A programmer, database designer, and system analyst who creates information systems for the hospitality industry found it difficult to keep up with continuously changing client needs. At all times, he must build systems that are reliable, attractive, and easy to use.
**CHALLENGE**

The programmer needed to build a user-friendly and functional application that fit the new era of software user interfaces and functionalities. The standard text box controls available for his development platforms worked, but were difficult to customize, particularly when it came to implementing data validation.

**SOLUTION**

The programmer found Syncfusion in a magazine article and began using Essential Studio for ASP.NET and Essential Studio for Windows Forms. He soon found that every control he needed was included, and that he could get exactly the functionality he needed from the controls simply by adjusting their properties.

The programmer used the AdvancedTextBox, AdvancedListView, DataGrid, DoubleTextBox, and CurrencyTextBox controls in the application. In addition to the expansive feature set of each control, the built-in themes proved to be a great hidden value that helped make the application more visually appealing and user friendly. Building such features from scratch would have cost him valuable development time. The Syncfusion support team also helped the programmer save time by answering his questions quickly and fully with detailed examples. By using Syncfusion components, the programmer was able to build a professional, modern enterprise application that met his clients’ needs.

**BENEFITS**

- Found user-friendly standard for development.
- Added value to desktop applications.
- Saved development hours.
