The Future of CancerLinQ
Reinvesting in practical solutions for Oncologists, Practices, and Researchers

CancerLinQ is re-designing the future of our product offering around three product lines in 2022 to support the oncology community:

SmartLinQ™ App Store
A one stop shop for solutions and services for oncologists, care teams, and administrators to improve the quality of care, support decision making, reduce administrative burdens, and more. CancerLinQ’s native quality and insight solutions will be joined by applications co-developed in partnership with other innovators to provide our network with a growing number of impactful tools.

TriaLinQ
CancerLinQ’s clinical trial and prospective data collection solution is designed to support real-world disease registries, and, in the near future, cancer clinical trials conducted in diverse patient populations, including those historically under-represented in clinical investigations across our growing network of community oncology practices and cancer centers.

CancerLinQ Discovery®
CancerLinQ will continue to serve the oncology research community with access to real world oncology data from over 6 million longitudinal patient records (and growing!), and services to support study design, planning and, analytics.
