## Chrome update version 2019

To mark its 10th Chrome anniversary, Google is rolling out a substantial refresh of the browser, giving it a softer, rounded look with some new clean features. Most of the changes in Chrome 69 are small type-of-life tweaks, some of which are so subtle you might not even notice as part of Chrome's new design. Though they can't change lives, here are a few things worth checking out in the new Chrome experience: Generator PasswordScreenshot: Mike EpsteinChrome can now do your password in addition to storing them – the most substantial feature in this update. The browser's password storage and autofill features now include a password manager, a lastPass or 1Password, which makes it a lot easier to use longer, better passwords by default. When signing up for a new service, Chrome will more than happy to suggest a strong password for you to try. Simply click the password box and Google will generate one on your behalf, as it would offer fill in a password you have already saved. G/O Media can find a 10%10% commissioner Ring KitThe standard or stable version of Google Chrome offers much handy personalization and... Read more you're already using a password generator, this feature won't feel like anything new, but it's convenient to have this service integrated into the browser, at least. Google gives the search bar a great boostScreenshot: Mike EpsteinChrome now presents search results for common questions (like the current weather) in the search bar, so you don't even have to click into a second page to get the answer whatever it is you're looking for. In its announcement blog post, Google said it can present all kinds of information via Omnibox Chrome's, but does it seem to be limited to very common, specific phrases now, such as How incredible Time 2? (two hours, five minutes) and What's the time? (a wish degree 91 here in Brooklyn). Apple debuted 3D Touch on the iPhone back in 2015. The concept behind the technology is simple: You read moreTab search of Omniboxl is surprisingly excited about this. Have you ever had many open tabs that you couldn't find the item or conversation you were looking for, forcing you to systematically turn off closed tabs for the needle of the haystack that is your digital life? Of course you have. I do it at least twice a day. To help us all find that we have saved and lost in our browser, Google has given Chrome the ability to find specific web pages via its Omnibox (the address bar). Simply type the website or page name and select Switch to Tab to discover what you lost! I breathe easier already. Chrome aesthetic overhaul also makes tabs easier to read by making each site's icon more important, so you're less likely to lose your tabs in the first your phone, a search bar within reach of the sore inch you use Chrome on your phone, there is a big UI change that sticks out like a sore -- forgive me -- deep inches. The Chrome app now features a toolbar toolbar at the bottom of the screen, rather than the top. This effectively recognizes the experience for browsing one-hand, as you don't need left hand changes up to the top of your phone screen to select a tab or zoom up the search bar. There are too many Michael Epsteins out there... Screenshot: Mike EpsteinThe list of options in plus the menu — ellipses on the right side of the toolbar — is also easier to read and scan, thanks to greater text and new icons for functions such as marking and requiring the desktop version of a page. Photo: Deepanker Verma (Pexels)A security flaw in Google Chrome was under active attack last week, although Google's Chrome update (hopefully) automatically fixes the issue in your browser, it is important that you double-check that you are running the newest version (72.0.3626.121). But don't take our word for that. When it's Chrome's lead in Security and Desktop Engineering suggests that you update now - like right this minute - you should take a few seconds to check your browser's version. Launch the built-in Chrome update tool, simply open the browser and select On Google Chrome, which you will find in the Help section of its main drop-down menu. Your browser should then automatically update for you if there is a more recent version to download. For more of Lifehacker, be sure to follow us on Instagram @lifehackerdotcom. G/O Media can get a 10-headed RingBlitzWolf Commissioner Ring Kit Expensive Lifehacker. I am a great Chrome user and see that there's yet another channel (Canary) out for Mac users to try. I was always a little sure about which one of these I should run; Can you give me any advice? Sincerely, Confused by ChromeDear Confused, Chrome, Firefox and Opera all have multiple versions, called channels that you can run, each of which exchanges different levels of stability for new features. Each channel automatically updates to the latest version of this channel, so once you've installed the browser, you don't need to manually update it yourself — it will automatically update to the newest version available on that channel, unless you reinstall a different channel. Here's a quick BEVISION about how each channel works. Channel to stable: I want stabilityThe channel stable of each browser is the official release that you'll find in the browser download page, and the one that most people use. It's expected to be completely stable, and for all the features to work correctly, so if you want everything to work just work, this is probably the channel for you. You won't find any of the newest features until they've been fully tested, but if you're and most of the Chrome features and Firefox already provide, which is not much of a problem. G/O Media may find a 10-headed 10BlitzWolf commissioner Ring KitThe Beta Channel: I would like new features but not at the expense of usability Is where new features come to be more widely tested before moving on to the stable channel. This is designed for more cutting edge users, who want to get a piece of the newest action before their march, and test out new features (usually with the expectations that they bugs files to make sure everything gets fixed before they are officially released). Examples include the long-lasting extension feature, which has been in the dev channel for approximately two months, before moving onto the beta channel. After that, it beta users tried it out for a month before Google added it to the stable channel for all to use. Long we have searched for an easy way to sync browser extensions across multiple machines, and for... It plus! found that beta channels are usually very stable and help find me closer to these new features earlier on. This is usually my preferred channel for day-to-day work (call me boring, I don't care), Chain of Dev: I perform extension browser extensions Known as Aurora on Firefox or Opera Next on Opera, the Dev channel is the release designed for developing the extension to ensure that the extensions work with next version of the browser. This is where new features appear once they have finished, and get set at their pace. At this time of writing, for example, you can only delete extra data plugin if you are using the dev version. Google's is also working on certain guidance and performance issues in the current dev-bugs channel that can make it from canary alive, but didn't get realized until more people tested the new version. Windows / Mac / Linux: Mozilla today launched Aurora, a semi-stable developer of Firefox that... Read moreYou may experience a bit less stability with this channel (as Google is still working on calm bugs such as the aorsive issues), and some of your extensions can break since they're not yet being updated. If you need the latest features as soon as you can get them though, this is the channel to use - you just might have to deal with a few more accidents or problems than normal. Chrome Canary and Firefox Nightlies: I'm somewhat crazy and/or have a more bleeding-edge backupThe browser built around, Chrome Canary and Firefox nightly build, is where new features get developed. This channel is for maters only, and is not always stable enough for everyday use. You'll see new features as soon as possible (such as the brand new Chrome, somewhat working multiple profile supports), but may not always work correctly, and yet, many of your extensions may not work. That said, these builds are usually installed separately in the other channels, so you can have them This is useful if you find a specific Kane or Nightly build is too unstable for your daily use, or if you just want to keep it around to see what the features are coming next. Windows: We've been waiting for multiple profile support in Chrome for a long time, and if you have it plusNote that Chromium, the open source project behind Chrome, also has nightly builds, but they kind of a whole separate program than Google Chrome itself. They are even less stable than Canary, and don't come with proprietary add-ons like Flash, so you'll have to do a bit of extra work if you want to watch Charlie bite his brother's... Again. If you're using Chrome, Cana's probably the best cutting-edge option, while Firefox users will have to use building each night instead. Hopefully that helps you decide which browser channels you should run. It's mostly up to your own preferences as far as how stable you want your daily browser to be (and how impatient you are for new features). You can find the Chrome channel in Early Access Chromium page. You can find the stable Firefox, Beta, and Aurora channels in the Firefox Future Releases page, and nights at the Night Builds page. Sincerely, LifehackerP.S. Got your own point to add, or any thoughts to share about why a specific channel is your favorite? Share with us in the comments.
