Monetary Trends

November 2010

Is More QE in Sight?

The recent U.S. financial crisis—characterized by financial institution failures, heightened fear of counterparty risk, and worldwide coordinated central bank intervention to reduce financial market stress—is widely regard to have ended by March 2009. Since its end, the Federal Open Market Committee (FOMC) has focused on policy to accelerate the recovery of economic activity. Prominent among the FOMC’s policies has been the “Large Scale Asset Purchase” program (LSAP), a quantitative easing (QE) policy designed to reduce long-term market interest rates. The program called for the Federal Reserve to purchase $300 billion of long-term Treasury securities, approximately $175 billion of federal agency debt, and up to $1.25 trillion of agency-guaranteed mortgage-backed securities, concluding in March 2010. The recent slowing in the pace of economic recovery has raised discussion of the need for a second LSAP-style program.

Most analysts have concluded that the LSAP successfully reduced long-term market interest rates. Two recent studies, for example, suggest that the LSAP reduced yields on 10-year Treasury securities by as much as 100 basis points below levels that otherwise would have prevailed. In addition, the program appears to have reduced interest rates abroad.

How, exactly, do LSAP-style programs succeed? Two elements are necessary: Long-term market rates must decrease and aggregate spending must respond. Consider the first: Asset purchases are asserted to affect market rates by a “portfolio balance” effect. A typical analysis begins with the public holding two assets that differ only in time to maturity. Holders of the long-maturity asset risk a decrease in the asset’s price if/when market interest rates increase. When the Fed purchases such assets from the public, the extent of this asset’s price fall depends on the risk premium. Formal models of this effect, however, usually require an ad hoc market friction. In a recent analysis, Hamilton and Wu consider an experiment in which a central bank sells its holdings of short-term Treasury securities and purchases an equal amount of long-term Treasuries. In their model, short-term yields rise and long-term yields fall. This result, however, requires at least two distinct groups of investors, each of which strongly prefers either short- or long-term assets even after allowing for differences in yields. Further, in the real world, the Fed’s actions differ somewhat from those in the model: Since March 2009, the Fed has paid for purchased assets by creating new deposits at the Federal Reserve Banks, not by the sale of existing short-term assets. Only banks and a few other financial institutions are permitted to hold deposits at the Fed, while Treasury securities are widely held.

Second, aggregate demand must respond to lower long-term interest rates—a sustained economic rebound requires recovery in household spending and business investment. This aspect is more uncertain. Recent surveys suggest that business investment spending is tepid due to uncertainty regarding future demand, not high long-term interest rates—indeed, large businesses are borrowing readily in credit markets at highly favorable terms. Lending to households and small businesses remains constrained by increased lender caution about risk tied to uncertainty regarding future demand, sales, and income. Neither sector is hampered by excessively high long-term interest rates.

—Richard G. Anderson

1 Here, “agency” refers to three organizations: FNMA (Federal National Mortgage Association, also referred to as Fannie Mae), FHLMC (Federal Home Loan Mortgage Corporation, also known as Freddie Mac), and GNMA (Government National Mortgage Association, also referred to as Ginnie Mae). GNMA is part of the U.S. Department of Housing and Urban Development. FNMA and FHLMC, government-chartered but privately owned corporations, were placed into federal receivership on September 6, 2008.

2 Gagnon, Joseph; Raskin, Matthew; Remache, Julie and Sack, Brian. “Large-Scale Asset Purchases by the Federal Reserve: Did They Work?” Staff Report No. 441, Federal Reserve Bank of New York, March 2010; www.newyorkfed.org/research/staff_reports/sr441.pdf.

Conventions used in this publication:

1. Unless otherwise indicated, data are monthly.
2. Shaded areas indicate recessions, as determined by the National Bureau of Economic Research.
3. Percent change at an annual rate is the simple, not compounded, monthly percent change multiplied by 12. For example, using consecutive months, the percent change at an annual rate in \(x\) between month \(t-1\) and the current month \(t\) is: \(\left(\frac{x_t}{x_{t-1}}\right) - 1\times 1200\). Note that this differs from National Economic Trends. In that publication, monthly percent changes are compounded and expressed as annual growth rates.
4. The percent change from year ago refers to the percent change from the same period in the previous year. For example, the percent change from year ago in \(x\) between month \(t-12\) and the current month \(t\) is: \(\left(\frac{x_t}{x_{t-12}}\right) - 1\times 100\).

*See table of contents for changes to the series.
Definitions

M1: The sum of currency held outside the vaults of depository institutions, Federal Reserve Banks, and the U.S. Treasury, traveler’s checks; and demand and other checkable deposits issued by financial institutions (except demand deposits due to the Treasury and depository institutions), minus cash items in process of collection and Federal Reserve float.

M2: M1 plus savings deposits (including money market deposit accounts) and small-denomination (under $100,000) time deposits issued by financial institutions; and shares in retail money market mutual funds (funds with initial investments under $50,000), net of retirement accounts.

M3: M2 plus large-denomination ($100,000 or more) time deposits; repurchase agreements issued by depository institutions; Eurodollar deposits, specifically, dollar-denominated deposits due to nonbank U.S. addresses held at foreign offices of U.S. banks worldwide and all banking offices in Canada and the United Kingdom; and institutional money market mutual funds (funds with initial investments of $50,000 or more).

Bank Credit: All loans, leases, and securities held by commercial banks.

Domestic Nonfinancial Debt: Total credit market liabilities of the U.S. Treasury, federally sponsored agencies, state and local governments, households, and nonfinancial firms. End-of-period basis.

Adjusted Monetary Base: The sum of currency in circulation outside Federal Reserve Banks and the U.S. Treasury, deposits of depository financial institutions at Federal Reserve Banks, and an adjustment for the effects of changes in statutory reserve requirements on the quantity of base money held by depositories. This series is a spliced chain index; see Anderson and Rasche (1996a, 2001, 2003).

Adjusted Reserves: The sum of vault cash and Federal Reserve Bank deposits held by depository institutions and an adjustment for the effects of changes in statutory reserve requirements on the quantity of base money held by depositories. This spliced chain index is numerically larger than the Board of Governors’ measure, which excludes vault cash not used to satisfy statutory reserve requirements and Federal Reserve Bank deposits used to satisfy required clearing balance contracts; see Anderson and Rasche (1996a, 2001, 2003).

Monetary Services Index: An index that measures the flow of monetary services received by households and firms from their holdings of liquid assets; see Anderson, Jones, and Nesmith (1997). Indexes are shown for the assets included in M2, with additional data at research.stlouisfed.org/msi/index.html.

Note: M1, M2, M3, Bank Credit, and Domestic Nonfinancial Debt are constructed and published by the Board of Governors of the Federal Reserve System. For details, see Statistical Supplement to the Federal Reserve Bulletin, tables 1.21 and 1.26. MZM, Adjusted Monetary Base, Adjusted Reserves, and Monetary Services Index are constructed and published by the Research Division of the Federal Reserve Bank of St. Louis.

Notes

Page 3: Readers are cautioned that, since early 1994, the level and growth of M1 have been depressed by retail sweep programs that reclassify transactions deposits (demand deposits and other checkable deposits) as savings deposits overnight, thereby reducing banks’ required reserves; see Anderson and Rasche (2001) and research.stlouisfed.org/aggreg/swdata.html. Primary Credit Rate. Discount Rate, and Intended Federal Funds Rate shown in the chart Reserve Market Rates are plotted as of the date of the change, while the Effective Federal Funds Rate is plotted as of the end of the month. Interest rates in the table are monthly averages from the Board of Governors H.15 Statistical Release. The Treasury Yield Curve and Real Treasury Yield Curve show constant maturity yields calculated by the U.S. Treasury for securities 5, 7, 10, and 20 years to maturity. Inflation-Indexed Treasury Yield Spreads are a measure of inflation compensation at those horizons, and it is simply the nominal constant maturity yield less the real constant maturity yield. Daily data and descriptions are available at research.stlouisfed.org/fred2. See also Statistical Supplement to the Federal Reserve Bulletin, table 1.35. The 30-year constant maturity series was discontinued by the Treasury as of February 18, 2002.

Page 5: Checkable Deposits is the sum of demand and other checkable deposits. Savings Deposits is the sum of money market deposit accounts and passbook and statement savings. Time Deposits have a minimum initial maturity of 7 days. Retail Money Market Mutual Funds are included in M2. Institutional money market funds are not included in M2.

Page 6: Excess Reserves plus RCB (Required Clearing Balance) Contracts equals the amount of deposits at Federal Reserve Banks held by depository institutions but not applied to satisfy statutory reserve requirements. This measure excludes the vault cash held by depository institutions that is not applied to satisfy statutory reserve requirements. Consumer Credit includes most short- and intermediate-term credit extended to individuals. See Statistical Supplement to the Federal Reserve Bulletin, table 1.55.

Page 7: Data are reported in the Senior Loan Officer Opinion Survey on Bank Lending Practices.

Page 8: Inflation Expectations measures include the quarterly Federal Reserve Bank of Philadelphia Survey of Professional Forecasters, the monthly University of Michigan Survey Research Center’s Surveys of Consumers, and the annual Federal Open Market Committee (FOMC) range as reported to the Congress in the February testimony that accompanies the Monetary Policy Report to the Congress. Beginning February 2000, the FOMC began using the personal consumption expenditures (PCE) price index to report its inflation range; the FOMC then switched to the PCE chain-type price index excluding food and energy prices (“core”) beginning July 2004. Accordingly, neither are shown on this graph. CPI Inflation is the percentage change from a year ago in the consumer price index for all urban consumers. Real Interest Rates are ex post measures, equal to nominal rates minus year-over-year CPI inflation.

From 1991 to the present the source of the long-term PCE inflation expectations data is the Federal Reserve Bank of Philadelphia’s Survey of Professional Forecasters. Prior to 1991, the data were obtained from the Board of Governors of the Federal Reserve System. Realized (actual) inflation is the annualized rate of change for the 40-quarter period that corresponds to the forecast horizon (the expectations measure). For example, in 1965-Q1, annualized PCE inflation over the next 40 quarters was expected to average 1.7 percent. In actuality, the average annualized rate of change measured 4.8 percent from 1965-Q1 to 1975-Q1. Thus, the vertical distance between the two lines in the chart at any point is the forecast error.

Page 9: FOMC Intended Federal Funds Rate is the level (or midpoint of the range, if applicable) of the federal funds rate that the staff of the FOMC expected to be consistent with the desired degree of pressure on bank reserve positions. In recent years, the FOMC has set an explicit target for the federal funds rate.

Page 10: Federal Funds Rate and Inflation Targets shows the observed federal funds rate, quarterly, and the level of the funds rate implied by applying Taylor’s (1993) equation

$$\Delta_0 = 2.5 + \pi_{-1} + (\pi_{-1} - \pi^*)/2 + 100 \times (\gamma_{-1} - \gamma^*)/2$$

to five alternative target inflation rates, $\pi^* = 0, 1, 2, 3, 4$ percent, where $\Delta_0$ is the implied federal funds rate, $\pi_{-1}$ is the previous period’s inflation rate (PCE) measured on a year-over-year basis, $\gamma_{-1} = \log$ of the previous period’s level of real gross domestic product (GDP), and $\gamma^*$ is the log of an estimate of the previous period’s level of potential output. Potential Real GDP is estimated by the Congressional Budget Office (CBO).

Monetary Base Growth and Inflation Targets shows the quarterly growth of the adjusted monetary base implied by applying McCallum’s (2000, p. 52) equation

$$\Delta_0 = \Delta_0^* - \Delta_0 + \Delta_t (\Delta_0^* - \Delta_0)$$

$\Delta_0^*$ is the 10-year implied growth rate of the adjusted monetary base, $\Delta_t$ is the 10-year
moving average growth in real GDP, \( \Delta v_t^p \) is the average base velocity growth (calculated recursively), \( \Delta v_{t-1} \) is the lag growth rate of nominal GDP, and \( \lambda = 0.5 \).

**Page 11: Implied One-Year Forward Rates** are calculated by this Bank from Treasury constant maturity yields. Yields to maturity, \( R(m) \), for securities with \( m = 1, \ldots, 10 \) years to maturity are obtained by linear interpolation between reported yields. These yields are smoothed by fitting the regression suggested by Nelson and Siegel (1987),

\[
R(m) = a_0 + (a_1 + a_2)(1 - e^{-m/50})/(m/50) - a_3 \times e^{-m/50},
\]

and forward rates are calculated from these smoothed yields using equation (a) in table 13.1 of Shiller (1990),

\[
f(m) = \frac{[D(m)R(m) - D(m-1)]}{[D(m) - D(m-1)]},
\]

where duration is approximated as \( D(m) = (1 - e^{-R(m) \times m})/R(m) \). These rates are linear approximations to the true instantaneous forward rates; see Shiller (1990). For a discussion of the use of forward rates as indicators of inflation expectations, see Sharpe (1997). Rates on 3-Month Eurodollar Futures and Rates on Selected Federal Funds Futures Contracts trace through time the yield on three specific contracts. Rates on Federal Funds Futures on Selected Dates displays a single day’s snapshot of yields for contracts expiring in the months shown on the horizontal axis. Inflation-Indexed Treasury Securities and Yield Spreads are those plotted on page 3. Inflation-Indexed 10-Year Government Notes shows the yield of an inflation-indexed note that is scheduled to mature in approximately (but not greater than) 10 years. The current French note has a maturity date of 7/25/2015, the current U.K. note has a maturity date of 4/16/2020, and the current U.S. note has a maturity date of 5/15/2020. Inflation-Indexed Treasury Yield Spreads and Inflation-Indexed 10-Year Government Yield Spreads equal the difference between the yields on the most recently issued inflation-indexed securities and the unadjusted yield securities of similar maturity.

**Page 12: Velocity** (for MZM and M2) equals the ratio of GDP, measured in current dollars, to the level of the monetary aggregate. MZM and M2 Own Rates are weighted averages of the rates received by households and firms on the assets included in the aggregates. Prior to 1982, the 3-month T-bill rates are secondary market yields. From 1982 forward, rates are 3-month constant maturity yields.

**Page 13: Real Gross Domestic Product** is GDP as measured in chained 2000 dollars. The Gross Domestic Product Price Index is the implicit price deflator for GDP, which is defined by the Bureau of Economic Analysis, U.S. Department of Commerce, as the ratio of GDP measured in current dollars to GDP measured in chained 2005 dollars.

**Page 14: Investment Securities** are all securities held by commercial banks in both investment and trading accounts.

**Page 15: Inflation Rate Differentials** are the differences between the foreign consumer price inflation rates and year-over-year changes in the U.S. all-items Consumer Price Index.

**Page 17: Treasury Yields** are Treasury constant maturities as reported in the Board of Governors of the Federal Reserve System’s H.15 release.
