

Start with the Tread facing up, and the points of the Alligator Clip Facing Down.

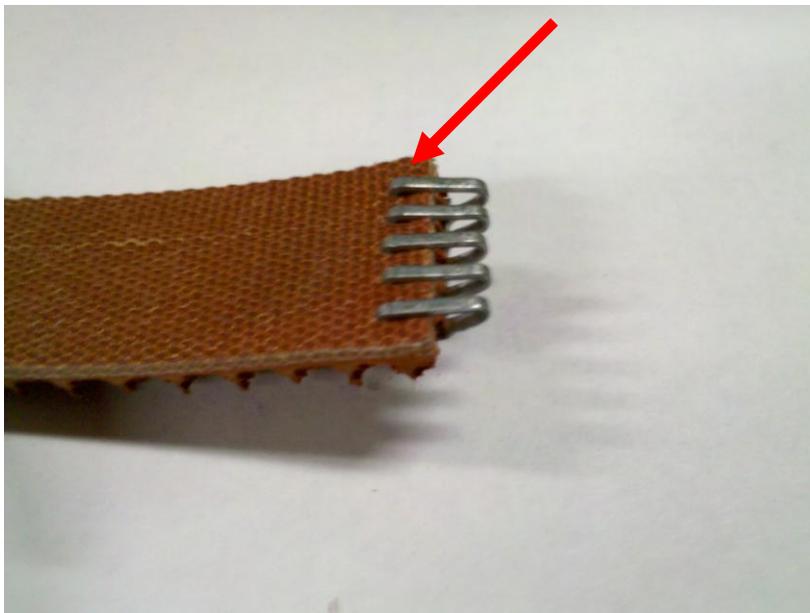

Slide the Alligator Clip over the end of the tread, sometimes this is easier by coming from the side of the tread.

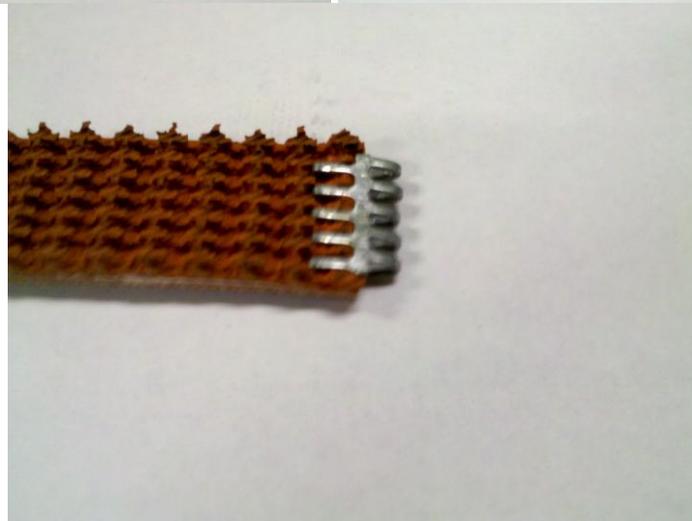

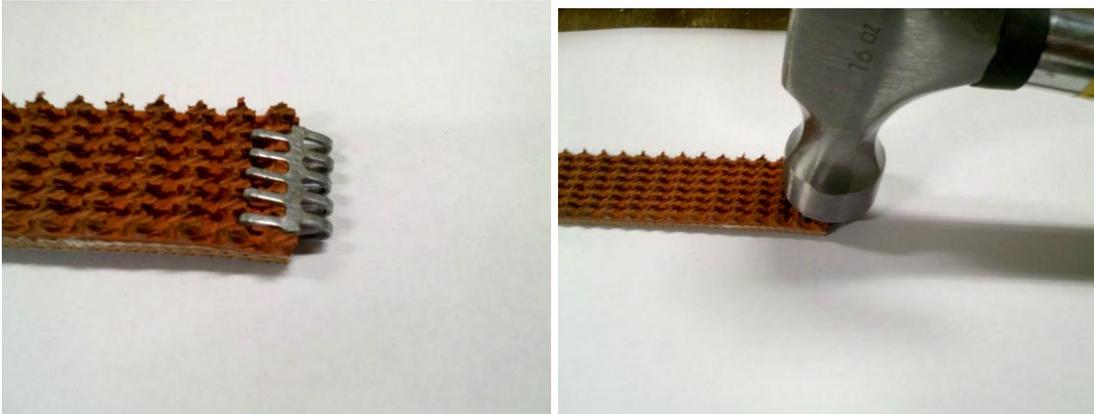

Now flip the tread over so the longer points of the Alligator clip are exposed.

Use a hammer to tap down the longer points into the tread, use a motion more inline with the points.

Now flip the tread back over so the tread is exposed, and finish tapping the Alligator Clip tight.

Do the same thing to the other end of the tread, wrap it around your wheel, and slide the pin between the clips. (If you are doing this on a placation wheel, you will need to loosen the wheel to get the tread to fit, after you do this step be sure to tighten the wheel halves together)
