Unit Assessment

In general, the purpose of assessing young children in the early childhood classroom is to collect information necessary to make important decisions about their developmental and educational needs. Because assessment is crucial to making informed teaching decisions, it is necessarily a vital component of DLM Early Childhood Express. The guidelines and forms found online allow the teacher to implement assessment necessary in the pre-kindergarten classroom.

Effective assessment is an ongoing process that always enhances opportunities for optimal growth, development, and learning. The process of determining individual developmental and educational needs tailors early childhood education practices and provides a template for setting individual and program goals.

Pre-kindergarten assessment should be authentic; that is, it should be a natural, environmental extension of the classroom. Assessments should be incorporated into classroom activities whenever possible, not completed as separate, pull-out activities in which the teacher evaluates the student one-on-one. Whenever possible, assessment should evaluate children’s real knowledge in the process of completing real activities. For example, observing children as they equally distribute snacks would be a better assessment of their ability to make groups than observing an exercise in which children group counters would be.

It is also important to note that assessments should be administered over time, as environmental influences can greatly impact single outcomes. If a pre-kindergarten child is tired or ill, for example, the child may not demonstrate knowledge of a skill that has actually been mastered. It is also important to consider the length of assessment for children of this age, as attention spans are still developing and can vary greatly based on environmental influences. Most assessments should be completed within half an hour.

If possible, use multiple types of assessment for the same content area when working with pre-kindergarten children. Some children may be able to demonstrate mastery kinesthetically if they are not able to use expressive language well; others may not process auditory instruction adequately, but will be able to complete an assessment after observing someone model the task. It is vital that the assessment process should never make the child anxious or scared.

Informal Assessment

INFORMAL assessments rely heavily on observational and work-sampling techniques that continually focus on child performance, processes, and product over selected periods of time and in a variety of contexts.

ANEDDOTAL assessments are written descriptions that provide a short, objective account of an event or an incident. Only the facts are reported—where, what, when, and how. Anecdotal records are especially helpful when trying to understand a child’s behavior or use of skills. These recordings can be used to share the progress of individual children and to develop and individualize curriculum.

The Anecdotal Observational Record Form can be use at any time to document an individual child’s progress toward a goal or signs indicating the need for developmental or medical evaluation. Observations can reflect the focused skills for the week, but are not limited to those skills. You may pair the form with video or audio recordings of the child to complete an anecdotal record.

CHECKLISTS are lists of skills or behaviors arranged into disciplines or developmental domains and are used to determine how a child exhibits the behaviors or skills listed. Teachers can quickly and easily observe groups of children and check the behaviors or skills each child is demonstrating at the moment.

Weekly Assessments measure progress toward specific guidelines that are addressed in the weekly curriculum. The Performance Assessment Checklist measures progress toward the guidelines of the entire curriculum. It is intended to be used three times per year.
When using either type of checklist, it is important to remember that the skills and behaviors on the list are only guidelines. Each child is unique and has her or her own developmental timetable. It is also important to remember that the checklist only documents the presence or absence of a specific skill or behavior during the time of observation. It does not necessarily mean the skill is consistently present or lacking, though consistency may be noted when the skill has been observed over time.

PORTFOLIO assessments are collections of thoughtfully selected work samples, or artifacts, and accompanying reflections indicative of the child's learning experiences, efforts, and progress toward and/or attainment of established curriculum goals. They are an authentic, performance-based method to allow teachers to analyze progress over time. As children choose work samples for their portfolios, they become involved in their own learning and assessment and begin to develop the concept of evaluating their own work.

Although early childhood activities tend to focus on processes as opposed to products, there are numerous opportunities to collect samples of children's work. Items to collect include drawings, tracings, cuttings, attempts to print their names, and paintings. You may also include informal assessments of a child's ability to recognize letters, shapes, numbers, and rhyming words.

Formal Assessment

FORMAL assessments involve the use of standardized tests. They are administered in a prescribed manner and may require completion within a specified amount of time. Standardized tests result in scores that are usually compared to the scores of a normative group. These tests generally fall into the following categories: achievement tests, readiness tests, developmental screening tests, intelligence tests, and diagnostic tests.

Assessing Children with Special Needs

Children with special needs may require a more thorough initial assessment, more frequent on-going assessments, and continuous adaptation of activities. Assessment is essentially the first task for the teacher or caregiver in developing the individualized instruction program required for children with disabilities.

Assessing Children Who Are English Language Learners

Whenever possible, assessments should be given in both the child's first language and in English.
