flow velocity calculated for the surficial aquifer using the above input values is 2.9E-01 ft./day (106 ft./yr.) for OU 1/2 flow path and 5.2E-01 ft./day (189 ft./yr.) for OU 2/OU3 flow path.

4.1.2 Confined Aquifer

Figure 4-2 (page 4-3) has a potentiometric surface contour map (May 15, 2023) for the Potomac that occurs under confined conditions. Groundwater flow direction is generally toward the east-southeast.

Input values for the confined aquifer include:

- K of 14.0 ft./day (average for pumping test from USGS 1987).
- Estimated effective porosity of 0.22 (estimated from OU 6 physical data from the Potomac).
- Average hydraulic gradient of 0.01 for the May 2024 sampling event across OU 1 (Figure 4-2).
- Average hydraulic gradient of 0.0079 for the May 2024 sampling event across OU 2/OU 3 (Figure 4-2).

The estimated horizontal groundwater flow velocity calculated for the confined aquifer using the above input values is 6.4E-01 ft./day (232 ft./yr.) for OU 1 flow path and 5.0E-01 ft./day (184 ft./yr.) for OU 2/OU3 flow path.

4.2 Geochemical Environment

This report uses a combination of VOC, water quality, and MNA parameter data to characterize general geochemical environments of plume areas and monitored zones as summarized in Table 4-1.

Table 4-1 Plume Area Geochemical Environments

Geochemical Environment	Parameter Criteria in Plume Area
Anaerobic	Average DO concentration < ~ 1 mg/L + Sulfate concentration < ~ 50 mg/L (general for most sites) + Nitrate < ~ 1 mg/L + Methane or ferrous iron or sulfide detected in most wells + Dechlorination products present
Partially oxidizing or reducing	Average DO concentration <2 mg/L + Plume area does not meet all anaerobic criteria
Aerobic	Average DO concentration >2 mg/L + Plume area does not meet any anaerobic criteria

Source: Modified from Washington Savannah River Company Savannah River National Laboratory, 2007. Scenarios Evaluation Tool for Chlorinated Solvent MNA, WSRC-STI-2006-00096, Rev. 2, Prepared for the Department of Energy, February 7, mg/L – milligrams per liter, [1] the upper range value used is 1.1 mg/L (+10 percent of 1 mg/L), [2] the upper range used is 55 mg/L (+10 percent of 50 mg/L),

4.3 Overview for Groundwater Monitoring

OU 6 has dissolved phase VOC plume areas in groundwater in the surficial and confined aquifers. Primary constituents of concern (COCs) that spatially occur and exceed EPA MCLs for monitored plume areas include chlorinated VOCs, PCE, TCE, cis-1,2-dichloroethene (cDCE), and vinyl chloride, 1,1-dichloroethene (1,1-DCE), 1,2-dichloroethane (1,2-DCA), 1,4-dichlorobenzene (1,4-DCB), and chlorobenzene (CB). Appendix B has complete analytical results summarized in tables for groundwater monitoring including:

- Appendix B.1 –November 2023 ISB performance monitoring
- Appendix B.2 – May 2024 annual groundwater monitoring event for VOCs and WQP
- Appendix B.3 – May 2024 annual groundwater monitoring event for geochemical parameters and microbial analysis
- Appendix B.4 – May 2023 annual groundwater monitoring event for leachability analysis
- Appendix B.5 – May 2024 annual surface water monitoring event at No Name Creek

Appendix C has laboratory reports and data validation reports for November 2023 ISB performance monitoring (C.1) and May 2024 annual monitoring (C.2).

4.4 ISB Performance Monitoring Results (November 2023)

Section 4.4 has a summary of performance monitoring results for the sampling event completed in November 2023. Appendix B.1 has complete result tables for this monitoring event including VOCs, water quality parameters, geochemical parameters, and microbial parameters. The VOC table has comparisons of the data to OU 6 cleanup levels (MCLs), EPA regional screening levels (RSLs) with a target risk (TR) of 1E-06 and target hazard quotient (THQ) of 0.1, and EPA Region 3 Biological Technical Assistance Group

(BTAG) screening benchmarks for surface water (freshwater). Appendix E.1 has data distribution analysis presented in Section 4.4 for ISB performance monitoring completed in November 2023.

4.4.1 Water Quality Parameters

Exhibit 4-1 (page 4-6) has box plots and tabular information displaying data distributions for pH, DO, ORP, and SC for the November 2023 monitoring event for ISB performance monitoring in the OU 1 subarea of OU 6.

4.4.1.1 pH

For November 2023, the distribution range for pH is 1.99 with a mean of 6.37 and median of 6.07. The distribution 25th and 75th percentiles are 5.27 and 6.35, respectively. Three of 14 data observations have a pH < 5 with no data outliers.

4.4.1.2 Dissolved Oxygen

For November 2023, the distribution range for DO is 4.89 mg/L with a mean of 1.49 mg/L and median of 1.21 mg/L. The distribution 25th and 75th percentiles are 0.64 mg/L and 1.51 mg/L, respectively. Five of 14 data observations have a DO ≤ 1 mg/L with one distribution outlier.

4.4.1.3 Oxidation-Reduction Potential

For November 2023, the distribution range for ORP is 534.2 mV with a mean of -83.2 mV and median of -94.7 mV. The distribution 25th and 75th percentiles are -243 mV and -33.1 mV, respectively. Nine of 14 data observations have an ORP < 50 mV with no data outliers.

4.4.1.4 Specific Conductivity

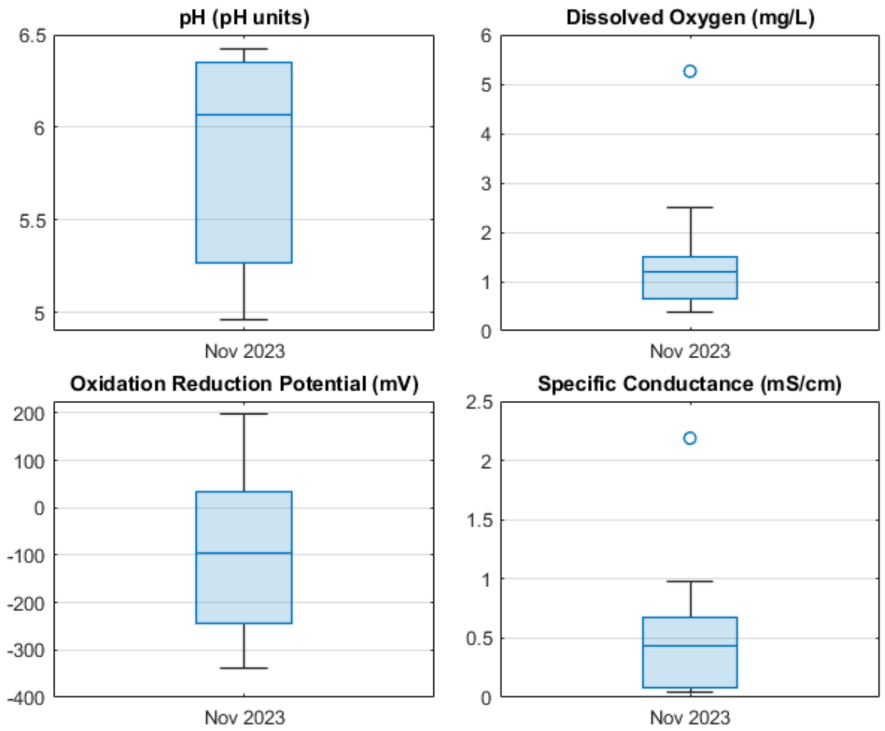
For November 2023, the distribution range for SC is 2.14 mS with a mean of 0.536 mS and median of 0.434 mS. The distribution 25th and 75th percentiles are 0.192 mS and 1.00 mS, respectively. For July 2024, the distribution range for SC is 1.295 mS with a mean of 0.536 mS and median of 0.407 mS with one data outlier.

4.4.2 VOC Results

Table 4-2 (page 4-7) has a statistical summary of VOC constituents detected in one or more samples collected for the November 2023 ISB performance monitoring. This table has descriptive statistics, identifies the location of the maximum detected concentrations, and presents screening comparisons to remedy cleanup levels (MCLs), EPA RSLs, and ecological screening benchmarks. Exhibit 4-2 (page 4-8) has box plots and tabular information displaying data distributions for primary VOC constituents detected for the November ISB sampling event in the OU 1 area.

4.4.2.1 COCs

VOCs detected in groundwater for the performance monitoring events at levels > MCLs include: PCE, TCE, cDCE, VC, and 1,1-DCE. For constituents without MCLs, VOCs detected at concentrations > RSLs include: 1,1-dichloroethane, 2-hexanone, and naphthalene. Ketone constituents such as 2-hexanone typically form as a temporary by-product of engineered bioremediation actions.



4.4.2.2 PCE

For November 2023, 12 of 15 samples had detections of PCE and detected concentrations ranging from 2.5 µg/L to 6,900 µg/L. Mean and median concentrations for PCE are 1,070 µg/L and 65 µg/L, respectively, with 10 samples having concentrations greater than the MCL of 5 µg/L. Distribution 25th and 75th percentiles for PCE are 37 µg/L and 150 µg/L, respectively. The distribution has two data outliers.

4.4.2.3 TCE

For November 2023, 15 of 15 samples had detections of TCE and detected concentrations ranging from 1.6 µg/L to 6,200 µg/L. Mean and median concentrations for TCE are 1,080 µg/L and 75 µg/L, respectively, with 12 samples having concentrations greater than the MCL of 5 µg/L. Distribution 25th and 75th percentiles for TCE are 10.2 µg/L and 1,080 µg/L, respectively. The distribution has two data outliers.

4.4.2.4 cDCE

For November 2023, 15 of 15 samples had detections of cDCE and detected concentrations ranging from 7 µg/L to 33,000 µg/L. Mean and median concentrations for cDCE are 4,360 µg/L and 140 µg/L, respectively, with 12 samples having concentrations greater than the MCL of 70 µg/L. Distribution 25th and 75th percentiles for cDCE are 38.3 µg/L and 1,765 µg/L, respectively. The distribution has two data outliers.

4.4.2.5 VC

For November 2023, 15 of 15 samples had detections of VC and detected concentrations ranging from 7 µg/L to 33,000 µg/L. Mean and median concentrations for VC for November 2023 are 4,360 µg/L and 140 µg/L, respectively, with 12 samples having concentrations greater than the MCL of 2 µg/L. Distribution 25th and 75th percentiles for VC are 38.3 µg/L and 1,765 µg/L, respectively. The distribution has two data outliers.

4.4.2.6 1,1 DCE

For November 2023, 13 of 15 samples had detections of 1,2-DCA and detected concentrations ranging from 0.69 µg/L to 1,400 µg/L. Mean and median concentrations for 1,2-DCA are 251.4 µg/L and 9.1 µg/L, respectively, with 11 samples having concentrations greater than the MCL of 5 µg/L. Distribution 25th and 75th percentiles for 1,2-DCA are 2.6 µg/L and 362.5 µg/L, respectively. The distribution has two data outliers.

4.4.3 Geochemical Parameter Results

Exhibit 4-3 (page 4-10) has box plots and tabular information displaying data distributions for geochemical parameters for the November 2023 performance monitoring event (ISB) in the OU 1 area.

4.4.3.1 Chloride

For November 2023, chloride concentrations ranged from 5.5 mg/L to 51 mg/L with mean and median concentrations of 15.6 mg/L and 11 mg/L, respectively. Distribution 25th and 75th percentiles for chloride are 8.8 mg/L and 19 mg/L, respectively. The chloride data distribution has one outlier.

4.4.3.2 Nitrate

For November 2023, nitrate had detections in 4 of 14 samples with detected concentrations ranging from 0.11 mg/L to 1.2 mg/L. Three of the four detections had levels of nitrate < 1 mg/L.

4.4.3.3 Sulfate

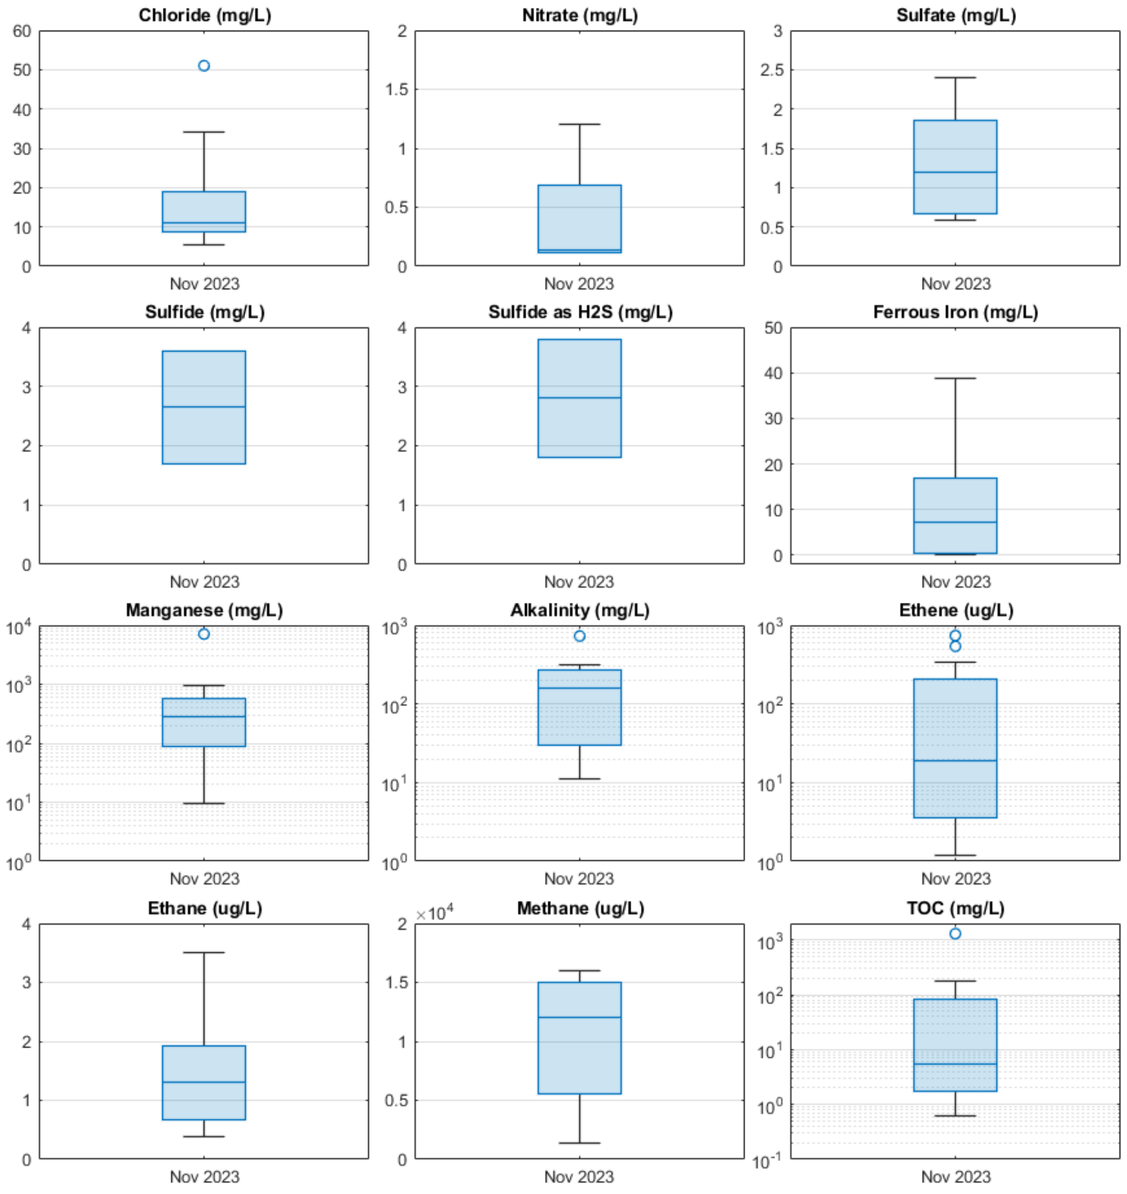
For November 2023, nine of 14 samples had detections of sulfate and detected concentrations ranged from 0.59 mg/L to 2.4 mg/L. Distribution 25th and 75th percentiles for sulfate are 0.67 mg/L and 1.85 mg/L, respectively.

4.4.3.4 Sulfide

For November 2023, 2 of 14 samples had detections of sulfide with concentrations of 1.7 mg/L and 3.6 mg/L.

4.4.3.5 Sulfide as Hydrogen Sulfide

For November 2023, 2 of 14 samples had detections of sulfide as hydrogen sulfide with concentrations of 1.8 mg/L and 3.8 mg/L.



4.4.3.6 Ferrous Iron

For November 2023, ferrous iron concentrations ranged from 0.22 mg/L to 38.88 mg/L with mean and median concentrations of 9.96 mg/L and 7.2 mg/L, respectively, with 10 samples having concentrations > 1 mg/L. Distribution 25th and 75th percentiles for ferrous iron are 0.51 mg/L and 16.9 mg/L, respectively.

4.4.3.7 Manganese

For November 2023, manganese concentrations ranged from 9.4 µg/L to 7,100 µg/L with mean and median concentrations of 801.5µg/L and 280 µg/L, respectively. Distribution 25th and 75th percentiles for manganese are 86 µg/L and 580 µg/L, respectively.

4.4.3.8 Alkalinity

For November 2023, alkalinity levels ranged from 11 mg/L to 730 mg/L with mean and median concentrations of 204 mg/L and 109 mg/L, respectively. Distribution 25th and 75th percentiles for alkalinity are 30 mg/L and 270 mg/L, respectively. The data distribution has one outlier.

4.4.3.9 Ethene

For November 2023, 13 of 14 samples had ethene detections with concentrations ranging from 1.2 µg/L to 740 µg/L with mean and median concentrations of 152.8 µg/L and 19 µg/L, respectively. Distribution 25th and 75th percentiles for ethene are 3.58 µg/L and 205 µg/L, respectively. The data distribution has one outlier with 8 samples having concentrations > 10 µg/L.

4.4.3.10 Ethane

For November 2023, five of 14 samples had ethane detections with concentrations ranging from 0.39 µg/L to 3.5 µg/L with mean and median concentrations of 1.47 µg/L and 1.3 µg/L, respectively. Distribution 25th and 75th percentiles for ethene are 0.68 µg/L and 1.9 µg/L, respectively.

4.4.3.11 Methane

For January 2023, detected levels of methane ranged from 1,400 µg/L to 16,000 µg/L with mean and median concentrations of 10,400 µg/L and 12,000 µg/L, respectively. Distribution 25th and 75th percentiles for methane are 5,600 µg/L and 15,000 µg/L, respectively. The data distribution did not have outliers.

4.4.3.12 Total Organic Carbon

For November 2023, detected levels of TOC ranged from 0.61 mg/L to 1,300 mg/L with mean and median concentrations of 122.6 mg/L and 5.55 mg/L, respectively. The data distribution had one outlier with five of 14 samples having TOC concentrations > 20 mg/L.

4.5 Annual Water Quality Parameter Results (May 2024)

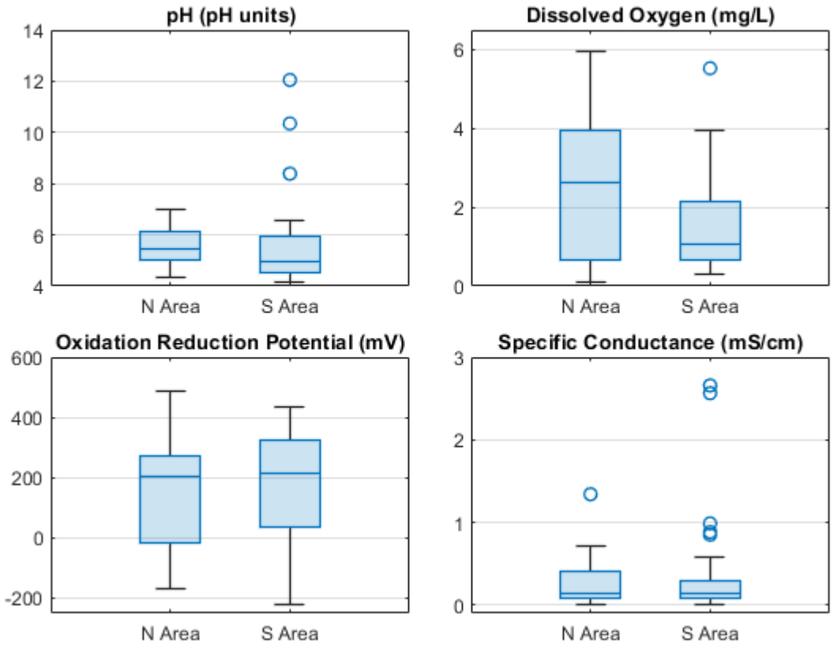
Section 4.5 has a summary of water quality parameter results for the annual sampling event completed in May 2024. Appendix E.2 has data distribution analysis presented in Section 4.5 for water quality parameter results.

4.5.1 Surficial Aquifer

Section 4.5.1 has a summary of water quality parameter results for the surficial aquifer with data distributions grouped by the northern and southern areas monitored at OU 6.

4.5.1.1 pH

For the northern monitored area, the distribution range for pH is 2.61 with a mean of 5.54 and median of 5.47. The distribution 25th and 75th percentiles are 5.00 and 6.11, respectively. Nine of 39 data observations have a pH < 5. For the southern area, the distribution range for pH is 7.89 with a mean of 5.59 and median of 4.97. The distribution 25th and 75th percentiles are 4.52 and 5.95, respectively with three data outliers. Fifteen of 30 data observations have a pH < 5.



4.5.1.2 Dissolved Oxygen

The data distribution for DO plots with a larger data range for the northern monitored area compared to the southern area. For the northern area, the distribution range for DO is 5.83 mg/L with a mean of 2.59 mg/L and median of 2.61 mg/L. The distribution 25th and 75th percentiles are 0.675 mg/L and 3.95 mg/L, respectively. Thirteen of 39 data observations have a DO ≤ 1 mg/L. For the southern area, the distribution range for DO is 5.21 mg/L with a mean of 1.61 mg/L and median of 1.05 mg/L. The distribution 25th and 75th percentiles are 0.65 mg/L and 2.15 mg/L, respectively. Fifteen of 30 data observations have a DO level ≤ 1 mg/L.

4.5.1.3 Oxidation-Reduction Potential

For the northern monitored area, the distribution range for ORP is 660.0 mV with a mean of 154.5 mV and median of 206.3 mV. The distribution 25th and 75th percentiles are -16.0 mV and 273.5 mV, respectively. Eight of 39 data observations have an ORP < 50 mV. For the southern area, the distribution range for ORP is 654.5 mV with a mean of 188.7 mV and median of 212.4 mV. The distribution 25th and 75th percentiles are 35.9 mV and 327.1 mV, respectively. Three of 30 data observations have an ORP level < 50 mV.

4.5.1.4 Specific Conductivity

The data distributions for SC plots with a lower range for the northern area compared to the southern area. For the northern monitored area, the distribution range for SC is 1.333 mS with a mean of 0.268 mS and median of 0.142 mS. The distribution 25th and 75th percentiles are 0.083 mS and 0.399 mS, respectively. For the southern area, the distribution range for SC is 2.643 mS with a mean of 0.404 mS and median of 0.137 mS. The distribution 25th and 75th percentiles are 0.073 mS and 0.296 mS, respectively.

4.5.2 Confined Aquifer

Section 4.5.2 has a summary of water quality parameter results for the confined aquifer with data distributions grouped by the northern and southern areas monitored at OU 6.

4.5.2.1 pH

For the northern area, the distribution range pH is 4.53 with a mean of 5.98 and median of 5.52. The distribution 25th and 75th percentiles are 5.20 and 6.50, respectively. One of the 12 data observations have a pH < 5. For the southern area, the distribution range for pH is 6.80 with a mean of 6.24 and median of 5.80. The distribution 25th and 75th percentiles are 5.65 and 6.06, respectively. None of the data observations have a pH < 5.

4.5.2.2 Dissolved Oxygen

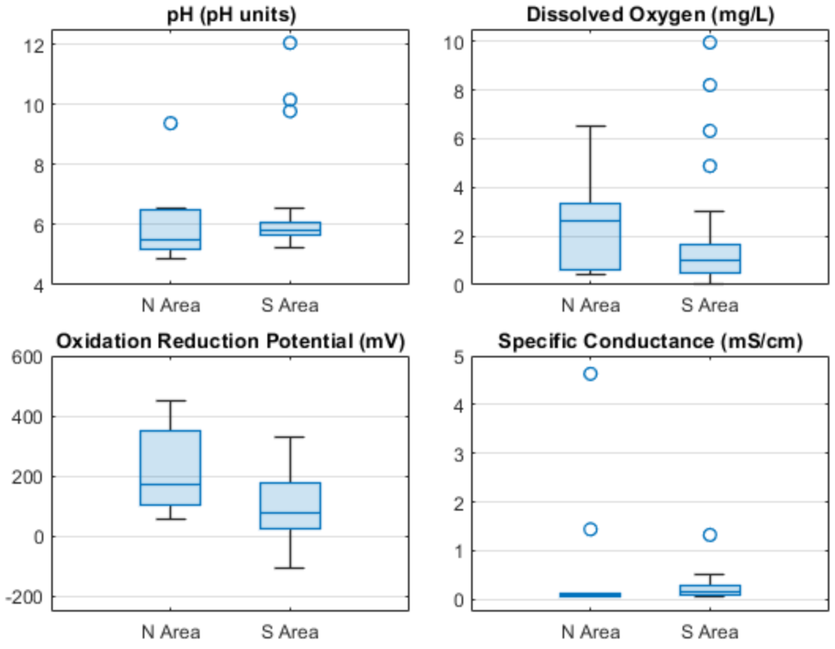
The data distribution for DO plots with a lower data range for the northern area compared to the southern area. For the northern monitored area, the distribution range for DO is 6.04 mg/L with a mean of 2.51 mg/L and median of 2.65 mg/L. The distribution 25th and 75th percentiles are 0.615 mg/L and 3.32 mg/L, respectively. Four of 12 data observations have a DO ≤ 1 mg/L. For the southern area, the distribution range for DO is 9.94 mg/L with a mean of 1.73 mg/L and median of 1.03 mg/L. The distribution 25th and 75th percentiles are 0.49 mg/L and 1.63 mg/L, respectively. 17 of 33 data observations have a DO level ≤ 1 mg/L.

4.5.2.3 Oxidation-Reduction Potential

The data distribution for ORP plots with a lower data range for the northern area compared to the southern area. For the northern monitored area, the distribution range for ORP 391.7 mV with a mean of -216.3 mV and median of 174.2 mV. The distribution 25th and 75th percentiles are 102.2 mV and 350.0 mV, respectively. None of the data observations have an ORP < 50 mV. For the southern area, the distribution range for ORP is 434.8 mV with a mean of 97.3 mV and median of 77.3 mV. The distribution 25th and 75th percentiles are 23.0 mV and 178.1 mV, respectively. One of 33 data observations have an ORP level < 50 mV.

4.5.2.4 Specific Conductivity

The data distributions for SC plots at a higher range for the northern area compared to the southern area. For the northern monitored area, the distribution range for SC is 4.588 mS with a mean of 0.569 mS and median of 0.076 mS. The distribution 25th and 75th percentiles are 0.054 mS and 0.121 mS, respectively. For the southern area, the distribution range for SC is 1.268 mS with a mean of 0.234 mS and median of 0.168 mS. The distribution 25th and 75th percentiles are 0.104 mS and 0.276 mS, respectively.



4.6 Annual VOC Results (May 2024)

Section 4.6 has a summary of VOC parameter results for the annual sampling event completed in May 2024.

4.6.1 Surficial Aquifer

Section 4.6.1 has a summary of VOC results for the surficial aquifer with data distributions grouped by the northern and southern areas monitored at OU 6.

Notes: N Area = northern OU 6 monitoring area includes OU 1 wells, OU 2 wells DMW-9B, and DMW-34B. S Area = southern OU 6 monitoring area (includes OU 2 wells except those included in northern area grouping, OU 3 wells and offsite OU 6 wells, N = number of normal samples, D = number of detected results, Min = minimum detected result, max = maximum detected result, Std. Dev. = standard deviation, Var = variance, PCTL25 = 25th percentile, PCTL75. = 75th percentile, pH <5 = number of results with pH less than 5, DO <= 1 = number of results with dissolved oxygen level less than or equal to 1 milligram per liter, ORP<-50 = number of results with oxidation-reduction potential less than -50 millivolts.

4.6.1.1 COCs

For the surficial aquifer, Table 4-3 (page 4-16) has a statistical summary of VOC constituents detected in one or more samples collected for annual groundwater monitoring. This table has descriptive statistics, identifies the location of the maximum detected concentrations, and presents screening comparisons to remedy cleanup levels (MCLs), EPA RSLs, and ecological screening benchmarks. VOCs detected in groundwater for the annual monitoring event at levels > MCLs include: PCE, TCE, cDCE, VC, 1,1-DCE, 1,2-DCA, carbon tetrachloride, 1,4-DCB, and CB. For constituents without MCLs, VOCs detected at concentrations > RSLs include: 1,1,1,2-trichloroethane, 1,1-dichloroethane, 1,2,4-trichlorobenzene, 1,2,3-trichloropropane, 1,3,5-trimethylbenzene, chloromethane, and naphthalene.

Exhibit 4-6 (page 4-18) has box plots and tabular information displaying data distributions for VOC constituents detected at concentrations greater than remedy cleanup levels (MCLs).

4.6.1.2 PCE

The PCE data distribution for the northern area plots at a higher concentration range than the southern area. For the northern area, 27 of 39 samples had detections of PCE and detected concentrations ranging from 0.47 µg/L to 4,300 µg/L. Mean and median concentrations for PCE in the northern area are 170.8 µg/L and 8.6 µg/L, respectively. Distribution 25th and 75th percentiles for PCE in the northern area are 1.14 µg/L and 16 µg/L, respectively, with three distribution outliers. In the northern area, 15 samples had PCE concentrations greater than the MCL of 5 µg/L.

For the southern area, 13 of 30 samples had detections of PCE and detected concentrations ranging from 0.77 µg/L to 14 µg/L. Mean and median concentrations for PCE in the southern area are 3.71 µg/L and 1.7 µg/L, respectively. Distribution 25th and 75th percentiles for PCE in the southern area are 1.18 µg/L and 4.13 µg/L, respectively, with two distribution outliers. In the southern area, two samples had PCE concentrations greater than the MCL of 5 µg/L.

4.6.1.3 TCE

The TCE data distribution for the northern area plots at a higher concentration range than the southern area. For the northern area, 30 of 39 samples had detections of TCE and detected concentrations ranging from 0.34 µg/L to 3,900 µg/L. Mean and median concentrations for TCE in the northern area are 333.9 µg/L and 15.0 µg/L, respectively. Distribution 25th and 75th percentiles for TCE in the northern area are 2.20 µg/L and 76 µg/L, respectively, with four distribution outliers. In the northern area, 21 samples had TCE concentrations greater than the MCL of 5 µg/L.

For the southern area, 16 of 30 samples had detections of TCE and detected concentrations ranging from 0.32 µg/L to 190 µg/L. Mean and median concentrations for TCE in the southern area are 27.72 µg/L and 12.5 µg/L, respectively. Distribution 25th and 75th percentiles for TCE in the southern area are 3.95 µg/L and 26.5 µg/L, respectively, with two distribution outliers. In the southern area, 12 samples had TCE concentrations greater than the MCL of 5 µg/L.

4.6.1.4 cDCE

The cDCE data distribution for the northern area plots at a higher concentration range than the southern area. For the northern area, 32 of 39 samples had detections of cDCE and detected concentrations ranging from 0.47 µg/L to 14,000 µg/L. Mean and median concentrations for cDCE in the northern area are 825 µg/L and 41 µg/L, respectively. Distribution 25th and 75th percentiles for cDCE in the northern area are 4.75 µg/L and 180 µg/L, respectively, with four distribution outliers. In the northern area, 13 samples had cDCE concentrations greater than the MCL of 70 µg/L.

For the southern area, 20 of 30 samples had detections of cDCE and detected concentrations ranging from 0.51 µg/L to 530 µg/L. Mean and median concentrations for cDCE in the southern area are 86 µg/L and 35 µg/L, respectively. Distribution 25th and 75th percentiles for cDCE in the southern area are 1.30 µg/L and 115 µg/L, respectively, with two distribution outliers. In the southern area, seven samples had cDCE concentrations greater than the MCL of 70 µg/L.

Notes: N = number of normal samples, D = number of detected results, Min = minimum detected result, max = maximum detected result, Std. Dev. = standard deviation, Var = variance, PCTL25 = 25th percentile, PCTL75. = 75th percentile,

4.6.1.5 VC

The VC data distribution for the northern area plots at a higher concentration range than the southern area. For the northern area, 19 of 39 samples had detections of VC and detected concentrations ranging from 0.94 µg/L to 2,300 µg/L. Mean and median concentrations for VC in the northern area are 221.1 µg/L and 4.1 µg/L, respectively. Distribution 25th and 75th percentiles for VC in the northern area are 2.12 µg/L and 18.8 µg/L, respectively, with three distribution outliers. In the northern area, 15 samples had VC concentrations greater than the MCL of 2 µg/L.

For the southern area, 17 of 30 samples had detections of VC and detected concentrations ranging from 0.48 µg/L to 500 µg/L. Mean and median concentrations for VC in the southern area are 70.7 µg/L and 11 µg/L, respectively. Distribution 25th and 75th percentiles for VC in the southern area are 1.28 µg/L and 70.2 µg/L, respectively, with two distribution outliers. In the southern area, 12 samples had VC concentrations greater than the MCL of 2 µg/L.

4.6.1.6 1,1-DCE

The 1,1-DCE data distribution for the northern area plots at a higher concentration range than the southern area. For the northern area, 16 of 39 samples had detections of 1,1-DCE and detected concentrations ranging from 0.47 µg/L to 410 µg/L. Mean and median concentrations for 1,1-DCE in the northern area are 43.0 µg/L and 2.9 µg/L, respectively. Distribution 25th and 75th percentiles for 1,1-DCE in the northern area are 1.2 µg/L and 7.8 µg/L, respectively, with three distribution outliers. In the northern area, four samples had 1,1-DCE concentrations greater than the MCL of 7 µg/L.

For the southern area, seven of 30 samples had detections of 1,1-DCE and detected concentrations ranging from 0.46 µg/L to 2.2 µg/L. Mean and median concentrations for 1,1-DCE in the southern area are 1.19 µg/L and 1.1 µg/L, respectively. Distribution 25th and 75th percentiles for 1,1-DCE in the southern area are 0.70 µg/L and 1.5 µg/L, respectively, with no distribution outliers. In the southern area, none of the samples had 1,1-DCE concentrations greater than the MCL of 7 µg/L.

4.6.1.7 1,1,2-TCA

The 1,1,2-TCA data distribution for the northern area plots at a lower concentration range than the southern area. For the northern area, two of 39 samples had detections of 1,1,2-TCA and detected concentrations ranging from 0.52 µg/L to 0.82 µg/L. In the northern area, none of the samples had 1,1,2-TCA concentrations greater than the MCL of 5 µg/L.

For the southern area, five of 30 samples had detections of 1,1,2-TCA and detected concentrations ranging from 0.39 µg/L to 6.3 µg/L. Mean and median concentrations for 1,1,2-TCA in the southern area are 2.1 µg/L and 1.1 µg/L, respectively. Distribution 25th and 75th percentiles for 1,1,2-TCA in the southern area are 0.85 µg/L and 2.7 µg/L, respectively, with one distribution outlier. In the southern area, one sample had 1,1,2-TCA concentrations greater than the MCL of 5 µg/L.

4.6.1.8 1,2-DCA

The 1,2-DCA data distribution for the northern area plots at a lower concentration range than the southern area. For the northern area, six of 39 samples had detections of 1,2-DCA and detected concentrations ranging from 0.27 µg/L to 1.3 µg/L. Mean and median concentrations for 1,2-DCA in the northern area are 0.7383 µg/L and 0.545 µg/L, respectively. Distribution 25th and 75th percentiles for 1,2-DCA in the northern area are 0.47 µg/L and 1.3 µg/L, respectively, with no distribution outliers. In the northern area, none of the samples had 1,2-DCA concentrations greater than the MCL of 5 µg/L.

For the southern area, 10 of 30 samples had detections of 1,2-DCA and detected concentrations ranging from 0.56 µg/L to 18 µg/L. Mean and median concentrations for 1,2-DCA in the southern area are 5.422 µg/L and 3 µg/L, respectively. Distribution 25th and 75th percentiles for 1,2-DCA in the southern area are 0.68 µg/L and 8.5 µg/L, respectively, with no distribution outliers. In the southern area, four samples had 1,2-DCA concentrations greater than the MCL of 5 µg/L.

4.6.1.9 Carbon Tetrachloride

Samples collected from the northern area did not have detections of carbon tetrachloride. One of 30 samples in the southern area had a detection of carbon tetrachloride with a reported concentration of 11 µg/L greater than the MCL of 5 µg/L.

4.6.1.10 1,4-DCB

The 1,4-DCB data distribution for the northern area plots at a lower concentration range than the southern area. For the northern area, six of 39 samples had detections of 1,4-DCB and detected concentrations ranging from 0.68 µg/L to 17 µg/L. Mean and median concentrations for 1,4-DCB in the northern area are 4.98 µg/L and 2.4 µg/L, respectively. Distribution 25th and 75th percentiles for 1,4-DCB in the northern area are 0.79 µg/L and 6.6 µg/L, respectively, with one distribution outliers. In the northern area, none of the samples had 1,4-DCB concentrations greater than the MCL of 75 µg/L.

For the southern area, 14 of 30 samples had detections of 1,4-DCB and detected concentrations ranging from 0.77 µg/L to 180 µg/L. Mean and median concentrations for 1,4-DCB in the southern area are 51.57 µg/L and 20.5 µg/L, respectively. Distribution 25th and 75th percentiles for 1,4-DCB in the southern area are 2.5 µg/L and 93 µg/L, respectively, with no distribution outliers. In the southern area, four samples had 1,4-DCB concentrations greater than the MCL of 75 µg/L.

4.6.1.11 CB

The CB data distribution for the northern area plots at a lower concentration range than the southern area. For the northern area, six of 39 samples had detections of CB and detected concentrations ranging from 0.71 µg/L to 31 µg/L. Mean and median concentrations for CB in the northern area are 9.89 µg/L and 3.85 µg/L, respectively. Distribution 25th and 75th percentiles for CB in the northern area are 0.9 µg/L and 19 µg/L, respectively, with no distribution outliers. In the northern area, none of the samples had CB concentrations greater than the MCL of 100 µg/L.

For the southern area, 15 of 30 samples had detections of CB and detected concentrations ranging from 0.62 µg/L to 290 µg/L. Mean and median concentrations for CB in the southern area are 69.6 µg/L and 38 µg/L, respectively. Distribution 25th and 75th percentiles for CB in the southern area are 6.7 µg/L and 109 µg/L, respectively, with one distribution outlier. In the southern area, four samples had CB concentrations greater than the MCL of 100 µg/L.

4.6.2 Confined Aquifer

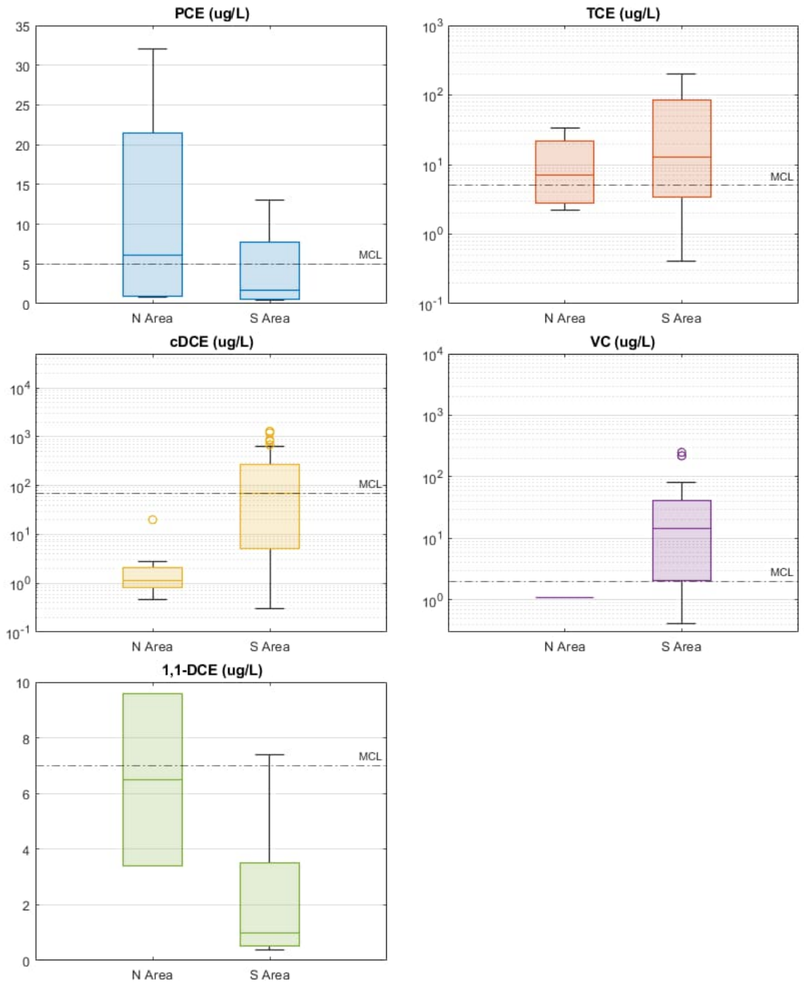
Section 4.6.2 has a summary of VOC results for the confined aquifer with data distributions grouped by the northern and southern areas monitored at OU 6.

4.6.2.1 COCs

For the confined aquifer, Table 4-4 (page 4-21) has a statistical summary of VOC constituents detected in one or more samples collected for annual groundwater monitoring. This table has descriptive statistics, identifies the location of the maximum detected concentrations, and presents screening comparisons to remedy cleanup levels (MCLs), EPA RSLs, and ecological screening benchmarks. VOCs detected in groundwater for the annual monitoring event at levels greater than MCLs include: PCE, TCE, cDCE, VC, and 1,1-DCE. For constituents without MCLs, VOCs detected at concentrations > RSLs include:1,1-dichloroethane, 2-butanone, acetone, and hexachlorobutadiene. Exhibit 4-7 (page 4-22) has box plots and tabular information displaying data distributions for VOC constituents detected at concentrations > remedy cleanup levels (MCLs).

4.6.2.2 PCE

For the northern area, four of 12 samples had detections of PCE and detected concentrations ranging from 0.84 µg/L to 32 µg/L. Mean and median concentrations for PCE in the northern area are 11.3 µg/L and 6.1 µg/L, respectively. Distribution 25th and 75th percentiles for PCE in the northern area are 1.0 µg/L and 21.5 µg/L, respectively, with two samples having PCE concentrations greater than the MCL of 5 µg/L.



For the southern area, eight of 34 samples had detections of PCE and detected concentrations ranging from 0.42 µg/L to 13 µg/L. Mean and median concentrations for PCE in the southern area are 4.2 µg/L and 1.7 µg/L, respectively, with three samples having concentrations greater than the MCL of 5 µg/L. Distribution 25th and 75th percentiles for PCE in the southern area are 0.54 µg/L and 7.7 µg/L, respectively.

Table 4-4 Statistical Summary for VOCs: Statistical Summary for VOCs: Confined Aquifer May 2024 (Detects)

Chemical	Matrix	No. of Results	Unit	Min	Max	Mean	Median	95th Percentile	No. > LOD	% > LOD	Location of Max	Federal MCL[1]			EPA RSL[2] (May 2024)			BTAG FWSB[3] (2006)

4.6.2.3 TCE

The TCE data distribution for the northern area plots at a lower concentration range than the southern area. For the northern area, nine of 12 samples had detections of TCE and detected concentrations ranging from 2.2 µg/L to 34 µg/L. Mean and median concentrations for TCE in the northern area are 12.7 µg/L and 7.0 µg/L, respectively. Distribution 25th and 75th percentiles for TCE in the northern area are 2.8 µg/L and 22 µg/L, respectively, with five samples having TCE concentrations greater than the MCL of 5 µg/L.

For the southern area, 26 of 34 samples had detections of TCE and detected concentrations ranging from 0.41 µg/L to 200 µg/L. Mean and median concentrations for TCE in the southern area are 46.6 µg/L and 13.0 µg/L, respectively. Distribution 25th and 75th percentiles for TCE in the southern area are 3.4 µg/L and 84 µg/L, respectively, with 17 samples having concentrations greater than the MCL of 5 µg/L.

4.6.2.4 cDCE

The cDCE data distribution for the northern area plots at a lower concentration range than the southern area. For the northern area, eight of 12 samples had detections of cDCE and detected concentrations ranging from 0.47 µg/L to 20 µg/L. Mean and median concentrations for cDCE in the northern area are 3.5 µg/L and 1.14 µg/L, respectively. Distribution 25th and 75th percentiles for cDCE in the northern area are 0.8 µg/L and 2.1 µg/L, respectively, with one distribution outlier. In the northern area, none of the samples had cDCE concentrations greater than the MCL of 70 µg/L.

For the southern area, 27 of 34 samples had detections of cDCE and detected concentrations ranging from 0.31 µg/L to 1300 µg/L. Mean and median concentrations for cDCE in the southern area are 248.9 µg/L and 68 µg/L, respectively. Distribution 25th and 75th percentiles for cDCE in the southern area are 5.13 µg/L and 267.5 µg/L, respectively, with five distribution outliers. In the southern area, 13 samples had concentrations greater than the MCL of 70 µg/L.

4.6.2.5 VC

The VC data distribution for the northern area plots at a lower concentration range than the southern area. For the northern area, one of 12 samples had detections of VC and detected at 1.1 µg/L, which is less than the MCL of 2 µg/L.

For the southern area, 22 of 34 samples had detections of VC and detected concentrations ranging from 0.41 µg/L to 250 µg/L. Mean and median concentrations for VC in the southern area are 38.1 µg/L and 14.5 µg/L, respectively. Distribution 25th and 75th percentiles for VC in the southern area are 2.1 µg/L and 41 µg/L, respectively, with two distribution outliers. In the southern area, 17 samples had concentrations greater than the MCL of 2 µg/L.

4.6.2.6 1,1-DCE

For the northern area, two of 12 samples had detections of 1,1-DCE and detected concentrations ranging from 3.4 µg/L to 9.6 µg/L. Mean and median concentrations for 1,1-DCE in the northern area are 6.5 µg/L and 6.5 µg/L, respectively. Distribution 25th and 75th percentiles for 1,1-DCE in the northern area are 3.4 µg/L and 9.6 µg/L, respectively, with no distribution outliers. In the northern area, one of the samples had 1,1-DCE concentrations greater than the MCL of 7 µg/L.

For the southern area, 14 of 34 samples had detections of 1,1-DCE and detected concentrations ranging from 0.37 µg/L to 7.4 µg/L. Mean and median concentrations for 1,1-DCE in the southern area are 2.2 µg/L and 0.98 µg/L, respectively. Distribution 25th and 75th percentiles for 1,1-DCE in the southern area are 0.53 µg/L and 3.5 µg/L, respectively, with no distribution outliers. In the southern area, one sample had concentrations greater than the MCL of 7 µg/L.

4.7 Annual Geochemical Parameter Results (May 2024)

Section 4.7 has a summary of geochemical parameter results for the annual sampling event completed in May 2024.

4.7.1 Surficial Aquifer

Exhibit 4-8 (page 4-25) has box plots and tabular information displaying data distributions for geochemical parameters detected in surficial aquifer samples collected from the northern and southern monitoring areas at OU 6.

4.7.1.1 Chloride

For the northern area, the data distribution for chloride plots at a lower concentration range than the southern area with concentrations ranging 1.1 mg/L to 56 mg/L. Mean and median concentrations for chloride in the northern area are 14.37 mg/L and 11 mg/L, respectively. Distribution 25th and 75th percentiles for chloride in the northern area are 8.53 mg/L and 14.75 mg/L, respectively, with four data outliers.

For the southern area, chloride concentrations ranged from 1.3 mg/L to 870 mg/L. Mean and median concentrations for chloride in the southern area are 77.9 mg/L and 28 mg/, respectively L. Distribution 25th and 75th percentiles for chloride in the southern area are 15 mg/L and 66 mg/L, respectively, with three data outliers.

4.7.1.2 Nitrate

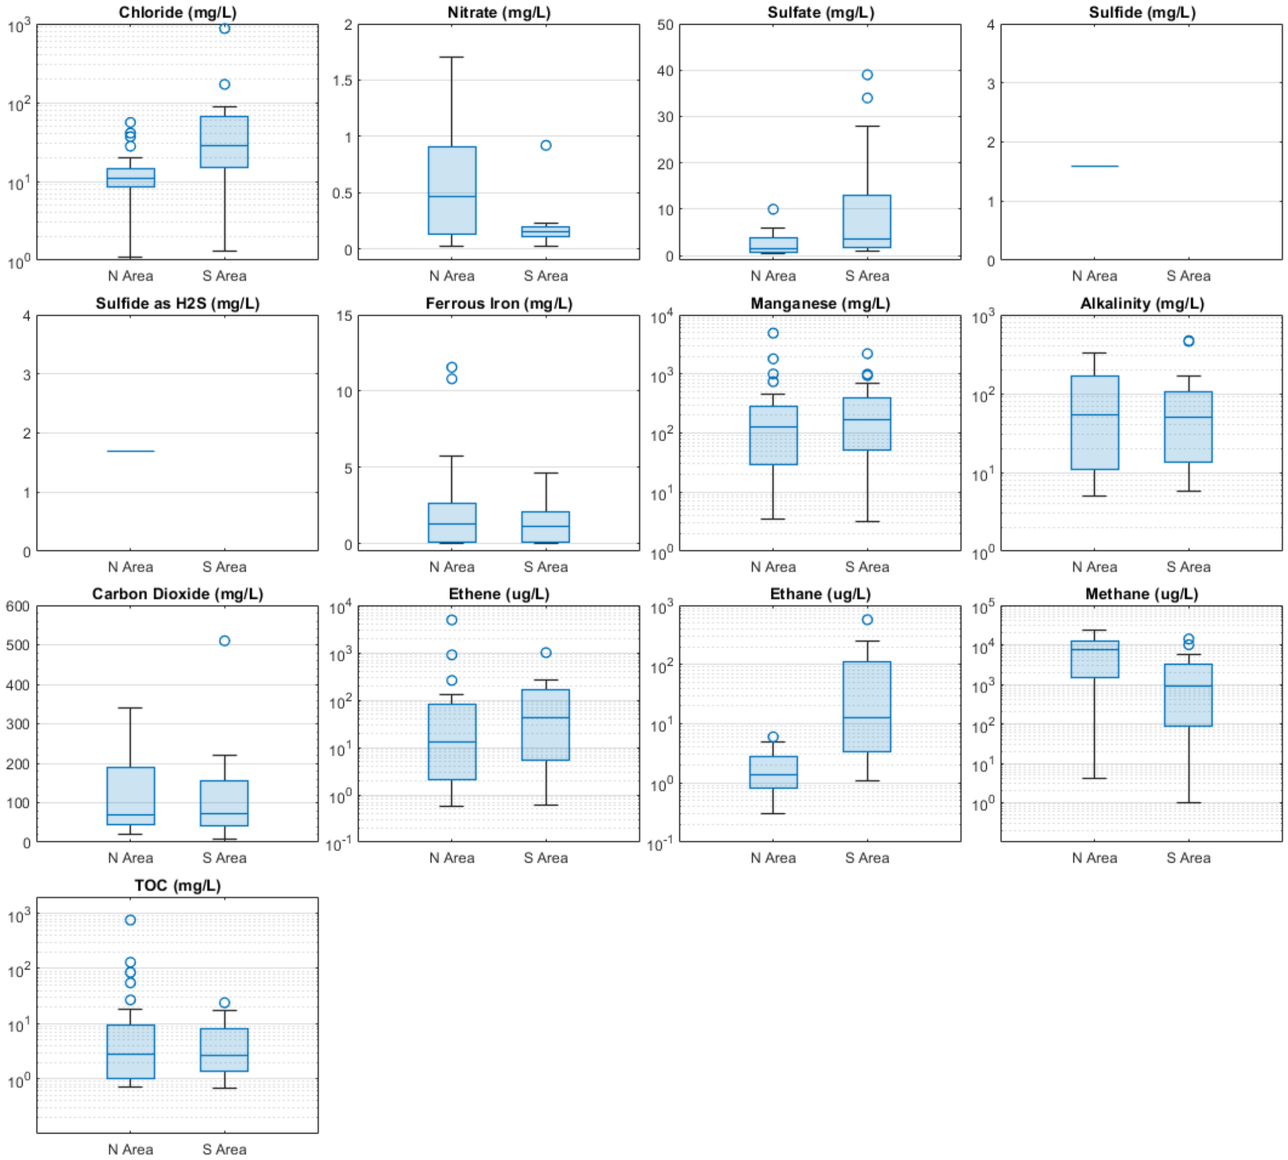
For the northern area, the data distribution for nitrate plots at a higher concentration range than the southern area with concentrations ranging 0.025 mg/L to 3 mg/L. Mean and median concentrations for nitrate in the northern area are 0.68 mg/L and 0.47 mg/L, respectively. Distribution 25th and 75th percentiles for nitrate in the northern area are 0.13 mg/L and 0.91 mg/L, respectively, with one data outlier.

For the southern area, nitrate concentrations ranged from 0.026 mg/L to 0.92 mg/L. Mean and median concentrations for nitrate in the southern area are 0.23 mg/L and 0.16 mg/L, respectively. Distribution 25th and 75th percentiles for nitrate in the southern area are 0.11 mg/L and 60.2 mg/L, respectively, with one data outlier. In the southern area, eight of the samples had nitrate concentrations > 1 mg/L.

4.7.1.3 Sulfate

For the northern area, the data distribution for sulfate plots at a lower concentration range than the southern area with concentrations ranging 0.49 mg/L to 10 mg/L. Mean and median concentrations for sulfate in the northern area are 2.49 mg/L and 1.6 mg/L, respectively. Distribution 25th and 75th percentiles for sulfate in the northern area are 0.79 mg/L and 3.85 mg/L, respectively, with one data outlier. In the northern area, 31 of the samples had sulfate concentrations greater than the MCL of 50 mg/L.

For the southern area, sulfate concentrations ranged from 0.99 mg/L to 150 mg/L. Mean and median concentrations for sulfate in the southern area are 14.42 mg/L and 3.50 mg/L, respectively. Distribution 25th and 75th percentiles for sulfate in the southern area are 1.65 mg/L and 13 mg/L, respectively, with three data outliers. In the southern area, 23 of the samples had sulfate concentrations > 50 mg/L.



4.7.1.4 Sulfide

For the northern area, one of 31 samples had a detection of sulfide at a concentration of 1.6 mg/L. No samples collected in the southern area had detections of sulfide.

4.7.1.5 Sulfide as Hydrogen Sulfide

For the northern area, one of 31 samples had detections of sulfide as hydrogen sulfide at a concentration of 1.7 mg/L. No samples collected in the southern area had detections of sulfide as hydrogen sulfide.

4.7.1.6 Ferrous Iron

For the northern area, the data distribution for ferrous iron plots at a higher concentration range than the southern area with concentrations ranging 0.01 mg/L to 11.56 mg/L. Mean and median concentrations for ferrous iron in the northern area are 2.17 mg/L and 1.26 mg/L, respectively. Distribution 25th and 75th percentiles for ferrous iron in the northern area are 0.13 mg/L and 2.62 mg/L, respectively, with two data outliers. In the northern area, 16 of the samples had ferrous iron concentrations greater than the MCL of 1 mg/L.

For the southern area, ferrous iron concentrations ranged from 0.03 mg/L to 4.6 mg/L. Mean and median concentrations for ferrous iron in the southern area are 1.30 mg/L and 1.15 mg/L, respectively. Distribution 25th and 75th percentiles for ferrous iron in the southern area are 0.11 mg/L and 2.08 mg/L, respectively, with no data outliers. In the southern area, 12 of the samples had ferrous iron concentrations greater than the MCL of 1 mg/L.

4.7.1.7 Manganese

For the northern area, the data distribution for manganese plots at a higher concentration range than the southern area with concentrations ranging 3.5 µg/L to 4,900 µg/L. Mean and median concentrations for manganese in the northern area are 381.69 µg/L and 125 µg/L, respectively. Distribution 25th and 75th percentiles for manganese in the northern area are 29.5 µg/L and 285 µg/L, respectively, with four data outliers.

For the southern area, manganese concentrations ranged from 3.2 µg/L to 2,200 µg/L. Mean and median concentrations for manganese in the southern area are 335.18 µg/L and 170 µg/L, respectively. Distribution 25th and 75th percentiles for manganese in the southern area are 50.5 µg/L and 400 µg/L, respectively, with three data outliers.

4.7.1.8 Alkalinity

For the northern area, the data distribution for alkalinity plots at a lower concentration range than the southern area with concentrations ranging 5 mg/L to 330 mg/L. Mean and median concentrations for alkalinity in the northern area are 98.0 mg/L and 53 mg/L, respectively. Distribution 25th and 75th percentiles for alkalinity in the northern area are 11 mg/L and 170 mg/L, respectively, with no data outliers.

For the southern area, alkalinity concentrations ranged from 5.7 mg/L to 470 mg/L. Mean and median concentrations for alkalinity in the southern area are 103.4 mg/L and 50 mg/L, respectively. Distribution 25th and 75th percentiles for alkalinity in the southern area are 13.5 mg/L and 106 mg/L, respectively, with two data outliers.

4.7.1.9 Carbon Dioxide

For the northern area, the data distribution for carbon dioxide plots at a lower concentration range than the southern area with concentrations ranging 19 mg/L to 340 mg/L. Mean and median concentrations for carbon dioxide in the northern area are 119.20 mg/L and 69 mg/L, respectively. Distribution 25th and 75th percentiles for carbon dioxide in the northern area are 43.8 mg/L and 190 mg/L, respectively, with no data outliers.

For the southern area, carbon dioxide concentrations ranged from 6.2 mg/L to 510 mg/L. Mean and median concentrations for carbon dioxide in the southern area are 115.5 mg/L and 71 mg/L, respectively. Distribution 25th and 75th percentiles for carbon dioxide in the southern area are 42.8 mg/L and 155 mg/L, respectively, with two data outliers.

4.7.1.10 Ethene

For the northern area, the data distribution for ethene plots at a higher concentration range than the southern area with concentrations ranging 0.57 µg/L to 4,900 µg/L. Mean and median concentrations for ethene in the northern area are 288 µg/L and 13 µg/L, respectively. Distribution 25th and 75th percentiles for ethene in the northern area are 2.1 µg/L and 81.2 µg/L, respectively, with three data outliers. In the northern area, 12 of the samples had ethene concentrations > 10 µg/L.

For the southern area, ethene concentrations ranged from 0.62 µg/L to 1,000 µg/L. Mean and median concentrations for ethene in the southern area are 147 µg/L and 42.5 µg/L, respectively. Distribution 25th

and 75th percentiles for ethene in the southern area are 5.5 µg/L and 165 µg/L, respectively, with one data outlier. In the southern area, seven of the samples had ethene concentrations > 10 µg/L.

4.7.1.11 Ethane

For the northern area, the data distribution for ethane plots at a lower concentration range than the southern area with concentrations ranging 0.31 µg/L to 6 µg/L. Mean and median concentrations for ethane in the northern area are 2.08 µg/L and 1.4 µg/L, respectively. Distribution 25th and 75th percentiles for ethane in the northern area are 0.81 µg/L and 2.82 µg/L, respectively, with one data outlier. In the northern area, none of the samples had ethane concentrations > 10 µg/L.

For the southern area, ethane concentrations ranged from 1.1 µg/L to 570 µg/L. Mean and median concentrations for ethane in the southern area are 89.14 µg/L and 12.45 µg/L, respectively. Distribution 25th and 75th percentiles for ethane in the southern area are 3.3 µg/L and 110 µg/L, respectively, with one data outlier. In the southern area, seven of the samples had ethane concentrations > 10 µg/L.

4.7.1.12 Methane

For the northern area, the data distribution for methane plots at a higher concentration range than the southern area with concentrations ranging 4 µg/L to 23,000 µg/L. Mean and median concentrations for methane in the northern area are 8,000 µg/L and 7,400 µg/L, respectively. Distribution 25th and 75th percentiles for methane in the northern area are 1,525 µg/L and 12,750 µg/L, respectively, with no data outliers. In the northern area, 22 of the samples had methane concentrations > 500 µg/L.

For the southern area, methane concentrations ranged from 0.98 µg/L to 14,000 µg/L. Mean and median concentrations for methane in the southern area are 2,331 µg/L and 920 µg/L, respectively. Distribution 25th and 75th percentiles for methane in the southern area are 88.5 µg/L and 3,175 µg/L, respectively, with two data outliers. In the southern area, 12 of the samples had methane concentrations > 500 µg/L.

4.7.1.13 Total Organic Carbon

For the northern area, the data distribution for total organic carbon plots at a higher concentration range than the southern area with concentrations ranging 0.7 mg/L to 760 mg/L. Mean and median concentrations for total organic carbon in the northern area are 38.24 mg/L and 2.85 mg/L, respectively. Distribution 25th and 75th percentiles for total organic carbon in the northern area are 1 mg/L and 9.6 mg/L, respectively, with five data outliers. In the northern area, five of the samples had total organic carbon concentrations > 20 mg/L.

For the southern area, total organic carbon concentrations ranged from 0.66 mg/L to 24 mg/L. Mean and median concentrations for total organic carbon in the southern area are 5.61 mg/L and 2.70 mg/L, respectively. Distribution 25th and 75th percentiles for total organic carbon in the southern area are 1.35 mg/L and 8.05 mg/L, respectively, with one data outlier. In the southern area, one of the samples had total organic carbon concentrations > 20 mg/L.

4.7.2 Confined Aquifer

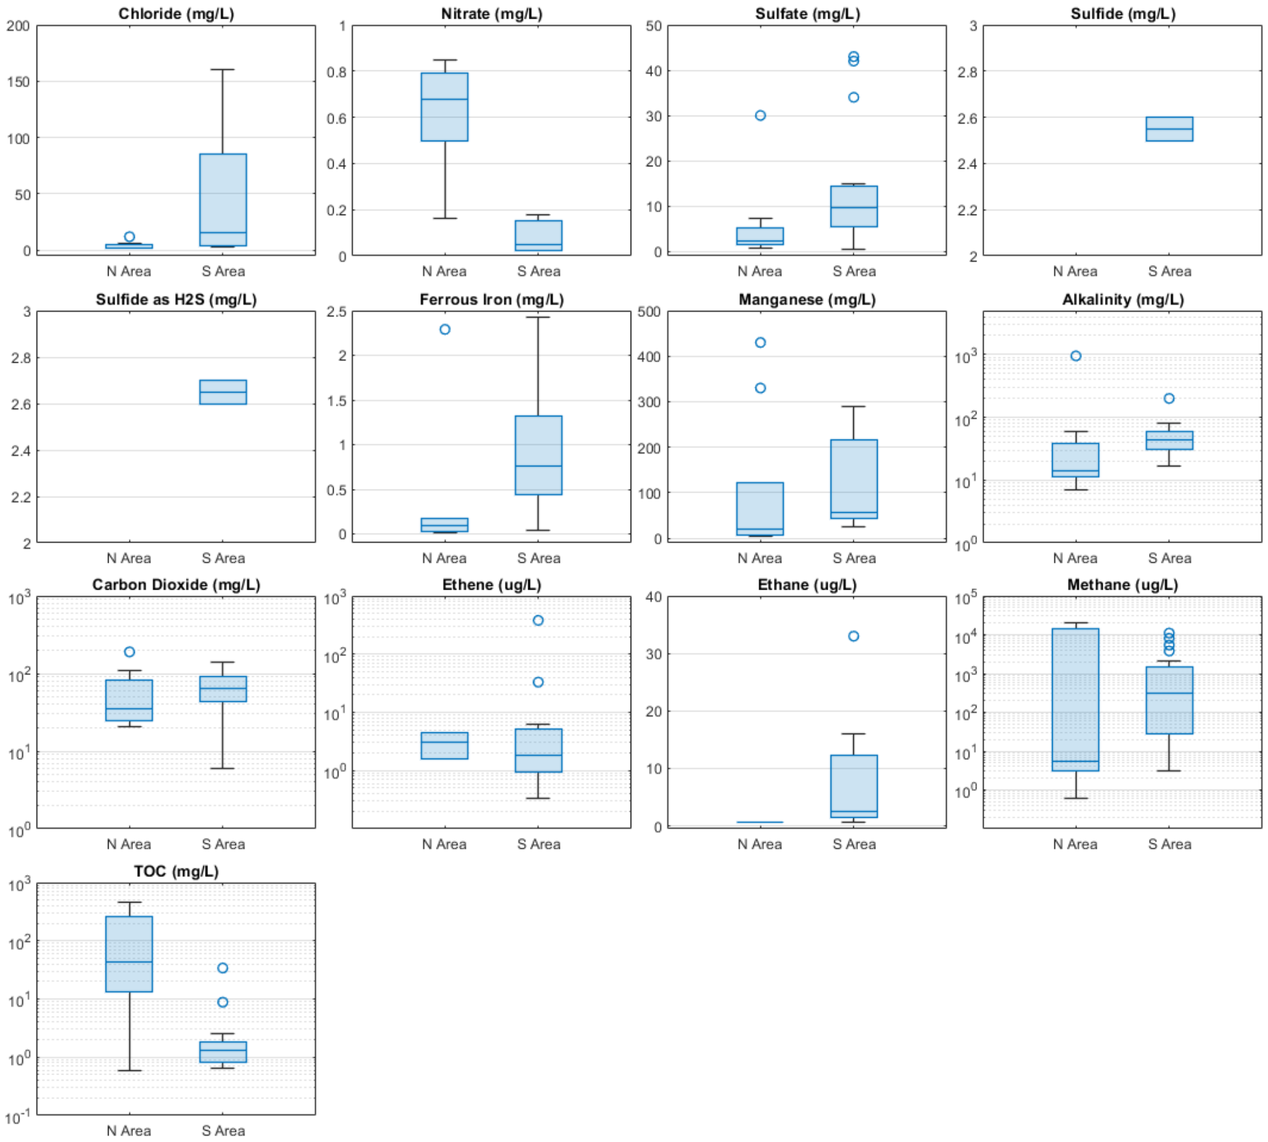

Exhibit 4-9 (page 4-28) has box plots and tabular information displaying data distributions for geochemical parameters detected in surficial aquifer samples collected from the northern and southern monitoring areas at OU 6.

4.7.2.1 Chloride

For the northern area, the data distribution for chloride plots at a lower concentration range than the southern area with concentrations ranging 1.7 mg/L to 12 mg/L. Mean and median concentrations for chloride in the northern area are 4.9 mg/L and 5.0 mg/L, respectively. Distribution 25th and 75th percentiles for chloride in the northern area are 2.2 mg/L and 5.6 mg/L, respectively, with one data outlier.

For the southern area, chloride concentrations ranged from 2.4 mg/L to 160 mg/L. Mean and median concentrations for chloride in the southern area are 33.9 mg/L and 16.0 mg/L, respectively. Distribution 25th and 75th percentiles for chloride in the southern area are 3.4 mg/L and 86 mg/L, respectively, with no data outliers.

4.7.2.2 Nitrate

For the northern area, the data distribution for nitrate plots at a higher concentration range than the southern area with concentrations ranging 0.16 mg/L to 0.85 mg/L. Mean and median concentrations for nitrate in the northern area are 0.61 mg/L and 0.68 mg/L, respectively. Distribution 25th and 75th percentiles for nitrate in the northern area are 0.5 mg/L and 0.79 mg/L, respectively, with no data outliers. In the northern area, six of the samples had nitrate concentrations > 1 mg/L.

For the southern area, nitrate ranged from 0.023 mg/L to 0.18 mg/L. Mean and median concentrations for nitrate in the southern area are 0.1 mg/L and 0.05 mg/L, respectively. Distribution 25th and 75th percentiles for nitrate in the southern area are 0.02 mg/L and 0.15 mg/L, respectively, with no data outliers. In the southern area, five of the samples had nitrate concentrations > 1 mg/L.

4.7.2.3 Sulfate

For the northern area, the data distribution for sulfate plots at a lower concentration range than the southern area with concentrations ranging 0.76 mg/L to 30 mg/L. Mean and median concentrations for sulfate in the northern area are 6.1 mg/L and 2.4 mg/L, respectively. Distribution 25th and 75th percentiles for sulfate in the northern area are 1.44 mg/L and 5.2 mg/L, respectively, with one data outlier. In the northern area, eight of the samples had sulfate concentrations > 50 mg/L.

For the southern area, sulfate ranged from 0.48 mg/L to 43 mg/L. Mean and median concentrations for sulfate in the southern area are 13.1 mg/L and 9.8 mg/L, respectively. Distribution 25th and 75th percentiles for sulfate in the southern area are 6.425 mg/L and 14.75 mg/L, respectively, with three data outliers. In the southern area, 19 of the samples had sulfate concentrations > 50 mg/L.

4.7.2.4 Sulfide

For the northern area, none of the samples collected had detections of sulfide. Two of 20 samples in the southern area had detections of sulfide (2.5 mg/L and 2.6 mg/L).

4.7.2.5 Sulfide as Hydrogen Sulfide

For the northern area, none of the samples collected had detections of sulfide as hydrogen sulfide. Two of 20 samples in the southern area had detections of sulfide as hydrogen sulfide (2.6 mg/L and 2.7 mg/L).

4.7.2.6 Ferrous Iron

For the northern area ferrous iron concentrations ranged from 0.01 mg/L to 2.29 mg/L. Mean and median concentrations for ferrous iron in the northern area are 0.31 mg/L and 0.095 mg/L, respectively. Distribution 25th and 75th percentiles for ferrous iron in the northern area are 0.03 mg/L and 0.17 mg/L, respectively, with one data outlier. In the northern area, one of the samples had ferrous iron concentrations > 1 mg/L.

For the southern area, ferrous iron ranged from 0.04 mg/L to 2.42 mg/L. Mean and median concentrations for ferrous iron in the southern area are 1.0 mg/L and 0.76 mg/L, respectively. Distribution 25th and 75th percentiles for ferrous iron in the southern area are 0.44 mg/L and 1.3 mg/L, respectively, with no data outliers. In the southern area, 10 of the samples had ferrous iron concentrations > 1 mg/L.

4.7.2.7 Manganese

For the northern area, the data distribution for manganese plots at a higher concentration range than the southern area with concentrations ranging 3.6 mg/L to 430 mg/L. Mean and median concentrations for manganese in the northern area are 100 mg/L and 20 mg/L, respectively. Distribution 25th and 75th percentiles for manganese in the northern area are 8.1 mg/L and 123 mg/L, respectively, with two data outliers.

For the southern area, manganese ranged from 25 mg/L to 290 mg/L. Mean and median concentrations for manganese in the southern area are 114 mg/L and 57 mg/L, respectively. Distribution 25th and 75th percentiles for manganese in the southern area are 44 mg/L and 215 mg/L, respectively, with no data outliers.

4.7.2.8 Alkalinity

For the northern area, the data distribution for alkalinity plots at a higher concentration range than the southern area with concentrations ranging 6.9 mg/L to 950 mg/L. Mean and median concentrations for

alkalinity in the northern area are 124 mg/L and 14 mg/L, respectively. Distribution 25th and 75th percentiles for alkalinity in the northern area are 12 mg/L and 38 mg/L, respectively, with one data outlier.

For the southern area, alkalinity ranged from 217 mg/L to 200 mg/L. Mean and median concentrations for alkalinity in the southern area are 41.50 mg/L and 41.1 mg/L, respectively. Distribution 25th and 75th percentiles for alkalinity in the southern area are 31 mg/L and 60 mg/L, respectively, with one data outlier.

4.7.2.9 Carbon Dioxide

For the northern area, the data distribution for carbon dioxide plots at a higher concentration range than the southern area with concentrations ranging 21 mg/L to 190 mg/L. Mean and median concentrations for carbon dioxide in the northern area are 60 mg/L and 35 mg/L, respectively. Distribution 25th and 75th percentiles for carbon dioxide in the northern area are 25 mg/L and 84 mg/L, respectively, with one data outlier.

For the southern area, carbon dioxide ranged from 6 mg/L to 100 mg/L. Mean and median concentrations for carbon dioxide in the southern area are 66 mg/L and 65 mg/L, respectively. Distribution 25th and 75th percentiles for carbon dioxide in the southern area are 31 mg/L and 60 mg/L, respectively, with no data outliers.

4.7.2.10 Ethene

For the northern area, two of nine samples had ethene detections (1.6 µg/L to 4.5 µg/L). For the southern area, 13 of 23 samples had detections of ethene ranging from 0.34 µg/L to 380 µg/L. Mean and median concentrations for ethene in the southern area are 34 µg/L and 1.8 µg/L, respectively. Distribution 25th and 75th percentiles for ethene in the southern area are 0.93 µg/L and 5.0 µg/L, respectively, with two data outliers. In the southern area, one of the samples had ethene concentrations > 10 µg/L.

4.7.2.11 Ethane

For the northern area, one of nine samples had an ethane detection (0.66 µg/L). For the southern area, 13 of 23 samples had detections of ethene ranging from 0.65 µg/L to 33 µg/L. Mean and median concentrations for ethene in the southern area are 7.8 µg/L and 2.6 µg/L, respectively. Distribution 25th and 75th percentiles for ethene in the southern area are 1.4 µg/L and 12 µg/L, respectively, with one data outliers. In the southern area, four of the samples had ethane concentrations > 10 µg/L.

4.7.2.12 Methane

For the northern area, the data distribution for methane plots at a higher concentration range than the southern area with concentrations ranging 0.63 µg/L to 21,000 µg/L. Mean and median concentrations for methane in the northern area are 7,144 µg/L and 5.3 µg/L, respectively. Distribution 25th and 75th percentiles for methane in the northern area are 3.2 µg/L and 14,750 µg/L, respectively, with four data outliers. In the northern area, three of the samples had methane concentrations > 500 µg/L.

For the southern area, methane ranged from 3.2 µg /L to 11,000 µg /L. Mean and median concentrations for methane in the southern area are 1,705 µg/L and 300 µg/L, respectively. Distribution 25th and 75th percentiles for methane in the southern area are 29 µg/L and 1,780 µg/L, respectively, with four data outliers. In the southern area, nine of the samples had methane concentrations > 500 µg/L.

4.7.2.13 Total Organic Carbon

For the northern area, the data distribution for total organic carbon plots at a higher concentration range than the southern area with concentrations ranging 0.6 mg/L to 450 mg/L. Mean and median concentrations for total organic carbon in the northern area are 135 mg/L and 44 mg/L, respectively. Distribution 25th and 75th percentiles for total organic carbon in the northern area are 13 mg/L and 256 mg/L, respectively, with no data outliers. In the northern area, three of the samples had total organic carbon concentrations > 20 mg/L.

For the southern area, total organic carbon ranged from 0.64 mg/L to 34 mg/L. Mean and median concentrations for total organic carbon in the southern area are 4.0 mg/L and 1.3 mg/L, respectively. Distribution 25th and 75th percentiles for total organic carbon in the southern area are 0.82 mg/L and 1.8 mg/L, respectively, with two data outliers. In the southern area, one of the samples had total organic carbon concentrations > 20 mg/L.

4.7.2.14 Geochemical Conditions Summary

Geochemical conditions in the 2021 ISB injection area (northern area) range from anaerobic to partially anaerobic conditions based on DO levels, lower nitrate and sulfate levels, presence of methane and ferrous iron, detections of sulfide, and presence of PCE degradation by-products. Conditions in the surficial aquifer in the northern area at monitored locations outside of the ISB area generally fall under aerobic conditions. Conditions in the underlying confined aquifer in the northern area range from partially anaerobic to aerobic conditions. Geochemical conditions in the surficial aquifer in the southern area range from anaerobic to partially anaerobic conditions based on DO levels, lower nitrate and sulfate levels, presence of methane and ferrous iron, and presence of PCE degradation by-products. Conditions in the underlying confined aquifer within plume areas range from anaerobic to partially anaerobic conditions.

4.8 Leachability Results

Table 4-5 (page 4-32) has a statistical summary (detects) for annual LTM for leaching and screening of results to MCLs, EPA RSLs, and ecological benchmarks. Appendix B.4 has complete tabulated sample results. Figure 3-1 identifies these LTM locations. Constituents detected in one or more of the samples include 1,4-dioxane, metals, and PAHs. Constituents not detected in samples include SVOCs, PCBs, and pesticides.

4.8.1 SVOCs

One of 10 samples had a detection of 1,4-dioxane with a result of 27 µg/L at well MW-243 in the OU 1 area where a chlorinated VOC source zone exists in groundwater. No other detections of SVOCs occurred for leachability sampling of the 10 well locations in the northern and southern monitoring areas of OU 6.

4.8.2 Metals

Leachability sampling indicated the detection of 19 of 23 metals in one or more samples collected from the northern and southern monitoring areas. Metals concentrations detected did not exceed MCLs or action levels for lead or copper. RSL screening for analytes without an MCL or action limit indicates that cobalt, iron, manganese, and zinc have concentrations > RSLs for one or more samples. Ecological benchmark screening for analytes without an MCL or action limit indicates that aluminum, cobalt, iron, manganese, and zinc have concentrations greater than these benchmarks for one or more samples.

4.8.3 PAHs

Sample results indicated two detections of 1-methylnaphthalene (MW-243 and MW-279) at concentrations greater than the RSL with the detection at MW-279 reported as estimated less than the method LOQ. Ecological benchmark screening for analytes without an MCL or action limit indicates that anthracene (two samples), fluoranthene (one sample), and pyrene (one samples).

4.9 Surface Water Results

A component of annual LTM at OU 6 is the collection of surface water samples from No Name Creek at established stations NNC-1, NNC-2, and NNC-3 for field WQP measurement and laboratory analysis of VOCs. Figure 3-1 shows the location of sample stations for surface water. Appendix B.5 has complete WQP and VOC data table results for surface water samples. Table 4-6 (page 4-33) has a statistical summary of VOC constituents detected in one or more samples collected for annual surface water monitoring. This table has descriptive statistics, identifies the location of the maximum detected concentrations, and presents screening comparisons to remedy groundwater cleanup levels (MCLs), EPA RSLs, and ecological screening benchmarks.

Table 4-5 Statistical Summary: Annual LTM for Potential Leaching (Detects)

Notes: J = the reported result is an estimated value with an unknown bias. Descriptive statistics minimum, maximum, mean, median, 95% percentile for distribution of detected results, WG = groundwater, ug/L = micrograms per liter, Min = minimum, Max = maximum, No. > = number greater, LOD = limit of detection, % = percent, , [1]Subpart G—National Primary Drinking Water Regulations: Maximum Contaminant Levels and Maximum Residual Disinfectant Levels, § 141.61 Maximum contaminant levels for organic contaminants.> LOD = percent of detected results greater than laboratory limit of detection, [2] EPA Regional Screening Level for Resident Tap Water with a target cancer risk (TR) of 1E-06 and target hazard quotient (THQ) of 0.1, May 2024 at https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables. [3]EPA Region III BTAG Freshwater Screening Benchmarks, 7/2006. https://www.epa.gov/risk/freshwater-screening-benchmarks, Number of results with concentrations greater than the MCL, Number of results with concentration greater than the RSL, Number of results with concentrations greater than the BTAG FWSB.

VOCs detected in surface water included chloromethane, PCE, TCE, cDCE, 1,2-dichloroethene (total), and Trichlorotrifluoroethane (Freon 113). Detected results for chloromethane, PCE, cDCE, 1,2-dichloroethene (total), and Trichlorotrifluoroethane (Freon 113) are reported as estimated concentrations (flagged "J") less than the laboratory LOQ, RSLs, and the ecological screening benchmarks, as applicable. TCE results for downstream and mid-point sample locations NNC-1 and NNC-2 are less than the laboratory LOQ and ecological screening benchmark with the reported estimated concentration greater than the RSL. The result for the upstream sample NNC-3 (1.2 µg/L) is greater than the RSL and less than the MCL (5 µg/L) and ecological screening benchmark (21 µg/L).

It is noted that chemical substance Trichlorotrifluoroethane (Freon 113) is a category 2 toxicant this is toxic to aquatic organisms and may cause long-term adverse effects to the aquatic environment (ThermoFisher Scientific 2023). The presence of dissolved Trichlorotrifluoroethane in surface water at location NNC-3 is not quantifiable and therefore, it is not considered a potential risk to aquatic organisms.

4.10 Building 151 SSDS

Section 4.10 has field monitoring results for the Building 151 SSDS that includes and quarterly system readings and field measurements at extraction points and VMPs. Appendix A.3 has quarterly forms and documentation for OM&M field measurements and activities for the Building 51 SSDS. Table 4-7 (page 4-35) has a summary of vent well and VMP differential pressure measurements for monitoring conducted in FY 2024. The target depressurization area for the SSDS is below the tool and break rooms with a targeted differential pressure of -0.004 inches of water column (Arcadis 2018a).

Vent well measurements show attainment of minimum targeted negative differential pressures for the four VMPs in the tool room and break room except for the July 1, 2024 measurement event. The SSDS fan required replacement based on alarm conditions found during the July 1 quarterly measurement event. Meadows installed a replacement SSDS fan unit on August 19, 2024 and confirmed system operation and induced differential pressure measurements. Meadows performed follow-up system measurements on August 28, 2024 to confirm system operations and obtained measurements at all monitoring locations.

Field measurement for gases did not indicate accumulation of methane beneath the slab at Building 151. Photoionization detector readings at the VMPs indicated response measurements in the range of 0 to 2 parts per million by volume (ppmV) with detectable levels generally occurring within the VMPs within the target depressurization area.

4.11 VOC Distribution in Groundwater

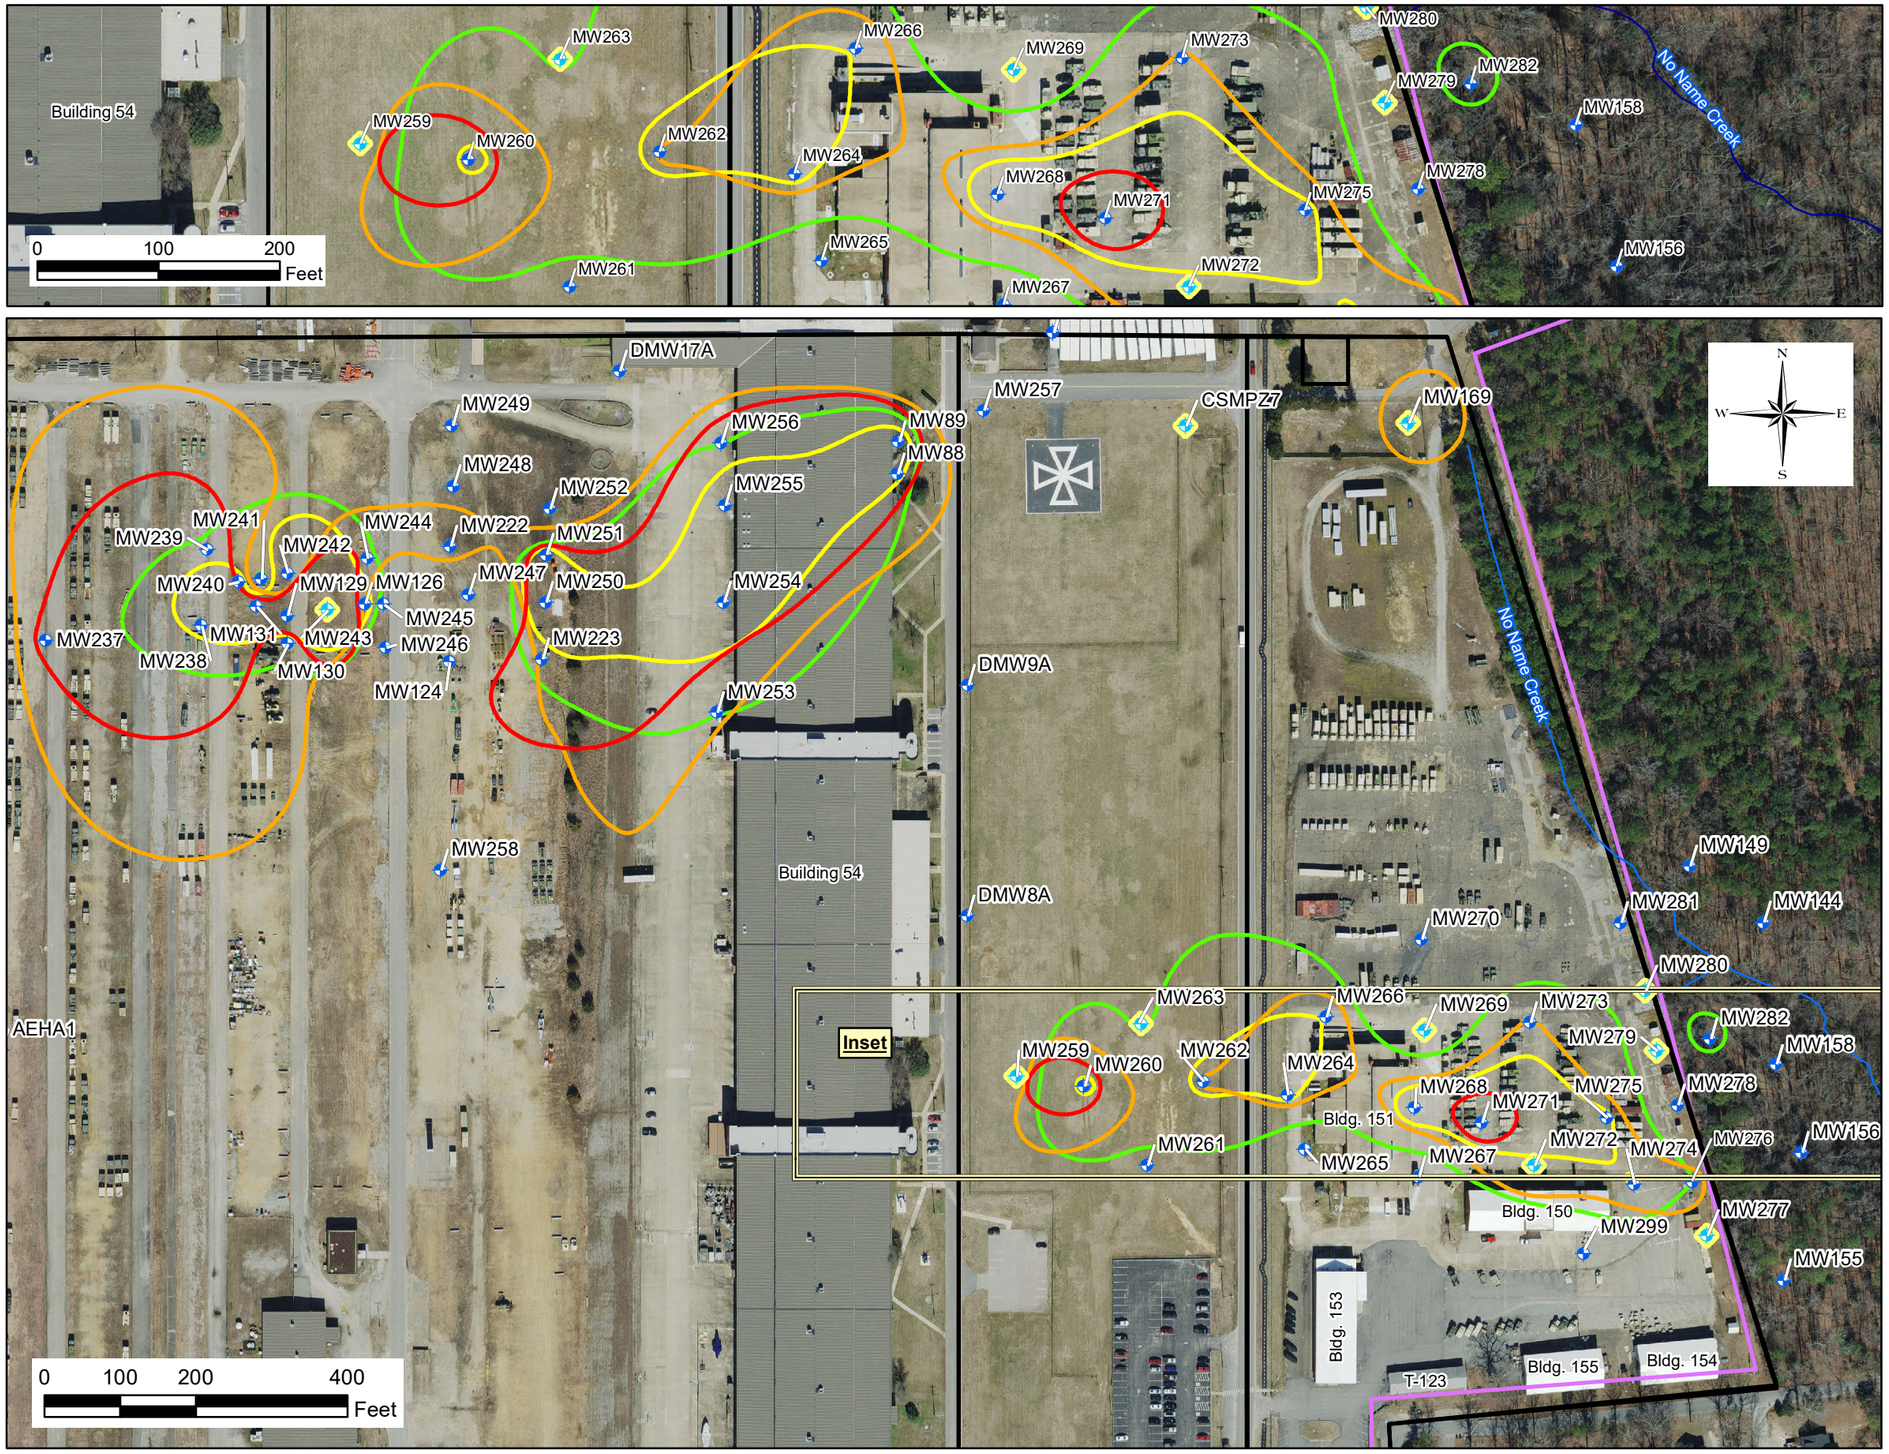
VOC plumes occur in the surficial aquifer (Eastover) and confined aquifer (Aquia-Potomac) within the northern and southern areas of OU 6. Figure 4-3 (page 4-36) and Figure 4-4 (page 4-37) depict the lateral extent of PCE, TCE, cDCE, and VC plume areas within the surficial aquifer and confined aquifer, respectively, at concentrations greater than or equal to (≥) MCLs. These are the primary COCs in groundwater at OU 6 that have the most extensive plume areas and highest number of detections > cleanup levels (MCLs).

The lateral extent of the VOC plumes in the surficial aquifer is within the installation area except in an isolated area around MW-282 in the area between the installation fence line at OU 3 and No Name Creek. For the confined aquifer, discontinuous plume areas of PCE and TCE occur in the northern area of OU 1 and OU 2. In the southern area of OU 6, a VOC plume consisting of PCE, TCE, cDCE, and VC extends from the central OU 3 area into the undeveloped offsite area east of the installation.

4.11.1 Surficial Aquifer

This section describes the distribution of VOCs in the surficial aquifer for VOCs that have concentrations > cleanup levels (MCLs) in one or more samples. The lateral extent of VOCs plumes in the surficial aquifer is within the installation area except for an isolated detection of VC at well MW-282 in the offsite monitored area as shown on Figure 4-3. Well MW-282 is located between the installation fence line and No Name Creek. Surface water samples collected from No Name Creek did not have detections of VC.

Figure 4-5 through Figure 4-12 (pages 4-38 through 4-45) show the distribution of PCE, TCE, cDCE, VC, 1,1-DCE, 1,2-DCA, 1,4-DCB, and CB within the surficial aquifer.



4.11.1.1 PCE

For the surficial aquifer, plume renderings in Figure 4-5 (page 4-38) show the extent of PCE at concentrations ≥ MCL (5 µg/L). Isoconcentration lines for PCE in Figure 4-5 are based a logarithmic scale from 5 µg/L to 500 µg/L.

L:\Legacy\USGNA2FP002\Data\projects\0_GIS\DLA\OU8\Annual Report Figures\2024\Figure 4-12 Eastover Lateral Distribution of Chlorobenzene 2024

PCE plume areas primarily occur in the northern area within OU 1 where a residual source zone exists in groundwater centered in the area of well MW-243. ISB actions in the OU 1 area have reduced the PCE plume into two areas with the maximum reported concentration of 4,400 µg/L at well MW-243. The northern plume area near and beneath Building 54 has a maximum PCE concentration of 40 µg/L at well MW-255.

In the southern area, PCE occurrence consists of limited plume areas around well MW-260 (14 µg/L) in OU 2 and around well MW-271 (12 µg/L) in OU 3.

4.11.1.2 TCE

For the surficial aquifer, plume renderings in Figure 4-6 (page 4-39) show the extent of TCE at concentrations ≥ MCL (5 µg/L). Isoconcentration lines for TCE in Figure 4-6 are based a logarithmic scale from 5 µg/L to 500 µg/L.

The northern area has a TCE plume area that extends east to west across the OU 1 area and beneath Building 54 to a downgradient extent near the OU 2 area. The highest concentration areas are at wells MW-238 (2,800 µg/L) and MW-243 (3,900 µg/L) in the open storage area. In the Building 54 area, well MW-255 (100 µg/L) has the highest TCE concentration. In the northern area of OU 3, an isolated detection of PCE (11 µg/L) at a concentrations greater than the MCL occurred at well MW-169.

In the southern area, the TCE plume has disaggregated into three areas with one area centered at well MW-260 (190 µg/L) in the OU 2 area, a second area extending from the OU 2 into the Building 151 area, and a third area in OU 3 extending from Building 151 east to the fence line area (see Figure 4-6). The maximum concentration in the plume area within OU 3 is at well MW-271 (71 µg/L).

4.11.1.3 cDCE

For the surficial aquifer, plume renderings in Figure 4-7 (page 4-40) show the extent of cDCE at concentrations ≥ MCL (70 µg/L). Isoconcentration lines for cDCE in Figure 4-6 are based a logarithmic scale from 70 µg/L to 7,000 µg/L.

The northern area has two cDCE plumes within OU 1 with one plume area centered around well MW-243 (14,000 µg/L) and the other plume area extending beneath Building 54. The maximum concentration of cDCE detected in the Building 54 area is 180 µg/L at wells MW-254 and MW-255.

In the southern area, two cDCE plume areas occur with one area extending from OU 2 into the Building 151 area and second area in OU 3 extending from Building 151 east to the fence line area (see Figure 4-7). The maximum concentration in the plume area within OU 3 is at well MW-271 (530 µg/L).

4.11.1.4 VC

For the surficial aquifer, plume renderings in Figure 4-8 (page 4-41) show the extent of VC at concentrations ≥ MCL (2 µg/L). Isoconcentration lines for VC in Figure 4-8 are based a logarithmic scale from 2 µg/L to 200 µg/L.

The northern area has two VC plumes within OU 1 with one plume area centered around wells MW-129 (2,300 µg/L) and MW-243 (1,700 µg/L). The other plume area extends beneath Building 54. The maximum concentration of VC detected in the Building 54 area is 38 µg/L at well MW-255.

In the southern area, a VC plume areas extends from OU 2 across the OU 3 area toward the fence line area. The highest VC concentration is at well MW-260 (550 µg/L) in the OU 2 area with the highest concentration in the OU 3 area at well MW-268 (260 µg/L). An isolated detection of VC occurs in the offsite area at well MW-282 (11 µg/L) between the installation fence line and No Name Creek. The VC plume defines the extent of overall VOC plume area in the southern area.

4.11.1.5 1,1-DCE

For the surficial aquifer, plume renderings in Figure 4-9 (page 4-42) show the extent of 1,1-DCE at concentrations ≥ MCL (7 µg/L). Isoconcentration lines for 1,1-DCE in Figure 4-9 are based a logarithmic scale from 7 µg/L to 70 µg/L. The northern area has a limited 1,1-DCE plume within the residual VOC source zone in groundwater centered at well MW-243. The maximum concentration of 1,1-DCE for this

plume area is 410 µg/L at well MW-243. 1,1-DCE concentrations detected in the southern area are ≤ 2.2 µg/L compared to the MCL of 7 µg/L.

4.11.1.6 1,2-DCA

For the surficial aquifer, plume renderings in Figure 4-10 (page 4-41) show the extent of 1,2-DCA at concentrations ≥ MCL (5 µg/L). The northern area has detections of 1,2-DCA at levels less than the MCL. In the southern area, 1,2-DCA has a detection greater than the MCL at well MW-260 (18 µg/L) and a localized plume in the OU 3 area with a maximum concentration of 12 µg/L at well MW-271.

4.11.1.7 DCB

For the surficial aquifer, plume renderings in Figure 4-11 (page 4-42) show the extent of 1,4-DCB at concentrations ≥ MCL (75 µg/L). The northern area does not have detections of 1,4-DCB. In the southern area, 1,4-DCB has a detection greater than the MCL at well MW-260 (180 µg/L) in OU 2 and at well MW-268 (150 µg/L) in OU 3. A localized plume also occurs in OU 3 encompassing wells MW-271 and MW-275 with a maximum concentration of 150 µg/L at MW-271.

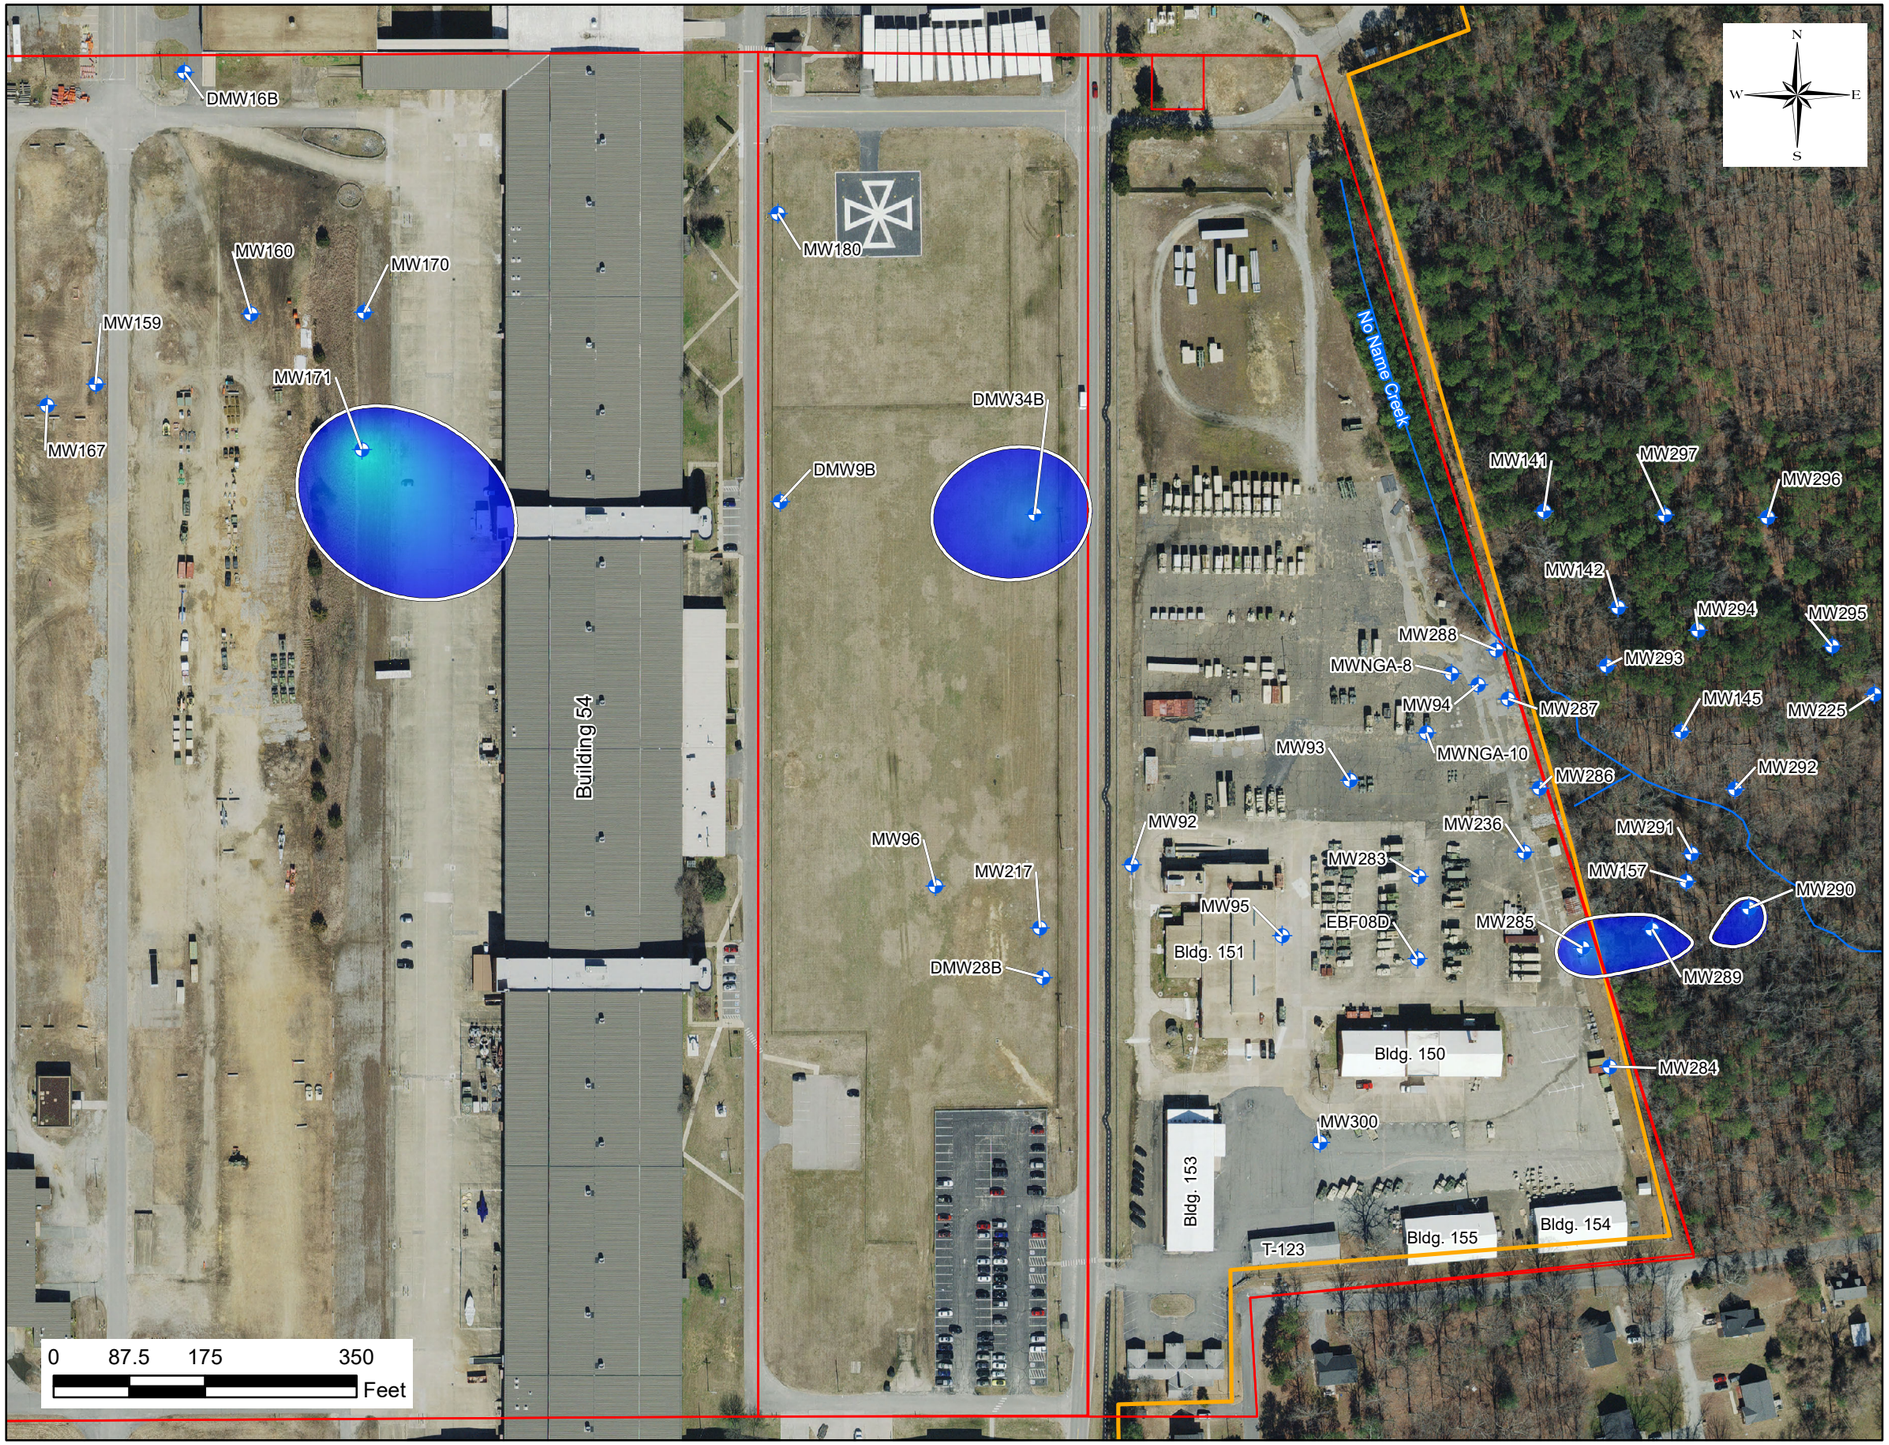
4.11.1.8 CB

For the surficial aquifer, plume renderings in Figure 4-12 (page 4-43) show the extent of CB at concentrations ≥ MCL (100 µg/L). The northern area does not have detections of CB. In the southern area, CB has a detection greater than the MCL at well MW-260 (290 µg/L) in OU 2 and at well MW-268 (160 µg/L) in OU 3. A localized plume also occurs in OU 3 encompassing wells MW-271 and MW-275 with a maximum concentration of 200 µg/L at MW-271.

4.11.2 Confined Aquifer

This section describes the distribution of VOCs in the confined aquifer for VOCs that have concentrations greater than cleanup levels (MCLs) in one or more samples. For the northern monitoring area, the lateral extent of VOCs plumes in the confined aquifer is within the installation area. For the southern monitoring area, the VOC plume in the confined aquifer extends from the OU 2 area across OU 3 approximately 380 ft. into the offsite area. The lateral extent of the VOC plume in the southern area is defined by VC. Figure 4-13 through Figure 4-16 (pages 4-48 through 4-51) show the distribution of PCE, TCE, cDCE, and VC within the confined aquifer.

4.11.2.1 PCE



For the confined aquifer, plume renderings in Figure 4-13 (page 4-48) show the extent of PCE at concentrations ≥ MCL (5 µg/L). In the northern area, limited plume areas occur around wells MW-171 (32 µg/L) in OU 1 and around DMW-34B (11 µg/L) in OU 2.

Limited PCE plume areas are located along the fence line in OU 3 extending into the offsite area between the installation fence line and No Name Creek. The maximum PCE concentration detected in the southern area is 13 µg/L at well MW-285 at the fence line.

4.11.2.2 TCE

For the confined aquifer, plume renderings in Figure 4-14 (page 4-49) show the extent of TCE at concentrations ≥ MCL (5 µg/L). Isoconcentration lines for TCE in Figure 4-14 are based a logarithmic scale from 5 µg/L to 50 µg/L.

The northern area has two limited TCE plume areas in the OU 1 area east of Building 54 with a maximum concentration of 34 µg/L at well MW-160. A TCE plume in the southern area extends from the Building 151 area across the OU 3 area into the offsite site approximately 320 ft. beyond the installation fence line. The maximum concentration of TCE in the southern area is 200 µg/L at well MW-157 in the offsite area between the installation fence line and No Name Creek. The approximate area of the TCE plume is 4.88 acres.

L:\Legacy\USGNA2FP002\Data\projects\0_GIS\DLA\OU8\Annual Report Figures\2024\Figure 4-16 Potomac Lateral Distribution of VC 2024

4.11.2.3 cDCE

For the confined aquifer, plume renderings in Figure 4-15 (page 4-50) show the extent of cDCE at concentrations ≥ MCL (70 µg/L). Isoconcentration lines for cDCE in Figure 4-15 are based a logarithmic scale from 7 µg/L to 70 µg/L.

The northern area has detected cDCE concentrations less than the MCL. A cDCE plume in the southern area extends across the OU 3 area into the offsite site approximately 330 ft. beyond the installation fence line. The maximum concentration of cDCE in the southern area is 1,300 µg/L at well MW-291 in the offsite area between the installation fence line and No Name Creek. The approximate area of the VC plume is 3.68 acres.

4.11.2.4 VC

For the confined aquifer, plume renderings in Figure 4-16 (page 4-51) show the extent of VC at concentrations equal to and greater than the MCL of 2 µg/L. Isoconcentration lines for VC in Figure 4-16 are based a logarithmic scale from 2 µg/L to 20 µg/L.

The northern area has one location (DMW-9A) with a detected VC concentration (result is > MCL). A VC plume in the southern area extends from the OU 2 area across the OU 3 area into the offsite site approximately 370 ft. beyond the installation fence line. The maximum concentration of VC in the southern area is 250 µg/L at well MW-291 in the offsite area between the installation fence line and No Name Creek. The approximate area of the VC plume is 7.74 acres.

4.12 Dissolved Gases Distribution in Groundwater

Section 4.12 describes the distribution of dissolved gases for the surficial aquifer and confined aquifers at OU 6.

4.12.1 Surficial Aquifer

This section describes the distribution of carbon dioxide, methane, ethene, and ethane for the northern and southern monitored areas of the surficial aquifer.

4.12.1.1 Carbon Dioxide

In the northern area, two well locations (MW-247 and MW-252) outside of the VOC plume area (concentrations < MCLs) did not have detections of carbon dioxide (<5 mg/L). Upgradient well MW-298 in OU 1 had a detected carbon dioxide concentration of 38 mg/L. Carbon dioxide levels in the 2021 ISB area generally are > 100 mg/L with a mean concentration of 119.1 mg/L in the northern monitored area. The interquartile concentrations for carbon dioxide in the northern area are 43.75 mg/L (25^{th} percentile) and 190 mg/L (75^{th} percentile).

In the southern area, two well locations (MW-265 and MW-271) monitored outside of the plume area (concentrations < MCLs) did not have detections of carbon dioxide (< 5 mg/L). A third sample in the plume area in OU 3 (MW-271) did not have detectable levels of carbon dioxide. Carbon dioxide levels in the 2021 ISB area generally are > 100 mg/L with a mean concentration of 119.1 mg/L in the northern monitored area. The interquartile concentrations in the southern area are 42.75 mg/L (25^{th} percentile) and 155 mg/L (75^{th} percentile). In the southern area, the highest concentration of carbon dioxide is 510 mg/L at well MW-260 in the OU 2 area where ISB actions occurred in 2015.

4.12.1.2 Methane

In the northern area, methane levels outside of the VOC plume (concentrations < MCLs) generally are in the range of not detectable to 10 µg/L. Methane levels in the ISB area are > 500 µg/L with a mean concentration of 8,000 µg/L in the northern monitoring area. The interquartile concentrations for methane in the northern area are 1,525 µg/L (25^{th} percentile) and 12,750 µg/L (75^{th} percentile).

In the southern area, methane levels outside of the VOC plume (concentrations < MCLs) generally are in the range of not detectable to 50 µg/L. Methane in the southern monitoring area has a mean concentration of 2,332 µg/L for southern monitoring area. The interquartile concentrations for methane in the southern area are 88.5 µg/L (25^{th} percentile) and 3,175 µg/L (75^{th} percentile).

4.12.1.3 Ethene

Figure 4-17 (page 4-54) shows the distribution of ethene in groundwater within the surficial aquifer. Plume renderings show the extent of ethene at concentrations ≥ 1 µg/L. Isoconcentration lines for ethene in Figure 4-17 are based a logarithmic scale from 1 µg/L to 1,000 µg/L.

In the northern area, the ethene plume extends across the OU 1 area and beneath Building 54.Three areas within this plume have ethene concentrations > 10 µg/L principally in, around, and downgradient of ISB injections completed in October-November 2021. The maximum concentration of ethene is 4,900 µg/L at well MW-129 with a mean concentration of 289 µg/L in the northern monitored area. The interquartile concentrations for ethene in the northern area are 2.1 µg/L (25th percentile) and 81 µg/L (75th percentile).

In the southern area, the ethene plume extends from the OU 2 area across the OU 3 area with a downgradient extent near the installation fence line. The contiguous plume has ethene concentrations ≥ 10 µg/L. The maximum concentration of ethene is 1,000 µg/L at well MW-260 (OU 2) with a mean concentration of 147 µg/L in the southern monitored area. The interquartile concentrations for ethene in the southern area are 5.5 µg/L (25th percentile) and 165 µg/L (75th percentile).

4.12.1.4 Ethane

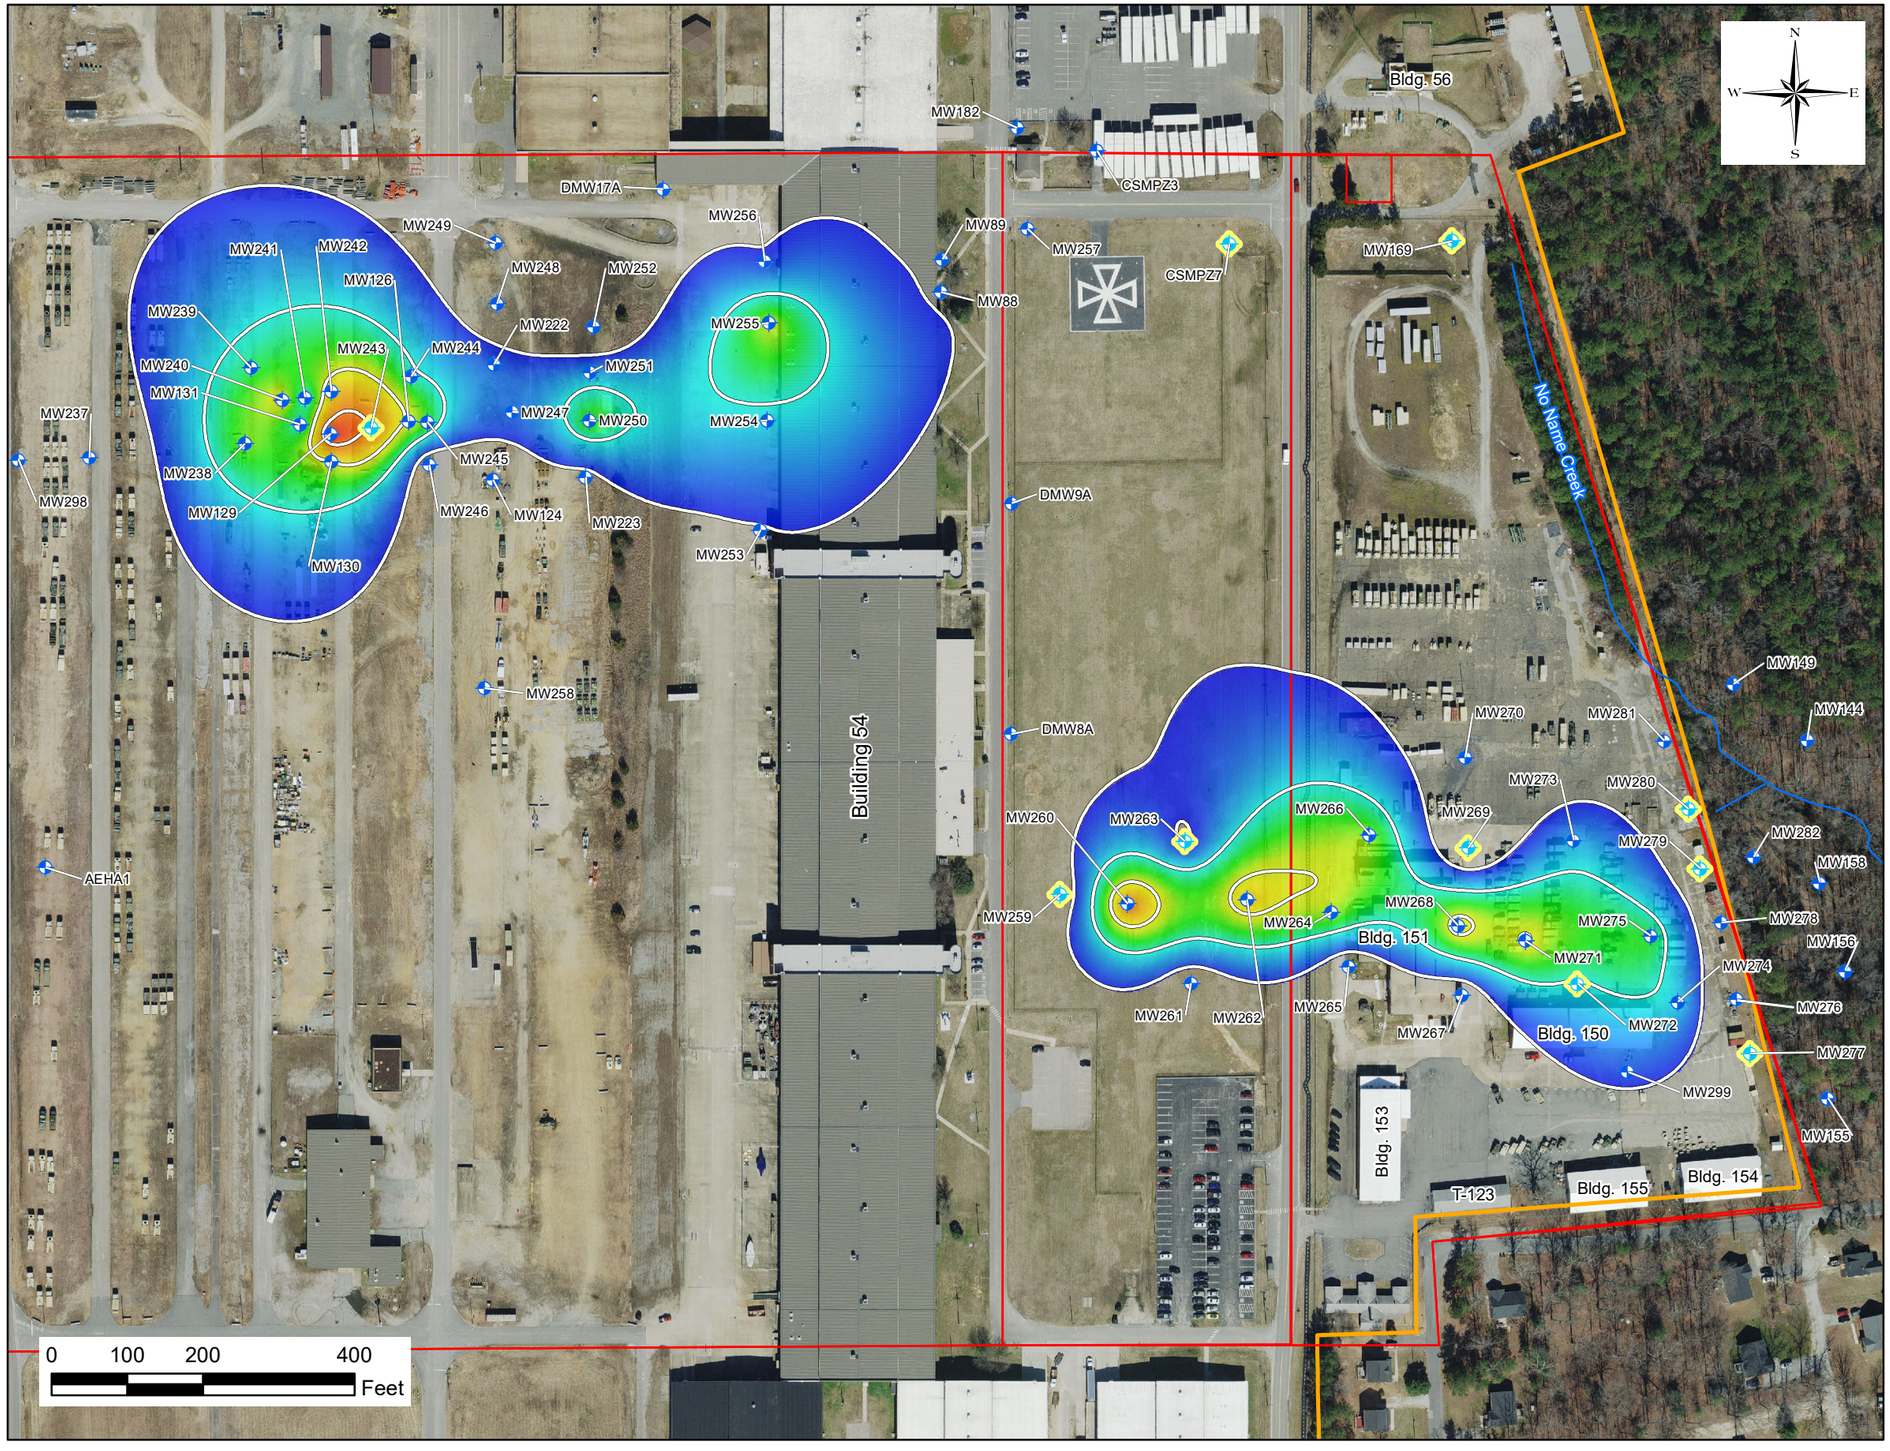
Figure 4-18 (page 4-55) shows the distribution of ethane in groundwater within the surficial aquifer. Plume renderings show the extent of ethane at concentrations ≥1 µg/L. Isoconcentration lines for ethane in Figure 4-18 are based a logarithmic scale from 1 µg/L to 100 µg/L. Limited ethane plume areas occur In the northern area with a maximum concentration of 6 µg/L detected at well MW-241 in the 2021 ISB area. Thirteen of 32 samples in the northern area had detections of ethane with a distribution mean of 2.1 µg/L for detected results.

In the southern area, the ethane plume extends from the OU 2 area across the OU 3 area into the offsite monitored area. The ethane plume with concentrations ≥ 10 µg/L extends from the OU 2 area across the OU 3 area with a downgradient extent near the installation fence line. The maximum concentration of ethene is 570 µg/L at well MW-260 (OU 2) with a mean concentration of 89 µg/L in the southern monitored area. The interquartile concentrations for ethane in the southern area are 3.3 µg/L (25th percentile) and 110 µg/L (75th percentile).

4.12.2 Confined Aquifer

This section describes the distribution of carbon dioxide, methane, ethene, and ethane for the northern and southern monitored areas of the confined aquifer.

4.12.2.1 Carbon Dioxide



In the northern monitoring area, the levels of carbon dioxide at the nine (9) monitored locations ranged from 21 mg/L (MW-160) to 190 mg/L (MW-170) with a mean concentration of 60 mg/L. The southern area had detectable levels of carbon dioxide in 17 of 19 samples with detected concentrations ranging from 6 mg/L (MW-288) to 100 mg/L (MW-291). The highest levels of carbon dioxide occurred in OU 2 and along the fence line/offsite area where VOC concentrations are highest.

4.12.2.2 Methane

In the northern area, methane levels are highest in OU 1 beneath the groundwater source zone in the surficial aquifer with the highest concentrations in the range of 14,000 µg/L to 21,000 µg/L and concentration < 10 µg/L at other locations. In the southern area, methane in the monitored area has a mean concentration of 1,100 µg/L with the highest concentration (11,000 µg/L) at the fence line in OU 3. Monitoring wells outside of the MCL exceedance area generally have methane concentrations < 50 µg/L.

4.12.2.3 Ethene

Figure 4-19 (page 4-56) shows the distribution of ethene in groundwater within the confined aquifer. Plume renderings show the extent of ethene at concentrations equal to and > 1 µg/L. Isoconcentration lines for ethene in Figure 4-19 are based a logarithmic scale from 1 µg/L to 100 µg/L. A limited area of ethene in groundwater occurs in the northern monitoring area around well MW-170 in OU 1.

Figure 4-20
2024 Lateral Distribution of
Ethane in the Confined Aquifer

2024 Annual Monitoring Report - OU 6
Defense Supply Center Richmond
Richmond, VA

Prepared By: JLD	Reviewed By: JOS
Scale: 1 " = 175 '	Date: September 12, 2024

L:\Legacy\USGNA2FP002\Data\projects\0_GIS\DLA\OU8\Annual Report Figures\2024\Figure 4-20 Potomac Lateral Distribution of Ethane 2024

In the southern area, an ethene plume extends from OU 2 across OU 3 and approximately 180 ft. beyond the installation fence line. Well MW-95 near the eastern edge of Building 151 has the highest ethene concentration (380 µg/L) in the southern area.

4.12.2.4 Ethane

Figure 4-20 (page 4-57) shows the distribution of ethane in groundwater within the confined aquifer. Plume renderings show the extent of ethene ≥ 1 µg/L. Isoconcentration lines for ethane in Figure 4-20 are based a logarithmic scale from 1 µg/L to 100 µg/L.

Monitored locations in the northern area did not have detections of ethane. In the southern area, an ethane plume extends from OU 2 across OU 3 and approximately 300 ft. beyond the installation fence line. Well MW-95 near the eastern edge of Building 151 has the highest ethene concentration (33 µg/L) in the southern area.

4.13 Distribution of TOC in Groundwater

Section 4.13 describes the distribution of TOC for the surficial aquifer and confined aquifers at OU 6.

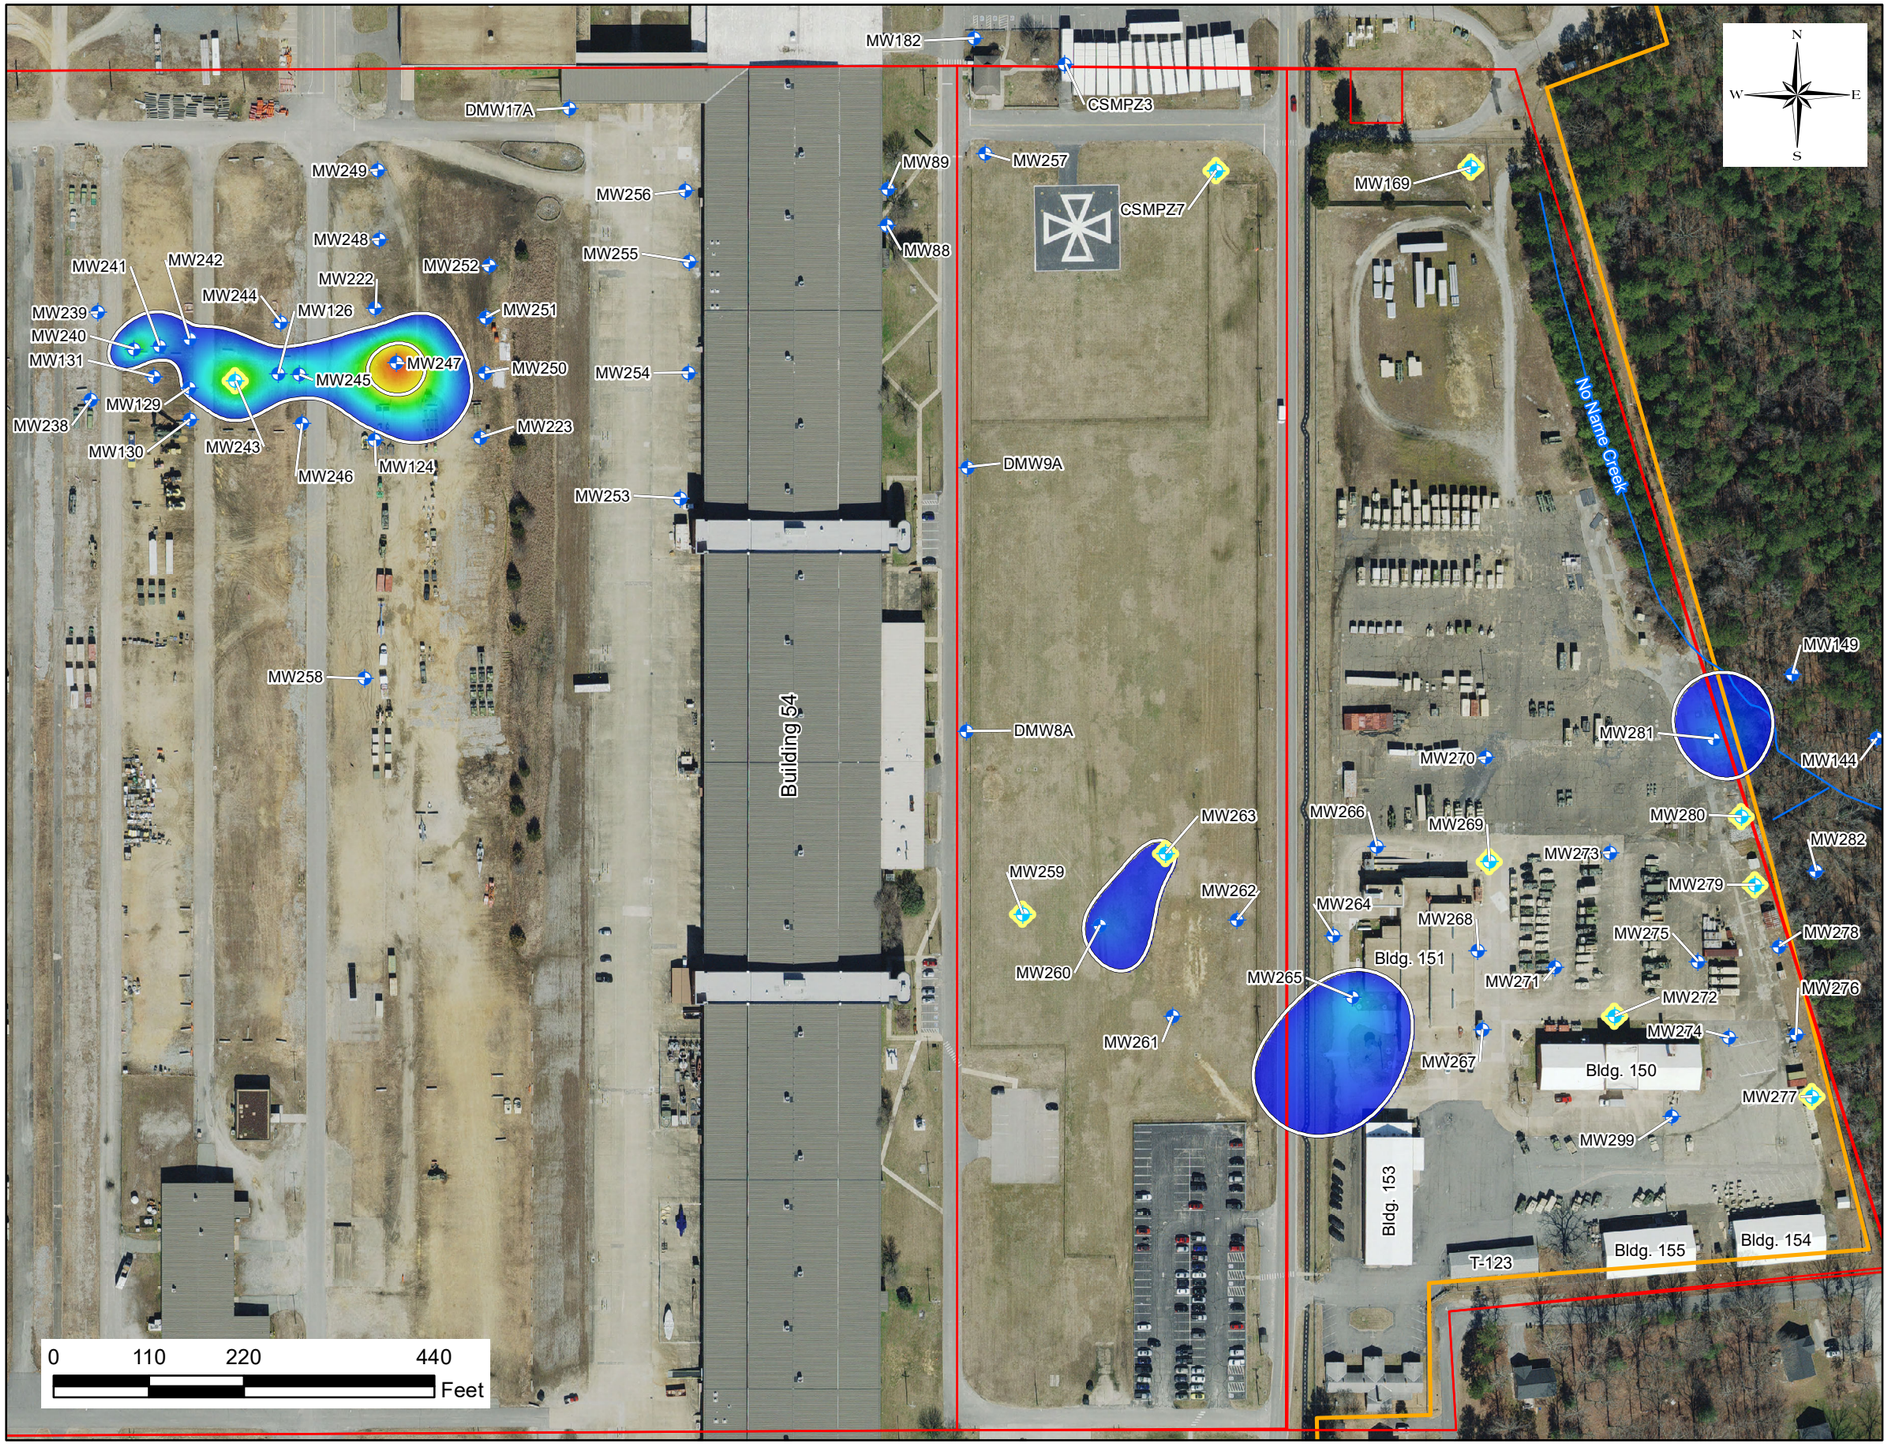
4.13.1 Surficial Aquifer

Figure 4-21 (page 4-60) shows the distribution of TOC in groundwater within the surficial aquifer. Plume renderings show the extent of TOC at concentrations ≥ 10 mg/L associated with ISB injections performed at OU 6. Isoconcentration lines for TOC in Figure 4-21 are based a logarithmic scale from 10 mg/L to 100 mg/L. In the northern monitoring area, the area with TOC ≥ 10 mg/L encompasses the 2021 ISB area in OU 1 with concentrations > 20 mg/L at wells MW-265 (24 mg/L), MW-241 (27 mg/L), MW-245 (27 mg/L), MW-240 (85 mg/L), MW-243 (130 mg/L), and MW-247 (260 mg/L).The southern area has areas of TOC concentrations > 10 mg/L in OU 2 encompassing wells MW-260 and MW-263, in OU 3 around well MW-265, and along the installation fence line around well MW-281.

4.13.2 Confined Aquifer

In the northern area, TOC concentrations in groundwater at monitored locations are < 1 mg/L except at wells MW-259 (26 mg/L), MW-167 (62 mg/L), and MW-170 (450 mg/L) within an ISB injection area in the confined aquifer within OU 1. In the southern area, TOC concentration in groundwater at monitoring locations are < 5 mg/L except at well MW-289 (8.8 mg/L) in the offsite monitored area and at well MW-217 in the OU 2 area.

4.14 Data Validation



Appendices C.1 and C.2 have laboratory and data validation reports for monitoring conducted at OU 6 for FY 2024. AECOM used the Earthsoft EQuIS Data Qualification Module (DQM) using Stage 2a electronic data deliverables to perform data validation on 100% of the data obtained for site monitoring. Measured performance criteria consist of the DoD Quality Systems Manual 5.4 Worksheets #12 and #28. Validation procedures followed included:

- DoD General Data Validation Guidelines, November 2019.
- National Functional Guidelines for Organic Superfund Methods Data Review, EPA 540-R-20-005, November 2020.
- National Functional Guidelines for Inorganic Superfund Methods Data Review, EPA 540-R-20-006, November 2020.
- The Quality Assurance Project Plan for the project.

The data review included the following elements:

Sample preservation and technical hold times	Temperature	Method and field blanks
Surrogate/tracer spikes	Matrix spike/matrix spike duplicates	Laboratory duplicates
Laboratory replicates	Laboratory control samples	Relative percent difference checks
Verification of sample units		

Table 4-8 (page 4-61) has a summary of the data validation results for FY2024 monitoring at OU 6. For each monitoring task, this table identifies sample type and quantities, data validation qualifiers, and data usability results. All data, as qualified, are usable for the intended purpose of contamination and remedy performance assessment.

Notes:
N = normal sample, DUP = duplicate sample, LCS = laboratory control sample, LCSD = laboratory control sample duplicate, EB = equipment blank, MB = method blank, TB = trip blank
B = blank contamination detected in an associated quality control blank at a concentration greater than the laboratory quantitation limit (method blank, trip blank, equipment blank),
J = the reported result was an estimated value with an unknown bias, J+ = the result was an estimated quantity, but the result may be biased high, J- = the result was an estimated quantity, but the result may be biased low,
UJ = the analyte was not detected and was reported as less than the LOD or as defined by the customer. However, the associated numerical value is approximate,
R = Rejected. this datum has been deemed by the project team, due to deficiencies in meeting quality control criteria and/or data quality objectives, as unusable for use in making project decisions.
X = the sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

1 $\%\ \text{Usability} = \frac{No.of\ Rejected\ Results}{No.of\ Normal\ Samples + No.of\ Duplicate\ Samples} \times 100$

5. Remedy Performance Assessment

Section 5.0 has a remedy performance assessment for OU 6. Initial ISB remedial actions occurred at OU 6 in 2015 as part of post-ROD remedy implementation with follow-up ISB actions in October-November 2021. The 2015 ISB actions included EVO injections at injection well transects in the northern area (surficial aquifer) and southern area (surficial and confined aquifers). The ISB actions completed in October-November 2021 included targeted source zone treatment of groundwater beneath OU 1 using semi-soluble substrate EVO with bioaugmentation. The injection design used three grid treatment areas with 80 injection points (DPT, see Figure 5-1, page 5-2).

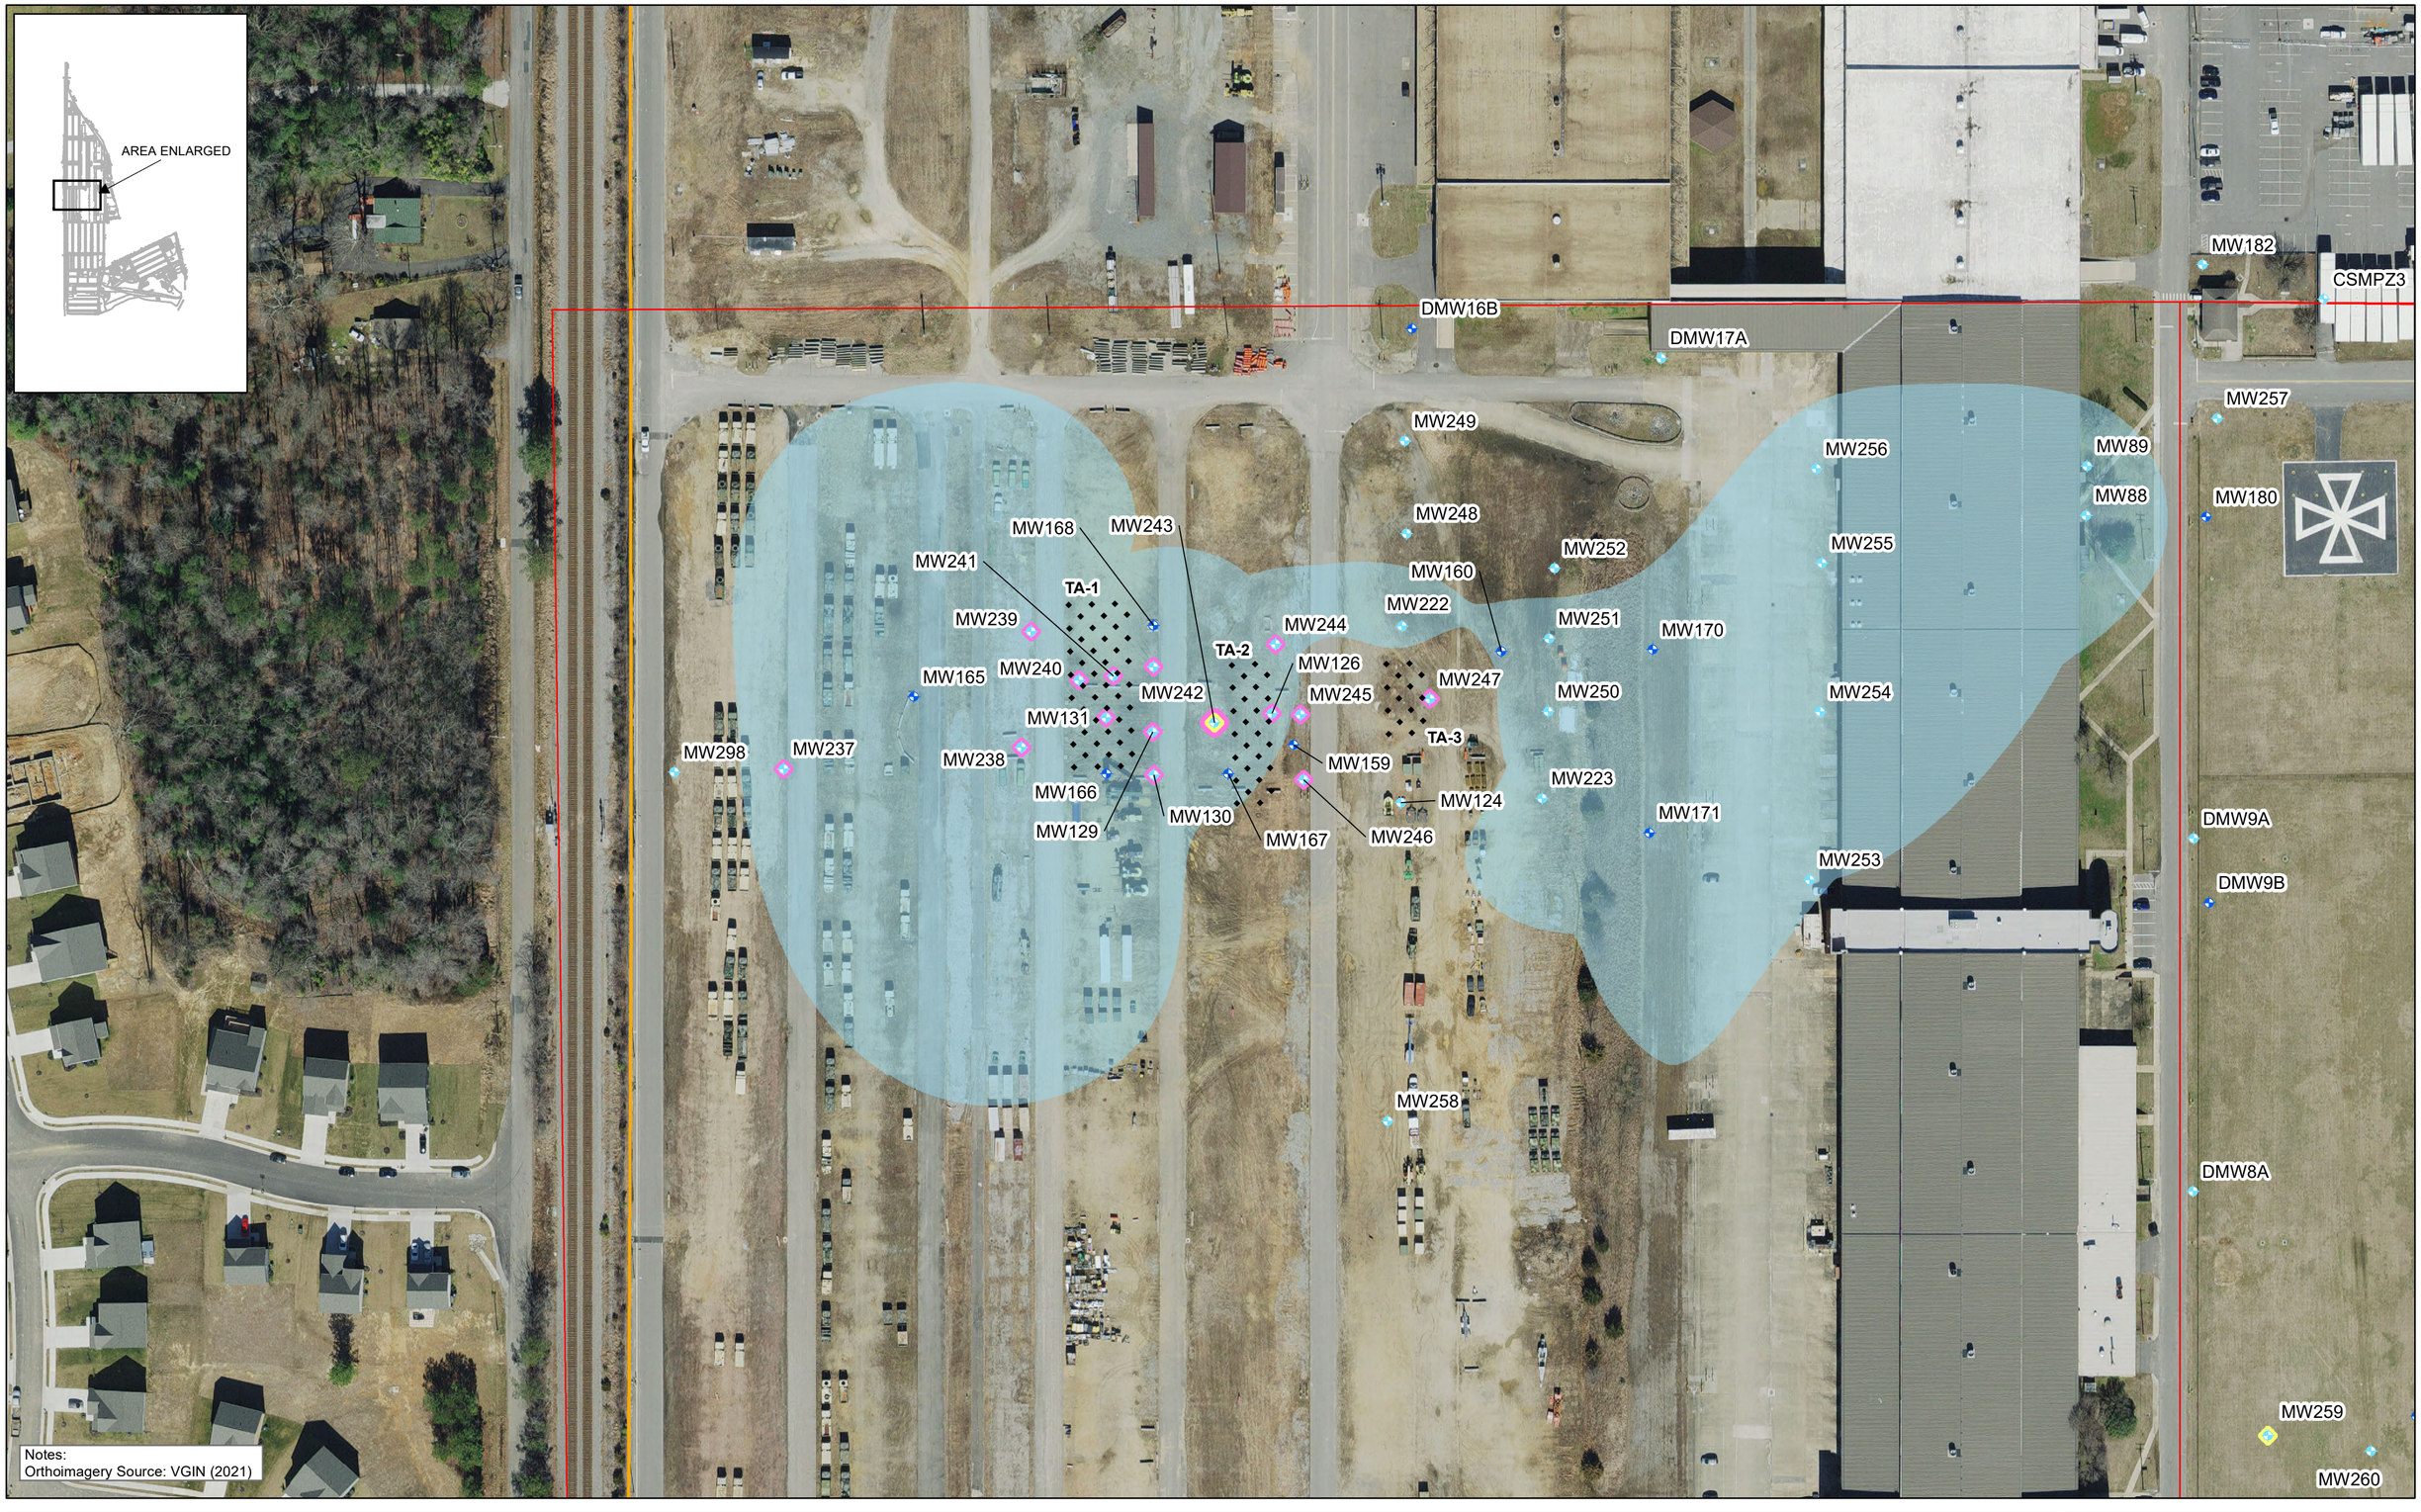
5.1 Evaluation Methods

The remedy performance assessment uses exploratory data analysis and trend analysis to evaluate remedy performance.

5.1.1 Data Distribution

Data distribution has an influence on the approaches used for analyzing data and remediation processes and selection of parametric and non-parametric methods of analysis. This evaluation used distribution visualizations and the Lilliefors test, which is a hypothesis test that evaluates whether the data distribution comes from a distribution in the normal family, against the alternative that it does not come from a normal distribution.

5.1.2 Outlier Detection



Methods of outlier detection used for this evaluation included box plots and outlier tests (quartile method). The quartile method identifies an outlier locationally more than 1.5 interquartile ranges above the upper quartile (75%) or below the lower quartile (25%). This method can evaluate both normal and non-normal distributions.

5.1.3 Coefficient of Variation

Coefficient of variation (CV) of a time series data set is the ratio of standard deviation and mean. CV provides a measure of variability of intra-well and inter-well time series data. Generally, a data distribution with CV>1 has a higher relative variation contrasting with a CV<1 that has a lower relative variation. The CV in combination with correlation and trend analysis can evaluate the relative stability of site conditions and intrinsic processes.

5.1.4 Linear Correlation

Correlation quantifies the strength of a linear relationship between two variables. When there is no correlation between two variables, then there is no tendency for the values of the variables to increase or decrease together. This assessment uses Pearson's linear correlation coefficient to evaluate one parameter versus (vs.) time or a comparison matrix of multiple parameters over time. Values of the correlation coefficient can range from –1 to +1. A value of –1 indicates perfect negative correlation, while a value of +1 indicates perfect positive correlation. A value of 0 indicates no correlation between the sets of data observations. The analysis also tests the null hypothesis of no correlation against an alternative hypothesis for positive, negative, or nonzero correlation at a significance of 5 percent (%) or alpha (α) of 0.05. A calculated probability value (p-value) <0.05 rejects the null hypothesis of no correlation indicating the correlation is significantly positive, negative, or different than 0.

Local Extrema

Local extrema analysis of a time series data set identifies local maxima and local minima for the LTM period evaluated for each site. The frequency, location, and prominence of local extrema can provide insights on time series data patterns and variation, and intrinsic processes in groundwater at the sites. The prominence of a local maximum (or peak) measures how the peak stands out with respect to its height and location relative to other peaks. Conversely, the prominence of a local minimum (or valley) measures how the valley stands out with respect to its depth and location relative to other valleys.

5.2 Trend Evaluations

This remedy performance assessment uses various methods to evaluate changes or trends in data over time. Time series data can vary over time due to a combination of factors including long-term trend, oscillatory or seasonal variation, or random (unassignable) causes.

5.2.1 Mann-Kendall Tests

Forms of the non-parametric Mann-Kendall (M-K) test for trend used for data evaluations include original, cumulative, and sequential. The M-K tests detect monotonic trends in data. M-K tests allow for missing values, do not require a particular distribution assumption, and can accommodate trace reported values and left censored data (non-detect).

The original form of the M-K test (two-way) evaluates the null hypothesis of no trend (H_0) vs. an alternative hypothesis (H_A) of trend at a significance level of 5% (0.05).[1] A test result of H=0 indicates no trend with a result of H =1 indicate a trend. In null hypothesis statistical testing, the probability value (p-value) of statistical test is the probability, under the null hypothesis, of obtaining a value of the test statistic as extreme or more extreme than the value computed from the sample. Typically, a p-value quantifies the statistical significance of the result is less than or equal to the significant level. In a significance test, the null hypothesis H_0 is rejected if the p-value is less than or equal to a predefined threshold value of significance (alpha).

A cumulative form of the M-K test used in the evaluation consists of one-way test that can evaluate an alternative hypothesis of trend greater than zero or less than zero.[2] A sequential version of the M-K test used in the LTM evaluation allows for detection of the approximate beginning of a developing trend.[3] When the progressive series (original time series) and retrograde (backward sequential time series) curves are plotted, the intersection of the curves locates an approximate potential trend turning point. If the intersection of the curves occurs within +/- 1.96 (5% level) of the standardized statistic, a detectable change at that point in the time series can be inferred.

5.2.2 Singular Spectrum Analysis (SSA)

SSA is a spectrum estimation method (non-parametric) to analyze time series data for trend and forecasting. SSA assumes the additive decomposition of the data into long-term trend, oscillatory or seasonal trend or trends, and remainder or random. The SSA function[4] used for the LTM evaluation solves for long-term trend without decomposition of seasonal or remainder components given the variable or annual frequency of sampling. Calculated long-term trend as tabular and plotted data allows for further analysis of rates of change and degree of trend.

5.2.3 Regression

Regression models describe the relationship between a response (output) variable, and one or more predictor (input) variables. For trend evaluation of data, the predictor variable is time. Regression models

[1] Mann, H. B. (1945), Nonparametric tests against trend, Econometrica, 13, 245– 259. Kendall, M. G. (1975), Rank Correlation Methods, Griffin, London. MATLAB Code written by: Simone Fatichi -- simonef@dicea.unifi.it Copyright 2009, Date: 2009/10/03

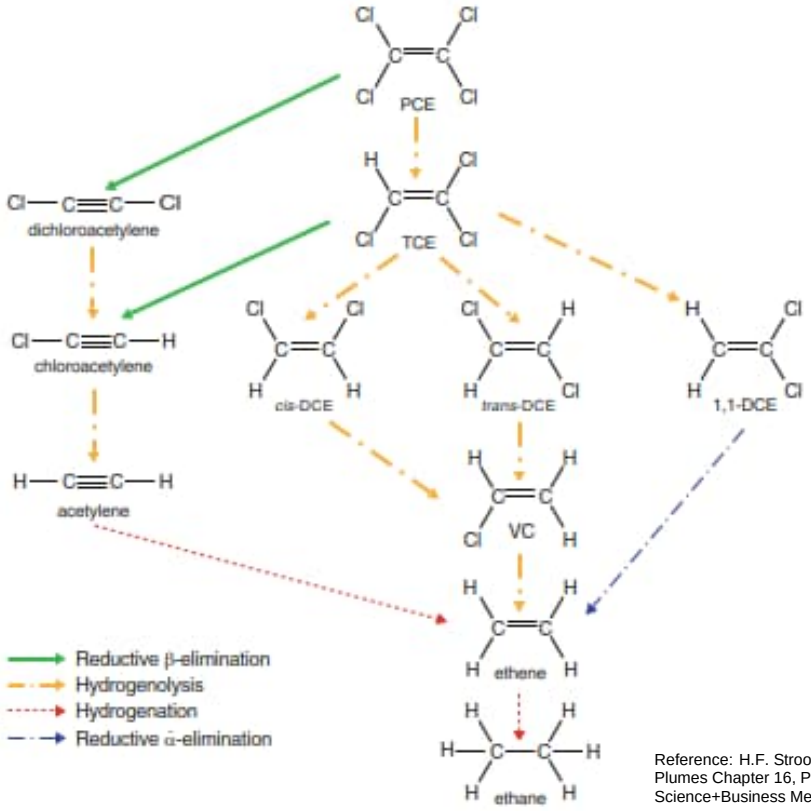
[3] Chatterjee, S., Bisai, D. and Khan, A., 2014. Detection of approximate potential trend turning points in temperature time series (1941–2010) for Asansol Weather Observation Station, West Bengal, India., Atmospheric and Climate Sciences, 4, pp.64-69.
[4] Singular Spectrum Analysis function using MATLAB 2022a.

can use linear and non-linear forms depending on the linearity of the relationship between the response and predictor variables. The regression analysis has a t-test to evaluate the statistical significance of regression slope with a calculated t-statistic and p-value. A statistically significant regression slope (not zero) can reveal the direction and relative magnitude of trend.



5.3 Bioremediation Assessment

Section 5.3 has a bioremediation assessment for OU 6 evaluating site conditions for 2022-2024 in response to ISB actions and intrinsic degradation processes.

5.3.1 Dechlorination Reactions

The remedy designs at OU 6 have used engineered processes targeting complete dechlorination of chlorinated ethenes and ethanes. Exhibit 5-1 shows the reaction pathways for chlorinated ethenes, the primary COCs at OU 6.

Exhibit 5-1 Pathways for Dechlorination of Chlorinated Ethenes

Reference: H.F. Stroo and C.H. Ward (eds.), In Situ Remediation of Chlorinated Solvent Plumes Chapter 16, Page 541, doi: 10.1007/978-1-4419-1401-9_16, #Springer Science+Business Media, LLC 2010

ISB designs have used slow-release substrates (EVO) for bioremediation at OU 6 that by design follow the hydrogenolysis pathway for dechlorination shown in Exhibit 5-1. Ethene generated from the various reaction pathways cab degrade to ethane by hydrogenation. Ethane is generated by a combination of dechlorination of chlorinated ethanes and by hydrogenation processes from ethene. In an oxidizing geochemical environment, ethene degrades to carbon dioxide and water.

5.3.2 Anaerobic Biodegradation Screening

Tables 5-1 and 5-2 (pages 5-7 and 5-8) have anaerobic biodegradation screening of monitored plume areas for the surficial and confined aquifers, respectively, for 2022-2024 using annual site-wide monitoring data. The EPA (1998) bioattenuation screening process (EPA 1998) is used for these evaluations. This screening process uses chemical and geochemical data to determine if biodegradation is occurring at the time of the monitoring. The scoring process results in interpretations on evidence for anaerobic biodegradation of chlorinated VOCs (reductive dechlorination) based on the total score as follows: 0 to 5 is inadequate evidence, 6 to 14 is limited evidence, 15 to 20 is adequate evidence, and > 20 is strong evidence. Scores of ≥ 15 indicate probable occurrence of biodegradation processes.

5.3.2.1 2022 Screening Results

Section 5.3.2.1 discusses the anaerobic biodegradation screening results for 2022 Annual Monitoring completed in April-May 2022.

Surficial Aquifer Northern Area

In Table 5-1, the screening results for the surficial aquifer for April-May 2022 in the northern area represent data collected approximately six (6) months after the 2021 injections. The screening score is 27 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, low sulfate concentrations < 3 mg/L, sulfide concentrations > 1 mg/L, TOC concentrations > 20 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels more than 10 times higher than background. Chloride levels are more than two (2) times higher than background providing evidence of daughter production from the reduction of organic chlorine.

Surficial Aquifer Southern Area

In Table 5-1, the screening score for the surficial aquifer (southern area) for April-May 2022 is 26 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, lower sulfate concentrations < 12 mg/L, sulfide concentrations > 1 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels 10 times or more higher than background. Chloride levels are more than six (6) times higher than background providing evidence of daughter production from the reduction of organic chlorine.

Confined Aquifer Northern Area

In Table 5-2, the screening score for the confined aquifer (northern area) for April-May 2022 is 15 indicating adequate evidence of anaerobic biodegradation processes. These results are driven by lower concentrations of PCE and TCE with limited detections of cDCE (<MCL) and absence of VC. Geochemical conditions providing evidence of reducing conditions include the presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels 10 or more times higher than background. Chloride levels are more than two (2) times higher than background providing evidence of daughter production from the reduction of organic chlorine.

Confined Aquifer Southern Area

In Table 5-2, the screening score for the confined aquifer (southern area) for April-May 2022 is 22 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, lower sulfate concentrations < 14 mg/L, presence of methane > 0.5 mg/L, and carbon dioxide and alkalinity levels 10 times higher than background. Chloride levels are more than 10 times higher than background providing evidence of daughter production from the reduction of organic chlorine.

5.3.2.2 2023 Screening Results

Section 5.3.2.2 discusses the anaerobic biodegradation screening results for 2023 Annual Monitoring completed in May 2023.

Surficial Aquifer Northern Area

In Table 5-1, the screening results for the surficial aquifer for May 2023 in the northern area represent data collected approximately 18 months after the 2021 injections, which at the mid-point of the injection design treatment period. The screening score is 22 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, low sulfate concentrations < 3 mg/L, TOC concentrations > 20 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels 10 times or more higher than background. Chloride levels are slightly less than two (2) times higher than background levels. The difference in the screening results between 2022 and 2023 is higher mean sulfide and chloride levels in the monitored area for 2022 compared to 2023 results.

Surficial Aquifer Southern Area

In Table 5-1, the screening score for the surficial aquifer (southern area) for May 2023 is 22 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, lower sulfate concentrations < 4 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels 10 times or more higher than background. Chloride levels are four (5) times higher than background providing evidence of daughter production from the reduction of organic chlorine. The difference in the screening results between 2022 and 2023 is higher mean sulfide and ethene/ethane levels in the monitored area for 2022 compared to 2023 results.

Confined Aquifer Northern Area

In Table 5-2, the screening score for the confined aquifer (northern area) for May 2023 is 20 indicating adequate evidence of anaerobic biodegradation processes. These results are driven by overall lower concentrations of PCE and TCE with limited detections of cDCE and VC (<MCL). Geochemical conditions providing evidence of reducing conditions include the presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels 10 or more times higher than background. Chloride levels are more than two (2) times higher than background providing evidence of daughter production from the reduction of organic chlorine. Combined ethene/ethane levels are < 0.01 µg/L. The screening results for 2023 and 2024 are 20.

Confined Aquifer Southern Area

In Table 5-2, the screening score for the confined aquifer (southern area) for May 2023 is 22 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, lower sulfate concentrations < 10 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels five (5) times higher than background. Chloride levels are more than 10 times higher than background providing evidence of daughter production from the reduction of organic chlorine. Both 2022 and 2023 have screening scores of 22.

5.3.2.3 2024 Screening Results

Section 5.3.2.3 discusses the anaerobic biodegradation screening results for 2024 Annual Monitoring completed in May 2024.

Surficial Aquifer Northern Area

In Table 5-1, the screening results for the surficial aquifer for May 2024 in the northern area represent data collected approximately 30 months after the 2021 injections, which is approximately 83% through the

injection design treatment period. The screening score is 25 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, low sulfate concentrations < 3 mg/L, TOC concentrations > 20 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels 10 times or more higher than background. Chloride levels are slightly more than two (2) times higher than background levels. The difference in the screening results between 2022 and 2023 is higher chloride and ethene/ethane levels in the monitored area for 2024 compared to 2023 results.

Surficial Aquifer Southern Area

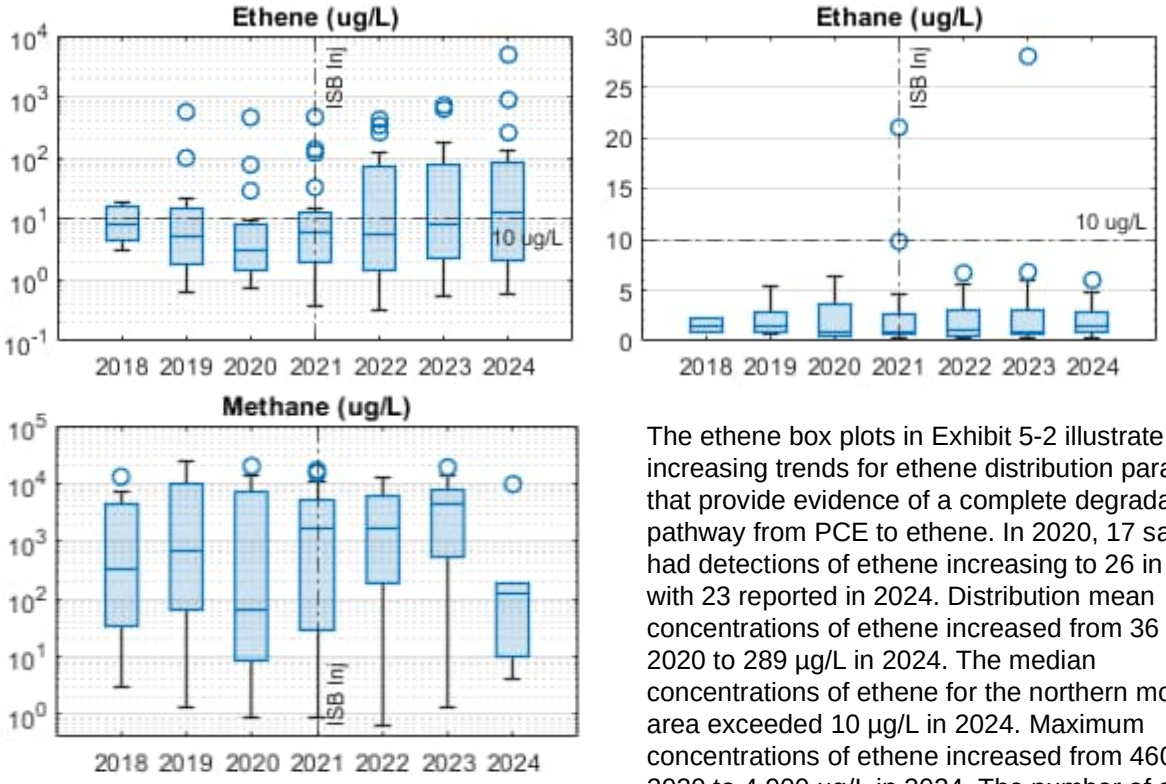
In Table 5-1, the screening score for the surficial aquifer (southern area) for May 2024 is 23 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, lower sulfate concentrations < 15 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels five (5) times higher than background. Chloride levels are 10 times higher than background providing evidence of daughter production from the reduction of organic chlorine. The difference in the screening results between 2024 and 2023 is higher ethene/ethane levels in the monitored area for 2024 compared to 2023 results.

Confined Aquifer Northern Area

In Table 5-2, the screening score for the confined aquifer (northern area) for May 2024 is 20 indicating adequate evidence of anaerobic biodegradation processes. These results are driven by overall lower concentrations of PCE and TCE with limited detections of cDCE and VC (<MCL). Geochemical conditions providing evidence of reducing conditions include the presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels five (5) times higher than background. Chloride levels are more than two (2) times higher than background providing evidence of daughter production from the reduction of organic chlorine. Combined ethene/ethane levels are < 0.01 µg/L. The screening results for 2023 and 2024 are 20 compared to a result of 15 for 2022.

Confined Aquifer Southern Area

In Table 5-2, the screening score for the confined aquifer (southern area) for May 2024 is 22 indicating strong evidence of anaerobic biodegradation processes. These results are driven by reductive geochemical conditions and presence of degradation by products along the complete reaction pathway from PCE to ethane. Geochemical conditions indicate overall reductive pathways including the presence of ferrous iron > 1 mg/L, lower sulfate concentrations < 14 mg/L, presence of methane > 1 mg/L, and carbon dioxide and alkalinity levels five (5) times higher than background. Chloride levels are 15 times higher than background providing evidence of daughter production from the reduction of organic chlorine.



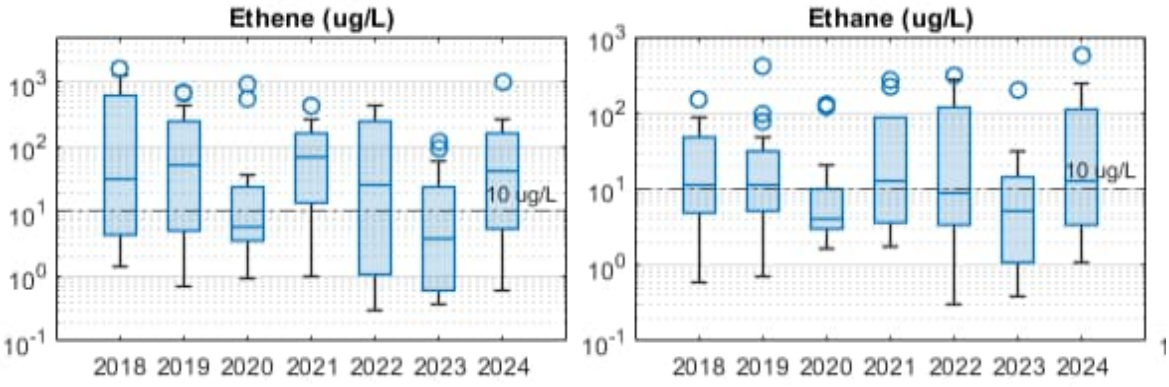
5.3.3 Dissolved Gases Evaluation

Section 5.3.3 discusses data distribution and trends for ethene, ethane, and methane that relate to biodegradation processes at OU 6. This evaluation focuses on monitoring completed for the period April 2018 through April 2024. The sampling frequency for dissolved gases included all collected samples for 2018-2022 ranging from 90 to 93 samples decreasing in 2023-2024 to 54 to 55 locations in and around plume areas with concentrations > MCLs. This assessment evaluates the surficial aquifer and confined aquifer in the northern and southern monitored areas at OU 6.

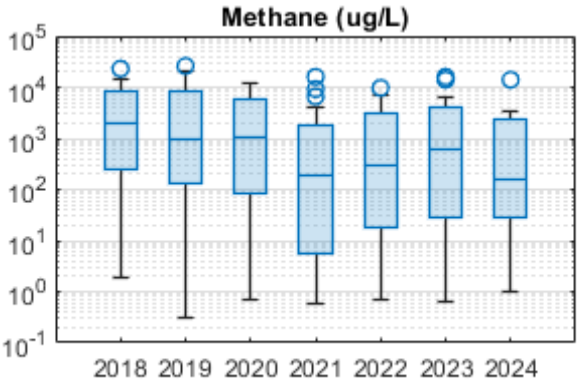
5.3.3.1 Surficial Aquifer: Northern Area

For the surficial aquifer in the northern area, Exhibit 5-2 (page 5-11) has a time series plots of data distributions (box plots) for ethene, ethane, and methane (2018-2024). This exhibit has reference lines for ISB injections completed in October-November 2021 (OU 1 area) and reference lines for ethene and ethane concentration thresholds of 10 µg/L used in the screening assessment presented in Table 5-1.

Exhibit 5-2 Dissolved Gas Distribution for Surficial Aquifer: Northern Area (2018-2024)



The ethene box plots in Exhibit 5-2 illustrate increasing trends for ethene distribution parameters that provide evidence of a complete degradation pathway from PCE to ethene. In 2020, 17 samples had detections of ethene increasing to 26 in 2022 with 23 reported in 2024. Distribution mean concentrations of ethene increased from 36 µg/L in 2020 to 289 µg/L in 2024. The median concentrations of ethene for the northern monitoring area exceeded 10 µg/L in 2024. Maximum concentrations of ethene increased from 460 µg/L in 2020 to 4,900 µg/L in 2024. The number of samples with ethene concentrations > 10 µg/L increased from three (3) in 2020 to 12 in 2023 and 2024. For 2018-2024, maximum concentrations for ethane peaked at 28 µg/L in 2023 in the ISB area.

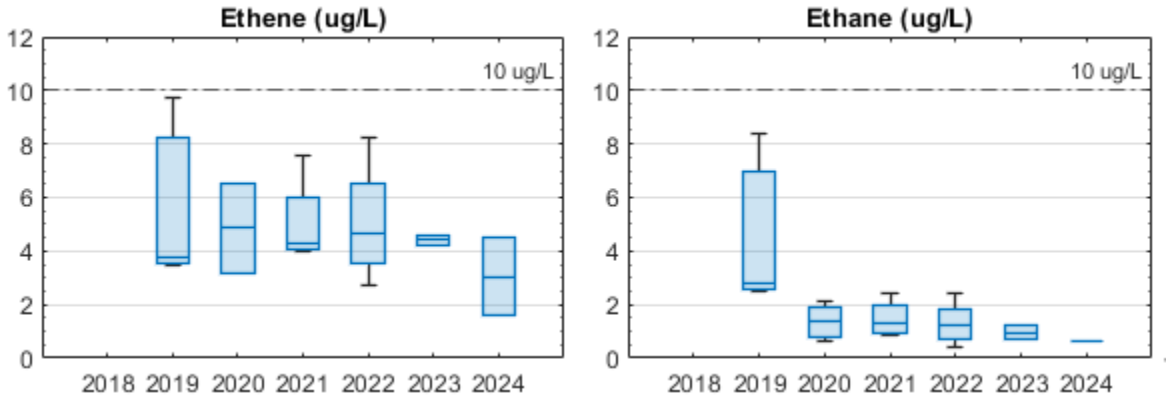


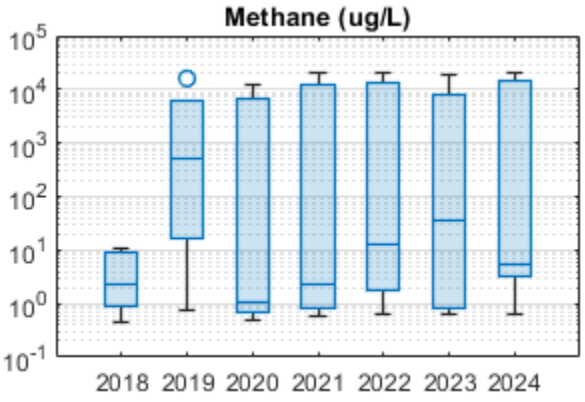
Ethane generation in the northern area increased after completion of the ISB injections in October-November 2021. The number of ethane detections increased from 6 in 2020 to a local maximum of 20 in 2022 with 13 detections reported for 2024. Mean concentrations for methane in the northern monitored area have exceeded 1 mg/L for 2018-2024 indicating highly reductive conditions that support anaerobic biodegradation processes for chlorinated VOCs.

5.3.3.2 Surficial Aquifer: Southern Area

For the surficial aquifer in the southern area, Exhibit 5-3 has a time series plots of data distributions (box plots) for ethene, ethane, and methane (2018-2024). This exhibit has reference lines for an ethene and ethane concentration threshold of 10 µg/L used in the screening assessment presented in Table 5-1. For 2018-2024, mean ethene concentrations in the southern monitoring area exceeded 110 µg/L except for 2023, which had a reported mean of 22 µg/L. The maximum concentrations of ethene reported for 2024 (1,000 µg/L) is the highest reported since 2018 (1,600 µg/L).

Exhibit 5-3 Dissolved Gas Distribution for Surficial Aquifer: Southern Area (2018-2024)





Mean concentrations for ethane have exceeded 20 µg/L for 2018-2024 with maximum concentrations ranging from 130 µg/L in 2020 to 570 µg/L in 2024. The levels of ethane and ethane present in VOC plume areas in the southern area indicate an active and complete pathway for anaerobic degradation of chlorinated VOCs from parent compounds to ethene and end product ethane. Mean concentrations for methane in the northern monitored area have exceeded 1 mg/L for 2018-2024 with maximum concentrations in the range of 10 mg/L to 26 mg/L. These levels of methane indicate highly reductive conditions that support anaerobic biodegradation processes for chlorinated VOCs.

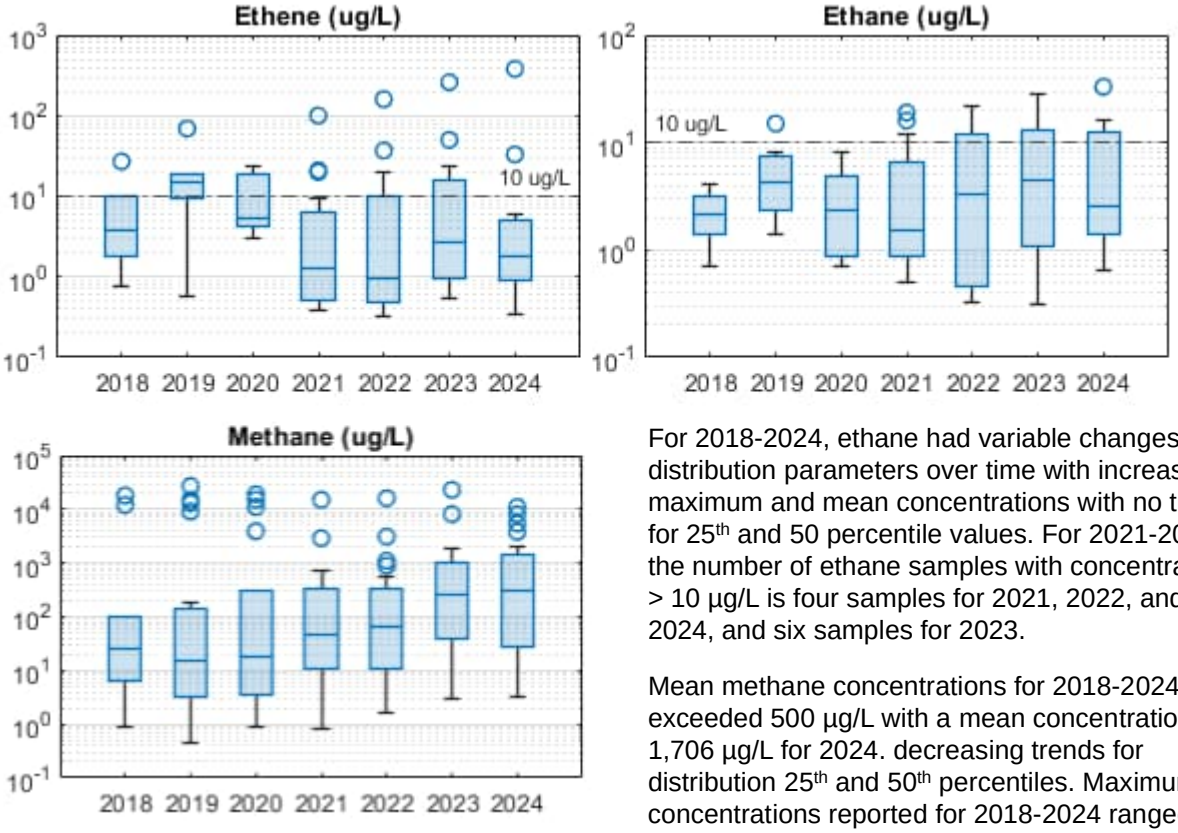
5.3.3.3 Confined Aquifer: Northern Area

For the confined aquifer in the northern area, Exhibit 5-4 has a time series plots of data distributions (box plots) for ethene, ethane, and methane (2018-2024). This exhibit has reference lines for ethene and ethane concentration thresholds of 10 µg/L used in the screening assessment presented in Table 5-2.

Exhibit 5-4 Dissolved Gas Distribution for Confined: Northern Area (2018-2024)

For 2019-2024, detectable levels of ethene in the northern area ranged from 1.6 µg/L to 9.7 µg/L with two detections reported for 2023 and 2024. For ethene, the box plots show decreasing trends for frequency of detection and concentration metrics including maximum, median, and median concentrations.

For 2019-2024, detectable levels of ethane in the northern area ranged from 0.39 µg/L to 8.4 µg/L with two detections reported for 2023 and one detection reported for 2024. For ethane, the box plots show decreasing trends for frequency of detection and concentration metrics including maximum, median, and median concentrations.



For 2019-2024 in the northern area, mean methane concentrations ranged from 2.6 mg/L to 7.1 mg/L. The detection of ethene, ethane, and higher concentrations of methane indicate reducing conditions that support anaerobic biodegradation process for chlorinated VOCs in the confined aquifer within the northern area of OU 6.

5.3.3.4 Confined Aquifer: Southern Area

For the confined aquifer in the southern area, Exhibit 5-5 (page 5-13) has a time series plots of data distributions (box plots) for ethene, ethane, and methane (2018-2024). This exhibit has reference lines for

an ethene and ethane concentration threshold of 10 µg/L used in the screening assessment presented in Table 5-2. For 2018-2024, ethene had variable changes in distribution parameters over time with increasing maximum and mean concentrations with decreasing trends for distribution 25th and 50th percentiles. The number of samples with ethene concentrations > 10 µg/L had a local maximum of four in 2022 with two samples having concentrations > 10 µg/L in 2024.

Exhibit 5-5 Dissolved Gas Distribution for Confined: Southern Area (2018-2024)

For 2018-2024, ethane had variable changes in distribution parameters over time with increasing maximum and mean concentrations with no trend for 25th and 50 percentile values. For 2021-2024, the number of ethane samples with concentrations > 10 µg/L is four samples for 2021, 2022, and 2024, and six samples for 2023.

Mean methane concentrations for 2018-2024 exceeded 500 µg/L with a mean concentration of 1,706 µg/L for 2024. decreasing trends for distribution 25th and 50th percentiles. Maximum concentrations reported for 2018-2024 ranged from 11,000 µg/L (2024) to 27,000 µg/L in 2019. The detection of ethene, ethane, and higher concentrations of methane indicate reducing conditions that support anaerobic biodegradation process for chlorinated VOCs in the confined aquifer within the southern area of OU 6.

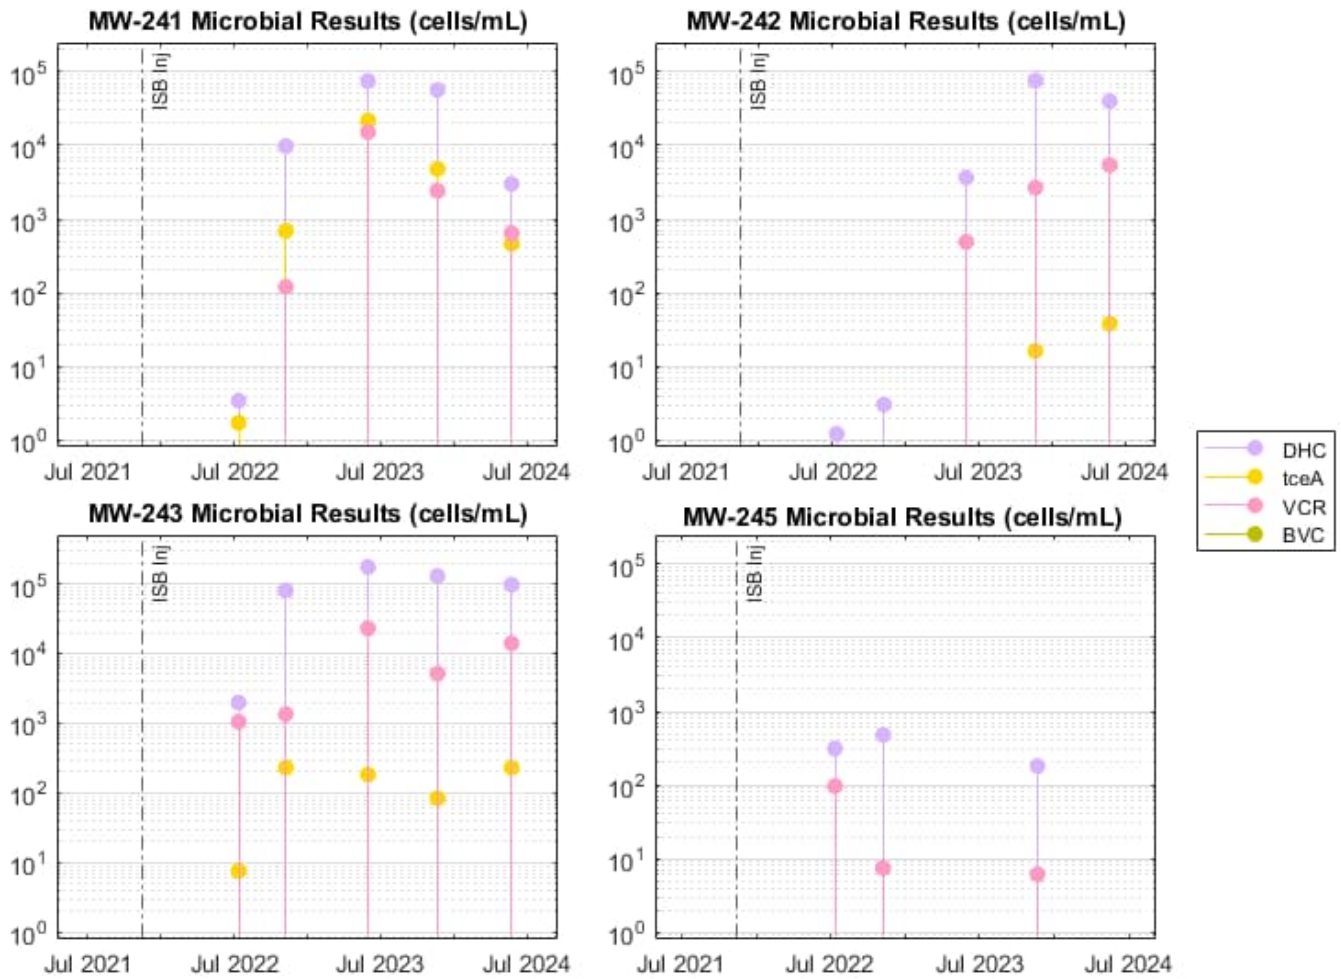
5.3.4 Microbial Evaluation

Section 5.3.4 evaluates microbial data as a line of evidence for biodegradation processes in ISB treatment areas at OU 6. Table 5-3 has a microbial evaluation of census data obtained from wells MW-241, MW-242, MW-243, and MW-245 after completion of injections in October-November 2021.

Table 5-3 Microbial Evaluation for ISB Treatment (2022-2024 Data in cells per milliliter)

Location	x̄ DHC	x̄ tceA	x̄ VCR	x̄ Ethene	Microbial Assessment
MW-241	2.90E+04	5.55E+03	3.68E+03	1.82E+01	High DHC[2], tceA, VCR, and ethene presence, microbial/chemical indicate a pathway for dechlorination from PCE to ethene.
MW-242	2.40E+04	1.11E+01	1.71E+03	1.31E+02	High DHC[2], tceA, VCR, and ethene presence, microbial/chemical indicate a pathway for dechlorination from PCE to ethene.
MW-243	9.67E+04	1.47E+02	8.87E+03	6.27E+02	High DHC[2], tceA, VCR, and ethene presence, microbial/chemical indicate a pathway for dechlorination from PCE to ethene.
MW-245	1.94E+02	ND	2.22E+01	1.37E+02	Moderate DHC[1], VCR and ethene presence, microbial/chemical indicate a pathway for dechlorination from PCE to ethene.

Source: x̄ = mean for January 2022-May 2024 sample data, microbial census units = cells per milliliter, ethene units = micrograms per liter, [1]Moderate DHC levels x̄ 1E+01 to <1E+04 cells/mL, [2]High DHC levels x̄ ≥1E+04 cells/mL.



Five microbial sampling events occurred from July 2022 through May 2024. Exhibit 5-6 has microbial stem plots for wells MW-241, MW-242, MW-243, and MW-245 in the ISB treatment area beneath OU 1. Each plot has a reference line for the ISB injections completed in October-November 2021. Exhibit 5-6 shows post-ISB injection increases in DHC and microbial populations at each well exhibited the expected response with injection of the EVO substrate with bioaugmentation (DHC cultures).

A higher threshold for DHC populations is considered ≥ 1E+04 cells per milliliter (mL) that will yield functional biodegradation rates capable of degrading PCE to ethene. When moderate levels of DHC (1E+01 to ≤1E+03 cells/mL) are present with vinyl chloride reductase genes (VCR), complete dechlorination of PCE and TCE to ethene may still occur. Complete dechlorination of PCE and TCE to ethene is unlikely to occur under conditions when DHC levels < 1E+01 cells/mL.

The evaluations in Table 5-3 indicate mean DHC levels > 1E+04 cells/mL at wells MW-241, MW-242, and MW-243 and the presence of tceA and VC genes with mean ethene concentrations ranging from 1.83E+01 to 6.27E+02 µg/L. The microbial/chemical data for these wells indicate a pathway for dechlorination from PCE and TCE to ethene. Well MW-245 has moderate levels of DHC with tceA and VCR genes present with a mean ethene concentration of 1.37E+02 µg/L. These indicate a pathway for dechlorination of PCE and TCE to ethene.

As of May 2024, the concentrations of PCE, TCE, cDCE, and VC are < MCLs at wells MW-241, MW-242, and MW-245. At well MW-243, the percent decreases in PCE and TCE concentrations from pre-injection baseline to May 2024 are 88% with a 42% decrease for cDCE.

Exhibit 5-6 OU 1 ISB Treatment Area Microbial Data (2021-2024)

5.3.5 TOC Evaluation

TOC is a parameter measured in groundwater that is related to the EVO substrate used for ISB injections and treatment of groundwater. EVO used for the injection contains 60% vegetable oil with the injection designs having effective TOC concentrations[5] of 821 mg/L for treatment area TA-1, 816 mg/L for treatment area TA-2, and 788 mg/L for treatment area TA-3 (see Figure 5-1). The ISB performance monitoring program has included 15 monitoring wells in the northern area of OU 1 west of Building 54 (see Figure 3-1). Baseline monitoring performed on October 13-14, 2021 characterized groundwater conditions in and around the treatment area prior to the ISB injections performed from October 25-November 17, 2021.

5.3.5.1 TOC Data Distribution Changes

Table 5-4 has a data summary that characterizes changes in data distributions for TOC in groundwater after completion of the ISB injections. A green to red color gradient displays patterns and trends for the following distribution parameters for TOC: maximum concentration, mean concentration, median concentration, 75th percentile, and number of samples with TOC concentrations > 20 mg/L. The color gradient progresses from minimum (green) to median (yellow) to maximum (red). Distribution maxima for concentrations expressed as maximum, mean, median, and 75th percentile occurred between December 2021 and July 2022. The number of samples with TOC concentrations > 20 mg/L increased from one for baseline to seven for 2022 monitoring events, decreasing to five in November 2023 and May 2024. As of May 2024, the distribution mean concentration for TOC is 78.5 mg/L with a 75th percentile value of 48 mg/L.

Table 5-4 TOC Distribution Changes for OU 1 ISB Area (2021-2024, mg/L)

Event	Date	#D	Min	Max	Mean	Median	25th PCTL	75th PCTL	# Outliers	#>20 mg/L
ISB Baseline[1]	Oct 21	12	0.63	41	4.74	1.25	0.82	1.75	1	1
2021 Annual	Dec 21	14	0.86	3300	430	6	1.3	405	2	6
2022 Annual	Apr-May 22	14	0.58	3400	372.1	71	1.18	312	1	7
ISB Performance	Jul 2022	14	0.72	3600	359	20.5	1.6	250	1	7
ISB Performance	Nov 2022	14	0.59	3300	307.5	25.5	2.15	140	2	7
2023 Annual	May 23	13	0.78	2000	205	20	4.4	69.0	2	6
ISB Performance	Nov 23	14	0.61	1300	122.5	5.55	1.72	69.2	1	5
2024 Annual	May 24	14	0.72	760	78.5	8.05	1.3	48.0	1	5

Notes: mg/L = milligrams per liter., #D = number of detections, Min = minimum, Max = maximum, 25th PCTL = 25th percentile, 75th PCTL = 75th percentile, # = number, # outliers = number of distribution outliers. [1]ISB baseline performed on October 12-13, 2021 before ISB injections performed from 10/25/2021-11/17/2021.

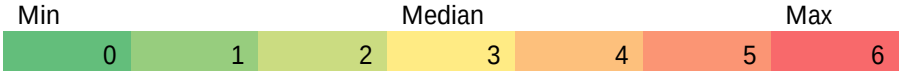


Table 5-5 (page 5-16) has ISB performance monitoring data expressed as mean concentrations of TOC by treatment area and for the overall combined treatment area. Additional columns in the table identify the design concentration for each treatment area, maximum TOC concentration detected in each treatment area, and treatment timeline relative to the 36-month ISB treatment design period.

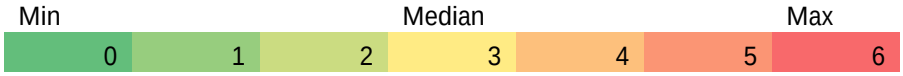
A green to red color gradient displays patterns and trends for mean concentrations of TOC by treatment area for the monitoring period December 2021-May 2024. The color gradient progresses from minimum (green) to median (yellow) to maximum (red). Mean concentration peaks occurred in December 2021 for TA-1 and TA-2 and in July 2022 for TA-3. Table 5-5 shows sustainment of mean TOC levels > 20 mg/L



[5]Design concentration from treatment area design corresponding to the effective concentration for total volume of groundwater treated from AECOM-Meadows, 2021c. Final Operable Unit 6 Remedial Action Work Plan Addendum, Prepared for Defense Logistics Agency and U.S. Army Corps of Engineers, Baltimore, September 2021.

threshold in the treatment areas through 30 months of the 36 month design period, which corresponds to 83% of the 36 month design period.

Table 5-5 Mean TOC Concentrations in ISB Treatment Areas

Treatment Area	Design Conc.[1]	Max Conc.[2]	Mean TOC Concentration (mg/L)						
			Dec 21	Apr-May 22	Jul 22	Nov 22	May 23	Nov 23	May 24
TA-1	821	1300	366	223	179	136	112	57.5	28.7
TA-2	816	430	254	170	53.2	53.2	33.3	38.1	62

Area Wide	808	--	655	558	616	460	219	189	121
3 Yr. Design: Elapsed Months			1	5	8	12	18	24	30
Percent of 3 Yr. Design Period			3%	15%	22%	33%	50%	67%	83%

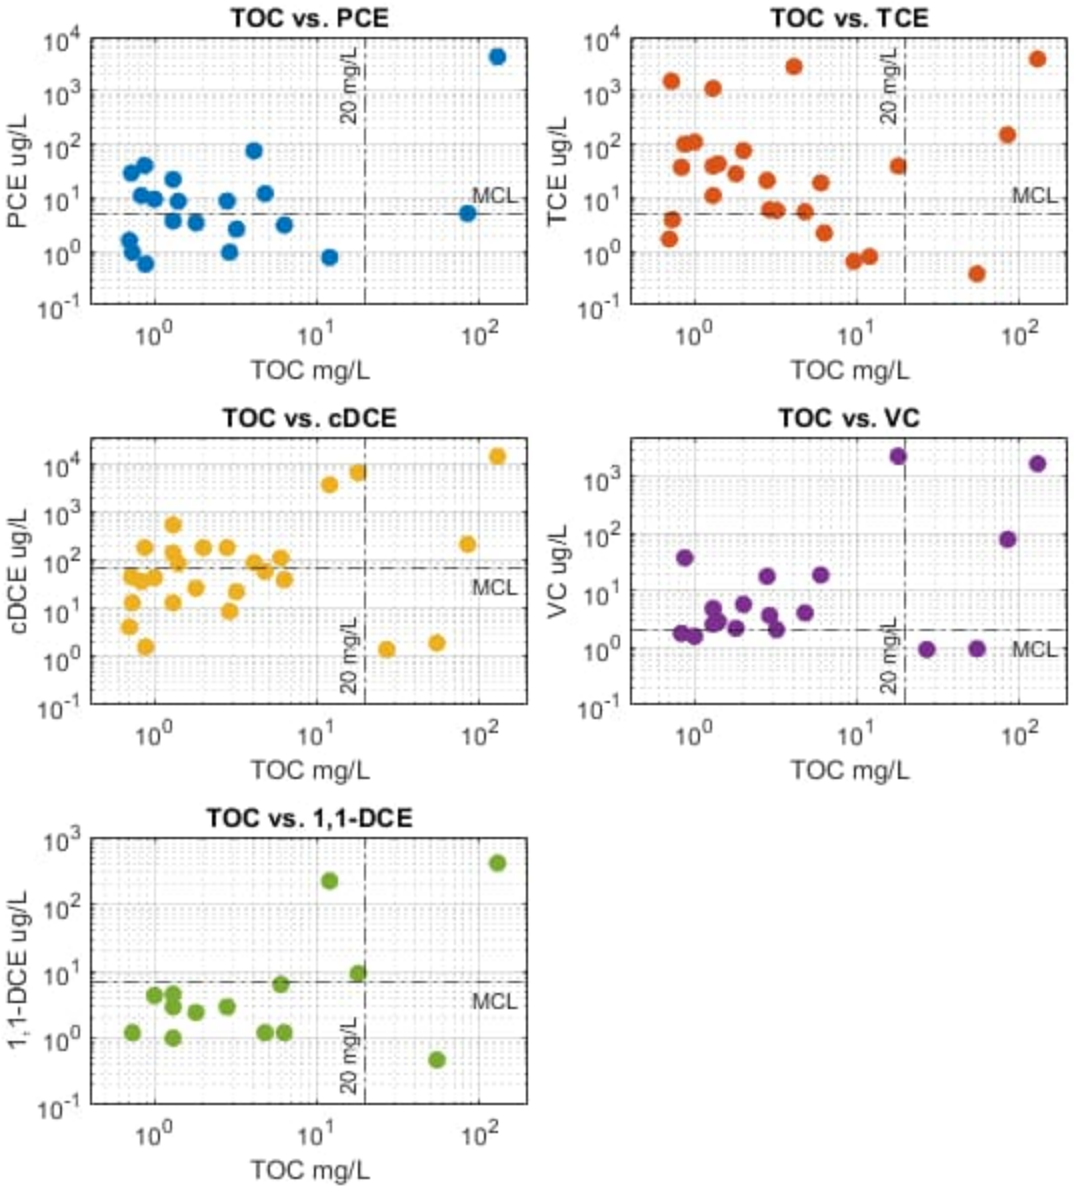
Notes: mg/L = milligrams per liter, [1]Design concentration from treatment area design corresponding to the effective concentration for total volume of groundwater treated from AECOM-Meadows, 2021c. Final Operable Unit 6 Remedial Action Work Plan Addendum, Prepared for Defense Logistics Agency and U.S. Army Corps of Engineers, Baltimore, September 2021. 2maximum concentration for the subset of monitoring wells associated with each treatment area for post-baseline monitoring period of December 2021-May 2024.

5.3.5.2 TOC and VOC Distribution (2024)

Exhibit 5-7 (page 5-17) has scatter plots for TOC vs. primary COC concentrations (May 2024) with reference lines for cleanup level (MCLs) and a TOC threshold of 20 mg/L, which provides an energy source for enhanced bioremediation (EPA 1998, 29). These plots evaluate the correlation between these variables supplemented by linear correlation analysis (Pearson's linear correlation coefficient) to quantify the degree and statistical significance of correlation.

TOC vs. PCE

The plot for TOC vs. PCE shows 20 sample locations have detectable levels of these constituents. Nine locations have PCE concentrations < MCLs and TOC concentrations < 20 mg/L. Eight locations have PCE concentrations > MCLs with TOC concentrations < 20 mg/L with a maximum concentration of 75 µg/L reported for PCE. The remaining PCE hotspot at well MW-243 (4,300 µg/L) has a TOC concentration of 130 mg/L.



The calculated correlation coefficient for TOC vs. PCE is 0.8253 with a p-value of 6.93E-07 at a significance level of 0.05 (5%). This result indicates statistically significant, positive correlation between TOC and PCE.

TOC vs. TCE

The plot for TOC vs. TCE shows 25 sample locations have detectable levels of these constituents. Five locations have TCE concentrations < MCLs and TOC concentrations < 20 mg/L. Seventeen locations have TCE concentrations > MCLs with TOC concentrations < 20 mg/L with a maximum concentration of 2,800 µg/L reported for TCE. The remaining TCE hotspot at well MW-243 (3,800 µg/L) has a TOC concentration of 130 mg/L with one additional sample location having TCE concentration of 150 µg/L and a TOC concentration of 85 mg/L.

The calculated correlation coefficient for TOC vs. TCE is 0.5484 with a p-value of 4.63E-03 at a significance level of 0.05 (5%). This result indicates statistically significant, positive correlation between TOC and TCE.

Exhibit 5-7 TOC vs. VOCs Northern Monitoring Area: Surficial Aquifer (May 2024)

TOC vs. cDCE

The plot for TOC vs. cDCE shows 26 sample locations have detectable levels of these constituents. Twelve locations have cDCE concentrations < MCLs and TOC concentrations < 20 mg/L. Nine locations have cDCE concentrations > MCLs with TOC concentrations < 20 mg/L with a maximum concentration of 6,400 µg/L reported for cDCE. A second well (MW-243) in the remaining VC hotspot (14,000 µg/L) has a TOC concentration of 130 mg/L with one additional sample location having a cDCE concentration of 210 µg/L and a TOC concentration of 150 mg/L.

The calculated correlation coefficient for TOC vs. cDCE is 0.0814 with a p-value of 6.83E-01 at a significance level of 0.05 (5%). This result does not indicate linear correlation between TOC and cDCE.

TOC vs. VC

The plot for TOC vs.VC shows 18 sample locations have detectable levels of these constituents. Two locations have VC concentrations < MCLs and TOC concentrations < 20 mg/L. Twelve locations have VC concentrations > MCLs with TOC concentrations < 20 mg/L with a maximum concentration of 2,300 µg/L reported for VC. A second well (MW-243) in the remaining VC hotspot (1,700 µg/L) has a TOC

concentration of 130 mg/L with one additional sample location having a VC concentration of 80 µg/L and a TOC concentration of 150 mg/L.

The calculated correlation coefficient for TOC vs. VC is 0.4784 with a p-value of 4.46E-02 at a significance level of 0.05 (5%). This result indicates statistically significant, positive correlation between TOC and VC.

TOC vs. 1,1-DCE

The plot for TOC vs.1,1-DCE shows 14 sample locations have detectable levels of these constituents. Ten locations have 1,1-DCE concentrations < MCLs and TOC concentrations < 20 mg/L. Two locations have 1,1-DCE concentrations > MCLs with TOC concentrations < 20 mg/L with a maximum concentration of 220 µg/L reported for 1,1-DCE. Well MW-243 has a 1,1-DCE concentration (410 µg/L) greater than the MCL with a TOC concentration (130 mg/L) > 20 mg/L.

The calculated correlation coefficient for TOC vs. 1,1-DCE is 0.8131 with a p-value of 4.05E-04 at a significance level of 0.05 (5%). This result indicates statistically significant, positive correlation between TOC and 1,1-DCE.

Summary

TOC has statistically significant, positive correlation with PCE, TCE, VC, and 1,1-DCE where both constituents are detected in samples collected from the northern monitoring area principally within OU 1 The degree of correlation decreases along the reaction pathway from PCE to VC with cDCE having no linear correlation with TOC. The decreases in correlation is an expected result given that bioremediation processes first reduce PCE and then sequentially reduce less chlorinated VOCs. Treatment of the hotspots found in the OU 1 area have generated higher concentrations of cDCE and VC that have reduced TOC concentrations relative to the remaining concentrations of these constituents.

5.4 VOC Plume Distribution Trends

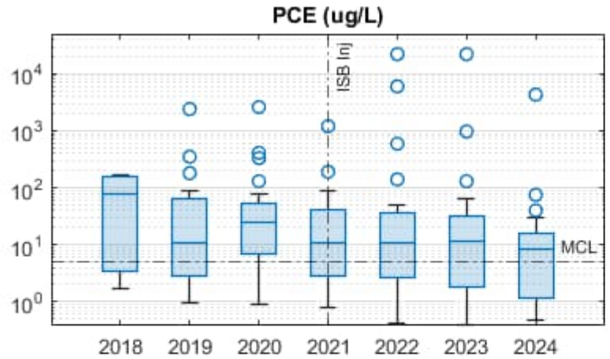
Section 5.4 discusses VOC plume conditions for the remedy performance assessment. Appendix E.3 has statistical evaluations for VOC plumes. The data sets used for the evaluations are annual monitoring events for 2018-2024.

5.4.1 Plume Distribution Trends: Surficial Aquifer

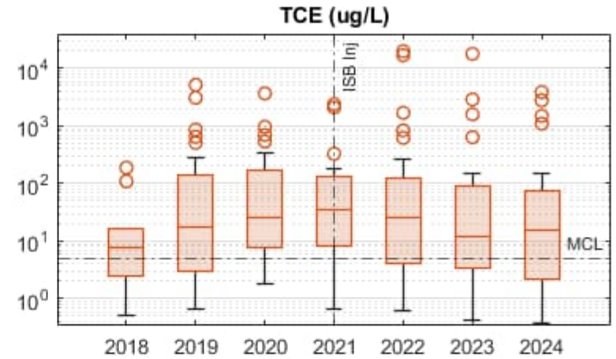
Section 5.4.1 uses time-series plots (box plots and line plots) to evaluate plume distribution for primary COCs in the surficial aquifer.

5.4.1.1 Northern Area

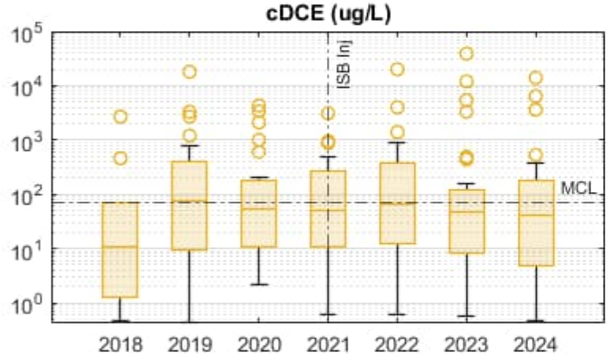
COCs in the northern area include PCE, TCE, cDCE, VC, and 1,1-DCE. Exhibit 5-8 (page 5-19) has tiled box plots and line plots. These plots have x-axis reference lines for the ISB injections performed in 2021 and the box plots have y-axis reference lines for cleanup levels (MCLs).



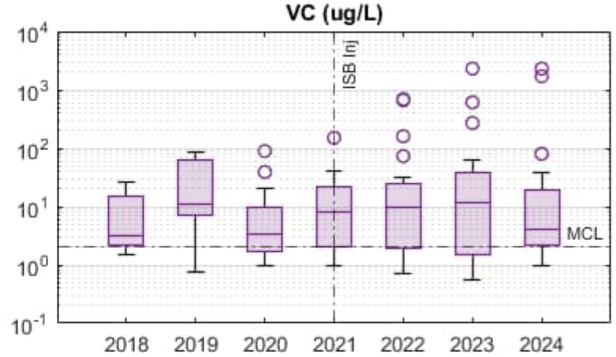
Number of Detections



cDCE has the greatest number of detections slighter more frequent than TCE followed by PCE, 1,1-DCE, and VC. Following the sequential degradation pathway shown in Exhibit 5-1, the parent and immediate daughter products have a high correlation (positive) for the number of detections over time that is statistically significant with p-values ≤2.22E-03.



Concentrations



For 2018-2024, data distributions for PCE, TCE, cDCE, and 1,1-DCE had a similar pattern of an increase in mean and maximum concentrations with sequential peaking concentrations observed for PCE and TCE in 2022 followed by cDCE and 1,1-DCE in 2023. VC had an increasing trend for mean and maximum concentrations for 2018-2024. Upper quartile concentrations had decreasing trends for PCE (2018-2024) and TCE (2020-2024) with generally sinusoidal variation for cDCE, 1,1-DCE, and VC.

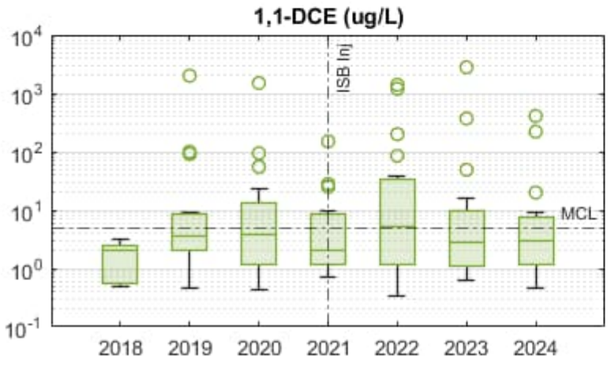


Exhibit 5-8 VOC Distribution Trends for Surficial Aquifer: Northern Area (2018-2024)

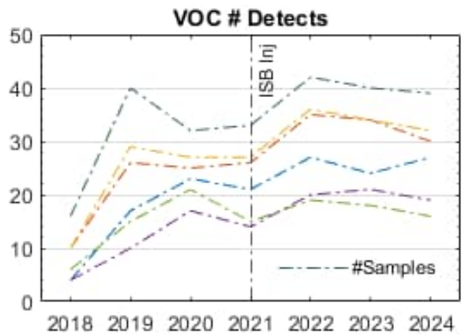
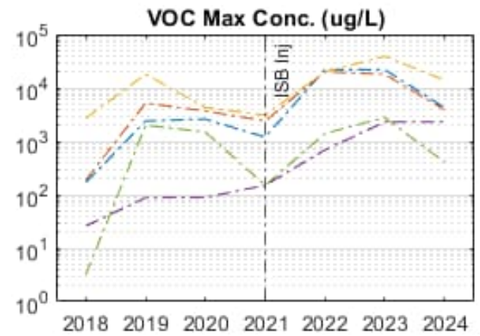
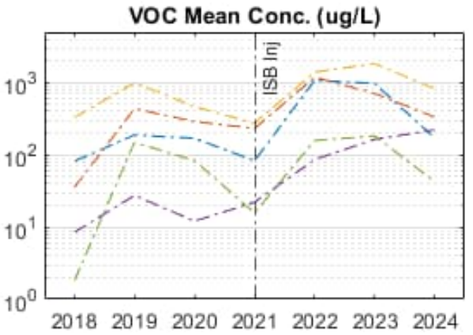
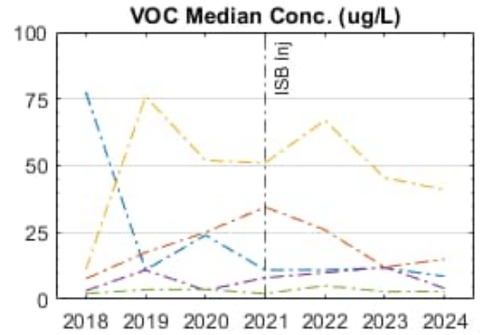
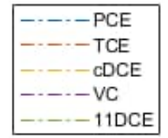
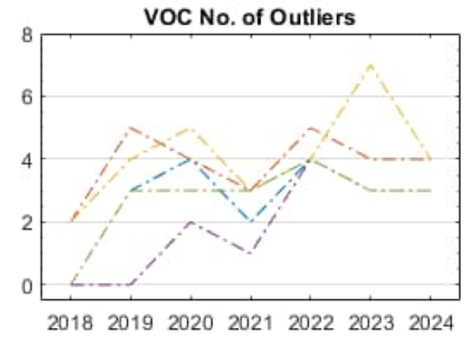


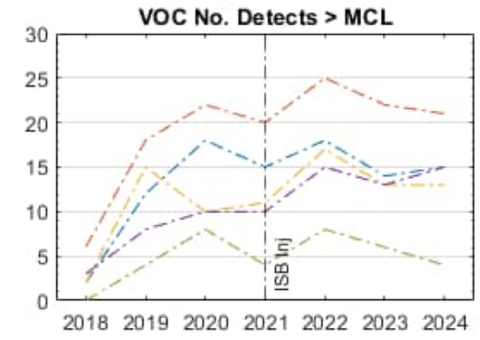












Median concentrations had a decreasing trend for PCE with an increasing trend for TCE that peaked in 2021 (34.5 µg/L) decreasing to 15 µg/L in 2024. Median concentrations for cDCE, 1,1-DCE, and VC generally had sinusoidal variation with concentrations < MCLs for cDCE and 1,1-DCE in 2023 and 2024. The maxima for sinusoidal variation occurred in 2019 for cDCE, in 2022 for 1,1-DCE, and in 2023 for VC.

Distribution Outliers

For 2018-2024, PCE had local maxima for the number of distribution outliers (five) in 2019 and 2022 decreasing to four outliers in 2023 and 2024. In 2019 and 2022, TCE had local maxima (five) for distribution outliers decreasing to four outliers in 2023 and 2024. cDCE had a peak number of outliers (seven) in 2023 decreasing to four outliers in 2024. VC and 1,1-DCE had a peak number of outliers (four) in 2022 decreasing to three in 2023 and 2024.

No. of Detections > MCLs

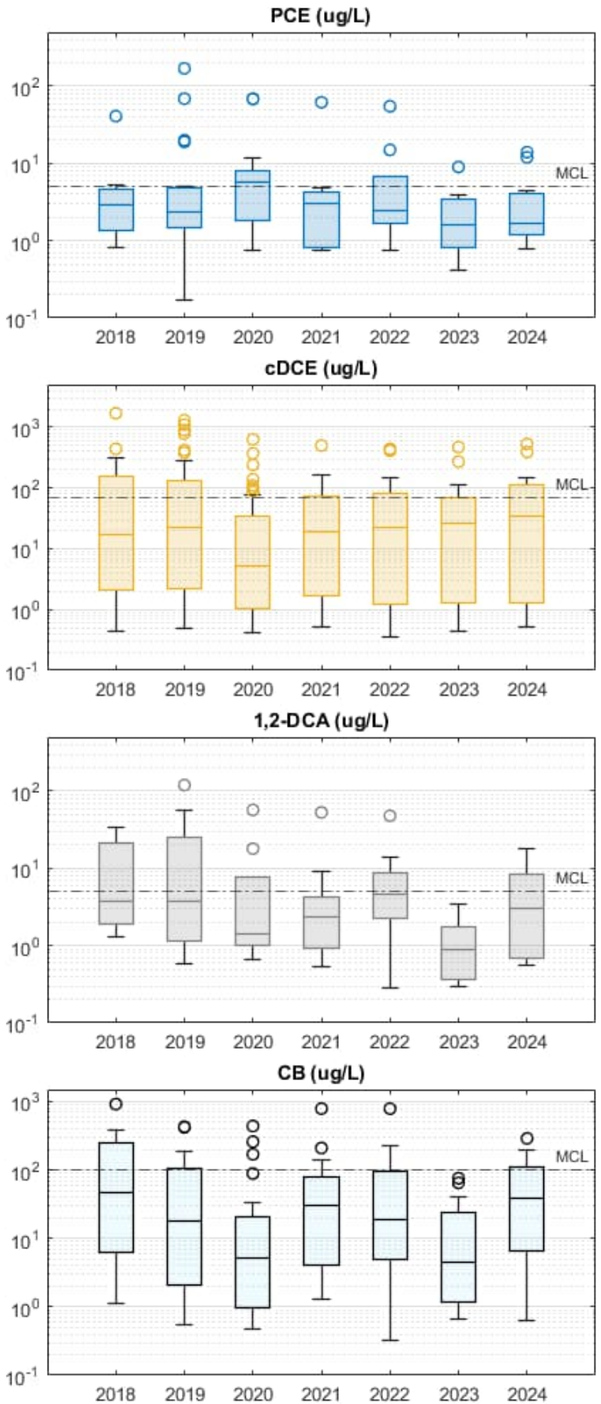
For 2018-2024, COCs had a peak number of detections > MCLs in 2022 with 25 of 42 samples exceeding the MCL for TCE followed by 18 samples for PCE, 17 samples for cDCE, 15 samples for VC, and 8 samples for 1,1-DCE. As of 2024, 21 of 39 samples had exceedances of the TCE MCL followed by 15 samples for PCE, 13 samples for cDCE, 15 samples for VC, and 4 samples for 1,1-DCE.

5.4.1.2 Southern Area

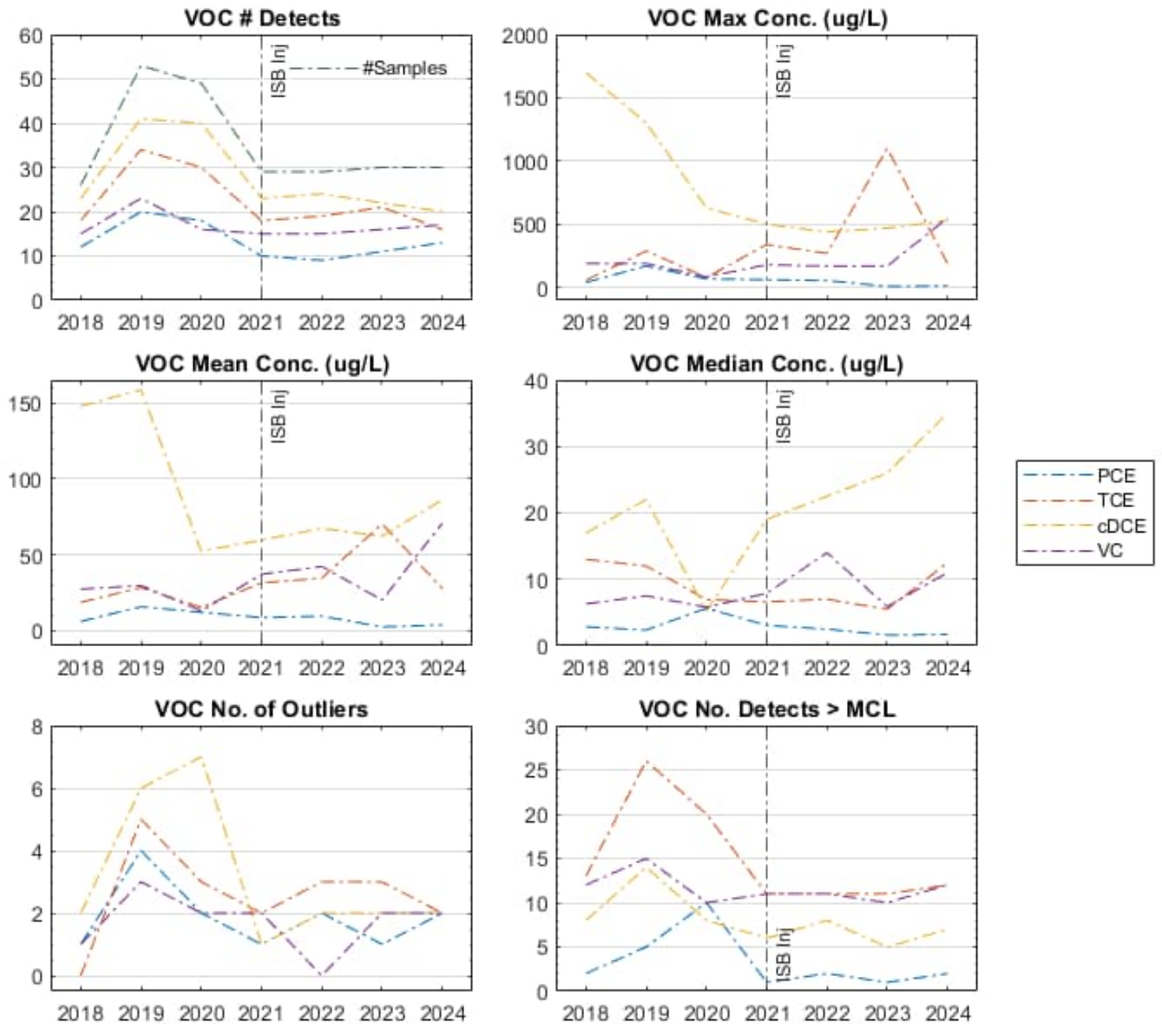
COCs in the southern area include PCE, TCE, cDCE, VC, 1,2-DCA, 1,4-DCB, and CB. Exhibit 5-9 (page 5-12) has tiled box plots and line plots. Box plots include all of these COCs with line plots displaying primary COCs PCE, TCE, cDCE, and VC. The box plots have y-axis reference lines for cleanup levels (MCLs).

Number of Detections

cDCE has the greatest number of detections for the surficial aquifer in the southern area followed by TCE, VC, CB, 1,4-DCB, PCE, and 1,2-DCA. Following the sequential degradation pathway shown in Exhibit 5-1, the parent and immediate daughter products for PCE vs. TCE and TCE vs. cDCE have a high positive correlation for the number of detections over time that is statistically significant with p-values ≤6.80E-03. cDCE vs. VC had moderate positive correlation (0.6452) with a p-value of 1.18E-01.



Concentrations



For 2018-2024, PCE had upper quartile concentrations < MCL for 5 of 7 events including 2023 and 2024 with 2020 and 2022 slightly > MCL. Maximum concentrations of PCE peaked in 2019 (170 µg/L) decreasing to 14 µg/L in 2024. TCE had upper quartile concentrations generally with sinusoidal variation ranging 32 µg/L in 2018 to 16 µg/L in 2022 and 2023 with a reported concentration of 26.6 µg/L in 2024. TCE maximum concentrations for 2018-2024 consisted of outliers peaking in 2023 at 1,100 µg/L with a reported maximum concentration of 190 µg/L in 2024.

For 2018-2024, cDCE had peak concentration for maximum and upper quartile in 2018 with the median peaking in 2024. The distribution parameters did not have linear decreasing values from the observed peaks. VC had peak concentrations for the maximum and mean in 2024 with peaks for the upper quartile and median occurring in 2022. and upper quartile distribution values in 2018 with mean peaking in 2020 and median peaking in 2024. These distribution parameters did not have linear decreasing values from the observed peaks.

For 2018-2024, 1,2-DCA had peak concentrations for maximum, mean, and upper quartile in 2019 with the median peak in 2022. These distribution parameters did not have linear decreasing values from the observed peaks. 1,4-DCB had peak concentrations for maximum, mean, median in 2022 with the peak for the upper quartile occurring in 2018. CB had peak maximum concentrations in 2019 with maxima for mean, median, and upper quartile occurring in 2018.

Exhibit 5-9 VOC Distribution Trends Surficial Aquifer: Southern Area (2018-2024)

Distribution Outliers

For 2018-2024, the number of distribution outliers peaked for PCE (4), TCE (5) and VC (2) in 2019 with a local maxima for cDCE (7) in 2020 with the number of outliers decreasing to two (2) in 2024.

No. of Detections > MCLs

For 2018-2024, COCs had a peak number of detections > MCLs in 2019 with 26 of 53 samples exceeding the MCL for TCE followed by 15 samples for VC, 14 samples for cDCE, 7 for 1,2-DCA, 6 for CB, and 5 for 1,4-DCB. In 2020, PCE had 10 of 49 samples exceeding the MCL. In 2024, sampling included 30 locations with 12 MCL exceedances for TCE and VC, 7 MCL exceedances for cDCE, 4 MCL exceedances for 1,2-DCA, 1,4-DCB, and CB with 2 MCL exceedances for PCE.

5.4.2 Plume Distribution Trends Confined Aquifer

Section 5.4.2 uses time-series plots (box plots and line plots) to evaluate plume distribution for primary COCs in the confined aquifer.

5.4.2.1 Northern Area

COCs in the northern area include PCE, TCE, and 1,1-DCE with cDCE and VC detected at concentrations < MCLs. Exhibit 5-10 (page 5-23) has tiled box plots and line plots. Box plots have y-axis reference lines for cleanup levels (MCLs).

Number of Detections

TCE has the greatest number of detections in the confined aquifer for the northern area followed by cDCE, PCE, 1,1-DCE with single detections of VC reported in 2023 and 2024. Following the sequential degradation pathway shown in Exhibit 5-1, the parent and immediate daughter products through the pathway have positive correlation that is statistically significant for PCE vs. TCE.

Concentrations

For 2018-2024, PCE and 1,1-DCE had increasing trends for maximum, mean, and median concentrations with no overall trends for TCE, cDCE, and VC concentrations.

Distribution Outliers

For 2018-2024, cDCE had a single distribution outlier for 2019 and 2024.

No. of Detections > MCLs

For 2018-2024, TCE and PCE have statistically significant correlation (positive) for the number of detections > MCLs. TCE for the period had 4 to 6 samples with concentrations > MCL with four samples in 2024 having concentrations > MCL. PCE for the period had 1 to 2 samples with concentrations > MCL. 1,1-DCE for the period had a reported concentration > MCL in 2024.

5.4.2.2 Southern Area

COCs in the southern area include PCE, TCE, cDCE, and VC. Exhibit 5-11 (page 5-24) has tiled box plots and line plots. Box plots have y-axis reference lines for cleanup levels (MCLs).

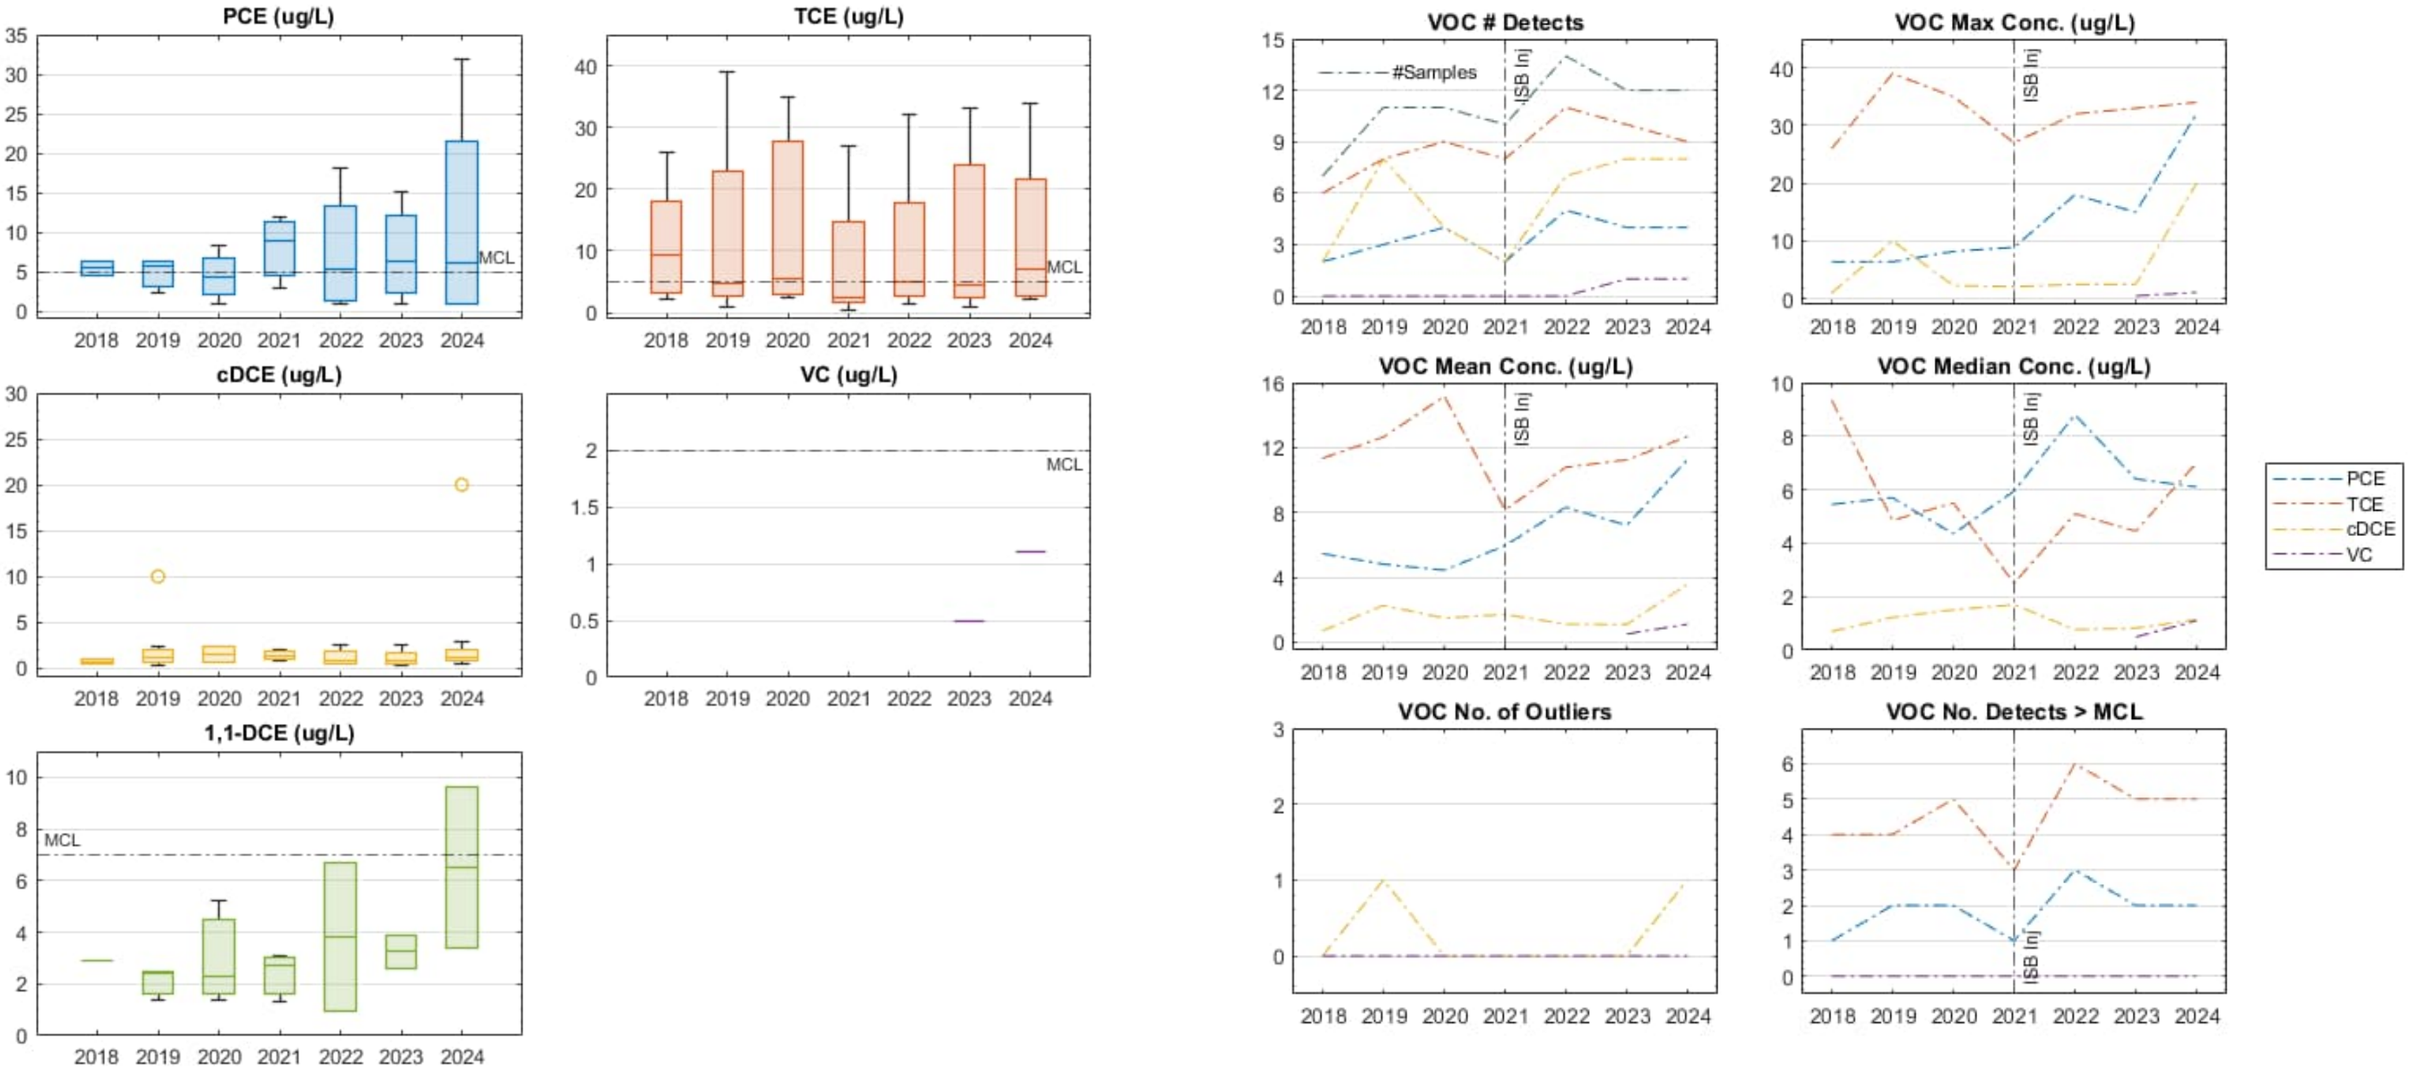
Number of Detections

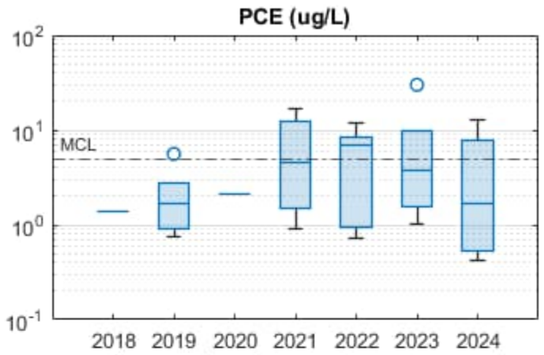
cDCE and TCE had the most detections for the confined aquifer in the southern area followed by VC and PCE. Following the sequential degradation pathway shown in Exhibit 5-1, the parent and immediate daughter products through the pathway have moderate correlation (positive) for number of detections.

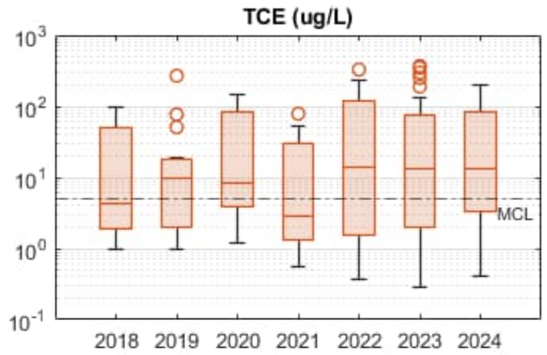
Concentrations

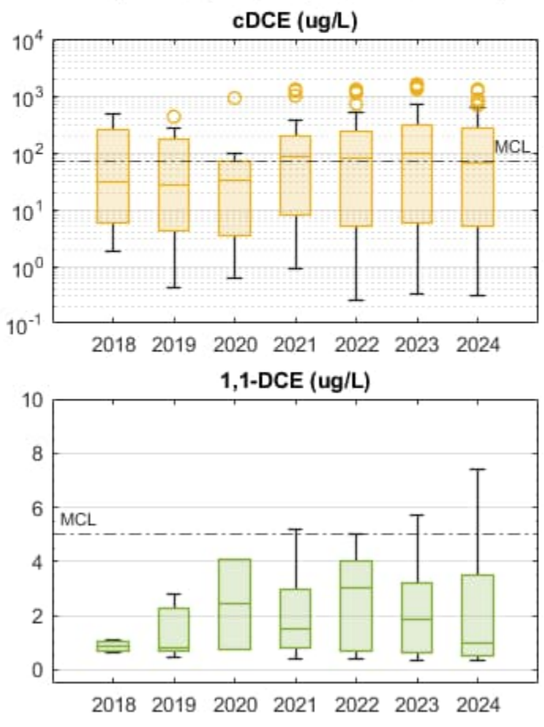
For 2018-2024, PCE had a M-K increasing trend for maximum concentrations with an overall increase in the distribution mean. 1,1-DCE had increasing trends for maximum, mean, and median concentrations with no overall trends for TCE, cDCE, and VC concentrations.

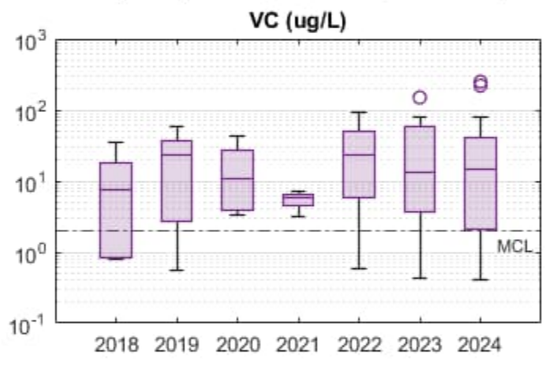
Exhibit 5-10 VOC Distribution Trends Confined Aquifer: Northern Area (2018-2024)











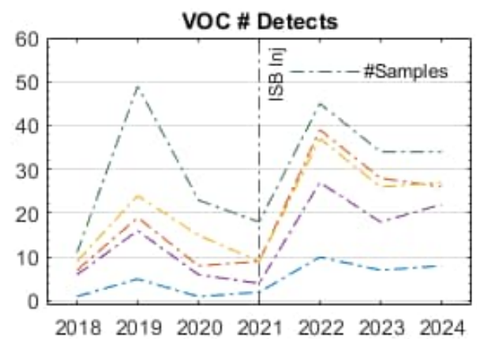


Exhibit 5-11 VOC Distribution Trends Confined Aquifer: Southern Area (2018-2024)

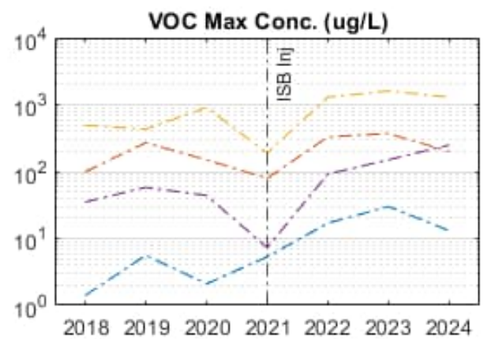
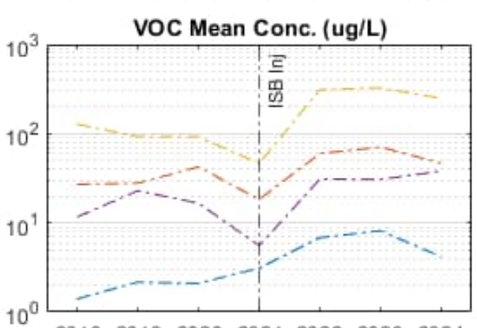
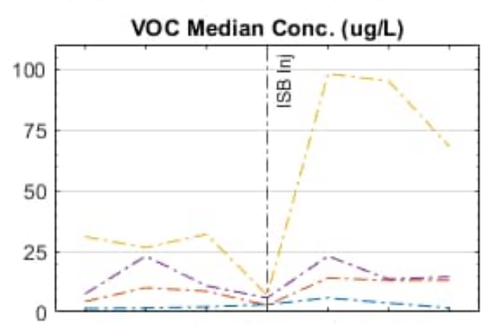
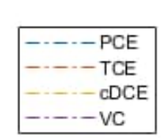
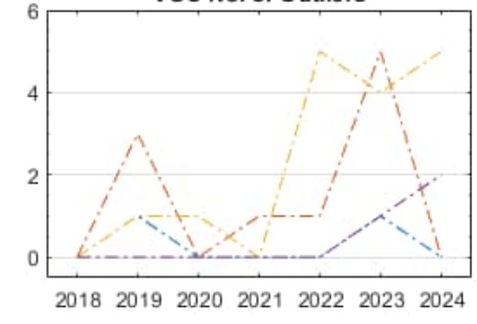
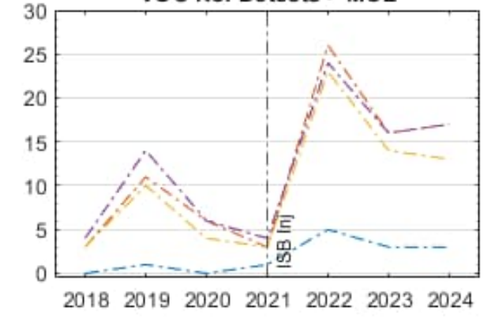












Distribution Outliers

For 2018-2024, the number of distribution outliers for PCE (1) and TCE (5) peaked in 2023 with an increasing trend for cDCE with no outliers reported for 2018 and five outliers reported for 2022 and 2024. VC had one distribution outlier reported for 2023 and two distribution outliers reported for 2024.

No. of Detections > MCLs

For 2018-2024, a peak for the number samples with concentrations > MCLs occurred in 2022 with the most exceedances for TCE (26) followed by VC (24), cDCE (23), and PCE (5). As of 2024, TCE and VC each 17 samples with concentrations > MCLs with 13 for cDCE and three (3) for PCE. Parent and daughter products have positive correlation (moderate) for the number of detections > MCLs.

5.5 Bulk Plume Area Trends

One objective of groundwater remedial actions at OU 6 is to reduce the extent of bulk plume areas. This remedy performance assessment evaluates changes in bulk plume areas (acres) using data from the new monitoring network for 2021-2024. Descriptive statistics used to evaluate changes in bulk plume areas include percent change[6], linear correlation (correlation)[7] for plume area vs. times and between parent and daughter plume areas over time, and Mann-Kendall[8] trend tests for plume area vs. time. Appendix E.4 has statistical evaluations for bulk plume trends for OU 6.

5.5.1 VOC Bulk Plume Areas: Surficial Aquifer

Section 5.5.1 discusses VOC bulk plume trends for the surficial aquifer at OU 6. Exhibits 5-12 (page 5-26) and 5-13 (page 5-27) have stem plots that visualize the timeseries data for the surficial aquifer in the northern and southern areas, respectively. Figures 5-3 through 5-6 (pages 5-28-5-31) display the differences in PCE, TCE, cDCE, and VC plumes for 2021 and 2024.

5.5.1.1 Northern Area

Table 5-6 has summary statistics for bulk plume areas for the surficial aquifer in the northern monitoring area. PCE, TCE, cDCE, and VC plume areas did not have statistically significant correlation or M-K trends for plume areas vs. time. PCE and TCE bulk plumes had moderate correlation (negative) with PCE having a slight increase in plume area from 5.11 acres in 2021 to 5.27 acres in 2024 (3.1% change) contrasted by TCE that had a decrease of 11.2% in plume area from 11.0 acres in 2021 to 9.77 acres in 2024. TCE and cDCE plume areas had moderate correlation (positive).

Table 5-6 Bulk Plume Area Metrics: Northern Area Surficial Aquifer

	Plume Area (Acres)					Linear Correlation			M-K One Way Trend		
Plume	2021	2022	2023	2024	Δ%	r	p-value (α=0.05)	Corr	H	p-value (α=0.05)	SS Trend
PCE	5.11	5.34	4.73	5.27	3.1	-6.16E-02	9.38E-01	No	0	0	No
TCE	11.0	11.5	12.8	9.77	-11.2	-2.48E-01	7.52E-01	Low (-)	0	0	No
cDCE	3.44	3.46	3.24	2.35	-31.7	-8.59E-01	1.41E-01	High (-)	0	-1.54E-01	No
VC	4.20	4.56	5.78	4.84	15.2	6.00E-01	4.00E-01	Mod (+)	0	1.54E-01	No
PCE vs TCE						-7.44E-01	2.56E-01	Mod (-)			
TCE vs cDCE						6.77E-01	3.23E-01	Mod (+)			
cDCE vs VC						-1.76E-01	8.24E-01	Low (-)			

Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, Δ% = percent change in bulk plume area from 2021 to 2024, % reduction in plume area from 2021 to 2024, r = Pearson's linear correlation coefficient, p-value = probability value, Corr. = correlation: negative (-), positive correlation (+), M-K = Mann-Kendall, SS Trend = statistically significant trend at a significance level of 0.05 (5 percent).

[6] Percent change of bulk plume area from 2021 to 2024.
[7] Pearson's linear correlation coefficient at a significance level (alpha) of 0.05 or 5 percent.
[8] Mann-Trend test for monotonic trend with a one-way test that evaluate an alternative hypothesis of trend greater than zero or less than zero.

Figure 5-3 (page 5-28) for PCE in 2024 shows a reduction of the hotspot around wells MW-243 and MW-130 with overall lower concentrations compared to 2021. Figure 5-4 for TCE in 2024 (page 5-29) shows a shift of the hotspot area to the west of well MW-243 with a reduced plume area toward the east and Building 54 compared to 2021. cDCE had a 31.7% decrease in plume area from 2021 to 2024 with high linear correlation (negative) vs. time. Figure 5-5 (page 5-30) for cDCE in 2024 shows two plume areas of reduced area compared to 2021.

Exhibit 5-12 VOC Plume Area Changes for Surficial Aquifer: Northern Area

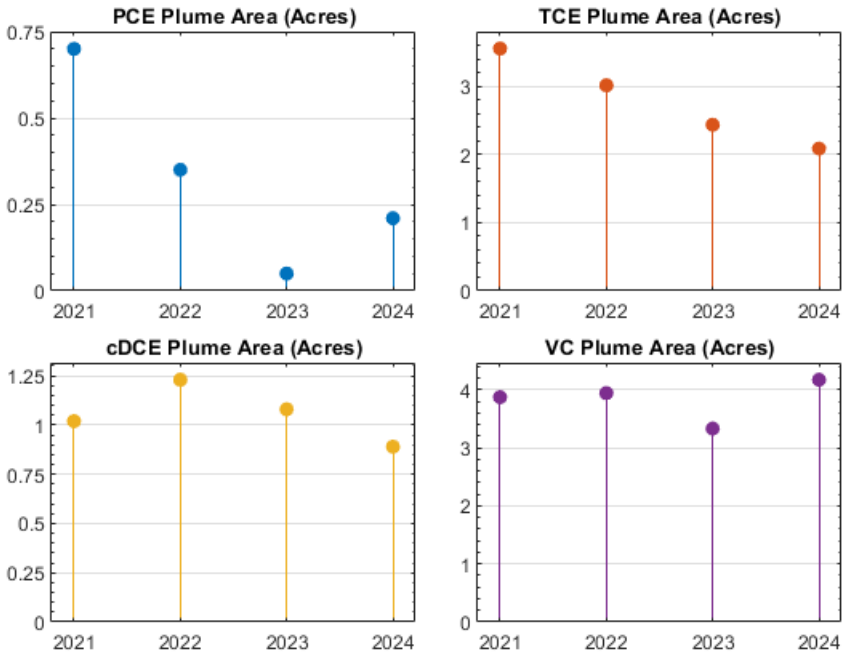
The stem plot for VC shows an increase in plume area from 4.2 acres in 2021 to a local maximum of 5.78 acres in 2023 decreasing to 4.84 acres in 2024. The percent change in VC plume area from 2021 to 2024 is 15.2%. cDCE and VC bulk plumes had low linear correlation (negative). Figure 5-6 (page 5-31) for VC shows break up of a single plume area in 2021 to two separate areas in 2024.

5.5.1.2 Southern Area

Table 5-7 has summary statistics for bulk plume areas for the surficial aquifer in the southern monitoring area. Exhibit 5-13 (page 5-27) has stem plots that visualize the timeseries data for the plume areas. PCE, TCE, cDCE, and VC plume areas did not have statistically significant correlation or M-K trends for plume areas vs. time.

Table 5-7 Bulk Plume Area Metrics: Southern Area Surficial Aquifer

	Plume Area (Acres)					Linear Correlation			M-K One Way Trend		
Plume	2021	2022	2023	2024	Δ%	r	p-value (α=0.05)	Corr	H	p-value (α=0.05)	SS Trend
PCE	0.70	0.35	0.05	0.21	-70.0	-8.25E-01	1.75E-01	High (-)	0	-1.54E-01	No
TCE	3.56	3.02	2.44	2.09	-41.3	-9.95E-01	5.00E-03	SS (-)	1	-4.47E-02	Yes
cDCE	1.02	1.23	1.08	0.89	-12.7	-4.94E-01	5.06E-01	Mod (-)	0	-3.67E-01	No
VC	3.87	3.94	3.33	4.17	7.8	1.05E-01	8.95E-01	Low (+)	0	-3.67E-01	No
PCE vs TCE						8.76E-01	1.24E-01	High (+)			
TCE vs cDCE						4.38E-01	5.62E-01	Low (+)			
cDCE vs VC						-3.37E-01	6.62E-01	Low (-)			



Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, Δ% = percent change in bulk plume area from 2021 to 2024, % reduction in plume area from 2021 to 2024, r = Pearson's linear correlation coefficient, p-value = probability value, Corr. = correlation: negative (-), positive correlation (+), M-K = Mann-Kendall, SS Trend = statistically significant trend at a significance level of 0.05 (5 percent).

PCE had a 70% decrease in plume area from 0.70 acres in 2021 to 0.21 acres in 2024 with high correlation (negative). Figure 5-3 (page 5-28) shows limited PCE plume areas in the fence line area OU 3 extending into the offsite area. TCE had a 41.3% decrease in plume area from 3.56 acres in 2021 to 2.09 acres in 2024. PCE and TCE plume areas had high correlation (positive) for 2021-2024. Figure 5-4 (page

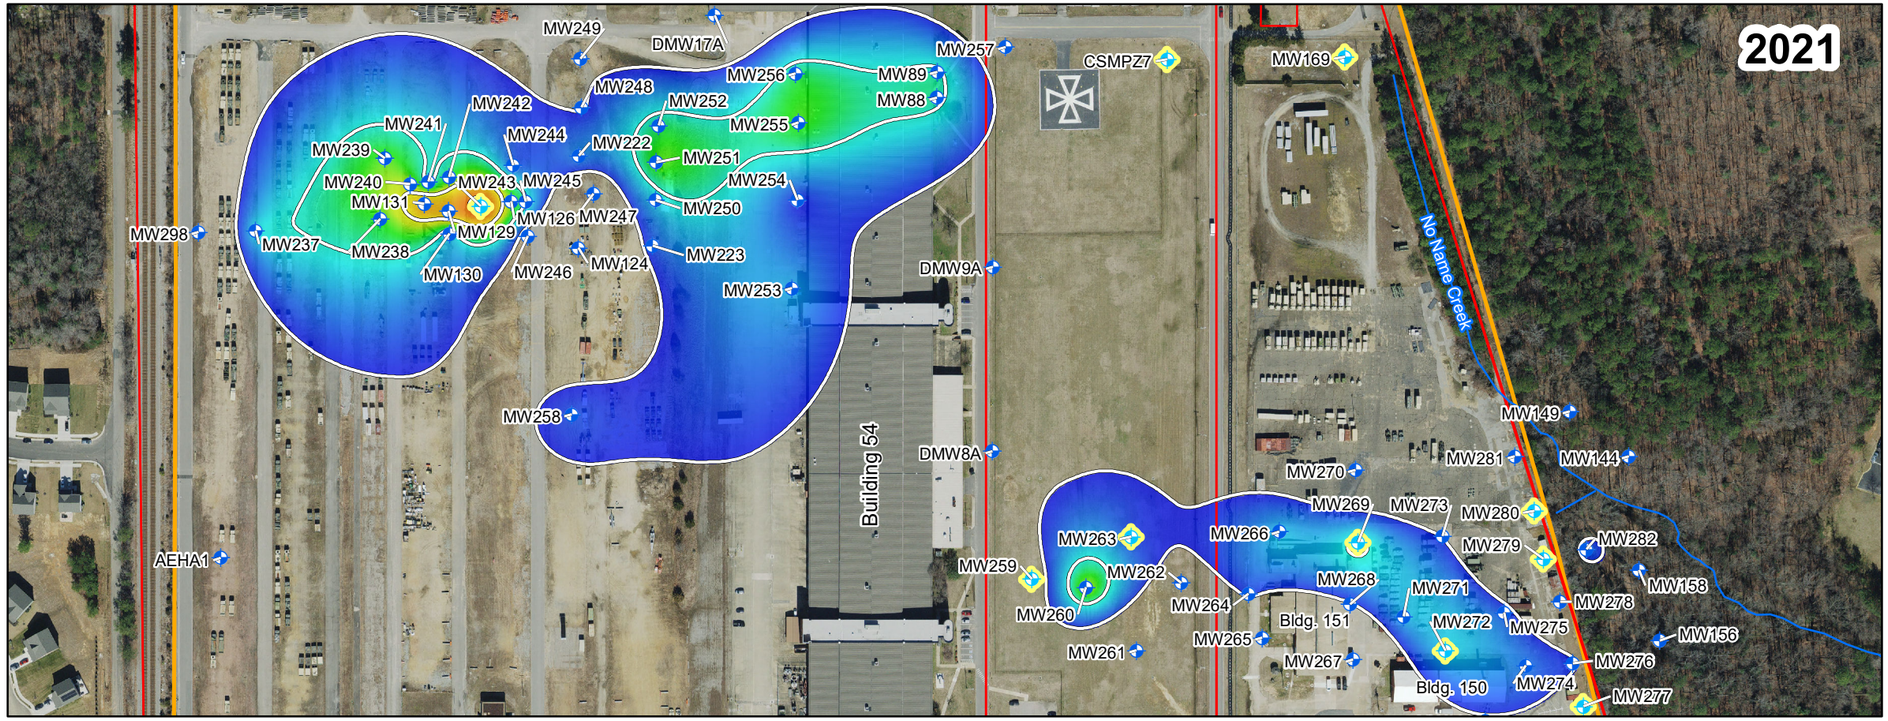
5-29) shows reduction of a contiguous plume in the OU 2/OU 3 area in 2021 to disaggregated TCE plumes across this area in 2024.

TCE and cDCE plume areas have low positive correlation for 2021-2024. cDCE had a 12.7% decrease in plume area from 1.02 acres in 2021 to 0.89 acres in 2024. Figure 5-5 (page 5-30) shows two limited plume areas for cDCE in the OU 2 and OU 3 area (2021 and 2024) upgradient of the fence line area. VC had a 7.8% increase in plume area from 3.87 acres in 2021 to 4.17 acres in 2024. Figure 5-6 (page 5-31) shows a contiguous plume for VC extending from OU 2 across the OU 3 area (2021 and 2024) upgradient of the fence line area. cDCE and VC plume areas have low negative correlation for 2021-2024.

Exhibit 5-13 VOC Plume Area Changes for Surficial Aquifer: Southern Area

5.5.2 VOC Bulk Plume Areas: Confined Aquifer

Section 5.5.2 discusses VOC bulk plume trends for the confined aquifer at OU 6. Figures 5-7 through 5-10 (pages 5-34-5-37) display the differences in PCE, TCE, cDCE, and VC plumes for 2021 and 2024.



5.5.2.1 Northern Area: Confined Aquifer

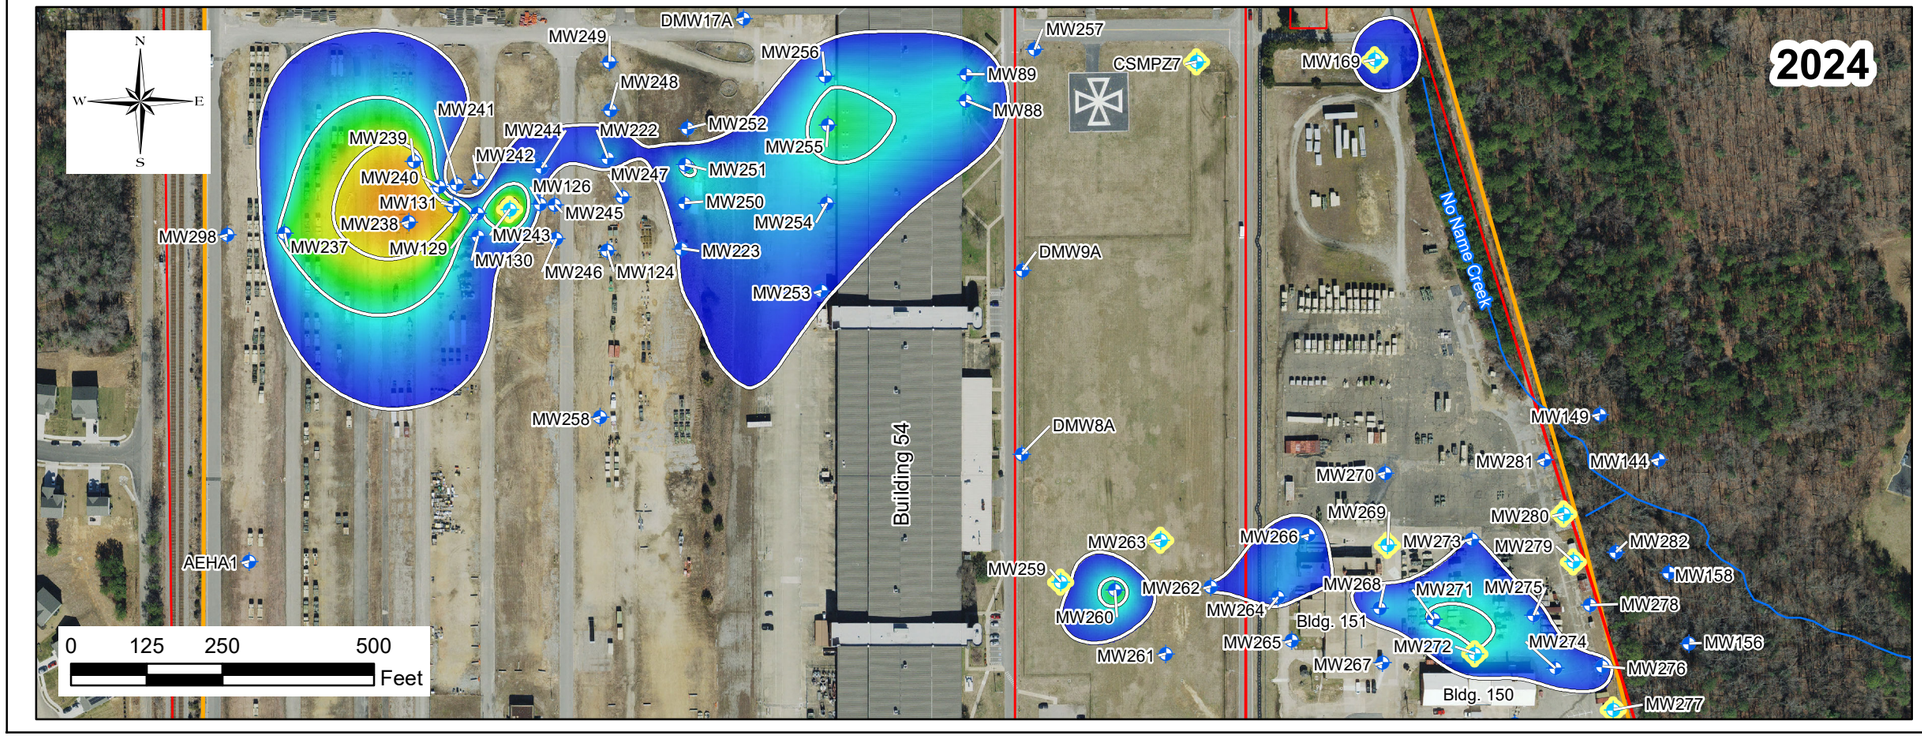


Table 5-8 has summary statistics for bulk plume areas for the confined aquifer in the northern monitoring area. Exhibit 5-14 (page 5-32) has stem plots that visualize the timeseries data for the plume areas. PCE and TCE plume areas did not have statistically significant correlation or M-K trends for plume areas vs. time. PCE had a 101% increase in plume area from 0.74 acres in 2021 to 1.49 acres in 2024 with low correlation (positive). Figure 5-7 (page 5-34) shows the two plume areas for PCE centered around wells MW-171 (OU 1) and DMW-34B (OU 2). TCE had a 48.2% decrease in plume area from 2.18 acres in 2021 to 3.23 acres in 2024 with low correlation (negative). Figure 5-8 (page 5-35) shows two plume areas for TCE in the OU 1 area centered around wells beneath the higher concentration VOC plume in the surficial aquifer. For 2021-2024, PCE and TCE did not have correlation for plume areas over time.

Table 5-8 Bulk Plume Area Metrics: Northern Area Confined Aquifer

	Plume Area (Acres)					Linear Correlation			M-K One Way Trend		
Plume	2021	2022	2023	2024	Δ%	r	p-value (α=0.05)	Corr	H	p-value (α=0.05)	SS Trend
PCE	0.74	2.27	2.55	1.49	101	3.98E-01	6.02E-01	Low (+)	0	3.67E-01	No
TCE	2.18	3.54	3.88	3.23	48.2	6.11E-01	3.89E-01	Mod (+)	0	3.67E-01	No
PCE vs TCE						7,11E-02	9.29E-01	No			

Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, Δ% = percent change in bulk plume area from 2021 to 2024, r = Pearson's linear correlation coefficient, p-value = probability value, Corr. = correlation: negative (-), positive correlation (+), M-K = Mann-Kendall, SS Trend = statistically significant trend at a significance level of 0.05 (5 percent).

5.5.2.2 Southern Area: Confined Aquifer

Table 5-9 has summary statistics for bulk plume areas for the confined aquifer in the southern monitoring area. Exhibit 5-14 has stem plots that visualize the timeseries data for the plume areas.

PCE, TCE, cDCE, and VC plume areas did not have statistically significant correlation or M-K trends for plume areas vs. time. PCE had a 38.5% decrease in plume area from 0.39 acres in 2021 to 0.24 acres in 2024 with moderate correlation (negative). Figure 5-7 (page 5-34) shows limited PCE plume areas in the fence line area (OU 3) extending into the offsite area.

TCE had a 19.6% increase in plume area from 4.08 acres in 2021 to 4.88 acres in 2024. PCE and TCE plume areas had no correlation for 2021-2024. Figure 5-8 (page 5-35) shows a contiguous TCE plume area extending from the Building 151 area into the offsite area with the 2024 plume extending farther into the offsite area.

Exhibit 5-14 VOC Plume Area Changes in Confined Aquifer: Northern Area

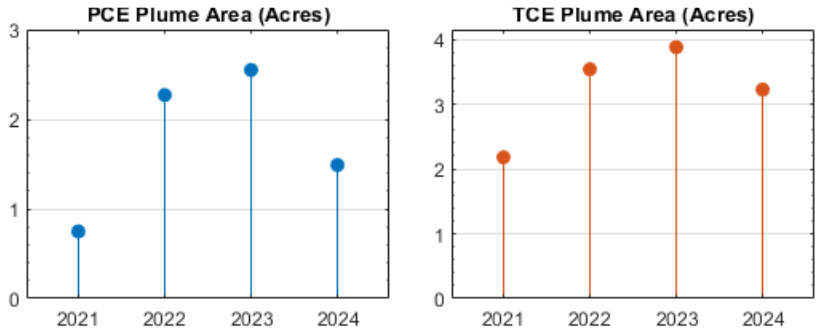

Exhibit 5-15 VOC Plume Area Changes in Confined Aquifer: Southern Area

PCE vs TCE						-5.36E-02	9.46E-01	No			
TCE vs cDCE						8.54E-01	1.46E-01	High (+)			
cDCE vs VC						9.89E-01	1.07E-02	SS (+)			

Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, Δ% = percent change in bulk plume area from 2021 to 2024, % reduction in plume area from 2021 to 2024, r = Pearson's linear correlation coefficient, p-value = probability value, Corr. = correlation: negative (-), positive correlation (+), M-K = Mann-Kendall, SS Trend = statistically significant trend at a significance level of 0.05 (5 percent).

cDCE had a 46% percent increase in plume area from 2.52 acres in 2021 to 3.68 acres in 2024. Figure 5-9 (page 5-36) shows a cDCE plume area extending from OU 2 across OU 3 into the offsite area with the 2024 plume extending farther into the offsite area. TCE and cDCE had statistically significant correlation (positive) for 2021-2024. VC had a 41% increase in plume area from 5.49 acres in 2021 to 7.74 acres in 2024. Figure 5-10 (page 5-37) shows a VC plume area extending from OU 2 across OU 3 into the offsite area with the 2024 plume extending farther into the offsite site area. cDCE and VC had statistically significant correlation (positive) for 2021-2024.

5.5.3 Plume Area Concentration vs. Distance Plots

This assessment uses monitoring well transects in monitored areas to evaluate plume changes and attenuation with distance. Exhibit 5-16 (page 5-38) has time series plots of the plume center of mass (molar) along the transects shown in Exhibits 5-16, 5-17, and 5-18. Exhibits 5-17, 5-18, and 5-19 (page 5-39) have concentration vs. distance plots (2024) for the surficial aquifer in the northern area, surficial aquifer in the southern area, and confined aquifer in the southern area, respectively. The transect plots are along plume centerlines with the left plots of each exhibit using concentrations reported in micrograms per liter and the right plots of each exhibit using molar concentrations expressed as micromoles.

5.5.3.1 Surficial Aquifer in Northern Area

The transect in Exhibit 5-17 (page 5-39) extends from well MW-238 upgradient of the current hotspot source zone in OU 1 downgradient to well MW-182 over a distance of 1,190 ft. VOC concentrations along the plume transect peak at 169 ft. at hotspot well MW-243 in OU 1 with concentrations decreasing to levels < MCLs before reaching 1,075 ft. at well MW-257 in OU 2. cDCE has the highest molar percentage from the hotspot well (MW-243) to the farthest downgradient well (MW-257) with constituent detections. TCE has the second highest molar percentage along the plume transect except the well upgradient of the hotspot (MW-23*) where TCE has the highest molar percentage.

5.5.3.2 Surficial Aquifer in Southern Area

The transect in Exhibit 5-18 (page 5-40) extends from well MW-260 in OU 2 across OU 3 to offsite well MW-156 over a distance of 949 ft. PCE, TCE, cDCE, and VC along the plume transect have the highest concentration at well MW-260 in OU 2 with secondary peaks at downgradient well MW-268 (near Building 151) for PCE, cDCE, and VC and at farther downgradient well MW-272 in OU 3 (near Building 150) for TCE. VOC concentrations decrease to levels < MCLs before reaching offsite well MW-156 located downgradient of the installation fence line. PCE and cDCE are less than their MCLs at well MW-276 located upgradient of the fence line area in OU 3.

Degradation by-products cDCE and VC have the greatest molar percentages along the plume transect with VC predominating at well MW-260 in OU 2 (75%) with cDCE predominating at other locations except near Building 151 (MW-260) where VC slightly exceeds cDCE as a molar percentage. cDCE comprises approximately 60% to 75% of the molar percentage in the downgradient portion of surficial aquifer plume.

Exhibit 5-19 (page 5-41) shows the plume center of mass (molar) for 2021, 2022, and 2024 at a distance of 256 ft to 270 ft from well MW-260 west of Building 151 near the upgradient edge of OU 3.

5.5.3.3 Confined Aquifer in Southern Area

The transect in Exhibit 5-19 (page 5-41) extends from well DMW-28B in OU 2 across OU 3 to offsite well MW-295 over a distance of 1,054 ft. TCE, cDCE, and VC along the plume transect have the highest concentrations in the offsite area at well MW-289 (TCE and cDCE) and well MW-291 (VC). The peak concentration from PCE (17 µg/L) occurred at fence line well MW-285. PCE, TCE, and cDCE concentrations decrease to levels < MCL at well MW-292 located 215 ft. downgradient of the installation fence line. VC concentrations decreased to a level < MCL at well MW-295 located 350 ft. downgradient of the installation fence line.

L:\Legacy\USGNA2FP002\Data\projects\0_GIS\DLA\OU8\Annual Report Figures\2024\Figure 5-10 Changes in Lateral Distribution of Ethene in Eastover

As a molar percentage of CVOCs, cDCE predominates (78% to 87%) along the plume transect (confined aquifer in southern area) where constituents have concentrations > MCLs. TCE has the next highest molar percentage in the transect segment from the center of OU 3 extending into the offsite area 120 ft. to well MW-157. VC had the second highest molar percentage at well DMW-28B in OU 2 and in the offsite area downgradient of MW-157 at wells MW-291 and MW-292.

Exhibit 5-16 shows the plume center of mass (molar) in the range of 688 ft (2024) and 705 ft. (2023) near well MW-289 in the offsite area approximately 70 ft downgradient of the installation fence line.

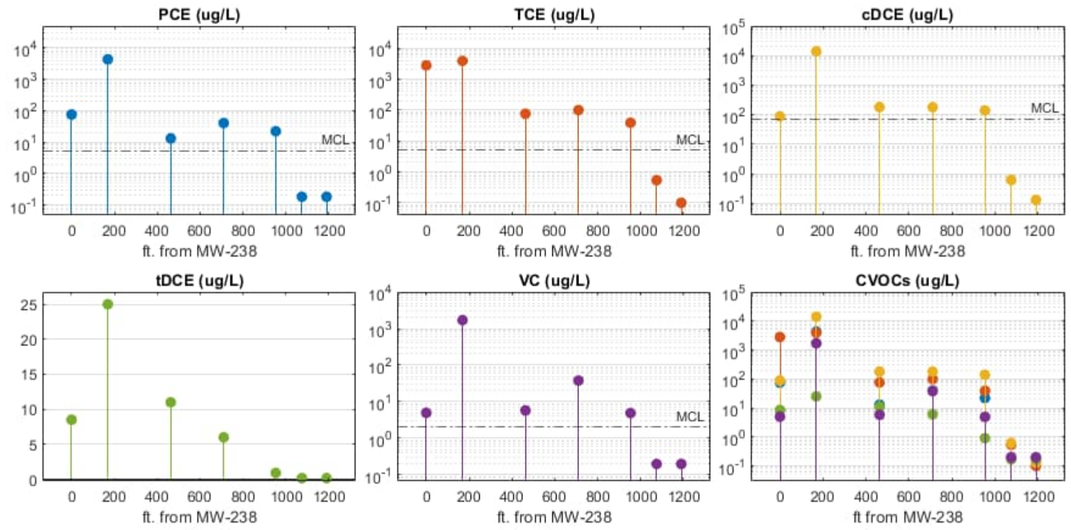
Exhibit 5-16 Plume Center of Mass

5.6 Well Trends

Section 5.6 evaluates COC concentration trends at monitoring well locations in the northern and southern monitoring areas of OU 6.

5.6.1 Surficial Aquifer: Northern Area

The trend assessment for the surficial aquifer in the northern area evaluates 18 wells monitored for performance assessment of the ISB injections (Oct-Nov 2021) completed in the OU 1 area (Figure 5-1). The data evaluated has eight (8) sampling events including a pre-ISB baseline sampling event (October 2021) and seven sampling events performed from December 2021 to May 2024. The well network includes 14 monitoring wells installed in 2021 prior to baseline monitoring and four (4) existing monitoring wells. Appendix E.5 has statistical and trend analysis documentation for the surficial aquifer in the northern area



5.6.1.1 Upgradient Well MW-237

Well MW-237 is located 250 ft. upgradient of the ISB injection area. Exhibit 5-20 (page 5-41) has time series plots for MW-237 with x-axis reference lines for cleanup levels (MCLs) and y-axis reference lines for ISB injections performed in Oct-Nov 2021. The plots have SSA lines for long-term trend. The table in Exhibit 5-20 has a summary of statistical and trend evaluations for MW-237 for October 2021-May 2024. The data plot shows a greater than order of magnitude change in concentrations for TCE for May 2023 from previous events. A verification sampling event occurred in July 2023 that did not confirm the higher concentration reported for May 2023.

The coefficients of variation for COCs show moderate variance except for TCE (high related to the detection in May 2023). COCs have positive linear correlation for concentrations vs. time with M-K trend tests indicating increasing trends for TCE, cDCE, and 1,1-DCE. SSA indicating COC trend changes to decreasing in May 2024.

5.6.1.2 Treatment Area: TA-1

ISB performance monitoring in and around treatment area TA-1 included eight locations: MW-129, MW-130, MW-131, MW-238, MW-239, MW-240, MW-241, and MW-242 (Figure 5-1). Table 5-10 (page 5-42) has a summary of the statistical and trend analysis for these wells. Exhibit 5-21 (pages 5-43, 5-44) for wells in the TA-1 area have time series data plots with x-axis reference lines for cleanup levels (MCLs) and y-axis reference lines for ISB injections performed in Oct-Nov 2021. The plots have SSA lines for long-term trend.

Well MW-129

Well MW-129 is located < 20 ft. downgradient of ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots of data for MW-129. The baseline sample from the well had progressively higher concentrations for PCE, TCE, and cDCE. The coefficients of variation for COCs show high variance except for 1,1-DCE that had lower frequency of detection (3 of 8). COCs have positive linear correlation for concentrations vs. time. M-K tests indicate an increasing trend for cDCE with no trends identified for other COCs. ISB injections at this location mostly have reduced PCE and TCE to cDCE and VC.

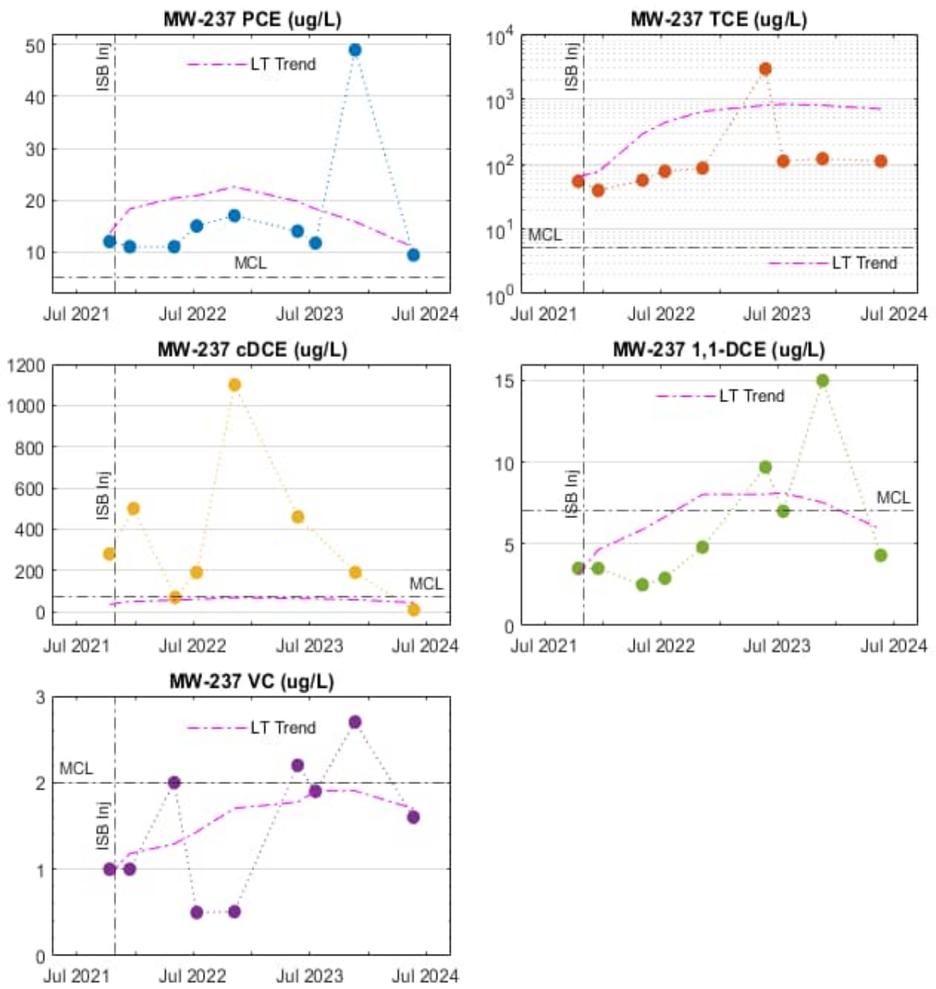
Well MW-130

Well MW-130 is 20 ft. downgradient of ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots of data for MW-130. The baseline sample from MW-130 had progressively higher concentrations for PCE, TCE, and cDCE. The coefficients of variation for COCs show high variance for PCE, TCE, and VC with moderate variance for cDCE and 1,1-DCE. For concentration vs. time correlation, PCE has positive correlation, TCE has no correlation, and cDCE, 1,1-DCE, and VC have negative correlation.

M-K tests indicate an increasing trend for PCE with no trends detected for other COCs. SSA shows apparent COC trend changes to decreasing in May 2024. ISB injections at this location mostly have reduced PCE and TCE to cDCE and VC. As of May 2024, concentrations for PCE, cDCE, and 1,1-DCE at MW-130 are < MCLs with TCE and VC slightly > MCLs.

Well MW-131

Well MW-131 is located in the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots of data for MW-131. TCE in the baseline sample from MW-131 had the highest concentration followed by cDCE and PCE. The coefficients of variation for COCs show moderate variance for PCE, TCE, and cDCE with lower detection frequencies for 1,1-DCE (4 of 8 samples) and VC (2 of 8 samples). For concentration vs. time correlation, PCE, TCE, cDCE, and 1,1-DCE have negative correlation.



M-K tests did not indicate statistical evidence of trends at a significance level of 0.05 (5%) with a decreasing trend for TCE at significance level of 0.10 (10%). SSA generally indicated no long term trends for COCs. As of May 2024, concentration reductions from baseline levels are 39% for PCE, 35% for TCE, and 22% for cDCE.

Well MW 238

Well MW-238 is located 45 ft. upgradient (west) of the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots for MW-238. TCE in the baseline sample from MW-238 had the highest concentration followed by cDCE with other COCs near or < MCLs. The coefficients of variation for COCs show moderate variance for PCE, TCE, and cDCE with lower detection frequencies for 1,1-DCE and VC (2 of 8 samples). For concentration vs. time correlation, PCE and TCE have positive correlation with negative correlation for cDCE.

M-K tests indicated statistical evidence of increasing trends for PCE and TCE at a significance level of 0.05 (5%). SSA indicates increasing trends for PCE and TCE and decreasing trend for cDCE. As of May 2024, concentration reductions from baseline levels are 62% for cDCE.

Exhibit 5-20 Upgradient Well MW-237: Time Series Plots and Statistical Summary

Summary of Statistical and Trend Analysis: MW-237

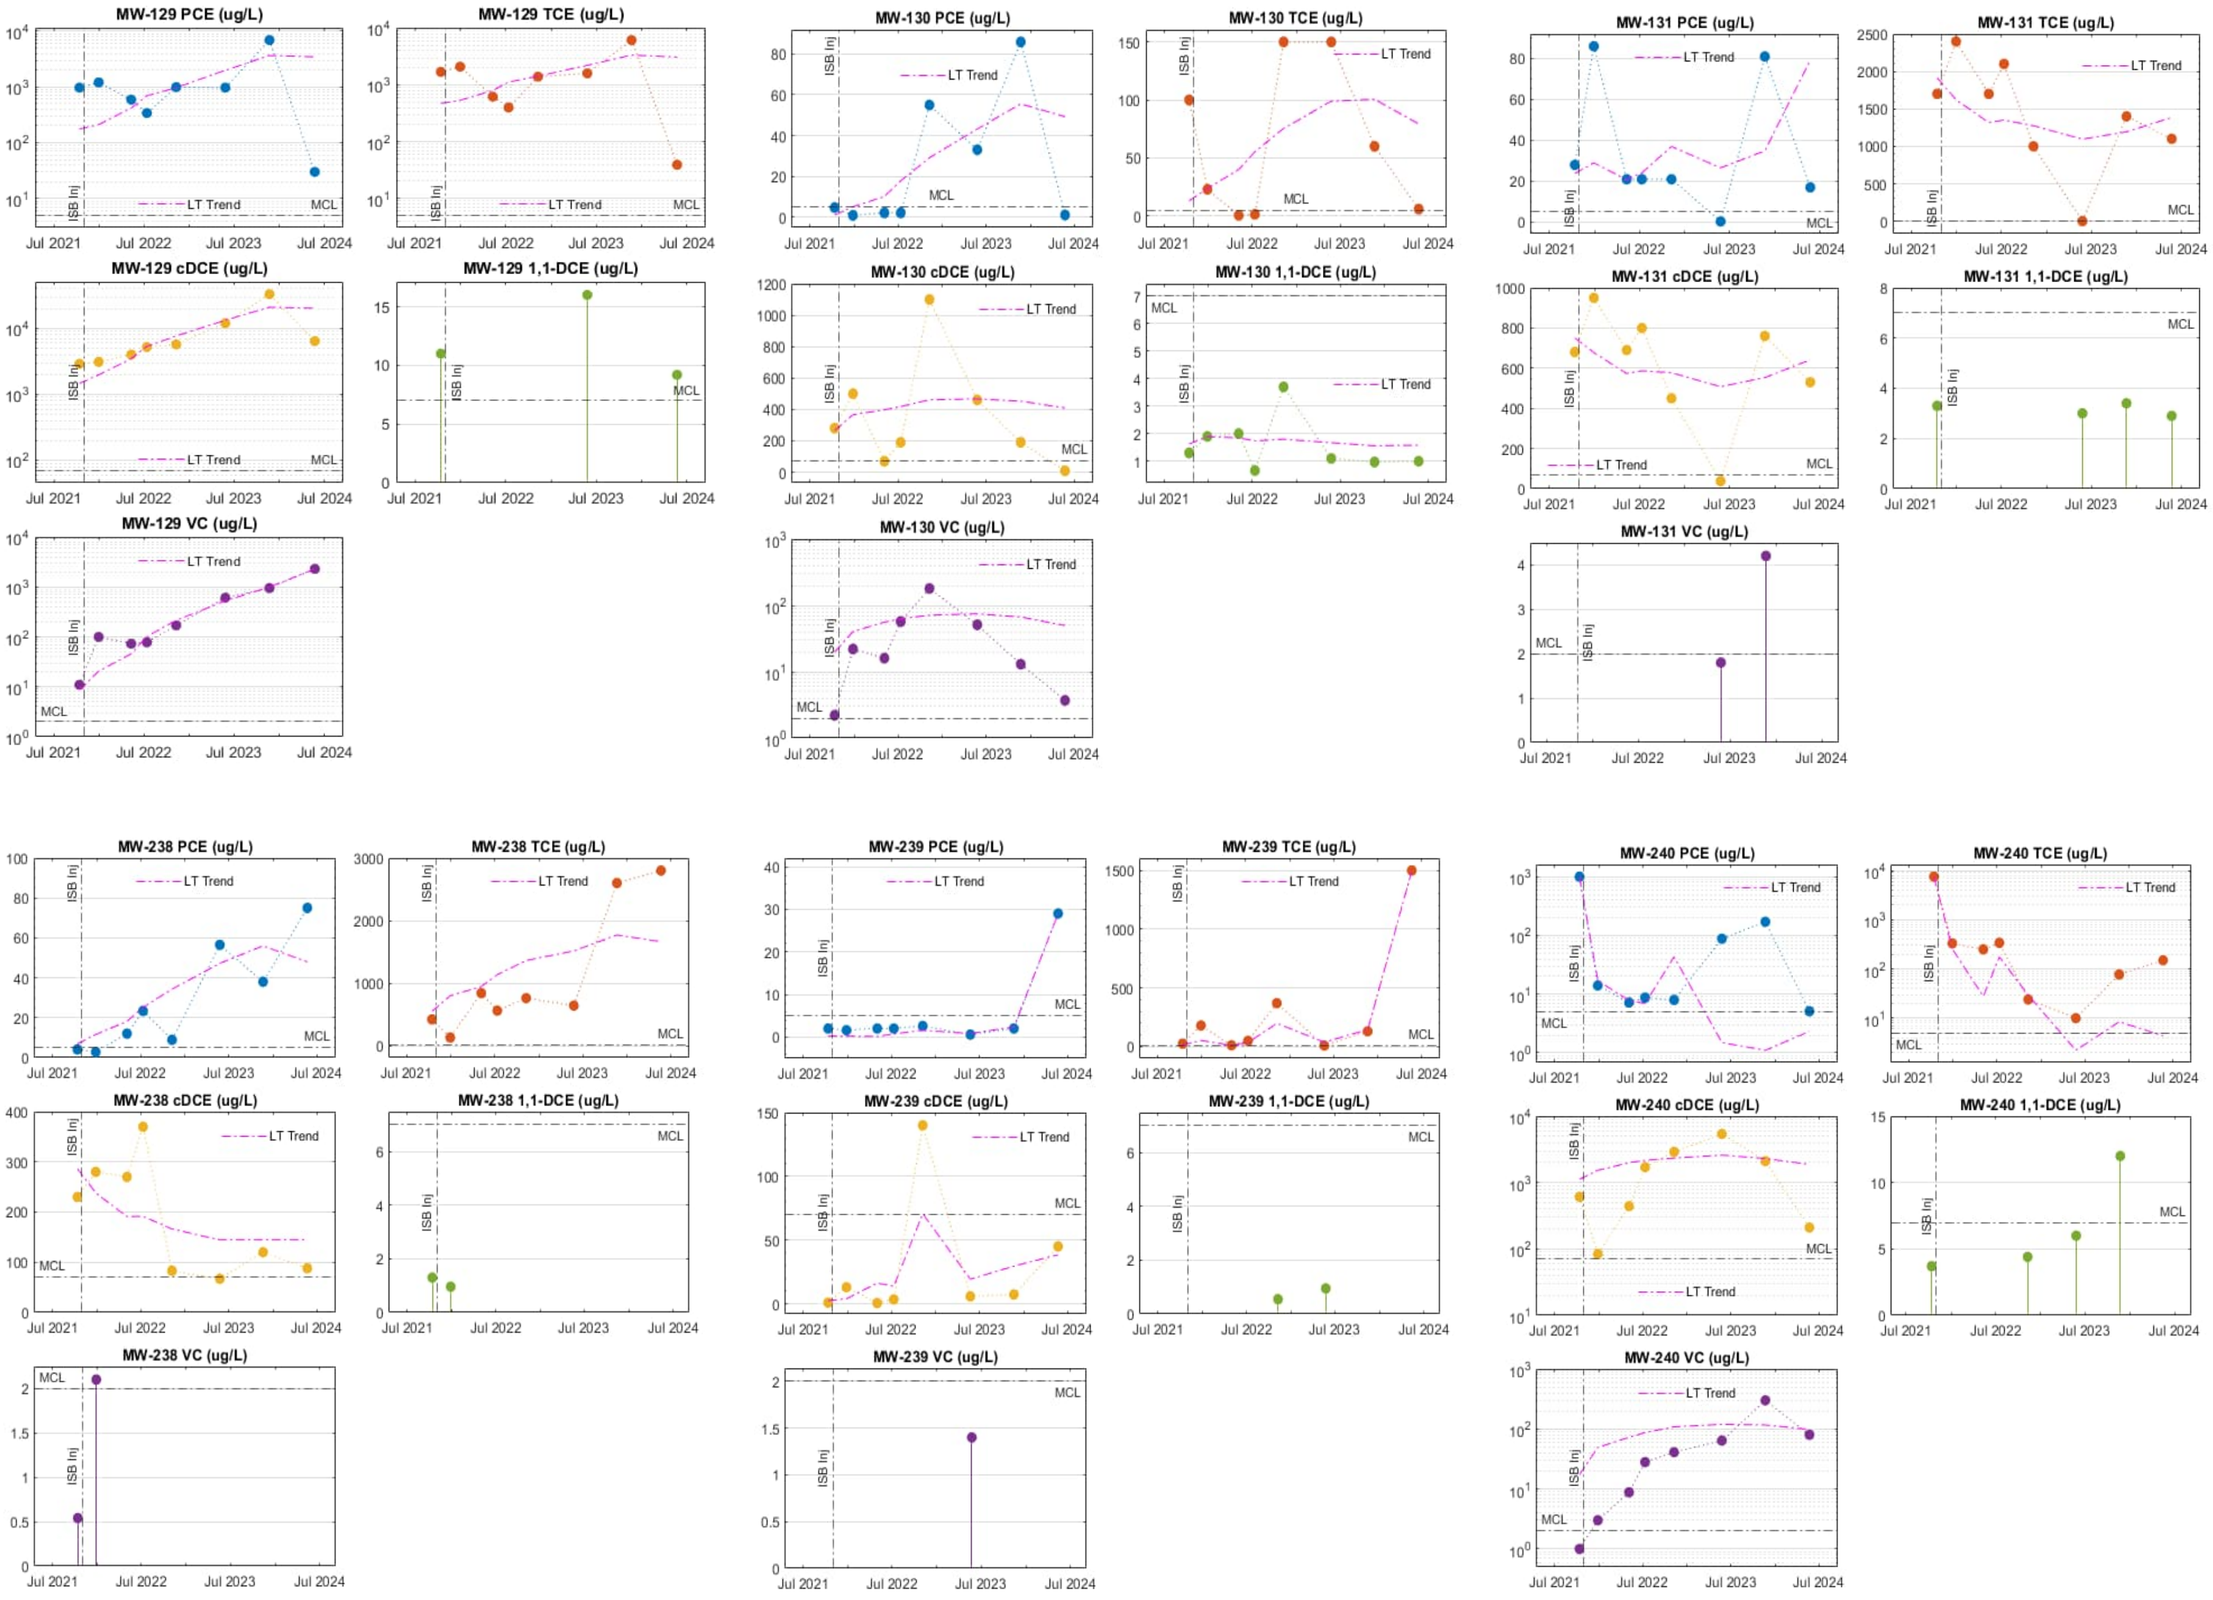
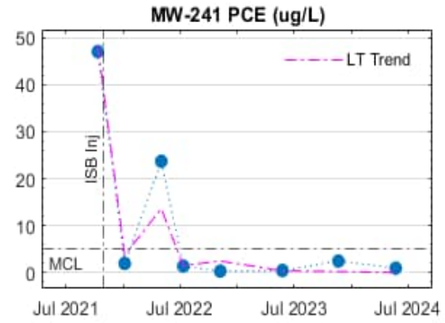
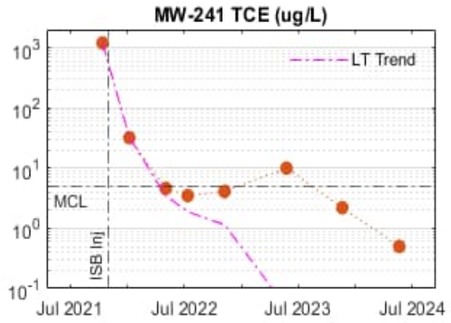
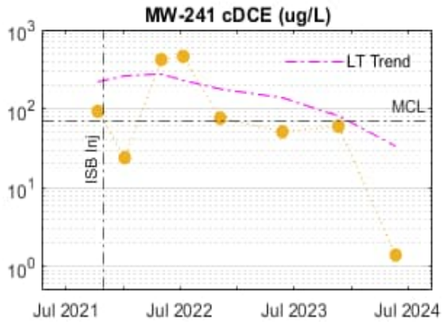
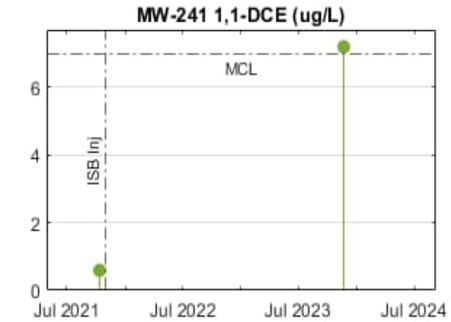
Exhibit 5-21 Time Series Plots for TA-2











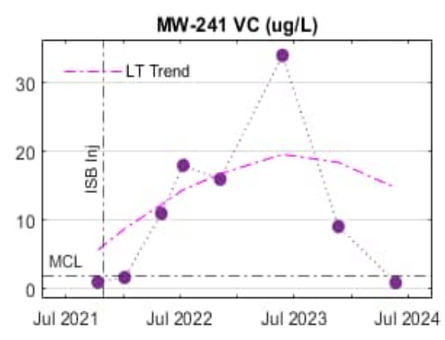


Exhibit 5-21 (Cont'd)

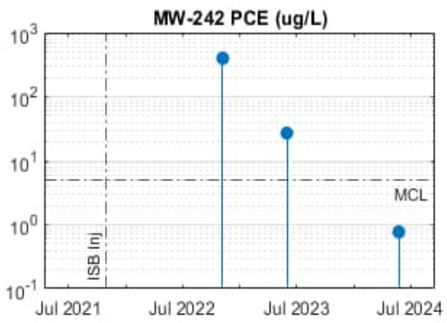
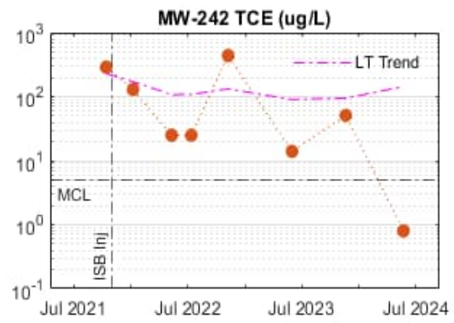
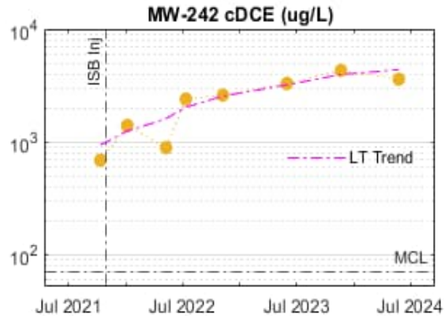
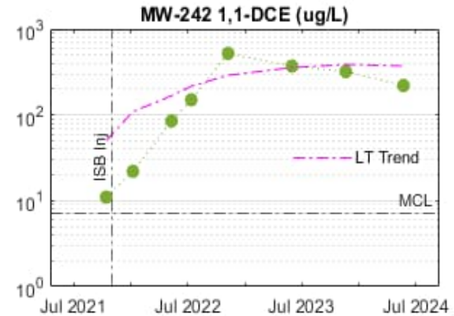
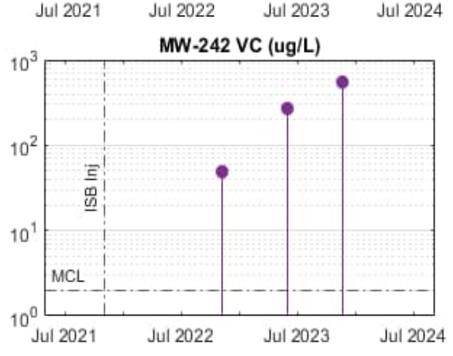










Well MW-129

Well MW-129 is located < 20 ft. downgradient of ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots of data for MW-129. The baseline sample from the well had progressively higher concentrations for PCE, TCE, and cDCE. The coefficients of variation for COCs show high variance except for 1,1-DCE that had lower frequency of detection (3 of 8). COCs have positive linear correlation for concentrations vs. time. M-K tests indicate an increasing trend for cDCE with no trends identified for other COCs. ISB injections at this location mostly have reduced PCE and TCE to cDCE and VC.

Well MW-130

Well MW-130 is 20 ft. downgradient of ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots of data for MW-130. The baseline sample from MW-130 had progressively higher concentrations for PCE, TCE, and cDCE. The coefficients of variation for COCs show high variance for PCE, TCE, and VC with moderate variance for cDCE and 1,1-DCE. For concentration vs. time correlation, PCE has positive correlation, TCE has no correlation, and cDCE, 1,1-DCE, and VC have negative correlation.

M-K tests indicate an increasing trend for PCE with no trends detected for other COCs. SSA shows apparent COC trend changes to decreasing in May 2024. ISB injections at this location mostly have reduced PCE and TCE to cDCE and VC. As of May 2024, concentrations for PCE, cDCE, and 1,1-DCE at MW-130 are < MCLs with TCE and VC slightly > MCLs.

Well MW-131

Well MW-131 is located in the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots of data for MW-131. TCE in the baseline sample from MW-131 had the highest concentration followed by cDCE and PCE. The coefficients of variation for COCs show moderate variance for PCE, TCE, and cDCE with lower detection frequencies for 1,1-DCE (4 of 8 samples) and VC (2 of 8 samples). For concentration vs. time correlation, PCE, TCE, cDCE, and 1,1-DCE have negative correlation.

M-K tests did not indicate statistical evidence of trends at a significance level of 0.05 (5%) with a decreasing trend for TCE at significance level of 0.10 (10%). SSA generally indicated no long term trends for COCs. As of May 2024, concentration reductions from baseline levels are 39% for PCE, 35% for TCE, and 22% for cDCE.

Well MW 238

Well MW-238 is located 45 ft. upgradient (west) of the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots for MW-238. TCE in the baseline sample from MW-238 had the highest concentration followed by cDCE with other COCs near or < MCLs. The coefficients of variation for COCs show moderate variance for PCE, TCE, and cDCE with lower detection frequencies for 1,1-DCE and VC (2 of 8 samples). For concentration vs. time correlation, PCE and TCE have positive correlation with negative correlation for cDCE.

M-K tests indicated statistical evidence of increasing trends for PCE and TCE at a significance level of 0.05 (5%). SSA indicates increasing trends for PCE and TCE and decreasing trend for cDCE. As of May 2024, concentration reductions from baseline levels are 62% for cDCE.

Well MW-239

Well MW-239 is located 33 ft. upgradient (west) of the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots for MW-239. TCE in the baseline sample from MW-239 had a concentration greater than the MCL with other COCs < the MCL. The coefficients of variation for COCs show high variance for PCE, TCE, and cDCE with lower detection frequencies for 1,1-DCE (2 of 8 samples) and VC (1 of 8 samples). For concentration vs. time correlation, PCE, TCE, and cDCE have positive correlation.

M-K tests did not indicate statistical evidence of trends for COCs at a significance level of 0.05 (5%). SSA indicates increasing trends for PCE, TCE, and cDCE. As of May 2024, MW-239 had PCE and TCE concentrations > MCLs and pre-injection baseline levels.

Well MW-240

Well MW-240 is located within the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots for MW-240. TCE in the baseline sample from MW-240 had the highest concentration followed by PCE and cDCE. The coefficients of variation for COCs show high variance except for 1,1-DCE that has a lower detection frequency (4 of 8 samples). For concentration vs. time correlation, PCE and TCE have negative correlation with cDCE and VC having positive correlation.

M-K tests indicate statistical evidence of an increasing trend for VC at a significance level of 0.05 (5%). SSA indicates an increasing trend for VC, decreasing trends for PCE and TCE, and a trend change to decreasing for cDCE in May 2024. As of May 2024, the PCE concentration at MW-240 had decreasing more than 99% from baseline approaching the MCL.

Well MW-241

Well MW-241 is located within the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots for MW-241. TCE in the baseline sample from MW-240 had the highest concentration followed by cDCE and PCE. The coefficients of variation for PCE, TCE, and cDCE show high variance with moderate variance for VC. 1,1-DCE has a low detection frequency (2 of 8 samples). For concentration vs. time correlation, PCE and TCE have negative correlation with cDCE and VC having positive correlation.

M-K tests indicate statistical evidence of a decreasing trend for TCE at a significance level of 0.05 (5%) with a decreasing trend for PCE at a significance level of 0.10 (10%). SSA indicates decreasing trends for PCE, TCE, and cDCE with a trend change to decreasing for VC in May 2024. As of May 2024, COCs had concentrations < MCLs at well MW-241.

Well MW-242

Well MW-242 is located < 20 ft. downgradient of the ISB injection area for TA-1 (Figure 5-1). Exhibit 5-21 has time series plots for MW-241. cDCE in the baseline sample from MW-241 had the highest concentration followed by TCE and 1,1-DCE. The coefficients of variation show high variance for TCE and moderate variance for cDCE and 1,1-DCE. PCE and VC have a lower detection frequency (3 of 8 samples). For concentration vs. time correlation, TCE has negative correlation with cDCE having statistically significant, positive correlation at a significance level of 0.05 (5%). 1,1-DCE has positive correlation.

M-K tests indicate statistical evidence of increasing trends for cDCE and 1,1-DCE at a significance level of 0.05 (5%). SSA indicates an increasing trend for cDCE and a leveling trend for TCE and 1,1-DCE. As of May 2024, PCE and TCE had detected concentrations < MCLs at well MW-242.

Summary of Trend Analysis for TA-1

Table 5-11 (page 5-47) has a summary of the statistical and trend analysis for TA-1. M-K trend trends indicated statistical evidence of decreasing trends (significance level of 0.05) for 1 of 30 tests performed. Four (4) M-K tests for PCE and TCE indicated decreasing trends at a significance level of 0.10. Seven (7) M-K tests indicated statistical evidence of increasing trends (significance level of 0.05) with 5 of 7 tests for daughter products cDCE, 1,1-DCE, and VC. SSA trend tests for the 31 month monitoring period identified trends prevalent through this period and changes in trends within the monitoring period. SAA identified increasing trends for 9 of 30 tests with 7 of 9 tests for daughter products cDCE, 1,1-DCE, and VC. SSA identified decreasing trends for 5 of 30 tests, changes to no trend for 2 of 30 tests, and changes to deceasing trend for 9 of 30 tests.

5.6.1.3 Treatment Area: TA-2

ISB performance monitoring in and around treatment area TA-2 included four locations: MW-126, MW-243, MW-245, and MW-246. (Figure 5-1). Table 5-12 (page 5-48) has a summary of the statistical and trend analysis for these wells. Exhibit 5-22 (page 5-49) has time series data plots for wells in TA-2 with x-axis reference lines for cleanup levels (MCLs) and y-axis reference lines for ISB injections performed in Oct-Nov 2021. The plots have SSA lines for long-term trend.

Table 5-11 Summary of Statistical and Trend Analysis: TA-1

Parameter	Samples for Trend Evaluation	Mann-Kendall Trend (M-K, One Way)				Singular Spectrum Analysis (SSA)			
		No Trend	Decreasing (α - 0.10)	Decreasing (α - 0.05)	Increasing (α - 0.05)	Decreasing	Increasing	Change to No Trend	Change to Decreasing
Total	30	18	4	1	7	5	9	2	9
PCE	7	5	1	--	1	1	2	1	1
TCE	8	3	3	1	1	2	3	--	1
cDCE	8	6	--	--	2	2	3	--	3
11DCE	3	2	--	--	1	--	--	1	1
VC	4	2	--	--	2	--	1	--	3

Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, α – 0.05 = alpha significance level of 0.05 (5 percent), α – 0.10 = alpha significance level of 0.10 (10 percent).

Well MW-126

Well MW-126 is located within the ISB injection area for TA-2 (Figure 5-1). Exhibit 5-22 (page 5-49) has time series plots of data for MW-126. The baseline sample from MW-126 had the following concentration progression: TCE > PCE > cDCE with a concentration range of 400 µg/L. The coefficients of variation for COCs show high variance except for 1,1-DCE that had a lower frequency of detection (3 of 8 samples).

COCs have positive linear correlation for concentrations vs. time with M-K trend tests indicating an increasing trend for cDCE. SSA indicated COC trend changes to decreasing in May 2024. The baseline sample from MW-126 had the following concentration progression: TCE > PCE > cDCE with a concentration range of 400 µg/L. The coefficients of variation for COCs show high variance except for 1,1-DCE that lower frequency of detection (3 of 8). COCs have positive linear correlation for concentrations vs. time with M-K trend tests. ISB injections at this location mostly have reduced PCE and TCE to cDCE and VC.

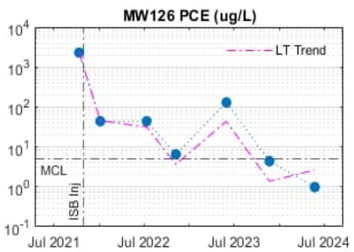
Well MW-243

Well MW-243 is located 15 ft. upgradient of the ISB injection area for TA-2 (Figure 5-1). Exhibit 5-22 (page 5-49) has time series plots of data for MW-243. This well is a hotspot within the OU 1 area with the highest baseline concentrations for PCE, TCE, and cDCE ≥24,000 µg/L. The coefficients of variation for COCs show low variance for cDCE and moderate variance for other COCs. PCE, TCE, and 1,1-DCE have negative linear correlation for concentrations vs. time. cDCE has no linear correlation and VC has positive linear correlation.

M-K tests indicate decreasing trends for PCE and TCE, no trend for cDCE and 1,1-DCE, and an increasing trend for VC. SSA indicates decreasing trends for PCE, TCE, and 1,1-DCE with an apparent change to a decreasing trend for cDCE in May 2024. M-K tests indicate an increasing trend for VC.

Well MW-245

Well MW-245 is located 35 ft. downgradient of the ISB injection area for TA-2 (Figure 5-1). Exhibit 5-22 (page 5-49) has time series plots of data for MW-245. cDCE had the highest concentration for the baseline sample followed by TCE, 1,1-DCE, PCE, and VC. The coefficients of variation for COCs show high variance. cDCE and VC have statistically significant, negative linear correlation for concentrations vs. time. Other COCs have negative correlation.



M-K tests and SSA indicate decreasing COCs concentrations. As of May 2024, detected concentrations of COCs at well MW-245 did not exceed MCLs.

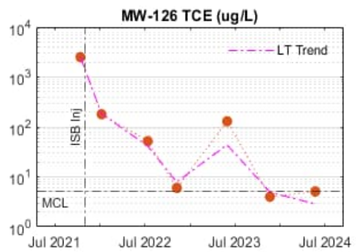


Table 5-12 ISB Treatment Area TA-2 Wells: Summary of Statistical and Trends Analysis

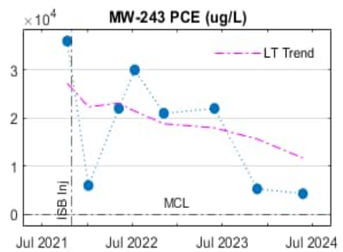

Location	Analyte	No. Samples	Concentration (ug/L)		Variance		Pearson's Linear Correlation			Mann-Kendall Trend One Way			Singular Spectrum Analysis (SSA)

Notes: PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, CV = coefficient variation, r = correlation coefficient, p-value = probability value, Corr. = correlation: negative (-) and positive (+), SS = statistically significant at an alpha significance level of 0.05 (5 percent), [1]decreasing trend at alpha significance level of 0.10 (10 percent), Constituent concentration is less than the MCL., decreasing trend

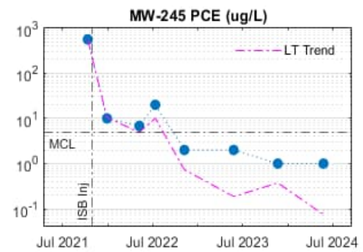

Exhibit 5-22 Time Series Plots for TA-2

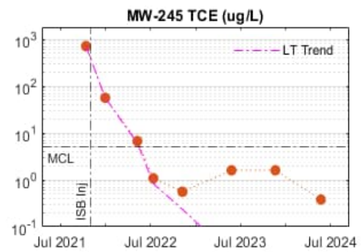

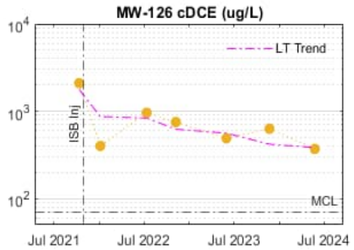

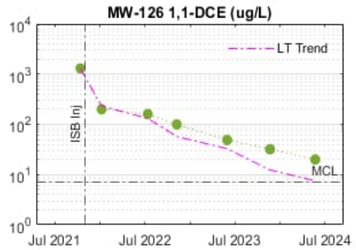

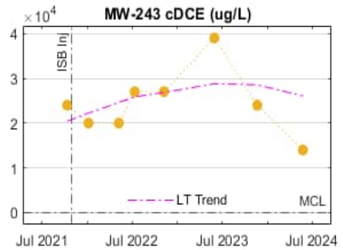

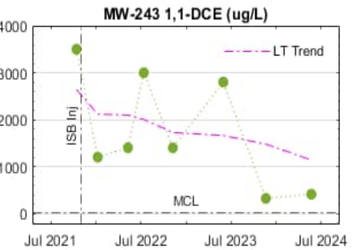

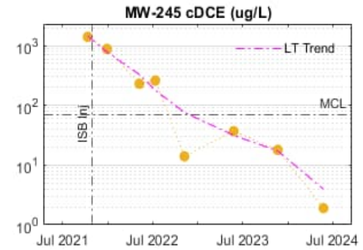

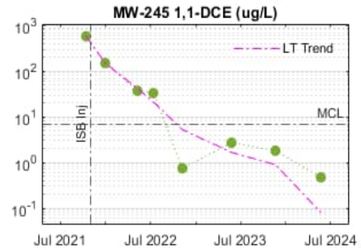

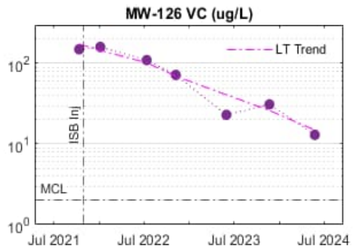

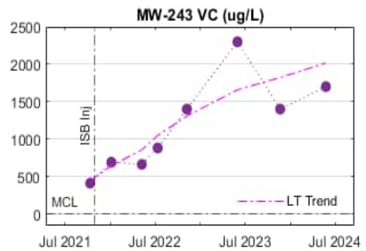

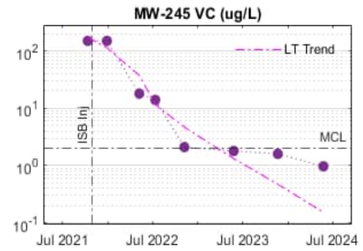

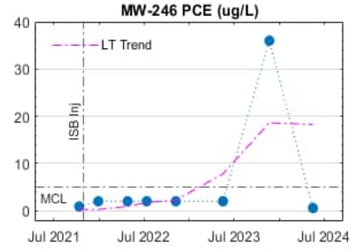

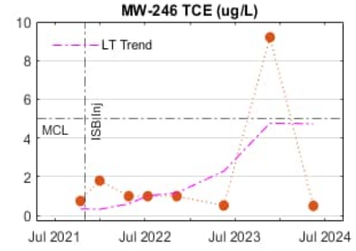

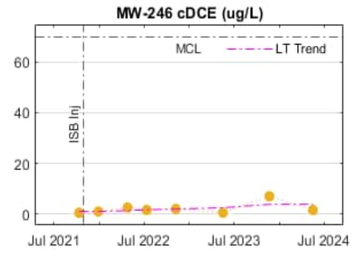

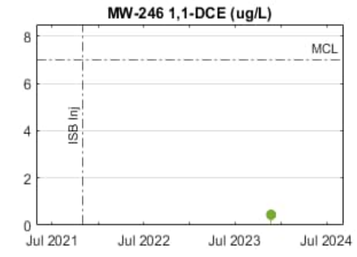

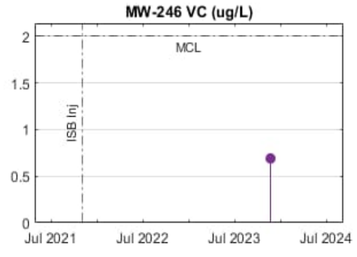

Well MW-245

Well MW-245 is located 35 ft. downgradient of the ISB injection area for TA-2 (Figure 5-1). Exhibit 5-22 (page 5-49) has time series plots of data for MW-245. cDCE had the highest concentration for the baseline sample followed by TCE, 1,1-DCE, PCE, and VC. The coefficients of variation for COCs show high variance. cDCE and VC have statistically significant, negative linear correlation for concentrations vs. time. Other COCs have negative correlation.

M-K tests and SSA indicate decreasing COCs concentrations. As of May 2024, detected concentrations of COCs at well MW-245 did not exceed MCLs.

Well MW-246

Well MW-246 is located 20 ft. downgradient of the ISB injection area for TA-2 (Figure 5-1). Exhibit 5-22 (page 5-49) has time series plots of data for MW-246. cDCE had the highest concentration for the baseline sample followed by TCE, 1,1-DCE, PCE, and VC. The coefficients of variation for COCs show high variance for PCE and TCE with moderate variance for cDCE. 1,1-DCE and VC have detections in 1 of 8 samples. PCE, TCE, and cDCE have positive linear correlation for concentrations vs. time. Other COCs have negative correlation.

M-K tests and SSA do not indicate trends for PCE, TCE, and cDCE. As of May 2024, detected concentrations of COCs at well MW-246 did not exceed MCLs.

Summary of Trend Analysis for TA-2

Table 5-13 has a summary of the statistical and trend analysis for TA-2. M-K trend trends indicated statistical evidence of decreasing trends (significance level of 0.05) for 11 of 18 tests performed. One M-K test for cDCE indicated a decreasing trend at a significance level of 0.10. One M-K test for VC indicated statistical evidence of an increasing trend (significance level of 0.05). SSA trend tests for the 31 month monitoring period identified decreasing trends prevalent through this period and one change in trend to decreasing (cDCE) within the monitoring period. SAA identified an increasing trend for 1 of 18 tests (VC), decreasing trends for 13 of 18 tests, and changes to decreasing trend for 1 of 18 tests.

Table 5-13 Summary of Statistical and Trend Analysis: TA-2

		Mann-Kendall Trend (M-K, One Way)				Singular Spectrum Analysis (SSA)			
Parameter	Samples for Trend Evaluation	No Trend	Decreasing (α - 0.10)	Decreasing (α - 0.05)	Increasing (α - 0.05)	Decreasing	Increasing	Change to No Trend	Change to Decreasing
Total	18	5	1	11	1	13	1	--	1
PCE	4	1	--	3	--	3	--	--	--
TCE	4	1	--	3	--	3	--	--	--
cDCE	4	2	1	1	--	2	--	--	1
11DCE	3	1	--	2	--	3	--	--	--
VC	3	--	--	2	1	2	1	--	--

Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, α – 0.05 = alpha significance level of 0.05 (5 percent), α – 0.10 = alpha significance level of 0.10 (10 percent).

5.6.1.4 Treatment Area: TA-3

ISB performance monitoring in and around treatment area TA-3 included well MW-247 located < 10 ft. downgradient of the ISB injection area for TA-3 (Figure 5-1). Table 5-14 (page 5-51) has a summary of the statistical and trend analysis for these wells. Exhibit 5-23 (page 5-51) has a time series data plot for well MW-247 with x-axis reference lines for cleanup levels (MCLs) and y-axis reference lines for ISB injections performed in Oct-Nov 2021. The plots have SSA lines for long-term trend.

MW-247 had baseline concentrations for cDCE, 1,1-DCE, and VC at levels > MCLs with PCE and TCE < MCLs. The coefficients of variation for COCs show high variance for PCE, TCE, and VC. 1,1-DCE had detections in 2 of 8 samples in 2021-2022. PCE and TCE have positive linear correlation for concentrations vs. time with cDCE and VC having negative correlation.

Table 5-14 ISB Treatment Area TA-3 Wells: Summary of Statistical and Trend Analysis

Location	Analyte	No. Samples	Concentration (ug/L)		Variance		Pearson's Linear Correlation			Mann-Kendall Trend One Way			Singular Spectrum Analysis (SSA)

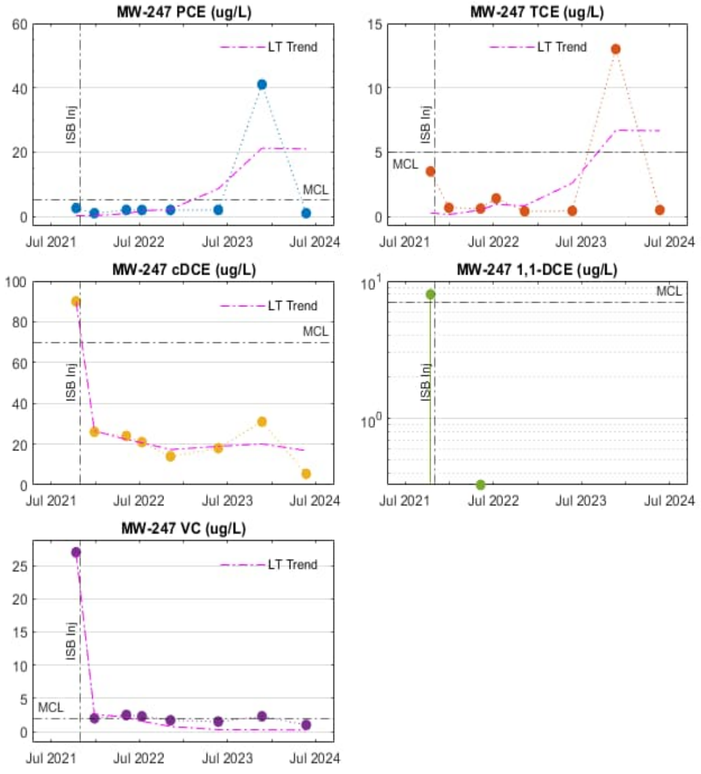
Exhibit 5-23 Time Series Plots for TA-3



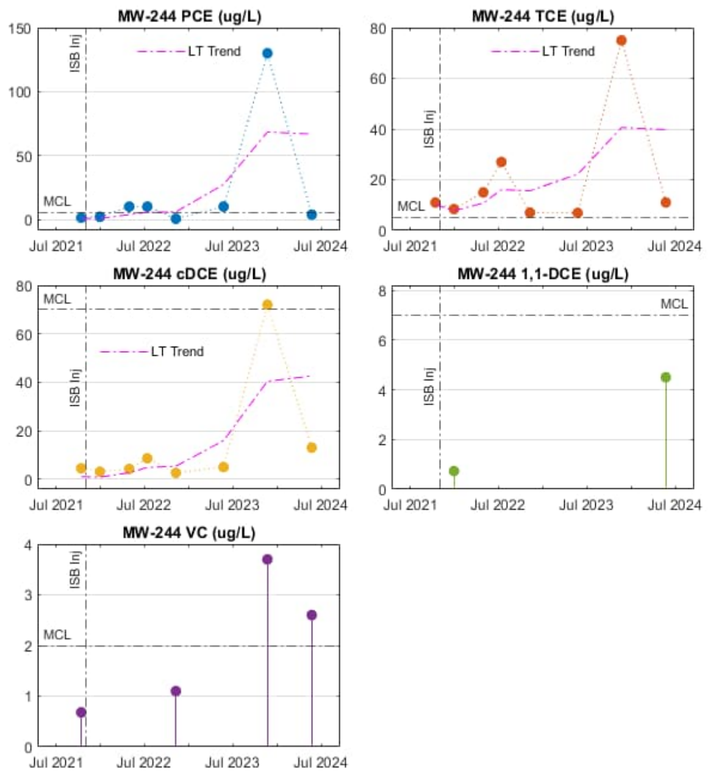


Exhibit 5-24 Time Series Plots for Well MW-244

5.6.1.5 Well MW-244

ISB performance monitoring well MW-244 is 25 ft. north and cross gradient of ISB injection area for TA-2 (Figure 5-1). Table 5-15 (page 5-51) has a summary of the statistical and trend analysis for well MW-244. Exhibit 5-24 (page 5-51) has a time series data plot for well MW-244 with x-axis reference lines for cleanup levels (MCLs) and y-axis reference lines for ISB injections performed in Oct-Nov 2021. The plots have SSA lines for long-term trend.

MW-244 had baseline concentrations < MCL for COCs except for TCE (11 µg/L). The coefficients of variation for COCs show high variance for PCE, TCE, and cDCE and moderate variance for VC. 1,1-DCE had detections in 2 of 8 samples. PCE, TCE, cDCE and VC have positive linear correlation for concentrations vs. time. M-K tests did not indicate trends for COCs. SSA indicated an increasing trend for cDCE with no trends for PCE and TCE.

5.6.2 Surficial Aquifer for Southern Area

The trend assessment for the surficial aquifer in the southern area evaluates 11 wells monitored in the OU 2 and OU 3 areas of OU 6 for the monitoring period 2021 through 2024. These wells are located in the remaining plume area in the surficial aquifer where COCs for the monitoring period had concentrations > cleanup levels (MCLs) for one or more samples. For 2021-2024, PCE, TCE, cDCE, VC, 1,2-DCA, 1,4-DCB, and CB had detected concentrations > MCLs. Each monitoring well has four (4) data observations. Criteria used for performing trend evaluations of COCs for each location includes detections in 4 of 4 samples. M-K tests require a minimum of four detected observations with a determination of statistical evidence of trend generally requiring a monotonic increase or decrease for the four observations. Appendix E.6 has statistical and trend analysis documentation for the surficial aquifer in the southern area.

Exhibit 5-25 (pages 5-53, 5-54) has COC data plots for the 11 wells evaluated for trends. The stem plots have y-axis reference lines for cleanup levels (MCLs).

5.6.2.1 Operable Unit 2 Area

Trend analysis for the OU 2 area includes monitoring wells MW-260 and MW-262 (Figure 3-1). Table 5-16 has a summary of the statistical and trend analysis for these wells. Exhibit 5-25 has data plots for wells MW-260 and MW-262. M-K tests did not indicate statistical evidence of trends for MW-260 or MW-262.

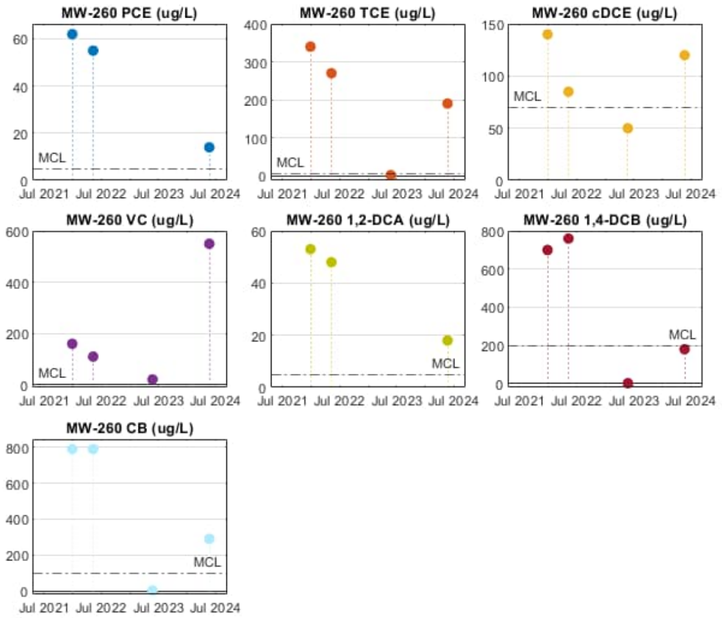

Table 5-16 OU 2 Wells: Summary of Statistical and Trend Analysis

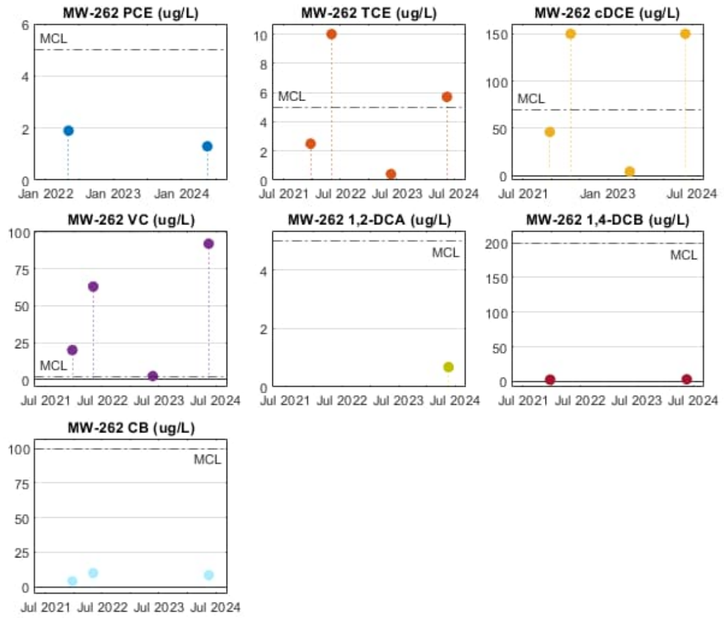

Location	Analyte	Concentration (µg/L)		Pearson's Linear Correlation			Mann-Kendall Trend One Way		
		2021	2024	r	p-value (α=0.05)	Corr	H	p-value (α=0.05)	Trend

M-K tests for OU 3 wells indicating decreasing trends for VC at MW-264, PCE at MW-266, and for 1,4-DCB and CB at MW-274. M-K test indicated an increasing trend for cDCE at MW-273.

5.6.2.3 Summary of Trend Analysis for Surficial Aquifer: Southern Area

Table 5-18 has a summary of the statistical and trend analysis for the surficial aquifer in the southern area of OU 6. M-K trend trends indicated 4 of 52 tests had a decreasing trend with 1 of 52 tests having an increasing trend. Because of the limited observations at each well (4), M-K tests generally will indicate a trend only if there is a monotonic increase or decrease for the four observations at each location with no left censored results for the well evaluated (non-detect).

Maximum concentrations occurrence at the 11 well locations indicated 18 of 77 results had the maximum concentration occur at the beginning of the monitored period (2021). Thirty-seven of 77 results had the maximum concentration occur at the end of the monitored period (2024). Ten of 77 locations had the minimum occur at the end of the monitored period (2024).

Table 5-18 Summary of Statistical and Trend Analysis for Surficial Aquifer: Southern Area

Parameter	No of Well Locations	No. of Maxima Locations		No. of Minima Locations	Samples for Trend Evaluation	Mann-Kendall Trend (M-K, One Way)			
		2021	2024	2024		No Trend	Decreasing (α - 0.10)	Decreasing (α - 0.05)	Increasing (α - 0.05)
Total	11	18	37	10	52	5	4	3	1

Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, α – 0.05 = alpha significance level of 0.05 (5 percent), α – 0.10 = alpha significance level of 0.10 (10 percent).

5.6.3 Confined Aquifer for Northern Area

The trend assessment for the confined aquifer in the northern area evaluates five (5) wells monitored that have currently have concentrations > MCLs for PCE and/or TCE. Appendix E.7 has statistical and trend analysis documentation for the confined aquifer in the northern area.

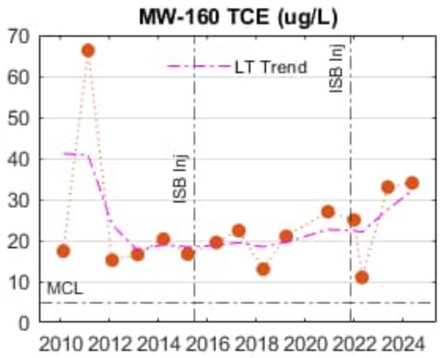
5.6.3.1 OU 1 Area

Wells evaluated for the OU 1 area include MW-160, MW-165, MW-165, and MW-171 near or beneath the source zone within the surficial aquifer (Figure 3-1). Exhibit 5-26 (page 5-58) has time series plots with x-axis reference lines for injections performed in 2015 and 2021 and y-axis reference lines for cleanup levels (MCLs).

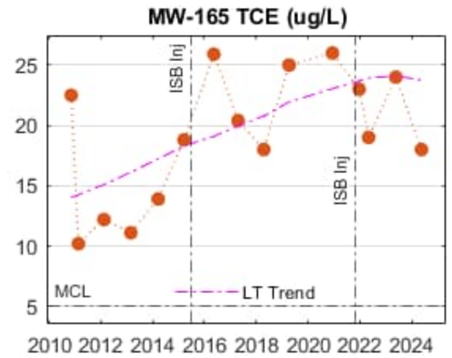
Table 5-19 (page 5-59) has a summary of the statistical and trend analysis for PCE and/or TCE at these wells in the OU 1 area. The coefficients of variation for COCs show moderate variance except for TCE MW-165 that has low variance. For concentration vs. time correlation, TCE at well MW-160 has no correlation with positive correlation for TCE at MW-165 and for PCE and TCE at MW-171. For well MW-166, TCE has negative correlation for concentration vs. time. M-K tests indicate an increasing trend for TCE at well MW-166, an increasing trend for PCE and TCE at well MW-171 with no trends for other well locations. SSA detected trend changes for TCE at wells MW-160 (decreasing to increasing in 2023), MW-165 (increasing to no trend in 2024), and MW-166 (decreasing to increasing in 2022). At well MW-171, SSA showed increasing trends for PCE and TCE.

5.6.3.2 OU 2 Area

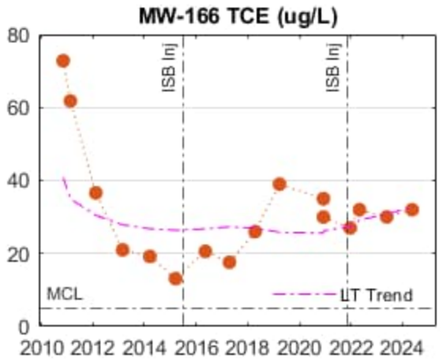
The trend evaluation for the OU 2 area included well DMW-34B (Figure 3-1). Exhibit 5-27 (page 5-58) has time series plots for DMW-34B with x-axis reference lines for injections performed in 2015 and 2021 and y-axis reference lines for cleanup levels (MCLs). Table 5-19 (page 5-59) has a summary of the statistical and trend analysis for PCE and TCE at DMW-34B.



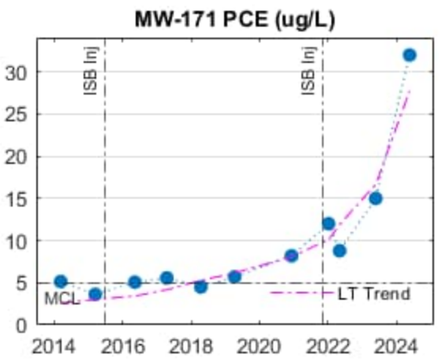
The wells evaluated include: DMW-34B in the OU 2 area and wells MW-160, MW-165, MW-166, and MW-171 in the OU 1 area beneath or near the groundwater source zone in the surficial aquifer (Figure 3-1). PCE and TCE have moderate variance at DMW-34B with coefficients of variation > 0.40 and < 0.70. PCE and TCE have positive linear correlation for concentrations vs. time with M-K trend tests indicating an increasing trend for PCE and no trend for TCE at a significance level of 0.05 (5 percent). SSA indicated a trend change for TCE at DMW-34B from an increasing trend to no trend in 2023.



5.6.4 Confined Aquifer for Southern Area



The trend assessment for the confined aquifer in the southern area evaluates two (2) wells monitored in OU 2, seven (7) wells monitored in the OU3 area, and eight (8) wells monitored in the offsite OU 6 area. These wells are located in the plume area in the confined aquifer where COCs for the monitoring period 2021-2024 had concentrations > cleanup levels (MCLs) for one or more samples. For 2021-2024, PCE, TCE, cDCE, and VC had detected concentrations > MCLs. Each monitoring well has a minimum of four



(4) data observations. Appendix E.8 has statistical and trend analysis documentation for the confined aquifer in the southern area.

Notes: < Notes: PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, CV = coefficient variation, r = correlation coefficient, p-value = probability value, Corr. = correlation: negative (-) and positive (+), SS = statistically significant at an alpha significance level of 0.05 (5 percent), [1]decreasing trend at alpha significance level of 0.10 (10 percent), Constituent concentration is less than the MCL., decreasing trend , ↓decreasing trend, ↑ increasing trend, → SSA no trend

5.6.4.1 OU 2 Area

Wells evaluated for the OU 2 area include DMW-28B and MW-217 with a former higher concentration source zone in the confined aquifer (Figure 3-1). Exhibit 5-28 (page 5-61) has time series plots with x-axis reference lines for injections performed in 2015 and y-axis reference lines for cleanup levels (MCLs). Table 5-20 (page 5-59) has a summary of the statistical and trend analysis performed for wells DMW-28B and MW-217.

The coefficients of variation for DMW-28B and MW-217 indicate high and moderate variation, respectively. COCs have negative linear correlation for concentrations vs. time, except for cDCE at MW-217 with no correlation. M-K trend tests indicated decreasing trends for TCE, cDCE, and VC at DMW-28B with no trends for MW-217. SSA indicated decreasing trends for TCE, cDCE, and VC at DMW-28B and VC at MW-217. SSA detected a trend change for cDCE at MW-217 from increasing to decreasing in 2022.

5.6.4.2 OU 3 Area

Wells evaluated for the OU 3 area include: MW-95 (Building 151 area), EBF-08D, MW-283, fence line wells MW-285, MW-286, MW-287, and MW-288, and well MW-236 located 50 ft. upgradient of the fence line (Figure 3-1). Exhibit 5-29 (page 5-62) has time series plots with x-axis reference lines for injections performed in 2015 (as applicable) and y-axis reference lines for cleanup levels (MCLs). Table 5-21 (page 5-63) has a summary of the statistical and trend analysis performed for the wells.

Central Area of OU 3

The central OU 3 area includes wells MW-95, EBF-8D, and MW-283 downgradient of Building 151 (Figure 3-1). Closest to Building 151 at MW-95, M-K tests indicate increasing trends for cDCE and VC with an overall decrease in TCE concentrations for the period 2019-2024. M-K tests at EBF-08D indicate a decreasing trend for TCE with no other COC trends detected for this well. At well MW-283, M-K tests did not indicate trends for PCE, TCE, cDCE, and VC.

Northern Fence Line Area

The northern fence line area at OU 3 includes wells MW-287, MW-288, and MW-94 (Figure 3-1). Each of these wells had overall decreasing concentrations for COCs for the monitoring periods evaluated. M-K tests at MW-287 indicated decreasing trends for PCE and VC with no trends identified for TCE and cDCE. At MW-288, M-K tests indicated a decreasing trend for TCE and no trend for cDCE detected at levels less than the MCL. M-K and SSA tests for MW-94 indicated decreasing trends for PCE, TCE, cDCE, and VC.

Central Fence Line Area

The central fence line area of OU 3 includes wells MW-285 and MW-286 with well MW-236 located 50 ft upgradient of the fence line. M-K tests did not identify COC trends for these wells. SSA tests for MW-236 did not show a consistent trend over the 2019-2024 monitoring period.

Southern Fence Line Area

Well MW-284 is located in the southern fence line area. Monitoring results for 2021-2024 did not report detections of VOCs.

5.6.4.3 Offsite Area

Wells evaluated for the offsite area at OU 6 include: MW-145, MW-157, MW-289, MW-290, MW-291, MW-292, MW-294, MW-297, and LAWMW-Q (Figure 3-1). Table 5-22 (page 5-64) has a summary of the statistical and trend analysis performed for the wells. Exhibit 5-30 (page 5-65) has time series plots with x-axis reference lines for injections performed in 2015 (as applicable) and y-axis reference lines for cleanup levels (MCLs).

Notes: < Notes: PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, CV = coefficient variation, r = correlation coefficient, p-value = probability value, Corr. = correlation: negative (-) and positive (+), SS = statistically significant at an alpha significance level of 0.05 (5 percent), [1]decreasing trend at alpha significance level of 0.10 (10 percent), Constituent concentration is less than the MCL., decreasing trend , ↓decreasing trend, ↑ increasing trend, → SSA no trend

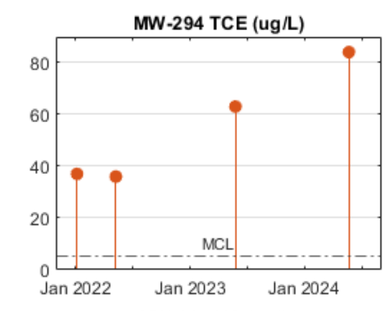

Exhibit 5-30 Data Plots for Offsite OU 6 Area: Confined Aquifer Southern Area

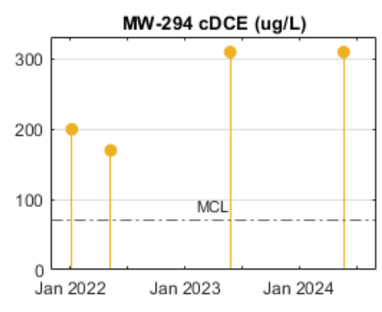

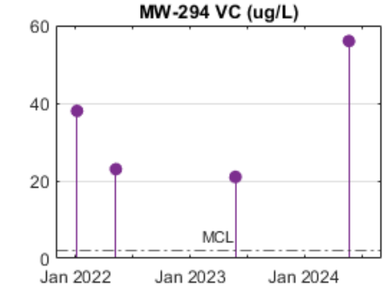

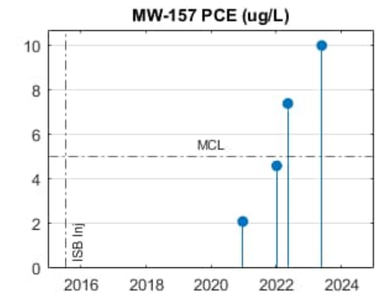

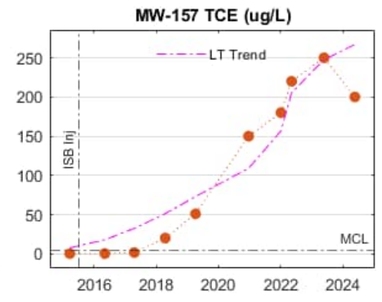

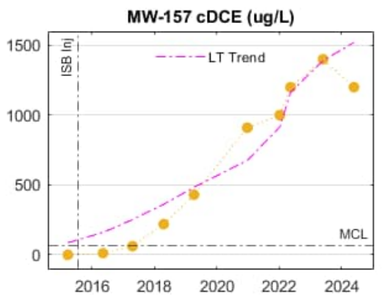

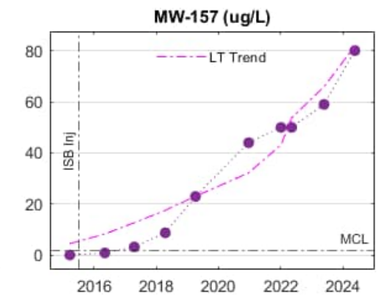

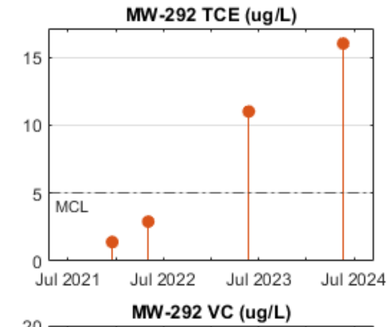

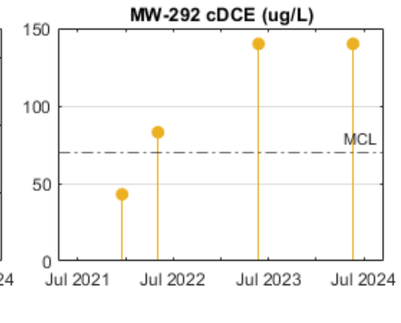

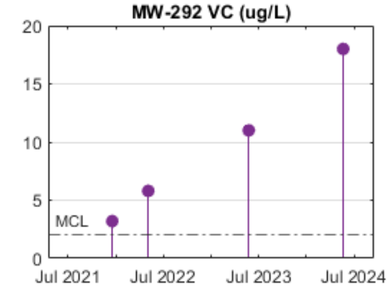

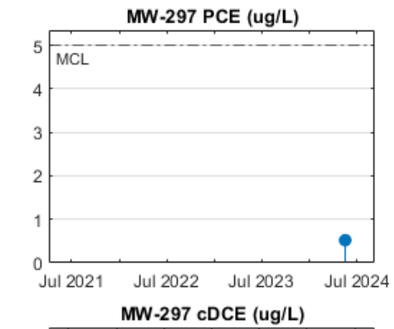

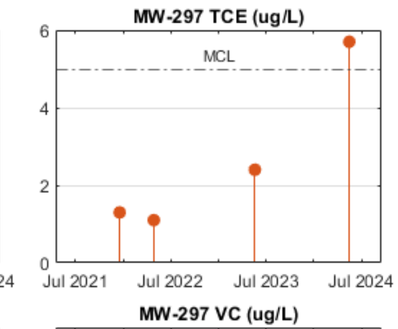

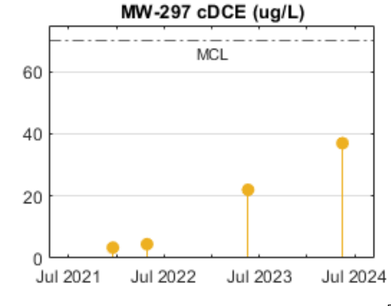

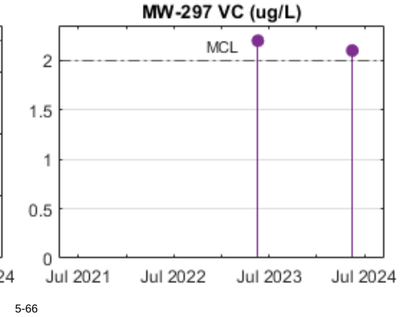

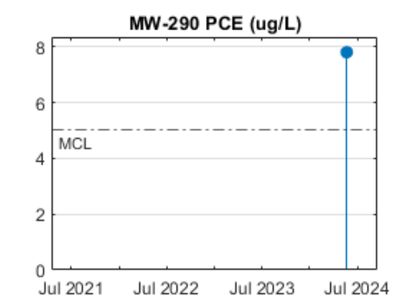

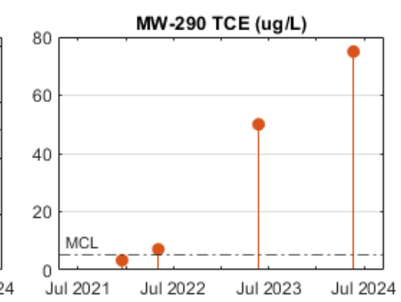

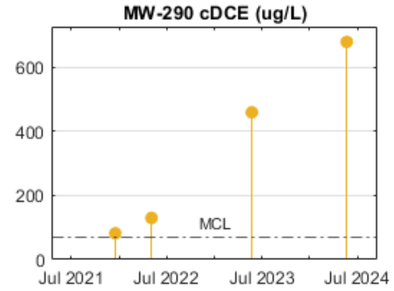

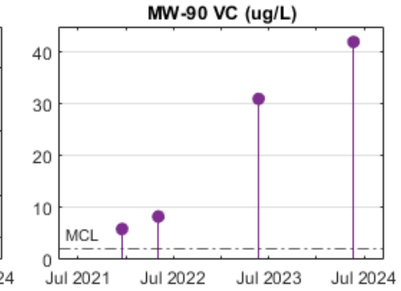

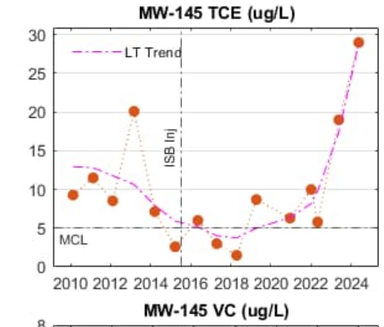

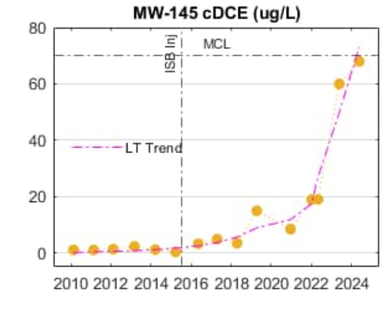

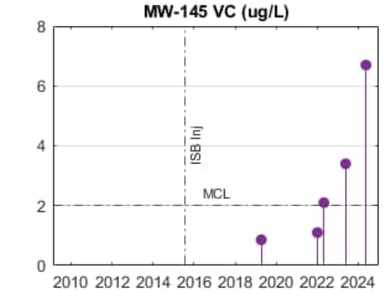

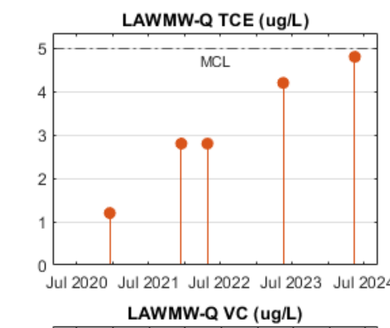

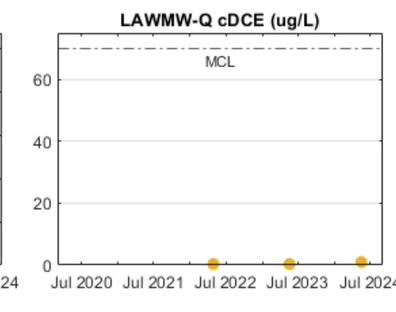

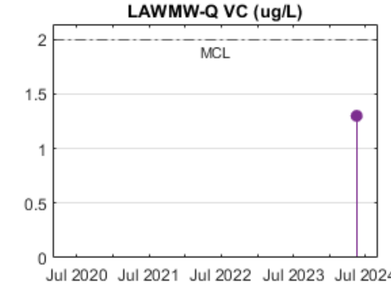

MW-289

Well MW-289 installed in 2021 is located 65 ft. into the offsite area between the fence line and No Name Creek (Figure 3-1). This well is in the southern portion of the offsite area monitoring the confined aquifer. Overall, concentrations for PCE, TCE, cDCE, and VC decreased from 2021 to 2024. M-K tests did not indicate trends for these COCs.

MW-157

Well MW-157 installed in 2010 is located 120 ft. into the offsite area between the installation fence line and No Name Creek (Figure 3-1). This well did not have COC detections for 2010-2014. Trend evaluations use monitoring data from 2015-2024. Coefficient of variation tests indicate moderate variance for TCE, cDCE, and VC. M-K and SSA tests indicate increasing trends for TCE, cDCE, and VC at well MW-157.

MW-290

Well MW-290 installed in 2021 is located 180 ft. into the offsite area between the fence line and No Name Creek (Figure 3-1). This well is in the southern portion of the offsite area monitoring the confined aquifer. Overall, concentrations for PCE, TCE, cDCE, and VC have increased from 2021 to 2024. M-K tests indicate increasing trends for TCE, cDCE, and VC.

MW-291

Well MW-291 installed in 2021 is located 130 ft. into the offsite area between the fence line and No Name Creek (Figure 3-1). This well is 36 ft. north of well MW-157. Overall, concentrations for PCE and TCE decreased from 2021 and 2024 with cDCE and VC having overall concentration increases from 2021 to 2024. M-K tests did not indicate trends for TCE, cDCE, and VC with insufficient data to evaluate PCE trends.

MW-292

Well MW-290 installed in 2021 is located 200 ft. into the offsite area and east of No Name Creek (Figure 3-1). This well is in the central portion of the offsite area monitoring the confined aquifer. Overall, concentrations for TCE, cDCE, and VC have increased from 2021 to 2024. No samples collected from well MW-292 had PCE detections. M-K tests indicate increasing trends for TCE, cDCE, and VC.

MW-145

Well MW-145 installed in 2010 is located 160 ft. into the offsite area and east of No Name Creek (Figure 3-1). MW-145 is 175 ft. north of MW-157. Trend evaluations use monitoring data from 2010-2024. Coefficient of variation tests indicate high variance for cDCE and moderate variance for TCE and VC. M-K tests indicate increasing trends for cDCE and VC with the sequential M-K and SSA tests indicating a change to an increasing trend for TCE in 2022. SSA tests indicate an increasing trend for TCE with insufficient data to evaluate trends for VC.

MW-294

Well MW-294 installed in 2021 is located 210 ft. into the offsite area and east of No Name Creek (Figure 3-1). This well is in the northern portion of the offsite area monitoring the confined aquifer. Overall, concentrations for TCE, cDCE, and VC have increased from 2021 to 2024. No samples collected from well MW-292 had PCE detections. M-K tests did not indicate trends for TCE, cDCE, and VC.

MW-297

Well MW-294 installed in 2021 is located 210 ft. into the offsite area and east of No Name Creek (Figure 3-1). This well is 135 ft. north of MW-294 within the northern portion of the offsite area monitoring the confined aquifer. Overall, concentrations for PCE, TCE, cDCE, and VC have increased from 2021 to 2024. No samples collected from well MW-292 had PCE detections. M-K tests indicate an increasing trend for cDCE with no trend detected for TCE. PCE and VC had insufficient detected results to evaluate trend.

LAWMW-Q

Well LAWMW-Q installed in 1996 is located 535 ft. into the offsite area and east of No Name Creek (Figure 3-1). LAWMW-Q is the farthest downgradient monitoring well in the offsite area. Monitoring at this well initially occurred in 1997 to support completion of a natural attenuation study for OU 6 (Law 2000a). Samples collected from this well in 1997 and 1999 had detections of TCE at levels less than the laboratory LOQ with a sample collected in 2012 having a TCE concentration of 1.2 µg/L. No VOC sampling for this well occurred from 2013-2019. The trend assessment uses data from 2020-2024. The tiled plot in Exhibit 5-30 (page 5-65) shows one three detections for cDCE at levels less than the laboratory LOQ with one detection of VC in 2024. M-K testing for TCE indicate an increasing trend for 2020-2024.

5.6.4.4 Summary of Trend Analysis for Confined Aquifer: Offsite OU 6 Area

Table 5-23 has a summary of the statistical and trend analysis for the confined aquifer in the offsite area of OU 6. M-K trend trends indicated 13 of 24 tests had an increasing trend with no tests having a decreasing trend. Because of the limited observations (4) at 6 of 9 wells, M-K tests at these wells generally will indicate a trend only if there is a monotonic increase or decrease for the four observations at each location with no left censored results for the well evaluated (non-detect). Twenty-five of 31 results presented in Table 5-22 have higher COC concentrations in 2024 than the initial results for the evaluation period.

Table 5-23 Summary of Statistical and Trend Analysis for Confined Aquifer: Southern Area

Parameter	No of Well Locations	Samples for Mann-Kendall Trend Evaluation	Mann-Kendall Trend (M-K, One Way)			Seq Mann-Kendall Trend	Singular Spectrum Analysis (SSA) of Trend	
			No Trend	Increasing (α - 0.05)	Increasing (α - 0.10)	Change to Increasing	Samples for Trend Evaluation	Increasing as of 2024
Total	9	24	11	12	1	--	--	--
PCE	0	--	--	--	--	--	--	--
TCE	9	9	5	4	--	1	2	2
cDCE	9	8	3	4	1	--	2	2
VC	11	7	3	4	--	--	1	1

Notes: : PCE = tetrachloroethene, TCE = trichloroethene, cDCE = cis-1,2-dichloroethene, VC = vinyl chloride, α – 0.05 = alpha significance level of 0.05 (5 percent), α – 0.10 = alpha significance level of 0.10 (10 percent).

5.7 Leaching Assessment

The LTM program for OU 6 has included annual sampling for SVOCs, PAHs, pesticides, PCBs, and metals at 10 monitoring wells to evaluate potential leaching of these constituents from soil in the areas of OU 1, OU 2, and OU 3. Table 5-24 (page 5-68) has a statistical summary of detected analyte results for the LTM sampling for 2021-2024 and compares the results to MCLs, RSLs, and ecological screening values for surface water. Detected analyte groups included metals, PAHs, pesticides, and SVOCs. Two LTM locations prior to 2024 (two samples) had arsenic concentrations greater than the MCL within active ISB injection areas where arsenic can temporarily and locally solubilize from injection processes rather than natural soil leaching processes (He, Fitzmaurice, et. al 2010).

Samples collected from well MW-243 (OU 1) for 2021-2024 annual sampling events had detections of 1,4-dioxane at concentrations greater than the RSL with one sample collected from MW-279 (2021) also having a concentration greater than the RSL.

LTM sampling indicated potential low-level leaching of PAHs and SVOCs from soil to groundwater and infrequent or isolated detections of select pesticides most reported as estimated concentrations less than the LOQ. One normal sample collected from well MW-272 (OU 3) in 2022 had a bis(2-ethylhexl)phthalate concentration slightly greater than the MCL and RSL; the duplicate sample and average of the normal and duplicate sample have a concentration less than the MCL and RSL.

Table 5-24 Statistical Summary: Annual LTM for Potential Leaching (2021-2024 Detects)

Analyte Group	Chemical	Matrix	No. of Results	Unit	Min	Max	Mean	Median	95th Percentile	No. > LOD	% > LOD	Location of Max	Federal MCL[1]			EPA RSL[2] (May 2024)			BTAG FWSB[3] (2006)

Notes: PAHs = polycyclic aromatic hydrocarbons, SVOCs = semi-volatile organic compounds, WG = groundwater, ug/L = micrograms per liter, Min = minimum, Max = maximum, No. > = number greater, LOD = limit of detection, % = percent, , [1]Subpart G—National Primary Drinking Water Regulations: Maximum Contaminant Levels and Maximum Residual Disinfectant Levels, § 141.61 Maximum contaminant levels for organic contaminants.> LOD = percent of detected results greater than laboratory limit of detection, [2]EPA Regional Screening Level for Resident Tap Water with a target cancer risk (TR) of 1E-06 and target hazard quotient (THQ) of 0.1, May 2024 at https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables. [3]EPA Region III BTAG Freshwater Screening Benchmarks, 7/2006. https://www.epa.gov/risk/freshwater-screening-benchmarks, [4]updated lead action level of 10 micrograms per liter is incorporated into November 2024 Regional Screening Level is used for screening, Number of results with concentrations greater than the MCL, Number of results with concentration greater than the RSL, Number of results with concentrations greater than the BTAG FWSB

5.8 Surface Water

Table 5-25 (page 5-71) has summary statistics for detected VOC results for surface water in No Name Creek for the monitoring period 2020-2024 and compares the results to MCLs and BTAG screening benchmarks for surface water. VOCs detected in surface water samples collected for this five-year period include cDCE, chloroform, chloromethane, ethylbenzene, PCE, TCE, and trichlorotrifluoroethane (Freon 113). No samples had detected concentrations > MCLs or BTAG screening benchmarks.

Table 5-26 (page 5-71) has a summary of trend analysis performed for PCE and TCE for surface water monitoring at No Name Creek. M-K and SSA tests indicate decreasing trends for TCE at NNC-2 (off installation mid-point) and NNC-3 (on-installation location).

Exhibit 5-31 (page 5-71) has data plots (line) for PCE and TCE for 2007-2024 with SSA trend lines as applicable. The plots show synchronous variation for PCE between the locations with maximum concentrations for PCE occurring in 2020 followed by minimum concentrations less than the laboratory limit of detection (LOD) in 2024. TCE also had minimum concentrations near or less than the LOQ in 2024. At NNC-2 in the off-installation area where the VOC plume previously had reached No Name Creek at concentrations > MCLs, TCE concentrations peaked in 2008 with local maxima in 2015 and 2020. The maxima for TCE in 2008 and 2015 had concentrations slightly greater than the MCL of 5 µg/L. At NNC-3 in the on-installation area, TCE concentrations peaked in 2013 with the most prominent local maxima occurring in 2018. SSA plots showed decreasing trends for TCE at NNC-2 and NNC-3. Surface water sampling performed in 2024 confirmed continued remedy protectiveness with respect to surface water at No Name Creek.

5.9 Building 151 SSDS and Indoor Air

A SSDS continues to operate at Building 151 as a preventative measure for potential vapor intrusion of subsurface vapor into the tool room and break room of Building 151. Field measurements obtained in 2024 indicate continued attainment of targeted differential pressures beneath the building floor slab in the tool room and break room to mitigate potential vapor intrusion of VOCs into these building areas.

Indoor air sampling completed in Building 151 in January 2023 did not indicate VOC detections in indoor air at concentrations greater than EPA composite worker RSLs for ambient air. These air sampling results indicated continued remedy protectiveness for workers in Building 151 with the SSDS mitigation measure operating as designed at Building 151.

Table 5-25 OU 6 VOC Summary Statistics for No Name Creek Surface Water (2020-2024)

Volatile Organic Compound	Matrix	No. of Results	Unit	Min	Max	Max Date	# > LOD	% > LOD	Location of Max	Federal MCL Screening[1]			BTAG SW Screening[2]		
										No. Exceeding	% Exceeding	MCL	No. Exceeding	% Exceeding	EPA BTAG R3 SW

Trichloroethene (TCE)	16 of 18	0.9044	0	-2.91E-02	Decreasing	No Trend	17 of 18	0.7304	1	-2.80E-03	Decreasing	Decreasing	18 of 18	0.4597	0	-8.04E-02	Decreasing[1]	Decreasing

Notes: N = number of detected observations of total observations, H_o = null hypothesis of no trend at significance level of 5%, α=0.05 = alpha significance of 0.05 or 5%. H_o = 0 indicates no statistical evidence of trend, H_o = 1 indicates statistical evidence of trend at significance level of 0.05 (5%), [1]decreasing trend at a significance level of 0.10 (10%), CV = coefficient of variation., SSA = Singular spectrum analysis, LT = long-term trend line from singular spectrum analysis.

Exhibit 5-31 OU 6 Time Series Data Plots for PCE and TCE for No Name Creek

6. Summary and Planned Actions

Section 6 has a summary of the activities performed at OU 6 in fiscal year 2024 and general findings of site monitoring and assessments. This section also identifies planned actions at OU 6.

6.1 Summary

Remedy monitoring and actions performed at OU 6 in FY 2024 included: annual groundwater monitoring at 69 locations in the surficial aquifer and 46 locations in the confined aquifer, OM&M of the SSDS at Building 151, ISB performance monitoring at 15 locations in the OU 1 area. Annual monitoring included LTM for potential leaching of non-VOC constituents from soil to groundwater from OUs 1, 2, and 3 and surface water sampling at three established stations at No Name Creek.

6.1.1 Monitoring Network

The new optimized monitoring network for groundwater implemented at OU 6 in 2021-2024 has refined delineations of plume areas and allows for enhanced monitoring of bioremediation progress and assessment of stability of plume areas in the surficial and confined aquifers.

6.1.2 VOC Plume Characterization

VOC plumes occur in the surficial aquifer (Eastover) and confined aquifer (Aquia-Potomac) within the northern and southern areas of OU 6. Primary COC plumes that have concentrations ≥ MCLs include PCE, TCE, cDCE, and VC. The lateral extent of the VOC plumes in the surficial aquifer is within the installation area except in an isolated area around well MW-282 in the area between the installation fence line at OU 3 and No Name Creek. For the confined aquifer, discontinuous plume areas of PCE and TCE occur in the northern area of OU 1 and OU 2. In the southern area of OU 6, a VOC plume consisting of PCE, TCE, cDCE, and VC extends from the central OU 3 area into the undeveloped offsite area east of the installation. The installation has an environmental easement in the offsite area of OU 6 that includes a network of monitoring wells and surface water stations in No Name Creek.

6.1.3 Bioremediation Assessment

Anaerobic biodegradation screening performed of the monitored plume areas for 2022-2024 found strong evidence for these processes. For the established 2021 ISB treatment area in the northern area (surficial aquifer), the presence of microbial communities for DHC, tceA, BVC, and VCR in groundwater combined with observed generation of ethene and ethane confirms a complete degradation pathway from PCE to ethane. Mean TOC concentrations in the ISB treatment areas for 2022-2024 exceeded the threshold of 20 mg/L that provides an enhanced energy source for microbial degradation processes (EPA 1998, 29). In the southern area, the screening process identified reductive geochemical conditions and the presence of degradation by products along the complete reaction pathway from PCE to ethane.

6.1.4 Northern Area VOC Plume Trends

For the northern area, ISB actions performed in Oct-Nov 2021 targeted a residual source zone in the surficial aquifer beneath the northern OU 1 area. Performance monitoring has indicated a reduction of contaminant mass in this source zone from pre-injection baseline levels in October 2021. Maximum concentrations reported for the surficial aquifer in the northern area have decreased by 88% for PCE/TCE and decreased by 42% for cDCE. VC maximum concentrations detected have increased by 42% from baseline levels. Plume area reductions from 2021 to 2024 have occurred for TCE (-11%) and cDCE (-32%) with increases for PCE (3%) and VC (15%). As of May 2024, M-K and/or SSA tests show decreasing trends for COCs at 6 of 8 wells for treatment area TA-1 and at 3 of 3 locations in treatment TA-2 with concentrations > MCLs. COC concentrations at the monitoring location in treatment area TA-3 are < MCLs.

For the northern area, limited vertical migration of PCE and TCE from the surficial aquifer to the confined aquifer has occurred compared to the southern area. A disaggregated and diffuse plume is present beneath OU 1 with a limited plume area around a single well in the OU 2 area.

6.1.5 Southern Area VOC Plume Trends

For the southern area, ISB actions consisting of injections in fixed-based injection wells occurred in the surficial and confined aquifers in Jul-Aug 2015.

For the surficial aquifer, VOC plume distribution metrics evaluated for 2018-2024 indicate transition to VC predominance over time as measured by percentage of detects, maximum concentrations, measures of central tendency (mean/median), and number of detections greater than the MCL. M-K tests indicated a decreasing trend for maximum concentrations of cDCE. For 2021-2024, plume areas in the surficial aquifer decreased for PCE (-70%), TCE (-41%), and cDCE (13%). The VC plume area increased by 8% from 2021 to 2024. Plume metrics for the surficial aquifer in the southern area indicate continued plume degradation with the plume area remaining within the installation area.

For the confined aquifer, VOC plume distribution metrics evaluated for 2018-2024 indicate cDCE predominance over time as measured by percentage of detects, maximum concentrations, measures of central tendency (mean/median), number of distribution outliers, For 2021-2024, the plume areas in the confined aquifer decreased for PCE (-38%) and increased for TCE (20%), cDCE (46%), and VC (41%) with the VC plume area predominating. The new monitoring network has detected apparent TCE, cDCE, and VC plume expansion/movement for the period 2021-2024 with an increase in concentrations and plume area in the offsite area.

6.1.6 Long-Term Monitoring

Annual LTM performed in 2024 at OU 6 evaluated potential leaching of non-VOC constituents from soil to groundwater in the OU 1, 2, and 3 areas. Constituents detected in 2024 included 19 metals, eight (8) PAHs, and one SVOC (1,4-dioxane). No LTM locations had constituent concentrations > MCLs. The number of detections reported for 2024 is less than the previous three years that reported detections of 16 PAHs, five SVOCs, and five pesticides. The low detection frequency of organic constituents and lower concentrations of metals < MCLs does not indicate significant potential leaching of non-VOCs from soil to groundwater at OUs 1, 2, and 3.

The annual LTM surface water results at No Name Creek had low-level VOCs detections in the surface water samples with detected concentrations < MCLs and ecological screening benchmarks. Surface water sampling performed in 2024 confirmed continued remedy protectiveness with respect to surface water at No Name Creek.

Operation of the SSDS and air monitoring at Building 151 has indicated continued remedy protectiveness for workers in Building 151. Five-year air and subsurface vapor sampling performed at Buildings 54, 85, and 150 in 2023 indicated continued remedy protectiveness for workers in these building and did not indicate vapor intrusion into these buildings.

6.2 Planned Actions

DLA will continue implementing adaptive remedial strategies and optimizations at OU 6 based on the data collected for annual monitoring, supplemental ISB performance monitoring, LTM, and corresponding updates to the CSM.

Planned activities for FY2025 will include additional ISB actions for groundwater at OU 6 and completion of a site optimization evaluation with report. A remedial action work plan (addendum) will identify areas targeted for additional ISB actions and describe planned activities.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: DSCR

Project/Client: MEADOWS Project Number: 0045-0013

Location: RICHMOND

Field Analyst(s): BMW W. DIGGS

Date: 1-12-2024 Start Time: 0700 Finish Time: 0731

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	YSI	556	4314	21L06
pH				
Specific Conductance				
ORP				
Temperature				
Turbidity				

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- ♦Weekly DO Winkler Titration ☐
- ♦5-Point Conductivity Curve ☐
- ♦Annual Conductivity Cell Constant ☐
- ♦Quarterly NIST Traceable Thermometer ☐
- ♦Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O.G)

100% Saturation	
Barometric Pressure (mmHg)	760.9
Temperature (°C)	~3.787
Initial Reading	10.94
Reset Reading	10.92

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
7	3660021	JUL 25	19.43	7.06	(Y) / N	6.99
4	3CC916	MAR 25	17.86	4.23	(Y) / N	3.93
10	30D200	APR 25	18.70	9.99	Y / (N)	10.00
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S \cdot cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S \cdot cm^{-1}$)
1.413	3GP 1571	Jan 24	19.71	1204	Y / N	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240.0	3GD 1P	Jan 24	19.63	232.4	Y / N	240.0

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
				Y / N	
				Y / N	
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM:

YSI 6-Series:		Horriba U-20XD Series:	
Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater	Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.2 units	pH **	± 0.1 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks		
Specific Conductivity	± 0.5% + 0.001 mS/cm	Specific Conductivity	± 3%
ORP	± 20 mV	ORP	± 15 mV
Turbidity	± 2%	Turbidity	± 5%

LaMotte 2020e/i Turbidity Meter:
±0.05 or ±2%, below 100 NTU
±3%, above 100 NTU

AECOM

Notes:
ft = feet
TOC = top of casing
[1] = Vertical elevations are surveyed, measured in feet based on the NAVD 1988.
[2] = Depths are measured in the field using a water level sensor.
[3] = Calculated groundwater elevation using TOC elevation and water level depth.

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: Richmond DCR

Project/Client: MSA0045 Project Number: 0045-011

Location: Richmond DCA

Field Analyst(s): Bruce W. DT665

Date: 5-15-2024 Start Time: 0630 Finish Time: 1150

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	YSI	PRO PLUS	21B046	21B077
pH	↓	PDS		
Specific Conductance		↓	↓	↓
ORP		↓		
Temperature	↓			
Turbidity				

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- ♦Weekly DO Winkler Titration ☐
- ♦5-Point Conductivity Curve ☐
- ♦Annual Conductivity Cell Constant ☐
- ♦Quarterly NIST Traceable Thermometer ☐
- ♦Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O.G)

100% Saturation	
Barometric Pressure (mmHg)	750.2
Temperature (°C)	21.5
Initial Reading	8.86
Reset Reading	8.60

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
4	3660023	JUL 25	22.3	3.79	Y / N	4.00
7	36K1332	11/25	22.4	7.01	Y / N	7.00
10	36K6004	11/25	22.4	10.03	Y / N	10.00
126	23J-7400J3	4/24	22.4	141.0	Y / N	124.0

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S \cdot cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S \cdot cm^{-1}$)
1.413	36T0310	10/24	22.4	1.321	Y / N	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240.0	36J0094	7/24	22.4	226.2	Y / N	238.8

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
				Y / N	
				Y / N	
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM:

YSI 6-Series:

Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater
pH **	± 0.2 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks
Specific Conductivity	± 0.5% + 0.001 mS/cm
ORP	± 20 mV
Turbidity	± 2%

Horriba U-20XD Series:

Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.1 units
Specific Conductivity	± 3%
ORP	± 15 mV
Turbidity	± 5%

LaMotte 2020e/i Turbidity Meter:

±0.05 or ±2%, below 100 NTU
±3%, above 100 NTU

HACH Ferrous Iron Field Test Kit Results (If Applicable)

Ferrous Iron Result (mg/L):

Dilution: Multiplier: (1,**2**) (2,**4**) (3,**8**) (4,**16**) (5,**32**)

Reportable Result:

Samples Field Filtered? No **If Yes, Which Analyses?**

QA/QC Samples Collected? No If Yes, List ID and Analyses

COMMENTS/NOTES

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: Richmond DSCR

Project/Client: METHOWS Project Number: 0045-0011

Location: Richmond VA / DCA

Field Analyst(s): BRUCE W. DT665

Date: 5-16-2024 Start Time: 0630 Finish Time: 0650

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	YSI	Pro Plus	18046	21802?
pH		DSS		
Specific Conductance				
ORP				
Temperature				
Turbidity				

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- ♦Weekly DO Winkler Titration ☐
- ♦5-Point Conductivity Curve ☐
- ♦Annual Conductivity Cell Constant ☐
- ♦Quarterly NIST Traceable Thermometer ☐
- ♦Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O.G)

100% Saturation	
Barometric Pressure (mmHg)	765.5
Temperature (°C)	22.9
Initial Reading	8.03
Reset Reading	8.11

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
4	3660023	7/25	22.5	3.88	Y / N	4.00
7	36K1332	11/25	22.5	7.15	Y / N	7.01
10	36K004	11/25	22.4	10.05	Y / N	10.00
12.6	af24003259	6/24	22.4	12.6	Y / N	12.60

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S \cdot cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S \cdot cm^{-1}$)
1.413	3GT0310	10/28	22.5	0.759	Y / N	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240.0	3GJ3894	7/24	22.4	1	Y / N	240.0

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
				Y / N	
				Y / N	
				Y / N	
				Y / N	
126. NTU	23F24003259	6-24	130.9		126.2

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM:

YSI 6-Series:		Horriba U-20XD Series:	
Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater	Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.2 units	pH **	± 0.1 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks		
Specific Conductivity	± 0.5% + 0.001 mS/cm	Specific Conductivity	± 3%
ORP	± 20 mV	ORP	± 15 mV
Turbidity	± 2%	Turbidity	± 5%

LaMotte 2020e/i Turbidity Meter:
±0.05 or ±2%, below 100 NTU
±3%, above 100 NTU

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- ♦Weekly DO Winkler Titration ☐
- ♦5-Point Conductivity Curve ☐
- ♦Annual Conductivity Cell Constant ☐
- ♦Quarterly NIST Traceable Thermometer ☐
- ♦Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O.G)

100% Saturation	
Barometric Pressure (mmHg)	752 ϕ
Temperature (°C)	21.2
Initial Reading	8.75
Reset Reading	8.81

0% Saturation	
Solution Temperature (°C)	X
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
10	36F1088	6/25	21.1	10.07	Y / N	
7	46B1040	2/26	21.6	7.06	Y / N	
4	32017	12/25	21.4	3.98	Y / N	
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S \cdot cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S \cdot cm^{-1}$)
1.413	36E0678	5/24	21.4	1.425	Y / N	

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240.0	36H0038	5/24	21.5	236.6	Y / N	

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
126.0	23J2405648	9/24	120.2	Y / N	126.0
0	24063824	7/24	-0.68	Y / N	00
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM:

YSI 6-Series:

Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater
pH **	± 0.2 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks
Specific Conductivity	± 0.5% + 0.001 mS/cm
ORP	± 20 mV
Turbidity	± 2%

Horriba U-20XD Series:

Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.1 units
Specific Conductivity	± 3%
ORP	± 15 mV
Turbidity	± 5%

LaMotte 2020e/i Turbidity Meter:

±0.05 or ±2%, below 100 NTU

±3%, above 100 NTU

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: OU6

Project/Client: Project Number: 0045-0011

Location: DSCR - RICHMOND

Field Analyst(s): T.M BROWN

Date: 24/5/17 Start Time: 0650 Finish Time: 0715

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	YSI	PRO QSS	16855	218078
pH	↓	↓	↓	↓
Specific Conductance				
ORP				
Temperature				
Turbidity				

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- ♦Weekly DO Winkler Titration ☐
- ♦5-Point Conductivity Curve ☐
- ♦Annual Conductivity Cell Constant ☐
- ♦Quarterly NIST Traceable Thermometer ☐
- ♦Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O.G)

100% Saturation	
Barometric Pressure (mmHg)	755.9
Temperature (°C)	22.0
Initial Reading	8.65
Reset Reading	8.66

0% Saturation	
Solution Temperature (°C)	X
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
10	36F1088	6/25	22.8	10.0	Y / N	
7	46B1040	2/26	22.9	7.08	Y / N	
4	32017	12/25	22.9	3.95	Y / N	
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S \cdot cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S \cdot cm^{-1}$)
1.413	36E0678	5/24	22.8	1.406	Y / N	

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240.0	36H0038	5/24	22.5	232.8	Y / N	240

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
126.0	23J2405648	9/24	118.61	Y / N	126
0	2400 3824	7/24	0.09	Y / N	0
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM:

YSI 6-Series:		Horriba U-20XD Series:	
Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater	Dissolved Oxygen	± 0.2 mg/L
pH **,	± 0.2 units	pH **	± 0.1 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks		
Specific Conductivity	± 0.5% + 0.001 mS/cm	Specific Conductivity	± 3%
ORP	± 20 mV	ORP	± 15 mV
Turbidity	± 2%	Turbidity	± 5%

LaMotte 2020e/i Turbidity Meter:
±0.05 or ±2%, below 100 NTU
±3%, above 100 NTU

				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM:

YSI 6-Series:		Horriba U-20XD Series:	
Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater	Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.2 units	pH **	± 0.1 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks		
Specific Conductivity	± 0.5% + 0.001 mS/cm	Specific Conductivity	± 3%
ORP	± 20 mV	ORP	± 15 mV
Turbidity	± 2%	Turbidity	± 5%

LaMotte 2020e/i Turbidity Meter:
±0.05 or ±2%, below 100 NTU
±3%, above 100 NTU

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: OUG
Project/Client:
Project Number: 0043-ecll
Location: DSCR - Richmond
Field Analyst(s): Quin Rebrcky
Date: 5/17/24 Start Time: 0700 Finish Time: 0730

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	PRO DSS	YSI	21137 0	469 82
pH	↓	↓	↓	↓
Specific Conductance	↓	↓	↓	↓
ORP	↓	↓	↓	↓
Temperature	↓	↓	↓	↓
Turbidity	↓	↓	↓	↓

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- •Weekly DO Winkler Titration ☐
- •5-Point Conductivity Curve ☐
- •Annual Conductivity Cell Constant ☐
- •Quarterly NIST Traceable Thermometer ☐
- •Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O G)

100% Saturation	
Barometric Pressure (mmHg)	
Temperature (°C)	22.1
Initial Reading	8.98
Reset Reading	8.98

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
7	460 1040	2/26	23	7.06	Y / N	7
4	46B0637	2/26	23	4	Y / N	4
10	3G Fields	6/25	23	9.92	Y / N	10
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S\ cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S\ cm^{-1}$)
1.413	16K0355	11/24	22.2	1.347	Y / (N)	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240	20H0038	3/24	22.2	239.4	Y / (N)	240

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
0	24007124	1/25	15.75	(Y) / N	0
126	23J2704364B	9/24	149.56	Y / N	126
				Y / N	
				Y / N

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: OUG
Project/Client:
Project Number: 0043-ecll
Location: DSCR - Richmond
Field Analyst(s): Quin Rebrcky
Date: 5/20/14 Start Time: 0700 Finish Time: 0730

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	PRO DSS	YSI	211370	469 82
pH	↓	↓	↓	↓
Specific Conductance	↓	↓	↓	↓
ORP	↓	↓	↓	↓
Temperature	↓	↓	↓	↓
Turbidity	↓	↓	↓	↓

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- •Weekly DO Winkler Titration ☐
- •5-Point Conductivity Curve ☐
- •Annual Conductivity Cell Constant ☐
- •Quarterly NIST Traceable Thermometer ☐
- •Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O G)

100% Saturation	
Barometric Pressure (mmHg)	
Temperature (°C)	22.1
Initial Reading	9.50
Reset Reading	9.48

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
7	46B1040	2/26	21.9	7.21	Y / N	7
4	46B0637	2/26	21.9	4.12	Y / N	4
10	JG Fields	6/25	21.9	10.19	Y / N	10
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S\ cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S\ cm^{-1}$)
1.413	16Ec855	11/24	22.2	1.428	Y / (N)	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240	20H0038	3/24	22.2	243.1	Y / (N)	240

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
0	24067124	1/25	2.66	(Y) / N	0
126	23J2704364B	9/24	102.05	(Y) / N	126
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM

YSI 6-Series

Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater
pH **	± 0.2 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks
Specific Conductivity	± 0.5% + 0.001 mS/cm
ORP	± 20 mV
Turbidity	± 2%

Horiba U-20XD Series

Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.1 units
Specific Conductivity	± 3%
ORP	± 15 mV
Turbidity	± 5%

LaMotte 2020wi Turbidity Meter

±0.05 or ±2% below 100 NTU

±3% above 100 NTU

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: OUG

Project/Client:

Project Number: 0043-ecll

Location: DSCR - Richmond

Field Analyst(s): Quin Rebrcky

Date: 5/21/24

Start Time: 0700 Finish Time: 0730

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	PRO DSS	YSI	21137 0	469 82
pH	↓	↓	↓	↓
Specific Conductance				
ORP				
Temperature	↓	↓	↓	↓
Turbidity				

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- •Weekly DO Winkler Titration ☐
- •5-Point Conductivity Curve ☐
- •Annual Conductivity Cell Constant ☐
- •Quarterly NIST Traceable Thermometer ☐
- •Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O G)

100% Saturation	
Barometric Pressure (mmHg)	
Temperature (°C)	21.5
Initial Reading	880
Reset Reading	4.48

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
7	460 1040	2126	22.2	7.21	Y / N	7
4	46B0637	2126	22.2	3.93	Y / N	4
10	3G F1815	6125	22.2	10.18	Y / N	10
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S\ cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S\ cm^{-1}$)
1.413	16K0355	11/24	22.2	1.562	Y / (N)	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240	20H0038	3/24	22.2	238.8	Y / (N)	240

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
0	24007124	1/25	4.41	(Y) / N	0
126	23J2704364B	9/24	136.04	Y / N	126
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM

YSI 6-Series

Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater
pH **	± 0.2 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks
Specific Conductivity	± 0.5% + 0.001 mS/cm
ORP	± 20 mV
Turbidity	± 2%

Horiba U-20XD Series

Dissolved Oxygen	± 0.2 mg/L

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- ♦Weekly DO Winkler Titration ☐
- ♦5-Point Conductivity Curve ☐
- ♦Annual Conductivity Cell Constant ☐
- ♦Quarterly NIST Traceable Thermometer ☐
- ♦Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O.G)

100% Saturation	
Barometric Pressure (mmHg)	~~759~~ 774
Temperature (°C)	22.7
Initial Reading	9.00
Reset Reading	8.61

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note. DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
4	3660073	7/25	23.3	3.86	Y / N	3.98
7	3GK1332	11/25	23.2	7.09	Y / N	6.99
10	3GK004	11/25	23.1	10.03	Y / N	10.00
126.	2FY00325	6/24	23.4	1411.	Y / N	124.0

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S \cdot cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S \cdot cm^{-1}$)
1.413	36T0310	10/24	23.0	1.460	Y / N	1.414

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240.0	36J0094	7/24	~~29.2~~ 23.3	229.2	Y / N	240.3

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: OUG
Project/Client:
Project Number: 0043-ecll
Location: DSCR - Richmond
Field Analyst(s): Quin Rebrcky
Date: 5/22/24
Start Time: 0700 Finish Time: 0730

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	PRO DSS	YSI	21137 0	469 82
pH	↓	↓	↓	↓
Specific Conductance	↓	↓	↓	↓
ORP	↓	↓	↓	↓
Temperature	↓	↓	↓	↓
Turbidity	↓	↓	↓	↓

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- •Weekly DO Winkler Titration ☐
- •5-Point Conductivity Curve ☐
- •Annual Conductivity Cell Constant ☐
- •Quarterly NIST Traceable Thermometer ☐
- •Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O G)

100% Saturation	
Barometric Pressure (mmHg)	
Temperature (°C)	21.5
Initial Reading	19.14
Reset Reading	9.48

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
7	460 1040	2/26	22.2	7.16	Y / N	7
4	46B0637	2/26	22.2	4.09	Y / N	4
10	3G Fields	6/25	22.2	10.29	Y / N	10
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S\ cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S\ cm^{-1}$)
1.413	16K0355	11/24	22.2	1.323	Y / (N)	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240	20H0038	3/24	22.2	238.7	Y / (N)	240

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
0	24007124	1/25	-2.49	(Y) / N	0
126	23J2704364B	9/24	130.2	Y / N	126
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM

YSI 6-Series

Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater
pH **	± 0.2 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks
Specific Conductivity	± 0.5% + 0.001 mS/cm
ORP	± 20 mV
Turbidity	± 2%

Horiba U-20XD Series

Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.1 units
Specific Conductivity	± 3%
ORP	± 15 mV
Turbidity	± 5%

LaMotte 2020wi Turbidity Meter

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Site Name: OUG
Project/Client:
Project Number: 0043-ecll
Location: DSCR - Richmond
Field Analyst(s): Quin Rebrcky
Date: 5/23/24
Start Time: 0700 Finish Time: 0730

Instrument Information

Parameter	Make	Model	Meter Serial #	Probe Serial #
DO	PRO DSS	YSI	21137 0	469 82
pH	↓	↓	↓	↓
Specific Conductance	↓	↓	↓	↓
ORP	↓	↓	↓	↓
Temperature	↓	↓	↓	↓
Turbidity	↓	↓	↓	↓

Pre-Field Calibration and Quality Control Requirements

Prior to using instrument(s) in the field, field analysts must ensure that certain quality control procedures and calibrations have been completed for the instruments listed above. Records of the following, completed either by AECOM or the vendor, must be retained:

- •Weekly DO Winkler Titration ☐
- •5-Point Conductivity Curve ☐
- •Annual Conductivity Cell Constant ☐
- •Quarterly NIST Traceable Thermometer ☐
- •Solution Records ☐

Field Calibration/Calibration Check

DO (Method SM 4500 O G)

100% Saturation	
Barometric Pressure (mmHg)	
Temperature (°C)	21.5
Initial Reading	8.67
Reset Reading	8.48

0% Saturation	
Solution Temperature (°C)	
Solution Manufacturer & Lot #	
Reading	
*Requires Recalibration	Y / N
Reset Reading	

Note: DO must be calibrated to 100% saturation. DO may only be calibration checked to 0% saturation (zero oxygen solution standard). Calibration methods may differ between DO meters, and some fields listed may not be applicable. Refer to instrument manual for calibration instructions.

pH (Method SM 4500-H B)

Buffer Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading	*Requires Recalibration	Reset Reading
7	460 1040	2/26	22.2	7.09	Y / N	7
4	46B0637	2/26	22.2	3.93	Y / N	4
10	3G Fields	6/25	22.2	10.11	Y / N	10
					Y / N	

Note: A calibration check against one standard buffer must be performed and recorded in the field book every 3-hours of use after daily calibration/calibration check.

AECOM

DAILY FIELD INSTRUMENT CALIBRATION/ CALIBRATION CHECK FORM

Specific Conductance (Method 2510 B)

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading ($\mu S\ cm^{-1}$)	*Requires Recalibration	Reset Reading ($\mu S\ cm^{-1}$)
1.413	16K0355	11/24	22.2	1.495	Y / (N)	1.413

ORP

Standard Solution	Solution Manufacturer & Lot #	Solution Expiration Date	Solution Temperature	Reading (mV)	*Requires Recalibration	Reset Reading (mV)
240	20H0038	3/24	22.2	233.9	Y / (N)	240

Turbidity (Method 2130 B)

Standard Solution (NTU)	Solution Manufacturer & Lot #	Solution Expiration Date	Reading (NTU)	*Requires Recalibration	Reset Reading (NTU)
0	24007124	1/25	-0.70	(Y) / N	0
126	23J2704364B	9/24	104.90	Y / N	126
				Y / N	
				Y / N	

*Field check readings should be within the accuracy listed by the manufacturer's specifications or per New Jersey regulations (NJAC 7:18), whichever is more stringent. Otherwise, the instrument must be recalibrated for that parameter. Refer to instrument manual for accuracy. Values provided below for instruments typically used by AECOM

YSI 6-Series

Dissolved Oxygen	± 0.1 % or ± 0.1 mg/L, whichever is greater
pH **	± 0.2 units
	**NJAC 7:18 requires that calibration values be accurate to ±0.05, and accuracy within ±0.1 units for the initial calibration check and ±0.2 units for 3-hour checks
Specific Conductivity	± 0.5% + 0.001 mS/cm
ORP	± 20 mV
Turbidity	± 2%

Horiba U-20XD Series

Dissolved Oxygen	± 0.2 mg/L
pH **	± 0.1 units
Specific Conductivity	± 3%
ORP	± 15 mV
Turbidity	± 5%

LaMotte 2020wi Turbidity Meter

±0.05 or ±2% below 100 NTU

±3% above 100 NTU

A.3 Building 151 Quarterly OM&M

MEADOWS

QUARTERLY O & M CHECKLIST
SUB-SLAB DEPRESSURIZATION SYSTEM AT BUILDING 151
Defense Supply Center Richmond

AECOM Imagine it. Delivered.

Project Number: 60045-0011
Prepared By: A. VanBuskirk
Weather: 72°, SUNNY, WSW 10, 34%, 29.83"Hg
Meters: GEM 5000, MINIRAE 3000

Date: 11/10/23
Time Start: 1230
Time Finish: 1300
Indoor Air Temp: 76 (°F)
Elec Meter: 000 16791 (kilowatt hours)

SYSTEM COMPONENTS:

Exhaust Fan Operational:	(Yes) / No	(Circle)
EP-1 Operating Light	On / (Off)	(Circle)
EP-2 Operating Light	On / (Off)	(Circle)
Exterior Piping	(Good Condition) / Replace	(Circle)
Extraction Point Risers	(Good Condition) / Replace	(Circle)
Interior Piping	(Good Condition) / Replace	(Circle)
Any unusual noises, vibrations or odors at the fan?		Yes / No
Any damage to fittings, piping, or sample ports?		Yes / No

COMMENTS: (Samples collected, O&M performed, etc.)

DRAINED ~ 1 CUP OF CONDENSATION

RECOMMENDED REPAIR/MODIFICATIONS:

SYSTEM ALARMS:

SA-1 (Low Vacuum)	Yes / (No)	(Circle)
SA-2 (Low Vacuum)	Yes / (No)	(Circle)

GAUGES:

Extraction Point 1 (PG-1)	-4	IN WC
Extraction Point 2 (PG-2)	-4	IN WC
Effluent (PG-EF)	-4	IN WC

ANNUAL:

Low Vacuum Alarm Test: Turn off exhaust fan and ensure system alarms at EP-1 and EP-2 are functional.

SA-1 (functioning)	(Yes) / No	(Circle)
SA-2 (functioning)	(Yes) / No	(Circle)

SA - System Alarm
PG - Pressure Gauge
EF - Effluent
EP - Extraction Point

CERTIFICATION OF CALIBRATION

PJLA Calibration
No. 66916

QED

Date Of Calibration: 18-Mar-2024

Certificate Number: G510112_10/34958

Issued by: QED Environmental Systems Inc.

Customer: **PINE ENVIRONMENTAL SERVCIES LLC**
PO BOX 943 HEIGHTSTOWN, NJ 08520 US

Description:

Model: GEM5000

Serial Number: G510112

Accredited Results:

Methane (CH4)

Certified Gas (%)	Instrument Reading (%)	Uncertainty (%)
5.1	4.9	0.42
15.0	14.8	0.66
60.0	59.6	1.03

Carbon Dioxide (CO2)

Certified Gas (%)	Instrument Reading (%)	Uncertainty (%)
5.0	4.8	0.43
15.2	14.9	0.71
40.0	39.9	1.19

Oxygen (O2)

Certified Gas (%)	Instrument Reading (%)	Uncertainty (%)
20.9	20.9	0.25

Gas cylinders are traceable and details can be provided if requested.

CH4, CO2 readings recorded at: 31.8 °C/89.2 °F

O2 readings recorded at: 22.2 °C/71.9 °F

Barometric Pressure: 0980 mbar/28.95 "Hg

Method of Test : The analyzer is calibrated in a temperature controlled chamber using a series of reference gases, in compliance with procedure ISP17.

Instrument has passed calibration as the measurement result is within the specification limit. The specification limit takes into account the measurement uncertainty.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor of k=2, providing a level of confidence of approximately 95%. The uncertainty evaluation has been carried out in accordance with NIST requirements.

The calibration results published in this certificate were obtained using equipment capable of producing results that are traceable through NIST to the International System of Units (SI). Certification only applies to results shown. This certificate may not be reproduced other than in full, except with the prior written approval of the issuing laboratory.

Notes:
CAS = chemical abstract service, MCL = Maximum Contaminant Level from 40 CFR Subpart G - National Primary Drinking Water Regulations: Maximum Contaminant Levels and Maximum Residual Disinfectant Levels May 2024, BTAG = EPA Region III BTAG Freshwater Screening Benchmarks, 7/2006, RSL = Regional Screening Level (RSL) for Chemical Contaminants in Residential Tapwater at Superfund Sites (TR=1E-06, HQ=0.1) May 2024
µg/L = micrograms per liter, mg/L = milligrams per liter, mV = millivolts, mS/cm = milliSiemens per centimeter, °C = degree celcius, NTU = Nephelometric turbidity units
Sample types N = normal, FD = Field Duplicate
UWBU = upper water bearing unit,
Q = Lab qualifier, DV = validation qualifier

1- Parameters were not collected due to field conditions.

Lab Qualifiers (Q):
D = The reported value is from a dilution
H = Sample was prepped or analyzed beyond the specified holding time
J = Estimated: the analyte was positively idenfied; the quantitation is an estimation
J1 = Estimated: the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria
M = Manual integrated compound
Q = One of more quality control criteria failed
U = Undetected at the limit of detection

Validator Qualifiers (DV):
J = The reported result was an estimated value with an unknown bias

Bold Result = detection
Grey Shading Result = concentration > MCL
Underlined Result = concentration > BTAG
Italicized Result = concentration > RSL

Notes:
CAS = chemical abstract service, MCL = Maximum Contaminant Level from 40 CFR Subpart G - National Primary Drinking Water Regulations: Maximum Contaminant Levels and Maximum Residual Disinfectant Levels May 2024, BTAG = EPA Region III BTAG Freshwater Screening Benchmarks, 7/2006, RSL = Regional Screening Level (RSL) for Chemical Contaminants in Residential Tapwater at Superfund Sites (TR=1E-06, HQ=0.1) May 2024
VOC = Volatile organic compound
µg/L = micrograms per liter, mg/L = milligrams per liter, mV = millivolts, mS/cm = milliSiemens per centimeter, °C = degree celcius, NTU = Nephelometric turbidity units
Sample types N = normal, FD = Field Duplicate
UWBU = upper water bearing unit, LWBU = lower water bearing unit,
Q = Lab qualifier, DV = validation qualifier

1- Parameters were not collected due to field conditions, reference field logs for details.
2- Field parameters were collected on a different date, reference field logs for details.

Lab Qualifiers (Q):
D = The reported value is from a dilution
H = Sample was prepped or analyzed beyond the specified holding time
J = Estimated: the analyte was positively idenfied; the quantitation is an estimation
J1 = Estimated: the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria
M = Manual integrated compound
Q = One of more quality control criteria failed
U = Undetected at the limit of detection

Validator Qualifiers (DV):
J = The reported result was an estimated value with an unknown bias
J- = The result was an estimated quantity, but the result may be biased low
J+ = The result was an estimated quantity, but the result may be biased high

Bold Result = detection
Grey Shading Result = concentration > MCL
Italicized Result = concentration > RSL
Underlined Result = concentration > BTAG

Dissolved Oxygen (mg/L)	DO	**0.96**			**0.51**			**0.48**			**1.42**		
Ferrous Iron - Field (mg/L)	FIELD FE	**0.74**			**0.29**			**1.07**			**1.06**		
Oxidation Reduction Potential (mV)	ORP	**284**			**222**			**17.6**			**30.9**		
pH (pH unit)	PH	**5.45**			**6**			**6.06**			**5.37**		
Specific Conductivity (mS/cm)	SC	**0.061**			**0.063**			**0.103**			**0.48**		
Temperature (°C)	TEMP	**19.2**			**18.2**			**20.8**			**22.2**		
Turbidity (NTU)	TURB	**10.2**			**48**			**202.1**			**78.04**		

Notes:
CAS = chemical abstract service
µg/L = micrograms per liter, mg/L = milligrams per liter, mV = millivolts, mS/cm = milliSiemens per centimeter, °C = degree celcius, NTU = Nephelometric turbidity units
Sample types N = normal, FD = Field Duplicate
UWBU = upper water bearing unit, LWBU = lower water bearing unit,
Q = Lab qualifier, DV = validation qualifier

1- Parameters were not collected due to field conditions, reference field logs for details.
2- Field parameters were collected on a different date, reference field logs for details.

Lab Qualifiers (Q):
D = The reported value is from a dilution
H = Sample was prepped or analyzed beyond the specified holding time
H3 = Sample was received and analyzed past holding time
J = Estimated: the analyte was positively idenfied; the quantitation is an estimation
J1 = Estimated: the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria
M = Manual integrated compound
Q = One of more quality control criteria failed
U = Undetected at the limit of detection

Bold Result = detection

Validator Qualifiers (DV):
J = The reported result was an estimated value with an unknown bias
J- = The result was an estimated quantity, but the result may be biased low
J+ = The result was an estimated quantity, but the result may be biased high

Notes:
CAS = chemical abstract service, MCL = Maximum Contaminant Level from 40 CFR Subpart G - National Primary Drinking Water Regulations: Maximum Contaminant Levels and Maximum Residual Disinfectant Levels May 2024,
BTAG = EPA Region III BTAG Freshwater Screening Benchmarks, 7/2006, RSL = Regional Screening Level (RSL) for Chemical Contaminants in Residential Tapwater at Superfund Sites (TR=1E-06, HQ=0.1) May 2024
SVOCs = Semi-volatile organic compounds
µg/L = micrograms per liter, mg/L = milligrams per liter, mV = millivolts, pg/L = picograms per liter,
mS/cm = milliSiemens per centimeter, °C = degree celcius, NTU = Nephelometric turbidity units,
UWBU = upper water bearing unit,
Sample types N = normal, FD = Field Duplicate

1- Parameters were not collected due to field conditions, reference field logs for details.
A- Updated lead action level of 10 micrograms per liter (November 2024) is used as sceening level.

Lab Qualifiers (Q):
J = Estimated: the analyte was positively idenfied; the quantitation is an estimation
J1 = Estimated: the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria
M = Manual integrated compound
Q = One of more quality control criteria failed
U = Undetected at the limit of detection

Validator Qualifiers (DV):
J = The reported result was an estimated value with an unknown bias
J- = The result was an estimated quantity, but the result may be biased low

Bold Result = detection
Grey Shading Result = concentration > MCL
Italicized Result = concentration > RSL
Underlined Result = concentration > BTAG

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Authorization

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
D	The reported value is from a dilution.
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

GC VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
U	Undetected at the Limit of Detection.

HPLC/IC

Qualifier	Qualifier Description
D	The reported value is from a dilution.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

Metals

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
U	Undetected at the Limit of Detection.

General Chemistry

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
U	Undetected at the Limit of Detection.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Sample Summary

Client: Meadows CMPG, Inc
Project/Site: OU6 Performance

Job ID: 680-243265-1

Lab Sample ID	Client Sample ID	Matrix	Collected	Received
680-243265-1	OU6-MW-244-20231120	Water	11/20/23 13:10	11/21/23 10:28
680-243265-2	OU6-MW-242-20231120	Water	11/20/23 09:35	11/21/23 10:28
680-243265-3	OU6-MW-243-20231120	Water	11/20/23 12:00	11/21/23 10:28
680-243265-4	OU6-MW-241-20231120	Water	11/20/23 10:50	11/21/23 10:28
680-243265-5	OU6-MW-237-20231120	Water	11/20/23 10:15	11/21/23 10:28

680-243265-10	DUP-1-20231120	Water	11/20/23 00:00	11/21/23 10:28

Job ID: 680-243265-1

Laboratory: Eurofins Savannah

Narrative

Job Narrative
680-243265-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/21/2023 10:28 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.7°C and 3.2°C

GC/MS VOA
Method 8260D_DOD5: The following samples were diluted to bring the concentration of target analytes within the calibration range: OU6-MW-244-20231120 (680-243265-1), OU6-MW-242-20231120 (680-243265-2), OU6-MW-243-20231120 (680-243265-3), OU6-MW-239-20231120 (680-243265-6), OU6-MW-238-20231120 (680-243265-7) and DUP-1-20231120 (680-243265-10). Elevated reporting limits (RLs) are provided.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-811496 recovered outside acceptance criteria, low biased, for Carbon disulfide. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D_DOD5: Reanalysis of the following sample was performed outside of the analytical holding time due to dilution : OU6-MW-243-20231120 (680-243265-3).

Method 8260D_DOD5: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-811496.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC VOA
Method RSK_175_DOD5: Due to the high concentration of Methane (TCD), the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 680-810949 could not be evaluated for accuracy and precision. The associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

HPLC/IC
Method 9056A_OF_28D_D5: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-811389 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 9056A_OF_48H_D5: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-809480 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 9056A_OF_48H_D5: The following samples were diluted due to color: OU6-MW-242-20231120 (680-243265-2),

Job ID: 680-243265-1 (Continued)

Laboratory: Eurofins Savannah (Continued)

OU6-MW-241-20231120 (680-243265-4), OU6-MW-238-20231120 (680-243265-7), OU6-MW-238-20231120 (680-243265-7[MS]), OU6-MW-238-20231120 (680-243265-7[MSD]), OU6-MW-245-20231120 (680-243265-8) and DUP-1-20231120 (680-243265-10). Elevated reporting limits (RL) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method 2320B: The sample duplicate precision for the following sample associated with analytical batch 680-810526 was outside control limits: (680-243265-D-1 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method SM4500_S2_F: The method requirement for no headspace was not met. The following samples were analyzed with headspace in the sample container(s): OU6-MW-244-20231120 (680-243265-1), OU6-MW-242-20231120 (680-243265-2), OU6-MW-243-20231120 (680-243265-3), OU6-MW-241-20231120 (680-243265-4), OU6-MW-245-20231120 (680-243265-8), DUP-1-20231120 (680-243265-10), (680-243191-C-1) and (680-243191-D-1 DU).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Meadows CMPG, Inc
Project/Site: OU6 Monitoring

Job ID: 680-243330-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
D	The reported value is from a dilution.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

GC VOA

Qualifier	Qualifier Description
D	The reported value is from a dilution.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
U	Undetected at the Limit of Detection.

HPLC/IC

Qualifier	Qualifier Description
D	The reported value is from a dilution.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

Metals

Qualifier	Qualifier Description
U	Undetected at the Limit of Detection.

General Chemistry

Qualifier	Qualifier Description
D	The reported value is from a dilution.
U	Undetected at the Limit of Detection.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 680-243330-1

Laboratory: Eurofins Savannah

Narrative

Job Narrative
680-243330-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/22/2023 10:23 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.2°C

GC/MS VOA
Method 8260D_DOD5: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 680-810968 recovered outside control limits for the following analytes: Trichlorofluoromethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D_DOD5: The method blank for analytical batch 680-810968 contained 1,2,4-Trimethylbenzene above the method detection limit (MDL). Associated samples were not re-analyzed because the method blank results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D_DOD5: The following samples were diluted to bring the concentration of target analytes within the calibration range: OU6-MW-240-20231121 (680-243330-1) and OU6-MW-129-20231121 (680-243330-5). Elevated reporting limits (RLs) are provided.

Method 8260D_DOD5: The following samples were diluted to bring the concentration of target analytes within the calibration range: OU6-MW-130-20231121 (680-243330-4), OU6-MW-131-20231121 (680-243330-6) and OU6-MW-126-20231121 (680-243330-7). Elevated reporting limits (RLs) are provided.

Method 8260D_DOD5: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-811496.

Method 8260D_DOD5: Surrogate recovery for the following sample was outside the upper control limit: OU6-MW-246-20231121 (680-243330-2). This sample did not contain any detections for the target analytes reported; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

HPLC/IC
Method 9056A_OF_48H_D5: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-809700 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job ID: 680-243330-1 (Continued)

Laboratory: Eurofins Savannah (Continued)

Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method SM4500_S2_F: The method requirement for no headspace was not met. The following samples were analyzed with headspace in the sample container(s): OU6-MW-240-20231121 (680-243330-1), OU6-MW-246-20231121 (680-243330-2), OU6-MW-247-20231121 (680-243330-3), OU6-MW-130-20231121 (680-243330-4), (680-243330-B-1 DU), (680-243330-B-2 MS) and (680-243330-B-2 MSD).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Reason Codes	Reason Code Descriptions
ER1	The reported inorganic result is greater than/equal to the MDL and less than the RDL or QL; it should be considered an estimated value.
ER2	The reported organic result is greater than/equal to the MDL and less than the RDL or QL; it should be considered an estimated value.
NC	No code applied
LBH	Contamination detected in the Lab Blank greater than or equal to the Quantitation Limit.
LCSH	The LCS recovery exceeds the upper control limit.
MSDL	The Matrix Spike Duplicate Recovery for a sample is less than lower control limit but greater than the the lower cutoff.
MSH	The Matrix Spike recovery for a sample exceeds the upper control limit.
MSL	The Matrix Spike recovery for a sample is less than lower control limit but greater than the the lower cutoff.
SURR9	The Surrogate recovery exceeds the upper control limit.

Qualifiers	Qualifier Descriptions
B	Detections found in the method blank
E	Exceeds upper calibration level.
J	Estimated value
J+	Estimated value, with high bias
J-	Estimated value, with low bias
R	Rejected
U	Not Detected
UJ	Not Detected, Limit is estimated.
X	Data should be excluded

Notes:
DSCR = Defense Supply Center Richmond
FR = fraction
N = organic or not applicable , T = total
µg/L = micrograms per liter, mg/L = milligrams per liter
RDL = reporting detection limit

C.2 Annual Monitoring Laboratory and Data Validation Reports

eurofins | Environment Testing

ANALYTICAL REPORT

PREPARED FOR

Attn: Kandyce Keller
Meadows CMPG, Inc
2107 Granby Street
Norfolk, Virginia 23517

Generated 5/31/2024 5:40:13 PM

JOB DESCRIPTION

DSCR - OU6 Annual

JOB NUMBER

680-250771-1

Eurofins Savannah
5102 LaRoche Avenue
Savannah GA 31404

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Authorization

Generated
5/31/2024 5:40:13 PM

Authorized for release by
Jess Hornsby, Client Service Manager
Jess.Hornsby@et.eurofinsus.com
Designee for
Jerry Lanier, Project Manager I

(912)250-0281

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

GC/MS Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

GC VOA

Qualifier	Qualifier Description
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

GC Semi VOA

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

HPLC/IC

Qualifier	Qualifier Description
D	The reported value is from a dilution.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

Metals

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
U	Undetected at the Limit of Detection.

General Chemistry

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
U	Undetected at the Limit of Detection.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
680-250771-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 5/15/2024 9:35 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.7°C and 3.2°C.

Receipt Exceptions
Sample IDs logged based on notes on COC

Received extra samples not listed on the COC
-18 (OU6-MW-96-20240514)
-19 (Trip Blank)

GC/MS VOA
Method 8260D_DOD5: The initial calibration verification (ICV) analyzed in batch 680-836362 was outside method criteria for the following analyte(s): Bromoform and Carbon disulfide. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D_DOD5: The initial calibration verification (ICV) analyzed in batch 680-837880 was outside method criteria for the following analyte(s): Dichlorodifluoromethane. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838701 recovered outside acceptance criteria, low biased, for Methyl acetate. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838701 recovered above the upper control limit for Bromoform and Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D_DOD5: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 680-838701 recovered outside control limits for the following analytes: Trichlorofluoromethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D_DOD5: The method blank for 680-838701 contained Bromoform above the method detection limit (MDL). Associated samples were not re-analyzed because the method blank results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D_DOD5: The closing continuing calibration verification (CCVC) associated with batch 680-838701 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D_DOD5: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-838701.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838714 recovered above the upper control limit for Bromomethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the

data have been reported.

Method 8260D_DOD5: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 680-838997 recovered outside control limits for the following analytes: Acetone.

Method 8260D_DOD5: The method blank for 680-838997 contained Carbon disulfide above the method detection limit (MDL). Associated samples were not re-analyzed because the method blank results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D_DOD5: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-838997.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA
Method 8270E_DOD5: The initial calibration verification (ICV) result for batch 680-836548 was above the upper control limit. The affected analytes are: 2,4-Dimethylphenol. Sample results were non-detects, and have been reported as qualified data.

Method 8270E_DOD5: The continuing calibration verification (CCV) associated with batch 680-838829 recovered above the upper control limit for Bis(2-chloroethyl)ether. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8270E_SIM_DOD5: These samples were re-extracted out of hold due to low surrogate recovery of the MB and LCS and several of the samples. The re-extracted samples surrogates recovered within limits. Both sets of data have been reported.

OU6-CSMPZ-7-20240514 (680-250771-1) and OU6-MW-169-20240514 (680-250771-12)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC VOA
Method RSK_175_DOD5: The method requirement for no headspace was not met. The following volatile sample was analyzed with significant headspace in the sample container(s): OU6-DMW--9A-20240514 (680-250771-16). Significant headspace is defined as a bubble greater than 6 mm in diameter.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides/PCBs
Method 8081B_8082A_D5: The continuing calibration verification (CCV) associated with batch 680-838891 recovered above the upper control limit for PCB-1260. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data has been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

HPLC/IC
Method 9056A_OF_48H_D5: The matrix spike (MS) recoveries for analytical batch 680-838101 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2320B: The sample duplicate precision for the following sample associated with analytical batch 680-838857 was outside control limits: (680-250771-H-12 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method SM4500_CO2_D: The sample duplicate precision for the following sample associated with analytical batch 680-838857 was outside control limits: (680-250771-H-12 DU). The associated Laboratory Control Sample / Laboratory Control Sample

Job ID: 680-250771-1 (Continued) Eurofins Savannah

Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received extra samples not listed on COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Meadows CMPG, Inc
Project/Site: DSCR - OU6 Annual

Job ID: 680-250842-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

GC/MS Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

GC VOA

Qualifier	Qualifier Description
D	The reported value is from a dilution.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

GC Semi VOA

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

HPLC/IC

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

Metals

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
U	Undetected at the Limit of Detection.

General Chemistry

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
U	Undetected at the Limit of Detection.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Sample Summary

Client: Meadows CMPG, Inc
Project/Site: DSCR - OU6 Annual

Job ID: 680-250842-1

Lab Sample ID	Client Sample ID	Matrix	Collected	Received
680-250842-1	OU6-MW-277-20240515	Water	05/15/24 09:35	05/16/24 10:28

680-250842-6	OU6-MW-284-20240515	Water	05/15/24 08:50	05/16/24 10:28
680-250842-7	OU6-MWNGA-8-20240515	Water	05/15/24 12:25	05/16/24 10:28
680-250842-8	OU6-MWNGA-10-20240515	Water	05/15/24 10:15	05/16/24 10:28
680-250842-9	OU6-MW-297-20240515	Water	05/15/24 12:10	05/16/24 10:28
680-250842-10	OU6-MW-301-20240515	Water	05/15/24 13:35	05/16/24 10:28
680-250842-11	OU6-MW-246-20240515	Water	05/15/24 15:05	05/16/24 10:28
680-250842-12	OU6-MW-182-20240515	Water	05/15/24 12:55	05/16/24 10:28
680-250842-13	OU6-DMW-17A-20240515	Water	05/15/24 11:35	05/16/24 10:28
680-250842-14	OU6-MW-124-20240515	Water	05/15/24 09:15	05/16/24 10:28
680-250842-15	OU6-MW-8A-20240515	Water	05/15/24 10:35	05/16/24 10:28
680-250842-16	TRIP-BLANK-20240515	Water	05/15/24 00:00	05/16/24 10:28
680-250842-17	OU6-MW-92-20240515	Water	05/15/24 14:00	05/16/24 10:28

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 5/16/2024 10:28 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 0.2°C, 2.7°C and 2.7°C.

Receipt Exceptions
Missing sample OU6-MW-142-20240515; however, we received sample OU6-MW-92-20240515 that was not listed on the chain of custody. Sample was logged in for VOCs as this matches the containers.

Nitrate, Chloride and Sulfate bottles not received for the following samples: OU6-MW-277-20240515 (680-250842-1), OU6-MW-259-20240515 (680-250842-2) and OU6-MW-280-20240515 (680-250842-3).

Received one broken vial for: OU6-MWNGA-10-20240515 (680-250842-8). Sufficient vials remained to complete testing.

GC/MS VOA
Method 8260D_DOD5: The initial calibration verification (ICV) analyzed in batch 680-836351 was outside method criteria for the following analyte(s): Carbon disulfide. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated. The data has been qualified and reported.

Method 8260D_DOD5: The initial calibration verification (ICV) analyzed in batch 680-836362 was outside method criteria for the following analyte(s): Bromoform and Carbon disulfide. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D_DOD5: The initial calibration verification (ICV) analyzed in batch 680-837880 was outside method criteria for the following analyte(s): Dichlorodifluoromethane. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D_DOD5: The closing continuing calibration verification (CCVC) associated with batch 680-838669 recovered above the upper control limit for Bromoform and Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838669 recovered outside acceptance criteria, low biased, for Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D_DOD5: The laboratory control sample (LCS) for analytical batch 680-838669 recovered outside control limits for the following analytes: Trichlorofluoromethane This analyte was biased high in the LCS and were not detected in the associated samples; therefore, the data has been reported.

Method 8260D_DOD5: The laboratory control sample duplicate (LCSD) for analytical batch 680-838669 recovered outside control limits for the following analytes: Bromoform and Trichlorofluoromethane. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D_DOD5: The method blank for 680-838669 contained Methylcyclohexane above the method detection limit (MDL). Associated samples were not re-analyzed because the method blank results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D_DOD5: The closing continuing calibration verification (CCVC) associated with batch 680-838669 recovered above

the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838714 recovered above the upper control limit for Bromomethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D_DOD5: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-838714 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 8260D_DOD5: Surrogate recovery was outside acceptance limits for the parent sample: OU6-MWNGA-10-20240515 (680-250842-8). The matrix spike/matrix spike duplicate (MS/MSD) sample's surrogate recovery was within limits. The parent sample has been qualified and reported.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838727 recovered above the upper control limit for Cyclohexane and n-Butylbenzene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838727 recovered outside acceptance criteria, low biased, for Bromomethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D_DOD5: The laboratory control sample duplicate (LCSD) for analytical batch 680-838727 recovered outside control limits for the following analytes: Cyclohexane, Methylcyclohexane and n-Butylbenzene. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D_DOD5: The method blank for 680-838727 contained Hexachlorobutadiene above the method detection limit (MDL). Associated samples were not re-analyzed because the method blank results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D_DOD5: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 680-838727 recovered outside control limits for the following analytes: Methylcyclohexane.

Method 8260D_DOD5: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-838727.

Method 8260D_DOD5: The continuing calibration verification (CCV) associated with batch 680-838791 recovered above the upper control limit for Bromomethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D_DOD5: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-838791 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS Semi VOA

Method 8270E_DOD5: The initial calibration verification (ICV) result for batch 680-836548 was above the upper control limit. The affected analytes are: 2,4-Dimethylphenol. Sample results were non-detects, and have been reported as qualified data.

Method 8270E_DOD5: The continuing calibration verification (CCV) associated with batch 680-838829 recovered above the upper control limit for Bis(2-chloroethyl)ether. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8270E_DOD5: Surrogate recovery for the following sample was outside control limits: OU6-MW-259-20240515 (680-250842-2). Re-extraction and/or re-analysis was performed outside of holding time with acceptable results.

Method 8270E_DOD5: The following closing continuing calibration verification (CCVC) was outside the method defined tuning window: (CCVC 680-839803/29) and (CCVC 680-839803/30) All target analytes in the affected CCVC were within control limits.

The data has been reported.

Method 8270E_SIM_DOD5: These samples were re-extracted out of hold due to low surrogate recovery of the MB and LCS and several of the samples. The re-extracted samples surrogates recovered within limits. Both sets of data have been reported: OU6-MW-277-20240515 (680-250842-1), OU6-MW-259-20240515 (680-250842-2) and OU6-MW-280-20240515 (680-250842-3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC VOA
Method RSK_175_DOD5: The method requirement for no headspace was not met. The following volatile sample was analyzed with significant headspace in the sample container(s): OU6-MW-280-20240515 (680-250842-3). Significant headspace is defined as a bubble greater than 6 mm in diameter.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Pesticides/PCBs
Method 8081B_8082A_D5: Two surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: OU6-MW-259-20240515 (680-250842-2). Re-extraction would have been outside of holding time. These results have been reported and qualified.

Method 8081B_8082A_D5: The continuing calibration verification (CCV) associated with batch 680-838891 recovered above the upper control limit for PCB-1260. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data has been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

HPLC/IC
Method 9056A_OF_48H_D5: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-837892 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Client: Meadows CMPG, Inc
Project/Site: DSCR - OU6 Annual

Job ID: 680-250842-1

Client Sample ID: OU6-MW-277-20240515
Date Collected: 05/15/24 09:35
Date Received: 05/16/24 10:28

Lab Sample ID: 680-250842-1
Matrix: Water

Method: SW846 8260D - Volatile Organic Compounds (GC/MS)
