Infant Mortality Rates in Maryland Based Upon Neighborhood Influences

shamaera96@yahoo.com and chuston@scmail.spelman.edu

Often times the Infant Mortality Rate is used to indicate the health in a particular place. Sometimes this rate can be misleading as it can show poor health with little explanation of underlying factors. However, thorough examination it is evident that many of the infant mortality rates presented can be impacted by neighborhood factors. The purpose of this experiment is to show the impact on infant mortality rates due to neighborhood influences.
