## Manual Supplement

| Manual Title: | 5502A Operators | Supplement Issue: | $\mathbf{5}$ |
| :--- | :--- | :--- | :--- |
| Print Date: | September 2012 | Issue Date: | $3 / 21$ |
| Revision/Date |  | Page Count: | 19 |
| $:$ |  |  |  |

This supplement contains information necessary to ensure the accuracy of the above manual. This manual is distributed as an electronic manual on the following CD-ROM:

CD Title: 5502A
CD Rev. \& Date: 11/2012
CD PN: 4155227

## Change \#1, 66379, 561, 562, 564, 610

## On pages 1-9 through 1-28, replace the entire Specifications section with: General Specifications

The following tables list the 5502A specifications. All specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5502A has been turned off. (For example, if the 5502A has been turned off for 5 minutes, the warm-up period is 10 minutes.)

All specifications apply for the temperature and time period indicated. For temperatures outside of tcal $\pm 5^{\circ} \mathrm{C}$ (tcal is the ambient temperature when the 5502A was calibrated), the temperature coefficient as stated in the General Specifications must be applied.
The specifications also assume the Calibrator is zeroed every 7 days or whenever the ambient temperature changes more than $5{ }^{\circ} \mathrm{C}$. The tightest ohms specifications are maintained with a zero cal every 12 hours within $\pm 1^{\circ} \mathrm{C}$ of use.
Also see additional specifications later in this chapter for information on extended specifications for ac voltage and current.

| Warmup Time .............................................. Twice the time since last warmed up, to a maximum of 30 minutes. |  |
| :---: | :---: |
| Settling Time | Less than 5 seconds for all functions and ranges except as noted. |
| Standard Interfaces ........................................ IEEE-488 (GPIB), RS-232 |  |
| Temperature |  |
| Operating | $0^{\circ} \mathrm{C}$ to $50{ }^{\circ} \mathrm{C}$ |
| Calibration (tcal). | $15^{\circ} \mathrm{C}$ to $35^{\circ} \mathrm{C}$ |
| Storage | $-20^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$; The DC current ranges 0 to 1.09999 A and 1.1 A to 2.99999 A are sensitive to storage temperatures above $50^{\circ} \mathrm{C}$. If the 5502 A is stored above $50{ }^{\circ} \mathrm{C}$ for greater than 30 minutes, these ranges must be re-calibrated. Otherwise, the 90 day and 1 year uncertainties of these ranges double. |
| Temperature Coefficient | Temperature coefficient for temperatures outside of tcal $\pm 5^{\circ} \mathrm{C}$ is $10 \%$ of the stated specification per ${ }^{\circ} \mathrm{C}$. |
| Relative Humidity |  |
| Operating | $<80 \%$ to $30{ }^{\circ} \mathrm{C},<70 \%$ to $40{ }^{\circ} \mathrm{C},<40 \%$ to $50^{\circ} \mathrm{C}$ |
| Storage | <95\%, non-condensing. After long periods of storage at high humidity, a drying-out period (with power on) of at least one week may be required. |

| Altitude |  |
| :---: | :---: |
| Operating | $3050 \mathrm{~m}(10000 \mathrm{ft})$ maximum at $\leq 120 \mathrm{~V}$ line voltage operation |
|  | $2,000 \mathrm{~m}(6500 \mathrm{ft})$ maximum at $>120 \mathrm{~V}$ line voltage operation |
| Non-operatin | $12200 \mathrm{~m}(40000 \mathrm{ft})$ maximum |
| Safety | IEC 61010-1: Overvoltage CAT II, Pollution Degree 2 |

Output Terminal Electrical Overload Protection Provides reverse-power protection, immediate output disconnection, and/or fuse protection on the output terminals for all functions. This protection is for applied external voltages up to $\pm 300 \mathrm{~V}$ peak.
Analog Low Isolation........................................... 20 V normal operation, 400 V peak transient
Electromagnetic Compatibility
International ...................................................... IEC 61326-1: Controlled Electromagnetic Environment; IEC 61326-2-1 CISPR 11: Group 1, Class A
Group 1: Equipment has intentionally generated and/or uses conductively-coupled radio frequency energy that is necessary for the internal function of the equipment itself. Class A: Equipment is suitable for use in all establishments other than domestic and those directly connected to a low-voltage power supply network that supplies buildings used for domestic purposes. There may be potential difficulties in ensuring electromagnetic compatibility in other environments due to conducted and radiated disturbances.
Caution: This equipment is not intended for use in residential environments and may not provide adequate protection to radio reception in such environments.

Emissions that exceed the levels required by CISPR 11 can occur when the equipment is connected to a test object.
The equipment may not meet the immunity requirements of this standard when test leads and/or test probes are connected.

If used in areas with electromagnetic fields of $1 \mathrm{~V} / \mathrm{m}$ to $3 \mathrm{~V} / \mathrm{m}$ from 0.08 GHz to 1 GHz , resistance outputs have a floor adder of $0.508 \Omega$. Performance not specified above $3 \mathrm{~V} / \mathrm{m}$. This instrument may be susceptible to electro-static discharge (ESD) to the binding posts. Good static awareness practices should be followed when handling this and other pieces of electronic equipment. Additionally, this instrument may be susceptible to electrical fast transients on the mains terminals. If any disturbances in operation are observed, it is recommended that the rear-panel chassis ground terminal
be connected to a known good earth ground with a low-inductance ground strap. Note that a mains power outlet, while providing a suitable ground for protection against electric shock hazard, may not provide an adequate ground to properly drain away conducted rf disturbances and may, in fact, be the source of the disturbance. This instrument was certified for EMC performance with data I/O cables not in excess of 3 m .
Line Power...........................................................

Line Voltage (selectable): $100 \mathrm{~V}, 120 \mathrm{~V}, 220 \mathrm{~V}, 240 \mathrm{~V}$
Line Frequency: 47 Hz to 63 Hz
Line Voltage Variation: $\pm 10 \%$ about line voltage setting. For optimal performance at full dual outputs (e.g. $1000 \mathrm{~V}, 20 \mathrm{~A}$ ) choose a line voltage setting that is $\pm 7.5 \%$ from nominal.
Power Consumption
. 600 VA
Dimensions (HxWxL) ...............................................
$17.8 \mathrm{~cm} \times 43.2 \mathrm{~cm} \times 47.3 \mathrm{~cm}$ ( $7 \mathrm{in} \times 17 \mathrm{in} \times 18.6 \mathrm{in}$ ) Standard rack width and rack increment, plus 1.5 cm ( 0.6 in ) for feet on bottom of unit.
Weight (without options) $\qquad$ 22 kg (49 lb)
Absolute Uncertainty Definition
The 5502A specifications include stability, temperature coefficient, linearity, line and load regulation, and the traceability of the external standards used for calibration. You do not need to add anything to determine the total specification of the 5502A for the temperature range indicated.
Specification Confidence Level 99 \%

## Detailed Specifications

## DC Voltage

| 11 to 20.5 A ${ }^{\text {[1] }}$ | $0.080+750{ }^{[2]}$ | $0.10+750^{[2]}$ | $100 \mu \mathrm{~A}$ | 4 |  |

[1] Duty Cycle: Currents <11 A may be provided continuously. For currents $>11$ A, see Figure 1. The current may be provided Formula $60-\mathrm{T}$-I minutes any 60 minute period where T is the temperature in ${ }^{\circ} \mathrm{C}$ (room temperature is about $23^{\circ} \mathrm{C}$ ) and I is the output current in amperes. For example, 17 A , at $23^{\circ} \mathrm{C}$ could be provided for $60-23-17=20$ minutes each hour. When the 5502A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure 1 is achieved only after the 5502A is outputting currents $<5 \mathrm{~A}$ for the "off" period first.
[2] Floor specification is $1500 \mu \mathrm{~A}$ within 30 seconds of selecting operate. For operating times $>30$ seconds, the floor specification is $750 \mu \mathrm{~A}$.

| Range | Noise |  |

| [1] Continuously variable from $0 \Omega$ to 1.1 G . |  |  |  |  |  |  |
| [3] Do not exceed the largest current for each range. For currents lower than shown, the floor adder increases by Floor ${ }_{(\text {new })}=$ Floor $_{(\text {(odd })} X$ $I_{\text {min }} / l_{\text {actual }}$. For example, a $50 \mu \mathrm{~A}$ stimulus measuring $100 \Omega$ has a floor specification of: $0.0014 \Omega \times 3 \mathrm{~mA} / 50 \mu \mathrm{~A}=0.084 \Omega$, assuming an ohms zero calibration within 12 hours. | [2] Applies for 4-WIRE compensation only. For 2-WIRE and 2-WIRE COMP, add $5 \mu \mathrm{~V}$ per amp of stimulus current to the floor specification. For example, in 2-WIRE mode, at $1 \mathrm{k} \Omega$ the floor specification within 12 hours of an ohms zero cal for a measurement current of 1 mA is: $0.002 \Omega+5 \mu \mathrm{~V} / 1 \mathrm{~mA}=(0.002+0.005) \Omega=0.007 \Omega$. |  |  |  |  |  |

[1] Max Distortion for 100 kHz to 200 kHz . For 200 kHz to 500 kHz , the maximum distortion is $0.9 \%$ of output + floor as shown. Note

Remote sensing is not provided. Output resistance is $<5 \mathrm{~m} \Omega$ for outputs $\geq 0.33 \mathrm{~V}$. The AUX output resistance is $<1 \Omega$. The maximum load capacitance is 500 pF , subject to the maximum burden current limits.

[1] Duty Cycle: Currents <11 A may be provided continuously. For currents $>11 \mathrm{~A}$, see Figure 1. The current may be provided $60-\mathrm{T}$-I minutes any 60 minute period where T is the temperature in ${ }^{\circ} \mathrm{C}$ (room temperature is about $23^{\circ} \mathrm{C}$ ) and I is the output current in amps. For example, 17 A , at $23^{\circ} \mathrm{C}$ could be provided for $60-17-23=20$ minutes each hour. When the 5502A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure 1 is achieved only after the 5502A is outputting currents <5 A for the "off" period first.
[2] For compliance voltages greater than 1 V , add $1 \mathrm{~mA} / \mathrm{V}$ to the floor specification from 1 to 5 kHz .
[3] For compliance voltages greater than 1 V , add $5 \mathrm{~mA} / \mathrm{V}$ to the floor specification from 5 to 10 kHz .

[1] The output is continuously variable from 220 pF to 110 mF .
[2] Specifications apply to both dc charge/discharge capacitance meters and ac RCL meters. The maximum allowable peak voltage is 3 V . The maximum allowable peak current is 150 mA , with an rms limitation of 30 mA below $1.1 \mu \mathrm{~F}$ and 100 mA for $1.1 \mu \mathrm{~F}$ and above.
[3] The maximum lead resistance for no additional error in 2-wire COMP mode is $10 \Omega$.

To calculate exact ac watts power adders due to phase uncertainty for values not shown, use the subsequent formula:

$$
\operatorname{Adder}(\%)=100\left(1-\frac{\operatorname{Cos}(\Phi+\Delta \Phi)}{\operatorname{Cos}(\Phi)}\right)
$$

For example: For a PF of $9205(\Phi=23)$ and a phase uncertainty of $\Delta \Phi=0.15$, the ac watts power adder is:

$$
\operatorname{Adder}(\%)=100\left(1-\frac{\operatorname{Cos}(23+.15)}{\operatorname{Cos}(23)}\right)=0.11 \%
$$

## AC and DC Power Specifications

Power is simulated through the controlled simultaneous outputs of voltage and current from the Calibrator. While the amplitude and frequency ranges of the outputs are broad, there are certain combinations of voltage and current where the specifications are valid. In general these are for all dc voltages and currents, and AC voltages of 30 mV to 1020 V , ac currents from 33 mA to 20.5 A , for frequencies from 10 Hz to 30 kHz . Operation outside of these areas, within the overall calibrator capabilities, is possible, but it is not specified. The table and figure below illustrate the specified areas where power and dual output are possible.

## Specification Limits for Power and Dual Output Operation

Figure 2. Permissible Combinations of AC Voltage and AC Current for Power and Dual Output

## Calculate the Uncertainty Specifications of Power and Dual Output Settings

Overall uncertainty for power output in watts (or VARs) is based on the root sum square (rss) of the individual uncertainties in percent for the selected voltage, current, and, if AC power, the phase parameters:

Watts uncertainty

$$
U_{\text {power }}=\sqrt{U^{2}{ }_{\text {Voltage }}+U_{\text {Current }}^{2}+U_{\text {Phase }}^{2}}
$$

VARs uncertainty

$$
U_{\mathrm{VARs}}=\sqrt{U^{2}{ }_{\mathrm{Voltage}}+U^{2}{ }_{\mathrm{Current}}+U^{2}{ }_{\text {Phase }}}
$$

Dual Output uncertainty

$$
U_{\text {Dual }}=\sqrt{U^{2} \text { Voltage }+U^{2} \text { AuxVoltage }+U^{2} \text { Phase }}
$$

Because there are an infinite number of combinations, you must calculate the actual ac power uncertainty for your selected parameters. The results of this method of calculation are shown in the subsequent example. These examples are at various selected calibrator settings (with 1-year specifications):

Examples of Specified Power Uncertainties at Various Output Settings:

| Selected Output Settings |  |  |  |  |  | Absolute Uncertainty as specified for tcal $\pm 5^{\circ} \mathrm{C}, \pm(\%$ of output setting) |  |  | Power Absolute Uncerainty $\pm$ (\% of Watts ${ }^{[1]}$ |

| [1] | Add $0.02 \%$ unless a settling time of 30 seconds is allowed for output currents $>10 \mathrm{~A}$ or for currents on the highest two current ranges within 30 seconds of an output current $>10 \mathrm{~A}$. |  |  |  |  |  |  |  |  |

## Calculate Power Uncertainty

Overall uncertainty for power output in watts (or VARs) is based on the root sum square (RSS) of the individual uncertainties in percent for the selected voltage, current, and phase parameters:

Watts uncertainty $\quad U_{\text {Power }}=\sqrt{U^{2}{ }_{\text {Voltage }}+U^{2}{ }_{\text {Current }}+U^{2}{ }_{\text {Phase }}}$

VARs uncertainty

$$
U_{\mathrm{VARs}}=\sqrt{U^{2} \mathrm{Voltage}+U_{\mathrm{Current}}^{2}+U_{\text {Phase }}^{2}}
$$

Because there are an infinite number of combinations, you must calculate the actual ac power uncertainty for your selected parameters. The method of calculation is best shown in the subsequent examples (with 1-year specifications):

Example 1 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 60 \mathrm{~Hz}$, Power Factor = $1.0(\Phi=0)$.
Voltage Uncertainty Uncertainty for 100 V at 60 Hz is $0.050 \%+3 \mathrm{mV}$, totaling: $100 \mathrm{~V} \times .0 .0005=50 \mathrm{mV}$ added to $3 \mathrm{mV}=53 \mathrm{mV}$. Expressed in percent: $53 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.053} \%$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A at 60 Hz is $0.05 \%+100 \mu \mathrm{~A}$, totaling: $1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent: $0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").
Phase Uncertainty (Watts) Adder for PF $=1(\Phi=0)$ at 60 Hz is $\underline{0 \%}$ (see "Phase Specifications").

Total Power Uncertainty $=\mathrm{U}_{\text {power }}=\sqrt{0.053^{2}+0.06^{2}+0^{2}}=0.080 \%$
Example 2 Output: 100 V, $1 \mathrm{~A}, 400 \mathrm{~Hz}$, Power Factor $=0.5(\Phi=60)$
Voltage Uncertainty Uncertainty for 100 V at 400 Hz is $0.050 \%+3 \mathrm{mV}$, totaling: $100 \mathrm{~V} \times .0 .0005=50 \mathrm{mV}$ added to $3 \mathrm{mV}=53 \mathrm{mV}$. Expressed in percent: $53 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.053 \%}$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A at 400 Hz is $0.05 \%+100 \mu \mathrm{~A}$, totaling: $1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent: $0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").

Phase Uncertainty (Watts) Adder for PF $=0.5(\Phi=60)$ at 400 Hz is $\underline{2.73} \%$ (see "Phase Specifications").
Total Power Uncertainty $=\mathrm{U}_{\text {power }}=\sqrt{0.053^{2}+0.06^{2}+2.73^{2}}=2.73 \%$
VARs When the Power Factor approaches 0.0, the Watts output uncertainty becomes unrealistic because the dominant characteristic is the VARs (volts-amps-reactive) output. In these cases, calculate the Total VARs Output Uncertainty, as shown in example 3:
Example 3 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 60 \mathrm{~Hz}$, Power Factor $=0.174(\Phi=80)$
Voltage Uncertainty Uncertainty for 100 V at 60 Hz is $0.050 \%+3 \mathrm{mV}$, totaling: $100 \mathrm{~V} \times .0 .0005=50 \mathrm{mV}$ added to $3 \mathrm{mV}=53 \mathrm{mV}$. Expressed in percent: $53 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.053} \%$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A at 60 Hz is $0.05 \%+100 \mu \mathrm{~A}$, totaling: $1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent: $0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").
Phase Uncertainty (VARs) Adder for $\Phi=80$ at 60 Hz is $0.05 \%$ (see "Phase Specifications").
Total VARS Uncertainty $=$ UVARs $=\sqrt{0.053^{2}+0.06^{2}+0.05^{2}}=0.094 \%$

## Additional Specifications

The subsequent paragraphs provide additional specifications for the 5502A Calibrator ac voltage and ac current functions. These specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5502A has been turned off. All extended range specifications are based on performing the internal zero-cal function at weekly intervals, or when the ambient temperature changes by more than $5^{\circ} \mathrm{C}$.

## Frequency

| Frequency Range | Resolution | 1-Year Absolute Uncertainty, <br> tcal $\pm \mathbf{5}^{\circ} \mathbf{C} \pm(\mathbf{p p m}+\mathbf{m H z})$ | Jitter |
| :---: | :---: | :---: | :---: |
| 0.01 to 119.99 Hz | 0.01 Hz | $25+1$ | $2 \mu \mathrm{~s}$ |
| 120.0 to 1199.9 Hz | 0.1 Hz | $25+1$ | $2 \mu \mathrm{~s}$ |
| 1.2 to 11.999 kHz | 1 Hz | $25+1$ | $2 \mu \mathrm{~s}$ |
| 12 to 119.99 kHz | 10 Hz | $25+15$ | 140 ns |
| 120.0 to 1199.9 kHz | 100 Hz | $25+15$ | 140 ns |
| 1.2 to 2.000 MHz | 1 kHz | $25+15$ | 140 ns |

## Harmonics ( $2^{\text {nd }}$ to $50^{\text {th }}$ )

$\left.\begin{array}{|c|c|c|c|c|}\hline \begin{array}{c}\text { Fundamental } \\ \text { Frequency }{ }^{[1]}\end{array} & \begin{array}{c}\text { Voltages NORMAL } \\ \text { Terminals }\end{array} & \text { Currents } & \begin{array}{c}\text { Voltages AUX } \\ \text { Terminals }\end{array} & \begin{array}{c}\text { Amplitude } \\ \text { Uncertainty }\end{array} \\ \hline 10 \text { to } 45 \mathrm{~Hz} & 33 \mathrm{mV} \text { to } 32.9999 \mathrm{~V} & 3.3 \mathrm{~mA} \text { to } 2.99999 \mathrm{~A} & 10 \mathrm{mV} \text { to } 5 \mathrm{~V} & \\ \hline 45 \text { to } 65 \mathrm{~Hz} & 33 \mathrm{mV} \text { to } 1020 \mathrm{~V} & 3.3 \mathrm{~mA} \mathrm{to} 20.5 \mathrm{~A} & 10 \mathrm{mV} \mathrm{to} 5 \mathrm{~V} \\ \hline 65 \text { to } 500 \mathrm{~Hz} & 33 \mathrm{mV} \text { to } 1020 \mathrm{~V} & 33 \mathrm{~mA} \text { to } 20.5 \mathrm{~A} & 100 \mathrm{mV} \mathrm{to} 5 \mathrm{~V} \\ \hline 500 \mathrm{~Hz} \text { to } 5 \mathrm{kHz} & 330 \mathrm{mV} \text { to } 1020 \mathrm{~V} & 33 \mathrm{~mA} \text { to } 20.5 \mathrm{~A} & 100 \mathrm{mV} \text { to } 5 \mathrm{~V} \\ \text { output as of the } \\ \text { equivalent single } \\ \text { output, but twice } \\ \text { the floor adder. }\end{array}\right\}$

## Phase Uncertainty

Phase uncertainty for harmonic outputs is 1 degree or the phase uncertainty shown in "Phase Specifications" for the particular output, whichever is greater. For example, the phase uncertainty of a 400 Hz fundamental output and 10 kHz harmonic output is $10^{\circ}$ (from "Phase Specifications"). Another example, the phase uncertainty of a 50 Hz fundamental output and a 400 Hz harmonic output is 1 degree.

## Example of determining Amplitude Uncertainty in a Dual Output Harmonic Mode

What are the amplitude uncertainties for the following dual outputs?

| NORMAL (Fundamental) Output: |  |
| :---: | :---: |
| $100 \mathrm{~V}, 100 \mathrm{~Hz}$. | . From "AC Voltage (Sine Wave) 90 Day Specifications" the single output specification for $100 \mathrm{~V}, 100 \mathrm{~Hz}$, is $0.039 \%+3 \mathrm{mV}$. For the dual output in this example, the specification is $0.039 \%+6 \mathrm{mV}$ as the $0.039 \%$ is the same, and the floor is twice the value ( 2 x 3 mV ). |
| AUX (50th Harmonic) Output: |  |
| $100 \mathrm{mV}, 5 \mathrm{kHz}$ | .From "AC Voltage (Sine Wave) 90 Day Specifications" the auxiliary output specification for $100 \mathrm{mV}, 5 \mathrm{kHz}$, is $0.15 \%+450 \mu \mathrm{~V}$. For the dual output in this example, the specification is $0.15 \%+900 \mu \mathrm{~V}$ as the $0.15 \%$ is the same, and the floor is twice the value ( $2 \times 450 \mu \mathrm{~V}$ ). |

## AC Voltage (Sine Wave) Extended Bandwidth

| Range | Frequency | 1-Year Absolute Uncertainty tcal $\pm 5^{\circ} \mathrm{C}$ | Max Voltage Resolution |
| :---: | :---: | :---: | :---: |
| Normal Channel (Single Output Mode) |  |  |  |
| 1.0 to 33 mV | 0.01 to 9.99 Hz | $\pm(5.0$ \% of output <br> +0.5 \% of range) | Two digits, e.g., 25 mV |
| 34 to 330 mV |  |  | Three digits |
| 0.4 to 33 V |  |  | Two digits |
| 0.3 to 3.3 V | 500.1 kHz to 1 MHz | -10 dB at 1 MHz , typical | Two digits |
|  | 1.001 to 2 MHz | -31 dB at 2 MHz , typical |  |
| Auxiliary Output (Dual Output Mode) |  |  |  |
| 10 to 330 mV | 0.01 to 9.99 Hz | $\pm(5.0 \%$ of output <br> +0.5 \% of range) | Three digits |
| 0.4 to 5 V |  |  | Two digits |

## AC Voltage (Non-Sine Wave)

| Triangle Wave \& Truncated Sine Range, p-p ${ }^{[1]}$ | Frequency | ```1-Year Absolute Uncertainty, tcal }\pm5\mp@subsup{}{}{\circ}\textrm{C}\mathrm{ , \pm(% of output + % of range) [2]``` | Max Voltage Resolution |
| :---: | :---: | :---: | :---: |
| Normal Channel (Single Output Mode) |  |  |  |
| 2.9 to 92.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}{ }^{[3]}$ | $5.0+0.5$ |  |
| 93 to 929.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}{ }^{[3]}$ | $5.0+0.5$ |  |
| 0.93 to 9.29999 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}{ }^{[3]}$ | $5.0+0.5$ |  |
| 9.3 to 93 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}{ }^{[3]}$ | $5.0+0.5$ |  |
| Auxiliary Output (Dual Output Mode) |  |  |  |
| 29 to 929.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |

|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
| :---: | :---: | :---: | :---: |
|  | 1 to 10 kHz | $5.0+0.5$ |  |
| 0.93 to 9.29999 V | 0.01 to 10 Hz | $5.0+0.5$ | Six digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ |  |
|  | 45 Hz to 1 kHz | $0.25+0.25$ | $5.0+0.5$ |

[1] To convert p-p to rms for triangle wave, multiply the p-p value by 0.2886751 . To convert $p-\mathrm{p}$ to rms for truncated sine wave, multiply the p-p value by 0.2165063 .
[2] Uncertainty is stated in p-p. Amplitude is verified using an rms-responding DMM.
[3] Uncertainty for Truncated Sine outputs is typical over this frequency band.

## AC Voltage (Non-Sine Wave) (cont.)

| Square Wave Range (p-p) ${ }^{[1]}$ | Frequency | 1-Year Absolute Uncertainty, tcal $\pm 5^{\circ} \mathrm{C}, \pm\left(\%\right.$ of output $+\%$ of range) ${ }^{[2]}$ | Max Voltage Resolution |
| :---: | :---: | :---: | :---: |
| Normal Channel (Single Output Mode) |  |  |  |

| 6.6 to 65.999 mV | 0 to 50 mV | 80 mV | $0.1+66 \mu \mathrm{~V}$ |
| 66 to 659.999 mV | 0 to 500 mV | 800 mV | $0.1+660 \mu \mathrm{~V}$ |
| 0.66 to 6.59999 V | 0 to 5 V | 8 V | $0.1+6600 \mu \mathrm{~V}$ |
| 6.6 to 66.0000 V | 0 to 50 V | 55 V | $0.1+66 \mathrm{mV}$ |
| [2] The maximum offset value is determined by the difference between the peak value of the selected voltage output and the allowable maximum peak signal. For example, a 10 V p-p square wave output has a peak value of 5 V , allowing a maximum offset up to $\pm 50 \mathrm{~V}$ to not exceed the 55 V maximum peak signal. The maximum offset values shown above are for the minimum outputs in each range. |  |  |  |
| 3] For frequencies 0.01 to 10 Hz , and 500 kHz to 2 MHz , the offset uncertainty is $5 \%$ of output, $\pm 1 \%$ of the offset range. |  |  |  |

## AC Voltage, Square Wave Characteristics
