

5 Mobile-Responsive Layout Strategies

Designing with Container Types in Ignition Perspective

Presenters

Don Pearson

*Chief Strategy Officer
Inductive Automation*

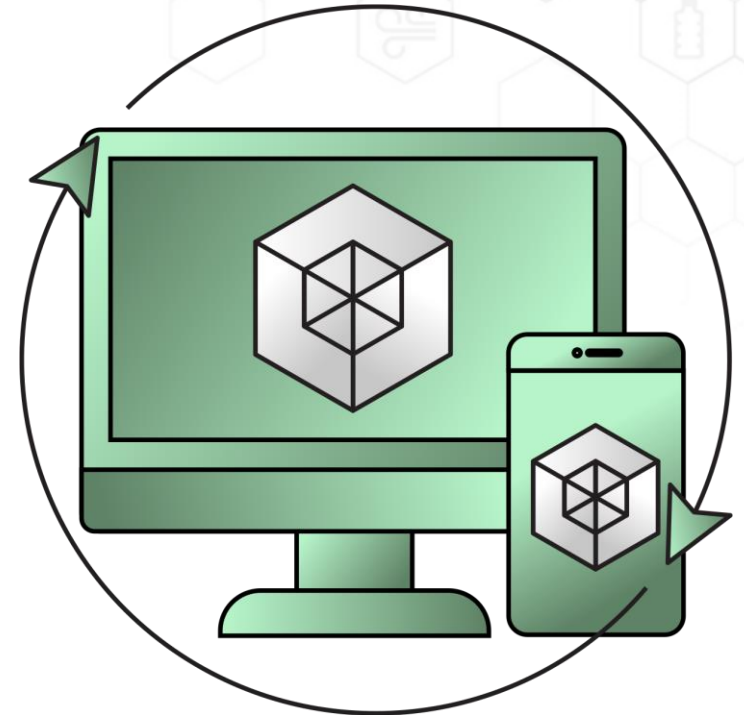

Travis Cox

*Co-Director of Sales Engineering
Inductive Automation*

Agenda

- **Introduction to Ignition**
- **Mobile-Responsive Design**
- **Ignition Perspective Container Types**
- **Design Use Cases (Combining Different Containers)**
- **Resources, Audience Q&A**

Ignition!

by inductive automation

**The Unlimited Platform for
SCADA and So Much More**

- **Connect, Design, Deploy Without Limits:**
 - One central hub for everything on the plant floor
 - Create any kind of industrial application
 - Web-deploy clients to desktops, industrial displays & mobile devices
- **Unlimited licensing**
- **Industrial-strength security and stability**
- **Trusted by thousands of companies worldwide**

Mobile-Responsive Design

- Mobile-responsive design is all about building screens that look great on small, medium, and large devices
- Mobile devices generally have less available width
- With smaller screens, focus on mandatory elements first
- Save “nice to have” elements for larger screens

Mobile-Responsive Design

Benefits:

- Lower development costs
- Single data model to maintain
- Support any device size
- Consistency in look and functionality

Drawbacks:

- Not one-strategy-fits-all
- Learning curve

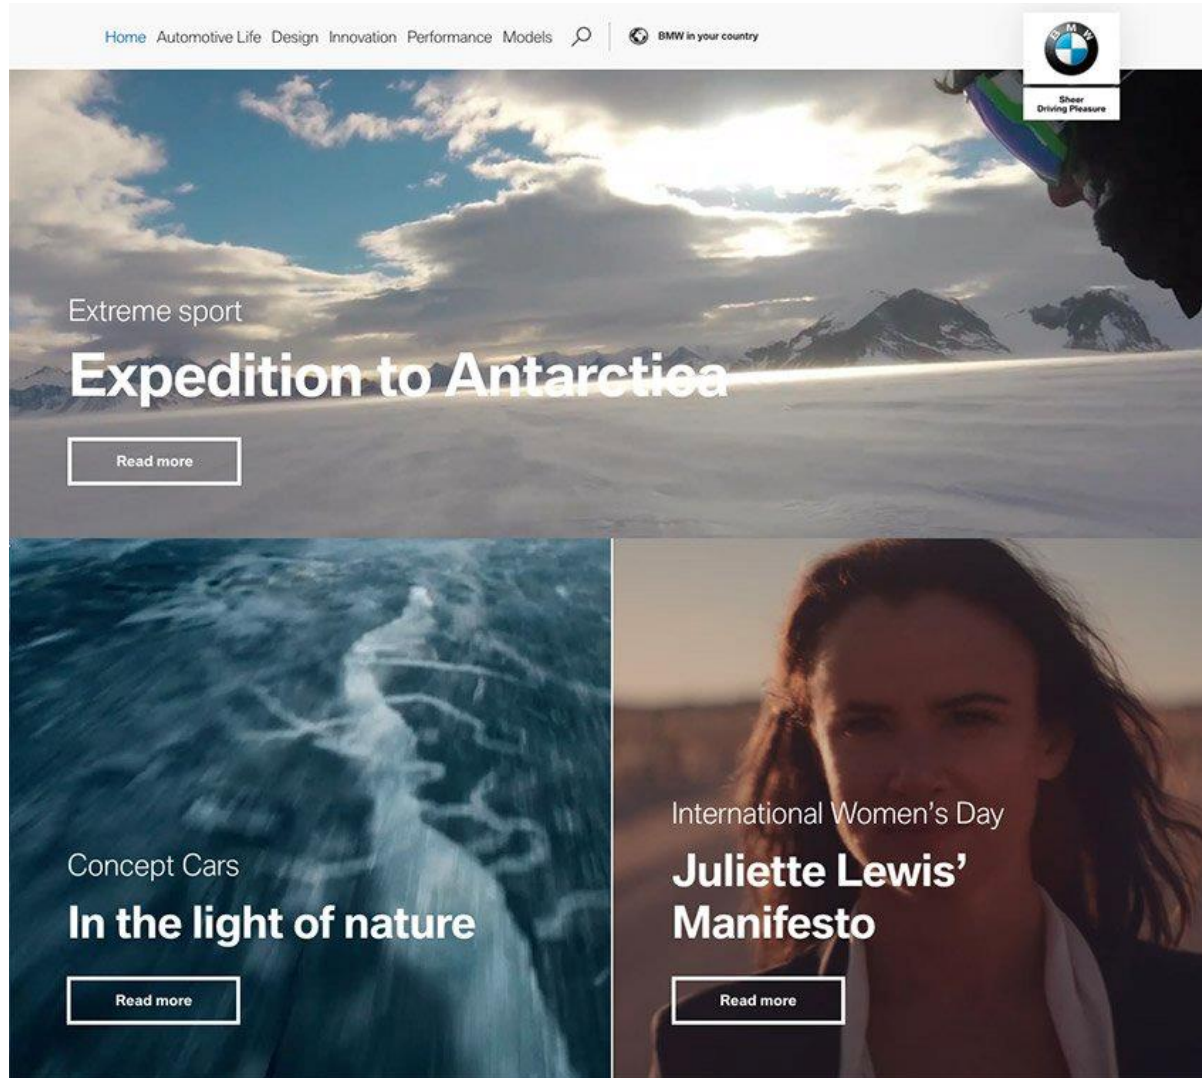

Mobile-Responsive Design

Layout strategy: Mostly Fluid

- On smaller screens, main content reflows and columns stack vertically
- On larger screens, it adjusts margins but usually remains the same size
- Usually only one breakpoint between small and large screens
- Works well for: Simple applications, reporting, documents

Mobile-Responsive Design

Mobile-Responsive Design

Layout strategy: Column Drop

- Full-width multi-column layout
- Similar to Mostly Fluid but without the fluid content
- Stacks columns vertically when the width is too narrow for the content
- Works well for: Simple applications, dashboards

Mobile-Responsive Design

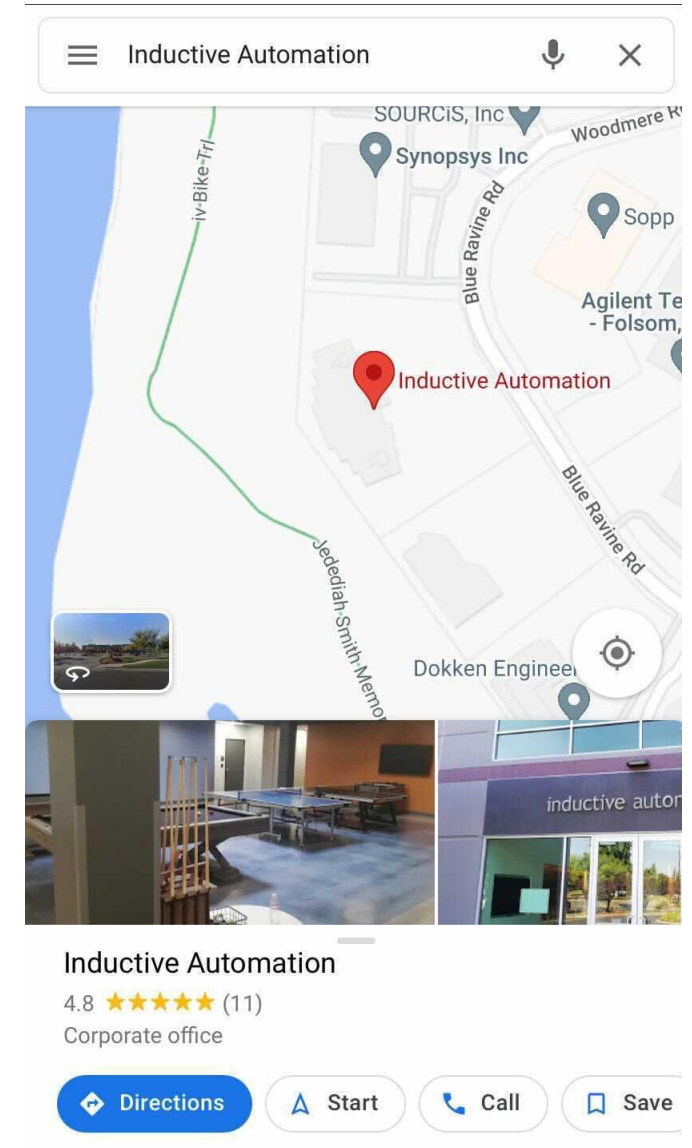

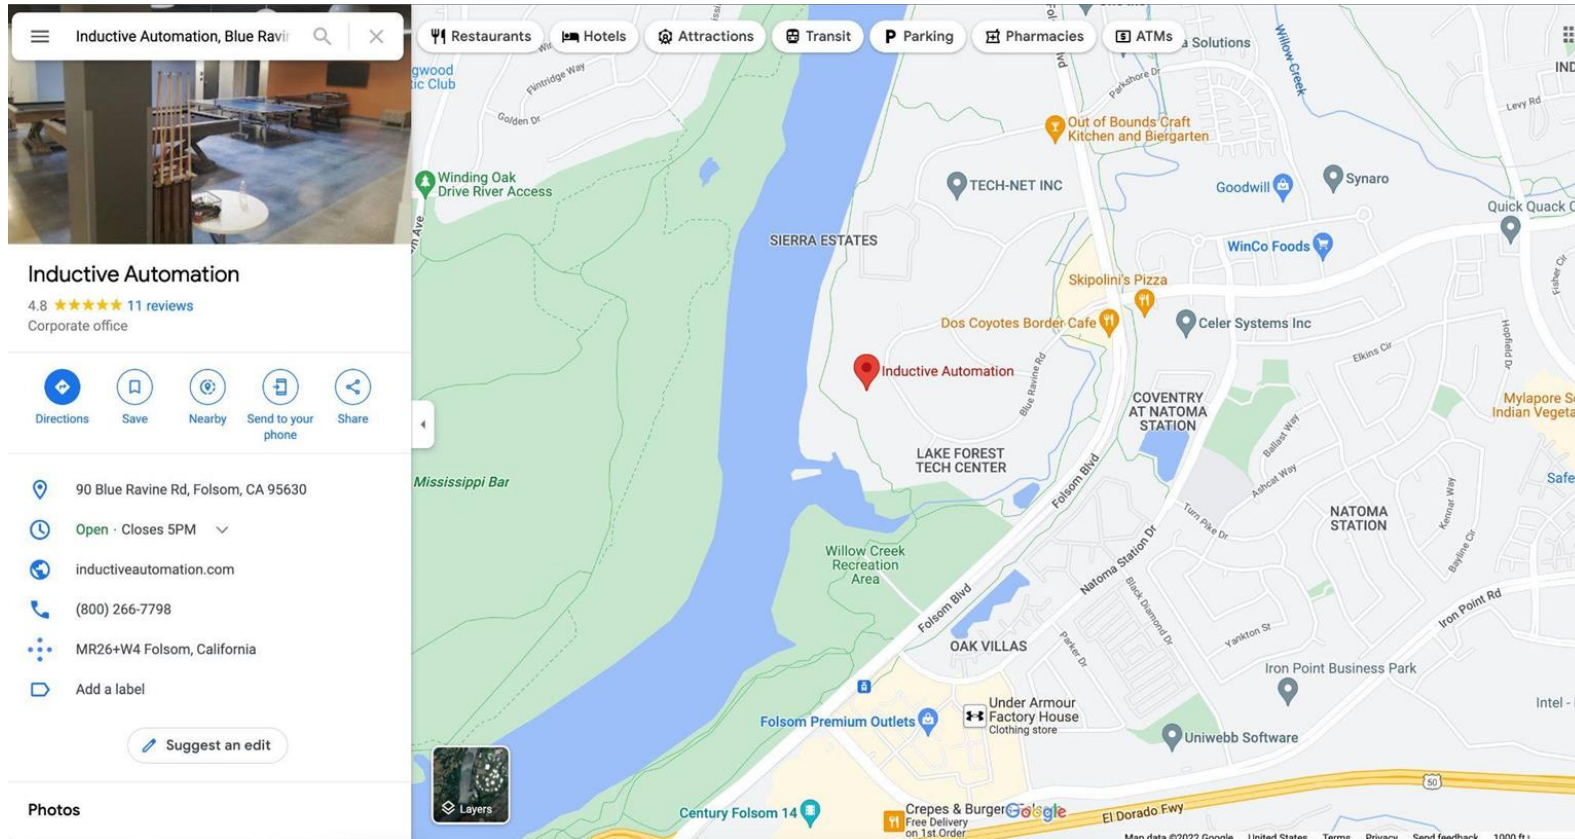

Mobile-Responsive Design

Layout strategy: Layout Shifter

- The most responsive pattern
- Different layouts across breakpoints
- Swaps components, not just layout
- Works well for: Complex applications, complex dashboards

Mobile-Responsive Design

Mobile-Responsive Design

Layout strategy: Tiny Tweaks

- Small changes to the content, like font & image size
- No changes to the layout
- Works well for: Nested views, Single-column layouts

Mobile-Responsive Design

FUTURE FRIENDLY

In today's incredibly exciting yet overwhelming world of connected digital devices, these are the truths we hold to be self-evident:

Disruption will only accelerate. The quantity and diversity of connected devices—many of which we haven't imagined yet—will explode, as will the quantity and diversity of the people around the world who use them. Our existing standards, workflows, and infrastructure won't hold up. Today's onslaught of devices is already pushing them to the breaking point. They can't withstand what's ahead. Proprietary solutions will dominate at first. Innovation necessarily precedes standardization. Technologists will scramble to these solutions before realizing (yet again) that a standardized platform is needed to maintain sanity. The standards process will be painfully slow. We will struggle with (and eventually agree upon) appropriate standards. During this period, the web will fall even further behind proprietary solutions.

- A NEW HOPE -

Mobile-Responsive Design

Layout strategy: Off Canvas

- Moves infrequently used content off-screen, shows it when the screen is large enough
- Content is only one click away
- Works well for: Complex applications, mobile applications

Containers in Ignition Perspective Module

- Containers are one of the ways that Perspective has mobile-responsive design built into its structure.
- Containers let you lay out and organize components within a View.
- Containers are like a box for content. The content is like fluid that shifts, moves around, and takes up available space in the container.
- The different container types support different layout strategies.

Containers in Ignition Perspective Module

Five different container types:

- Coordinate Container
- Tab Container
- Flex Container
- Column Container
- Breakpoint Container

Coordinate Container

Features:

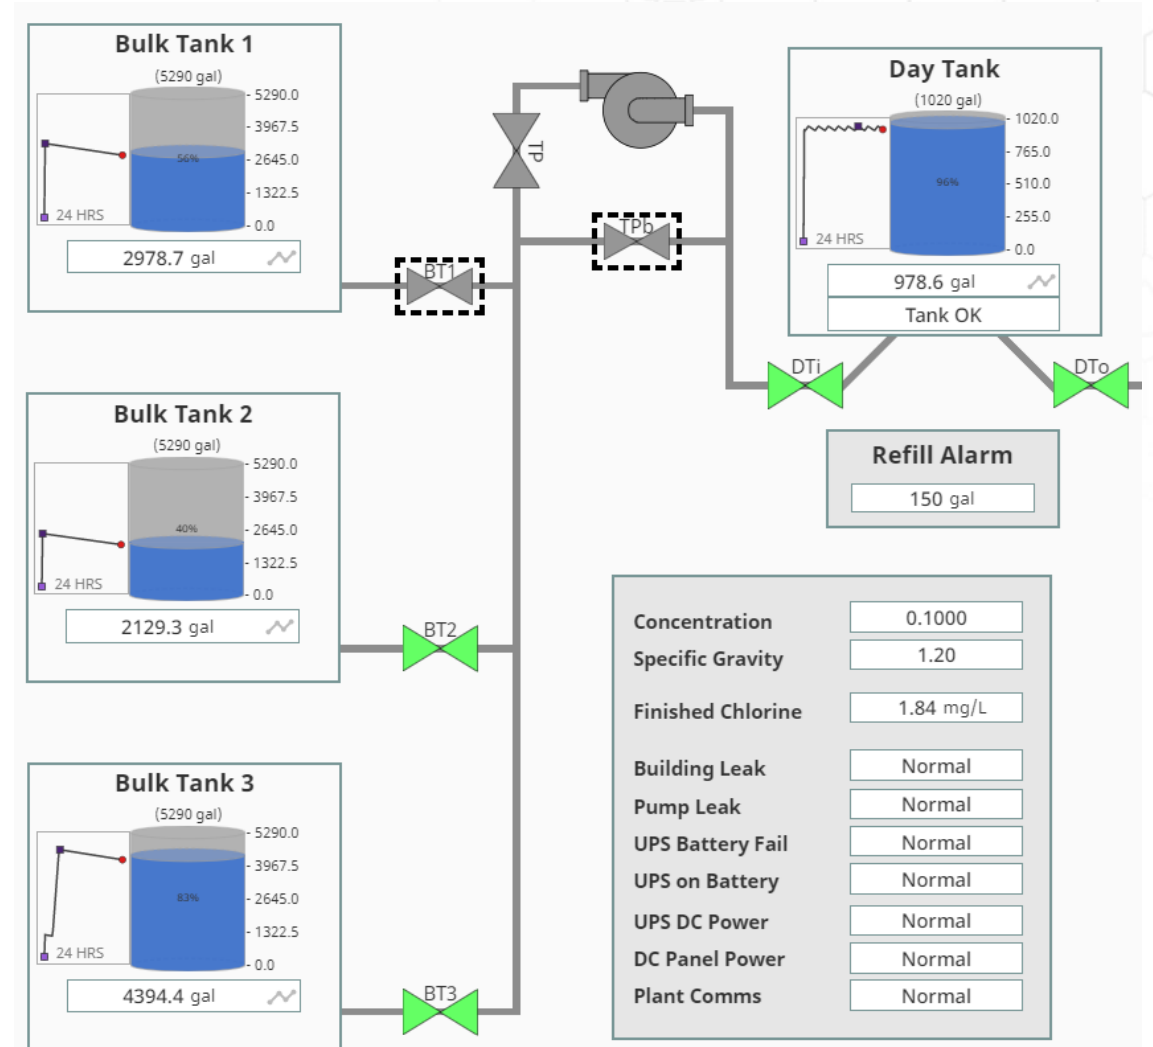

- The simplest container type
- Components use basic X, Y, Width, and Height position properties
- Components can be fixed size, or grow/shrink proportionally when the view is stretched
- Component size and location are relative to the parent container size and location
- Components can be rotated

Coordinate Container

When to use it:

- When components need to overlap each other
- When you don't want components to resize
- For Mostly Fluid layouts

Demo

Tab Container

Features:

- Classic tab strip navigation buttons
- 2 Variants:
 - Classic - traditional menu with boxed tabs
 - Modern - no border around each tab and selection is indicated with an underline

Tab Container

When to use it:

- Use when you only want to display one component in each tab
- Useful for complex devices or processes

Demo

Flex Container

Features:

- Alters a component's width and height to accommodate all types of devices and screen sizes
- Expands components to fill free space or shrinks them to prevent overflow
- Allows a great deal of control over how different components expand and shrink
 - Static widths
 - Even scaling

Flex Container

When to use it:

- Go-to container for mobile-responsive screens
- Use when the size of components is unknown or dynamic
- Use when operators will not have consistent screen sizes or devices
- For Column Drop layouts

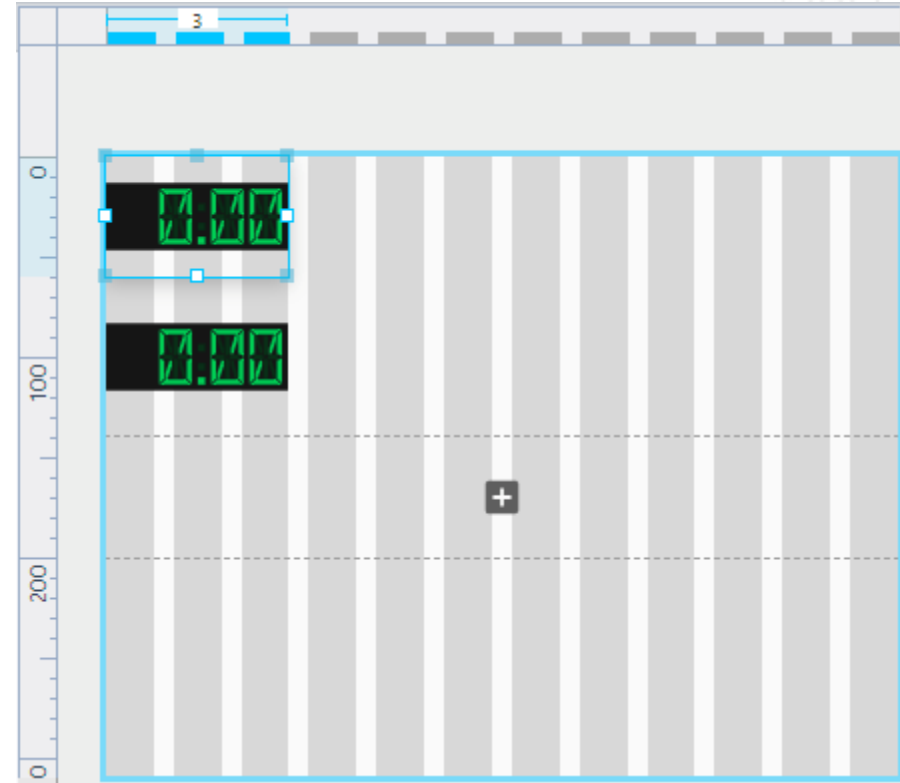

Demo

Column Container

Features:

- 3 breakpoints:
 - Small
 - Medium
 - Large
- 12 columns per breakpoint
- Unlimited rows

Column Container

When to use it:

- Use when you want the same components on all screen sizes but in different positions depending on size
- On a narrow screen, each component may take up all 12 columns but have its own row
- On a wide screen, components may share a row
- For Column Drop layouts

Demo

Breakpoint Container

Features:

- Create multiple versions of a single container using a pixel width as the cutoff, which completely changes the look or structure on mobile vs desktop sessions
- Swaps sub-containers based on a breakpoint in pixels
- Consists of a single breakpoint with two child views

Breakpoint Container

When to use it:

- When you want completely different components on mobile and desktop
- When you want the most comprehensive choice for developing a project that works for sessions of many shapes and sizes
- When you want small and large versions to have:
 - Differing components
 - Differing properties, bindings, or layout behavior
 - Differing navigation options
- For Layout Shifter layouts

Demo

Named Styles and Element States / Media Queries

- Tiny Tweaks layouts can be made using Named Styles and Element States or Media Queries.
- Styles are the main way to change the look of a component in Perspective.
- A Style Class is a group of style settings that can be quickly applied to multiple components.
- When you create a new Style Class, you can save it and name it.
- Element States are used on Style Classes to change the style configuration on a component based on the state of the component or media queries.

Named Styles and Element States / Media Queries

Docked Views

- Off Canvas layouts can be made using Docked Views.
- A View that is anchored or “docked” to the edge of a session
- Features multiple properties that alter the behavior of the dock in unique ways: Display, Resizable?, Modal?, Auto Breakpoint, and several more.

Docked Views

Power Chart

- The Power Chart works with the Tag Historian system to chart history data across the Perspective platform.
- Has a responsive design and a mobile-optimized display
- Has a mobile breakpoint to fit better on mobile devices

Power Chart

Design Use Cases (Combining Perspective Containers)

- Perspective is even more powerful when you combine container types:
 - Hierarchy
 - Nesting
 - Containers within containers
 - Different layouts at different sizes and at different levels
- Combine Perspective containers in an endless number of ways!

Design Use Cases (Combining Perspective Containers)

Let's look at examples from:

- The Perspective Demo Project
- Mobile-Responsive Layouts in Quick Start

Design Use Cases
