

## The McGraw-Hill My Math Data Dashboard transforms data from insights into action.

Drawing on performance data from student assessments and activities the McGraw-Hill My Math Data Dashboard:

- Enables immediate, leveled re-teaching and targeted assignments.
- Groups students automatically and recommends differentiated activities.
- Reports results at the individual, class, and district levels.
- Tracks progress in content standards.

The McGraw-Hill My Math Data Dashboard organizes student data into four interactive, actionable reports: Recommendations Report, Activity Report, Progress Report, and Skills Report.

### Recommendations Report

The Recommendations Report provides insight as to how a class or individual is doing on content standards, allowing teachers to easily plan and assign differentiated support.

- Quickly assign suggested activities to provide differentiation.
- Performance-based grouping shows which students are approaching, on, or beyond grade level on specific standards.
- Color-coded summary of student and class performance at the standard level helps teachers identify differentiation opportunities.

## Activity Report

The Activity Report shows student and class performance on activities like practice opportunities, homework, chapter tests, among others.

- Access an analysis by activity or grade level standard and see the average score for a class or student.
- Know just what to teach. Drill down on any activity to view an item analysis report that shows how students scored on individual items and compare them with other students in the class.

## Skills Report

The Skills Report provides teachers with a big-picture look at the standards assessed in McGraw-Hill My Math.

- Monitor class or individual progress toward learning goals at a class or student level.
- Plan future instruction by identifying skills and standards that may require targeted support.

## Progress Report

The Progress Report provides a view of scores-over-time on activities that contain selected skills or standards.

- Visualize and gain a complete picture of the class or individual progress towards grade-level learning goals.
- Communicate progress and learning goals when conferencing with students, families, or administrators.

In addition to the four classroom reports, district administrators can get insight into classroom success with Data Dashboard Administrator Reports. With shared insights, teachers will spend less time crunching numbers and more time doing what they love, inspiring their students.
