The Mobile Mindset

Focus on *information* and *tasks*

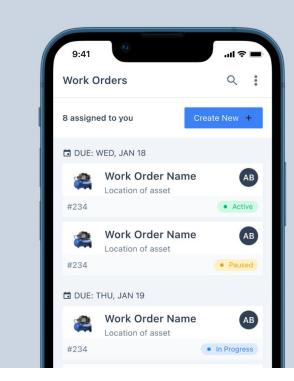

- What **information** might someone be looking for and what **tasks**, or actions might they need to take?
- Designing in a mobile context doesn't necessarily mean delivering less.
- It may mean prioritizing information in a different way.
- Feature parity between desktop and mobile applications is recommended.

Your mobile experience should be laser-focused on what users need and your software was created to do

Mobile Interface Design

- A balance between visual **form** and technical **functionality**.
- Bridge between the system and user.
- Regardless of functionality, if the interface is difficult to use it won't be.

Four Principles of Mobile UI Design

- 1. Place users in control of the interface
- 2. Make it comfortable for a user to interact with the app
- 3. Reduce cognitive load
- 4. Make user interfaces consistent

Four Principles of Mobile UI Design

Place users in control of the interface

Create an easy-to-navigate interface

- Navigation should always be clear and self-evident.
- Provide user's context of where they are, where they've been and where they can go next.
- Use **visual cues**, including:
 - Page and section titles
 - "You are here" nav indicators
 - Search and filtering

Place users in control of the interface

Create an easy-to-navigate interface

Can you answer these question from any screen in your app?

- Where am I?
- How did I get here?
- What can I do here?
- Where can I go from here?

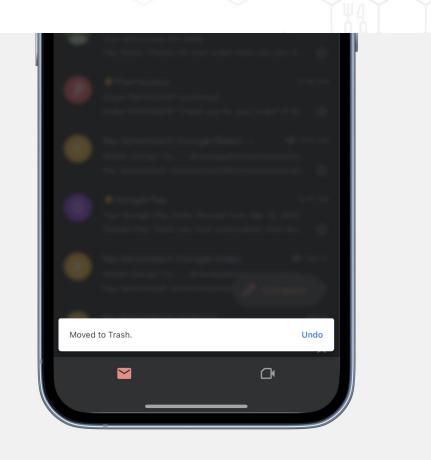

Try the trunk test, a strategy for analyzing the navigability of an app.

Place users in control of the interface Make actions reversible

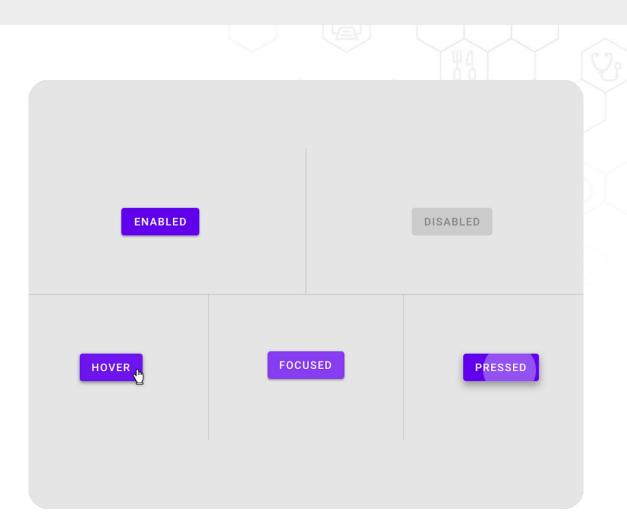

- Be forgiving!
- Users should always be able to quickly backtrack.
- Encourage exploration without the fear of failure or errors.
- Provide a clearly marked emergency exit for when users find themselves in an unwanted state.

Place users in control of the interface Provide informative feedback

- Be acknowledging!
- For every action, the system should show a meaningful, clear reaction.
- For frequent actions, the response can be modest.

Place users in control of the interface Provide informative feedback

• For infrequent or significant actions, response may be more substantial.

Four Principles of Mobile UI Design

- 1. Place users in control of the interface
- 2. Make it comfortable for a user to interact with the app
- 3. Reduce cognitive load
- 4. Make user interfaces consistent

Make it comfortable to interact with the app Don't ask users for data they've already entered

- Don't force users to have to repeat data they've previously entered.
- Use **smart defaults** when possible.
- Great mobile apps perform maximum work, while requiring minimum input from users.

Make it comfortable to interact with the app Design accessible interfaces

- Improving your product's accessibility enhances the usability for everyone.
- Avoid using color as the only way to convey information or states.
- Double-encode with color + text or icons to reinforce messages

Make it comfortable to interact with the app Engineer for Errors

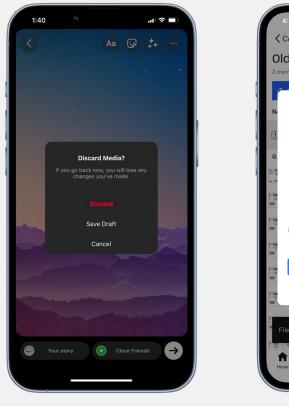

- Errors are unavoidable, design for these experiences.
- Effective errors include both clear messaging and solution paths.
- Explore error prevention strategies.

Make it comfortable to interact with the app Protect the User's Work

- Ensure that users never lose their work or data.
- Account for system errors as well as user errors.

Four Principles of Mobile UI Design

- 1. Place users in control of the interface
- 2. Make it comfortable for a user to interact with the app
- 3. Reduce cognitive load
- 4. Make user interfaces consistent

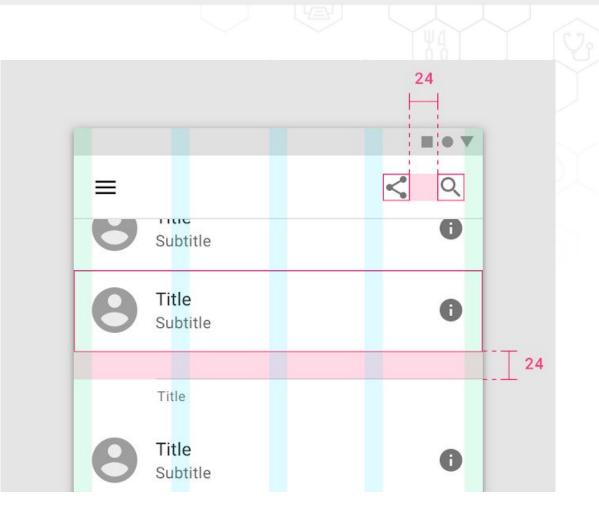

Reduce Cognitive Load Promote Visual Clarity

Good visual organization improves usability and legibility. Allow users to quickly find information.

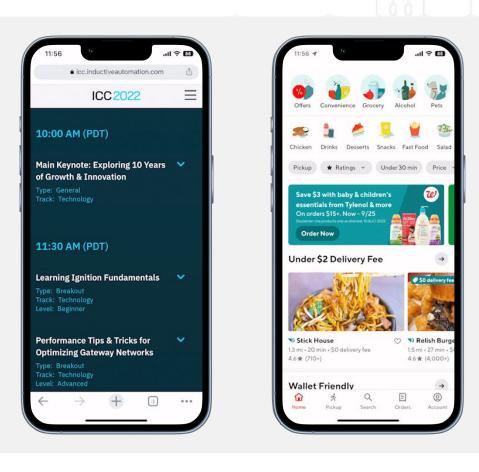

When designing layouts:

- Use a grid/spacing system
- Group similar items together, using headings and subheadings
- Avoid presenting too much at once

Reduce Cognitive Load Progressively disclose information

- Initially, show users only the most important actions and information.
- Offer the rest upon request.

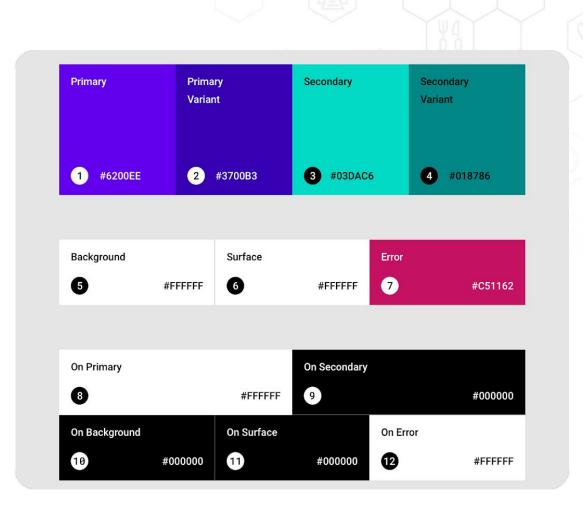

Four Principles of Mobile UI Design

- 1. Place users in control of the interface
- 2. Make it comfortable for a user to interact with the app
- 3. Reduce cognitive load
- 4. Make user interfaces consistent

Make User Interfaces Consistent Visual Consistency (style)

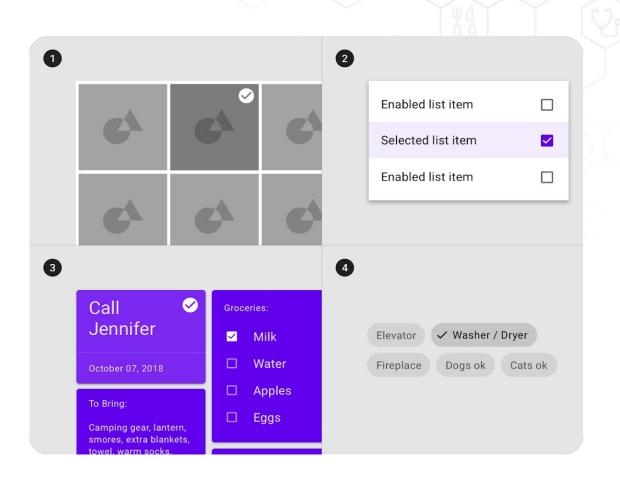

- The same colors, fonts, and icons should be used throughout the app.
- Colors or style that conveys meaning should be strictly applied.

Make User Interfaces Consistent Functional Consistency (behavior)

- Interface controls should work the same way across the application.
- Don't surprise your user by changing the way that things function.
- Changing functionality reduces confidence and inhibits exploration.

Design is a Process

- Planning is equally important to interface design execution.
- Talk to your users! A lot.
- Iterate.
- Follow mobile OS best practices.
