

Annotated Bibliography #2

Pissarides , Christopher A. *The Impact of AI on the Future of Work: Technology and Jobs in the Digital Era* , 15 Mar. 2018, personal.lse.ac.uk/ghatak/Chris1.pdf.

Abstract

The author goes over the impact Artificial intelligence has on jobs and the workforce. It focuses on the highlights of AI and how it has revolutionized the future. AI has the potential to contribute significantly to the work industry. It increases job productivity, efficiency and economic growth but causes job displacement and affects people's wages. Because AI causes a considerable risk for others, New positions are being opened in government departments such as education, healthcare and more that AI. Overall the article argues that certain policies and contributions (investments) could help AI transform the workforce into something new and better.

My Response

Seeing articles supporting the Idea of AI contributing in a good way to the workforce makes me consider how beneficial it would be. I think AI should be used in work and certain jobs but it should be limited to a certain degree. If AI and humans work together it has the potential to be great but if all the work is done by AI I think it's going cause job displacement like the article said but it would also cause economic growth. I feel like there are more pros than cons but there is still someone losing money in the end.

Rahayu, Sri, et al. "THE FUTURE OF WORK IN WORKFORCE: THE ROLE OF AI IN HUMAN LABOR REPLACEMENT AND BUSINESS TRANSFORMATION." *View of the Future of Work in Workforce: The Role of AI in Human Labor Replacement and Business Transformation*, 2024, conference.ut.ac.id/index.php/iscebe/article/view/3578/1529.

Abstract

The Text goes over how Artificial Intelligence completely changes the work industry. AI brings new opportunities but also new challenges and inequalities. Job displacement is a major issue when it comes to AI but can also be seen as a benefit by industries since it means less money being used to pay for labour and sometimes the AI is better than actual humans. The article also goes over a study that involves 8 scholarly sources that discuss market trends, the integration of AI in various industries and the creation of new jobs meant specifically for AI.

Annotated Bibliography #2

Overall the article goes over how the future of the work industry will have AI involved but it should be approached with balance. How there should be policies and certain implementation.

My Response

I think this article is one of my best sources. It mentions both the positives and negatives that AI brings to the workforce significantly. I agree with most of what Sri states and how AI should be controlled, monitored and put on a set of rules when it comes to implementing them in work. Since this article also mentions job displacement it makes me think not everyone is at risk. There are certain jobs I think can't be replaced with AI. Sometimes there are situations where jobs are replaced with AI but people do not like the quality.

Shelton, S. D. (2019, January). Robots Stole My Job.

Abstract

The article mainly goes over how AI replaces jobs related to writing. The author of the text also goes over how he was a librarian and how his job was taken by AI. Shelton talks about his experiences with computers and how they have changed throughout the years and he compares it to computers and Artificial Intelligence today. He states how Artificial Intelligence has already surpassed us in many ways and the complex things AI can do that we cannot do or can't do as fast such as writing, coding, reading/processing information and more. He thinks that AI can do something more important than a librarian's job, but something. Overall the article shortly goes over the stages of technology and artificial intelligence. It remains a threat to many people's jobs but creates new opportunities.

My Response

This is another source of mine that is good. Even after Shelton experiences job displacement from the AI he isn't mad and he understands why it happens. After reading Shelton's experiences with artificial intelligence over the years, I think it goes to show how beneficial AI would be in the workforce. AI is better than us at many things but not everything. Shelton

Annotated Bibliography #2

explains how AI should be used in the workforce and how it would be beneficial, but he doesn't mention anything about policies or rules I should follow, which makes me think that he doesn't believe in enforcing it which could be a problem. If Ai is not following any rules I think it would lead to it creating harmful things if it worked in writing-related jobs or any jobs. It could create fake news that goes against its competitors and could lead to negative outcomes. I think if there are no rules Ai follows, it can be used in a bad way.
