How did I feel about the lab report analysis

While making the lab report analysis I felt bored. To me it was just look at a lab report and compare it to a guideline in a textbook, rinse and repeat. Even though the assignment monotonous I stayed focused on the assignment because it was was an important one, it allowed us to see how other people make their lab reports and the differences that comes from that. An example of one of these differences I noticed from the two labs I chose is the formality, Lab report #1 was a lot less formal, probably because it was a student doing an assignment for a grade, so the structure wasn't needed. While the second lab report was a complete opposite, as if the lab report was going to be shown to a committee of people who knew about earth science and the information that comes with it. But in the end both lab reports followed the book's guideline well, showing me how it can be adapted to whatever I may needed it for weather that be an assignment like the first lab report or a lab report that's going to be shown to an important group of people. In the end I found this assignment boring, it was repetitive in having to go back and forth of the labs and the text book to make sure that I wasn't going to miss anything important, but it was a necessary evil because it ended up teaching me how to make a proper lab report, whatever the situation may be, and even how to find issues that may needed to be changed in my own lab report if someone else who might be looking for lab reports to look at and pick apart for an assignment.
