Similar to normal pivots, but it is clearer trading system. Created by trader Nick Stott in the late 80s it is still being used by many traders. We have lines: H5 – long breakout goal H4 – long breakout H3 – Short Pivot L3 – Long L4 – short breakout L5 – short breakout goal So same as with pivots there is an intermediate line – pivot. 3.1. Camarilla lines There are few strategies based on that when a price was at the start of the trading day (London session). Let's take a quick look at the example trading rules: Scenario 1 - price open between H3 and L3 lines When to go long: Wait for the price to move below the L3 line and move back over it – it's time to go long. Sometimes price jump from level, then we need another signal to get in (from price action, moving average or oscillator). Close position at H3 line (or H4/H5 if the trend is strong and you have a good successor system). Stop losses under the L4 line. When to go short: Wait until the price moves over the L3 line and move back under it - it's time to go short. Sometimes price jump from level, then we need another signal to get in (from price action, moving average or oscillator). Close position on L3 line (or L4/L5 if trend is strong and you have a good successor system). Stop losses under the H4 line. 3.2. Price between H3 and L3 Scenario 2 - price open between H3 and H4 3.3. Price open between H3 and H4. Example, when there was a long signal at close above H4 (finish at H5) When you need to go far: When the price moves over the H4 line, we go long. The target is the H5 line. Stop losses under H3. When to go short: When the price crosses under the H3 line, go short. The target is L3. Stop over H4. Scenario 3 – price open between L3 and L4 When to go far: When the price moves over the L3 line, we go a long way. The target is the H3 line. Stop losses under L4. When to go short: When the price crosses under the L4 line, go short. The target is L5. Stop over L3. Scenario 4 - The price is open under the L4 line or above the H4 line. Wait until it comes back and play according to scenario 1, 2 or 3. So... how to use it? This is a great tool, but I can write a separate manual on trading with Camarilla. You don't have to follow rules that I've described above. Check out the examples below and see how it works. SPX, 5m chart 3.4. Price open between H3 and H4. Example, when there was a long signal at close above H4 (exit at H5) SPX is below the pivot line (yellow). After range move, we can see that bears are up to something. We had selling signals from MACD and CCI, also moving averages were negative (so 21 under 33, and 33 under 55). L3 long did not hold and SPX started moving down. It looked like L4 is not a target and we will have a continuation of moving down. But no, worked differently. It was a fake outburst, and bulls came back. You can see that they managed to move up to 1945 points. I wanted to show this example for a reason - there are no 100% safe signals signals sometimes it looks like it's all going well and you have signal, but the price reversed. That's why I use subsequent stop loss. In this example after going short, let's say 1933 points, you would lower your stop to place it after each next lower high. These kind of traps happen. Oil, 15m short 3.5. Short trade from L3 to L5 Here all worked well. In fact, I opened this trade on the 5 min chart, but it's clearer on the 15 minute chart. We are below the pivot line (yellow), averages are negative. There are signals to go short from MACD and CCI (near the L3 line). I short-circuited on L3, closed on L4, and short-circuited again when L4 failed and there was a break during L4. It's up to you how you manage your trade. Just wanted to show you that sometimes we have a strong move from L3 to L5 without or with a very short break on the L4 line. If the trend is strong then L5 is a goal. EURUSD, 5m chart, part 1 At 5m EURUSD it looked like we might have a step up from L3 towards L4. There was even a signal from MACD, but as you can see this was a false signal (also average was negative at the time). After failed move to go long, price reversed and moved down to L4:3.6. Move up from the open, high, low, and end of the previous trading day. If the chart setting is 30 minutes to 4 hours, the pivots are calculated from the open, high, low, end of the previous trading week data, and the corresponding for daily charts are the previous monthly candlestick data. Camarilla Trading StrategiesThere are 4 different scenarios that may arise, when trading camarilla pivots:Scenario 1 - Open price is between H3 and L3Scenario 2 - Open price is between H3 and H4Scenario 3 - Open price is between L3 and L4Scenario 4 - Open price is without H4 and L4Scenario 10Opening price is between H3 and L3 Wait For the price of going under L3 and then when it moves back over L3, buy. Stoploss will be when the price moves below L4. Target1 - H1, Target2 - H2, Target3 - H3 For Short Sell Wait for the price to go over H3 and then when the price moves back below H3, sell. Stoploss will be when the price moves over H4. Target1 - L1, Target2 - L2, Target3- L3Scenario 2Open price is between H3 and H4 For Long When the price moves over H4, buy. Stoploss when the price goes under H3. Target 1 - H5, Target 2 - H6 For Short Sell When the price goes under H3, sell. Stoploss when prices move over H4. Target1 - L1, Target2 - L2, Target3- L3Scenario 3Open price is between L3 and L4 For Long When the price moves over L3, buy. Stoploss when the price moves below L4. Target1 - H1, Target2 - H2, Target3 - H3 For Short Sell When the price goes below L4, sell. Stoploss when the price moves over L3. Target 1 - L5, Target 2 - L6Scenario 4Open price is out of H4 and L4 Wait for prices to come within reach and trade discipline is key. Traders must wait for the levels to be reached before taking action. Once you are familiar with trading the basic strategy, you can further experiment by combining it with SMA, EMA or RSI to see if you can further improve your trading performance. TriviaCamarilla Pivot points were discovered by Nick Scott in 1989, a successful bond trader. Famous Nick Scott QuotesIf it ain't broke, don't fix it! Do the same dance as everyone else, just learn to sit down before the music stops! Most traders go bust because they can't adapt. They think they have found the 'secret', and may even make money for a while, but then suddenly it stops working. They don't adapt, they just keep on trying the same old (now non-functional) trick until they run out of cash. The reason I'm Nick Scott and you're not is that I adapt on a daily basis. Market Pulse is now available on the iPhone Note: This article is for educational purposes only. Learn kindly from it and build your knowledge. We do not advise or give tips. We always recommend to act using stop loss.
