

# Traceless Research

Major pharma companies are constantly researching young, promising biotech companies to determine which are the most promising acquisition or investment targets. Unfortunately, one firm found the market was able to consistently front-run their bids, driving up the cost of acquisition.

Believing their network traffic was being monitored, the firm contracted Dispel to provide custom virtual desktops that would entirely disassociate their researchers from the firm.

Using Dispel desktops, the company securely researched on their acquisition targets without exposing themselves to unwanted market volatility or bad actors looking to front-run their investments.

Of particular interest was the ability for researchers to grab a fresh desktop whenever they wanted, and to terminate it immediately after use. This allowed them to research independent investment targets without creating a cluster of research that could be mapped or could be interesting to a third party. Leveraging stockpile, the company was able to maintain a pool of desktops constantly available for their research teams.
