## Silver Mist's Hydro Seeding Process

Silver Mist Garden Center has perfected a process over the years to create the highest quality lawns. We start off by spreading a 4" layer of quality topsoil across the area, which we rake and pulverize. This thick layer of soil provides a nutrient rich soil medium for the grass seeds to germinate in. Our topsoil has a minimum number of weed seed contaminants in it, unlike regular topsoil you might find around the yard.

We then spray a dense layer of hydro seed on top. Hydro seed consists of a mixture of grass seed, fertilizer, and weed pre-emergent that has been specifically tailored by Dennis Timm to target common broad-leafed weeds, while not affecting the grass seeds. We have a high concentration of grass seeds in the mix, for maximum density germination and a resulting thick lawn. Hydro seeding, unlike straw, does not blow around the yard or bring in foreign weed seeds.

This year Silver Mist Landscape Services was named #1 Lawn Care Service in the Waupaca area thanks to our customer's satisfaction. We hope you are equally pleased with our lawn application and care. As part of our service, we can custom tailor our lawn application to fit your personal needs. Thank you for choosing Silver Mist to help you establish your own luscious lawn.
