Delivering a Professional Booking App with Syncfusion Angular Components

"The subscription contains a lot of useful and flexible controls. Using them, I can provide my customer with a consistent and comprehensive user interface, which makes it faster for them to learn to use it."

EGYÜD CSABA

BENEFITS

- Saved a lot of time.
- Controls look really professional.
- Support is quite fast and very helpful.

CHALLENGE & SOLUTIONS

My name is Együd Csaba and my firm, IN-FO Studio, is a one-man show. I cooperate with larger firms on larger projects. Most of my tasks are integrating new features into ERP systems (like MS Dynamics or Navision) for larger and mid-sized companies.

I was making an online office booking web app with an internal administration app for a customer. They have three offices and want to combine them together in one app and add some extra services like catering. For me, the main challenges were providing a clean interface where the visitor can see which office is available for which time slot, and making it possible to easily book in a calendar. It is not an easy task without a comprehensive scheduler control. This was my key motivation to find someone to create this for me. I use ASP.NET Core (for Web API) as the server platform and the client app is built on pure Angular, so I needed a control that supports this environment.

I have found that the Syncfusion Angular Scheduler is a fantastic control. It has lots of settings and views I can combine. And since it is very flexible, and with lots of help from the Syncfusion support team, I managed to configure it to meet my and my customer’s needs. It saved me a lot of time and it looks really professional.

I don’t just have a superb scheduler control from Syncfusion. The subscription contains a lot of useful and flexible controls. Using them, I can provide my customer with a consistent and comprehensive user interface, which makes it faster for them to learn to use it.

On top of this, using Syncfusion support, I got significant help in the learning process and, as a bonus, I learned how to do several other things, too, from them. The support is quite fast and very helpful. I especially love that they do not just explain the solution of a problem or give a code snippet, but they always provide a working sample app on StackBlitz or in an attachment. So, I can see their solution in action and can better understand it.

Creating complex UIs takes a lot of time, and sometimes it’s beyond my capabilities. One cannot be an expert in every field of programming. It’s hard to find someone who can help a little to put you on the right track, but for me, that someone was Syncfusion.
