

USER GUIDE

# Essential Studio for Xamarin

---

Version - v17.3.0.14 | Release Date - October 3, 2019

Welcome to Syncfusion Essential Studio for Xamarin.Forms .....	87
How to best read this user guide .....	87
Additional help resources .....	87
Create a support incident .....	87
System Requirements .....	87
Hardware Environment.....	87
Development Environment.....	87
Supported Platforms.....	87
Target Framework (Compile SDK Version) for Android .....	88
Download Installer .....	88
Download the Trial Version .....	88
Free Trial Page.....	88
Start Trial Page .....	89
Download the License Version.....	89
Installation and Upgrade.....	90
Installation using Web Installer .....	90
Installation using Offline Installer .....	99
Installing with UI .....	99
Installing in silent mode .....	105
Explore the libraries package .....	107
Mac Installation .....	107
Installation FAQ.....	116
Upgrade from one version to another version. ....	116
Upgrade from major version to service pack version .....	116
Upgrade from trial version to license version.....	116
Visual Studio Integration.....	117
Overview .....	117
Visual Studio Extensions .....	118
Create project .....	118
Toolbox control .....	123
Essential UI Kit.....	126
Check for Updates.....	130
Visual Studio Mac Extensions .....	131
NuGet Packages .....	139
Installing NuGet Packages.....	140

Explore Libraries Package .....	141
Troubleshooting.....	141
Themes.....	141
Overriding the default theme .....	145
Creating your own theme .....	149
Keys of Syncfusion Controls .....	149
SfChart.....	149
SfDateTimeRangeNavigator .....	152
SfKanban .....	153
SfListView .....	155
SfLinearProgressBar .....	156
SfCircularProgressBar.....	156
SfNumericTextBox.....	156
SfNumericUpDown .....	157
SfDiagram.....	158
SfMaskedEdit .....	158
SfTreeView .....	159
SfTextInputLayout.....	160
SfBackdropPage .....	162
SfCardView .....	162
SfPdfViewer.....	163
SfDataGrid.....	166
SfPopupLayout .....	168
SfPullToRefresh.....	170
SfDataForm .....	170
SfSchedule.....	171
SfCalendar .....	178
SfMaps .....	180
SfCircularGauge.....	181
SfLinearGauge .....	182
SfDigitalGauge.....	182
SfSunburstChart.....	183
SfSparkline .....	183
SfTreeMap.....	184
SfImageEditor.....	185

SfAutoComplete .....	185
SfBusyIndicator .....	186
SfButton .....	186
SfSwitch.....	187
SfBorder .....	188
SfCarousel .....	189
SfCheckBox.....	189
SfChip .....	189
SfChipGroup .....	190
SfComboBox.....	190
SfNavigationDrawer .....	192
SfPicker.....	192
SfRadioButton .....	193
SfRadialMenu .....	194
SfRangeSlider .....	194
SfRating .....	195
SfRotator .....	195
SfSegmentedControl .....	196
SfTabView .....	197
Switching between light theme and dark theme.....	197
UI Kit.....	198
Syncfusion XAML Pages for Xamarin.Forms .....	198
Supported Platforms.....	198
Getting started .....	198
Essential UI Kit for Xamarin.Forms Extension.....	198
How to render the added page.....	201
Requesting Screens and Reporting Bugs.....	201
Release Notes .....	201
UI Kit 1.0.0.0.....	201
UI Kit 2.0.0.0.....	201
SfAccordion .....	202
Getting started .....	202
Assembly deployment.....	202
Adding SfAccordion reference .....	202
Launching the accordion on each platform .....	204

Creating the Accordion .....	205
Animation duration .....	211
Animation easing .....	211
Auto scroll position .....	211
Expand mode .....	211
Item spacing .....	212
Appearance .....	212
Header icon position .....	212
Header background color customization .....	212
Icon color customization .....	213
Visual State Manager .....	213
Bindable Layout .....	216
Creating Data Model .....	216
Binding data to SfAccordion .....	217
Defining the AccordionItem .....	217
SfAutoComplete .....	220
Overview .....	220
Key Features .....	220
Getting Started .....	221
Adding SfAutoComplete reference .....	221
Initializing AutoComplete .....	224
Populating AutoComplete with Data .....	225
Configuring filter options .....	227
Populating Data .....	229
Populating String Data .....	229
Populating Business Objects .....	230
DataTemplateSelector .....	234
OnSelectTemplate .....	237
AutoComplete Modes .....	238
Suggesting Choices in List .....	238
Appending Suggestion to Text .....	240
Suggesting Choices and Appending Suggestions to Text .....	241
Multiple Selection .....	243
Token Representation .....	243
Delimiter .....	251

AutoComplete Filtering Options .....	257
Filtering Words that Starts with Input Text .....	257
Filtering Words that Contains the Input Text .....	260
Filtering Words that Equals the Input Text .....	263
Filtering Words that Ends with the Input Text.....	269
Diacritic Sensitivity .....	272
Header and Footer .....	274
Header Content.....	274
Footer Content.....	276
Highlighting matched text.....	279
First Occurrence .....	279
Multiple Occurrence .....	281
Maximum Display Item with Expander .....	282
No Results Found .....	285
Customizing NoResultsFoundText .....	286
Handling Selected Items .....	288
SelectedIndex.....	288
SelectedIndices .....	291
SelectedItem .....	294
Dealing with Suggestion Box.....	297
Suggestion box placement mode.....	297
Maximum suggestion box height.....	299
Opening suggestion box on focus .....	301
Delay opening suggestion box .....	303
Delay before searching algorithm starts.....	304
Avoid opening suggestion box .....	306
Prefix Characters Constraint .....	307
Watermark .....	309
Changing Watermark Text Color.....	310
Focus the control .....	312
Customizing AutoComplete .....	313
Customizing the Entry.....	314
Custom Template for Suggestion Items.....	315
Customizing the Suggestion Box.....	317
How to perform an operation when selecting an item from drop-down list? .....	329

AutomationId .....	333
SfAvatarView .....	334
Overview .....	334
Key features .....	335
Getting Started.....	335
Adding SfAvatarView reference .....	335
Launching an application on each platform with SfAvatarView .....	336
Creating an SfAvatarView control.....	337
Avatar Types.....	339
Default.....	339
Initials.....	340
Custom image .....	342
Character avatars .....	342
GroupView .....	343
Add initials only in GroupView.....	345
Add both image and initials in a GroupView .....	346
Add GroupView using MVVM .....	347
Visual Style .....	350
Custom .....	350
Circle .....	350
Square .....	354
Customization .....	358
Colors .....	358
Sizing .....	362
How to.....	364
Set badge view to avatar.....	364
SfBackdropPage .....	366
Overview .....	366
Key features .....	366
Getting Started.....	367
Adding SfBackdropPage reference .....	367
Launch an application on each platform with backdrop page .....	369
Initialize backdrop page .....	370
Add back layer content .....	370
Add front layer content.....	371

Reveal and conceal the back layer .....	372
Corner Shape Customization .....	373
Reveal Height Customization .....	374
Events.....	377
BackLayerStateChanged event .....	377
Header Configuration.....	377
Icon customization .....	377
SfBadgeView .....	379
Overview .....	379
Key features .....	379
Getting Started.....	380
Adding SfBadgeView reference .....	380
Launching the application on each platform with badge view .....	381
Adding namespace.....	382
Initializing badge view.....	382
Adding badge text .....	383
Adding content.....	383
Badge Settings.....	385
Font customization .....	385
Stroke customization .....	386
Text customization.....	387
Predefined styles.....	388
Badge background customization.....	389
Setting corner radius of the badge .....	390
Alignment of badge.....	391
Position customization.....	392
Setting badge offset .....	392
Predefined symbols.....	393
Animation.....	395
SfBarcode .....	396
OVERVIEW.....	396
Getting Started.....	397
Adding SfBarcode reference .....	398
Configure the Barcode control.....	400
SUPPORTED SYMBOLOGIES .....	402

One Dimensional Barcodes .....	402
Two Dimensional Barcodes .....	412
SYMBOLLOGY SETTINGS .....	414
One Dimensional Barcode settings .....	414
Two Dimensional Barcode Settings.....	415
BARCODE CUSTOMIZATION .....	419
Bar Customization .....	419
Text Customization .....	420
SfBorder .....	421
Overview .....	421
Key Features.....	421
Getting Started.....	421
Adding SfBorder reference .....	421
Launching an application on each platform with SfBorder. ....	423
Creating SfBorder control .....	424
Customization .....	425
Border color .....	426
Background color .....	426
Border width .....	427
Corner radius.....	427
Adding circular image .....	428
Shadow Effect .....	429
SfBusyIndicator .....	430
Overview .....	430
Key Features.....	431
Getting Started.....	431
Adding SfBusyIndicator reference .....	431
Launching the SfBusyIndicator on each platform .....	432
Create a Simple SfBusyIndicator .....	433
Setting Animation Type.....	434
EnableAnimation.....	435
Make Busy Animation Idle .....	436
Set Header.....	437
Title .....	437
TextColor .....	438

TextSize .....	439
TitlePlacement .....	440
Sizing .....	441
Animation Type.....	442
Animation duration.....	446
SfButton .....	447
Overview .....	447
Key features .....	447
Getting Started.....	448
Adding SfButton reference .....	448
Creating a simple SfButton .....	451
Setting caption .....	452
Toggle button.....	452
Button icon.....	452
Button background image.....	453
Visual States .....	453
Customization .....	455
Text Customization .....	455
Background Customization .....	456
Image Customization .....	458
Gradient background .....	459
Command.....	461
Shadow Effect .....	462
How to.....	463
Add the custom view for button.....	463
Cards .....	464
Overview .....	464
Key features .....	464
Getting Started.....	465
Adding cards reference .....	465
Launching the application on each platform with cards.....	467
Initialize cards .....	468
SwipeToDismiss.....	470
Customization in CardLayout .....	474
Customization in CardView .....	480

Initialize view model .....	482
Populate CardLayout with data .....	483
Define the appearance of SfCardView .....	483
Events.....	483
CardTapped .....	483
VisibleCardIndexChanging .....	484
VisibleCardIndexChanged .....	485
Calculate.....	486
Overview .....	486
Getting Started.....	486
Adding Calculate reference .....	487
Compute formula using CalcQuickBase .....	487
Compute formula using ICalcData .....	488
Choosing between CalcQuickBase and ICalcData .....	489
Cross Sheet Reference .....	489
Compute formulas in different region settings .....	490
Parse and Compute.....	490
Parsing.....	490
Computation .....	491
Error Messages.....	493
Formatting the Computed Results.....	494
Working with CalcQuickBase .....	495
Compute using values .....	495
Compute using Variables .....	495
Automatic calculations.....	496
Reset keys .....	497
Working with ICalcData .....	497
Methods and Events in ICalcData .....	497
Computation using ICalcData.....	499
Working with CalcEngine .....	500
Computation using CalcEngine .....	501
Data Objects maintained in CalcEngine .....	501
Properties in CalcEngine .....	502
Methods in CalcEngine.....	506
Working with Essential XlsIO .....	509

Open a Workbook using XlsIO .....	509
Enable and Disable Calculations in XlsIO .....	510
Set and Compute the values at runtime in the Worksheet .....	510
To compute particular cell in the worksheet .....	511
Ambiguity Issue .....	511
Table Formulas .....	511
Supported Formulas .....	512
Database Functions .....	512
Date and Time Functions .....	513
Engineering Functions .....	515
Financial Functions .....	517
Information Functions .....	519
Logical Functions .....	520
Lookup & Reference Functions .....	520
Math & Trigonometry functions .....	521
Statistical functions .....	525
Text Functions .....	532
Web Functions .....	533
Operators .....	534
Arithmetic Operators .....	534
Logical Operators .....	534
Text concatenation operator (Binary literal operator) .....	534
Operator precedence .....	535
Equal Sign, the Formula Character .....	535
Square Brackets, indexers in CalcQuickBase class .....	535
Named Ranges Support in Essential Calculate .....	536
Syntax to define a name .....	536
Add Named Ranges .....	536
Remove Named Ranges .....	536
Manage Named Ranges .....	536
Custom Function .....	537
LibraryFunction .....	537
Add Custom Function .....	537
Remove Custom Function .....	538
Replace Function .....	538

Performance and Limitations.....	539
To improve the performance .....	539
To avoid stack overflow exception .....	540
Limitations.....	541
SfCalendar .....	542
Overview .....	542
Key Features.....	542
Getting Started.....	542
Adding SfCalendar reference .....	543
Launching the SfCalendar on each platform.....	544
Create a Simple SfCalendar .....	545
Set Blackout Dates .....	546
Enable Multiple Selection .....	546
Restrict Dates .....	546
Calendar views .....	547
Month view .....	547
Trailing and leading days.....	548
Enable and disable past dates.....	549
Month view customization .....	550
Week view.....	554
Year view .....	555
Year view mode.....	556
Year view customization .....	557
Decade view .....	558
Decade view customization .....	559
Century view .....	560
Century view customization.....	561
Date Navigation .....	562
Programmatic Navigation .....	562
Events (Appointments) .....	564
Month Appointment Display .....	565
Month Appointment Indicator.....	566
Customize inline/agenda view using DataTemplate.....	566
Customize inline/agenda view using Template Selector .....	568
Getting inline/agenda view appointment details .....	570

Select Multiple Dates .....	572
Multi selection mode .....	572
Range selection mode.....	573
Multi range selection mode .....	574
Single selection mode .....	575
Programmatically clear the selected dates.....	576
Restrict Dates From Selection .....	576
Range of Min / Max Dates .....	576
Blackout Dates .....	577
Binding Properties in MVVM Pattern .....	580
Binding SelectedDate .....	580
Binding SelectedDates .....	581
Binding SelectedRange.....	581
Commands .....	583
Change First Day Of Week .....	586
Localization .....	586
Change default control language .....	587
Localizing custom strings from PCL.....	587
Localizing the custom texts using platform renderer .....	588
Right to left(RTL) .....	590
Customization of Calendar control .....	592
How to Perform an Operation while a Calendar Cell is Tapped? .....	592
How to Perform an Operation when the Selected Date Get Changed? .....	592
How to Perform an Operation when Navigate to Next Month? .....	593
How to Perform an Operation while Dealing with Appointments?.....	593
How to Customize Cell or Month View? .....	594
Create your own custom calendar month cell view .....	595
How to customize month view cell using a template? .....	596
How to Perform the Operation while long pressing the dateCell?.....	598
How to Resize the SfCalendar Control? .....	599
How to Customize the SfCalendar Header?.....	599
How to enable or disable the YearView in SfCalendar? .....	600
How to enable or disable the Horizontal and Vertical cell grid lines in SfCalendar?.....	600
Customize the year cell or year view .....	601
Customize the year view with custom UI .....	602

Deselect today selection on initial load .....	603
Feature Comparison across the different platforms in Xamarin. ....	603
Theming .....	607
Default theme (light theme) .....	608
Customizing the default theme .....	609
AutomationId .....	611
SfCarousel .....	615
Overview .....	615
Key Features:.....	616
Getting Started.....	616
Adding SfCarousel reference .....	616
Launching the SfCarousel on each platform .....	617
Create a Simple SfCarousel .....	618
Add Carousel Items .....	619
Setting the height and width of the carousel item .....	623
Set Desire Item to be Selected.....	624
Linear Arrangement .....	626
Populating Data.....	628
Through Binding.....	629
Through Carousel Item.....	631
LoadMore.....	633
AllowLoadMore.....	633
LoadMoreItemsCount .....	635
LoadMoreView .....	637
UI Virtualization .....	640
EnableVirtualization.....	640
Transformation .....	642
Tilt Non Selected Items .....	642
Set Gap between Items.....	643
Set Gap between Selected and unselected Item .....	644
Set Scaling for Carousel Items.....	645
Spacing between the Items in Linear mode.....	647
Animation.....	649
How to perform an operation while changing the carouselItem? .....	651
AutomationId .....	653

SfChart.....	654
Overview .....	654
Key features .....	655
Getting Started.....	655
Adding SfChart reference.....	655
Launching the application on each platform with chart.....	657
Initialize Chart .....	659
Initialize view model .....	660
Populate Chart with data .....	661
Add Title .....	662
Enable data labels .....	662
Enable legend.....	663
Enable tooltip.....	663
Populating Data.....	666
Chart Data Point.....	666
Custom Object .....	667
Title .....	668
Text Alignment.....	669
Axis.....	670
Category Axis.....	670
Numeric Axis .....	673
Date Time Axis .....	678
Date-time category axis .....	683
Logarithmic axis .....	684
Common axis features .....	687
Axis Crossing .....	704
Smart Axis Labels .....	706
Event .....	707
Chart Series .....	708
Multiple Series .....	708
Combination Series .....	710
Grouping Stacked Series .....	712
Animation.....	714
Transpose the Series (Vertical Chart) .....	714
Methods.....	715

Chart Types .....	715
Line Chart .....	715
Fast Line Chart.....	716
Area Chart .....	718
Spline Area Chart .....	719
Step Area Chart.....	721
Range Area Chart .....	722
Spline Range Area Chart .....	723
Stacked Area Chart.....	726
100% Stacked Area Chart.....	727
Column Chart .....	728
Histogram Chart.....	730
Range Column Chart .....	731
Stacked Column Chart.....	733
100% Stacked Column Chart.....	735
Bar Chart .....	736
Stacked Bar Chart.....	738
100% Stacked Bar Chart.....	739
Spline Chart.....	741
Step Line Chart.....	744
Bubble Chart .....	745
Scatter Chart .....	747
Fast Scatter Chart.....	748
OHLC Chart.....	749
Candle Chart.....	752
Radar Chart .....	755
Polar Chart .....	761
Pie Chart.....	767
Doughnut Chart.....	772
Pyramid Chart .....	779
Funnel Chart.....	783
Waterfall Chart.....	787
Data Markers .....	788
Customizing labels .....	789
Formatting label content .....	790

Label position .....	791
Smart labels.....	794
Customizing marker shapes .....	795
Apply series color .....	796
Connector line.....	797
Label template .....	798
Event .....	800
Legend.....	800
Customizing labels .....	801
Legend icons.....	802
Legend title .....	803
Toggle the series visibility .....	804
Legend visibility.....	804
Legend item visibility .....	805
Legend wrap.....	806
Positioning the legend .....	808
Populate the data based legend items for all series.....	809
ItemTemplate.....	809
Event .....	811
Color Palette .....	812
Apply palette for Chart .....	812
Apply palette for Series.....	813
Gradient Colors .....	816
Plotting Area Customization .....	819
Zooming and Panning .....	819
Enable Zooming .....	819
Zoom Mode.....	821
Auto Interval On Zooming.....	822
Events.....	822
Methods.....	824
Selection.....	826
Data Point Selection.....	826
Series Selection .....	828
Events.....	829
Methods.....	830

Trackball.....	831
Label Display Mode .....	832
Activation mode .....	833
Customizing appearance.....	833
Show/hide the trackball label in axis .....	836
Axis label alignment .....	837
Show/hide the series label.....	837
Label Template.....	838
Methods .....	841
Events.....	842
Tooltip .....	842
Customizing appearance .....	843
Tooltip Template .....	844
Methods .....	846
Strip Lines.....	847
What is strip line? .....	847
How to add strip lines? .....	847
Strip Line Recurrence .....	850
Customize Text.....	851
Segmented StripLine .....	853
Performance .....	856
Annotation .....	858
Adding Annotations .....	858
Positioning the annotation .....	859
Adding annotation for multiple axes .....	861
Text annotation.....	862
Shape annotation .....	865
View annotation.....	875
Event .....	876
Get the touch position in annotation .....	876
Technical Indicators .....	877
Adding technical indicators to chart .....	877
Indicator visibility .....	880
Average true range indicator .....	881
Simple moving average indicator.....	882

Relative strength index indicator .....	883
Accumulation distribution indicator .....	884
Momentum indicator .....	886
Stochastic indicator .....	887
Exponential moving average indicator .....	888
Triangular moving average indicator .....	889
Bollinger band indicator .....	890
MACD indicator .....	892
Exporting .....	893
Export as an image .....	893
Get the stream of Chart .....	894
GetStream .....	894
GetStreamAsync .....	894
How to .....	894
Transform axis value to pixel value and vice-versa .....	894
Get the touch position in chart .....	895
Get the data point collection based on region .....	895
Adding duplicate axis in SfChart .....	895
Customize the SfChart padding .....	896
Adding custom labels to SfChart axis .....	897
Localization .....	898
Localize at application level .....	899
SfCheckBox .....	900
Overview .....	900
Key features .....	900
Getting Started .....	901
Adding SfCheckBox reference .....	901
Create a Simple SfCheckBox .....	904
Setting caption .....	904
Change the check box state .....	905
Indeterminate .....	907
Visual Customization .....	909
Customizing shape .....	909
Customizing state color .....	910
Setting caption text appearance .....	911

LineBreakMode .....	912
TickColor Customization .....	912
Visual States .....	913
Event .....	914
StateChanged event.....	914
Chips.....	916
Overview .....	916
Key Features.....	916
Getting started .....	916
Adding Chips reference.....	917
Launching an application on each platform with chips .....	918
Initialize chips.....	920
Set layout for the control.....	921
Populating business objects.....	922
Set types of chip group .....	924
Populating chips.....	927
Populating business objects as items .....	927
Populating SfChip as items.....	927
Set the type for chip group .....	928
Input.....	928
Choice.....	928
Filter .....	928
Action .....	928
Customization of SfChip.....	930
ShowCloseButton .....	930
ShowSelectionIndicator .....	931
CloseButtonColor .....	933
SelectionIndicatorColor .....	934
BackgroundColor.....	935
BorderColor .....	936
BorderWidth .....	937
CornerRadius.....	938
FontAttributes.....	939
FontFamily.....	941
FontSize.....	942

TextColor .....	943
TextAlignment.....	944
ShowIcon.....	946
ImageSource .....	947
ImageWidth.....	948
ImageAlignment.....	949
Command.....	950
Customization of SfChipGroup.....	952
InputView .....	952
SelectedChipBackgroundColor.....	953
SelectedChipTextColor.....	955
ChipBackgroundColor .....	956
ChipBorderColor .....	957
ChipTextColor.....	958
ChipTextSize .....	960
ChipPadding .....	961
ChipBorderWidth .....	963
ItemHeight .....	964
ShowIcon.....	965
CloseButtonColor .....	968
SelectionIndicatorColor .....	969
ChipImageWidth .....	971
SfCircularGauge.....	973
Overview .....	973
Key features .....	973
Getting Started.....	975
Adding SfCircularGauge reference.....	975
Launching an application on each platform with SfCircularGauge.....	976
Reference Mono.Android.Export.....	977
Initialize gauge .....	978
Adding header.....	979
Configuring scales .....	979
Adding ranges .....	979
Adding a needle pointer.....	980
Adding a range pointer .....	980

Adding a marker pointer .....	981
Scales.....	983
Scale .....	983
Setting start and end values for scale .....	984
Setting start and sweep angles for scale .....	985
Setting interval for scale .....	985
Setting auto interval for scale .....	986
Setting scale direction for scale .....	987
Setting maximum labels.....	987
Setting multiple scales for scale.....	988
Events.....	990
Rim .....	991
Rim customization.....	992
Setting position for rim .....	993
Show rim .....	994
Tick Setting.....	995
Show ticks for scale.....	995
Ticks customization.....	995
Customize major ticks for scale .....	995
Customize minor ticks for scale .....	996
Setting position for ticks .....	997
Labels .....	999
Label color customization .....	999
Label font customization.....	999
Setting position for labels .....	1000
Setting number of decimal digits for labels .....	1000
Setting postfix and prefix for labels .....	1001
Edge label customization .....	1002
Show labels .....	1003
Setting auto angle for label.....	1004
Custom labels for circular gauge.....	1004
Ranges.....	1005
Setting start and end values for range.....	1005
Range customization.....	1006
Setting position for range .....	1007

Setting range color for labels .....	1009
Setting multiple ranges .....	1010
Setting gradient color for range .....	1012
Pointers .....	1014
Needle pointer .....	1014
Range pointer .....	1018
Marker pointer .....	1022
Header .....	1029
Adding header in circular gauge .....	1029
Setting position for header .....	1030

SfLinearGauge .....	2057
Overview .....	2057
Key Features.....	2058
Getting Started.....	2058
Adding SfLinearGauge reference .....	2058
Launching an application on each platform with SfLinearGauge. ....	2060
Reference Mono.Android.Export.....	2060
Initialize gauge .....	2061
Adding header.....	2062
Configuring scales .....	2062
Adding a symbol pointer .....	2063
Adding a bar pointer .....	2063
Adding ranges .....	2063
Scales.....	2066
Linear scale.....	2066
Setting minimum and maximum values for scale.....	2067
Setting interval for scale .....	2068
Setting maximum labels.....	2068
Scale customization .....	2069
Scale Offset .....	2070
Setting opposite position .....	2071
Setting scale direction.....	2071
Setting corner radius type for scale .....	2072
Multiple scales .....	2073
Setting gradient color for scale .....	2075
Tick Setting.....	2077
Ticks visibility .....	2077
Tick customization .....	2077

Setting minor ticks per interval.....	2079
Setting position for ticks .....	2079
Labels .....	2080
Label color customization .....	2080
Label font customization.....	2081
Setting position for labels .....	2082
Custom labels.....	2084
Labels visibility .....	2085
Ranges.....	2086
Setting start and end values for range.....	2086
Range customization.....	2087
Setting position for range .....	2088
Setting multiple ranges .....	2089
Setting gradient color for range.....	2090
Pointers .....	2091
Adding bar pointer to scale.....	2091
Bar pointer customization .....	2092
Setting corner radius type for bar pointer .....	2093
Setting gradient color for bar pointer.....	2094
Adding symbol pointer to scale .....	2095
Symbol pointer customization .....	2096
Positioning symbol pointer .....	2097
Setting symbol pointer position.....	2097
Setting offset for symbol pointer .....	2098
Change symbol pointer shapes.....	2099
Setting image shape for symbol pointer .....	2101
Adding multiple pointers .....	2102
Change Orientation.....	2103
Header.....	2104
Adding header to linear gauge.....	2104
Positioning the header.....	2105
Customizing header text .....	2106
Annotations.....	2107
Annotation .....	2107
Positioning the annotation .....	2108

Set margin to the annotation.....	2111
Alignment of annotation.....	2112
Setting scale index for annotation .....	2115
Multiple annotations .....	2117
SfListView .....	2119
SfListView .....	2119
Key features .....	2119
Advantages of the SfListView over Xamarin.Forms ListView.....	2120
Getting Started.....	2121
Assembly Deployment .....	2121
Adding SfListView reference .....	2121
System Requirements .....	2123
Launching the SfListView on Each Platform.....	2123
Create a Simple SfListView.....	2125
Creating the Project .....	2126
Adding the SfListView in Xamarin.Forms .....	2126
Creating Data Model for the SfListView.....	2126
Binding Data to the SfListView.....	2128
Defining an ItemTemplate .....	2129

AutomationId .....	2567
PDF .....	2567
SfParallaxView.....	2567
Overview .....	2567
Key features .....	2568

Getting Started.....	2568
Adding SfParallaxView reference.....	2568
Launch an application in iOS.....	2569
Initialize parallax view.....	2570
Add content to the parallax view.....	2571
Bind source to the parallax view.....	2572
Customization .....	2575
Speed Customization .....	2575
Orientation.....	2575
Scrolling support for custom controls.....	2576
Scrollable ContentSize .....	2576
Scrolling event.....	2577
SfPdfViewer.....	2578
PDF Viewer.....	2578
Getting started.....	2579
Adding SfPdfViewer reference.....	2579
Creating a simple PDF Viewer application .....	2581
Resolving issue when deploying an application in ReleaseMode in the UWP platform .....	2581
Unloading PDF document from the Viewer.....	2585
How to get & set the current page number?.....	2585
How to get the total page number? .....	2585
How to navigate to next page and previous page? .....	2585
How to detect a page change? .....	2586
How to get and set the zoom for SfPdfViewer? .....	2586
How to get and set Horizontal and Vertical Offsets in PDF Viewer? .....	2586
AutomationId .....	2587
Single page view mode .....	2588
Switching between view modes .....	2591
Tracking the changes in the `PageViewMode` property .....	2594
Designing a custom toolbar .....	2594
Working with built-in toolbar .....	2596
How to disable/enable built-in toolbar.....	2596
How to disable/enable bookmark.....	2599
Search for a text instance .....	2600
How to initiate text search?.....	2600

How to identify if there is no instance of the text being searched?.....	2600
How to navigate to the next instance of the text? .....	2601
How to navigate to the previous instance of the text? .....	2601
How to identify if a complete cycle of text search is performed?.....	2601
How to cancel text search?.....	2602
How to track search progress? .....	2602
Implementing search bar with search features. ....	2603
Customizing search highlight color .....	2606
Select and copy text.....	2608
How to select text? .....	2609
How to enable or disable the context menu? .....	2609
How to modify the selection and its handle color? .....	2609
How to acquire selected text? .....	2609
How to acquire page number, page bounds and selected region?.....	2610
Working with Hyperlink navigation .....	2610
How to disable hyperlink navigation in PDF document using PDF viewer control? .....	2610
How to acquire the properties of clicked URI from PDF viewer? .....	2610
Working with Document Link Annotation (Table of content) .....	2611
How to disable document link navigation in PDF document using PDF viewer control?.....	2611
Working with ink annotation .....	2611
Inclusion of ink annotation .....	2611
How to identify whether the ink annotation is included? .....	2612
How to perform undo and redo operation during inking session? .....	2613
Deleting ink annotation .....	2614
Working with ink annotation settings.....	2615
How to select the ink annotation?.....	2616
How to deselect the ink annotation?.....	2618
How to move or resize the selected ink annotation? .....	2618
Working with handwritten signatures .....	2618
Adding handwritten signatures .....	2619
Customizing the appearance of handwritten signatures.....	2619
Similarity with Ink annotations .....	2620
Working with shape annotations.....	2621
Adding shape annotations .....	2621
Detecting tap on shape annotations.....	2622

Selecting shape annotations .....	2622
Deselecting shape annotations .....	2622
Customizing the appearance of shape annotations .....	2623
Moving or resizing shape annotations .....	2624
Deleting shape annotations .....	2625
Working with free text annotations.....	2626
Adding free text annotations .....	2626
Detecting tap on free text annotations .....	2627
Selecting free text annotations.....	2627
Deselecting free text annotations.....	2628
Customizing the appearance of free text annotations .....	2628
Moving or resizing free text annotations.....	2629
Deleting free text annotations .....	2630
Working with text markup annotation .....	2631
Highlight a text .....	2631
Underline a text .....	2632
Strikethrough a text .....	2633
Deleting a text markup annotation.....	2633
Editing the color of the text markup annotation .....	2635
Performing undo and redo.....	2635
Saving the PDF document .....	2636
Working with Bookmark Navigation .....	2636
Enabling and disabling bookmark feature .....	2636
Expand and collapse the bookmark pane from built-in toolbar .....	2637
Expand and collapse the bookmark pane programmatically.....	2637
Programmatically navigate to a bookmark destination.....	2638
Track the occurrence of the bookmark navigation.....	2638
Touch interaction events .....	2639
Tapped .....	2639
DoubleTapped.....	2639
LongPressed .....	2639
Working with PDF AcroForms .....	2640
How to restrict editing the form field values in the existing PDF document.....	2640
How to flatten and save the form fields data .....	2641
Working with ScrollHead .....	2641

Enabling and disabling ScrollHead .....	2641
Navigate to a desired page using ScrollHead.....	2641
Localization .....	2641
Add a .resx file.....	2642
Convert the platform specific language format to .NET format .....	2644
Apply the converted format.....	2648
Loading password protected PDFs.....	2649
Handling invalid passwords.....	2650
Importing and exporting form data .....	2650
Exporting form data .....	2650
Importing form data.....	2650
Exporting the pages of PDF document as images.....	2651
Exporting a single PDF page as image.....	2651
Exporting a single PDF page as image with custom scale factor .....	2651
Exporting a range of PDF pages as images.....	2651
Exporting a range of PDF pages as images with custom scale factor .....	2652
Working with magnification.....	2652
Set custom zoom percentage .....	2652
Get custom zoom factor .....	2652
Set maximum zoom percentage .....	2653
Set minimum zoom percentage.....	2653
SfPicker.....	2653
Overview .....	2653
Feature comparisons across iOS, Android, and UWP .....	2654
Getting Started.....	2655
Adding SfPicker reference.....	2655
Initialize picker on each platform .....	2656
Populating Items .....	2661
Binding data source .....	2661
Multi-column items.....	2662
Set items colors and font attributes customization.....	2664
Adding custom view to items.....	2667
DataTemplateSelector .....	2669
Dealing with Header and Footer.....	2672
Enable or disable header .....	2672

Set custom header .....	2673
Header customization .....	2673
Enable or disable footer .....	2675
Set custom footer .....	2675
Perform validation with default validation button .....	2675
Dealing with Columns .....	2676
Adjust column width .....	2676
Add caption .....	2677
Caption customization .....	2679
Cascading .....	2680
Looping .....	2683
EnableLooping .....	2683
How to restrict Looping in a particular column of the picker .....	2684

## Welcome to Syncfusion Essential Studio for Xamarin.Forms

Essential Studio for Xamarin.Forms is a comprehensive collection of enterprise-grade Xamarin.Forms components for building modern Mobile applications. It includes all the UI controls that are typically required for building line-of-business (LOB) applications including Charts, Gauge, Maps and much more.

### How to best read this user guide

- The best way to read the User guide is to start with the Getting Started section of the documentation for the component that you need. The Getting Started guide gives information needed to know before writing the code. This is the only section recommended for end-to-end reading before writing the code. All the other information can be referred as and when needed.
- Now, that you are familiar with the basics of using the component, the next step would be to start integrating the component into your application. A good starting point would be to refer to the code examples in the sample browser. It is very likely that you would find a code example that resembles your intended usage scenario.
- After you have integrated the component into your application, it is likely that you would need additional information on specific features and API. Search the specific topic by using the search box available at the top of the user guide.
- Another valuable resource is the API reference that provides detailed information on the classes and its members.

### Additional help resources

The Knowledge Base section contains responses to some of the most common questions that other customers had asked in the past. You can search for topics that are not covered in the user guide.

Similar to the Knowledge Base, the Forum section also contains responses to questions of other customers asked in the past.

### Create a support incident

In case, you are not able to find the information that you are looking for in the self-help resources mentioned above, then please contact us by creating a support ticket.

## System Requirements

### Hardware Environment

- Processor: x86 or x64
- RAM : 512 MB (minimum), 1 GB (recommended)
- Hard disk: up to 1.5 GB of available space may be required. However, 250 MB free space is required in boot drive even if you are installing the setup in other drive.

### Development Environment

Please find the recommended development environment for Xamarin platform in the following link.

<https://docs.microsoft.com/en-us/xamarin/cross-platform/get-started/requirements>

### Supported Platforms

The following table lists the platforms supported by our Xamarin.Forms controls.

Platform	Device Types	Controls	Supported versions
Android	Phone, Tablet	SfPdfViewer, SfCheckBox	API level 21 and later versions
		All other controls	API level 19 and later versions
iOS	iPhone, iPod, iPad	All controls	iOS 9.0 and later versions
UWP	Desktop, Tablet	All controls except SfEffectsView and SfShimmer	Windows 10 devices
macOS	iMac, Mac book, Mac mini	SfChart, SfDataGrid and SfListView	macOS 10.11 and later versions
WPF	Desktop	SfChart, SfListView, SfSchedule, SfBorder, SfButton, SfChip, SfSwitch, SfRadioButton, SfCheckBox, SfGradientView, SfSegmentedControl, SfTextInputLayout	Windows 10

#### Target Framework (Compile SDK Version) for Android

For Android platform, the target framework or compile SDK version of the application should be equal or greater than the latest API available at the time of our release. Please find more details about setting the target framework in the following link.

<https://docs.microsoft.com/en-us/xamarin/android/app-fundamentals/android-api-levels?tabs=windows#target-framework>

## Download Installer

You can download the installer from [Syncfusion.com](https://www.syncfusion.com) website.

## Download the Trial Version

There are two ways to download our 30-day trial.

### Free Trial Page

1. You can evaluate our 30-day free trial from [Free Trial](#) page.
2. Once you fill the required form or made the login using the your Syncfusion registered account you can download the trial installer setup in the confirmation page.
3. You can download the latest version trial installer.
4. You can unlock the installer using the unlock key, also you can unlock the installer using the Syncfusion registered login credential.
5. You can download the trial installer using the [Trials & Downloads](#) page under your registered account at any time before the trial expire. (Refer the below screenshot).

## Trial Downloads and Unlock Keys

Trial SKU Name	
Essential Studio	
Trial Version :	
<a href="#">What's New</a>   <a href="#">Generate License File</a> ?   <a href="#">Get Unlock Key</a> ?	<div>Download 1</div> <div>More Download Options 2</div>

### Start Trial Page

1. You can evaluate our 30-day free trial from [Start Trial](#) page.
2. You should login using your Syncfusion account to access this page.
3. You can start your trail by clicking on the required product.

**Note:** If you already using the trail products and it's not expired, you couldn't start the trial again for same product.

4. After you started the trial, you can download the latest version trial installer using the [Trials & Downloads](#) page.
5. In [Trials & Downloads](#) page, you can find your current active trial products. Trials, which you done in both Free Trial Page and Start trial pages are listed here.
6. Use the Download (element 1 in below screenshot) button to download the installer of respective product.
7. Online installer can be downloaded from this page.
8. No need of unlock key to unlock the online installer.
9. You can unlock the installer using the Syncfusion registered login credential.

## License Downloads and Unlock Keys

License SKU Name	
Essential Studio	
Latest Official Release :	
<a href="#">What's New</a>   <a href="#">Generate License File</a> ?   <a href="#">Get Unlock Key</a> ?	<div>Download Older Versions 2</div> <div>Download 1</div> <div>More Download Options 3</div>

**Note:** You can generate the license key for your active trial products from [Trials & Downloads](#) page. This license key will be mandatory to use our trial products in your application. To know more about License key, refer this [help topic](#).

### Download the License Version

1. You can find your available licensed products which under your registered Syncfusion account in [License & Downloads](#) page.
2. You can find all the licenses (both active licenses and expired licenses) which are under your account.
3. You can find the licenses listed based on SKU names.

4. Use the Download (element 1 in below screenshot) button to download the installer of respective product.
5. Latest version installer will be downloaded from this page.
6. You can navigate to [Downloads Older Versions](#) (element 2 in below screenshot) to download older version installers.
7. From 16.2 version online installer will be downloaded by default, and earlier versions offline installer will be downloaded.

---

**Note:** Online Installer have been introduced from the release version 16.2.

---

8. You can navigate to More Downloads Options (element 3 in below screenshot) to download other setups.
9. EXE and Zip format available to download for Windows OS. Both are Offline Installer.
10. No need of unlock key to unlock the online installer.
11. You can unlock the installer using the unlock key for versions earlier to 16.2, also you can unlock the installer using the Syncfusion registered login credential.

## License Downloads and Unlock Keys

---

**Note:** You can generate the license key for your licensed products from [License & Downloads](#) page. This license key will be required only from release version 16.2. To know more about License key, refer this [help topic](#).

---

## Installation and Upgrade

### Installation using Web Installer

The following procedure illustrates how to install Essential Studio for Xamarin Online Installer.

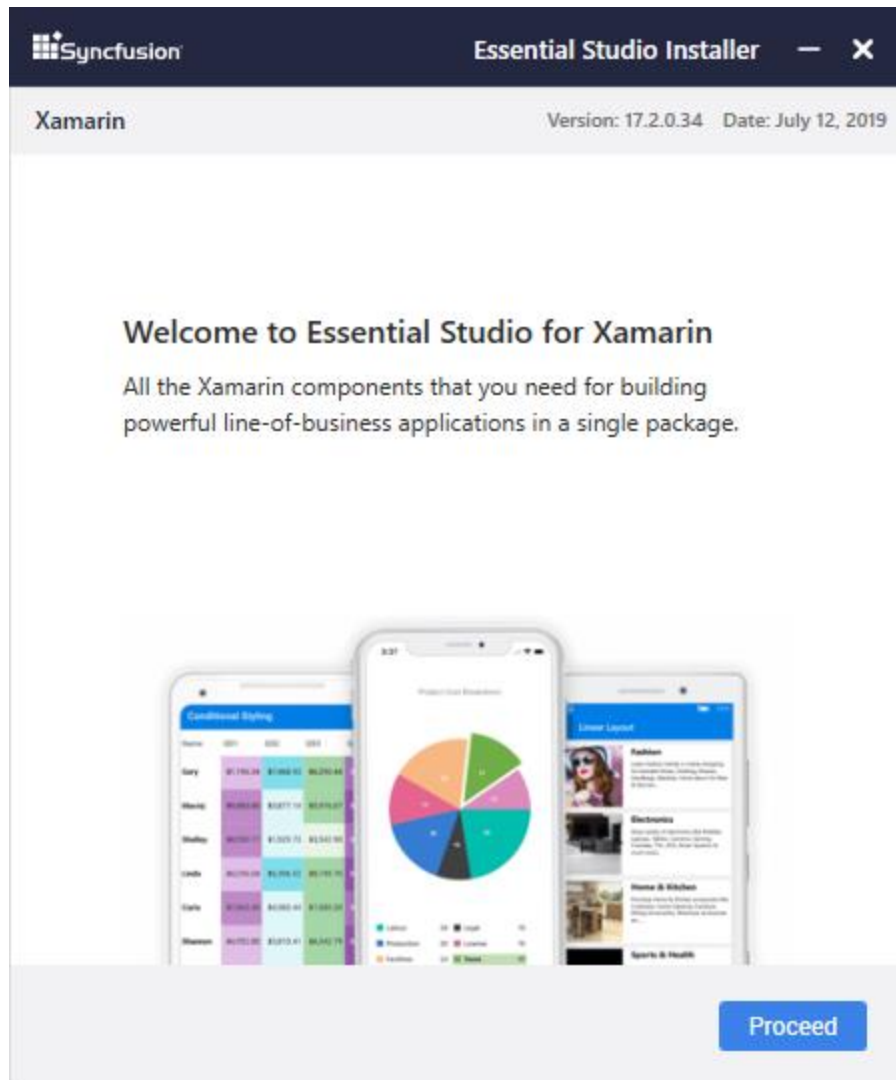

1. Double-click the Syncfusion Xamarin Online Installer setup file. The Setup Wizard opens and extracts the package automatically.

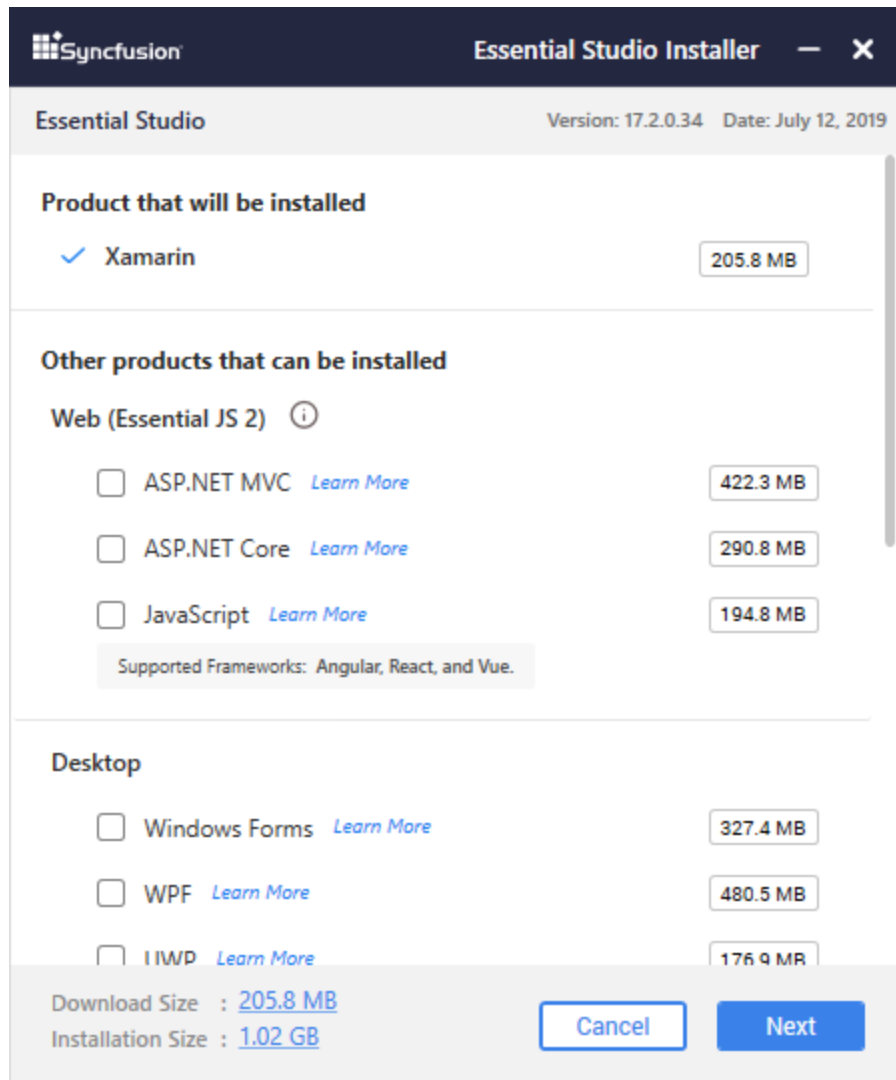

**Note:** The Setup wizard extracts the syncfusionxamarinwebinstaller\_{version}.exe dialog, displaying the unzip operation of the package.

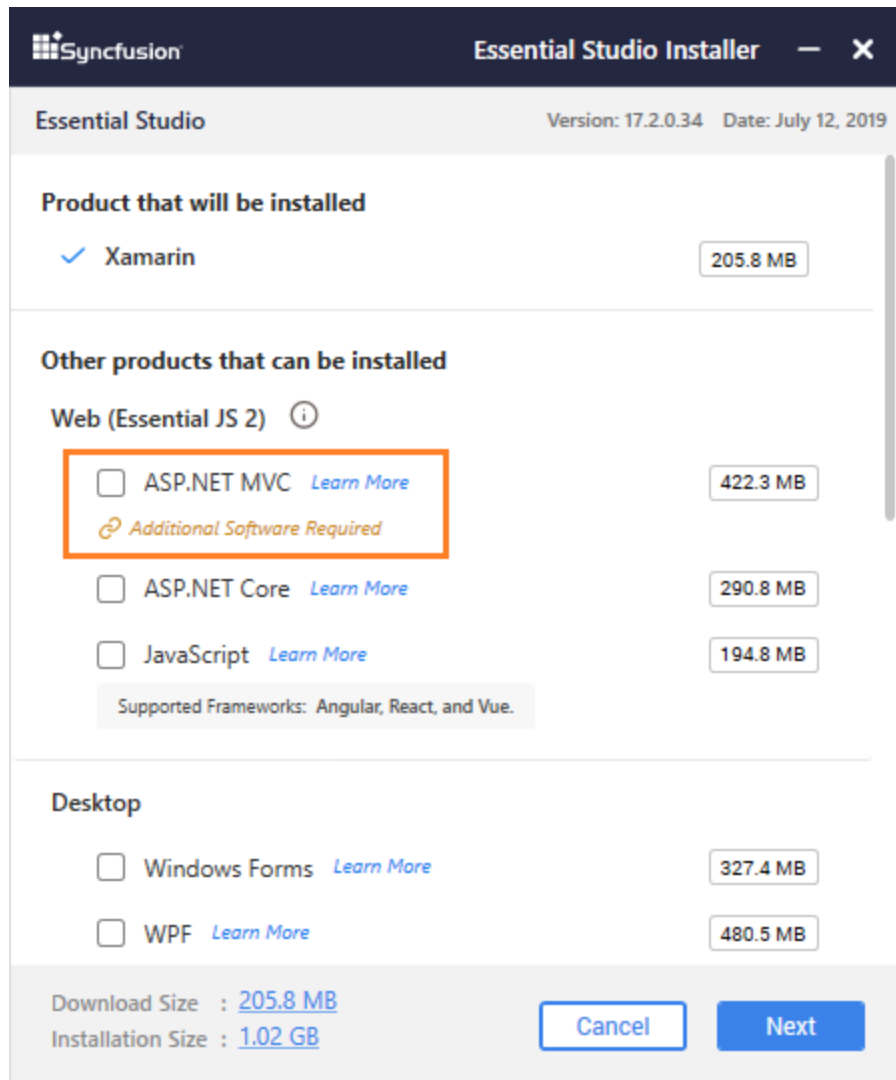

2. Welcome wizard of the Syncfusion Online Installer will be displayed. Click Proceed.

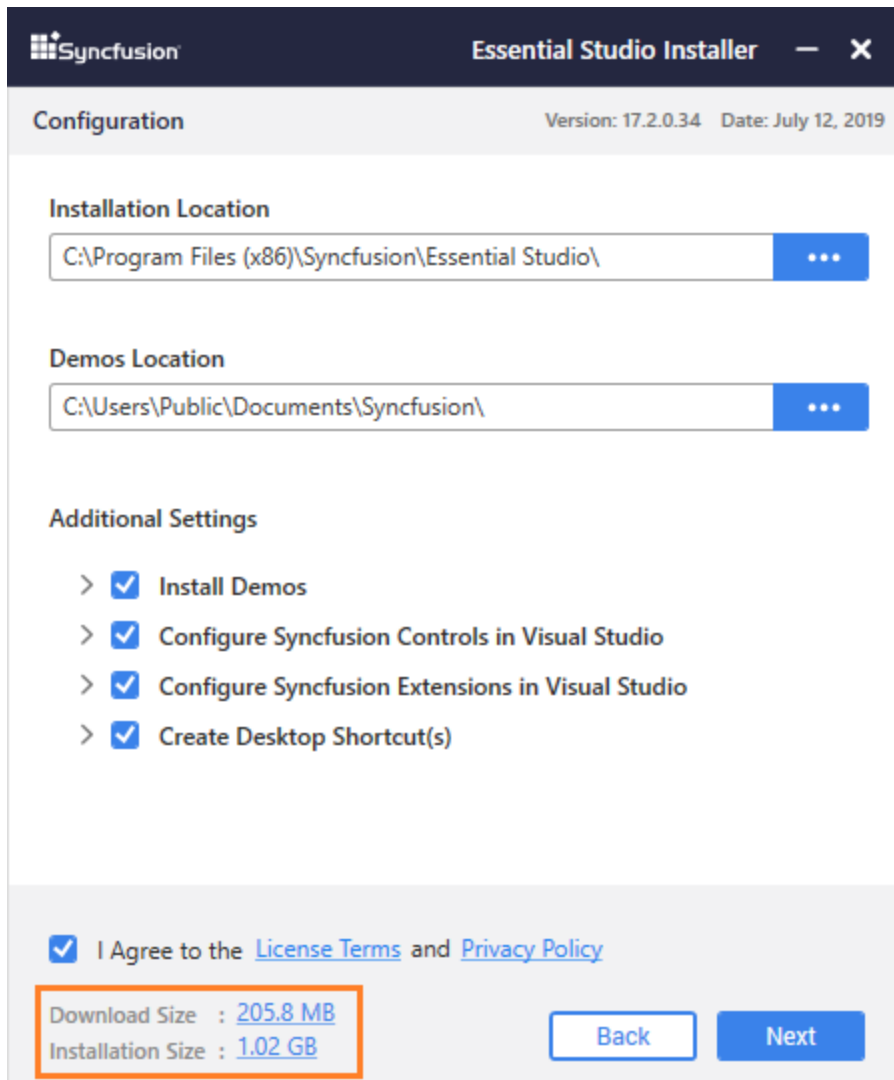

3. Platform Selection wizard will be displayed. Here you can select the required platforms to be installed. Click Next.

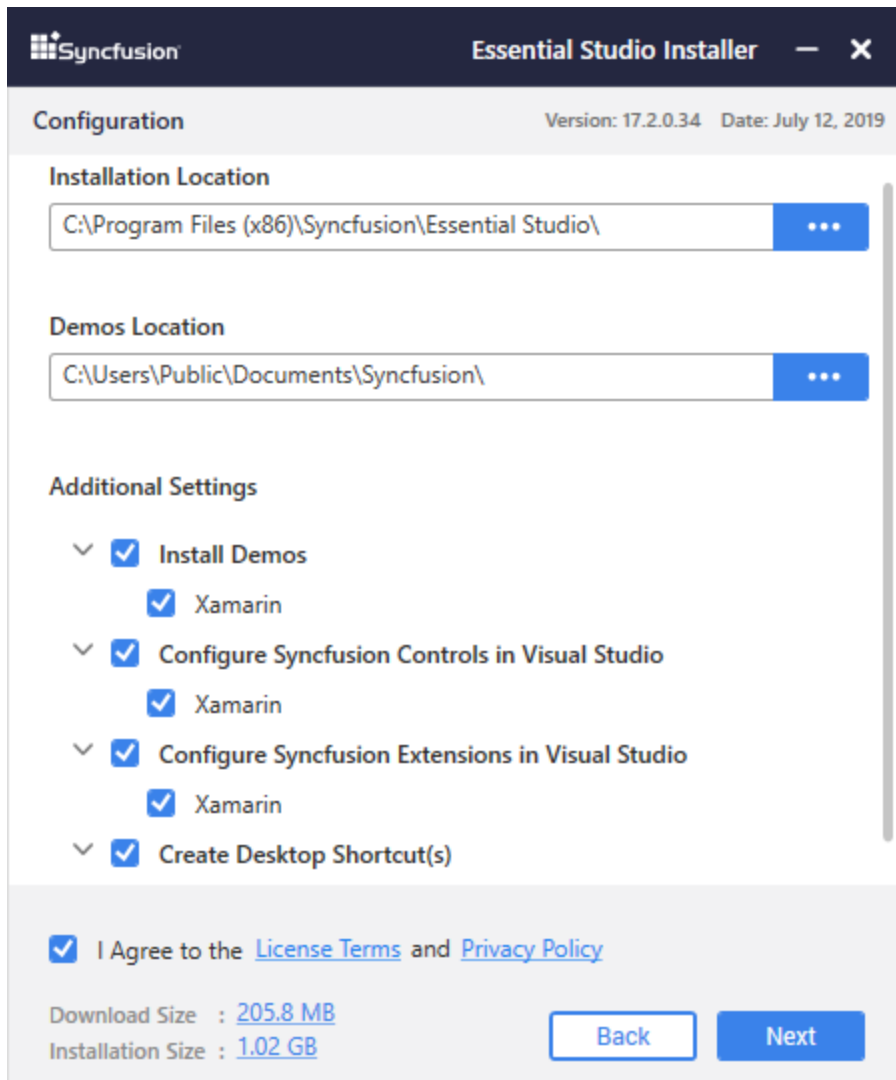

**Information:** If the required software of the selected platform was not already installed, **Additional Software Required** alert will be displayed. However, you can continue the installation and install the required software later.

**Note:** You can check the Estimated size of the Download and Installation by clicking the **Download Size and Installation Size** link.

4. Configuration wizard will be displayed. Here you can change the Install and samples location. Also, you can change the Additional settings by platform basis. To install using the default configuration, click Next.

**Note:** From the 2018 Volume 2 release, Syncfusion has changed the install and samples location

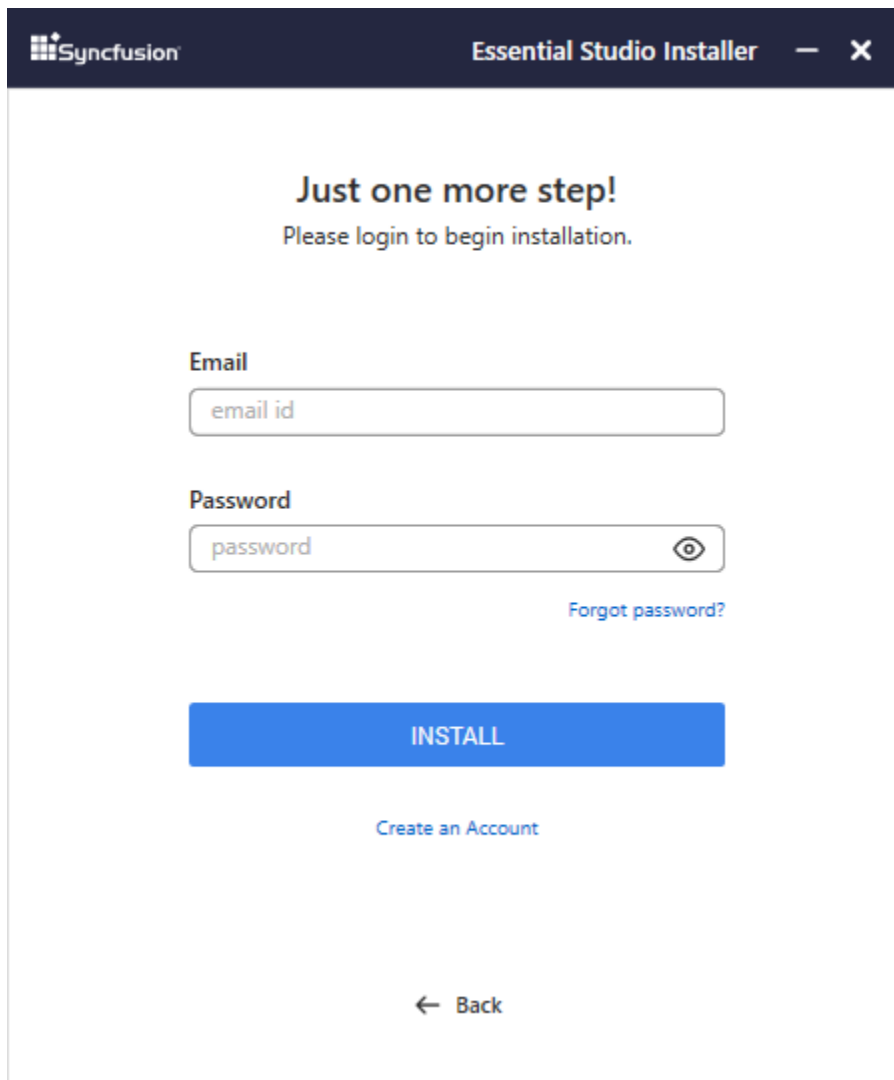

**Default Install location:** {ProgramFilesFolder}\Syncfusion\{Platform}\{version}

**Default Samples location:** C:\Users\Public\Documents\Syncfusion\{platform}\{version}

However, you can change the locations by clicking browse button.

- Select the **Install Demos** check box to install Syncfusion samples, or leave the check box clear, when you do not want to install Syncfusion samples.
- Select the **Configure Syncfusion controls in Visual Studio** check box to configure the Syncfusion controls in the Visual Studio toolbox, or clear this check box when you do not want to configure the Syncfusion controls in the Visual Studio toolbox during setup installation. Note that you must also select the Register Syncfusion assemblies in GAC check box when you select this check box.
- Select the **Configure Syncfusion Extensions in Visual Studio** checkbox to configure the Syncfusion Extensions in Visual Studio or clear this check box when you do not want to configure the Syncfusion Extensions in Visual Studio.

5. After reading the License Terms and Conditions, check the **I agree to the License Terms and Privacy Policy** check box. Click Next.
6. Login wizard will be displayed. You should enter your Syncfusion Direct-Trac login credentials. If you don't have Syncfusion Direct-Trac login credentials, then you can click on **Create an Account**. Else if you forgot your password, click on **Forgot Password** to create new password. Click Install.

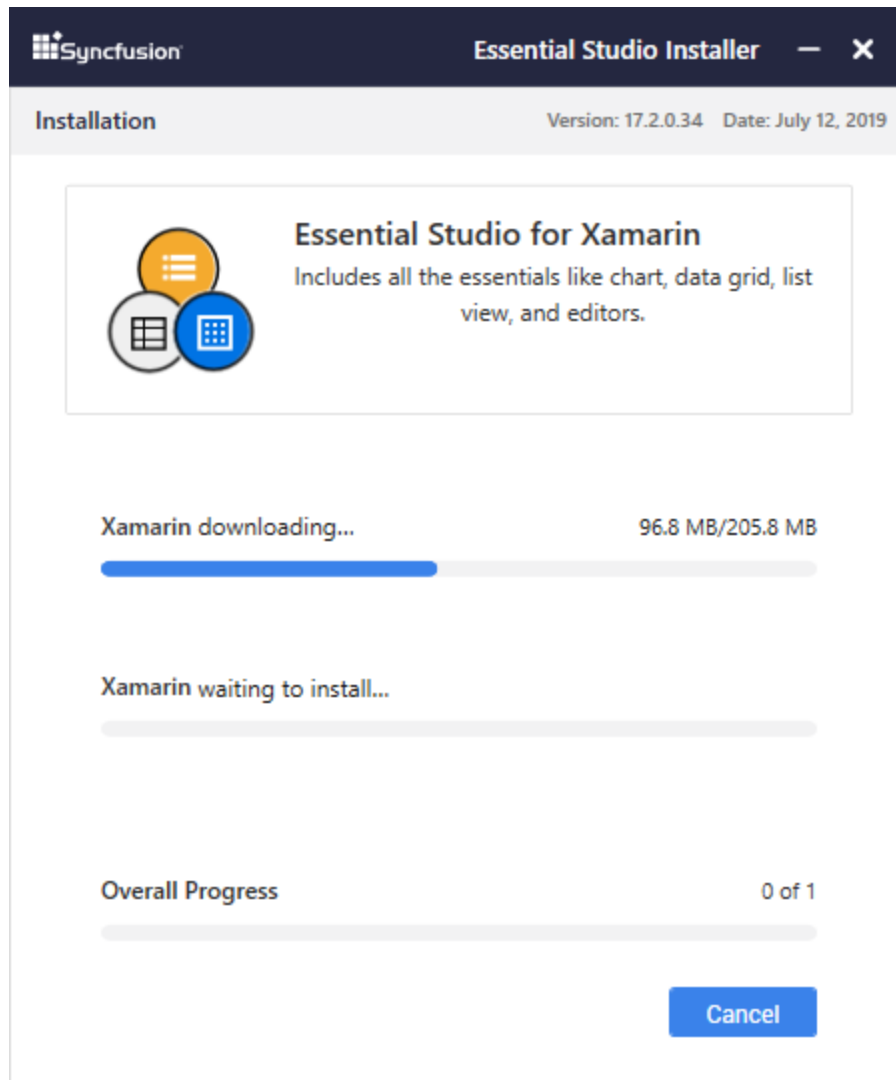

The screenshot shows the 'Essential Studio Installer' window. At the top, there's a dark blue header with the Syncfusion logo on the left and the text 'Essential Studio Installer' followed by a minus sign and a close button (X) on the right. The main content area is white and contains the following elements: a heading 'Just one more step!' in bold, followed by the instruction 'Please login to begin installation.' Below this, there are two input fields: 'Email' with a placeholder 'email id' and 'Password' with a placeholder 'password' and an eye icon for toggling visibility. To the right of the password field is a link 'Forgot password?'. Below the input fields is a large blue button labeled 'INSTALL'. Underneath the 'INSTALL' button is a link 'Create an Account'. At the bottom left, there is a back arrow icon followed by the text 'Back'.

---

**Information:** The selected platforms will be installed based on your Syncfusion License (Trial or Licensed).

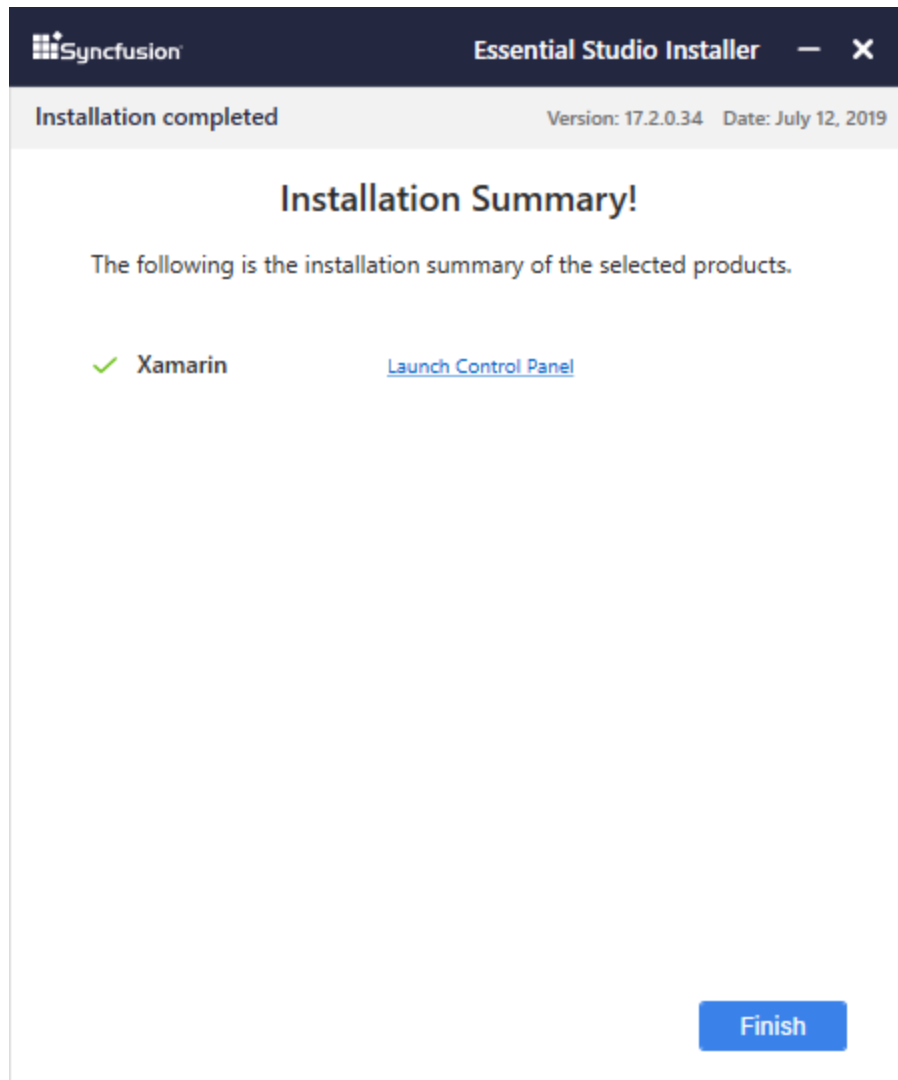

---

7. Download and Installation progress will be displayed.

8. Once the Installation is complete, **Installation Summary** wizard will be displayed. Here you can check the list of platforms which are installed successfully and failed. Click Finish to exit the Installation Summary wizard.

- Click **Launch Control Panel** to open the Syncfusion Control Panel.

## Installation using Offline Installer

### Installing with UI

The following procedure illustrates how to install Essential Studio Xamarin platform.

1. Close all the running Visual Studio instances.
2. Double-click the Syncfusion Xamarin platform Setup file. The Setup Wizard opens and extracts the package automatically.

---

**Note:** The Setup wizard extracts the syncfusionessentialxamarin\_(version).exe dialog, displaying the unzip operation of the package.

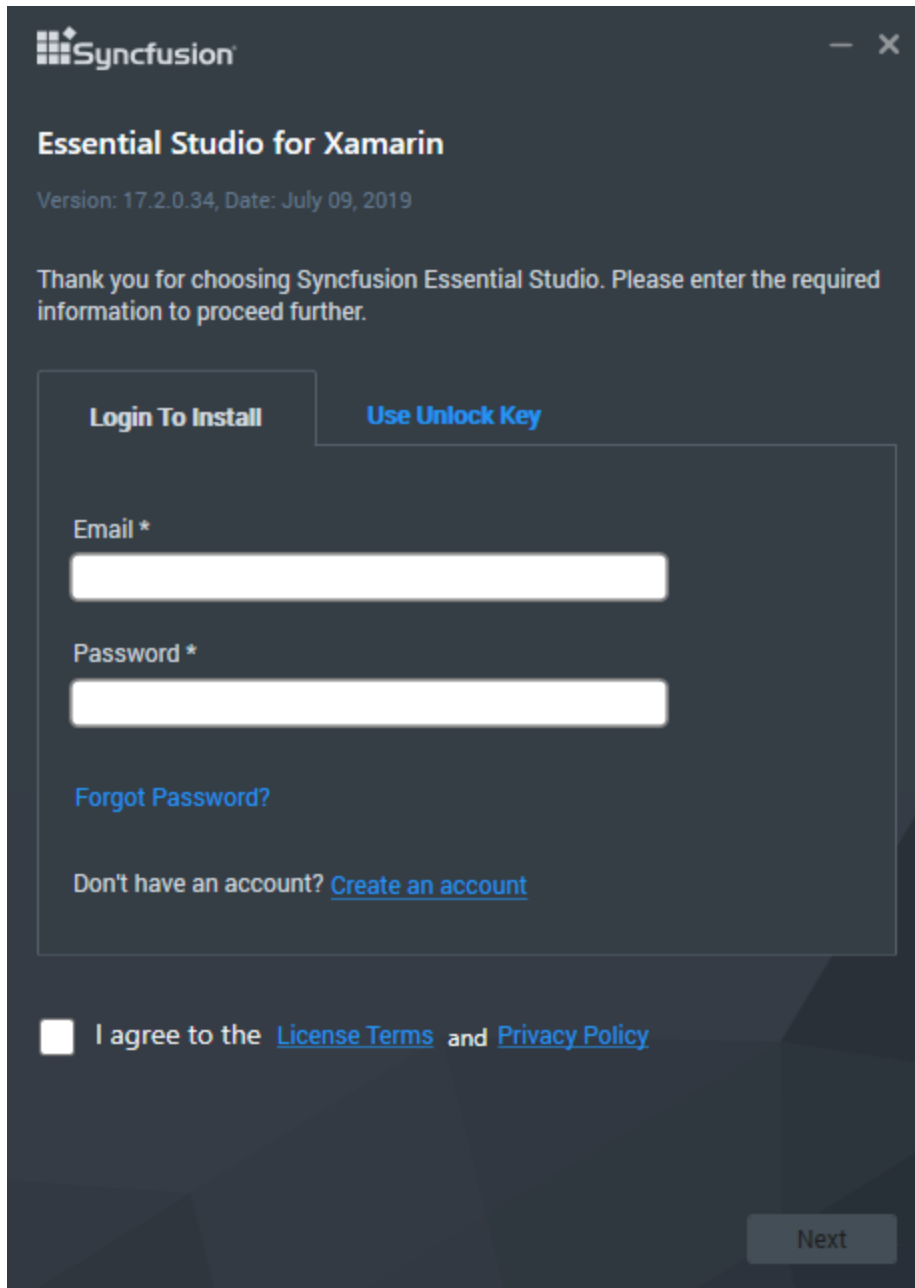

---

3. You have two options to unlock the Syncfusion setup:

- *Login To Install*
- *Use Unlock Key*

### Login To Install

You should enter your Syncfusion Direct-Trac login credentials. If you don't have Syncfusion Direct-Trac login credentials, then you can click on Sign Up to create a new account. Else if you forgot your password, click on Reset Password to create a new password. Here Email address and Password is validated and the Platform Selection window opens.

**Syncfusion**

## Essential Studio for Xamarin

Version: 17.2.0.34, Date: July 09, 2019

Thank you for choosing Syncfusion Essential Studio. Please enter the required information to proceed further.

**Login To Install** **Use Unlock Key**

Email \*

Password \*

[Forgot Password?](#)

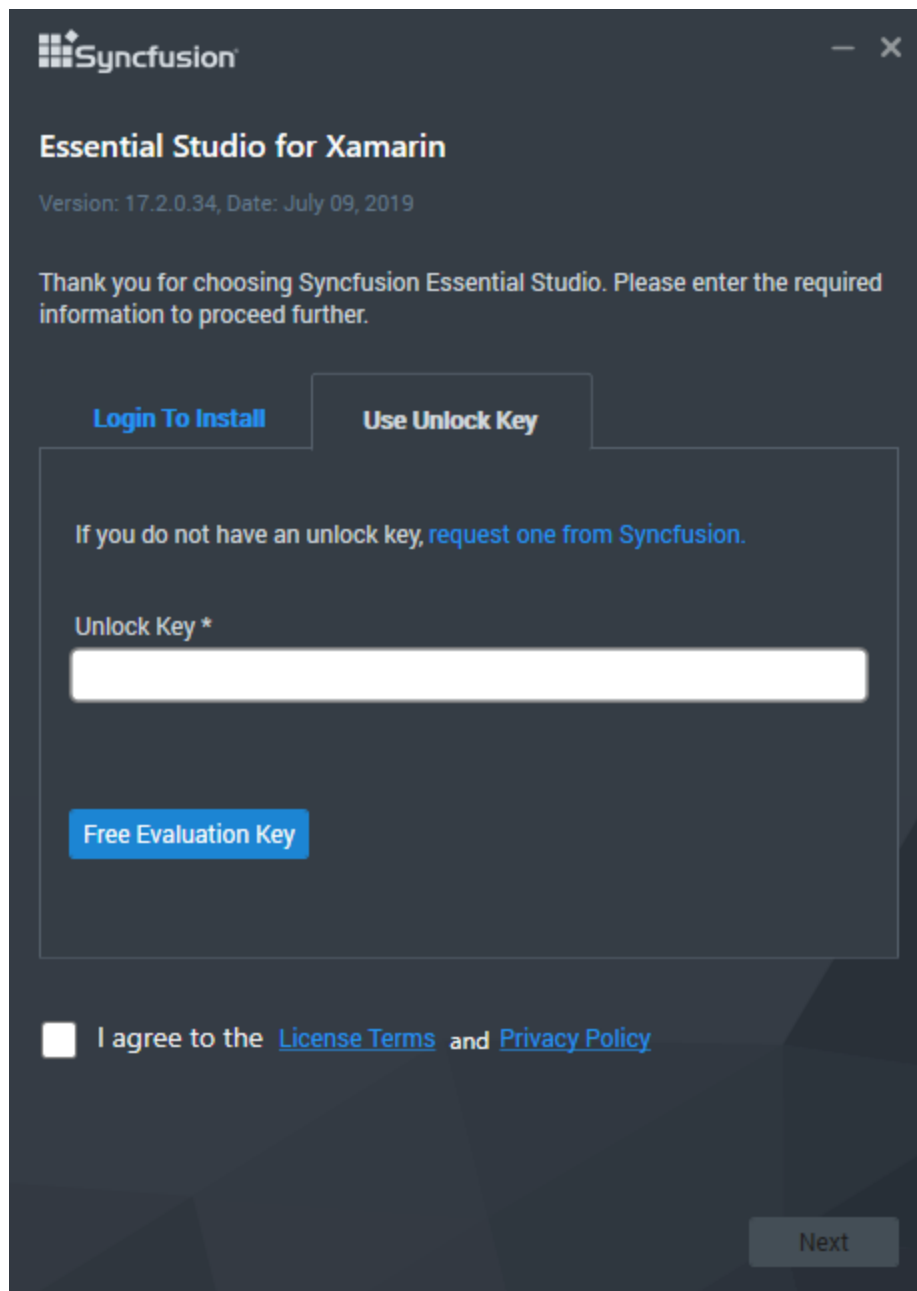

Don't have an account? [Create an account](#)

☐ I agree to the [License Terms](#) and [Privacy Policy](#)

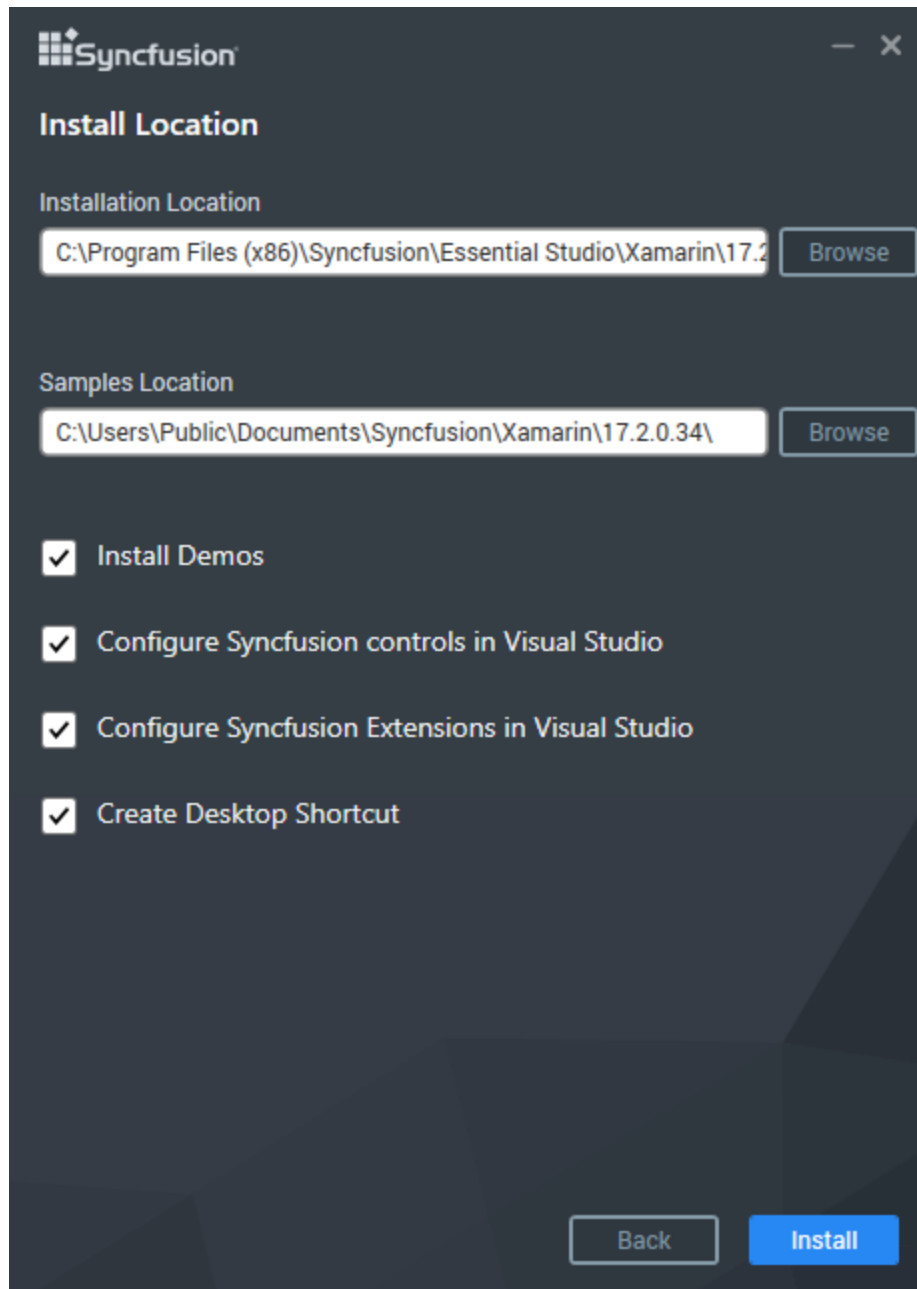

Next

### Use Unlock Key

You should use the Syncfusion License/Trial key. Trial key is valid for 30 days and the installer won't accept the expired trial key. Licensed customer can generate key from [here](#).

4. After reading the License Terms and Conditions, check the **I agree to the License Terms and Conditions** check box.
5. Click Next. Select the Installation, Samples Folder and Advanced Options screen opens. To install in the displayed default location, click Install

---

**Note:** From the 2018 Volume 2 release, Syncfusion has changed the install and samples location

---

**Default Install location:** {ProgramFilesFolder}\Syncfusion\{Platform}\{version}

**Default Samples location:** C:\Users\Public\Documents\Syncfusion\{platform}\{version}

However, you can change the locations by clicking browse button.

- Select the **Install Syncfusion Samples** check box to install Syncfusion samples, or leave the check box clear, when you do not want to install Syncfusion samples.
- Select the **Configure Syncfusion controls in Visual Studio Toolbox** check box to configure the Syncfusion controls in the Visual Studio toolbox, or clear this check box when you do not want to configure the Syncfusion controls in the Visual Studio toolbox during setup installation. Note

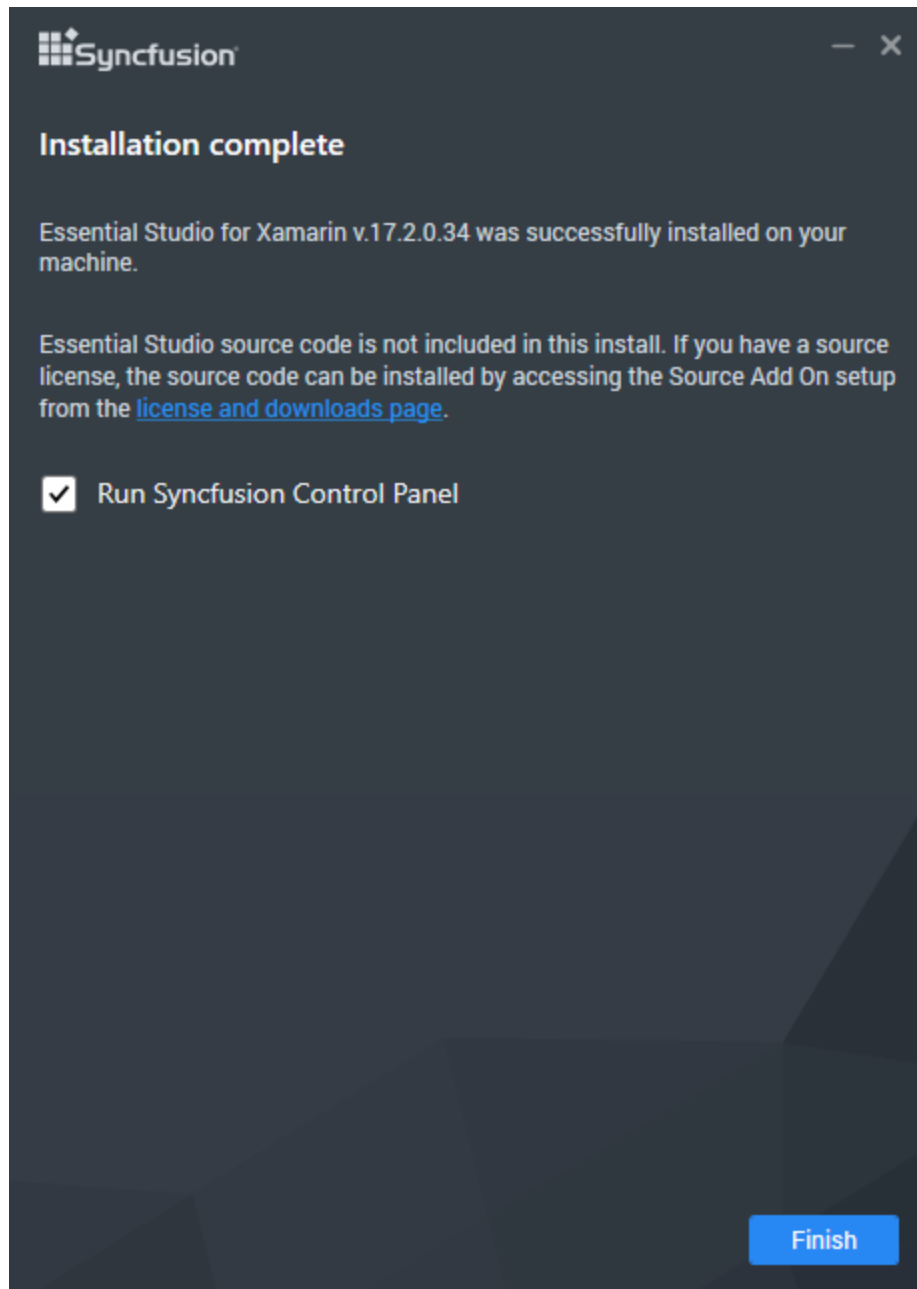

that you must also select the Register Syncfusion assemblies in GAC check box when you select this check box.

- Select the **Install Syncfusion Extensions** checkbox to configure the Syncfusion Extensions in Visual Studio or clear this check box when you do not want to configure the Syncfusion Extensions in Visual Studio.

6. Click Install.

7. The Completed screen is displayed once the Xamarin platform is installed.

8. Select the **Run Syncfusion Control Panel** check box to launch the Syncfusion Control Panel after installing.
9. Click Finish. Syncfusion Xamarin platform is installed in your system and the Syncfusion Essential Studio [Syncfusion Control Panel](#) is launched automatically.

#### Installing in silent mode

The Syncfusion Essential Studio Platform Installer supports installing/uninstalling the setup through Command Line. The following sections illustrate this ability.

### Command Line Installation

Follow the steps below to install through Command Line in Silent mode.

1. Double-click the Syncfusion Essential Studio platform setup file. The Setup Wizard opens and extracts the package automatically.
2. The syncfusionessentialxamarin\_(version).exe file is extracted into the Temp folder.
3. Run %temp%. The Temp folder will open. The syncfusionessentialxamarin\_(version).exe file is available in one of the folders.
4. Copy the extracted syncfusionessentialxamarin\_(version).exe file in local drive.
5. Cancel the Wizard.
6. Open the Command Prompt in administrator mode and pass the following arguments.

**Arguments:** "Setup file path\SyncfusionEssentialStudio(platform)\_(version).exe" /Install silent /PIDKEY:"(product unlock key)" [/log "{Log file path}"] [/InstallPath:{Location to install}] [/InstallSamples:{true/false}] [/InstallAssemblies:{true/false}] [/UninstallExistAssemblies:{true/false}] [/InstallToolbox:{true/false}]

---

**Note:** [...] – Arguments inside the square brackets are optional.

---

**Example:** "D:\Temp\syncfusionessentialxamarinx.x.x.x.exe" /Install silent /PIDKEY:"product unlock key" /log "C:\Temp\EssentialStudioPlatform.log" /InstallPath:C:\Syncfusion\x.x.x.x /InstallSamples:true /InstallAssemblies:true /UninstallExistAssemblies:true /InstallToolbox:true

7. Setup is installed.

---

**Note:** x.x.x.x needs to be replaced with the Essential Studio version and the Product Unlock Key needs to be replaced with the Unlock Key for that version.

---

### Command Line Uninstallation

Syncfusion Essential Studio supports uninstalling the setup through Command Line in Silent mode. The following steps illustrate this.

1. When you do not have the extracted setup (syncfusionessentialxamarin\_(version).exe) then follow the steps from 2 to 7.
2. Double-click the Syncfusion Essential Studio platform setup file. The Setup Wizard opens and extracts the package automatically.
3. The syncfusionessentialxamarin\_(version).exe file is extracted into the Temp folder.
4. Run %temp%. The Temp folder will open. The syncfusionessentialxamarin\_(version).exe file is available in one of the folders.
5. Copy the syncfusionessentialxamarin\_(version).exe file in local drive.
6. Cancel the Wizard.
7. Open the Command Prompt in administrator mode and pass the following arguments.

**Arguments:** "Copied setup file path\syncfusionessentialxamarin\_(version).exe" /uninstall silent

**Example:** "D:\Temp\syncfusionessentialxamarin\_x.x.x.x.exe" /uninstall silent

8. Setup is uninstalled.

---

**Note:** x.x.x.x needs to be replaced with the Essential Studio version installed in your machine.

---

### Explore the libraries package

You can find the Syncfusion libraries, samples and NuGet from the installed location in Windows.

{Essential Studio installed location}\Syncfusion\Essential Studio\{version}\Xamarin

- **“lib”** folder - e.g., C:\Program Files (x86)\Syncfusion\Essential Studio\16.2.0.41\Xamarin\lib

It contains all the required libraries for Xamarin.iOS, Xamarin.Android, and Xamarin.Forms projects.

- **“nuget”** folder - e.g., C:\Users\Public\Documents\Syncfusion\16.2.0.41\Xamarin\nuget

It contains the above libraries as NuGet packages. The same NuGet packages also can be configured from online [nuget.org](http://nuget.org).

- **“sample”** folder - e.g., C:\Users\Public\Documents\Syncfusion\16.2.0.41\Xamarin\sample

It contains the sample applications for our controls in Xamarin.iOS, Xamarin.Android, and Xamarin.Forms platforms in iOS, Android, and Forms folders, respectively.

The "Forms" directory includes,

- Individual control sample folders: It contains the samples for individual controls such as SfChart, SfDataGrid, etc. Since they represent the individual controls, these samples are light-weighted. You can check the samples for your required controls alone faster with minimum deployment time.
- **“nuget”** folder: It contains the compiled assemblies of the above samples as NuGet package. It is referred in the common sample browser as explained in the next step.
- **“SampleBrowser”** folder: It contains common sample browser, which refers the individual control's samples as NuGet package. Run this to see the demo samples of all the controls in single application.
- It also contains showcase samples such as Patient Monitor, Server Monitor, and Invoice.

### Add reference to the project

You can then add the assembly references to the respective projects such as PCL, XForms.Droid, XForms.iOS and XForms.UWP. You can find the dependencies for each control from this [link](#).

---

**Information:** After adding the reference, currently, an additional step is required for iOS and UWP projects. For example, if we are using SfKanban, we need to call the Init method of SfKanbanRenderer as shown in this [KB article](#).

---

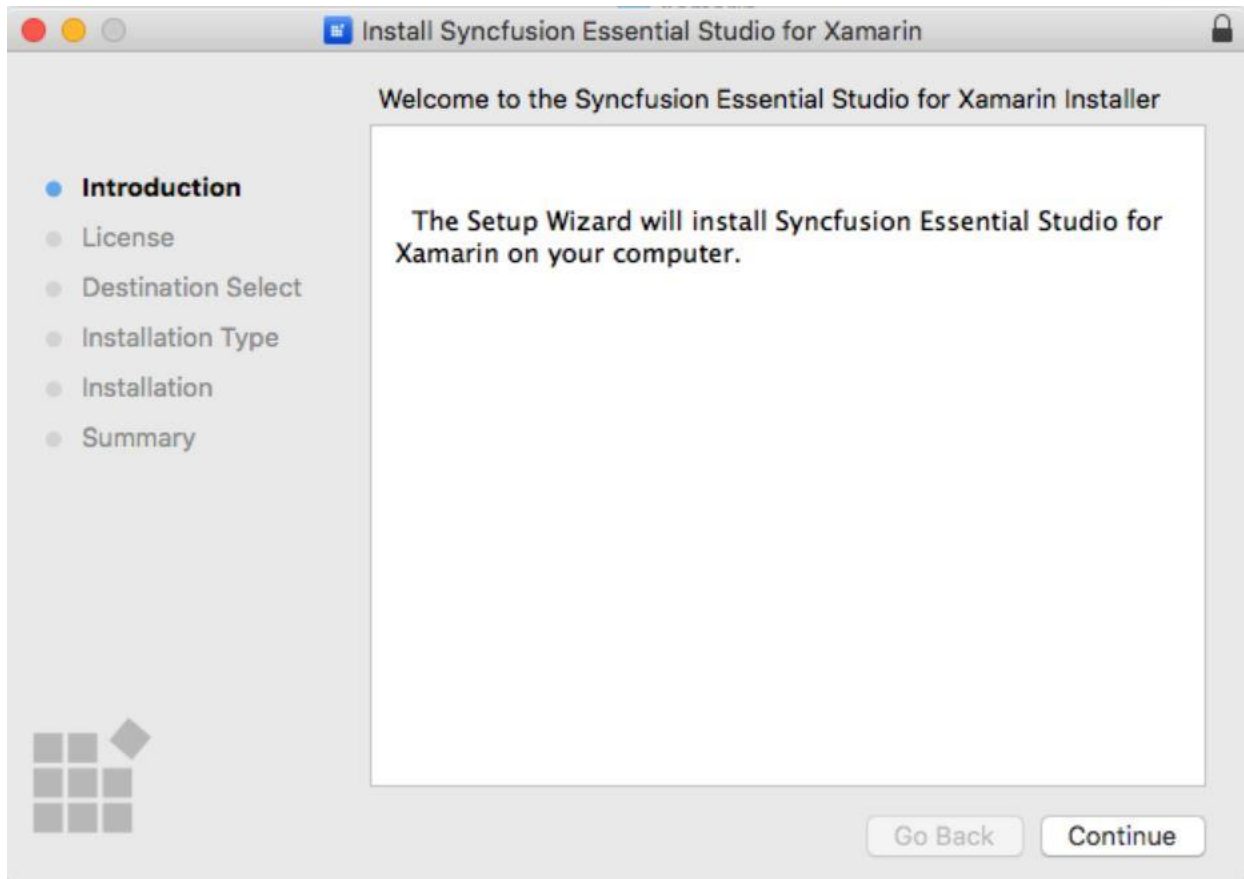

**Information:** For UWP alone, one more additional step is required if the project is built in release mode with .NET Native tool chain enabled. For example, if we are using SfKanban, you can refer the [KB article](#) for more details.

---

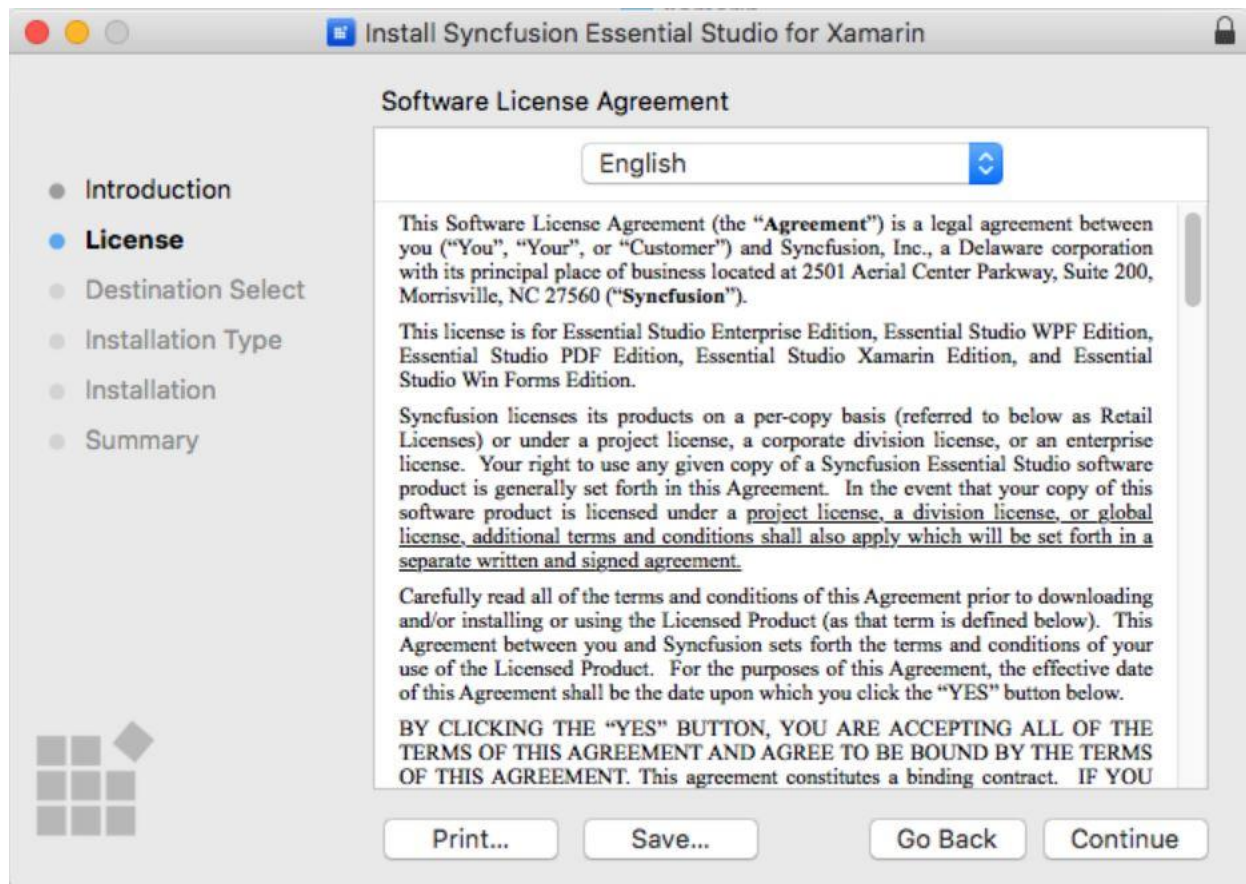

### Mac Installation

The following procedure illustrates how to install Xamarin Mac installer.

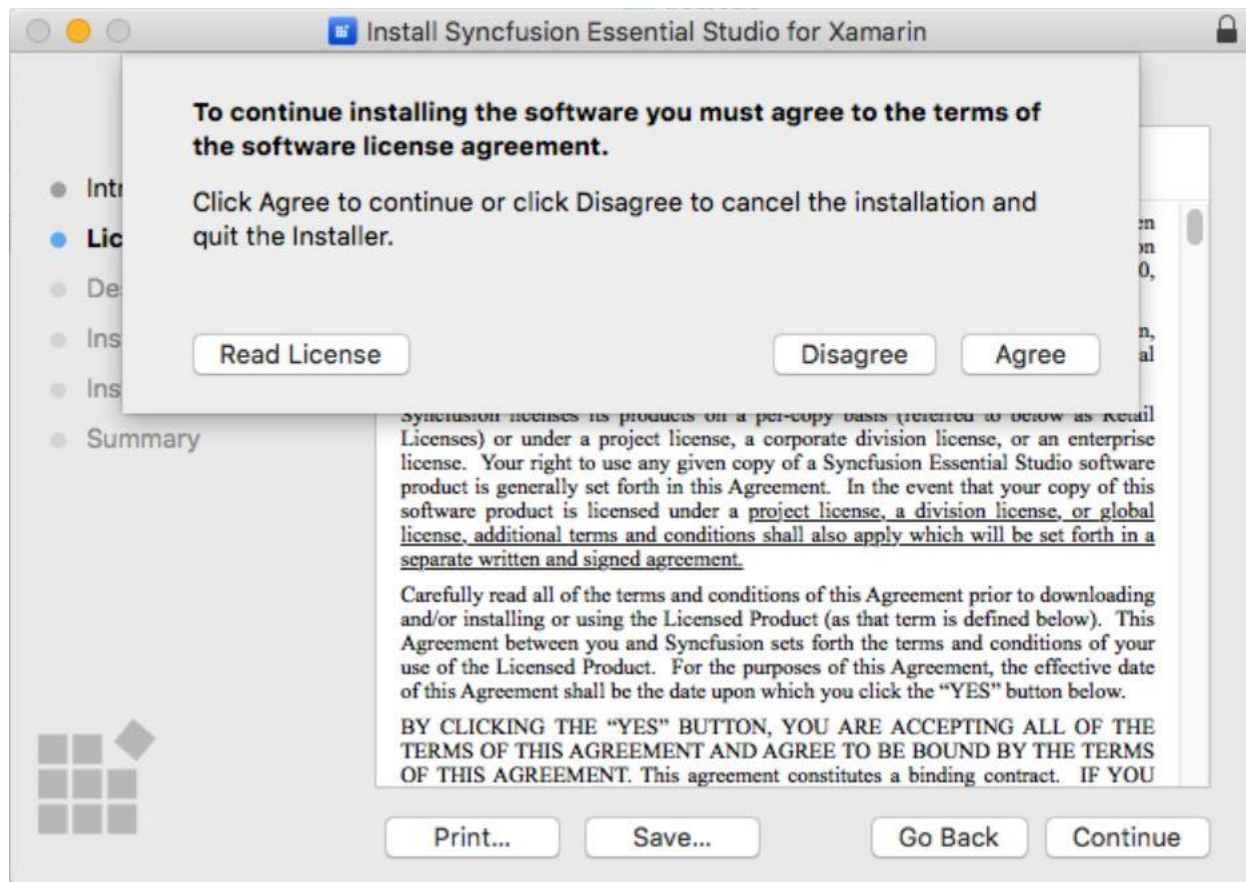

1. Double-click the Syncfusion Xamarin Mac Setup(.pkg) file. The Setup Wizard opens. Click Continue.

2. Software License Agreement window opens. Click Continue.

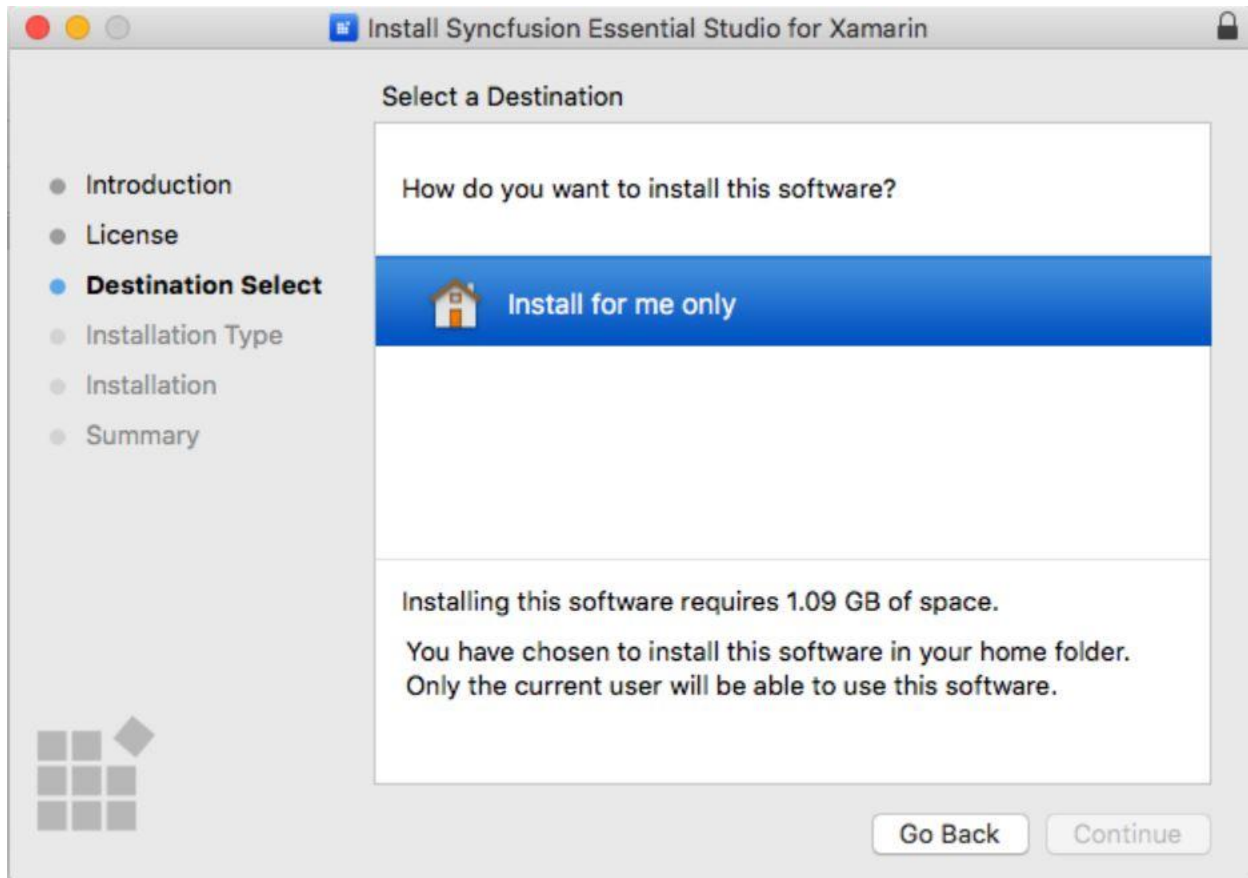

3. Confirmation window will be displayed for the License Agreement. Click **Agree**.

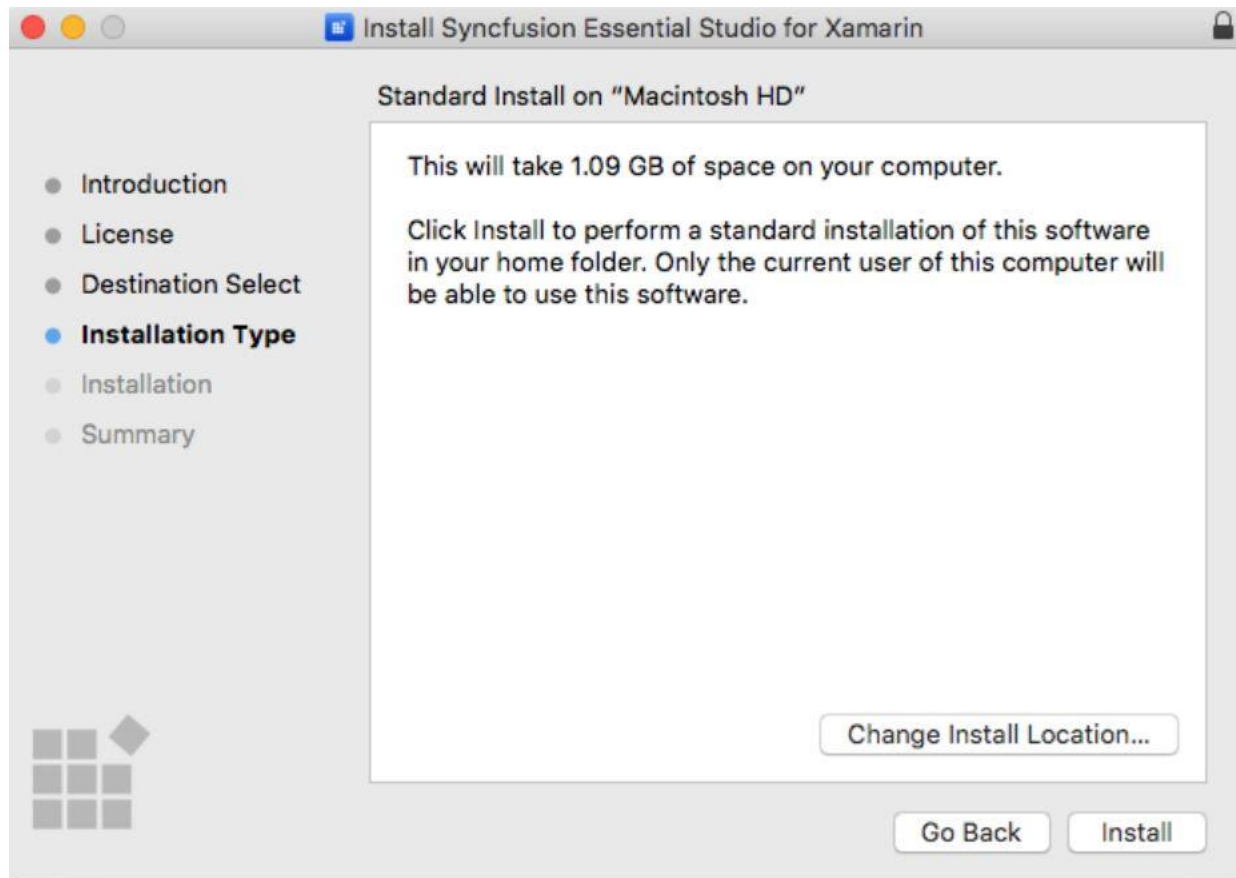

**Note:** Unlock key is not required for installing the Mac installer. Syncfusion Mac installer can be used for developing purposes without registering the Unlock key.

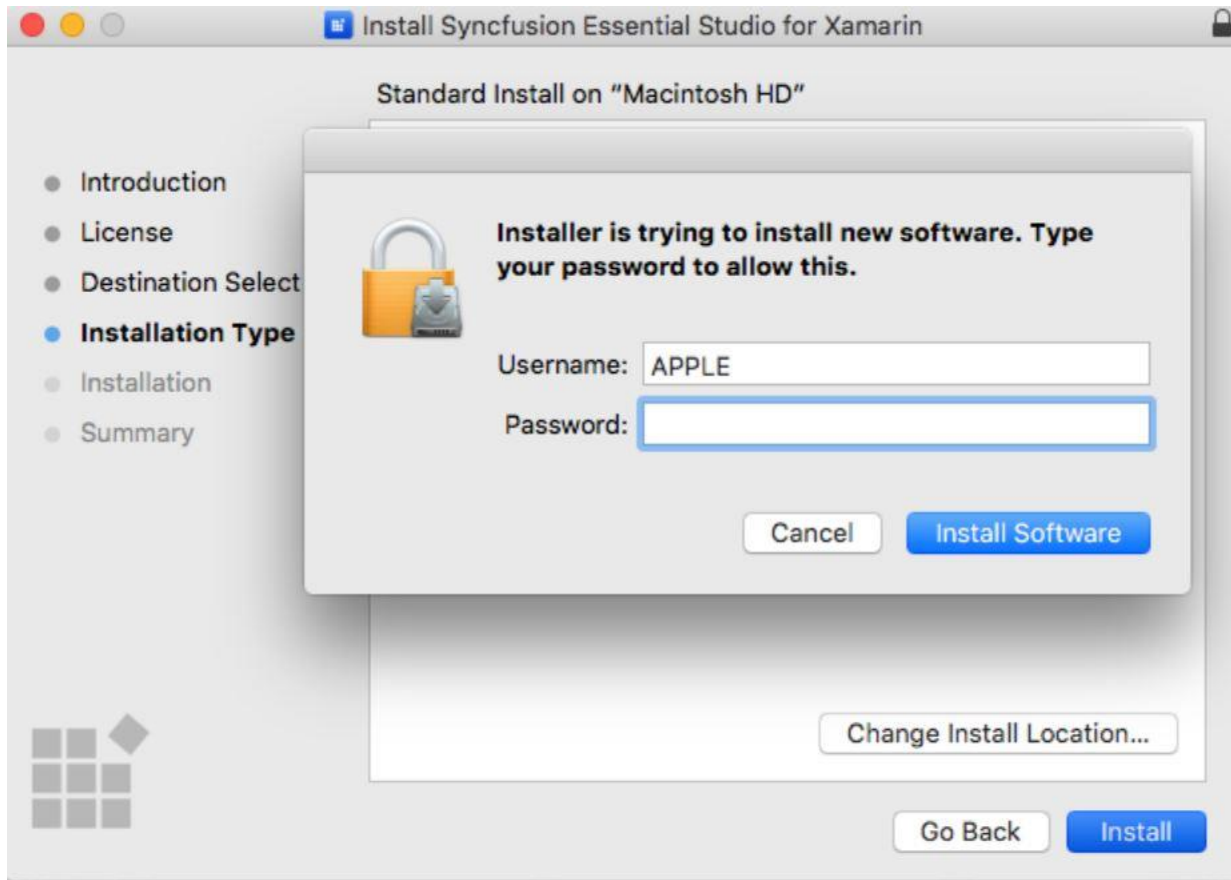

4. Destination Select windows opens. Click Continue.

5. Installation Type window opens. Click Install.

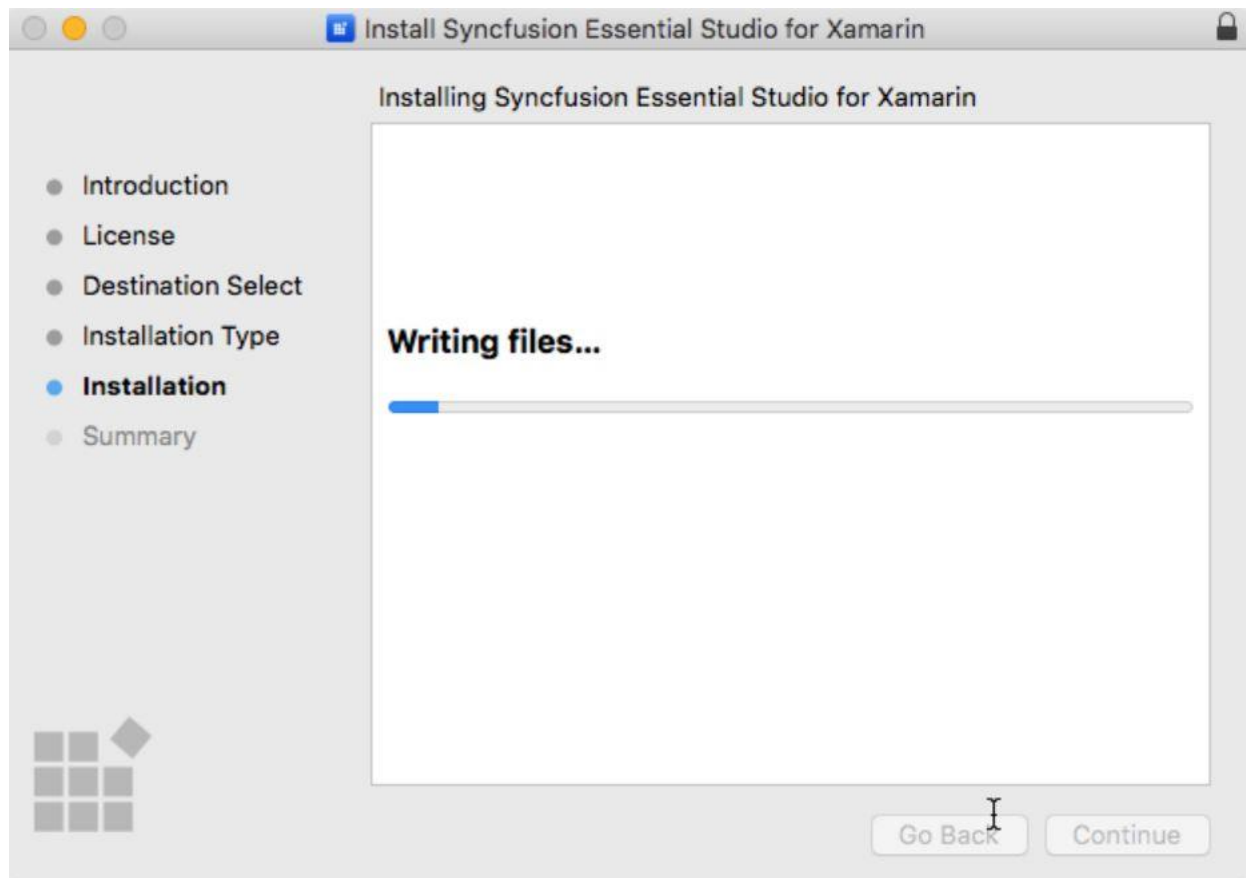

6. Authentication window opens. Provide the password and click **Install Software**

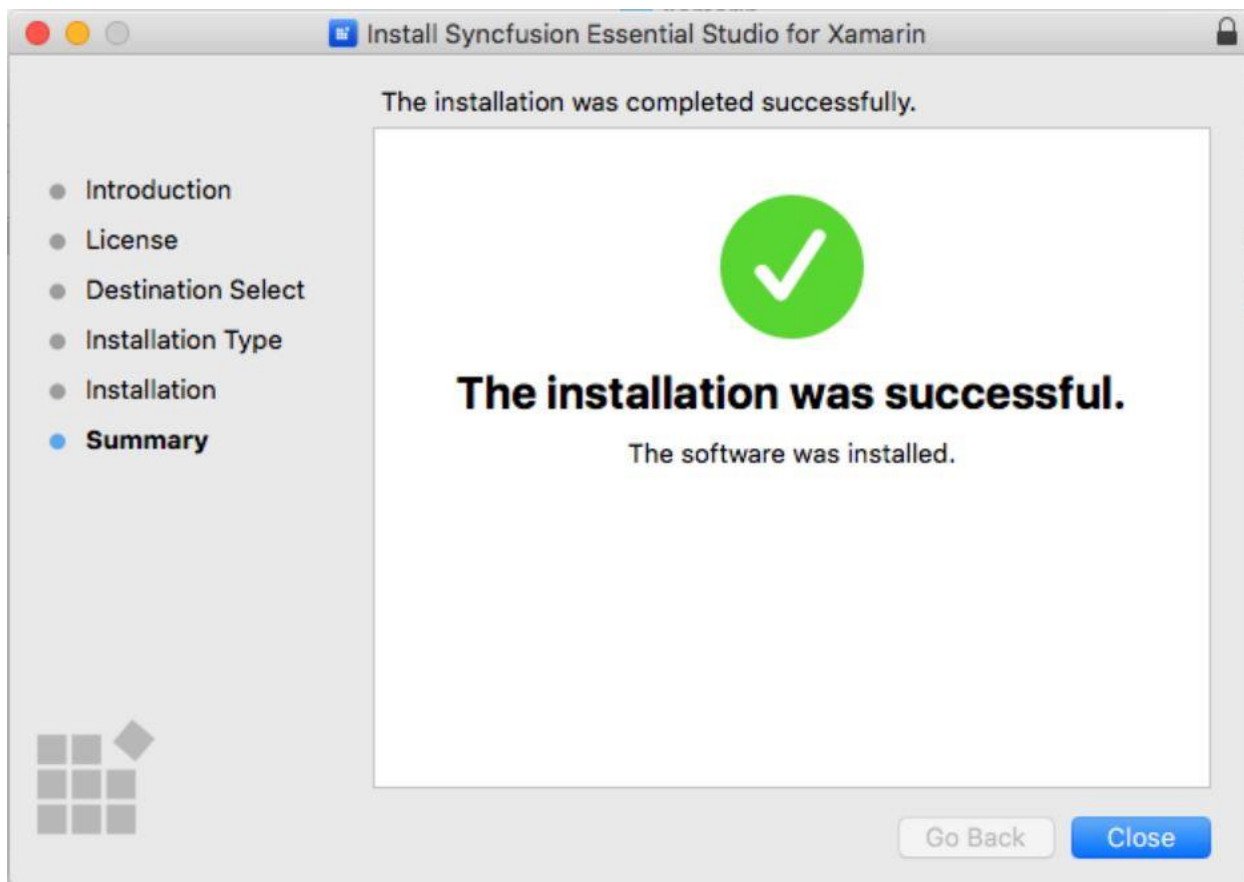

7. Installation will be started in your machine.

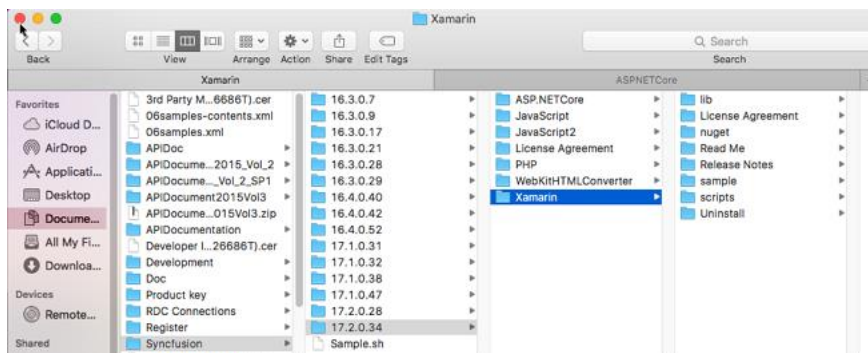

8. Completed screen will be displayed once the installation is finished. Click Close to exit the installation wizard.

By default, Mac installer will install the files in following location.

**Location:** {Documents}\Syncfusion\{version}\{platform}

#### [Explore the libraries package](#)

You can find the Syncfusion libraries, samples and NuGet from the installed location in Mac.

{Essential Studio installed location}\Syncfusion\Essential Studio\{version}\Xamarin

- **“lib”** folder - e.g., /Users/labuser/Documents/Syncfusion/16.2.0.41/Xamarin/lib

It contains all the required libraries for Xamarin.iOS, Xamarin.Android, and Xamarin.Forms projects.

- **“nuget”** folder - e.g., /Users/labuser/Documents/Syncfusion/16.2.0.41/nuget

It contains the above libraries as NuGet packages. The same NuGet packages also can be configured from online [nuget.org](https://nuget.org).

- **"sample"** folder - e.g., /Users/labuser/Documents/Syncfusion/16.2.0.41/sample

It contains the sample applications for our controls in Xamarin.iOS, Xamarin.Android, and Xamarin.Forms platforms in iOS, Android, and Forms folders, respectively.

The "Forms" directory includes,

- Individual control sample folders: It contains the samples for individual controls such as SfChart, SfDataGrid, etc. Since they represent the individual controls, these samples are light-weighted. You can check the samples for your required controls alone faster with minimum deployment time.
- "nuget" folder: It contains the compiled assemblies of the above samples as NuGet package. It is referred in the common sample browser as explained in the next step.
- "SampleBrowser" folder: It contains common sample browser, which refers the individual control's samples as NuGet package. Run this to see the demo samples of all the controls in single application.
- It also contains showcase samples such as Patient Monitor, Server Monitor, and Invoice.

#### *Add reference to the project*

You can then add the assembly references to the respective projects such as PCL, XForms.Droid, XForms.iOS. You can find the dependencies for each control from this [link](#).

---

**Information:** After adding the reference, currently, an additional step is required for iOS and UWP projects. For example, if we are using SfKanban, we need to call the Init method of SfKanbanRenderer as shown in this [KB article](#).

---

#### Installation FAQ

Refer [this](#) topic for more information regarding the issues related to installation.

#### Upgrade from one version to another version.

You can upgrade to the latest version by downloading and installing the platforms you require from [this](#) link.

#### Upgrade from major version to service pack version

Syncfusion provides a new Volume release once in every three months which has exciting new features. For that Volume release, there may be one or two Service Pack releases. The issues in the Volume release will be addressed in the Service Pack releases. You can download and install the latest Service Pack setup [here](#).

It is not required to install the Volume release setup before installing the Service Pack release setup. As Volume and Service Packs releases works independently, you can directly install the latest Service Pack setup which contains major issue fixes.

#### Upgrade from trial version to license version

To upgrade from trial version, there are two possible solutions.

- Uninstall the trial version and install the fully licensed build from the [License & Downloads](#) section of our website.

- Replace the currently used trial license key with a paid license key that can be generated from the [License & Downloads](#) section of our website. Refer to [this](#) topic for more information regarding registering the license in the application.

**Note:** License registration is not required if you reference Syncfusion assemblies from Licensed setup. These licensing changes applicable to all evaluators who refers the Syncfusion assemblies from evaluation setup and those who use Syncfusion NuGet packages from [nuget.org](https://nuget.org).

## Visual Studio Integration

### Overview

The Syncfusion Xamarin Visual Studio Extensions can be accessed through the Syncfusion Menu to create and configure the project with Syncfusion references in Visual Studio.

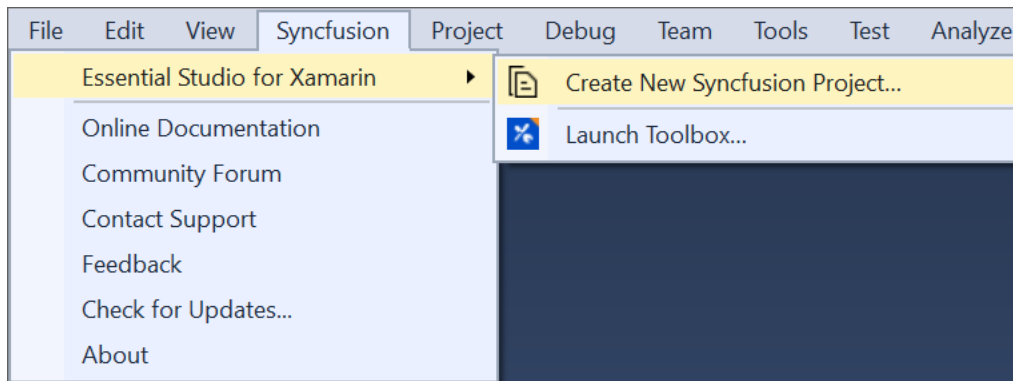

**Note:** Syncfusion Extension is published in Visual Studio Marketplace. You can download Xamarin Extensions [here](#).

**Information:** The Syncfusion Xamarin menu option is available from v17.1.0.32.

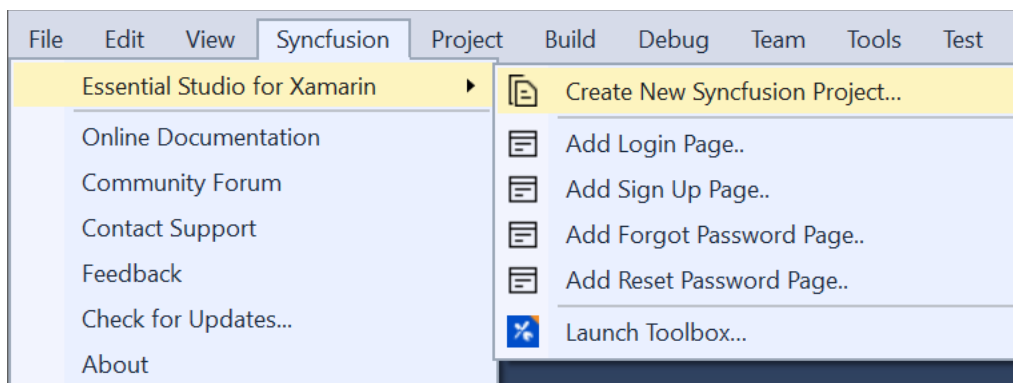

The Syncfusion provides the following extension supports in Visual Studio:

1. [Create Project](#): To create a Syncfusion Xamarin application by adding the required Syncfusion NuGet based on the control chosen.
2. [Item Template](#): Add the predefined Syncfusion items (Pages) in Xamarin.Forms and install the required Syncfusion NuGet packages.
3. [Toolbox](#): Add the Syncfusion Xamarin components in Xamarin.Forms designer from Syncfusion Toolbox.

### No project selected in Visual Studio

### Selected Microsoft/Syncfusion Xamarin (Xamarin.Forms) application in Visual Studio

---

**Note:** In Visual Studio 2019, Syncfusion menu is available under Extensions in Visual Studio menu.

---

## Visual Studio Extensions

### Create project

Syncfusion provides the Visual Studio Project Templates for the Syncfusion Xamarin platform to create the Syncfusion Xamarin Application by adding the required Syncfusion NuGet packages for the control chosen.

---

**Information:** The Syncfusion Xamarin Project Templates are available from v16.2.0.41.

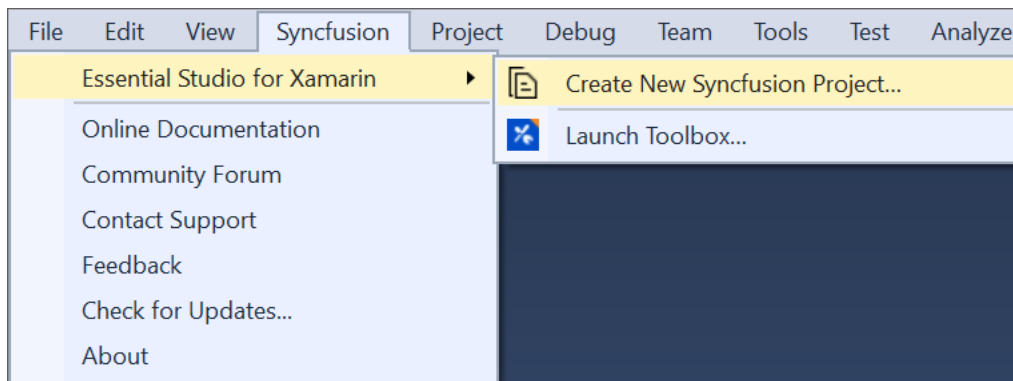

---

Use the following steps to create the **Syncfusion Xamarin Application** through the **Visual Studio 2017**:

1. To create a Syncfusion Xamarin project, follow either one of the options below:

#### Option 1:

Click **Syncfusion Menu** and choose **Essential Studio for Xamarin > Create New Syncfusion Project...** in **Visual Studio**.

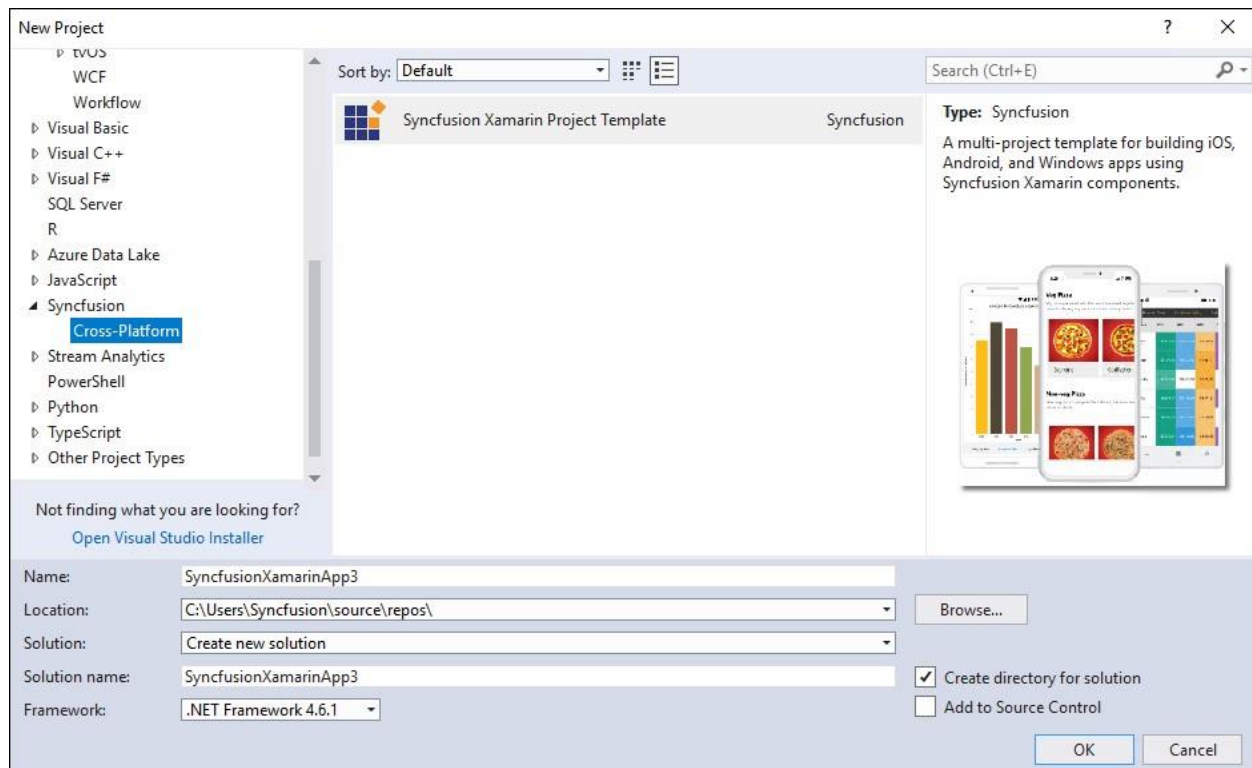

---

**Note:** In Visual Studio 2019, Syncfusion menu is available under Extensions in Visual Studio menu.

---

#### Option 2:

Choose **File > New > Project** and navigate to **Syncfusion > Cross-Platform > Syncfusion Xamarin Project Template** in **Visual Studio**.

2. Name the **Project**, choose the destination location, and set the Framework of the project, and then click **OK**. The Project Configuration Wizard appears.
3. Choose the options to configure the Syncfusion Xamarin Application by using the following Project Configuration dialog, choose the Project, Android, iOS, and UWP by on/off.

**New Project Configuration Wizard** Version 16.2.0.41

**Project Preference**

**Android** ☒

Minimum Android Version: Android 7.1 (API Level 25)

Target Android Version: Use Compile using SDK version

**iOS** ☒

Target Device: Universal

Target Version: 11.3

**UWP** ☒

Assemblies From: NuGet

**Choose controls**

Search here

- ☐ Autocomplete
- ☐ Bar Code
- ☐ Busy Indicator
- ☐ Calendar
- ☐ Carousel
- ☐ Chart
- ☐ Checkbox
- ☐ Circular Gauge
- ☐ Combo Box

Total Selected Controls: 0 [Clear All](#)

[Syncfusion](#) | [Help](#) | [Support](#) **Create** **Cancel**

### Project Configuration:

**Assemblies From:** Load the Syncfusion Xamarin reference to Xamarin Application, either NuGet or Installed Location.

**Note:** Installed location option will be available only when the Syncfusion Xamarin setup has been installed.

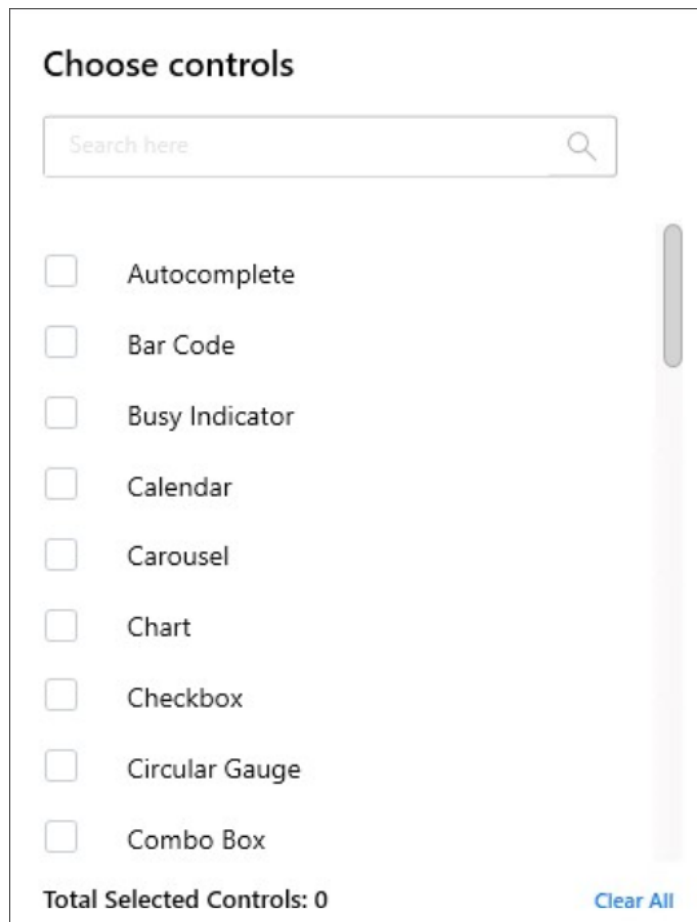

### Android

1. **Minimum Android Version:** Select the oldest Android version that you want to support your application.
2. **Target Android Version:** Select the version of Android to run your application.

### iOS

1. **Target Device:** Select the device of Xamarin.iOS project either Unified, iPhone/iPod, or iPad. 2. **Target Version:** Choose the version of Xamarin.iOS Project.

**Choose controls:** Choose the Xamarin application needs to create with the Syncfusion controls.

4. Click **Create**, the Syncfusion Xamarin Application has been created.

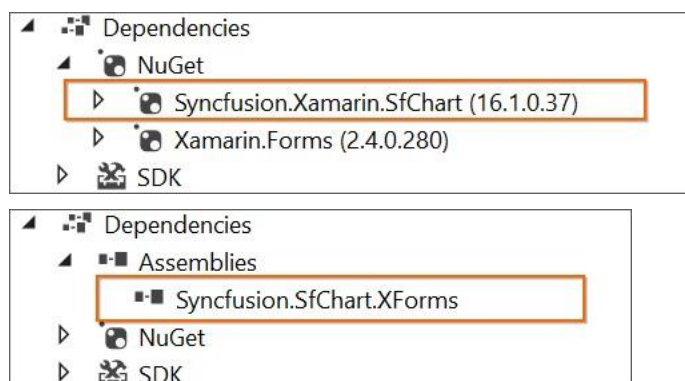

---

**Note:** Choose any one of the project type and controls from Project Configuration Wizard.

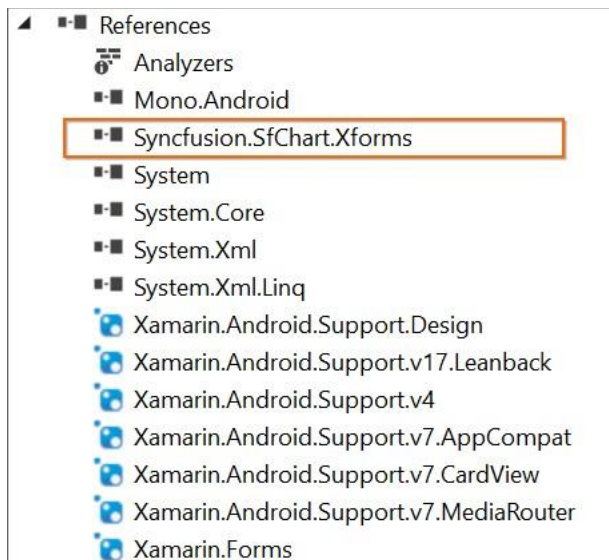

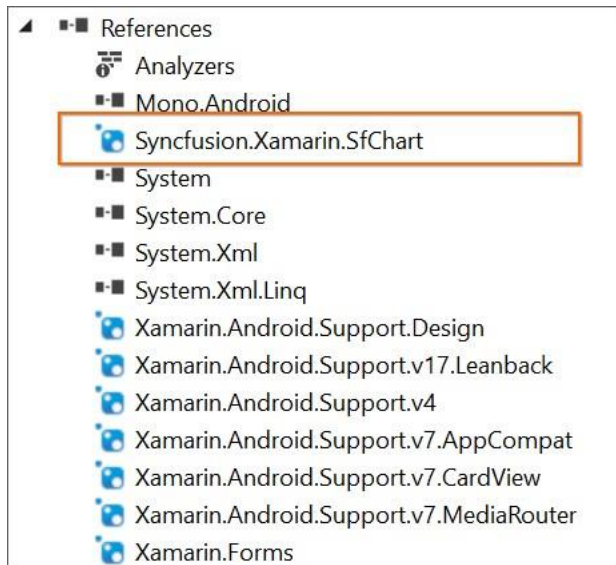

---

5. Required Syncfusion NuGet/Assemblies and configuration have been added to the project based on the control chosen.

#### Net Standard /PCL

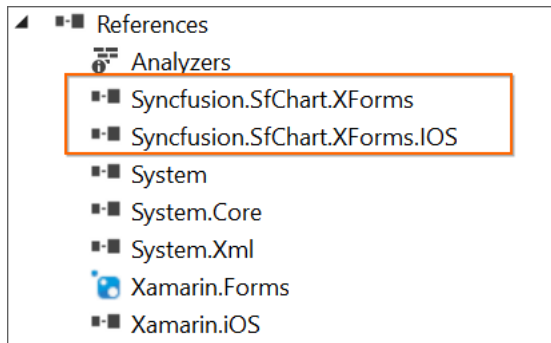

#### Android

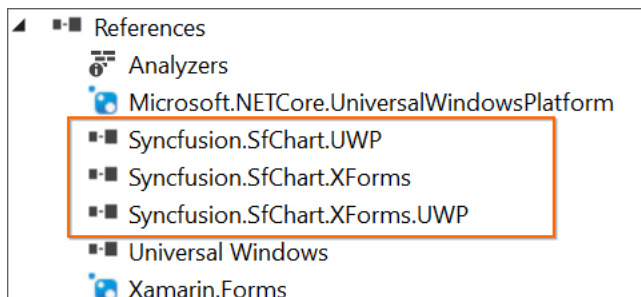

## iOS

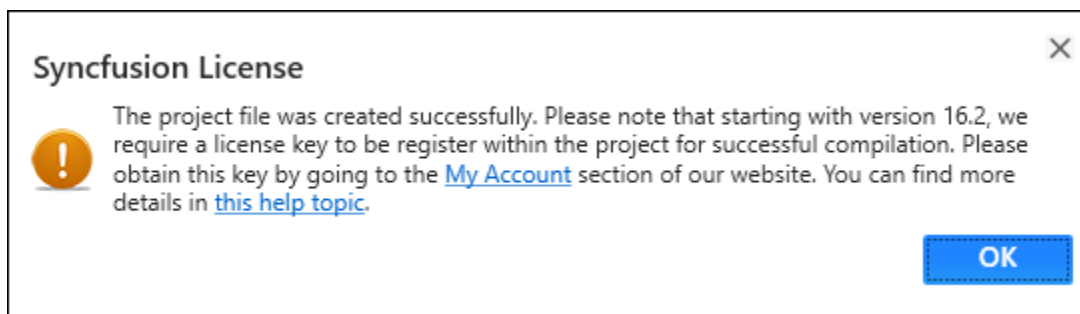

## UWP

6. Then, Syncfusion licensing registration required message box will be shown, if you installed the trial setup or NuGet packages since Syncfusion introduced the licensing system from 2018 Volume 2 (v16.2.0.41) Essential Studio release. Navigate to the [help topic](#), which is shown in the licensing message box to generate and register the Syncfusion license key to your project. Refer to this [blog](#) post for understanding the licensing changes introduced in Essential Studio.

## Toolbox control

Syncfusion provides the customized **Visual Studio Toolbox** for the Syncfusion Xamarin platform to add the Syncfusion Xamarin (Xamarin.Forms) controls in your project. It supports Microsoft Visual Studio 2017 and later. The Syncfusion Xamarin toolbox helps you use the Syncfusion controls without coding in the Visual Studio designer.

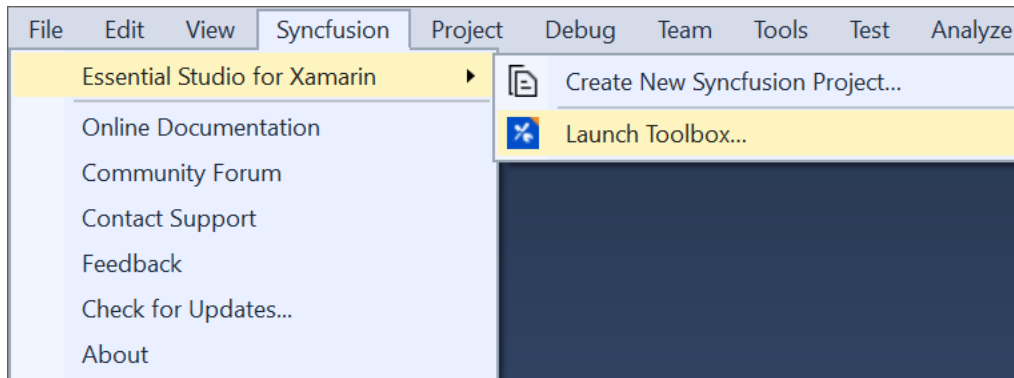

**Information:** The Syncfusion Xamarin Toolbox is available from v16.2.0.41.

Create the Xamarin or Syncfusion Xamarin project. The following steps help you add the Syncfusion controls through the Visual Studio Toolbox:

1. To open Syncfusion Toolbox Wizard, follow either one of the options below:

**Option 1:**

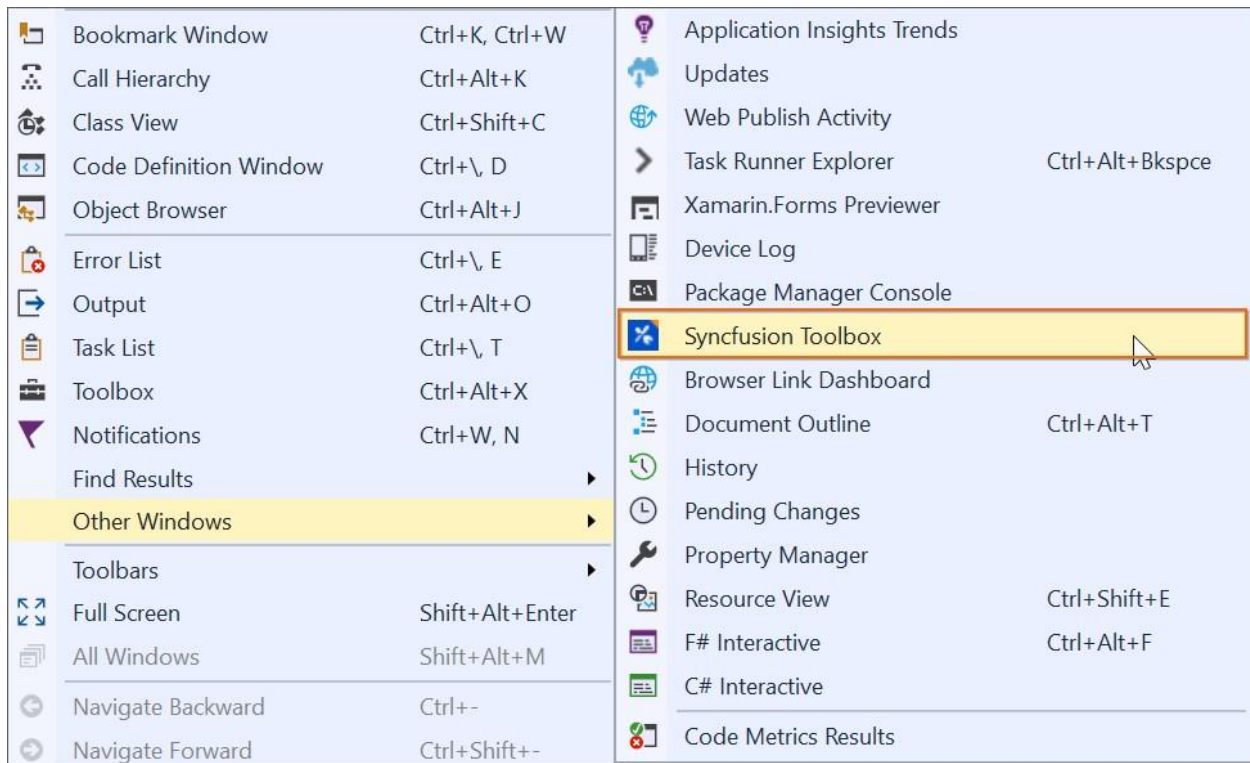

Click **Syncfusion Menu** and choose **Essential Studio for Xamarin > Launch Toolbox...** in **Visual Studio**.

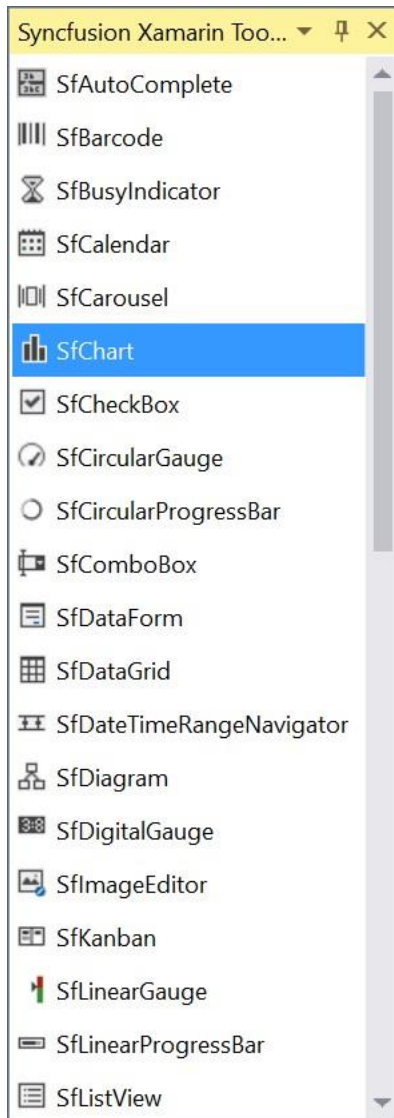

**Note:** In Visual Studio 2019, Syncfusion menu is available under Extensions in Visual Studio menu.

**Option 2:**

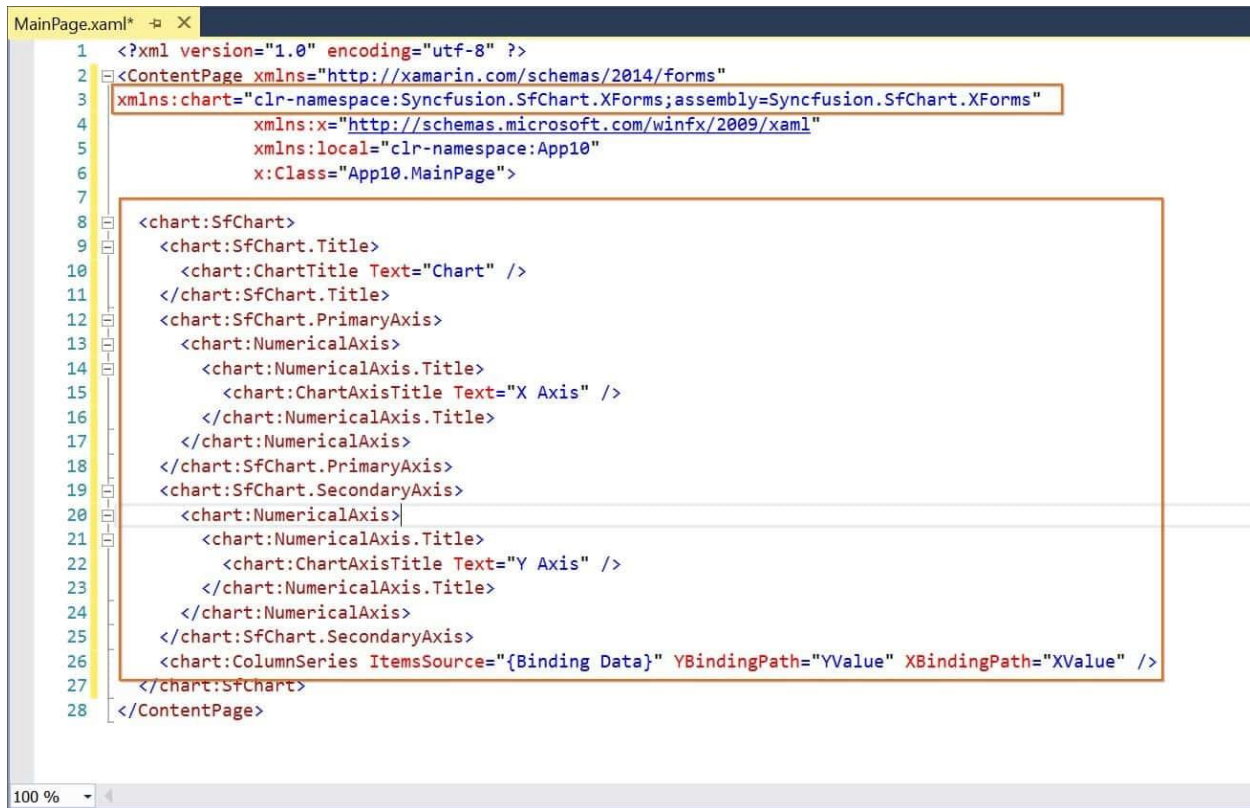

Choose **View > Other Windows > Syncfusion Toolbox** in **Visual Studio**.

2. Click **Syncfusion Toolbox** menu item, the Syncfusion Toolbox wizard appears. The Syncfusion control will be enabled when opening the Xamarin.Forms designer page. There is no Syncfusion control appears until open the appropriate .xaml file from the Xamarin shared/.NET Standard /PCL project.

3. The required Syncfusion controls design (.xaml) snippet and namespace will be added by drag and drop the required control from the toolbox to the designer.

Also, the required control Syncfusion Xamarin NuGet packages will be installed automatically when drag and drop the control to the designer to render the Syncfusion control.

### Essential UI Kit

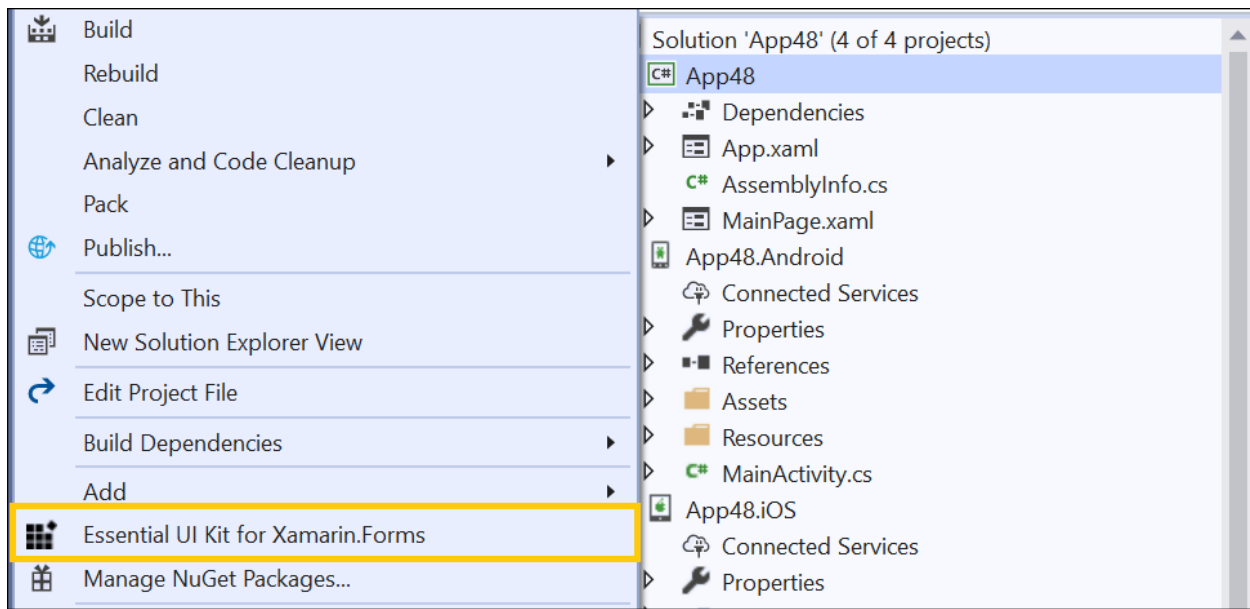

Essential UI Kit for Xamarin.Forms includes predefined XAML templates for Xamarin.Forms apps. The UI kit allows to build a user interface in a cross-platform application. It provides a clear separation of View, View Model, and Model classes, so integrating your business logic and making changes in the existing view is simple.

#### Installation of Xamarin UI Kit Extension

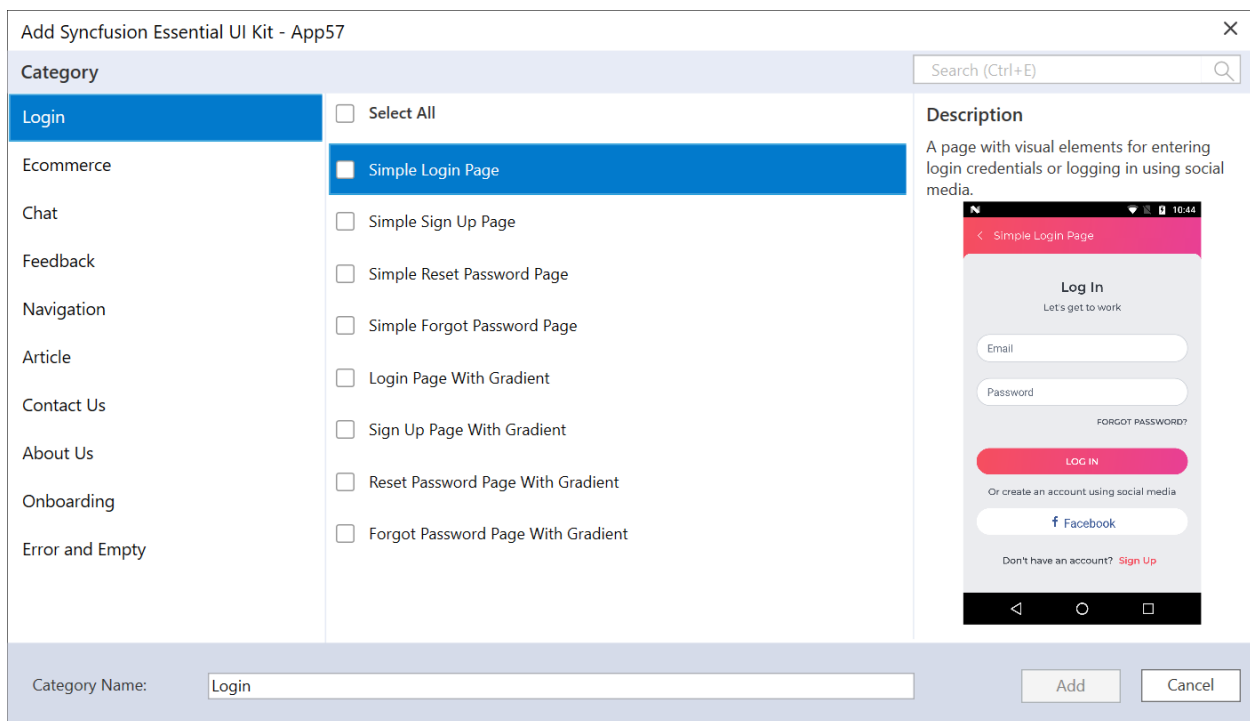

Download the necessary [Xamarin UI Kit Extension](#) from the market place and install them in your Visual Studio. So that, you can use the Syncfusion Extension from Syncfusion menu of your project.

#### Creating Syncfusion Xamarin application

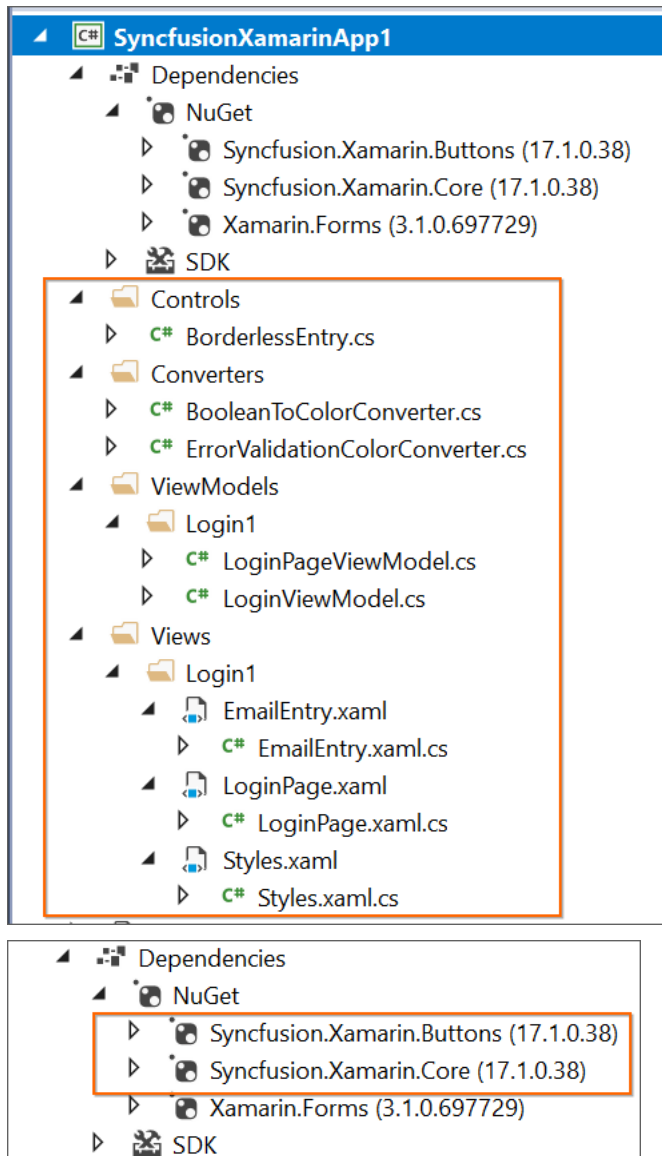

1. Open a new or existing Xamarin application.
2. Right-click on your **Xamarin.Form** project from the **Solution Explorer** and select the **Syncfusion UI for Xamarin** option.

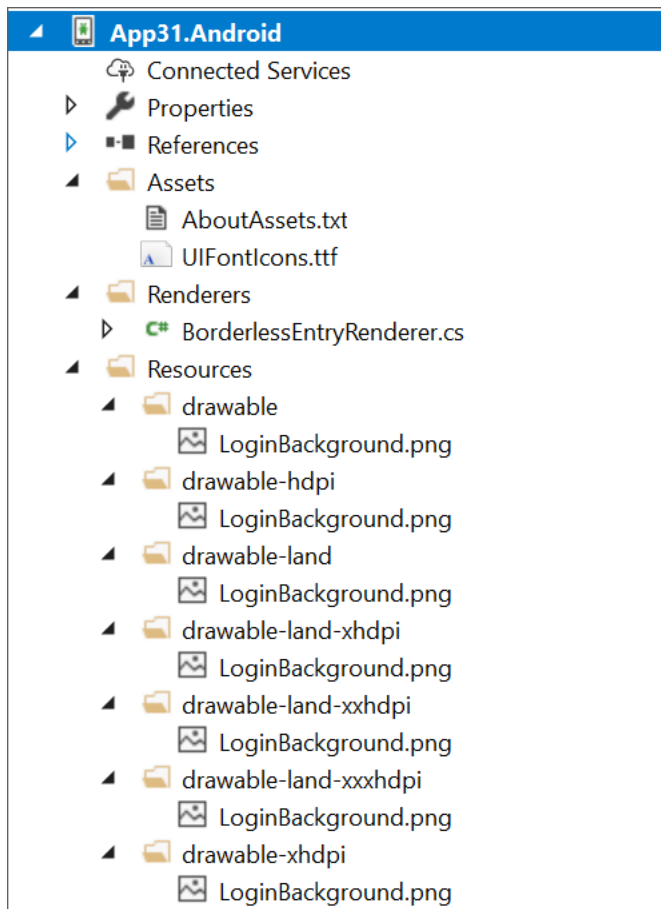

3. Then the Category dialog window will open with its predefined template

4. Now, add the desired pages of the any number of predefined categories
5. The selected pages will be added along View, ViewModel, Model classes, resource files and Syncfusion NuGet package reference,

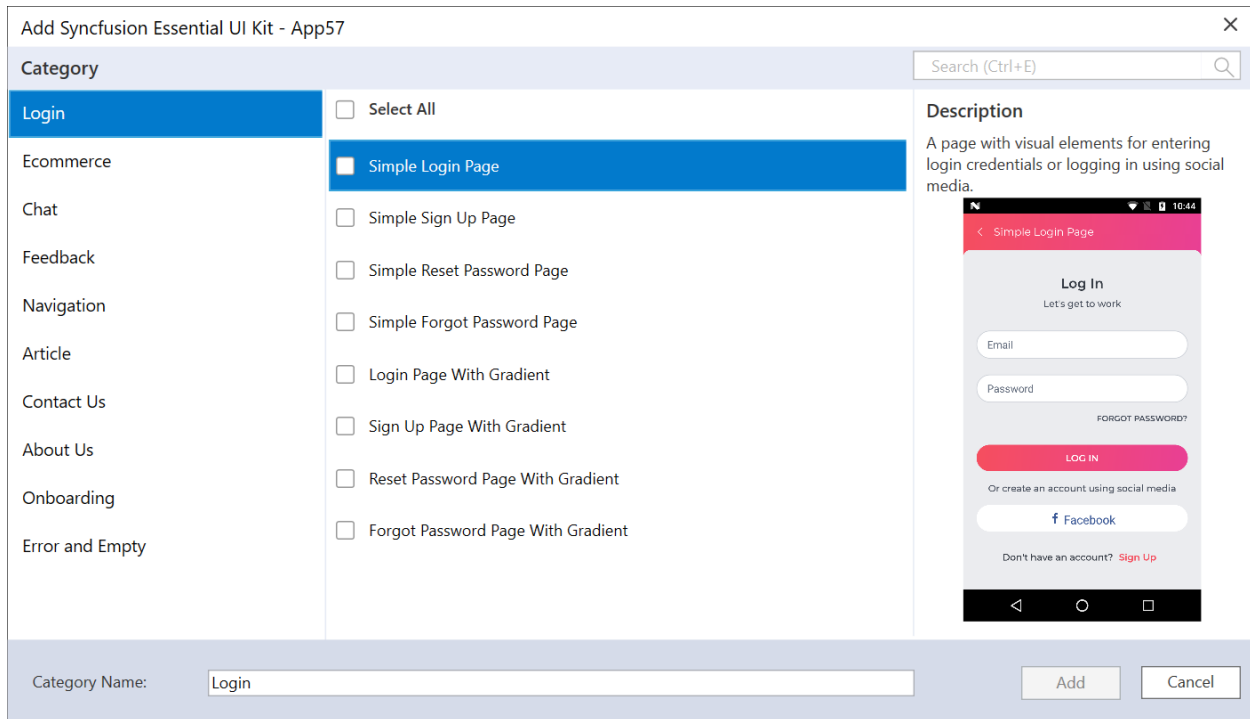

#### *Template Selection and naming*

The name of the categories such as Login, Chat, E-Commerce page can be changed while adding it to your project. Therefore, the corresponding category will be displayed with the provided name in the View, ViewModel and Model classes of the application.

The main advantage of category dialog window is to choose multiple pages from multiple categories of the UI templates at the time of addition.

#### Run the UI template item

To set the desired UI Template item as the start page of your application, Open the **App.xaml.cs** and make the following changes.

MainPage=new application name.Views.

**Item name**.selected template page name();

Example: If you added Login Page,

MainPage=new App1.Views.Login.LoginPage();

#### Check for Updates

Syncfusion provides the Extensions to update most recent version of the Essential Studio release. So that, you always get the latest features, fixes, and improvements by installing the latest version.

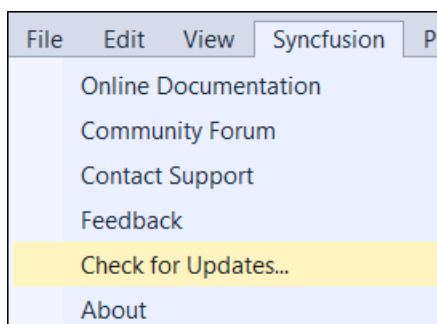

---

**Information:** The Syncfusion Check for updates is available from v17.1.0.32.

---

You can check updates availability in Visual Studio, and then install the update version if required.

1. Choose **Syncfusion -> Check for Updates...** in the Visual Studio menu

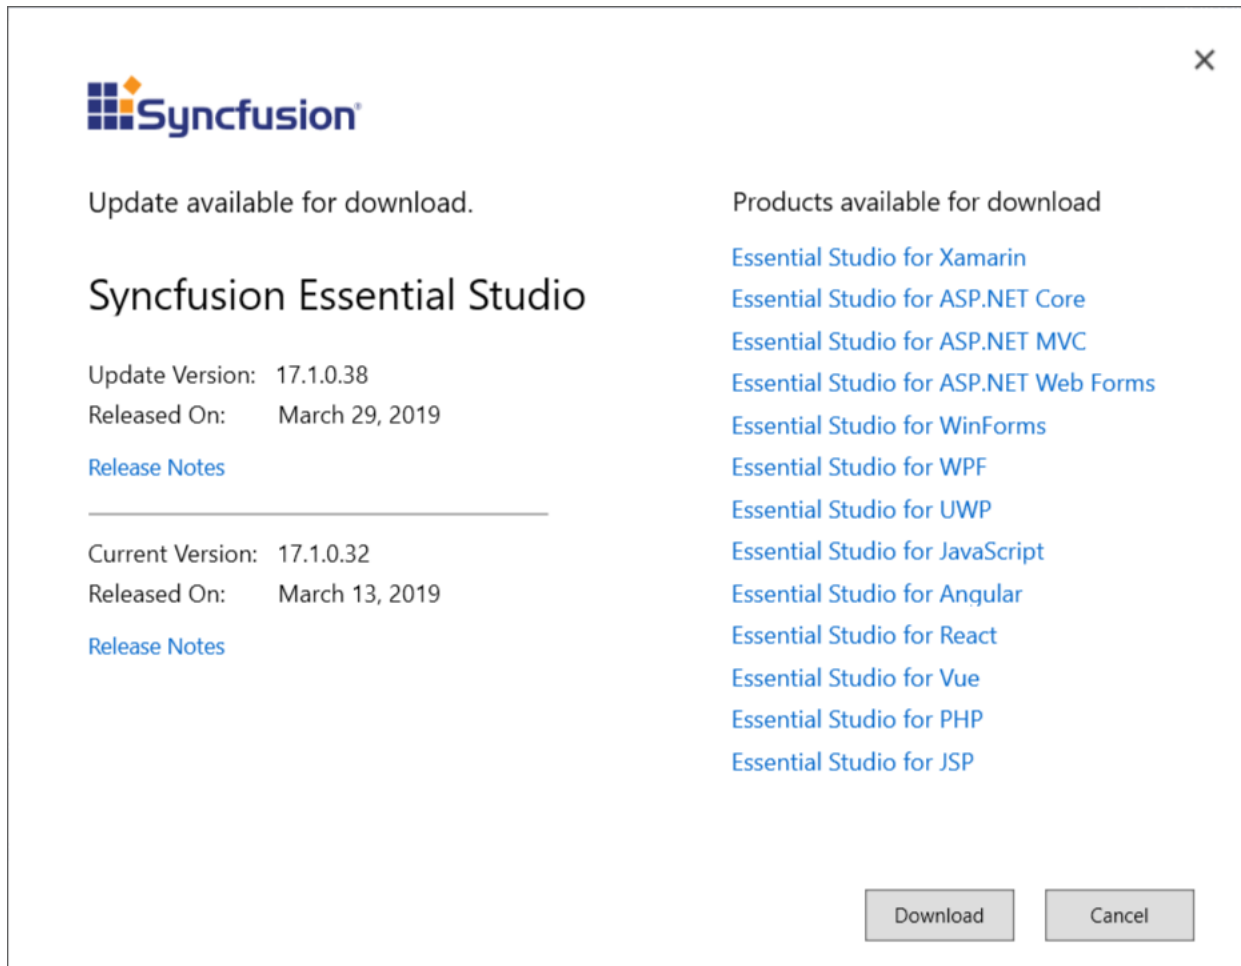

---

**Note:** In Visual Studio 2019, Syncfusion menu is available under Extensions in Visual Studio menu.

---

2. When there is an update, **Update** dialog box opens.

3. You can download the Syncfusion Essential Studio from the Syncfusion website by selecting **Download**.

## Visual Studio Mac Extensions

### Overview

The Syncfusion Essential Studio for Xamarin Visual Studio for Mac extensions that allow you to create the Xamarin application in Visual Studio for Mac with the Syncfusion components.

---

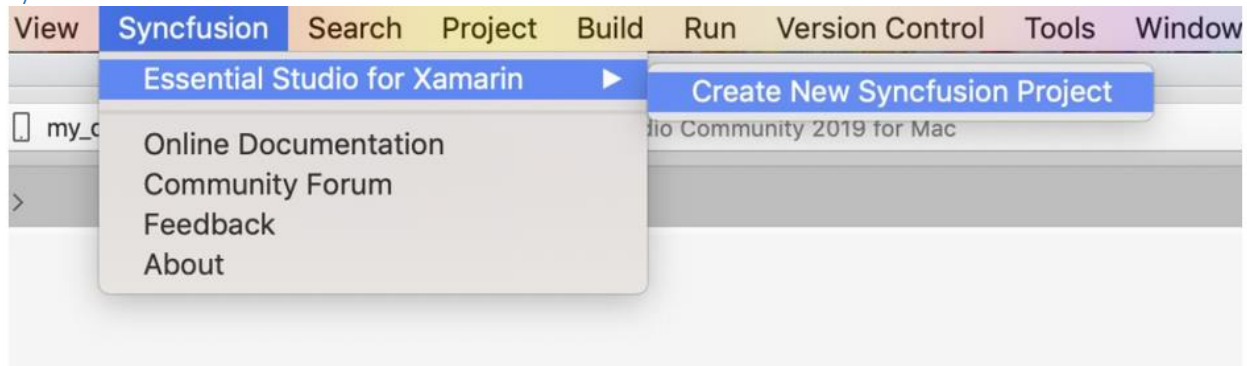

**Information:** The Syncfusion Xamarin Mac Extensions Support for Visual Studio for Mac 2019 and it is available from v17.3.0.9.

---

The Syncfusion provides the following extension supports in Visual Studio for Mac:

[Project template](#): To create a Syncfusion Xamarin application by adding the required Syncfusion NuGet based on the control chosen.

## Syncfusion Menu

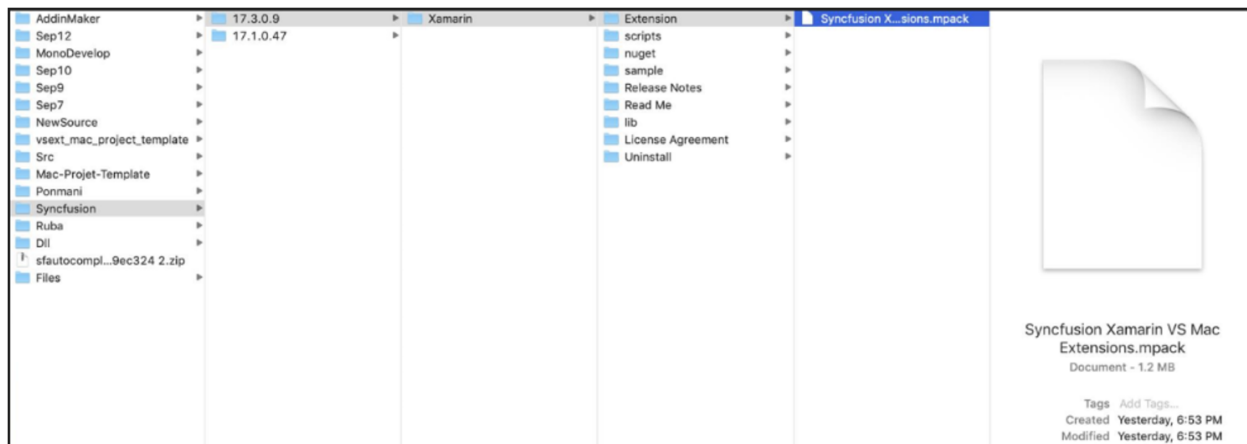

## Installation

The following procedure illustrates how to install Syncfusion Xamarin Extension in Visual Studio for Mac.

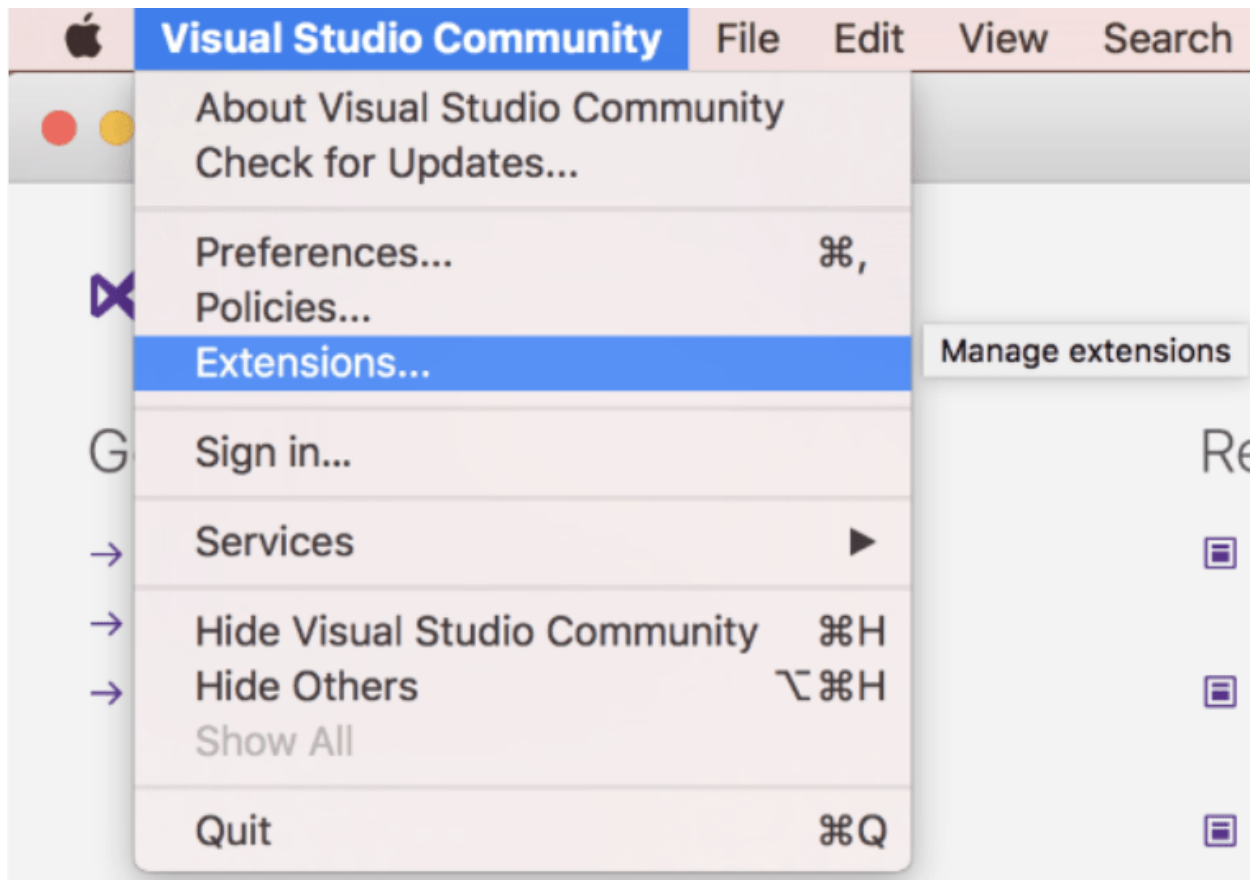

Follow [this guideline](#) to install the Essential Studio for Xamarin Mac build if not installed, then you will get the Visual Studio for Mac Extensions in installed location.

**Location:**

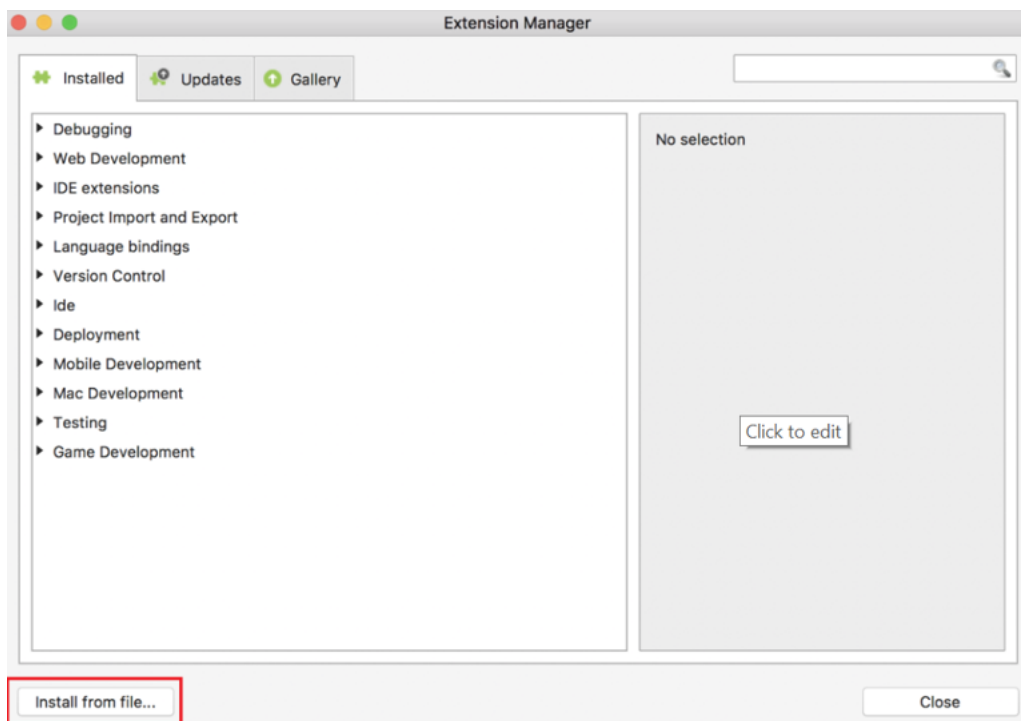

Eg: {Documents}\Syncfusion\ {version}\Xamarin\Extension\Syncfusion Xamarin VS Mac Extensions.mpack

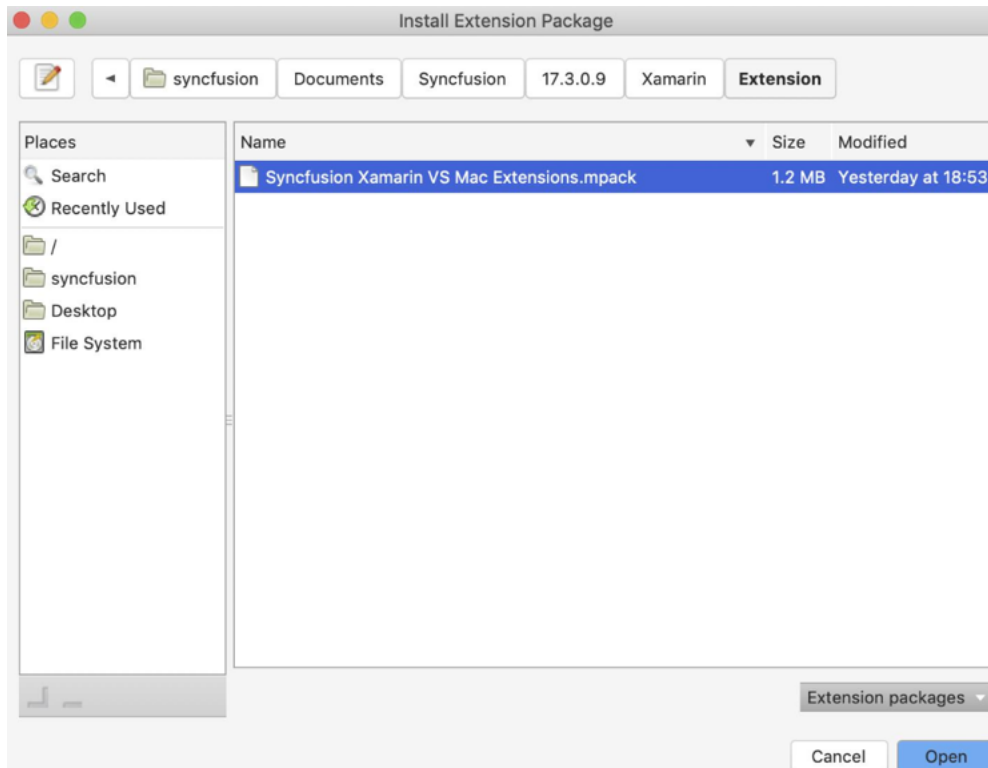

2. Open the Visual Studio 2019 for Mac.
3. Click the Visual Studio Community/Professional/Enterprise and select the Extensions...

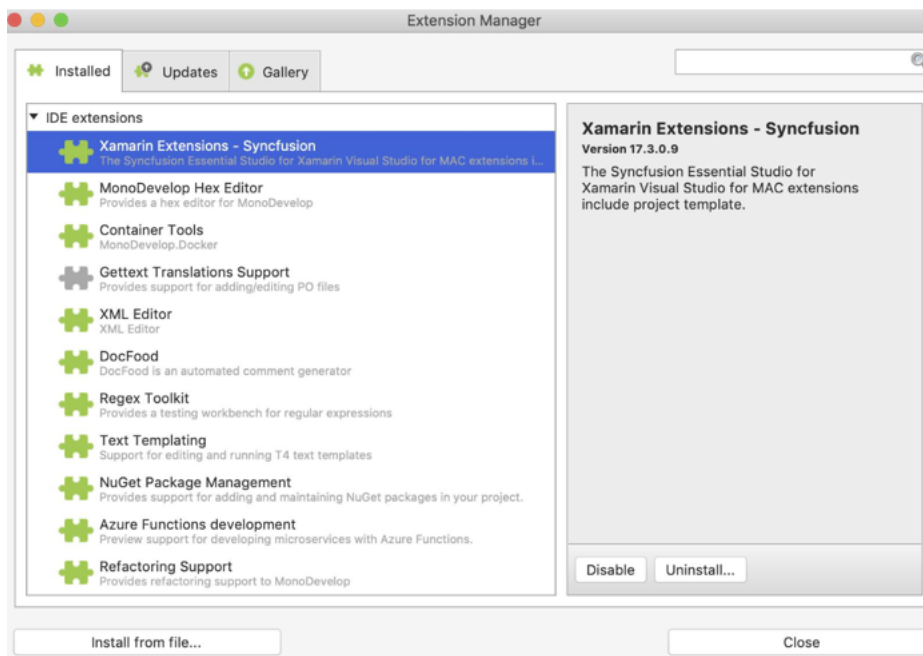

4. The Extension Manager window will open. Select the Install from file...

5. The Install Extension Package dialog will open. Navigate to Syncfusion Xamarin Mac Extensions file(.mpack) location which explained in above and click open to install.

6. Once the extension installed, the Syncfusion Xamarin Extension will listed in the IDE extension section.

### Create Project

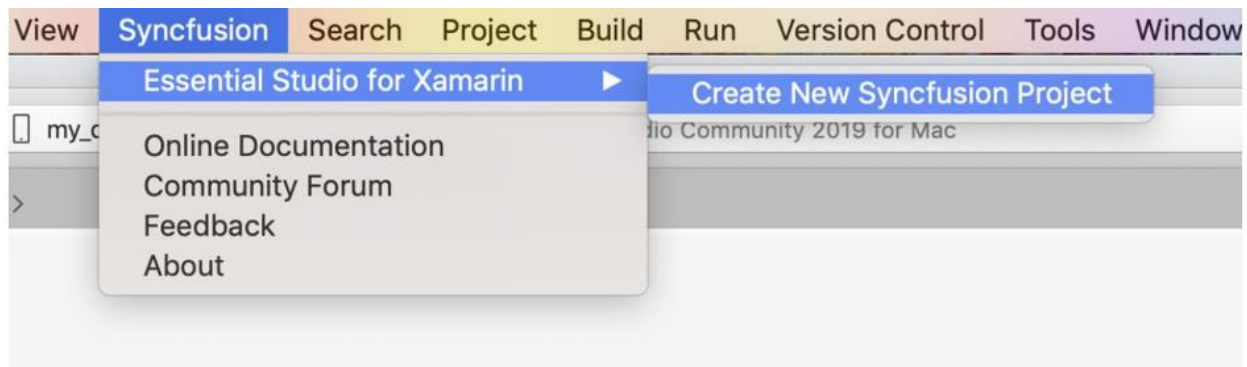

Syncfusion provides the Visual Studio for Mac Project Templates for Xamarin platform to create the Syncfusion Xamarin Application by adding the required Syncfusion NuGet packages.

Use the following steps to create the Syncfusion Xamarin Application through the Visual Studio 2019 for Mac:

1) To create a Syncfusion Xamarin project, follow either one of the options below in Visual Studio for Mac.

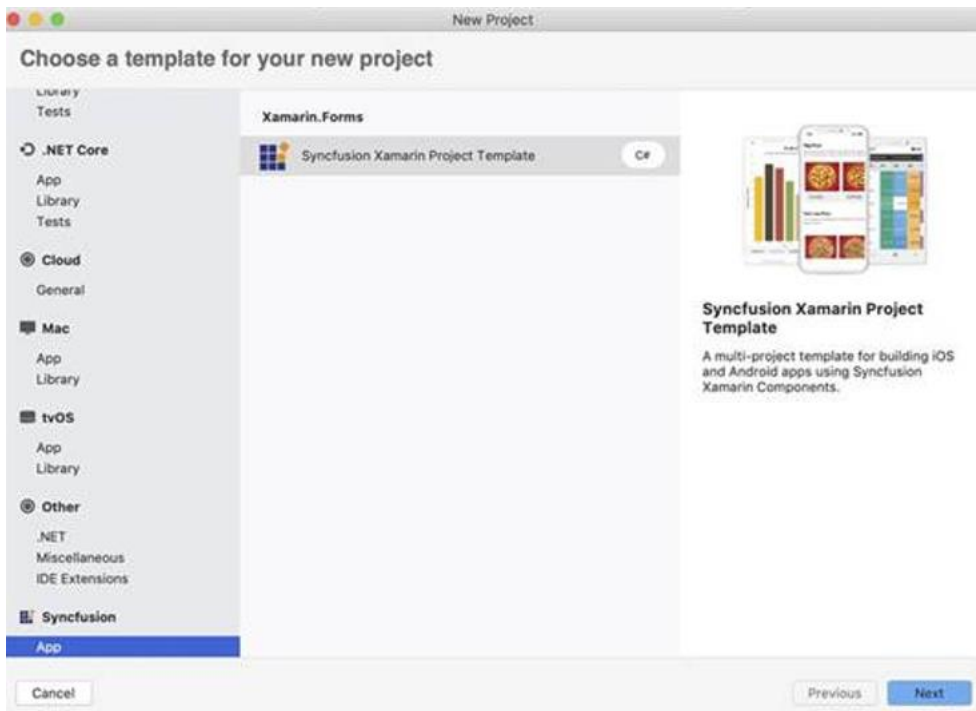

Option 1:

Click **Syncfusion Menu** and choose **Essential Studio for Xamarin > Create New Syncfusion Project**.

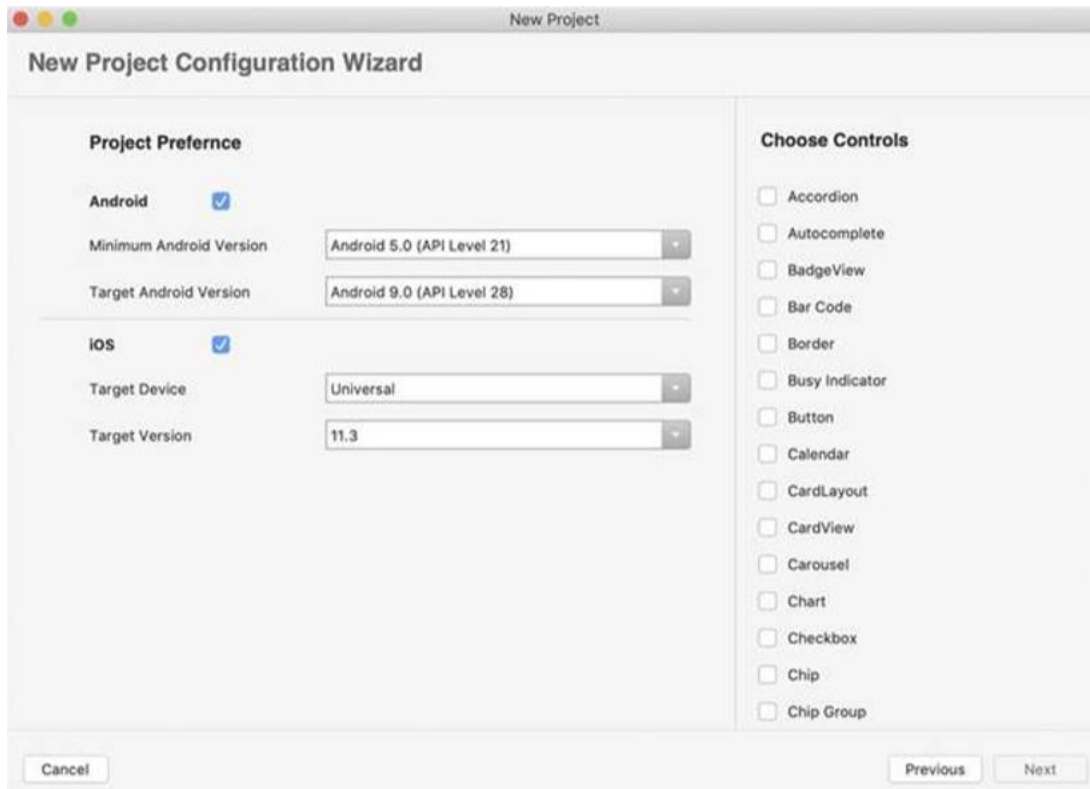

Option 2:

Choose **File > New > Project** and navigate to **Syncfusion > App > Syncfusion Xamarin Project Template**.

2) Configure the Syncfusion Xamarin Application by using the following Project Configuration dialog, choose the project Android and iOS by toggling respected checkbox and Syncfusion components.

#### Android:

- 1. Minimum Android Version:** Select the oldest Android version that you want to support your application.
- 2. Target Android Version:** Select the version of Android to run your application.

#### iOS:

- 1. Target Device:** Select the device of Xamarin.iOS project either Unified, iPhone/iPod, or iPad
- 2. Target Version:** Choose the version of Xamarin.iOS Project.

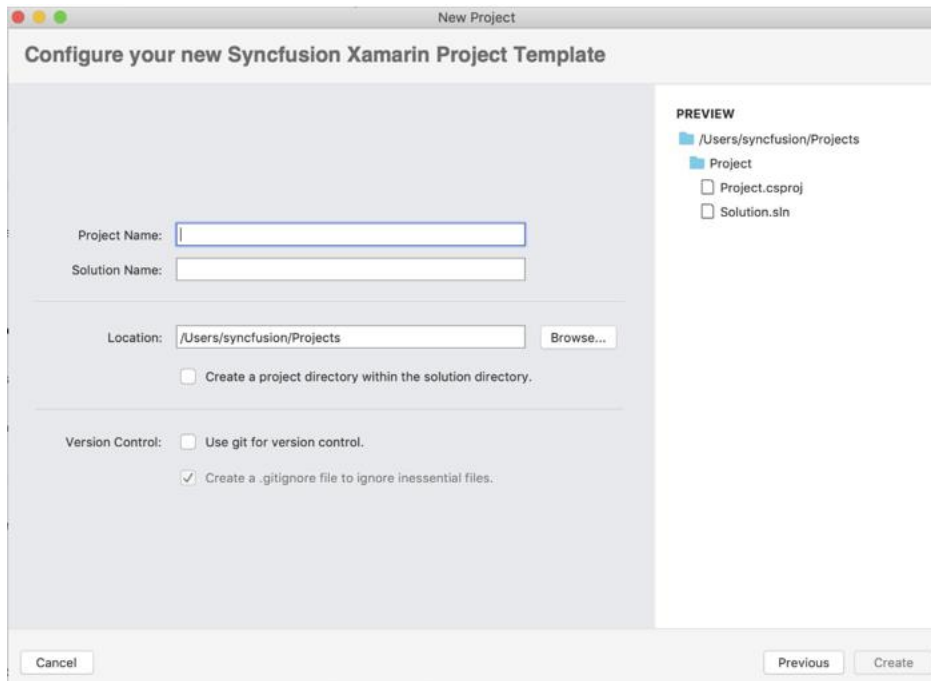

#### Choose controls:

Choose the Xamarin application needs to create with the Syncfusion controls.

**Choose Controls**

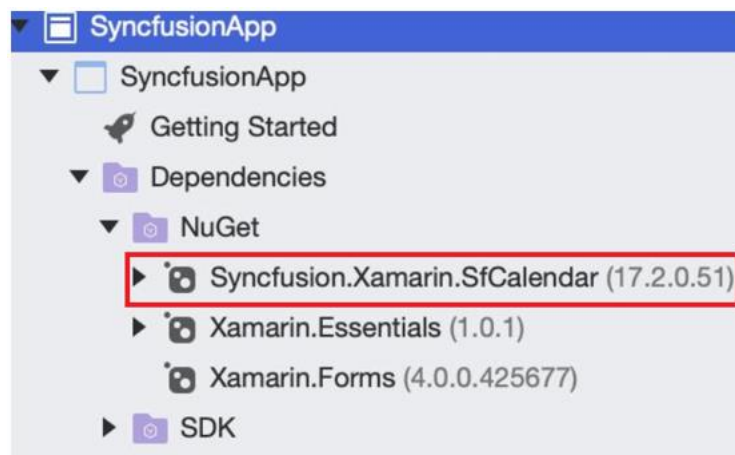

- ☐ Accordion
- ☐ Autocomplete
- ☐ BadgeView
- ☐ Bar Code
- ☐ Border
- ☐ Busy Indicator
- ☐ Button
- ☐ Calendar
- ☐ CardLayout
- ☐ CardView
- ☐ Carousel
- ☐ Chart
- ☐ Checkbox
- ☐ Chip
- ☐ Chip Group

3) Name the project and click the Create.

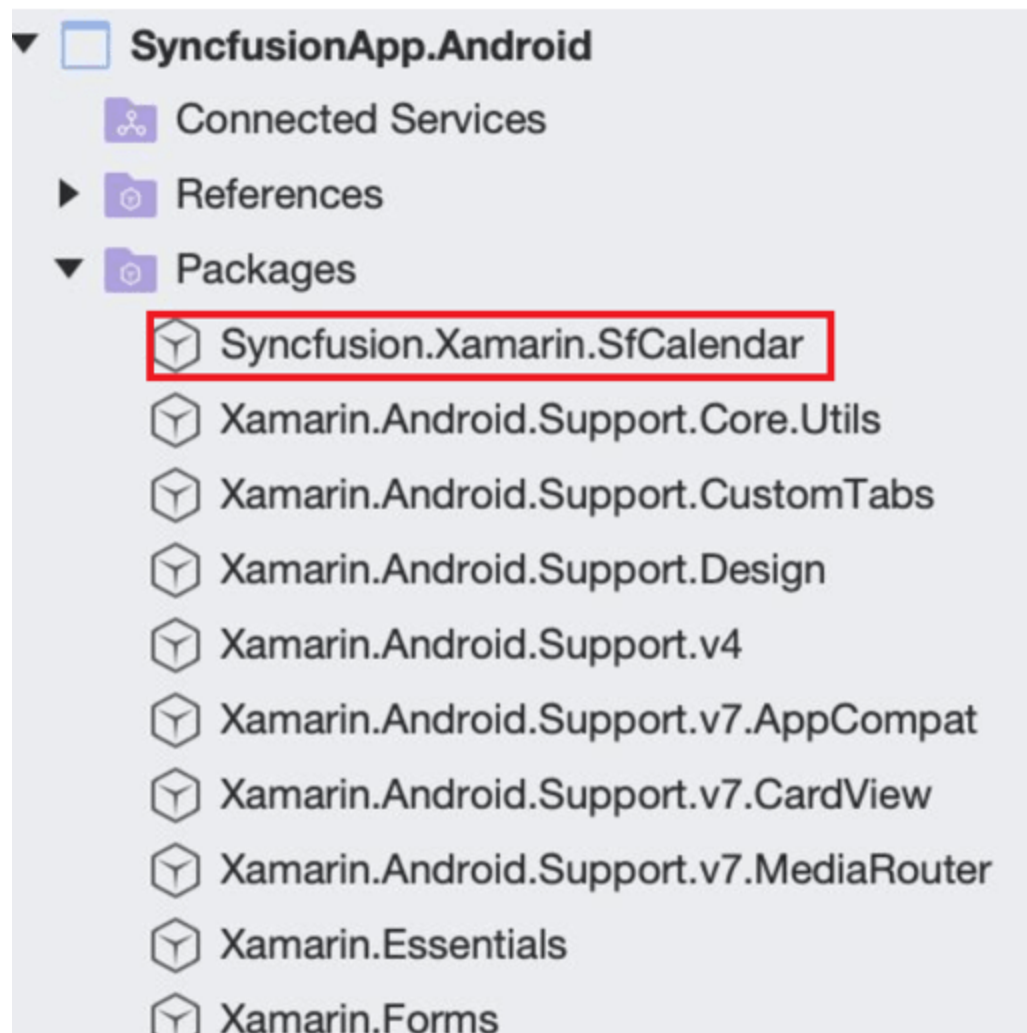

4) Required Syncfusion NuGet and configuration have been added to the project based on the Syncfusion component chosen.

#### Net Standard:

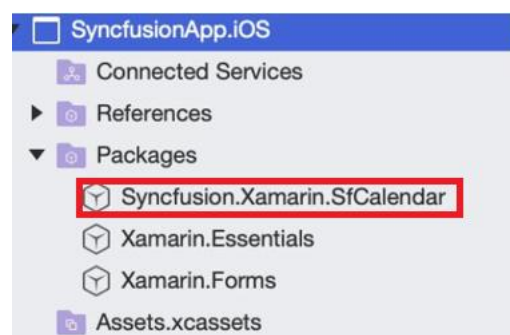

#### Android:

iOS:

Now, you can follow the [user guide documentation](#) to use the Syncfusion Xamarin components.

### NuGet Packages

[NuGet](#) can be used to automatically add files and references to your Visual Studio projects. You can use the Syncfusion Xamarin.Forms NuGet packages without installing the Essential Studio or Xamarin platform installation to development with the Syncfusion Xamarin. Forms controls.

From v15.4.0.17 onwards, the Syncfusion Xamarin.Forms NuGet packages are published in [nuget.org](https://www.nuget.org).

Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet package, you must include a license key in your projects. Refer to this [link](#) to learn about registering Syncfusion license key in your Xamarin.Forms application to use Syncfusion controls.

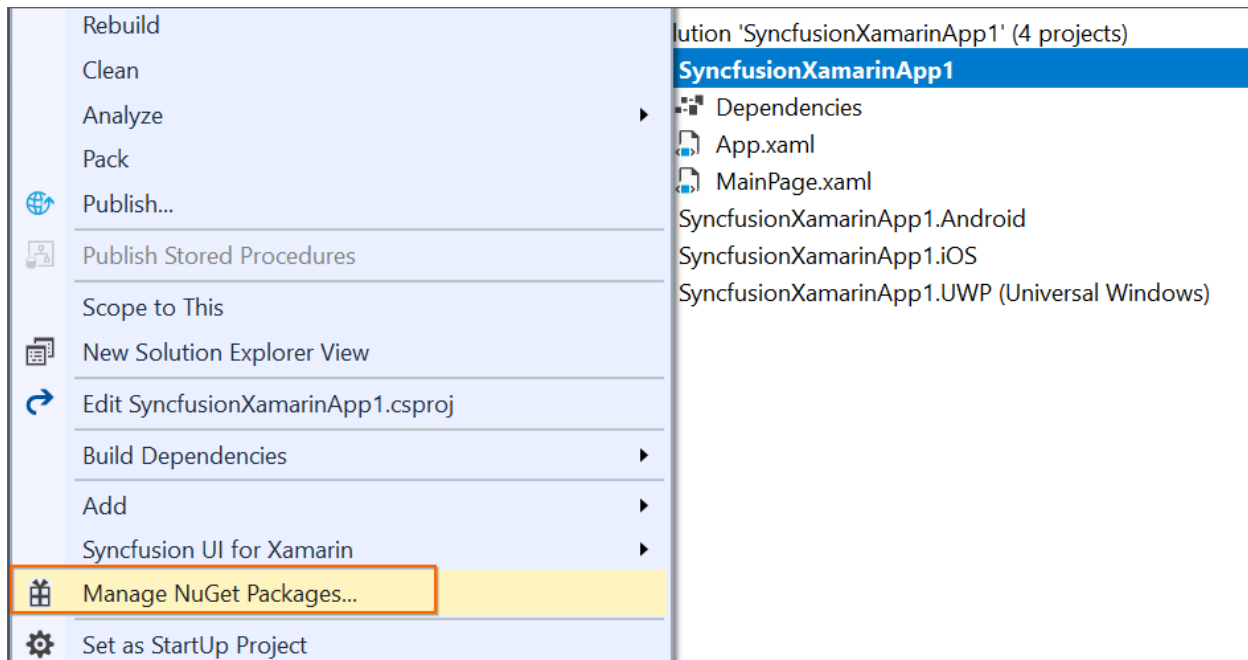

**Note:** Starting from v17.1.0.32 (2018 Volume 1), Syncfusion will no longer publish NuGet packages at [nuget.syncfusion.com](http://nuget.syncfusion.com).

## Installing NuGet Packages

### Using NuGet Package Manager

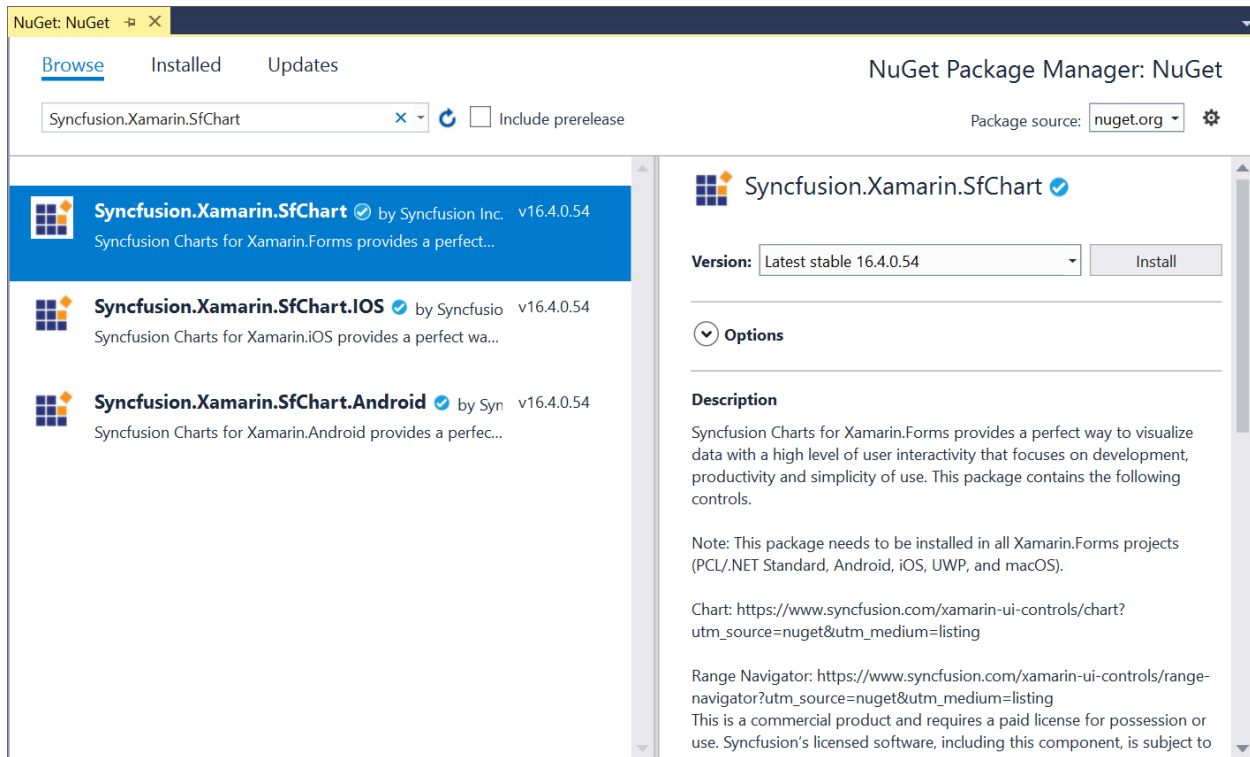

The NuGet Package Manager can be used to search and install NuGet packages in the Visual Studio solution or project:

1. Right-click the project or solution in the Solution Explorer tab, and choose **Manage NuGet Packages...**

Alternatively, click **Tools** menu, **NuGet Package Manager | Manage NuGet Packages for Solution...**

2. Select the NuGet.org from the **Package Source** drop-down.

3. All the Syncfusion NuGet Packages are listed and available. Search and install the required packages in your application, by clicking the **Install** button.

**Note:** The Syncfusion NuGet packages are published in public [NuGet.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfChart) from v16.2.0.46. To Install earlier version of 16.2.0.46 Syncfusion NuGet packages, [configure Syncfusion private feed URL](#).

#### Using Package Manager Console

To reference the Syncfusion Xamarin.Forms component using the Package Manager Console as NuGet packages, follow the below steps:

1. On the **Tools** menu, select **NuGet Package Manager** and then **Package Manager Console**. 2. Run the following NuGet installation commands.

## Explore Libraries Package

## Troubleshooting

## Themes

### XML

```
<Application xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms"
xmlns:gauge="clr-
namespace:Syncfusion.SfGauge.XForms;assembly=Syncfusion.SfGauge.XForms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
...>
<Application.Resources>
<ResourceDictionary>
```

```

<ResourceDictionary.MergedDictionaries>
<!-- Theme resource dictionary -->
<syncTheme:DarkTheme />
<!-- Control style resource dictionaries -->
<gauge:SfCircularGaugeStyles />
<buttons:SfButtonStyles />
</ResourceDictionary.MergedDictionaries>
</ResourceDictionary>
</Application.Resources>
...
</Application>

```

### Merging the dictionaries

You can merge the theme resource dictionary and control style resource dictionaries in the following two ways:

#### Manual merging

For manual merging, both the theme resource dictionary and each control style resource dictionary need to be merged for the required controls in the application resources as follows.

#### XML

```

<Application xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms"
xmlns:gauge="clr-
namespace:Syncfusion.SfGauge.XForms;assembly=Syncfusion.SfGauge.XForms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
...>
<Application.Resources>
<ResourceDictionary>
<ResourceDictionary.MergedDictionaries>
<!-- Theme resource dictionary -->
<syncTheme:DarkTheme />
<!-- Control style resource dictionaries -->
<gauge:SfCircularGaugeStyles />
<buttons:SfButtonStyles />
</ResourceDictionary.MergedDictionaries>
</ResourceDictionary>
</Application.Resources>
...
</Application>

```

#### Automatic merging

When using more number of Syncfusion controls in an application, to make the process easier for merging the control style dictionaries of the controls, the SyncfusionThemeDictionary class has been provided for automatic merging. When the theme resource dictionary is merged to this dictionary, control style resource dictionaries will be merged automatically. However, only the styles for the controls used in the application will be merged.

#### XML

```

<Application xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms"
...>

```

```
<Application.Resources>
<syncTheme:SyncfusionThemeDictionary>
<syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
<!-- Theme resource dictionary -->
<syncTheme:DarkTheme />
</syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
</syncTheme:SyncfusionThemeDictionary>
</Application.Resources>
....
</Application>
```

### Overriding the default theme

The theme resource dictionary contains a set of keys that are mapped to the style in control style dictionaries. The default appearance of themes can be customized by overriding the key values.

The following section explains how to override both the primary and control specific keys.

#### Overriding the primary keys

The theme resource dictionary contains the following set of primary keys that are mapped to the UI elements of all the controls. To override the primary colors of theme, change the values for these keys as required. You can find the keys and the UI elements to which they are mapped to all the controls in this [documentation](#).

- SyncPrimaryColor
- SyncPrimaryLightColor
- SyncPrimaryDarkColor
- SyncPrimaryForegroundColor
- SyncPrimaryLightForegroundColor
- SyncPrimaryDarkForegroundColor
- SyncSuccessColor
- SyncErrorColor
- SyncWarningColor
- SyncInfoColor

### XML

```
<Application xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms"
...>
<Application.Resources>
<syncCore:SyncfusionThemeDictionary>
<syncCore:SyncfusionThemeDictionary.MergedDictionaries>
<syncCore:DarkTheme />
<ResourceDictionary>
<Color x:Key="SyncPrimaryColor">LimeGreen</Color>
<Color x:Key="SyncPrimaryLightColor">LimeGreen</Color>
</ResourceDictionary>
</syncCore:SyncfusionThemeDictionary.MergedDictionaries>
</syncCore:SyncfusionThemeDictionary>
</Application.Resources>
...
</Application>
```

### *Overriding the control specific keys*

In addition to the primary keys, the theme resource dictionary also contains the keys that are specific to each controls; these keys can also be overridden. You can find the keys and the UI elements to which they are mapped to all the controls in this [documentation](#).

### **XML**

```
<Application xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms"
...>
<Application.Resources>
<syncCore:SyncfusionThemeDictionary>
<syncCore:SyncfusionThemeDictionary.MergedDictionaries>
<syncCore:DarkTheme />
<ResourceDictionary>
<Color x:Key="SyncPrimaryColor">LimeGreen</Color>
<Color x:Key="SyncPrimaryLightColor">LimeGreen</Color>
<Color x:Key="SfCircularGaugeScaleRimColor">Green</Color>
</ResourceDictionary>
</syncCore:SyncfusionThemeDictionary.MergedDictionaries>
</syncCore:SyncfusionThemeDictionary>
</Application.Resources>
....
</Application>
```

### Creating your own theme

As an alternative approach to the above methods, you can also create your own theme. To create own theme, first, you need to merge the resource, whose key name should be "ControlName" + "Theme" based on the controls, e.g., SfChartTheme and SfTextInputLayoutTheme. You can find this key for each control in this [documentation](#). After merge the control name, you need to merge the required color resources with keys based on the UI elements that need to be customized. You can find the keys and the UI elements to which they are mapped to all the controls in this [documentation](#).

Using this approach, you can create your own theme to all the controls or for specific controls you need.

### XML

```
<Application xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms"
...>
<Application.Resources>
<syncCore:SyncfusionThemeDictionary>
<syncCore:SyncfusionThemeDictionary.MergedDictionaries>
<ResourceDictionary>
<x:String x:Key="SfCircularGaugeTheme">CustomTheme</x:String>
<Color x:Key="SyncPrimaryColor">LimeGreen</Color>
<Color x:Key="SyncPrimaryLightColor">LimeGreen</Color>
<Color x:Key="SfCircularGaugeScaleRimColor">Green</Color>
</ResourceDictionary>
</syncCore:SyncfusionThemeDictionary.MergedDictionaries>
</syncCore:SyncfusionThemeDictionary>
</Application.Resources>
....
</Application>
```

### Keys of Syncfusion Controls

This page lists the keys for each control and the element to which it is mapped for all the controls.

#### SfChart

Theme Dictionary	Keys	Description
SfChartStyles	SfChartTheme	By merging this key in application resources, you can customize the appearance of SfChart without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CommonTheme Transparent Transparent ....{% endhighlight %}
	SyncPrimaryColor	Stroke color of annotation.
		Text color of annotation label.

		Background color of the axis label of VerticalLine and HorizontalLine annotations.
		Border color of the axis label of VerticalLine and HorizontalLine annotations.
	SfChartTitleTextColor	Text color of the chart title.
	SfChartTitleBorderColor	Border color of the chart title.
	SfChartTitleBackgroundColor	Background color of the chart title.
	SfChartBackgroundColor	Background color of the chart.
	SfChartSelectionRectFillColor	Fill color of the selection rectangle when selection zooming the chart.
	SfChartSelectionRectStrokeColor	Stroke color of the selection rectangle when selection zooming the chart.
	SfChartAnnotationFillColor	Fill color of annotation.
	SfChartAnnotationLabelBorderColor	Border color of the annotation label.
	SfChartAnnotationLabelBackgroundColor	Background color of the annotation label.
	SfChartAnnotationAxisLabelTextColor	Text color of axis label of VerticalLine and HorizontalLine annotations.
	SfChartTrackballLineStrokeColor	Stroke color of the trackball line.
	SfChartTrackballBackgroundColor	Background color of the trackball label.
	SfChartTrackballBorderColor	Border color of the trackball label.
	SfChartTrackballTextColor	Text color of the trackball label.
	SfChartTrackballAxisLabelBackgroundColor	Background color of the axis label of trackball.
	SfChartTrackballAxisLabelBorderColor	Border color of the axis label of trackball.
	SfChartTrackballAxisLabelTextColor	Text color of axis label of trackball.

	SfChartDataPointSelectionColor	Color of the selected segment of the series.
	SfChartSeriesSelectionColor	Color of the selected series.
	SfChartStriplineBackgroundColor	Background color of the strip line.
	SfChartStriplineBorderColor	Border color of the strip line.
	SfChartStriplineTextColor	Text color of the strip line label.
	SfChartStriplineLabelBorderColor	Border color of the strip line label.
	SfChartStriplineLabelBackgroundColor	Background color of the strip line label.
	SfChartMajorGridLineColor	Color of the axis major grid line.
	SfChartMinorGridLineColor	Color of the axis minor grid line.
	SfChartMajorTickLineColor	Color of the axis major tick line.
	SfChartMinorTickLineColor	Color of the axis minor tick line.
	SfChartAxisLineColor	Color of the axis line.
	SfChartAxisTitleTextColor	Color of the axis title text.
	SfChartAxisTitleBackgroundColor	Background color of the axis title.
	SfChartAxisTitleBorderColor	Border color of the axis title.
	SfChartAxisLabelColor	Color of the axis label.
	SfChartAxisLabelBackgroundColor	Background color of the axis label.
	SfChartAxisLabelBorderColor	Border color of the axis label.
	SfChartLegendTitleTextColor	Color of the Legend title text.
	SfChartLegendTitleBorderColor	Border color of the legend title.
	SfChartLegendTitleBackgroundColor	Background color of the legend title.
	SfChartLegendLabelColor	Color of the legend label.

## SfDateTimeRangeNavigator

Theme Dictionary	Keys	Description
SfDateTimeRangeNavigatorStyles	SfDateTimeRangeNavigatorTheme	By merging this key in application resources, you can customize the appearance of SfDateTimeRangeNavigator without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CommonTheme Transparent White ....{% endhighlight %}
	SyncPrimaryColor	Border color of tooltip and thumb.
		Line color of thumb.
		Background color of tooltip.
	SyncPrimaryLightColor	Selected label text color of scale.
	SfDateTimeRangeNavigatorBackgroundColor	Background color of the date-time range navigator.
	SfDateTimeRangeNavigatorOverlayColor	Overlay color of unselected region of the date time range navigator.
	SfDateTimeRangeNavigatorLabelTextColor	Text color of the date time range navigator label.
	SfDateTimeRangeNavigatorLabelBackgroundColor	Background color of the date time range navigator label.

	SfDateTimeRangeNavigatorLabelBorderColor	Border color of the date time range navigator label.
	SfDateTimeRangeNavigatorSelectedLabelBackgroundColor	Background color of the date time range navigator selected label.
	SfDateTimeRangeNavigatorSelectedLabelBorderColor	Border color of the date time range navigator selected label.
	SfDateTimeRangeNavigatorGridLineColor	Color of the date time range navigator grid lines.
	SfDateTimeRangeNavigatorTickLineColor	Color of the date time range navigator tick lines.
	SfDateTimeRangeNavigatorThumbBackgroundColor	Background color of the date time range navigator thumb.
	SfDateTimeRangeNavigatorThumbBorderColor	Border color of the date time range navigator thumb.
	SfDateTimeRangeNavigatorThumbLineColor	Color of the date time range navigator thumb line.
	SfDateTimeRangeNavigatorTooltipTextColor	Text color of the date time range navigator tooltip.

## SfKanban

Theme Dictionary	Keys	Description
SfKanbanStyles	SfKanbanTheme	By merging this key in application resources, you can customize the appearance of SfKanban without

		merging common theme resource and control style resource dictionaries. {% highlight xaml %} CommonTheme Transparent White Smoke ....{% endhighlight %}
	SfKanbanBackgroundColor	Background color of kanban.
	SfKanbanMinValidationColor	Color value of the error bar for minimum limit validation.
	SfKanbanMaxValidationColor	Color value of the error bar for maximum limit validation.
	SfKanbanValidationColor	Color value of the error bar for validation.
	SfKanbanPlaceholderBackgroundColor	Background color of the placeholder.
	SfKanbanPlaceholderBorderColor	Border color of the placeholder.
	SfKanbanPlaceholderTextColor	Text color of the placeholder.
	SfKanbanPlaceholderSelectedBackgroundColor	Background color of the selected placeholder.
	SfKanbanPlaceholderSelectedBorderColor	Border color of the selected placeholder.
	SfKanbanPlaceholderSelectedTextColor	Text color of the selected placeholder.
	SfKanbanCardBackgroundColor	Background color of the card.
	SfKanbanCardBorderColor	Border color of the card.
	SfKanbanCardTextColor	Text color of the card.
	SfKanbanCardTitleColor	Color of card title.
	SfKanbanCardTagBackgroundColor	Background color of the card tag.
	SfKanbanCardTagTextColor	Text color of the card tag.
	SfKanbanHeaderTitleTextColor	Text color of the header.
	SfKanbanHeaderBackgroundColor	Background color of the header.

	SfKanbanHeaderCollapsedBackgroundColor	Background color of the collapsed header.
	SfKanbanHeaderInfoTextColor	Text color of the header info.

## SfListView

Theme Dictionary	Keys	Description
SfListViewStyles	SfListViewTheme	By merging this key in application resources, you can customize the appearance of the SfListView without merging common theme resource and control style resource dictionaries.{% highlight xaml %} CustomTheme LightGreen DarkGreen ....{% endhighlight %}
	SfListViewBackgroundColor	Background color of ListView.
	SfListViewForegroundColor	Text color of the ListViewItem, when it in the default state.
	SfListViewSelectionBackgroundColor	Background color of the ListViewItem when it is in selection.
	SfListViewFocusBorderThickness	Border thickness of the ListViewItem when it is in selection.
	SfListViewFocusBorderColor	Border color of the ListViewItem when it is in selection.
	SfListViewGroupHeaderForegroundColor	Text color of the GroupHeaderItem, when it in the default state.
	SfListViewLoadMoreForegroundColor	Text color of the LoadMoreItem When it is in the default state.
	SyncPrimaryLightColor	Color of the LoadMoreIndicator when the indicator is in the progressed state.
	SfListViewLoadMoreBackgroundColor	Background color of the LoadMoreItem when it is in the default state.

	SfListViewLoadMoreOpacity	Percentage of transparency level for the text in the LoadMoreItem when it is in the default state.
--	---------------------------	--

## SfLinearProgressBar

Theme Dictionary	Keys	Description
SfProgressBarStyles	SfProgressBarTheme	By merging this key in application resources, you can customize the appearance of SfLinearProgressBar without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SyncPrimaryColor	Color of the progress indicator in the linear progress bar.
	SfProgressBarTrackColor	Color of the track in the linear progress bar.
	SfProgressBarSecondaryProgressColor	Color of the secondary progress(buffer) indicator in the linear progress bar.

## SfCircularProgressBar

Theme Dictionary	Keys	Description
SfProgressBarStyles	SfProgressBarTheme	By merging this key in application resources, you can customize the appearance of SfCircularProgressBar without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SyncPrimaryColor	Color of the progress indicator in the circular progress bar.
	SfProgressBarTrackColor	Color of the track in the circular progress bar.

## SfNumericTextBox

Theme Dictionary	Keys	Description
------------------	------	-------------

SfNumericTextBoxStyles	SfNumericTextBoxTheme	By merging this key in application resources, you can customize the appearance of SfNumericTextBox without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SyncPrimaryColor	Border color of the numeric text box.
	SfNumericTextBoxTextColor	Text color of the numeric text box.
	SfNumericTextBoxBackgroundColor	Background color of the numeric text box.
	SfNumericTextBoxBorderColor	Border color of the numeric text box.

## SfNumericUpDown

Theme Dictionary	Keys	Description
SfNumericUpDownStyles	SfNumericUpDownTheme	By merging this key in application resources, you can customize the appearance of SfNumericUpDown without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SyncPrimaryColor	Border color of numeric up down.
	SfNumericUpDownTextColor	Text color of the numeric up down.
	SfNumericUpDownBackgroundColor	Background color of numeric up down.
	SfNumericUpDownButtonBackgroundColor	Background color of the up and down buttons.

	SfNumericUpDownButtonForegroundColor	Foreground color of the up and down buttons.
	SfNumericUpDownBorderColor	Border color of the numeric up down.
	SfNumericUpDownHighlightedBackgroundColor	Sets the background color for the up-down button when it is pressed.
	SfNumericUpDownHighlightedFontColor	Sets the font color for the up-down button when it is pressed.

## SfDiagram

Theme Dictionary	Keys	Description
SfDiagramStyles	SfDiagramTheme	By merging this key in application resources, it is possible to customize the appearance of the SfDiagram without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfDiagramStencilHeaderBackgroundColor	Background color of the stencil header.
	SfDiagramStencilHeaderForegroundColor	Foreground color of the stencil header.
	SfDiagramDialogHeaderForegroundColor	Foreground color of header in dialog box.
	SfDiagramDialogBackgroundColor	Background color of header in dialog box.
	SfDiagramLabelBackgroundColor	Background color of Label in dialog box.
	SfDiagramStencilBorderColor	Border color of stencil.
	SfDiagramStencilBackgroundColor	Background color of stencil.

## SfMaskedEdit

Theme Dictionary	Keys	Description
------------------	------	-------------

SfMaskedEditStyles	SfMaskedEditTheme	By merging this key in application resources, you can customize the appearance of SfMaskedEdit without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SyncPrimaryColor	Border color of the masked edit.
	SfMaskedEditTextColor	Text color of the masked edit.
	SfMaskedEditBackgroundColor	Background color of the masked edit.
	SfMaskedEditWatermarkColor	Watermark color of the masked edit.

## SfTreeView

Theme Dictionary	Keys	Description
SfTreeViewStyles	SfTreeViewTheme	By merging this key in application resources, you can customize the appearance of SfTreeView without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue White ....{% endhighlight %}
	SfTreeViewBackgroundColor	Background color of TreeView.
	SfTreeViewSelectionBackgroundColor	Background color of TreeViewItem when it is in selection.
	SfTreeViewContentForegroundColor	Text color of content view label when it is in default state.
	SyncPrimaryLightColor	Text color of content view label when it is in selection.
	SfTreeViewExpanderColor	Color of expander icon.
	SfTreeViewFocusBorderColor	Border color of focused item.
	SfTreeViewFocusBorderThickness	Border thickness of focused item.

## SfTextInputLayout

Theme Dictionary	Keys	Description
SfTextInputLayoutStyles	SfTextInputLayoutTheme	By merging this key in application resources, it is possible to customize the appearance of the SfTextInputLayout without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SyncPrimaryLightColor	Color of hint when text input layout is focused.
	SyncPrimaryColor	Color of line/border when text input layout is focused.
	SyncErrorColor	Color of hint when the input view contains error and is focused.
		Color of border when input view contains error.
		Color of counter label when input view contains error.
	SfTextInputLayoutHintColor	Color of hint when the text input layout is in the default state.
	SfTextInputLayoutDisabledHintColor	Color of hint when text input layout is disabled.
	SfTextInputLayoutFloatedHintDisabledColor	Color of hint when text input layout is disabled,

		and text inside the input view is floated.
	SfTextInputLayoutLineColor	Color of line/border when text input layout is in the default state.
	SfTextInputLayoutFilledLineDisabledColor	Color of line when text input layout is in the disabled state.
	SfTextInputLayoutOutlinedLineDisabledColor	Color of border when text input layout is in the disabled state.
	SfTextInputLayoutCounterLabelColor	Color of counter label when text input layout is in the default state.
	SfTextInputLayoutCounterLabelDisabledColor	Color of counter label when text input layout is in the disabled state.
	SfTextInputLayoutContainerBackgroundColor	Color of container background when the text input layout is in the default state.
	SfTextInputLayoutContainerBackgroundDisabledColor	Color of container background when text input layout is in the disabled state.
	SfTextInputLayoutHelperTextColor	Color of helper text when text input layout is in the default state.
	SfTextInputLayoutHelperTextDisabledColor	Color of helper text when text input layout is in the disabled state.
	SfTextInputLayoutErrorTextColor	Color of error text when text input layout is in the default state.

	SfTextInputLayoutErrorTextDisabledColor	Color of error text when text input layout is in the disabled state.
	SfTextInputLayoutPasswordToggleFocusedColor	Color of password toggle button when the input view is focused.
	SfTextInputLayoutPasswordToggleDisabledColor	Color of password toggle button when the text input layout is in the disabled state.
	SfTextInputLayoutPasswordToggleUnfocusedColor	Color of password toggle button when the input view is unfocused.
	SfTextInputLayoutFloatedHintUnfocusedColor	Color of floated hint text when input view is unfocused.

### SfBackdropPage

Theme Dictionary	Keys	Description
SfBackdropPageStyles	SfBackdropPageTheme	By merging this key in application resources, you can customize the appearance of SfBackdropPage without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Red ....{% endhighlight %}
	SfBackdropPageFrontLayerBackgroundColor	Background color of the front layer.

### SfCardView

Theme Dictionary	Keys	Description
SfCardViewStyles	SfCardViewTheme	By merging this key in application resources, you can customize the appearance of SfCardView without merging common theme resource and control style resource

		dictionaries. {% highlight xaml %} CustomTheme Red ....{% endhighlight %}
	CardViewContentBackgroundColor	Background color of the card view content.

## SfPdfViewer

Theme Dictionary	Keys	Description
SfPdfViewerStyles	SfPdfViewerTheme	By merging this key in application resources, you can customize the appearance of SfPdfViewer without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CommonTheme Cyan Red ....{% endhighlight %}
	SfPdfViewerButtonIconEnabledColor	Text color of the button when it is in enabled state.
	SfPdfViewerButtonIconDisabledColor	Text color of the button when it is in disabled state.
	SfPdfViewerButtonPressedColor	Pressed color of the toolbar buttons.
	SfPdfViewerToolbarBackgroundColor	Background color of the toolbar.
	SfPdfViewerToolbarBorderColor	Border color of the toolbar.
	SfPdfViewerToolbarSeparatorColor	Toolbar separator color.
	SfPdfViewerEntryTextColor	Text color of entry.
	SfPdfViewerEntryBorderColor	Border color of entry.

	SfPdfViewerEntryPlaceholderColor	Placeholder color of entry.
	SfPdfViewerEntryBackgroundColor	Background color of entry.
	SfPdfViewerBookmarkItemBackgroundColor	Background color of the bookmark items.
	SfPdfViewerBookmarkTitleBarBackgroundColor	Background color of the bookmark title bar.
	SfPdfViewerBookmarkTitleBarTextColor	Text color of the bookmark title bar.
	SfPdfViewerTextElementColor	Text color of the PDF Viewer text labels.
	SfPdfViewerMoreMenuBackgroundColor	Background color of the more menu bar.
	SfPdfViewerMoreMenuTextDisabledColor	Text color of the more menu items when it is in disabled state.
	SfPdfViewerMoreMenuTextEnabledColor	Text color of the more menu items when it is in enabled state.
	SfPdfViewerScrollHeadColor	Background color of the scroll head label.
	SfPdfViewerScrollHeadBorderColor	Border color of the scroll head.
	SfPdfViewerScrollHeadPageNumberViewBackgroundColor	Background color of the page number alert dialog.
	SfPdfViewerScrollHeadPageNumberViewSeparatorColor	Separator color of the page number alert dialog.
	SfPdfViewerSignaturePadTitleColor	Title color of the signature pad.
	SfPdfViewerSignaturePadColor	Background color of the signature pad view.

	SfPdfViewerSignaturePadHeaderFooterColor	Background color of header and footer of signature pad.
	SfPdfViewerSignatureBorderColor	Border color of the signature pad.
	SfPdfViewerSignaturePadConfirmationButtonDisabledColor	Text color of the signature pad confirmation button when it is in disabled state.
	SfPdfViewerSignaturePadCancelButtonEnabledColor	Text color of the signature pad cancel button when it is in enabled state.
	SfPdfViewerSignaturePadCancelButtonDisabledColor	Text color of the signature pad cancel button when it is in disabled state.
	SfPdfViewerSignaturePadClearButtonEnabledColor	Text color of the signature pad clear button when it is in enabled state.
	SfPdfViewerSignaturePadClearButtonDisabledColor	Text color of the signature pad clear button when it is in disabled state.
	SfPdfViewerEditWindowPlaceHolderColor	Placeholder color of the edit text window.
	SfPdfViewerSearchBarBackgroundColor	Background color of the search bar.
	SfPdfViewerFreeTextConfirmationButtonDisabledColor	Text color of the FreeText confirmation button when it is in disabled state.

	SfPdfViewerFreeTextCancelButtonEnabledColor	Text color of the FreeText cancel button when it is in enabled state.
	SfPdfViewerFreeTextCancelButtonDisabledColor	Text color of the FreeText cancel button when it is in disabled state.
	SfPdfViewerThicknessViewBackgroundColor	Background color of the thickness selector toolbar.
	SfPdfViewerThicknessViewButtonBackgroundColor	Background color of the thickness button in thickness selector toolbar.
	SfPdfViewerThicknessViewButtonBorderDisabledColor	Border color of the thickness button when it is in disabled state.
	SfPdfViewerAlertDialogBackgroundColor	Background color of the page number alert dialog.
	SfPdfViewerAlertDialogTitleColor	Title color of the page number alert dialog.
	SfPdfViewerAlertDialogTextColor	Text color of the page number alert dialog.
	SfPdfViewerAlertDialogBorderColor	Border color of the page number alert dialog.

## SfDataGrid

Theme Dictionary	Keys	Description
SfDataGridStyles	SfDataGridTheme	By merging this key in application resources, it is possible to customize the appearance of the SfDataGrid without merging common theme resource and control style resource dictionaries. {% highlight xaml %}

		CustomTheme Blue Green ....{%endhighlight %}
	SfDataGridBackgroundColor	Background color of the remaining area other than rows/columns is rendered in DataGrid.
	SfDataGridHeaderBackgroundColor	Background color of the row and column headers in the SfDataGrid.
	SfDataGridHeaderForegroundColor	Foreground color of the row and column headers in the SfDataGrid.
	SfDataGridHeaderBorderColor	Border color of the row and column header cells in the SfDataGrid.
	SfDataGridRecordBackgroundColor	Background color of the grid cells in the SfDataGrid.
	SfDataGridRecordForegroundColor	Foreground color of the grid cells in the SfDataGrid.
	SfDataGridBorderColor	Border color of the grid cells in the SfDataGrid.
	SfDataGridSelectionBackgroundColor	Background color of the selected row in SfDataGrid.
	SfDataGridSelectionForegroundColor	Foreground color of the selected row in SfDataGrid.
	SfDataGridAlternatingRowBackgroundColor	Background color of the alternate rows in SfDataGrid.
	SfDataGridRowDragViewBackgroundColor	Background color of the row drag view.
	SfDataGridRowDragViewForegroundColor	Foreground color of the row drag view.
	SfDataGridColumnDragViewBackgroundColor	Background color of the column drag view.
	SfDataGridColumnDragViewForegroundColor	Foreground color of the column drag view.

	SfDataGridColumnDragViewBorderColor	Border color of the column drag view.
	SfDataGridTableSummaryBackgroundColor	Background color of the <a href="#">TableSummaryRow</a> in SfDataGrid.
	SfDataGridTableSummaryForegroundColor	Foreground color of the <a href="#">TableSummaryRow</a> in SfDataGrid.
	SfDataGridCaptionSummaryRowBackgroundColor	Background color of the <a href="#">CaptionSummaryRow</a> in SfDataGrid.
	SfDataGridCaptionSummaryRowForegroundColor	Foreground color of the <a href="#">CaptionSummaryRow</a> in SfDataGrid.
	SfDataGridGroupSummaryRowBackgroundColor	Background color of the <a href="#">GroupSummaryRow</a> in SfDataGrid.
	SfDataGridGroupSummaryRowForegroundColor	Foreground color of the <a href="#">GroupSummaryRow</a> in SfDataGrid.
	SfDataGridLoadMoreViewBackgroundColor	Background color of the LoadMore view in SfDataGrid.
	SfDataGridLoadMoreViewForegroundColor	Foreground color of the LoadMore view in SfDataGrid.
	SfDataGridIndentBackgroundColor	Background color of the indent column in SfDataGrid.

### SfPopupLayout

Theme Dictionary	Keys	Description
SfPopupLayoutStyles	SfPopupLayoutTheme	By merging this key in application resources, it is possible to customize the appearance of the SfPopupLayout without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Blue ....{% endhighlight %}

	SfPopupLayoutHeaderBackgroundColor	Background color of the header view in SfPopupLayout.
	SfPopupLayoutFooterBackgroundColor	Background color of the footer view in SfPopupLayout.
	SfPopupLayoutAcceptButtonBackgroundColor	Background color of the accept button in Xamarin.Forms.Android and Xamarin.Forms.iOS platform.
		Note: Background color of the accept button for Xamarin.Forms.UWP platform is obtained from SyncPrimaryColor key value.
	SfPopupLayoutDeclineButtonTextColor	Text color of the decline button in Xamarin.Forms.UWP platform.
		Note: Text color of the decline button for Xamarin.Forms.Android and Xamarin.Forms.iOS platform is obtained from SyncPrimaryLightColor key value.
	SfPopupLayoutBorderColor	Border color of the SfPopupLayout in Xamarin.Forms.Android and Xamarin.Forms.iOS platform.
		Note: Border color of the SfPopupLayout for Xamarin.Forms.UWP platform is obtained from SyncPrimaryColor key value.
	SfPopupLayoutDeclineButtonBackgroundColor	Background color of the decline button in Xamarin.Forms.UWP platform.
		Note: Background color of the decline button for Xamarin.Forms.Android and Xamarin.Forms.iOS platform is obtained from SyncPrimaryLightColor key value.

	SfPopupLayoutHeaderTextColor	Text color of the header in SfPopupLayout.

### SfPullToRefresh

Theme Dictionary	Keys	Description
SfPullToRefreshStyles	SfPullToRefreshTheme	By merging this key in application resources, it is possible to customize the appearance of the SfPullToRefresh without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue ....{% endhighlight %}
	SfPullToRefreshBackgroundColor	Background color of the circle view in SfPullToRefresh.

### SfDataForm

Theme Dictionary	Keys	Description
SfDataFormStyles	SfDataFormTheme	By merging this key in application resources, it is possible to customize the appearance of the SfDataForm without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Red Pink ....{% endhighlight %}
	SyncPrimaryColor	Border color of dataform editors when focused and date time picker's background color in dataform.
	SfDataFormBackgroundColor	Background color of the dataform.
	SfDataFormEditorBackgroundColor	Background color of the dataform editors.
	SfDataFormEditorDisabledBackgroundColor	Disabled editor's background color in dataform.
	SfDataFormEditorTextColor	Text color of the dataform editors.

	SfDataFormEditorPlaceholderColor	Placeholder color of the editor in dataform.
	SfDataFormEditorDisabledTextColor	Disabled editor`s text color in dataform.
	SfDataFormLabelTextColor	Text color of the dataform labels.
	SfDataFormLabelDisabledTextColor	Disabled label`s text color in dataform.
	SfDataFormLabelBackgroundColor	Background color of the dataform labels.
	SfDataFormLabelDisabledBackgroundColor	Disabled label`s background color in dataform.
	SfDataFormEditorBorderColor	Border color of the dataform editors.

## SfSchedule

Theme Dictionary	Keys	Description
SfScheduleStyles	SfScheduleTheme	By merging this key in application resources, it is possible to customize the appearance of the SfSchedule without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Red Blue Blue ....{% endhighlight %}
	SyncPrimaryColor	Change the color of today selection background in schedule month view.
	SyncPrimaryLightColor.	Change the color of current day(Sun,Mon,etc)

		text in schedule day, week and work week view.
		Change the color of current date(10,11,etc) text in schedule day, week and work week view.
	SyncPrimaryForegroundColor	Change the color of current day text in schedule month view.
	SfScheduleBackgroundColor	Change the color of schedule background.
	SfScheduleDayViewNonWorkingHoursTimeSlotColor	Change the color of non working hour time slot in schedule day view.
	SfScheduleDayViewNonWorkingHoursTimeSlotBorderColor	Change the color of non working hour time slot border in schedule day view.
	SfScheduleDayViewTimeSlotColor	Change the color of time slot in schedule day view.
	SfScheduleDayViewTimeSlotBorderColor	Change the color of time slot border color of schedule day view.
	SfScheduleDayViewVerticalLineColor	Change the color of time slot vertical lines at schedule day view.
	SfScheduleDayViewAllDayAppointmentLayoutColor	Change the color of all day appointment layout color, when

		enable the all day appointment in schedule day view.
	SfScheduleWeekViewNonWorkingHoursTimeSlotColor	Change the color of non working hour time slot in schedule week view.
	SfScheduleWeekViewNonWorkingHoursTimeSlotBorderColor	Change the color of non working hour time slot border in schedule week view.
	SfScheduleWeekViewTimeSlotColor	Change the color of time slot in schedule week view.
	SfScheduleWeekViewTimeSlotBorderColor	Change the color of time slot border in schedule week view.
	SfScheduleWeekViewVerticalLineColor	Change the color of time slots vertical line in schedule week view.
	SfScheduleWeekViewAllDayAppointmentLayoutColor	Change the color of all day appointment layout color, when enable the all day appointment in schedule week view.
	SfScheduleWorkWeekViewNonWorkingHoursTimeSlotColor	Change the color of non working hour timeslot in schedule work week view.
	SfScheduleWorkWeekViewNonWorkingHoursTimeSlotBorderColor	Change the color of non working hour time slot border in schedule work week view.

	SfScheduleWorkWeekViewTimeSlotColor	Change the color of time slot in schedule work week view.
	SfScheduleWorkWeekViewTimeSlotBorderColor	Change the color of time slot border in schedule work week view.
	SfScheduleWorkWeekViewVerticalLineColor	Change the color of time slot vertical line in schedule work week view.
	SfScheduleWorkWeekViewAllDayAppointmentLayout Color	Change the color of all day appointment layout color, when enable the all day appointment in schedule work week view.
	SfScheduleMonthViewTodayBackground	Change the color of current date circle background at schedule month view.
	SfScheduleMonthViewSelectionTextColor	Change the color of select month cell text at schedule month view.
	SfScheduleDayViewLabelTimeLabelColor	Change the color of time slot labels(2pm,3pm,etc) at schedule day view.
	SfScheduleWeekViewLabelTimeLabelColor	Change the color of time slot labels(2pm,3pm,etc) at schedule week view.
	SfScheduleWorkWeekViewLabelTimeLabelColor	Change the color of time slot

		labels(2pm,3pm,etc) at schedule work week view.
	SfScheduleHeaderBackgroundColor	Change the color of header layout in schedule.
	SfScheduleHeaderTextColor	Change the color of header text in schedule.
	SfScheduleViewHeaderDayTextColor	Change the color of view header day text(Sunday,Mondays,etc) in schedule.
	SfScheduleViewHeaderBackgroundColor	Change the color of view header layout in schedule.
	SfScheduleViewHeaderDateTextColor	Change the color of view header date text(10,11,etc) in schedule.
	SfScheduleSelectionBackgroundColor	Change the color of selection background at schedule.
	SfScheduleSelectionBorderColor	Change the color of selection border at schedule.
	SfScheduleAppointmentTextColor	Change the color of appointment text in schedule day, week and work week view.
	SfScheduleAppointmentBorderColor	Change the border color of appointment layout in schedule day,

		week and work week view.
	SfScheduleAppointmentSelectionBorderColor	Change the border color of appointment layout while select in schedule day, week and work week view.
	SfScheduleAppointmentSelectionTextColor	Change the text color of appointment while select in schedule day, week and work week view.
	SfScheduleMonthCellTextColor	Change the color of month cell text in schedule month view.
	SfScheduleMonthCellBackgroundColor	Change the color of month cell background in schedule month view.
	SfScheduleMonthCellTodayBackgroundColor	Change the current day background color of month cell in schedule month view.
	SfScheduleMonthCellTodayTextColor	Change the current date text color of month cell in schedule month view.
	SfScheduleMonthCellPreviousMonthTextColor	Change the previous month date text color of month cell in schedule month view.

	SfScheduleMonthCellPreviousMonthBackgroundColor	Change the previous month background color of month cell in schedule month view.
	SfScheduleMonthCellNextMonthBackgroundColor	Change the next month background color of month cell in schedule month view.
	SfScheduleMonthCellNextMonthTextColor	Change the next month date text color of month cell in schedule month view.
	SfScheduleMonthViewWeekNumberTextColor	Change the week number text color, when enable the week number view in schedule month view.
	SfScheduleMonthViewWeekNumberBackgroundColor	Change the week number background color, when enable the week number view in schedule month view.
	SfScheduleMonthAgendaViewSubjectFontColor	Change the appointment subject text color, when enable the agenda view in schedule month view.
	SfScheduleMonthAgendaViewBackgroundColor	Change the agenda view layout background color of schedule month view.

	SfScheduleMonthAgendaViewTimeFontColor	Change the appointment time text color, when enable the agenda view in schedule month view.
	SfScheduleMonthAgendaViewDateFontColor	Change the selected date text color, when enable the agenda view in schedule month view.
SfScheduleTimeIndicatorTextColor	Change the time indicator text color, when enable drag and drop in schedule day, week and work week view.	

## SfCalendar

Theme Dictionary	Keys	Description
SfCalendarStyles	SfCalendarTheme	By merging this key in application resources, it is possible to customize the appearance of the SfCalendar without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Green White Blue Blue Green ....{% endhighlight %}
	SyncPrimaryLightColor.	Change the color of current day text in calendar month view.
		Change the color of month header text in calendar year view.
	SfCalendarInlineTextColor	Change the color of inline appointment text in calendar month view.
	SfCalendarBlackoutColor	Change the color of black out date denoting view in calendar month view.

	SfCalendarDateSelectionColor	Change the color of selected date background in calendar month view.
	SfCalendarInlineBackgroundColor	Change the color of inline layout background in calendar month view.
	SfCalendarSelectedDayTextColor	Change the color of select date text color in calendar month view.
	SfCalendarBorderColor	Change the border color(vertical/horizontal line) of calendar month view.
	SfCalendarWeekDayBackgroundColor	Change the color of week day(Monday to Friday month cell) background in calendar month view.
	SfCalendarWeekDayTextColor	Change the color of week day(Monday to Friday month cell) text in calendar month view.
	SfCalendarDisabledBackgroundColor	Change the color of disabled month cell date background in calendar month view.
	SfCalendarDisabledTextColor	Change the color of disabled month cell date text in calendar month view.
	SfCalendarPreviousMonthBackgroundColor	Change the color of previous month cell date background in calendar month view.
	SfCalendarPreviousMonthTextColor	Change the color of previous month cell date text in calendar month view.
	SfCalendarCurrentMonthBackgroundColor	Change the color of current month cell background in calendar month view.
	SfCalendarCurrentMonthTextColor	Change the color of current month cell date text in calendar month view.
	SfCalendarWeekEndTextColor	Change the color of week end(Sunday & Saturday month cell) text in calendar month view.

	SfCalendarDayHeaderTextColor	Change the color day header (Sunday,Monday,etc) text color in calendar month view.
	SfCalendarDayHeaderBackgroundColor	Change the color day header (Sunday,Monday,etc) background color in calendar month view.
	SfCalendarWeekEndBackgroundColor	Change the color of week end(Sunday & Saturday month cell) background in calendar month view.
	SfCalendarHeaderBackgroundColor	Change the color of header layout background in calendar.
	SfCalendarHeaderTextColor	Change the color of header layout date text in calendar.
	SfCalendarYearViewLayoutBackground	Change the color of year view layout background in calendar.
	SfCalendarYearViewHeaderBackground	Change the color of header layout background in calendar year view.
	SfCalendarYearViewMonthLayoutBackground	Change the color of month layout(Jan,Feb,etc) background in calendar year view.
	SfCalendarYearViewMonthHeaderBackground	Change the color of month layout header(Jan,Feb,etc) background in calendar year view.
	SfCalendarYearViewDateTextColor	Change the color of month date (10,11,etc) text in calendar year view.
	SfCalendarYearViewHeaderTextColor	Change the color of month header text(Jan,Feb,etc) in calendar year view.

## SfMaps

Theme Dictionary	Keys	Description
SfMapsStyles	SfMapsTheme	By merging this key in application resources, it is possible to customize the appearance of the SfMaps without merging common theme resource and control style resource

		dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfMapsBackgroundColor	Color of maps background.
	SfMapsSelectedShapeColor	Color of selected shape in maps.
	SfMapsSelectedShapeStrokeColor	Color of selected shape stroke color in maps.
	SfMapsBubbleMarkerFillColor	Color of bubble marker in maps.
	SfMapsLegendTextColor	Color of legend text in maps.
	SfMapsDataLabelTextColor	Color of data label text in maps.
	SfMapsMarkerLabelColor	Color of marker label in maps.
	SfMapsMarkerIconColor	Color of marker icon in maps.
	SfMapsTooltipBackgroundColor	Color of tooltip background in maps.
	SfMapsTooltipStrokeColor	Color of tooltip stroke in maps.
	SfMapsTooltipTextColor	Color of tooltip text in maps.

## SfCircularGauge

Theme Dictionary	Keys	Description
SfCircularGaugeStyles	SfCircularGaugeTheme	By merging this key in application resources, it is possible to customize the appearance of the SfCircularGauge without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfCircularGaugeBackgroundColor	Color of circular gauge background.
	SfCircularGaugeNeedlePointerColor	Color of needle pointer in circular gauge.
	SfCircularGaugeSymbolPointerColor	Color of symbol pointer in circular gauge.

	SfCircularGaugeRangePointerColor	Color of range pointer in circular gauge.
	SfCircularGaugeRangeColor	Color of range in circular gauge.
	SfCircularGaugeHeaderColor	Color of header in circular gauge.
	SfCircularGaugeMinorTickColor	Color of minor tick in circular gauge.
	SfCircularGaugeMajorTickColor	Color of major tick in circular gauge.
	SfCircularGaugeKnobColor	Color of knob in circular gauge.
	SfCircularGaugeKnobStrokeColor	Color of knob stroke in circular gauge.
	SfCircularGaugeTailColor	Color of tail in circular gauge.
	SfCircularGaugeTailStrokeColor	Color of tail stroke in circular gauge.

## SfLinearGauge

Theme Dictionary	Keys	Description
SfLinearGaugeStyles	SfLinearGaugeTheme	By merging this key in application resources, it is possible to customize the appearance of the SfLinearGauge without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfLinearGaugeLabelColor	Color of label in linear gauge.
	SfLinearGaugeRangeColor	Color of range in linear gauge.
	SfLinearGaugeHeaderColor	Color of header in linear gauge.
	SfLinearGaugeSymbolColor	Color of symbol pointer in linear gauge.
	SfLinearGaugeTickColor	Color of tick in linear gauge.
	SfLinearGaugeBarColor	Color of bar pointer in linear gauge.

## SfDigitalGauge

Theme Dictionary	Keys	Description
------------------	------	-------------

SfDigitalGaugeStyles	SfDigitalGaugeTheme	By merging this key in application resources, it is possible to customize the appearance of the SfDigitalGauge without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfDigitalGaugeCharacterStrokeColor	Color of character stroke in digital gauge.

### SfSunburstChart

Theme Dictionary	Keys	Description
SfSunburstChartStyles	SfSunburstChartTheme	By merging this key in application resources, it is possible to customize the appearance of the SfSunburstChart without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfSunburstChartBackgroundColor	Color of sunburst background.
	SfSunburstSelectionColor	Color of selection when segment is focused in sunburst.
	SfSunburstSelectionStrokeColor	Color of selection stroke when segment is focused in sunburst.
	SfSunburstTooltipBorderColor	Color of tooltip border in sunburst.
	SfSunburstTooltipBackgroundColor	Color of tooltip background in sunburst.
	SfSunburstTooltipTextColor	Color of tooltip text in sunburst.

### SfSparkline

Theme Dictionary	Keys	Description
SfSparklineStyles	SfSparklineTheme	By merging this key in application resources, it is possible to customize the appearance of the SfSparkline without merging common theme resource and control style resource dictionaries. {% highlight xaml %}

		CustomTheme Blue Green ....{% endhighlight %}
	SfSparklineAreaBackgroundColor	Color of area sparkline background.
	SfLineSparklineBackgroundColor	Color of line sparkline background.
	SfColumnSparklineBackgroundColor	Color of column sparkline background.
	SfWinLossSparklineBackgroundColor	Color of win loss sparkline background.
	SfSparklineMarkerBaseColor	Color of marker base in sparkline.
	SfSparklineAxisStrokeColor	Color of axis stroke in sparkline.
	SfSparklineRangeBandColor	Color of range band in sparkline.
	SfWinLossSparklineStrokeColor	Color of stroke color in sparkline.
	SfWinLossSparklineColor	Color of win loss in sparkline.
	SfColumnSparklineStrokeColor	Color of stroke in column sparkline.
	SfColumnSparklineColor	Color of column sparkline.

## SfTreeMap

Theme Dictionary	Keys	Description
SfTreeMapStyles	SfTreeMapTheme	By merging this key in application resources, it is possible to customize the appearance of the SfTreeMap without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfTreemapGroupBackgroundColor	Color of group background in treemap.
	SfTreemapLeafItemBorderColor	Color of leaf item border in maps.
	SfTreemapTooltipBackgroundColor	Color of tooltip background in treemap.
	SfTreemapTooltipStrokeColor	Color of tooltip stroke in treemap.

	SfTreemapTooltipTextColor	Color of tooltip text in treemap.
--	---------------------------	-----------------------------------

### SfImageEditor

Theme Dictionary	Keys	Description
SfImageEditorStyles	SfImageEditorTheme	By merging this key in application resources, it is possible to customize the appearance of the SfImageEditor without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Green ....{% endhighlight %}
	SfImageEditorToolBarBackgroundColor	Color of background in image editor.
	SfImageEditorToolBarTextColor	Color of tool bar text in image editor.

### SfAutoComplete

Theme Dictionary	Keys	Description
SfAutoCompleteStyles	SfAutoCompleteTheme	By merging this key in application resources, you can customize the appearance of SfAutoComplete without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Red Green ....{% endhighlight %}
	SyncPrimaryColor	Color of indicator text in AutoComplete.
	SyncPrimaryLightColor	Color of highlighted text in AutoComplete.
	SfAutoCompleteBackgroundColor	Background color of AutoComplete.
	SfAutoCompleteTextColor	Text color of AutoComplete.
	SfAutoCompleteBorderColor	Border color of AutoComplete.

	SfAutoCompleteClearButtonColor	Color of the close button when enter the input text.
	SfAutoCompleteWatermarkColor	Color of AutoComplete's watermark text.
	SfAutoCompleteDropDownBackgroundColor	Background color of the drop-down box.
	SfAutoCompleteDropDownTextColor	Text color of items in the drop-down box.
	SfAutoCompleteTokenBackgroundColor	Background color of token.
	SfAutoCompleteTokenTextColor	Color of token's text.
	SfAutoCompleteTokenDeleteButtonColor	Color of token's delete button.

## SfBusyIndicator

Theme Dictionary	Keys	Description
SfBusyIndicatorStyles	SfBusyIndicatorTheme	By merging this key in application resources, you can customize the appearance of SfBusyIndicator without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Black ....{% endhighlight %}
	SyncPrimaryColor	Color of the SfBusyIndicator text.

## SfButton

Theme Dictionary	Keys	Description
SfButtonStyles	SfButtonTheme	By merging this key in application resources, you can customize the appearance of SfButton without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Black White ....{% endhighlight %}
	SyncPrimaryColor	Background color of the SfButton.
		Border color of the SfButton.
	SyncPrimaryDarkColor	Color of the button when it is in the pressed state.

	SyncPrimaryForegroundColor	Text color of the SfButton.
--	----------------------------	-----------------------------

## SfSwitch

Theme Dictionary	Keys	Description
SfSwitchStyles	SfSwitchTheme	By merging this key in application resources, you can customize the appearance of SfSwitch without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Black White ....{% endhighlight %}
	SyncPrimaryColor	Thumb color of the material switch in On state.
		Thumb border color of the material switch in On state.
		Track color of the Cupertino switch in On state.
		Track border color of the Cupertino switch in On state.
		Track color of the Fluent switch in On state.
		Track border color of the Fluent switch in On state.
	SyncPrimaryForegroundColor	Thumb color of the Cupertino switch in On state.
		Thumb border color of the Cupertino switch in On state.
		Thumb color of the Fluent switch in On state.
		Thumb border color of the Fluent switch in On state.

	MaterialOffThumbColor	Thumb color of the material switch in off state.
	MaterialOffTrackColor	Track color of the material switch in off state.
	MaterialOffThumbBorderColor	Thumb border color of the material switch in off state.
	MaterialOffTrackBorderColor	Track border color of the material switch in off state.
	MaterialIndeterminateTrackColor	Indeterminate track color of the material switch.
	MaterialIndeterminateTrackBorderColor	Indeterminate track border color of the material switch.
	CupertinoOffThumbBorderColor	Thumb border color of the Cupertino switch in off state.
	CupertinoOffTrackColor	Track color of the Cupertino switch in off state.
	CupertinoOffTrackBorderColor	Track border color of the Cupertino switch in off state.
	FluentOffThumbColor	Thumb color of the fluent switch in off state.
	FluentOffTrackColor	Track color of the fluent switch in off state.
	FluentOffThumbBorderColor	Thumb border color of the fluent switch in off state.
	FluentOffTrackBorderColor	Border color of the fluent switch in off state.

### SfBorder

Theme Dictionary	Keys	Description
SfBorderStyles	SfBorderTheme	By merging this key in application resources, you can customize the appearance of SfBorder without merging common theme resource and control style resource

		dictionaries. {% highlight xaml %} CustomTheme LightGray Gray ....{% endhighlight %}
	SfBorderBackgroundColor	Background color of the border.
	SfBorderBorderColor	Border color of the border control.

### SfCarousel

Theme Dictionary	Keys	Description
SfCarouselStyles	SfCarouselTheme	By merging this key in application resources, you can customize the appearance of SfCarousel without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme White ....{% endhighlight %}
	SfCarouselBackgroundColor	Background color of the SfCarousel.

### SfCheckBox

Theme Dictionary	Keys	Description
SfCheckBoxStyles	SfCheckBoxTheme	By merging this key in application resources, you can customize the appearance of SfCheckBox without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme White Black ....{% endhighlight %}
	SfCheckBoxUncheckedColor	Color of unchecked item.
	SyncPrimaryColor	Color of checked item.
	SfCheckBoxBackgroundColor	Background color of the SfCheckBox.
	SfCheckBoxTextColor	Text color of the SfCheckBox.

### SfChip

Theme Dictionary	Keys	Description
SfChipStyles	SfChipTheme	By merging this key in application resources, you can customize the appearance of SfChip without merging common theme resource and control style resource dictionaries. {% highlight xaml %}

		CustomTheme LightGray Transparent ....{% endhighlight %}
	SfChipTextColor	Color of the text in the SfChip.
	SfChipCloseButtonColor	Color of the close button in SfChip.
	SfChipSelectionIndicatorColor.	Color of the selection indicator in SfChip.
	SfChipBackgroundColor	Background color of the SfChip.
	SfChipBorderColor	Border color of the SfChip.

### SfChipGroup

Theme Dictionary	Keys	Description
SfChipGroupStyles	SfChipGroupTheme	By merging this key in application resources, you can customize the appearance of SfChipGroup without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Blue Transparent ....{% endhighlight %}
	SfChipGroupTextColor	Color of the text in SfChipGroup.
	SfChipGroupCloseButtonColor	Color of the close button in SfChipGroup.
	SfChipSelectionIndicatorColor.	Color of the selection indicator in SfChipGroup.
	SfChipGroupBackgroundColor	Background color of SfChipGroup.
	SfChipGroupBorderColor	Border color of SfChipGroup.
	SyncPrimaryColor	Background color of the selected chip in SfChipGroup.
	SyncPrimaryForegroundColor	Text color of the selected chip in SfChipGroup.

### SfComboBox

Theme Dictionary	Keys	Description
SfComboBoxStyles	SfComboBoxTheme	By merging this key in application resources,

		you can customize the appearance of SfComboBox without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme White Black ....{% endhighlight %}
	SyncPrimaryColor	Color of indicator text in ComboBox.
	SyncPrimaryLightColor	Color of highlighted text in ComboBox.
	SfComboBoxBackgroundColor	BackgroundColor of SfComboBox.
	SfComboBoxTextColor	Text color of SfComboBox.
	SfComboBoxBorderColor	Border color of SfComboBox.
	SfComboBoxClearButtonColor	Color of the close button in SfComboBox.
	SfComboBoxWatermarkColor	Color of the watermark's text in SfComboBox.
	SfComboBoxDropDownBackgroundColor	Background color of the suggestion box in SfComboBox.
	SfComboBoxSelectedDropDownItemColor	Color of the suggestion box's item in SfComboBox.
	SfComboBoxDropDownTextColor	Color of the suggestion box's text in SfComboBox.
	SfComboBoxTokenBackgroundColor	Background color of the token in SfComboBox.

	SfComboBoxTokenTextColor	Color of the token's text in SfComboBox.
	SfComboBoxTokenDeleteButtonColor	Color of the token's delete button in SfComboBox.
	SfComboBoxDropDownButtonBackgroundColor	Background color of the drop-down button in SfComboBox.
	SfComboBoxDropDownButtonTextColor	Color of the drop-down button's text in SfComboBox.
	SfComboBoxHighlightedDropDownButtonBackgroundColor	Highlighted Background color of the drop-down button in SfComboBox.

### SfNavigationDrawer

Theme Dictionary	Keys	Description
SfNavigationDrawerStyles	SfNavigationDrawerTheme	By merging this key in application resources, you can customize the appearance of SfNavigationDrawer without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Black ....{% endhighlight %}
	SfNavigationDrawerBackgroundColor	Background color of the SfNavigationDrawer.

### SfPicker

Theme Dictionary	Keys	Description
SfPickerStyles	SfPickerTheme	By merging this key in application resources, you can customize the appearance of SfPicker without merging common theme resource and control style resource dictionaries. {% highlight

		xaml %} CustomTheme Black Red ....{% endhighlight %}
	SyncPrimaryColor	Background color of header in SfPicker.
	SyncPrimaryLightColor	Color of SelectedItem's text in SfPicker.
	SyncPrimaryForegroundColor	Color of Header's text in SfPicker.
	SfPickerUnselectedItemTextColor	Color of UnSelectedItem's text in SfPicker.
	SfPickerColumnHeaderTextColor	Color of column header's text in SfPicker.
	SfPickerColumnHeaderBackgroundColor	Background color of theColumn header in SfPicker.
	SfPickerSelectionBackgroundColor	Background color of the selected item in SfPicker.
	SfPickerBackgroundColor	Background color of the SfPicker.
	SfPickerBorderColor	Border color of the SfPicker.

### SfRadioButton

Theme Dictionary	Keys	Description
SfRadioButtonStyles	SfRadioButtonTheme	By merging this key in application resources, you can customize the appearance of SfRadioButton without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme White Black ....{% endhighlight %}
	SyncPrimaryColor	Color of checked item.
	SfRadioButtonUncheckedColor	Color of unchecked item.
	SfRadioButtonBackgroundColor	Background color of the SfRadioButton.
	SfRadioButtonTextColor	Text color of the SfRadioButton.

## SfRadialMenu

Theme Dictionary	Keys	Description
SfRadialMenuStyles	SfRadialMenuTheme	By merging this key in application resources, you can customize the appearance of SfRadialMenu without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Gray White ....{% endhighlight %}
	SfRadialMenuPressedColor	Selection color of SfRadialMenu.
	SfRadialMenuCenterButtonBorderColor	Color of the center button's border in SfRadialMenu.
	SfRadialMenuCenterButtonBackgroundColor	Color of the center button's background in SfRadialMenu.
	SfRadialMenuCenterButtonTextColor	Color of the center button's text in SfRadialMenu.
	SfRadialMenuRimColor	Color of the rim when tap the center button of SfRadialMenu.
	SfRadialMenuSeparatorColor	Color of separator that appears between two items in SfRadialMenu.
	SfRadialMenuTextColor	Color of RadialMenu's text.
	SfRadialMenuIconFontColor	Color of font icon in SfRadialMenu.

## SfRangeSlider

Theme Dictionary	Keys	Description
SfRangeSliderStyles	SfRangeSliderTheme	By merging this key in application resources, you can customize the appearance of SfRangeSlider without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme White Gray ....{% endhighlight %}
	SyncPrimaryColor	Selection color of track in SfRangeSlider.

		Knob color in SfRangeSlider
	SfRangeSliderBackgroundColor	Background color of SfRangeSlider.
	SfRangeSliderTickColor	Color for ticks in SfRangeSlider.
	SfRangeSliderLabelColor	Color of SfRangeSlider's label.
	SfRangeSliderUnselectedTrackColor	Color of unselected track in SfRangeSlider.
	SfRangeSliderToolTipBackgroundColor	Background color of tooltip in SfRangeSlider.
	SfRangeSliderToolTipTextColor	Color of tooltip's text in SfRangeSlider.

### SfRating

Theme Dictionary	Keys	Description
SfRatingStyles	SfRatingTheme	By merging this key in application resources, you can customize the appearance of SfRating without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme White Green ....{% endhighlight %}
	SyncPrimaryColor	Stroke color of rated items.
		Fill color of rated items.
	SfRatingToolTipBackgroundColor	Background color of the tooltip in SfRating.
	SfRatingToolTipTextColor	Text color inside the tooltip in SfRating.
	SfRatingUnratedFillColor	Fill color for unrated items in SfRating.
	SfRatingUnratedStrokeColor	Stroke color for unrated items in SfRating.

### SfRotator

Theme Dictionary	Keys	Description
SfRotatorStyles	SfRotatorTheme	By merging this key in application resources,

		you can customize the appearance of SfRotator without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme White Gray ....{% endhighlight %}	
	SyncPrimaryColor	Color of selected dots in SfRotator.	
	SfRotatorUnselectedDotColor	Color of Unselected dots in SfRotator.	
	SfRotatorDotsBorderColor		Color of dots border in SfRotator.

### SfSegmentedControl

Theme Dictionary	Keys	Description
SfSegmentedControlStyles	SfSegmentedControlTheme	By merging this key in application resources, you can customize the appearance of SfSegmentedControl without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Gray White ....{% endhighlight %}
	SyncPrimaryForegroundColor	Text color of selected item in the SfSegmentedControl.
	SfSegmentFontIconFontColor	Color of font icon in the SfSegmentedControl.
	SfSegmentFontColor	Color of font in the SfSegmentedControl.
	SfSegmentedControlBorderColor	Color of segment's border in the SfSegmentedControl.

	SfSegmentColor	Color of segment in the SfSegmentedControl.
	SyncPrimaryColor	Background color of the selected item in the SfSegmentedControl.

### SfTabView

Theme Dictionary	Keys	Description
SfTabViewStyles	SfTabViewTheme	By merging this key in application resources, you can customize the appearance of SfTabView without merging common theme resource and control style resource dictionaries. {% highlight xaml %} CustomTheme Red ....{% endhighlight %}
	SfTabItemFontColor	Font color of title in SfTabView.
		Font color of font icon in SfTabView.
	SyncPrimaryColor	Background color of tab header in SfTabView.
	SyncPrimaryForegroundColor	Selection color of tab item in SfTabView.
		Color of selection indicator in SfTabView.

### Switching between light theme and dark theme

To switch to light theme from dark theme, use the following code snippet.

#### C#

```
void UpdateTheme(object sender, System.EventArgs e)
{
    ICollection<ResourceDictionary> mergedDictionaries =
    Application.Current.Resources.MergedDictionaries;
    var darkTheme = mergedDictionaries.OfType<DarkTheme>().FirstOrDefault();
    if (darkTheme != null)
    {
        mergedDictionaries.Remove(darkTheme);
    }
    mergedDictionaries.Add(new LightTheme());
}
```

Similarly, to switch to dark theme from light theme, remove the light theme resource, and add the dark theme resource dictionary.

## UI Kit

### Syncfusion XAML Pages for Xamarin.Forms

The [Syncfusion Essential UI Kit](#) is a collection of easy-to-use, extendable, and adaptable XAML pages that allows you to quickly create a Xamarin.Forms application by providing generic pre-defined screens. Now, the UI Kit has screens for the following categories:

- Forms
- Catalog
- Detail
- Chat
- Reviews and Ratings
- Contact Us
- About Us
- Navigation
- Error and Empty
- Transaction
- Bookmark
- History
- Social
- Profile

The screens are developed with MVVM pattern, which separates the UI and business logic results in a clean, professional, and scalable representation of user interface in your Xamarin.Forms applications. You can get the UI Kit application from [Google Play Store](#) and the complete source code is available in [GitHub repository](#)

### Supported Platforms

- Android 5.0 (or API level 21) and later versions.
- iOS 9.0 and later versions.
- UWP Build 17763 and later versions

---

**Note:** The required minimum version of Xamarin.Forms is 4.0.0.425677.

---

To get started with Syncfusion XAML Pages for Xamarin.Forms, refer to [Getting Started](#)

### Getting started

The UI Kit screens can be added in your application by the following two ways:

1. Using **Essential UI Kit for Xamarin.Forms** Visual Studio extension.
2. Copying the files from our open source [GitHub repository](#).

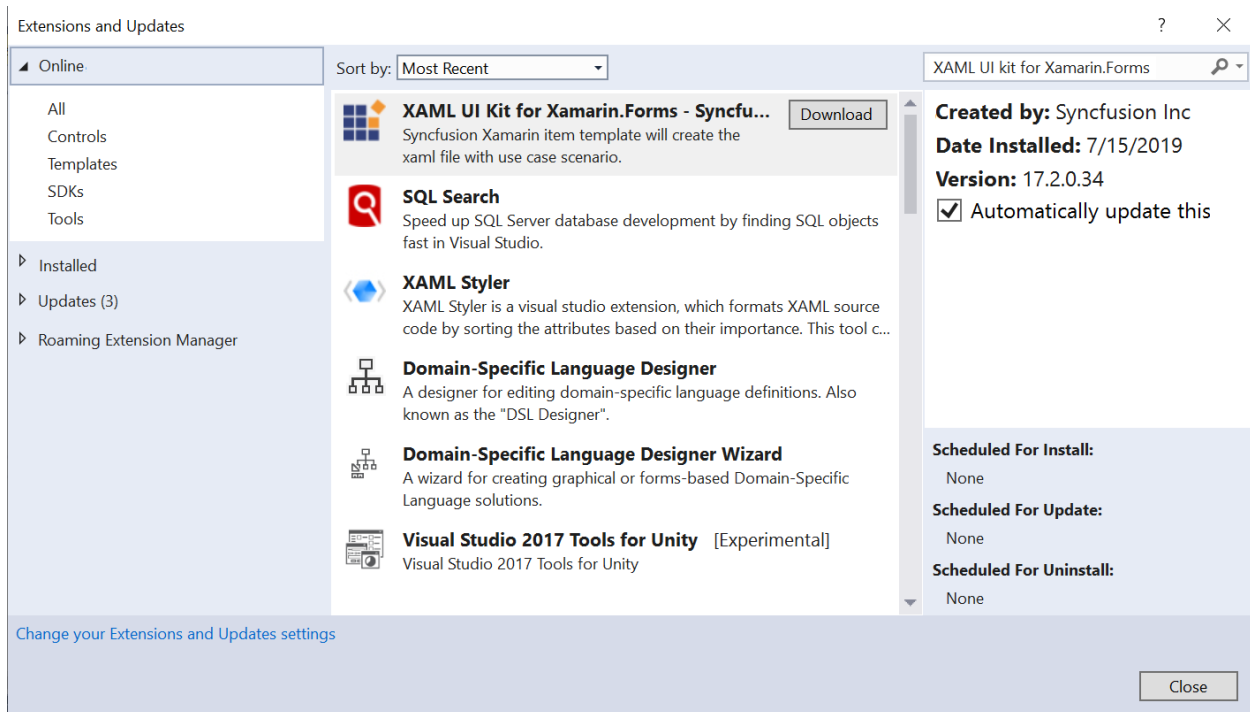

### Essential UI Kit for Xamarin.Forms Extension

This is the easiest way to add the pre-defined screens to your application. The following steps explain how to add screens to an application with our extension:

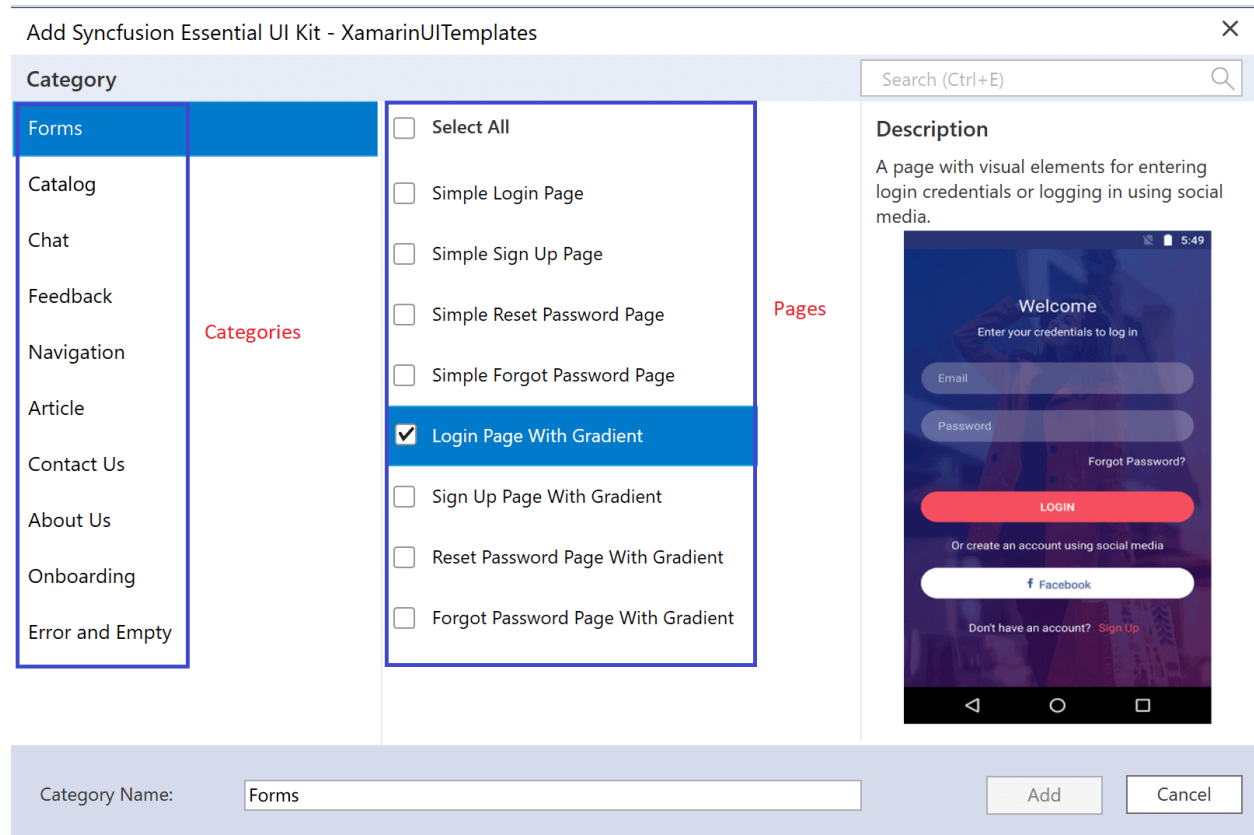

1. Open Visual Studio.
2. Go to Extension, and then click Manage Extensions as shown in the following screenshot.

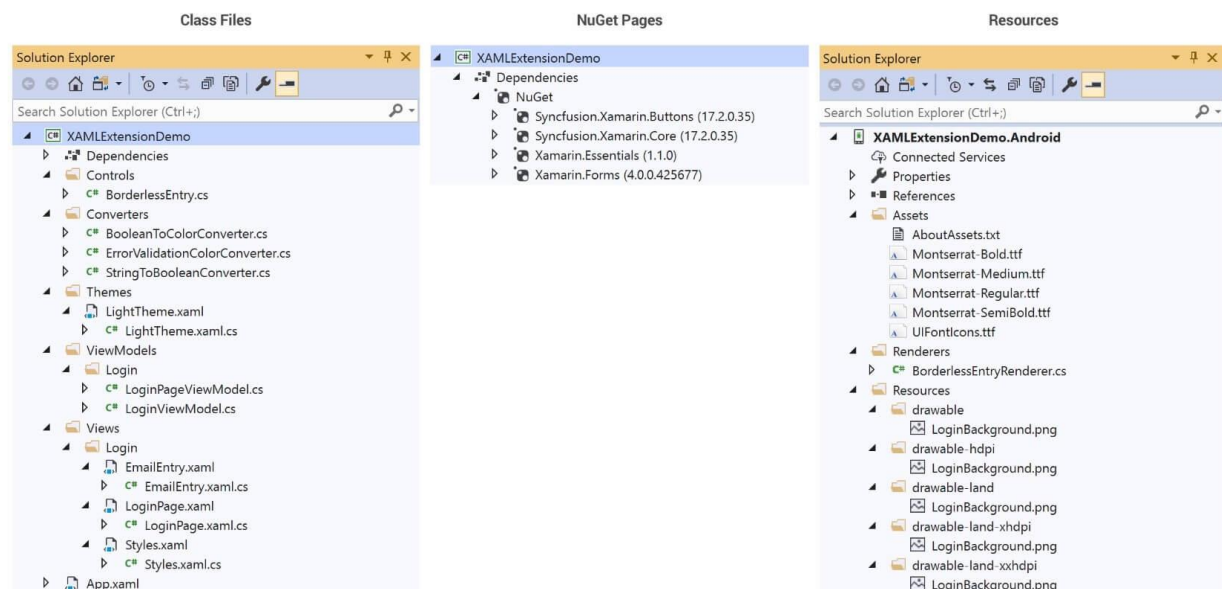

3. Search for **Essential UI Kit for Xamarin.Forms**, and then install it.

4. Restart the Visual Studio and allow it to complete the installation.
5. Now, open an existing Xamarin.Forms application or create a new application as per your requirements.
6. Right-click the Xamarin.Forms [NETStandard] project, and you can see the **Essential UI Kit for Xamarin.Forms** option.
7. Select the category and pages you need to add in your application. In the following screenshot, the **Login Page with Gradient** screen has been selected from the **Login** category.

- Clicking the 'Add' button will include the selected page to your project. The necessary class files, resources, and NuGet package references will automatically be added to your project as shown in the following screenshot.

### How to render the added page

In a Xamarin.Forms demo application, you must make the added page as the start-up page in the App.xaml.cs file.

Example: If you added the Login Page, then you must invoke the page as demonstrated in the following code.

#### C#

```
MainPage = new SampleFormsApplication.Views.Login.LoginPage();
```

In real-world applications, you may need to do the following to use these XAML pages:

1. Update the services for fetching the data from remote server or local database.
2. Wire up the navigation and update the business logics in view models.

### Requesting Screens and Reporting Bugs

If you would like to request a new screen or report a bug in existing screens, create a feature request or submit a bug through our [feedback portal](#)

---

**Note:** Now, **Essential UI Kit for Xamarin.Forms** Visual Studio extension is supported in the Windows operating system only.

---

### Release Notes

The UI Kit contains elegantly designed XAML pages for Xamarin.Forms apps. These pages are compatible with Android, iOS, and UWP platforms, and these pages use the MVVM design pattern to provide trouble-free integration.

To know more, refer to this [Read me](#) file.

#### UI Kit 1.0.0.0

The UI Kit version 1.0.0.0 has 45 screens for the following categories with RTL and themes support.

- Login
- ECommerce
- Chat
- Feedback
- Contact Us
- About Us
- Article
- Navigation
- Error and Empty

#### UI Kit 2.0.0.0

The UI Kit version 2.0.0.0 has 12 new screens for the following categories.

S.No	Categories	Pages
1	Forms	1. Add Contact Page 2. Tabbed Login Page 3. Add Card Page

2	Detail	1. Article Detail Page
3	Navigation	1. Bottom Navigation Page
4	Transaction	1. Payment Success Page 2. Payment Failure page
5	Bookmark	1. Wish List Page
6	History	1. Transaction History page 2. History - My Orders Page
7	Social	1. Social Profile with Connections Page 2. Social Profile with Card page

## SfAccordion

### Getting started

The Accordion control allows content to be organized in a vertically stacked list of items that is collapsible. Each item can also be expanded to reveal the content associated with that item. This section provides a quick overview for working with the **SfAccordion** for Xamarin.Forms.

### Assembly deployment

After installing Essential Studio for Xamarin, you can find all the required assemblies in the installation folders, {Syncfusion Essential Studio Installed location} \Essential Studio\16.x.x.x\Xamarin\lib

Eg: C:\Program Files (x86) \Syncfusion\Essential Studio\16.1.0.24\Xamarin\lib

---

**Note:** Assemblies can be found in unzipped package location in Mac.

---

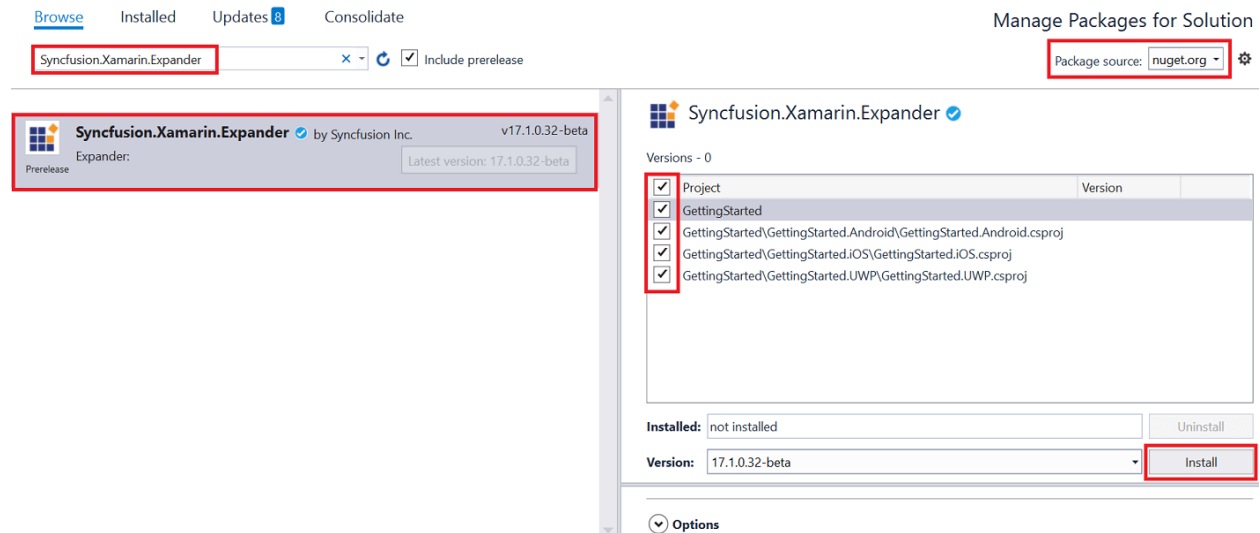

### Adding SfAccordion reference

You can add SfAccordion reference using one of the following methods:

#### Method 1: Adding SfAccordion reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Expander). To add SfAccordion to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Expander](https://www.nuget.org/packages/Syncfusion.Xamarin.Expander), and then install it.

**Note:** Install the same version of Expander NuGet in all the projects.

### Method 2: Adding SfAccordion reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfAccordion control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfAccordion assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Expander.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Expander.XForms.dll Syncfusion.Expander.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Expander.XForms.dll Syncfusion.Expander.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Expander.XForms.dll Syncfusion.Expander.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching the accordion on each platform

To use the accordion in an application, each platform application must initialize the accordion renderer. This initialization step varies from platform to platform and is discussed in the following sections:

#### Android

The Android launches the accordion without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

#### iOS

To launch the accordion in iOS, call the `SfAccordionRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework initialization and before the `LoadApplication` is called, as demonstrated in the following code example:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.XForms.iOS.Accordion.SfAccordionRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### Universal Windows Platform (UWP)

The UWP launches the accordion without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

#### ReleaseMode issue in UWP platform

The known Framework issue in UWP platform is that the custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the accordion assemblies in `App.xaml.cs` file in UWP project as in the following code snippet:

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
```

```
//Now, add all the assemblies your app uses
assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Accordion.SfAccordionRenderer).GetTypeInfo().Assembly);
// replaces Xamarin.Forms.Forms.Init(e);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
...
}
```

## Creating the Accordion

This section explains how to create a simple Xamarin.Forms application with [SfAccordion](#). The control should be configured entirely in C# code or by using XAML markup.

- Creating the project.
- Adding accordion in Xamarin.Forms.
- Defining accordion Items.

### Creating the project

Create a new blank (.Net Standard) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding accordion in Xamarin.Forms:

To add the accordion to your application, follow the steps:

1. Add required assemblies as discussed in assembly deployment section.
2. Import the control namespace as `xmlns:accordion="clr-namespace:Syncfusion.XForms.Accordion;assembly=Syncfusion.Expander.XForms"` in XAML Page.
3. Create an instance of accordion control and add as content for content page.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:syncfusion="clr-namespace:Syncfusion.XForms.Accordion;assembly=Syncfusion.Expander.XForms">
<ContentPage.Content>
<syncfusion:SfAccordion x:Name="accordion"/>
</ContentPage.Content>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.Accordion;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        SfAccordion accordion;
        public MainPage()
        {
```

```
InitializeComponent();
accordion = new SfAccordion();
}
}
}
```

### Defining accordion Items

**SfAccordion** is a layout control with vertically stacked list of accordion [Items](#) that comprise of [Header](#) and [Content](#). You can load any View in Header and Content. User can expand or collapse the Content view by tapping Header.

Here, Labels are loaded in Header and Content of accordion items.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.Accordion;assembly=Syncfusion.Expander.XForms">
<ContentPage.Content>
<syncfusion:SfAccordion Grid.Row="1">
<syncfusion:SfAccordion.Items>
<syncfusion:AccordionItem>
<syncfusion:AccordionItem.Header>
<Label TextColor="#495F6E" Text="Cheese burger" HeightRequest="50"
VerticalTextAlignment="Center"/>
</syncfusion:AccordionItem.Header>
<syncfusion:AccordionItem.Content>
<Grid Padding="10,10,10,10" BackgroundColor="#FFFFFF">
<Label TextColor="#303030" Text="Hamburger accompanied with melted cheese.
The term itself is a portmanteau of the words cheese and hamburger. The
cheese is usually sliced, then added a short time before the hamburger
finishes cooking to allow it to melt." HeightRequest="50"
VerticalTextAlignment="Center"/>
</Grid>
</syncfusion:AccordionItem.Content>
</syncfusion:AccordionItem>
<syncfusion:AccordionItem>
<syncfusion:AccordionItem.Header>
<Label TextColor="#495F6E" Text="Veggie burger" HeightRequest="50"
VerticalTextAlignment="Center"/>
</syncfusion:AccordionItem.Header>
<syncfusion:AccordionItem.Content>
<Grid Padding="10,10,10,10" BackgroundColor="#FFFFFF">
<Label TextColor="#303030" Text="Veggie burger, garden burger, or tofu
burger uses a meat analogue, a meat substitute such as tofu, textured
vegetable protein, seitan (wheat gluten), Quorn, beans, grains or an
assortment of vegetables, which are ground up and formed into patties."
HeightRequest="50" VerticalTextAlignment="Center"/>
</Grid>
</syncfusion:AccordionItem.Content>
</syncfusion:AccordionItem>
</syncfusion:AccordionItem>
```

```

<syncfusion:AccordionItem.Header>
<Label TextColor="#495F6E" Text="Barbecue burger" HeightRequest="50"
VerticalTextAlignment="Center"/>
</syncfusion:AccordionItem.Header>
<syncfusion:AccordionItem.Content>
<Grid Padding="10,10,10,10" BackgroundColor="#FFFFFF">
<Label TextColor="#303030" Text="Prepared with ground beef, mixed with
onions and barbecue sauce, and then grilled. Once the meat has been turned
once, barbecue sauce is spread on top and grilled until the sauce
caramelizes." HeightRequest="50" VerticalTextAlignment="Center"/>
</Grid>
</syncfusion:AccordionItem.Content>
</syncfusion:AccordionItem>
<syncfusion:AccordionItem>
<syncfusion:AccordionItem.Header>
<Label TextColor="#495F6E" Text="Chili burger" HeightRequest="50"
VerticalTextAlignment="Center"/>
</syncfusion:AccordionItem.Header>
<syncfusion:AccordionItem.Content>
<Grid Padding="10,10,10,10" BackgroundColor="#FFFFFF">
<Label TextColor="#303030" Text="Consists of a hamburger, with the patty
topped with chili con carne." HeightRequest="50"
VerticalTextAlignment="Center"/>
</Grid>
</syncfusion:AccordionItem.Content>
</syncfusion:AccordionItem>
</syncfusion:SfAccordion.Items>
</syncfusion:SfAccordion>
</ContentPage.Content>
</ContentPage>

```

## C#

```

public MainPageCS()
{
InitializeAccordionItems();
this.Content = Accordion;
}
private void InitializeAccordionItems()
{
Accordion = new SfAccordion();
Accordion.Items.Add(GenerateInvoiceHeaderAccordion());
Accordion.Items.Add(GenerateInvoiceItemsAccordion());
Accordion.Items.Add(GeneratePaymentDetailsAccordion());
}
private AccordionItem GenerateInvoiceHeaderAccordion()
{
var item = new AccordionItem();
var headerGrid = new Grid() { Padding = new Thickness(10, 0, 0, 10) };
var headerLabel = new Label() { TextColor = Color.FromHex("#495F6E"), Text =
"Invoice Date", HeightRequest = 50, VerticalTextAlignment =
TextAlignment.Center };
headerGrid.Children.Add(headerLabel);
var contentGrid = new Grid() { Padding = new Thickness(10, 0, 0, 10),
BackgroundColor = Color.FromHex("#FFFFFF") };

```

```

var contentLabel = new Label() { TextColor = Color.FromHex("#303030"), Text
= "11.03 AM, 15 January 2019", HeightRequest = 50, VerticalTextAlignment =
TextAlignment.Center };
contentGrid.Children.Add(contentLabel);

= "$36,000.00", HorizontalTextAlignment = TextAlignment.End, FontAttributes
= FontAttributes.Bold };
contentGrid.Children.Add(contentLabel0, 0, 0);
contentGrid.Children.Add(contentLabel11, 0, 1);
contentGrid.Children.Add(contentLabel2, 0, 2);
contentGrid.Children.Add(contentLabel3, 0, 3);

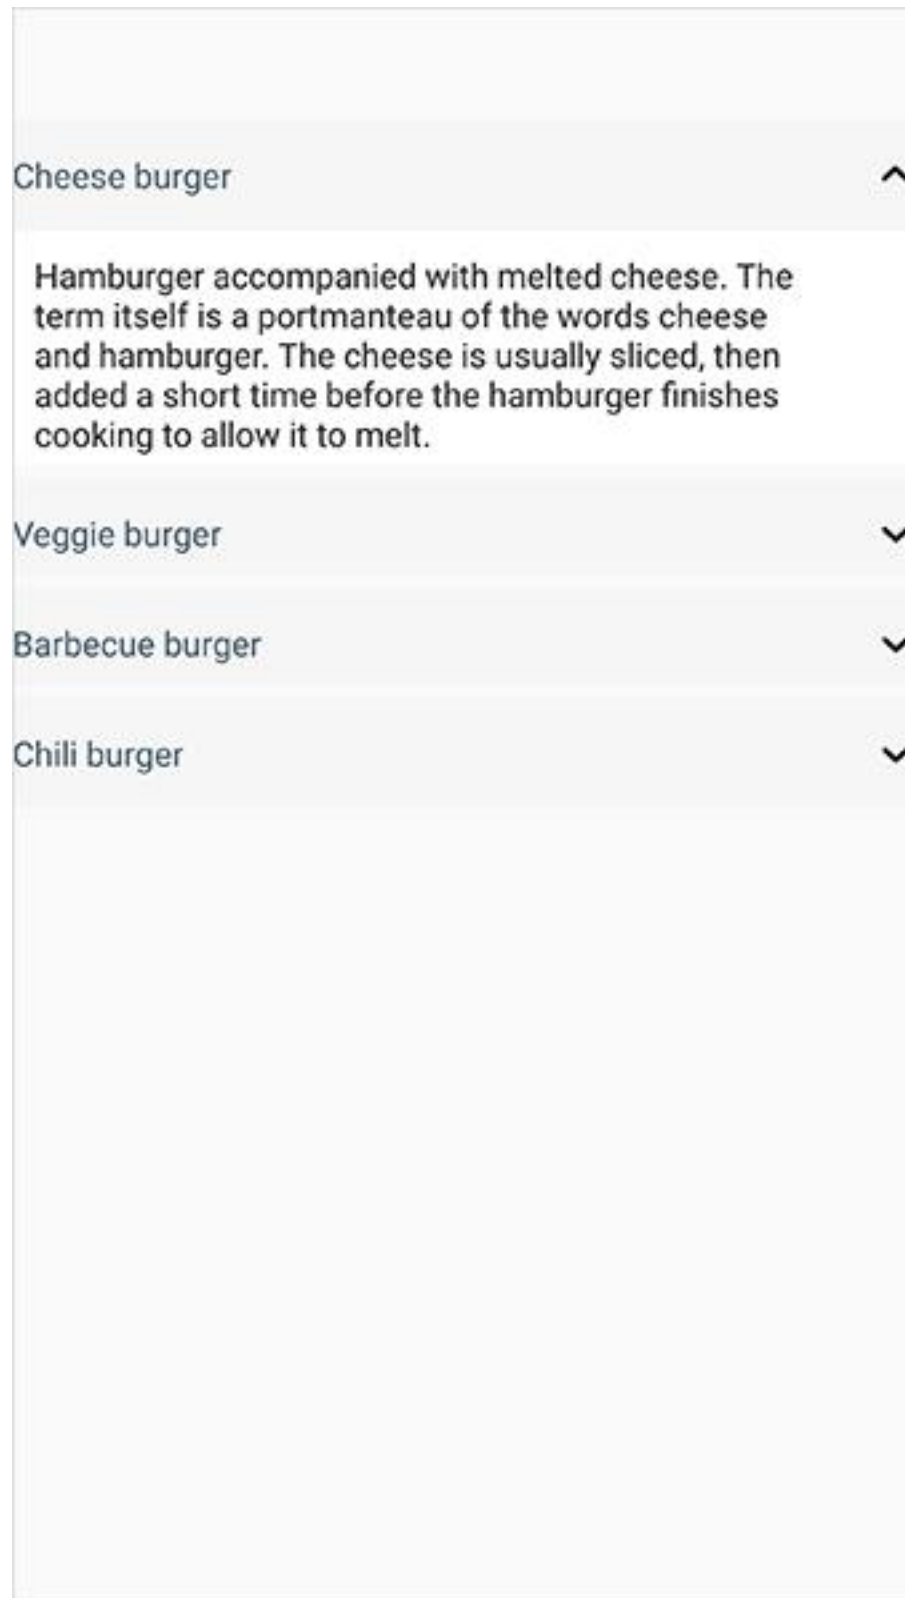

```

```

contentGrid.Children.Add(contentLabel4, 0, 4);
contentGrid.Children.Add(contentLabel5, 1, 0);
contentGrid.Children.Add(contentLabel6, 1, 1);
contentGrid.Children.Add(contentLabel7, 2, 1);
contentGrid.Children.Add(contentLabel8, 3, 1);
contentGrid.Children.Add(contentLabel9, 4, 1);
item.Header = headerGrid;
item.Content = contentGrid;
return item;
}
private AccordionItem GeneratePaymentDetailsAccordion()
{
var item = new AccordionItem();
var headerGrid = new Grid() { Padding = new Thickness(10, 0, 10, 10) };
var headerLabel = new Label() { TextColor = Color.FromHex("#495F6E"), Text =
"Payment Details", HeightRequest = 50, VerticalTextAlignment =
TextAlignment.Center };
headerGrid.Children.Add(headerLabel);
var contentGrid = new Grid() { Padding = new Thickness(10, 0, 10, 10),
BackgroundColor = Color.FromHex("#FFFFFF") };
contentGrid.RowDefinitions.Add(new RowDefinition() { Height = new
GridLength(1, GridUnitType.Auto) });
contentGrid.RowDefinitions.Add(new RowDefinition() { Height = new
GridLength(1, GridUnitType.Auto) });
contentGrid.RowDefinitions.Add(new RowDefinition() { Height = new
GridLength(1, GridUnitType.Auto) });
contentGrid.ColumnDefinitions.Add(new ColumnDefinition() { Width = new
GridLength(1, GridUnitType.Star) });
contentGrid.ColumnDefinitions.Add(new ColumnDefinition() { Width = new
GridLength(1, GridUnitType.Star) });
var contentLabel0 = new Label() { TextColor = Color.FromHex("#303030"), Text
= "Card Payment" };
var contentLabel1 = new Label() { TextColor = Color.FromHex("#303030"), Text
= "Third-Party coupons" };
var contentLabel2 = new Label() { TextColor = Color.FromHex("#303030"), Text
= "Total Amount Paid", FontAttributes = FontAttributes.Bold };
var contentLabel3 = new Label() { TextColor = Color.FromHex("#303030"), Text
= "$31,000.00", HorizontalTextAlignment = TextAlignment.End };
var contentLabel4 = new Label() { TextColor = Color.FromHex("#303030"), Text
= "$5,000.00", HorizontalTextAlignment = TextAlignment.End };
var contentLabel5 = new Label() { TextColor = Color.FromHex("#303030"), Text
= "$36,000.00", HorizontalTextAlignment = TextAlignment.End, FontAttributes
= FontAttributes.Bold };
contentGrid.Children.Add(contentLabel0, 0, 0);
contentGrid.Children.Add(contentLabel1, 0, 1);
contentGrid.Children.Add(contentLabel2, 0, 2);
contentGrid.Children.Add(contentLabel3, 1, 0);
contentGrid.Children.Add(contentLabel4, 1, 1);
contentGrid.Children.Add(contentLabel5, 1, 2);
item.Header = headerGrid;
item.Content = contentGrid;
return item;
}

```

Now, run the application to render the following output.

You can download accordion sample for Xamarin.Forms from here [AccordionGettingStarted](#).

### Animation duration

**SfAccordion** allows to customize the expanding and collapsing of accordion item by using [AnimationDuration](#) property. By default, the animation duration is 250 milliseconds.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion" AnimationDuration="150" />
```

#### C#

```
accordion.AnimationDuration = 150;
```

### Animation easing

**SfAccordion** allows to customize the rate of change of parameter over time or animation style of accordion item by using [AnimationEasing](#) property. By default, the animation easing is **Linear**.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion" AnimationEasing="SinOut" />
```

#### C#

```
accordion.AnimationEasing =  
Syncfusion.XForms.Expander.AnimationEasing.SinOut;
```

### Auto scroll position

**SfAccordion** allows to customize the scroll position of the expanded accordion item by using [AutoScrollPosition](#) property. By default, the auto scroll position is **MakeVisible**.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion" AutoScrollPosition="Top"/>
```

#### C#

```
accordion.AutoScrollPosition =  
Syncfusion.XForms.Accordion.AutoScrollPosition.Top;
```

### Expand mode

**SfAccordion** allows to expand single or multiple items by using the [ExpandMode](#) property. By default, the expand mode is **Single**.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion" ExpandMode="Multiple" />
```

#### C#

```
accordion.ExpandMode = Syncfusion.XForms.Accordion.ExpandMode.Multiple;
```

### Item spacing

**SfAccordion** allows to customize the vertical spacing between the accordion items by using [ItemSpacing](#) property. The default value is **6.0d**.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion" ItemSpacing="8.0d" />
```

#### C#

```
accordion.ItemSpacing = 8.0d;
```

### Appearance

The Accordion allows customizing appearance of the Icon, and provides different functionalities to the end-user.

#### Header icon position

**SfAccordion** allows to customize the position of the header icon in accordion item by using [HeaderIconPosition](#) property. By default, the header Icon position is **End**.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion" HeaderIconPosition="Start" />
```

#### C#

```
accordion.HeaderIconPosition =  
Syncfusion.XForms.Expander.IconPosition.Start;
```

#### Header background color customization

**SfAccordion** allows to customize the background color of the expander header by using [HeaderBackgroundColor](#) property.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion">  
  <syncfusion:SfAccordion.Items>  
    <syncfusion:AccordionItem HeaderBackgroundColor="Pink"/>  
  </syncfusion:SfAccordion.Items>  
</syncfusion:SfAccordion>
```

#### C#

```
SfAccordion accordion;  
public MainPage()  
{  
  InitializeComponent();  
  InitializeAccordionItems();  
  this.Content = accordion;  
}  
private void InitializeAccordionItems()  
{  
  accordion = new SfAccordion();
```

```
accordion.Items.Add(GenerateAccordionItem());
}
public AccordionItem GenerateAccordionItem()
{
    var item = new AccordionItem();
    item.HeaderBackgroundColor = Color.Pink;
    return item;
}
```

### Icon color customization

[SfAccordion](#) allows to customize the color of the expander icon by using [IconColor](#) property. By default, [IconColor](#) is black.

#### XML

```
<syncfusion:SfAccordion x:Name="accordion">
<syncfusion:SfAccordion.Items>
<syncfusion:AccordionItem IconColor="Accent"/>
</syncfusion:SfAccordion.Items>
</syncfusion:SfAccordion>
```

#### C#

```
SfAccordion accordion;
public MainPage()
{
    InitializeComponent();
    InitializeAccordionItems();
    this.Content = accordion;
}
private void InitializeAccordionItems()
{
    accordion = new SfAccordion();
    accordion.Items.Add(GenerateAccordionItem());
}
public AccordionItem GenerateAccordionItem()
{
    var item = new AccordionItem();
    item.IconColor = Color.Accent;
    return item;
}
```

### Visual State Manager

The appearance of the [SfAccordion](#) can be customized using the following two [VisualStates](#):

- Expanded
- Collapsed

#### XML

```
<syncfusion:SfAccordion x:Name="accordion">
<syncfusion:SfAccordion.Items>
<syncfusion:AccordionItem IconColor="Accent">
```

```

<syncfusion:AccordionItem.Header>
<Label TextColor="#495F6E" Text="Cheese burger" HeightRequest="50"
VerticalTextAlignment="Center"/>
</syncfusion:AccordionItem.Header>
<syncfusion:AccordionItem.Content>
<Grid Padding="10,10,10,10" BackgroundColor="#FFFFFF">
<Label TextColor="#303030" Text="Hamburger accompanied with melted cheese.
The term itself is a portmanteau of the words cheese and hamburger. The
cheese is usually sliced, then added a short time before the hamburger
finishes cooking to allow it to melt." HeightRequest="50"
VerticalTextAlignment="Center"/>
</Grid>
</syncfusion:AccordionItem.Content>
<VisualStateManager.VisualStateGroups>
<VisualStateGroupList>
<VisualStateGroup>
<VisualState Name="Expanded">
<VisualState.Setters>
<Setter Property="HeaderBackgroundColor" Value="Red"/>
</VisualState.Setters>
</VisualState>
<VisualState Name="Collapsed">
<VisualState.Setters>
<Setter Property="HeaderBackgroundColor" Value="Green"/>
</VisualState.Setters>
</VisualState>
</VisualStateGroup>
</VisualStateGroupList>
</VisualStateManager.VisualStateGroups>
</syncfusion:AccordionItem>
</syncfusion:SfAccordion>

```

**C#**

```

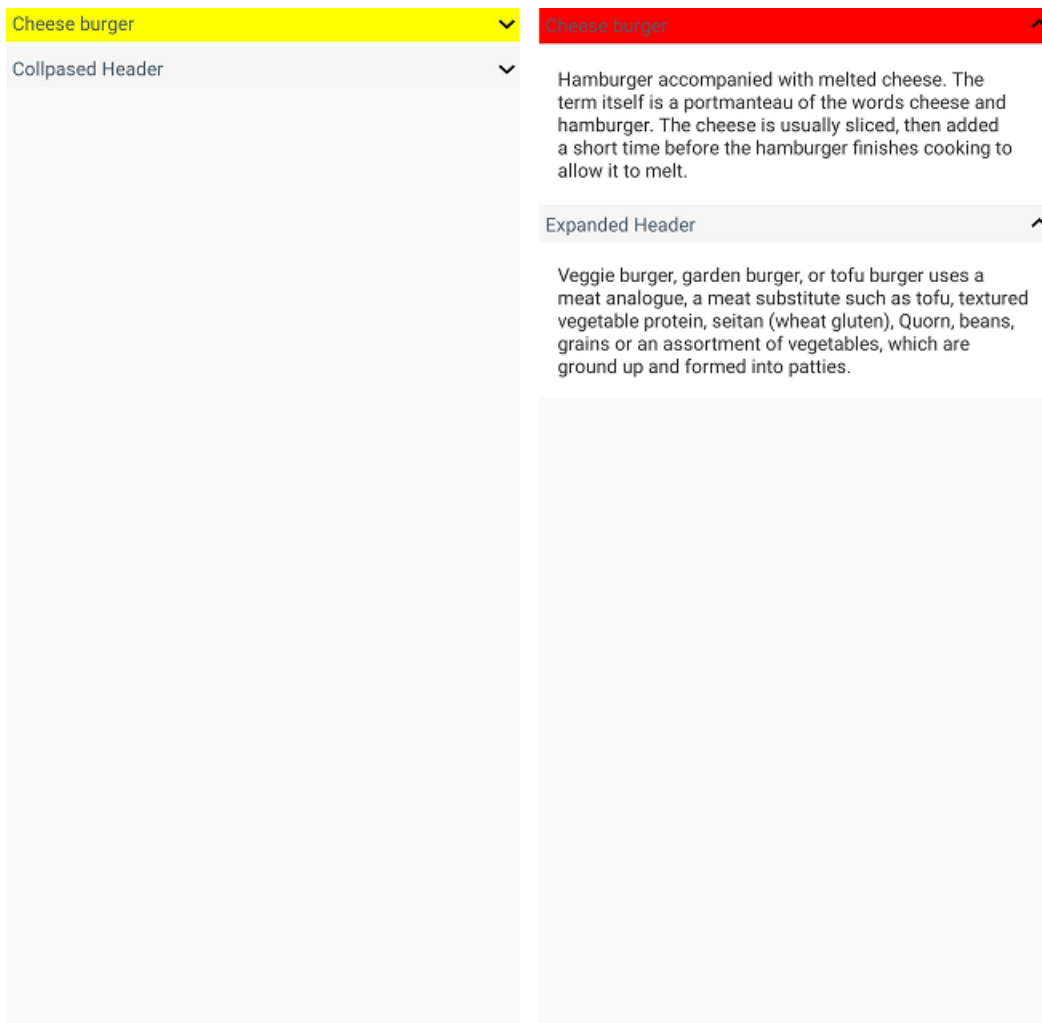

SfAccordion accordion;
public MainPage()
{
InitializeComponent();
InitializeAccordionItems();
this.Content = accordion;
}
private void InitializeAccordionItems()
{
accordion = new SfAccordion();
accordion.Items.Add(GenerateAccordionItem());
}
public AccordionItem GenerateAccordionItem()
{
var item = new AccordionItem();
item.IconColor = Color.Accent;
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState expanded = new VisualState
{
Name = "Expanded"

```

```

};
expanded.Setters.Add(new Setter { Property =
AccordionItem.HeaderBackgroundColorProperty, Value = Color.Red });
expanded.Setters.Add(new Setter { Property =
AccordionItem.HeaderBackgroundColorProperty, Value = Color.Red });
VisualState collapsed = new VisualState
{
    Name = "Collapsed"
};
collapsed.Setters.Add(new Setter { Property =
AccordionItem.HeaderBackgroundColorProperty, Value = Color.Green });
collapsed.Setters.Add(new Setter { Property =
AccordionItem.HeaderBackgroundColorProperty, Value = Color.Green });
commonStateGroup.States.Add(expanded);
commonStateGroup.States.Add(collapsed);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(item, visualStateGroupList);
return item;
}

```

You can download the entire source of this demo from [here](#).

## Bindable Layout

The [SfAccordion](#) allows to set a collection of items by setting `BindableLayout.ItemsSource` and `BindableLayout.ItemTemplate` properties. The Accordion supports Bindable Layout in Xamarin.Forms version 3.5 and above.

### Creating Data Model

Create a simple data model to bind the data for `SfAccordion` as shown in the following code example in a new class file, and save it as `ItemInfo.cs` file:

#### C#

```
public class ItemInfo
{
    public string Name { get; set; }
    public string Description { get; set; }
}
```

Create a model repository class with `ItemInfo` collection property initialized with required number of data objects in a new class file as shown in the following code example, and save it as `ItemInfoRepository.cs` file:

#### C#

```
public class ItemInfoRepository
{
    public ObservableCollection<ItemInfo> Info { get; set; }
    public ItemInfoRepository()
    {
        Info = new ObservableCollection<ItemInfo>();
        Info.Add(new ItemInfo() { Name = "Cheese burger", Description = "Hamburger accompanied with melted cheese. The term itself is a portmanteau of the words cheese and hamburger. The cheese is usually sliced, then added a short time before the hamburger finishes cooking to allow it to melt." });
        Info.Add(new ItemInfo() { Name = "Veggie burger", Description = "Veggie burger, garden burger, or tofu burger uses a meat analogue, a meat substitute such as tofu, textured vegetable protein, seitan (wheat gluten), Quorn, beans, grains or an assortment of vegetables, which are ground up and formed into patties." });
        Info.Add(new ItemInfo() { Name = "Barbecue burger", Description = "Prepared with ground beef, mixed with onions and barbecue sauce, and then grilled. Once the meat has been turned once, barbecue sauce is spread on top and grilled until the sauce caramelizes." });
        Info.Add(new ItemInfo() { Name = "Chili burger", Description = "Consists of a hamburger, with the patty topped with chili con carne." });
    }
}
```

Set the ViewModel instance as `BindingContext` of your page to bind properties of ViewModel to `SfAccordion`.

#### XML

```
<ContentPage.BindingContext>
<local:ItemInfoRepository/>
</ContentPage.BindingContext>
```

**C#**

```
this.BindingContext = new ItemInfoRepository();
```

## Binding data to SfAccordion

SfAccordion can be bounded with data by setting the ItemsSource property of BindableLayout.

The following code example binds the collection created in previous step to the Bindable.ItemsSource property:

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-namespace:Syncfusion.XForms.Accordion;assembly=Syncfusion.Expander.XForms"
xmlns:local="clr-namespace:AccordionBindableLayout"
x:Class="AccordionBindableLayout.MainPage">
<syncfusion:SfAccordion x:Name="Accordion"
BindableLayout.ItemsSource="{Binding Info}"/>
</ContentPage>
```

**C#**

```
SfAccordion Accordion = new SfAccordion();
BindableLayout.SetItemsSource(Accordion, viewModel.Info);
```

## Defining the AccordionItem

The SfAccordion accepts AccordionItem as its child element. The appearance of each AccordionItem can be defined by setting the BindableLayout.ItemTemplate property.

**XML**

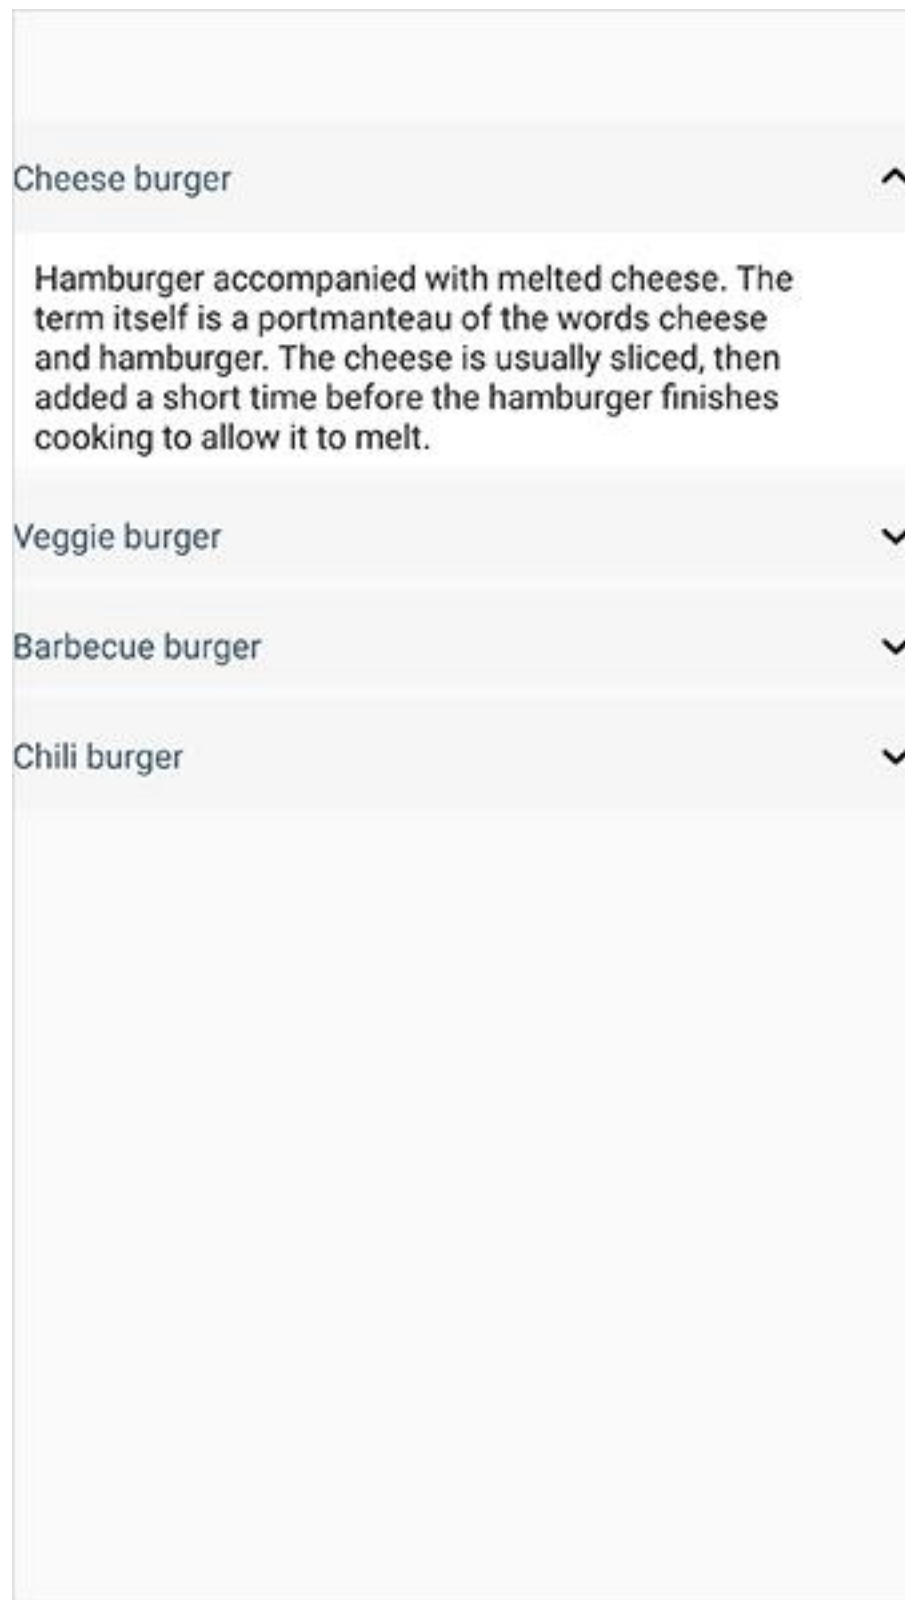

```
<syncfusion:SfAccordion x:Name="Accordion"
BindableLayout.ItemsSource="{Binding Info}">
<BindableLayout.ItemTemplate>
<DataTemplate>
<syncfusion:AccordionItem>
<syncfusion:AccordionItem.Header>
<Label Text="{Binding Name}"/>
</syncfusion:AccordionItem.Header>
<syncfusion:AccordionItem.Content>
<Label Text="{Binding Description}"/>
</syncfusion:AccordionItem.Content>
</syncfusion:AccordionItem>
</DataTemplate>
</BindableLayout.ItemTemplate>
</syncfusion:SfAccordion>
```

**C#**

```
SfAccordion Accordion = new SfAccordion();
DataTemplate ItemTemplate = new DataTemplate(() =>
```

```
{
    AccordionItem accordionItem = new AccordionItem();
    var header = new Label();
    header.SetBinding(Label.TextProperty, new Binding("Name"));
    accordionItem.Header = header;
    var content = new Label();
    content.SetBinding(Label.TextProperty, new Binding("Description"));
    accordionItem.Content = content;
    return accordionItem;
});
BindableLayout.SetItemTemplate(Accordion, ItemTemplate);
BindableLayout.SetItemsSource(Accordion, viewModel.Info);
```

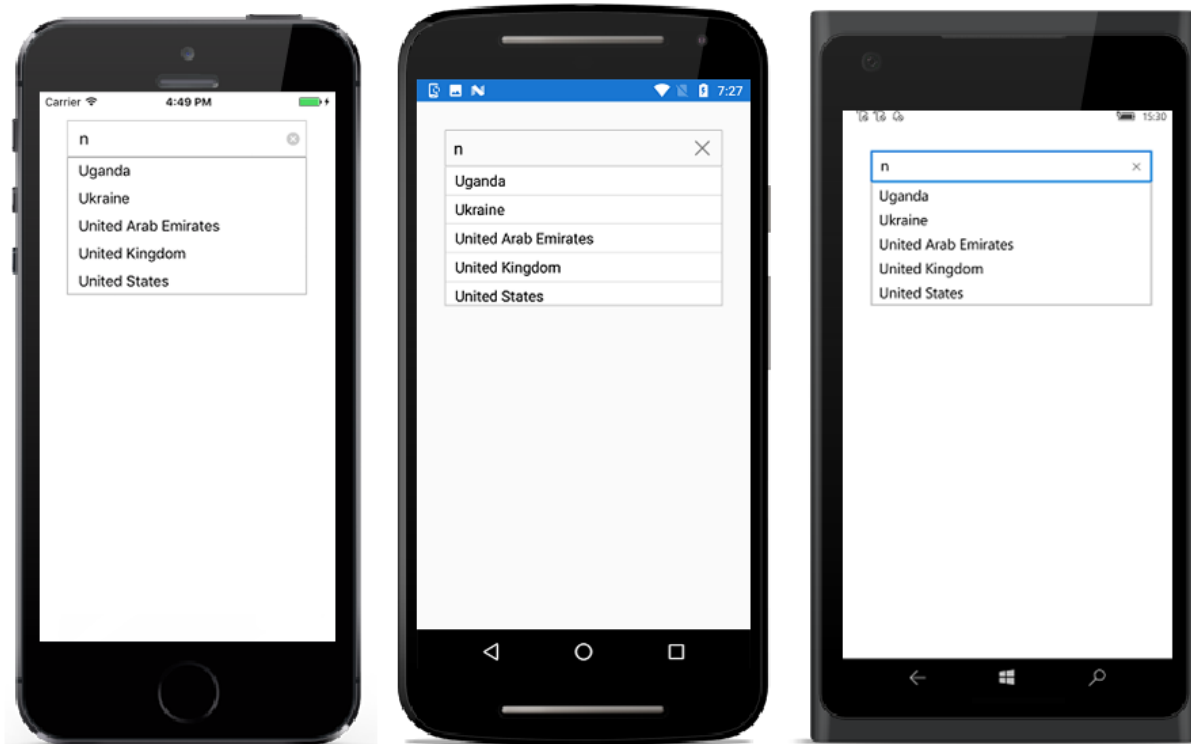

You can download the entire source of this demo from [here](#).

## SfAutoComplete

### Overview

Essential AutoComplete for Xamarin.Forms provides a simpler way to complete the text based on the characters that the user has entered before. It also provides option to choose a suggestion from drop down or append a suggestion to the text directly.

### Key Features

- AutoComplete modes - AutoComplete provides 3 different ways to display the filtered suggestions. They are displaying suggestion through drop down list, appending the first suggestion to text and both of these.
- Suggestion modes - Suggestions can be filtered in 9 different modes, like StartsWith, EndWith, Contains, Equals, Custom etc. AutoComplete provides both case sensitive and insensitive modes.
- Watermark - Supports explanatory text inside AutoComplete control until the user inputs text. Watermark is restored again if user clears the text in control.
- Popup delay & Minimum prefix characters - Filtering process can be delayed by providing the minimum character count, after which AutoComplete starts giving suggestions. Displaying the filtered suggestions through drop down list can also be delayed for some time duration.
- Customization support - AutoComplete provide options to customize both the Entry and Suggestion drop down.
- Multiple Selection - AutoComplete provides 2 different ways to select multiple items from the suggestion list. They are using Token representation and Delimiter. In Token mode, the text can

be wrapped in two ways. They are Wrap and None. In Wrap mode text will be wrap to next line. When using None, the text will be wrapped horizontally.

- Load More - Restrict the number of suggestions displayed and have the remaining items loaded by selecting LoadMore.
- Header and Footer - Header and Footer content can be given in the top and bottom of the Suggestion list in SfAutoComplete.
- Diacritic Sense - AutoComplete provides populating the items from a language with letters containing diacritics, and search for them with English characters from an en-US keyboard.
- Highlighting Text - AutoComplete provides highlighting the matching text in the Suggestion list based on the input given in it.
- Custom filter - AutoComplete provides the user to filter the item in the Suggestion list based on their filtering condition.

## Getting Started

This section explains the steps to create AutoComplete, populate it with data and filter the suggestions. This section covers only the minimal features that are needed to get started with the AutoComplete.

To get start quickly with Xamarin.Forms SfAutoComplete, you can check on this video:

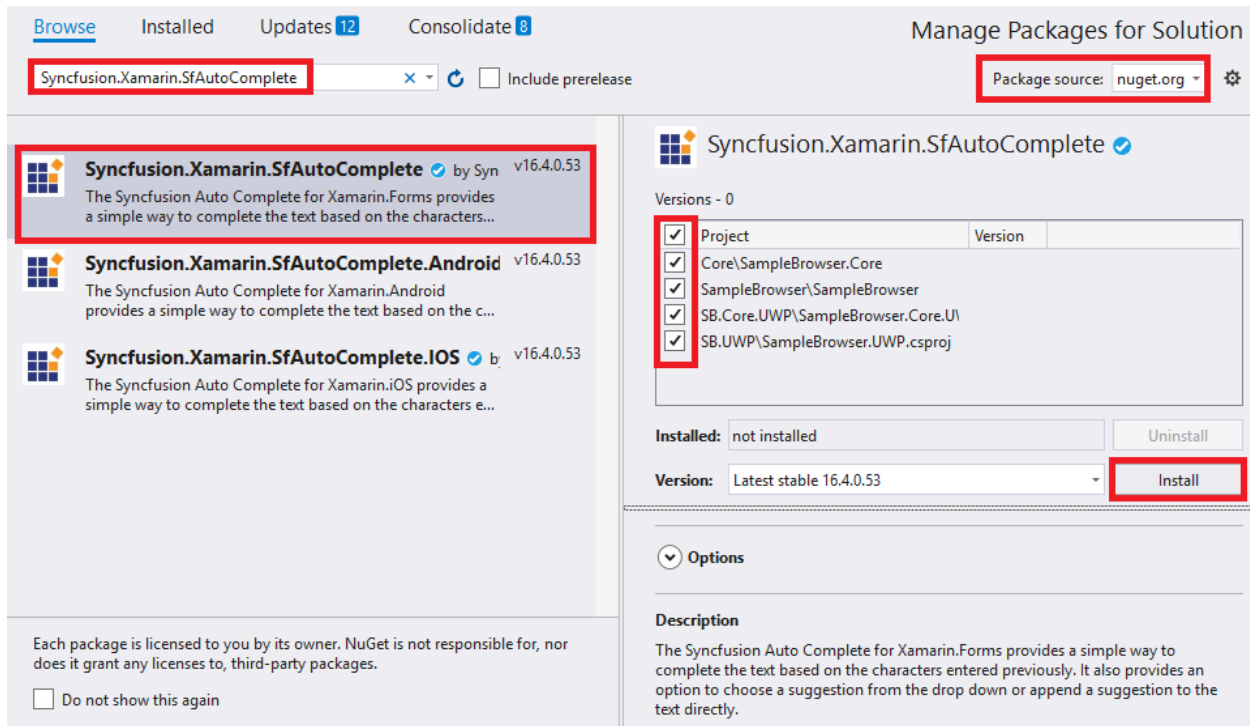

```
<style>#XamarinAutoCompleteVideoTutorial{width : 90% !important; height: 400px !important }</style>
<iframe id='XamarinAutoCompleteVideoTutorial' src='https://www.youtube.com/embed/XT5-CKZCiH8'></iframe>
```

## Adding SfAutoComplete reference

You can add SfAutoComplete reference using one of the following methods:

### Method 1: Adding SfAutoComplete reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfAutoComplete to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfAutoComplete](https://www.syncfusion.com/Products/xamarin/sfautocomplete.aspx), and then install it.

**Note:** Install the same version of SfAutoComplete NuGet in all the projects.

### Method 2: Adding SfAutoComplete reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfAutoComplete control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfAutoComplete assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfAutoComplete.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfAutoComplete.Android.dll Syncfusion.SfAutoComplete.XForms.Android.dll Syncfusion.SfAutoComplete.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfAutoComplete.iOS.dll Syncfusion.SfAutoComplete.XForms.iOS.dll Syncfusion.SfAutoComplete.XForms.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfAutoComplete.XForms.UWP.dll Syncfusion.SfAutoComplete.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### *Additional Step for iOS*

**Note:** If you are adding the references from toolbox, this step is not needed.

Create an instance of **SfAutoCompleteRenderer** in FinishedLaunching overridden method of an AppDelegate class in iOS project as shown below:

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    new Syncfusion.SfAutoComplete.XForms.iOS.SfAutoCompleteRenderer();
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### *Additional Step for UWP*

This step is required only if the application is deployed in Release mode with .NET native tool chain enabled and it is for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the SfAutoComplete assembly at OnLaunched overridden method of the App class in UWP project is the suggested workaround. And the code example is shown below:

#### **C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    #if DEBUG
    if (System.Diagnostics.Debugger.IsAttached)
    {
        this.DebugSettings.EnableFrameRateCounter = true;
    }
    #endif
    Frame rootFrame = Window.Current.Content as Frame;
    if (rootFrame == null)
```

```

{
    rootFrame = new Frame();
    rootFrame.NavigationFailed += OnNavigationFailed;
    List<System.Reflection.Assembly> assembliesToInclude = new
    List<System.Reflection.Assembly>();
    // Add all the renderer assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfAutoComplete.XForms.UWP.SfAutoCo
    mpleteRenderer).GetTypeInfo().Assembly);
    // Replace the Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    if (e.PreviousExecutionState == ApplicationExecutionState.Terminated)
    {
        //TODO: Load state from previously suspended application
    }
    // Place the frame in the current Window
    Window.Current.Content = rootFrame;
}
if (rootFrame.Content == null)
{
    // When the navigation stack isn't restored navigate to the first page,
    // configuring the new page by passing required information as a navigation
    // parameter
    rootFrame.Navigate(typeof(MainPage), e.Arguments);
}
// Ensure the current window is active
Window.Current.Activate();
}

```

### Initializing AutoComplete

Import the SfAutoComplete namespace in respective Page as shown below:

#### XML

```

xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"

```

#### C#

```

using Syncfusion.SfAutoComplete.XForms;

```

Then initialize an empty autocomplete as shown below,

#### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<StackLayout

```

```

VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete x:Name="autoComplete"
HeightRequest="40"/>
</StackLayout>
</ContentPage>

```

**C#**

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}

```

## Populating AutoComplete with Data

Now, let us create a simple list of country names and set it as the **AutoCompleteSource** of AutoComplete.

**XML**

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<StackLayout
VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">

```

```
<autocomplete:SfAutoComplete x:Name="autoComplete"
HeightRequest="40">
<autocomplete:SfAutoComplete.AutoCompleteSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>India</x:String>
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>Canada</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>France</x:String>
<x:String>United Kingdom</x:String>
<x:String>China</x:String>
<x:String>United States</x:String>
<x:String>Japan</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

## C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout()
{
VerticalOptions = LayoutOptions.Start,
HorizontalOptions = LayoutOptions.Start,
Padding = new Thickness(30)
};
SfAutoComplete autoComplete = new SfAutoComplete()
{
HeightRequest = 40,
AutoCompleteSource = new List<string>()
{
"India",
"Uganda",
"Ukraine",
"Canada",
"United Arab Emirates",
"France",
"United Kingdom",
"China",
"United States",
"Japan",
"Angola"
}
}
```

```
};  
stackLayout.Children.Add(autoComplete);  
this.Content = stackLayout;  
}  
}  
}
```

Refer [this](#) link to learn more about the options available in SfAutoComplete to populate data.

### Configuring filter options

By default, items are filtered in “StartsWith” case insensitive mode and the suggestions are displayed in a drop down popup. Autocomplete can now filter suggestions.

Here in this example, let us configure it to “Contains” case sensitive filter mode. This can be achieved by setting `SuggestionMode` property.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:autocomplete="clr-  
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple  
te.XForms"  
xmlns:ListCollection="clr-  
namespace:System.Collections.Generic;assembly=netstandard"  
xmlns:local="clr-namespace:AutocompleteSample"  
x:Class="AutocompleteSample.MainPage">  
  <StackLayout  
    VerticalOptions="Start"  
    HorizontalOptions="Start"  
    Padding="30">  
    <autocomplete:SfAutoComplete x:Name="autoComplete"  
      HeightRequest="40"  
      SuggestionMode="ContainsWithCaseSensitive">  
      <autocomplete:SfAutoComplete.AutoCompleteSource>  
        <ListCollection:List x:TypeArguments="x:String">  
          <x:String>India</x:String>  
          <x:String>Uganda</x:String>  
          <x:String>Ukraine</x:String>  
          <x:String>Canada</x:String>  
          <x:String>United Arab Emirates</x:String>  
          <x:String>France</x:String>  
          <x:String>United Kingdom</x:String>  
          <x:String>China</x:String>  
          <x:String>United States</x:String>  
          <x:String>Japan</x:String>  
          <x:String>Angola</x:String>  
        </ListCollection:List>  
      </autocomplete:SfAutoComplete.AutoCompleteSource>  
    </autocomplete:SfAutoComplete>  
  </StackLayout>  
</ContentPage>
```

### C#

```
using Syncfusion.SfAutoComplete.XForms;
```

```
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                SuggestionMode = SuggestionMode.ContainsWithCaseSensitive,
                AutoCompleteSource = new List<string>()
                {
                    "India",
                    "Uganda",
                    "Ukraine",
                    "Canada",
                    "United Arab Emirates",
                    "France",
                    "United Kingdom",
                    "China",
                    "United States",
                    "Japan",
                    "Angola"
                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}
```

Refer [this](#) link to learn more about the options available in SfAutoComplete to filter suggestions.

The complete Getting Started sample is available in [this](#) link.

## Populating Data

SfAutoComplete control can be populated with a list of string or business objects, which assists the user while typing. Users can choose one item from the filtered suggestion list.

[DataSource](#) property is used to populate data in SfAutoComplete control. This section explains populating AutoComplete with list of string and list of Employee details separately.

### Populating String Data

Create an instance of string list and populate items as shown below:

#### XML

```
<StackLayout
VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete x:Name="autoComplete"
HeightRequest="40">
<autocomplete:SfAutoComplete.AutoCompleteSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>India</x:String>
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>Canada</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>France</x:String>
<x:String>United Kingdom</x:String>
<x:String>China</x:String>
<x:String>United States</x:String>
<x:String>Japan</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
```

#### C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
```

```
HeightRequest = 40,
DataSource = new List<string>()
{
    "India",
    "Uganda",
    "Ukraine",
    "Canada",
    "United Arab Emirates",
    "France",
    "United Kingdom",
    "China",
    "United States",
    "Japan",
    "Angola"
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
```

### Populating Business Objects

Apart from string data, SfAutoComplete can deal with business object data also. Now let us create Model and ViewModel classes to populate AutoComplete with Employee details.

#### Create and Initialize Business Models

Define a simple model class Employee with fields ID, Name and populate employee data in ViewModel.

#### C#

```
namespace AutocompleteSample
{
    public class Employee
    {
        private int id;
        public int ID
        {
            get { return id; }
            set { id = value; }
        }
        private string name;
        public string Name
```

```

{
    get { return name; }
    set { name = value; }
}
}

public class EmployeeViewModel
{
    private ObservableCollection<Employee> employeeCollection;
    public ObservableCollection<Employee> EmployeeCollection
    {
        get { return employeeCollection; }
        set { employeeCollection = value; }
    }
    public EmployeeViewModel()
    {
        employeeCollection = new ObservableCollection<Employee>();
        employeeCollection.Add(new Employee() { ID = 1, Name = "Eric" });
        employeeCollection.Add(new Employee() { ID = 2, Name = "James" });
        employeeCollection.Add(new Employee() { ID = 3, Name = "Jacob" });
        employeeCollection.Add(new Employee() { ID = 4, Name = "Lucas" });
        employeeCollection.Add(new Employee() { ID = 5, Name = "Mark" });
        employeeCollection.Add(new Employee() { ID = 6, Name = "Aldan" });
        employeeCollection.Add(new Employee() { ID = 7, Name = "Aldrin" });
        employeeCollection.Add(new Employee() { ID = 8, Name = "Alan" });
        employeeCollection.Add(new Employee() { ID = 9, Name = "Aaron" });
    }
}

```

#### *Populate data in AutoComplete and Setting DisplayMemberPath*

Now populate this EmployeeViewModel data in SfAutoComplete control by binding with [DataSource](#) property. At this point, the control is populated with the list of employees. But the Employee model contains two properties ID and Name so it is necessary to intimate by which property it should filter suggestions. [DisplayMemberPath](#) property specifies the property path with which filtering is done on business objects.

#### **XML**

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
    <ContentPage.BindingContext>
    <local:EmployeeViewModel/>
    </ContentPage.BindingContext>
    <StackLayout VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
    <autocomplete:SfAutoComplete x:Name="autoComplete"

```

```
HeightRequest="40"
DisplayMemberPath="Name"
DataSource="{Binding EmployeeCollection}" />
</StackLayout>
</ContentPage>
```

**C#**

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            EmployeeViewModel employee = new EmployeeViewModel();
            StackLayout layout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                BindingContext = employee,
                DataSource = employee.EmployeeCollection,
                DisplayMemberPath = "Name"
            };
            layout.Children.Add(autoComplete);
            this.Content = layout;
        }
    }
}
```

**Note:** Set the EmployeeViewModel instance as the BindingContext of your control; this is done to bind properties of EmployeeViewModel to SfAutoComplete.

*Setting ItemTemplate*

[ItemTemplate](#) property helps to decorate suggestion items with custom templates. The following code explains the steps to add an image to the suggestion list item.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
```

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<ContentPage.BindingContext>
<local:EmployeeViewModel/>
</ContentPage.BindingContext>
<StackLayout VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete x:Name="autoComplete"
HeightRequest="40"
DisplayMemberPath="Name"
DataSource="{Binding EmployeeCollection}">
<autocomplete:SfAutoComplete.ItemTemplate>
<DataTemplate>
<StackLayout Orientation="Horizontal"
Padding="2,0,0,0">
<Image Source="User.png"
WidthRequest="12"/>
<Label Text="{Binding Name}"
VerticalOptions="Center"
WidthRequest="500"/>
</StackLayout>
</DataTemplate>
</autocomplete:SfAutoComplete.ItemTemplate>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

The ItemTemplate in above XAML code is translated to C# and given below:

### C#

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            EmployeeViewModel employee = new EmployeeViewModel();
            StackLayout layout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
        }
    }
}

```

```

SfAutoComplete autoComplete = new SfAutoComplete()
{
    HeightRequest = 40,
    BindingContext = employee,
    DataSource = employee.EmployeeCollection,
    DisplayMemberPath = "Name"
};
DataTemplate itemTemplate = new DataTemplate(() =>
{
    StackLayout stack;
    Image image;
    Label label;
    stack = new StackLayout();
    stack.Orientation = StackOrientation.Horizontal;
    image = new Image();
    image.Source = (FileImageSource)ImageSource.FromFile("User.png");
    label = new Label();
    label.SetBinding(Label.TextProperty, "Name");
    label.WidthRequest = 500;
    stack.Children.Add(image);
    stack.Children.Add(label);
    return new ViewCell { View = stack };
});
autoComplete.ItemTemplate = itemTemplate;
layout.Children.Add(autoComplete);
this.Content = layout;
}
}
}

```

Refer [this](#) link to learn more about the customizing options available in SfAutoComplete control.

**Note:** Add the required image in drawable folder(Android), Resources folder(iOS) and at project location for UWP.

### DataTemplateSelector

SfAutoComplete supports DataTemplateSelector, which is used to choose a DataTemplate based on data object.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

```

```

xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<ContentPage.BindingContext>
<local:MobileDetailViewModel/>
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="default">
<ViewCell>
<Grid Padding="5">
<Label Text="{Binding Mobile}" TextColor="Green"/>
</Grid>
</ViewCell>
</DataTemplate>
<DataTemplate x:Key="specific">
<ViewCell>
<Grid Padding="5">
<Label Text="{Binding Mobile}" BackgroundColor="LightGray" TextColor="Red"/>
</Grid>
</ViewCell>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<autocomplete:SfAutoComplete DataSource="{Binding MobileCollection}"
DisplayMemberPath="Mobile">
<autocomplete:SfAutoComplete.ItemTemplate>
<local:DataTemplateSelectorViewModel DefaultTemplate="{StaticResource
default}" SpecificDataTemplate="{StaticResource specific}" />
</autocomplete:SfAutoComplete.ItemTemplate>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

## C#

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace AutocompleteSample
{
public partial class MainPage : ContentPage
{
DataTemplate defaultTemplate;
DataTemplate specifictempalte;
public MainPage()
{
InitializeComponent();
MobileDetailViewModel mobileDetailViewModel = new MobileDetailViewModel();
defaultTemplate = new DataTemplate(() =>
{

```

```

Grid grid = new Grid();
grid.Padding = new Thickness(5);
Label label = new Label();
label.SetBinding(Label.TextProperty, "Mobile");
label.TextColor = Color.Green;
grid.Children.Add(label);
return new ViewCell { View = grid };
});
specifictempalte = new DataTemplate(() =>
{
    Grid grid = new Grid();
    grid.Padding = new Thickness(5);
    Label label = new Label();
    label.SetBinding(Label.TextProperty, "Mobile");
    label.BackgroundColor = Color.LightGray;
    label.TextColor = Color.Red;
    grid.Children.Add(label);
    return new ViewCell { View = grid };
});
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
SfAutoComplete autoComplete = new SfAutoComplete();
autoComplete.HeightRequest = 40;
autoComplete.DataSource = mobileDetailViewModel.MobileCollection;
this.BindingContext = mobileDetailViewModel;
autoComplete.DisplayMemberPath = "Mobile";
autoComplete.ItemTemplate = new DataTemplateSelectorViewModel {
    DefaultTemplate = defaultTemplate, SpecificDataTemplate = specifictempalte
};
layout.Children.Add(autoComplete);
Content = layout;
}
}
}

```

### Create and Initialize Business Models

Define a simple model class MobileDetail with fields IsAvailableInStock, Mobile and populate mobile detail in ViewModel.

### C#

```

namespace AutocompleteSample
{
    public class MobileDetailViewModel
    {
        public ObservableCollection<MobileDetail> MobileCollection { get; set; }
        public MobileDetailViewModel()
        {
            this.MobileCollection = new ObservableCollection<MobileDetail>()
            {
                new MobileDetail () { Mobile="Samasung S8", IsAvailableInStock=false },
                new MobileDetail () { Mobile="Samasung S9", IsAvailableInStock=true },
            }
        }
    }
}

```

```
new MobileDetail () { Mobile="Samsung S10", IsAvailableInStock=true },
new MobileDetail () { Mobile="Samsung S10 plus", IsAvailableInStock=true },
new MobileDetail () { Mobile="iPhone 7", IsAvailableInStock=true },
new MobileDetail () { Mobile="iPhone 8", IsAvailableInStock=true },
new MobileDetail () { Mobile="iPhone X", IsAvailableInStock=false },
new MobileDetail () { Mobile="iPhone XR", IsAvailableInStock=false },
new MobileDetail () { Mobile="iPhone XS", IsAvailableInStock=true },
};
}
}

public class MobileDetail
{
public string Mobile { get; set; }
public bool IsAvailableInStock { get; set; }
}
}
```

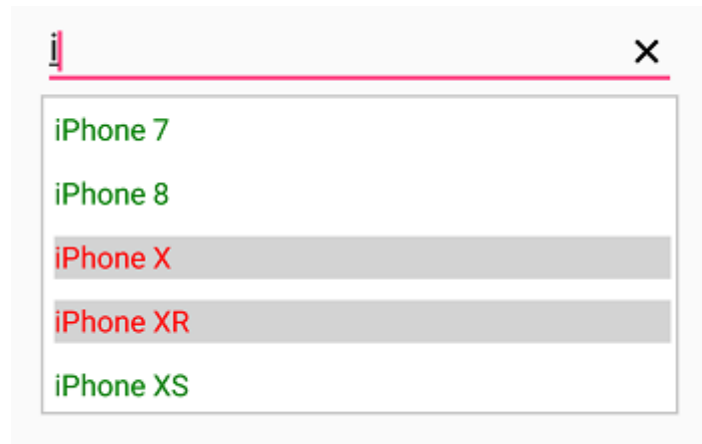

### OnSelectTemplate

The OnSelectTemplate is an overridden method to return a particular DataTemplate. The following code sample demonstrates how to use the OnSelectTemplate method.

#### C#

```
namespace AutocompleteSample
{
public class DataTemplateSelectorViewModel : DataTemplateSelector
{
public DataTemplate DefaultTemplate { get; set; }
public DataTemplate SpecificDataTemplate { get; set; }
protected override DataTemplate OnSelectTemplate(object item, BindableObject container)
{
var message = item as MobileDetail;
if (message.IsAvailableInStock == null)
return null;
return message.IsAvailableInStock == false ? SpecificDataTemplate :
DefaultTemplate;
}
}
}
```

The following screenshot illustrates the output of above code.

We have attached sample for reference. You can download the sample from the following link.

Sample Link: [SfAutoComplete DataTemplateSelector](#)

### AutoComplete Modes

AutoComplete provides three different ways to display the filtered suggestions. They are

- Suggest - displaying suggestion in drop down list
- Append - appending the first suggestion to text
- SuggestAppend - Both of these

**AutoCompleteMode** property is used to choose the suggestion display mode in SfAutoComplete control. The default value is Suggest.

### Suggesting Choices in List

The filtered suggestions are displayed in a drop down list. User can pick an item from the list.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<StackLayout VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete x:Name="autoComplete"
HeightRequest="40"
AutoCompleteMode="Suggest">
<autocomplete:SfAutoComplete.AutoCompleteSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>India</x:String>
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>Canada</x:String>
```

```

<x:String>United Arab Emirates</x:String>
<x:String>France</x:String>
<x:String>United Kingdom</x:String>
<x:String>China</x:String>
<x:String>United States</x:String>
<x:String>Japan</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

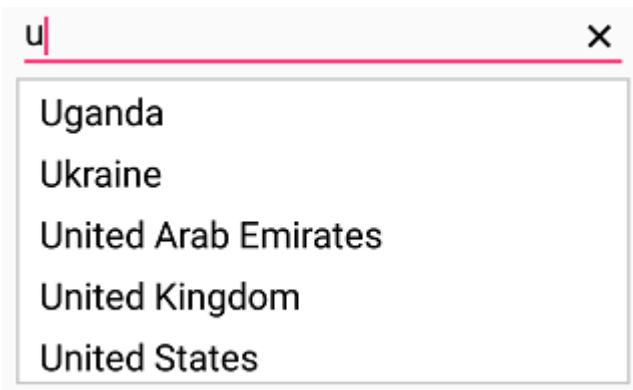

```

## C#

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                AutoCompleteMode = AutoCompleteMode.Suggest,
                AutoCompleteSource = new List<string>()
                {
                    "India",
                    "Uganda",
                    "Ukraine",
                    "Canada",
                    "United Arab Emirates",
                    "France",
                    "United Kingdom",
                    "China",
                    "United States",
                    "Japan",
                    "Angola"
                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}

```

### Appending Suggestion to Text

The first item in filtered suggestions is appended to SfAutoComplete text. In this mode, drop down remains closed.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}

```

Uganda ✕

### Suggesting Choices and Appending Suggestions to Text

The text is appended to the first matched item in the suggestions collection and filtered suggestions are displayed in a drop down list. The user can pick from a list directly or use up and down keys for browsing the list.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

```

```

xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"

</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

## C#

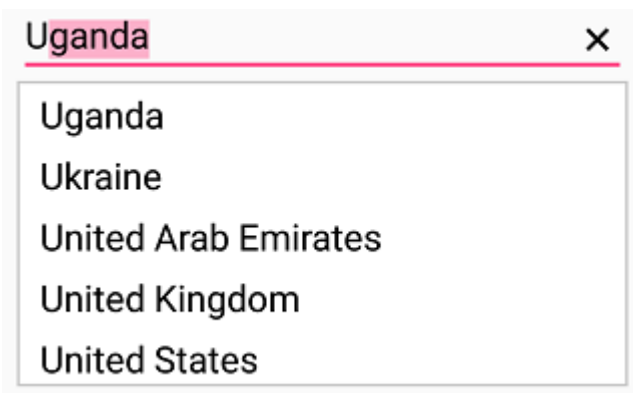

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                AutoCompleteMode = AutoCompleteMode.SuggestAppend,
                AutoCompleteSource = new List<string>()
            {

```

```
"India",  
"Uganda",  
"Ukraine",  
"Canada",  
"United Arab Emirates",  
"France",  
"United Kingdom",  
"China",  
"United States",  
"Japan",  
"Angola"  
}  
};  
stackLayout.Children.Add(autoComplete);  
this.Content = stackLayout;  
}  
}  
}
```

## Multiple Selection

Select multiple items from a suggestion list. There are two ways to perform multi selection in autocomplete.

- Token Representation
- Delimiter

### Token Representation

Selected items will be displayed with a customizable token representation and the users can remove each tokenized item with the close button.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

<x:String>United Arab Emirates</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

**C#**

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                MultiSelectMode = MultiSelectMode.Token,
                TokensWrapMode = TokensWrapMode.Wrap,
                IsSelectedItemsVisibleInDropDown = false,
                AutoCompleteSource = new List<string>()
                {
                    "India",
                    "Uganda",
                    "Ukraine",
                    "Canada",
                    "United Arab Emirates"
                }
            };
            stackLayout.Children.Add(autoComplete);
        }
    }
}

```

```

this.Content = stackLayout;
}
}
}

```

### Wrap Mode of Token

The selected item can be displayed as token inside SfAutoComplete in two ways. They are

- **Wrap** - When **TokensWrapMode** is set to **Wrap** the selected items will be wrap to the next line of the SfAutoComplete.
- **None** - When **TokensWrapMode** is set to **None** the selected item will be wrap in horizontal orientation.

        this.PropertyChanged(this, new PropertyChangedEventArgs(name));
}
}

```

#### Token Customization

Customization can be done for Token. There are various ways to customize the tokens. They are as follows.

- **TextColor** - sets the color of the text inside the token.
- **FontSize** - sets the size of the Font inside the token.
- **FontFamily** - sets the Font family for the text inside the token.
- **BackgroundColor** - sets the background color of the token.
- **SelectedBackgroundColor** - sets the background color of the token when it is selected.
- **IsCloseButtonVisible** - Enables and disables the close button inside SfAutoComplete.
- **DeleteButtonColor** - sets the color of the close button inside SfAutoComplete.
- **CornerRadius** - sets the corner radius for the token.
- **DeleteButtonPlacement** - sets the placement of delete button. **Left** and **Right** are the placement options. By default, it is set placed at right side of the token.

**Note:** SelectedBackgroundColor and CornerRadius support has enhanced only on iOS and Android platform.

## AutoComplete Filtering Options

The phenomenon of string comparison for filtering suggestions can be changed using the **SuggestionMode** property. The default filtering strategy is "StartsWith" and it is case insensitive. The available filtering modes are

- StartsWith
- StartsWithCaseSensitive
- Contains
- ContainsWithCaseSensitive
- Equals
- EqualsWithCaseSensitive
- EndsWith
- EndsWithCaseSensitive
- Custom

### Filtering Words that Starts with Input Text

Displays all the matches that starts with the typed characters in control. This strategy is case in-sensitive.

```

## C#

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                SuggestionMode = SuggestionMode.EndsWithCaseSensitive,
                AutoCompleteSource = new List<string>()
                {
                    "India",
                    "Uganda",
                    "Ukraine",
                    "Canada",
                    "United Arab Emirates",
                    "France",
                    "United Kingdom",
                    "China",

```

```

"United States",
"Japan",
"Angola"
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

### Diacritic Sensitivity

The control does not stick with one type of keyboard, so you can populate items from a language with letters containing diacritics, and search for them with English characters from an en-US keyboard. Users can enable or disable the diacritic sensitivity with the `IgnoreDiacritic` property. In the below code example we have illustrate how to enables the diacritic sensitivity so that items in the suggestion list get populated by entering any diacritic character of that alphabet.

            this.Content = stackLayout;
        }
    }
}
```

### Header and Footer

We can provide Header and Footer view in the suggestion list in SfAutoComplete by enabling `ShowDropDownHeaderView` and `ShowDropDownFooterView`.

### Header Content

We can provide Header Content at the top of the AutoComplete's Suggestion box.

`DropDownHeaderView` property is used to set the content of the header. The height of the Header in the SfAutoComplete can be adjusted by the property `DropDownHeaderViewHeight`.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

</StackLayout>
</autocomplete:SfAutoComplete.DropDownHeaderView>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

**C#**

```

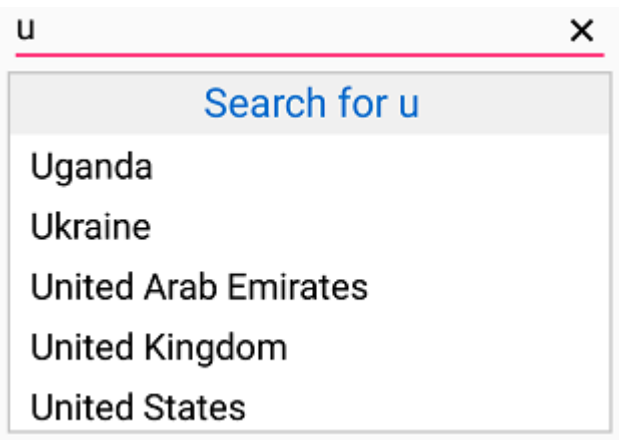

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        Label SearchLabel;
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                ShowDropDownHeaderView = true,
                DropDownHeaderViewHeight = 50,
                AutoCompleteSource = new List<string>()
                {
                    "India",
                    "Uganda",
                    "Ukraine",
                    "Canada",
                    "United Arab Emirates",
                    "France",
                    "United Kingdom",
                    "China",
                    "United States",
                    "Japan",

```

```

"Angola"
}
};
StackLayout layout = new StackLayout()
{
    BackgroundColor = Color.FromHex("#f0f0f0")
};
SearchLabel = new Label()
{
    FontSize = 20,
    VerticalTextAlignment = TextAlignment.Center,
    HorizontalOptions = LayoutOptions.Center,
    VerticalOptions = LayoutOptions.Center,
    TextColor = Color.FromHex("#006bcd")
};
layout.Children.Add(SearchLabel);
autoComplete.DropDownHeaderView = layout;
autoComplete.ValueChanged += SfAutoComplete_ValueChanged;
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
private void SfAutoComplete_ValueChanged(object sender,
Syncfusion.SfAutoComplete.XForms.ValueChangedEventArgs e)
{
    SearchLabel.Text = "Search for " + e.Value;
}
}
}

```

### Footer Content

We can provide Footer Content at the bottom of the AutoComplete's Suggestion box.

**DropDownFooterView** property is used to set the content of the footer. The height of the Header in the SfAutoComplete can be adjusted by the property **DropDownFooterViewHeight**.

The following code example illustrates how to set Footer content in SfAutoComplete.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

        "United Kingdom",
        "China",
        "United States",
        "Japan",
        "Angola"
    }
};
StackLayout layout = new StackLayout()
{
    BackgroundColor = Color.FromHex("#f0f0f0")
};
Label SearchLabel = new Label()
{
    FontSize = 20,
    Text = "Add New",
    VerticalTextAlignment = TextAlignment.Center,
    HorizontalOptions = LayoutOptions.Center,
    VerticalOptions = LayoutOptions.Center,
    TextColor = Color.FromHex("#006bcd")
};
layout.Children.Add(SearchLabel);
autoComplete.DropDownFooterView = layout;
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
```

### Highlighting matched text

Highlight matching characters in a suggestion list to pick an item with more clarity. There are two ways to highlight the matching text:

- First Occurrence
- Multiple Occurrence

The text highlight can be indicated with various customizing styles by enabling the below properties. They are

- HighlightedTextColor - sets the color of the highlighted text for differentiating the highlighted characters.
- HighlightedTextFontAttributes - sets the FontAttributes of the highlighted text.

### First Occurrence

It highlights the first position of the matching characters in the suggestion list.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

<x:String>American Samoa</x:String>
<x:String>Andorra</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

## C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                SuggestionMode = SuggestionMode.StartsWith,
                TextHighlightMode = OccurrenceMode.FirstOccurrence,
                HighlightedTextColor = Color.Red,
                HighlightedTextFontAttributes = FontAttributes.Bold,
                AutoCompleteSource = new List<string>()
                {
                    "Albania",
                    "Algeria",
                    "American Samoa",
                    "Andorra"
                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}
```

### Multiple Occurrence

It highlights the matching character that are present everywhere in the suggestion list for Contains case in SuggestionMode.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

<x:String>Andorra</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

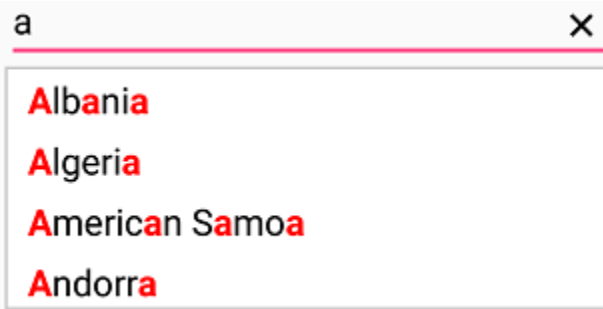

### C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
```

```

public MainPage()
{
    InitializeComponent();
    StackLayout stackLayout = new StackLayout()
    {
        VerticalOptions = LayoutOptions.Start,
        HorizontalOptions = LayoutOptions.Start,
        Padding = new Thickness(30)
    };
    SfAutoComplete autoComplete = new SfAutoComplete()
    {
        HeightRequest = 40,
        SuggestionMode = SuggestionMode.Contains,
        TextHighlightMode = OccurrenceMode.MultipleOccurrence,
        HighlightedTextColor = Color.Red,
        HighlightedTextFontAttributes = FontAttributes.Bold,
        AutoCompleteSource = new List<string>()
        {
            "Albania",
            "Algeria",
            "American Samoa",
            "Andorra"
        }
    };
    stackLayout.Children.Add(autoComplete);
    this.Content = stackLayout;
}
}

```

### Maximum Display Item with Expander

Restrict the number of suggestions displayed and have the remaining items loaded by selecting LoadMore. We can restrict maximum suggestion to be displayed with the `MaximumSuggestion` property. We can set the desired text for displaying the Load more text with the property `LoadMoreText`.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"

```

```

xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<StackLayout VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete HeightRequest="40"
MultiSelectMode="Delimiter"
Delimiter=", "
LoadMoreText="LOAD MORE"
MaximumSuggestion="2">
<autocomplete:SfAutoComplete.AutoCompleteSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>Albania</x:String>
<x:String>Algeria</x:String>
<x:String>American Samoa</x:String>
<x:String>Andorra</x:String>
<x:String>Aruba</x:String>
<x:String>Angola</x:String>
<x:String>Argentina</x:String>
<x:String>Armenia</x:String>
<x:String>America</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

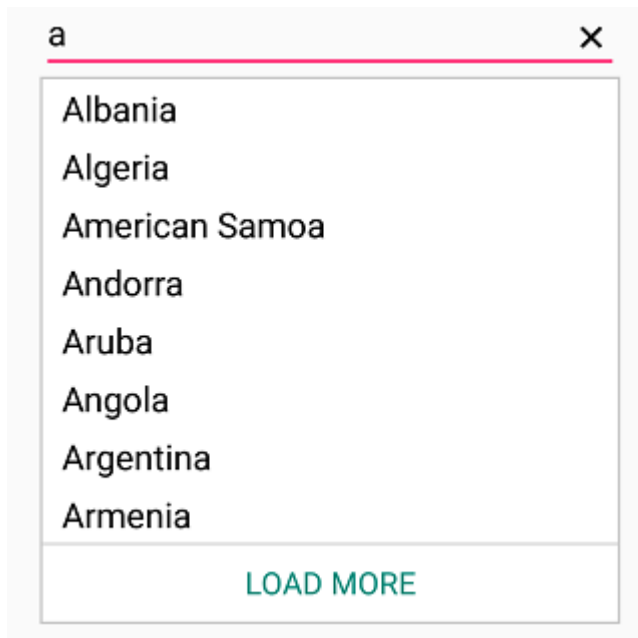

**C#**

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                MultiSelectMode = MultiSelectMode.Delimiter,
                Delimiter = ", ",
                LoadMoreText = "LOAD MORE",
                MaximumSuggestion = 2,
                AutoCompleteSource = new List<string>()
            {

```

```
"Albania",  
"Algeria",  
"American Samoa",  
"Andorra",  
"Aruba",  
"Angola",  
"Argentina",  
"Armenia",  
"America"  
}  
};  
stackLayout.Children.Add(autoComplete);  
this.Content = stackLayout;  
}  
}  
}
```

#### *Restricting the maximum display of item dynamically*

We can restrict the maximum display of items dynamically by calling `LoadMore` method. The user can dynamically change the maximum suggestion count by calling `LoadMore` method by giving the maximum suggestion as the argument inside.

**Note:** `LoadMore` method has enhanced only on iOS and Android platform.

#### **C#**

```
// without passing argument  
autocomplete.LoadMore();  
// with passing argument  
autocomplete.LoadMore(5);
```

## No Results Found

When the entered item is not in the suggestion list, SfAutoComplete displays a text indicating there is no search results found. We can set the desire text to be displayed for indicating no results found with the `NoResultsFoundText` property.

### XML

<x:String>Canada</x:String>
<x:String>United Arab Emirates</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

### C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
```

```

NoResultsFoundText = "No Results Found",
AutoCompleteSource = new List<string>()
{
    "India",
    "Uganda",
    "Ukraine",
    "Canada",
    "United Arab Emirates"
}
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

### Customizing NoResultsFoundText

The `NoResultsFoundTextColor`, `NoResultsFoundFontSize`, `NoResultsFoundFontAttributes`, and `NoResultsFoundFontFamily` properties are used to customize the foreground color, font size, font attribute, and font family of `NoResultsFoundText`.

```
}

```

**Note:** <https://xamarinhelp.com/custom-fonts-xamarin-forms/> provides how to add the ttf file in each platform

## Handling Selected Items

SfAutoComplete provides a way to handle the selected item using the following properties:

- SelectedIndex
- SelectedIndices
- SelectedItem

### SelectedIndex

You can get or set the index of the selected item using the [SelectedIndex](#) property. It can be applicable only when [MultiSelectMode](#) is None.

*How to set the index of item to be selected*

The [SelectedIndex](#) property holds the index of selected item in suggestion list.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

**C#**

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = 30
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                SelectedIndex = 1,
                MultiSelectMode = MultiSelectMode.None,
                AutoCompleteSource = new List<string>()
                {
                    "Antigua and Barbuda",
                    "American Samoa",
                    "Afghanistan",
                    "Antarctica",
                    "Argentina",
                    "Anguilla",
                    "Albania",
                    "Algeria",
                    "Andorra",
                    "Angola"
                }
            };
            stackLayout.Children.Add(autoComplete);

```

```

this.Content = stackLayout;
}
}
}

```

### *Retrieving the index of selected item*

When an item is selected from suggestion list, its index can be retrieved using the [SelectedIndex](#) property.

The following code snippet demonstrates the way to retrieve [SelectedIndex](#) and display it in an alert.

### **XML**

```

<?xml version="1.0" encoding="utf-8" ?>

</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

### **C#**

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{

```

```

public partial class MainPage : ContentPage
{
    SfAutoComplete autoComplete;
    public MainPage()
    {
        InitializeComponent();
        StackLayout stackLayout = new StackLayout()
        {
            VerticalOptions = LayoutOptions.Start,
            HorizontalOptions = LayoutOptions.Start,
            Padding = 30
        };
        autoComplete = new SfAutoComplete()
        {
            HeightRequest = 40,
            MultiSelectMode = MultiSelectMode.None,
            AutoCompleteSource = new List<string>()
            {
                "Antigua and Barbuda",
                "American Samoa",
                "Afghanistan",
                "Antarctica",
                "Argentina",
                "Anguilla",
                "Albania",
                "Algeria",
                "Andorra",
                "Angola"
            }
        };
        autoComplete.SelectionChanged += autoComplete_SelectionChanged;
        stackLayout.Children.Add(autoComplete);
        this.Content = stackLayout;
    }
    private void autoComplete_SelectionChanged(object sender,
        Syncfusion.SfAutoComplete.XForms.SelectionChangedEventArgs e)
    {
        DisplayAlert("Selection Changed", "SelectedIndex: " +
            autoComplete.SelectedIndex, "OK");
    }
}

```

### SelectedIndices

You can get or set the indices of the selected items using the [SelectedIndices](#) property. It can be applicable when [MultiSelectMode](#) is in either Token or Delimiter.

#### *How to set the indices of items*

[SelectedIndices](#) property holds the Indices of selected items in suggestion list.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>

                }
            };
            autoComplete.SelectionChanged += autoComplete_SelectionChanged;
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
        private void autoComplete_SelectionChanged(object sender,
            Syncfusion.SfAutoComplete.XForms.SelectionChangedEventArgs e)
        {
            DisplayAlert("Selection Changed", "SelectedItem: " +
                autoComplete.SelectedItem, "OK");
        }
    }
}

```

## Dealing with Suggestion Box

Suggestion box is the drop-down list box, which displays the filtered suggestions inside a popup. This section explains the properties that deals with drop-down list in the SfAutoComplete control.

### Suggestion box placement mode

Suggestion box can be placed either at the top or bottom using the `SuggestionBoxPlacement` property. By default, it is placed at the bottom.

## XML

```

</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

## C#

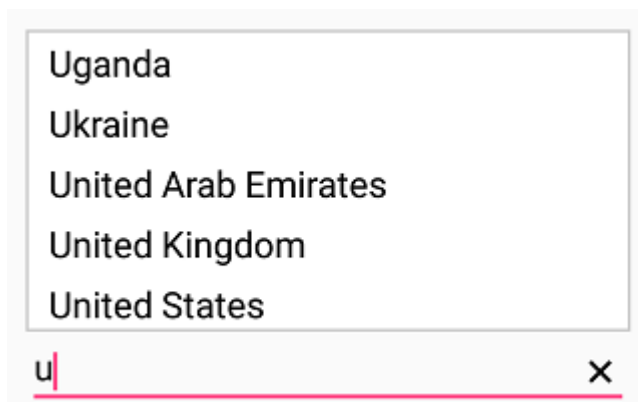

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Center,
                HorizontalOptions = LayoutOptions.Center,
                Padding = 30
            };
        }
    }
}
```

```

SfAutoComplete autoComplete = new SfAutoComplete()
{
    HeightRequest = 40,
    SuggestionBoxPlacement = SuggestionBoxPlacement.Top,
    AutoCompleteSource = new List<string>()
    {
        "India",
        "Uganda",
        "Ukraine",
        "Canada",
        "United Arab Emirates",
        "France",
        "United Kingdom",
        "China",
        "United States",
        "Japan",
        "Angola"
    }
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

### Maximum suggestion box height

The maximum height of the suggestion box in the SfAutocomplete control can be varied using the `MaximumDropDownHeight` property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

"Japan",
"Angola"
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

Opening suggestion box on focus

Suggestion box can be shown whenever the control receives focus using the `ShowSuggestionsOnFocus` property. At this time, suggestion list is the complete list of data source.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

<x:String>Japan</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>

```

```
</ContentPage>
```

## C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = 30
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                ShowSuggestionsOnFocus = true,
                AutoCompleteSource = new List<string>()
                {
                    "Great Britain",
                    "Canada",
                    "France",
                    "China",
                    "Japan"
                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}
```

### Delay opening suggestion box

The `PopupDelay` property is used to delay the suggestion box opening process. It gets milliseconds as input in integer data type.

In this example, a time duration of 3 seconds is set to popup delay.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

x:Class="AutocompleteSample.MainPage">
<StackLayout VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete
x:Name="autoComplete"
HeightRequest="40"
PopupDelay="3000">
<autocomplete:SfAutoComplete.AutoCompleteSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>India</x:String>
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>Canada</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>France</x:String>
<x:String>United Kingdom</x:String>
<x:String>China</x:String>
<x:String>United States</x:String>
<x:String>Japan</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

#### C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
    }
}
```

```

StackLayout stackLayout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = 30
};
SfAutoComplete autoComplete = new SfAutoComplete()
{
    HeightRequest = 40,
    PopupDelay = 3000,
    AutoCompleteSource = new List<string>()
    {
        "India",
        "Uganda",
        "Ukraine",
        "Canada",
        "United Arab Emirates",
        "France",
        "United Kingdom",
        "China",
        "United States",
        "Japan",
        "Angola"
    }
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

### Delay before searching algorithm starts

The **SearchDelay** property is used to delay the searching algorithm process. It gets milliseconds as input in integer data type.

In this example, a time duration of 3 seconds is set to search delay.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

            {
                "India",
                "Uganda",
                "Ukraine",
                "Canada",
                "United Arab Emirates",
                "France",
                "United Kingdom",
                "China",
                "United States",
                "Japan",
                "Angola"
            }
        };
        stackLayout.Children.Add(autoComplete);
        this.Content = stackLayout;
    }
}

```

## Prefix Characters Constraint

Instead of displaying suggestion list on every character entry, matches can be filtered and displayed after a few character entries. This can be done by `[MinimumPrefixCharacters]` property and its default value is 1.

## XML

```

<?xml version="1.0" encoding="utf-8" ?>

}
}
}

```

## Watermark

Watermark provides a short note about the type of input to enter in the editor control. Watermarks are visible only if the text is empty. Also it will reappear if the text is cleared.

The following example, explains the usability of watermark which hints user to start with the character "U".

## XML

                    "Albania",
                    "Algeria",
                    "Andorra",
                    "Angola"
                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}

```

## Enter 'U' to filter suggestions

### Changing Watermark Text Color

Text color of watermark can be customized using `WatermarkColor` property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>

};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

## Enter some text

Focus the control

The autocomplete sets the user to focus the autocomplete textbox initially after the control gets rendered using `IsFocused` property.

### XML

```

                    "Albania",
                    "Algeria",
                    "Andorra",
                    "Angola"
                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}
```

## Customizing AutoComplete

AutoComplete provides user friendly customizing options for both entry part and drop down part. In this section, customizing entire AutoComplete control is explained.

### Customizing the Entry

[TextColor](#), [TextSize](#), [FontAttributes](#), [FontFamily](#) and [BorderColor](#) are the properties used to customize the foreground color, font size, font attribute, font family and border color of the entry part.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<StackLayout
VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete HeightRequest="45"
Text="Sample text"
TextColor="#1976d2"
TextSize="20"
BorderColor="#1976d2"/>
</StackLayout>
</ContentPage>
```

### C#

```
using Syncfusion.SfAutoComplete.XForms;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 45,
                Text = "Sample text",
                TextColor = Color.FromHex("1976d2"),
                TextSize = 20,
                BorderColor = Color.FromHex("1976d2")
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}
```

```
}
}
```

## Sample text

### Custom Template for Suggestion Items

[ItemTemplate](#) property helps to decorate suggestion items with custom templates. The following code explains the steps to add an image to the suggestion list item.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<ContentPage.BindingContext>
<local:PersonViewModel/>
</ContentPage.BindingContext>
<StackLayout
VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">
<autocomplete:SfAutoComplete HeightRequest="40"
DisplayMemberPath="Name"
DataSource="{Binding PersonCollection}">
<autocomplete:SfAutoComplete.ItemTemplate>
<DataTemplate>
<StackLayout Orientation="Horizontal"
Padding="2,0,0,0">
<Image Source="User.png"
WidthRequest="12"/>
<Label Text="{Binding Name}"
VerticalOptions="Center"/>
</StackLayout>
</DataTemplate>
</autocomplete:SfAutoComplete.ItemTemplate>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

#### C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace AutocompleteSample
{
```

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
}

public class Person
{
    private int age;
    public int Age
    {
        get { return age; }
        set { age = value; }
    }
    private string name;
    public string Name
    {
        get { return name; }
        set { name = value; }
    }
}

public class PersonViewModel
{
    private ObservableCollection<Person> personCollection;
    public ObservableCollection<Person> PersonCollection
    {
        get { return personCollection; }
        set { personCollection = value; }
    }
    public PersonViewModel()
    {
        personCollection = new ObservableCollection<Person>();
        personCollection.Add(new Person() { Age = 21, Name = "Aldan" });
        personCollection.Add(new Person() { Age = 25, Name = "Clara" });
        personCollection.Add(new Person() { Age = 23, Name = "Aldrin" });
        personCollection.Add(new Person() { Age = 25, Name = "Mark" });
        personCollection.Add(new Person() { Age = 25, Name = "Lucas" });
        personCollection.Add(new Person() { Age = 24, Name = "Alan" });
        personCollection.Add(new Person() { Age = 25, Name = "James" });
        personCollection.Add(new Person() { Age = 22, Name = "Aaron" });
    }
}
}
```

## Customizing the Suggestion Box

### *Changing suggestion item height*

[DropDownItemHeight](#) property is used to modify the height of suggestion items in drop down list. The code example is given below:

#### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
  <StackLayout
    VerticalOptions="Start"
    HorizontalOptions="Start"
    Padding="30">
    <autocomplete:SfAutoComplete x:Name="autoComplete"
      HeightRequest="40"
      DropDownItemHeight="45">
      <autocomplete:SfAutoComplete.AutoCompleteSource>
      <ListCollection:List x:TypeArguments="x:String">
      <x:String>India</x:String>
      <x:String>Uganda</x:String>
      <x:String>Ukraine</x:String>
      <x:String>Canada</x:String>
      <x:String>United Arab Emirates</x:String>
      <x:String>United Kingdom</x:String>
      </ListCollection:List>
      </autocomplete:SfAutoComplete.AutoCompleteSource>
    </autocomplete:SfAutoComplete>
  </StackLayout>
</ContentPage>
```

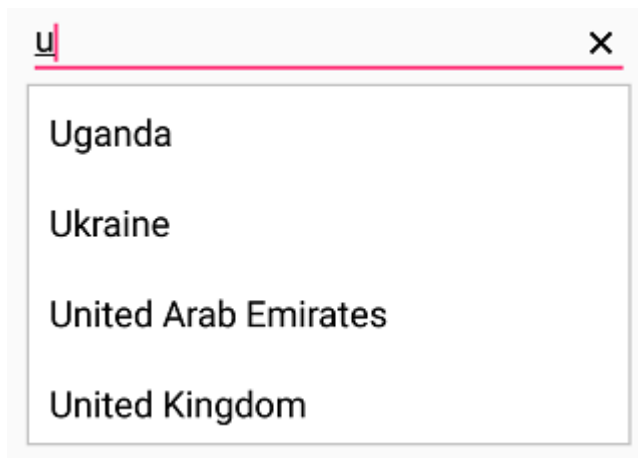

#### **C#**

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
        }
    }
}
```

```

SfAutoComplete autoComplete = new SfAutoComplete()
{
    HeightRequest = 40,
    DropDownItemHeight = 45,
    AutoCompleteSource = new List<string>()
    {
        "India",
        "Uganda",
        "Ukraine",
        "Canada",
        "United Arab Emirates",
        "United Kingdom"
    }
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

#### Changing suggestion box corner radius

The [DropDownCornerRadius](#) property is used to modify the corner radius of suggestion box. The following code example demonstrates how to change the suggestion box corner radius.

#### XML

```

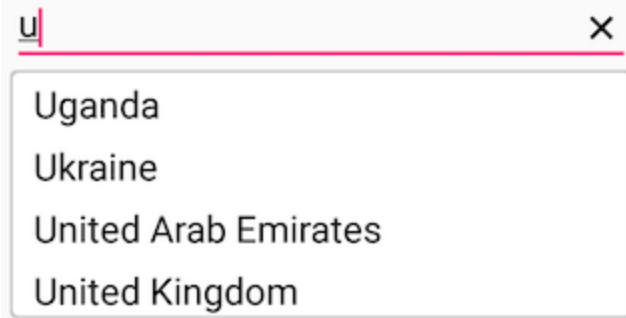

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
<StackLayout
VerticalOptions="Start"
HorizontalOptions="Start"
Padding="30">

```

```
<autocomplete:SfAutoComplete x:Name="autoComplete"
HeightRequest="40"
DropDownCornerRadius="3">
<autocomplete:SfAutoComplete.AutoCompleteSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>India</x:String>
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>Canada</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>United Kingdom</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

## C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout()
{
VerticalOptions = LayoutOptions.Start,
HorizontalOptions = LayoutOptions.Start,
Padding = new Thickness(30)
};
SfAutoComplete autoComplete = new SfAutoComplete()
{
HeightRequest = 40,
DropDownCornerRadius = 3,
AutoCompleteSource = new List<string>()
{
"India",
"Uganda",
"Ukraine",
"Canada",
"United Arab Emirates",
"United Kingdom"
}
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}
```

#### Changing suggestion box background color

The [DropDownBackgroundColor](#) property is used to modify the background color of suggestion box. The following code example demonstrates how to change the suggestion box background color.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
  <StackLayout
    VerticalOptions="Start"
    HorizontalOptions="Start"
    Padding="30">
    <autocomplete:SfAutoComplete x:Name="autoComplete"
      HeightRequest="40"
      DropDownBackgroundColor="Red">
      <autocomplete:SfAutoComplete.AutoCompleteSource>
      <ListCollection:List x:TypeArguments="x:String">
      <x:String>India</x:String>
      <x:String>Uganda</x:String>
      <x:String>Ukraine</x:String>
      <x:String>Canada</x:String>
      <x:String>United Arab Emirates</x:String>
      <x:String>United Kingdom</x:String>
      </ListCollection:List>
      </autocomplete:SfAutoComplete.AutoCompleteSource>
      </autocomplete:SfAutoComplete>
    </StackLayout>
  </ContentPage>
```

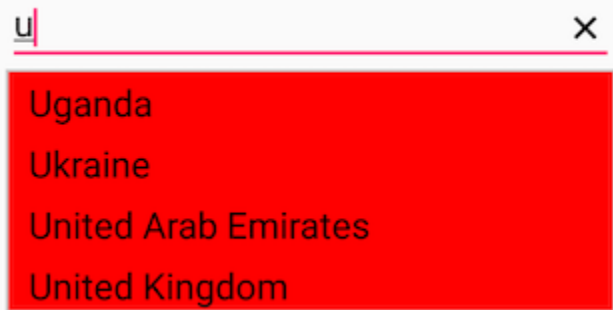

#### C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
```

```

public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        StackLayout stackLayout = new StackLayout()
        {
            VerticalOptions = LayoutOptions.Start,
            HorizontalOptions = LayoutOptions.Start,
            Padding = new Thickness(30)
        };
        SfAutoComplete autoComplete = new SfAutoComplete()
        {
            HeightRequest = 40,
            DropDownBackgroundColor = Color.Red,
            AutoCompleteSource = new List<string>()
            {
                "India",
                "Uganda",
                "Ukraine",
                "Canada",
                "United Arab Emirates",
                "United Kingdom"
            }
        };
        stackLayout.Children.Add(autoComplete);
        this.Content = stackLayout;
    }
}

```

#### *Changing the border color of suggestion box*

The `DropDownBorderColor` property is used to change the border color of suggestion box. The following code example demonstrates how to change the border color of suggestion box.

#### **XML**

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

</ListCollection:List>
</autoComplete:SfAutoComplete.AutoCompleteSource>
</autoComplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

## C#

```

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout layout = new StackLayout()
{
VerticalOptions = LayoutOptions.Start,
HorizontalOptions = LayoutOptions.Start,
Padding = new Thickness(30)
};
List<String> resolutionList = new List<String>();
resolutionList.Add("1920 x 1080");
resolutionList.Add("1680 x 1050");
resolutionList.Add("1600 x 900");
resolutionList.Add("1440 x 900");
resolutionList.Add("1400 x 1050");
}
}

```

```

resolutionList.Add("1366 x 768");
resolutionList.Add("1360 x 768");
resolutionList.Add("1280 x 1024");
resolutionList.Add("1280 x 960");
resolutionList.Add("1280 x 720");
resolutionList.Add("854 x 480");
resolutionList.Add("800 x 480");
resolutionList.Add("480 x 640");
resolutionList.Add("480 x 320");
resolutionList.Add("432 x 240");
resolutionList.Add("360 x 640");
resolutionList.Add("320 x 240");
SfAutoComplete autoComplete = new SfAutoComplete();
autoComplete.HeightRequest = 40;
autoComplete.AutoCompleteSource = resolutionList;
autoComplete.DropDownBorderColor = Color.Blue;
layout.Children.Add(autoComplete);
Content = layout;
}
}
}

```

#### Customizing suggestion items

Suggestion box items can be customized using [DropDownItemFontAttributes](#), [DropDownItemFontFamily](#), [DropDownTextSize](#) and [DropDownTextColor](#) properties.

#### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

<x:String>India</x:String>
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>Canada</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>United Kingdom</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>

```

## C#

```

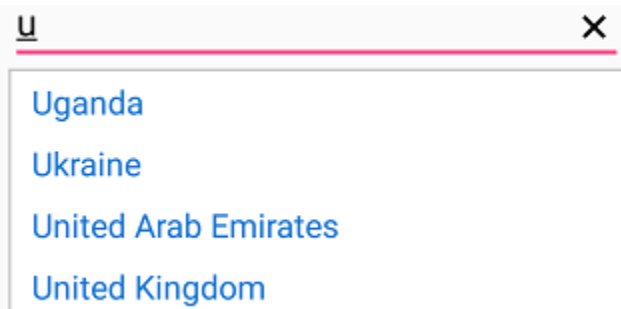

using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                DropDownTextColor = Color.FromHex("#1976d2"),
                DropDownTextSize = 16,
                AutoCompleteSource = new List<string>()
                {
                    "India",
                    "Uganda",
                    "Ukraine",
                    "Canada",
                    "United Arab Emirates",
                    "United Kingdom"
                }
            };
        }
    }
}

```

```

stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
}

```

#### Show clear button

The autocomplete provided the user to show or hide the clear button using [ShowClearButton](#) property.

#### XML

<x:String>United Arab Emirates</x:String>
<x:String>United Kingdom</x:String>
</ListCollection:List>
</autocomplete:SfAutoComplete.AutoCompleteSource>
</autocomplete:SfAutoComplete>
</StackLayout>
</ContentPage>
```

## C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
            {
                HeightRequest = 40,
                ClearButtonColor = Color.Red,
                AutoCompleteSource = new List<string>()
                {
                    "India",
                    "Uganda",
                    "Ukraine",
                    "Canada",
                    "United Arab Emirates",
                    "United Kingdom"
                }
            };
            stackLayout.Children.Add(autoComplete);
            this.Content = stackLayout;
        }
    }
}
```

### Changing border visibility

The [ShowBorder](#) property is used to modify the visibility of border. The following code example demonstrates how to change the border visibility.

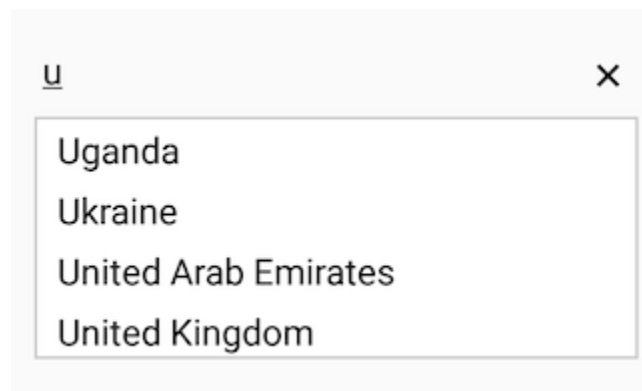

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:autocomplete="clr-
namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
e.XForms"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:local="clr-namespace:AutocompleteSample"
x:Class="AutocompleteSample.MainPage">
  <StackLayout
    VerticalOptions="Start"
    HorizontalOptions="Start"
    Padding="30">
    <autocomplete:SfAutoComplete x:Name="autoComplete"
      HeightRequest="40"
      ShowBorder="False">
      <autocomplete:SfAutoComplete.AutoCompleteSource>
        <ListCollection:List x:TypeArguments="x:String">
          <x:String>India</x:String>
          <x:String>Uganda</x:String>
          <x:String>Ukraine</x:String>
          <x:String>Canada</x:String>
          <x:String>United Arab Emirates</x:String>
          <x:String>United Kingdom</x:String>
        </ListCollection:List>
      </autocomplete:SfAutoComplete.AutoCompleteSource>
    </autocomplete:SfAutoComplete>
  </StackLayout>
</ContentPage>
```

#### C#

```
using Syncfusion.SfAutoComplete.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace AutocompleteSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = new Thickness(30)
            };
            SfAutoComplete autoComplete = new SfAutoComplete()
```

```
{
    HeightRequest = 40,
    ShowBorder = false,
    AutoCompleteSource = new List<string>()
    {
        "India",
        "Uganda",
        "Ukraine",
        "Canada",
        "United Arab Emirates",
        "United Kingdom"
    }
};
stackLayout.Children.Add(autoComplete);
this.Content = stackLayout;
}
}
```

### How to perform an operation when selecting an item from drop-down list?

You can perform an operation when selecting an item among the filtered suggestions using the **SelectionChanged** event. The SelectionChanged event returns the following arguments:

Members	Description
AddedItems	Shows recently added item in AutoComplete.
RemovedItems	Shows recently removed items in AutoComplete.
Value	Holds all selected items in AutoComplete.

### XML

```
[XAML]
<?xml version="1.0" encoding="utf-8"?>
<ContentPage
    xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:autocomplete="clr-
        namespace:Syncfusion.SfAutoComplete.XForms;assembly=Syncfusion.SfAutoComple
        e.XForms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
```

```
xmlns:local="clr-namespace:Events"
x:Class="Events.MainPage">
<ContentPage.BindingContext>
<local:EmployeeViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<StackLayout>
<autocomplete:SfAutoComplete
DisplayMemberPath="Name"
DataSource="{Binding EmployeeCollection}"
SelectionChanged="Handle_SelectionChanged"/>
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

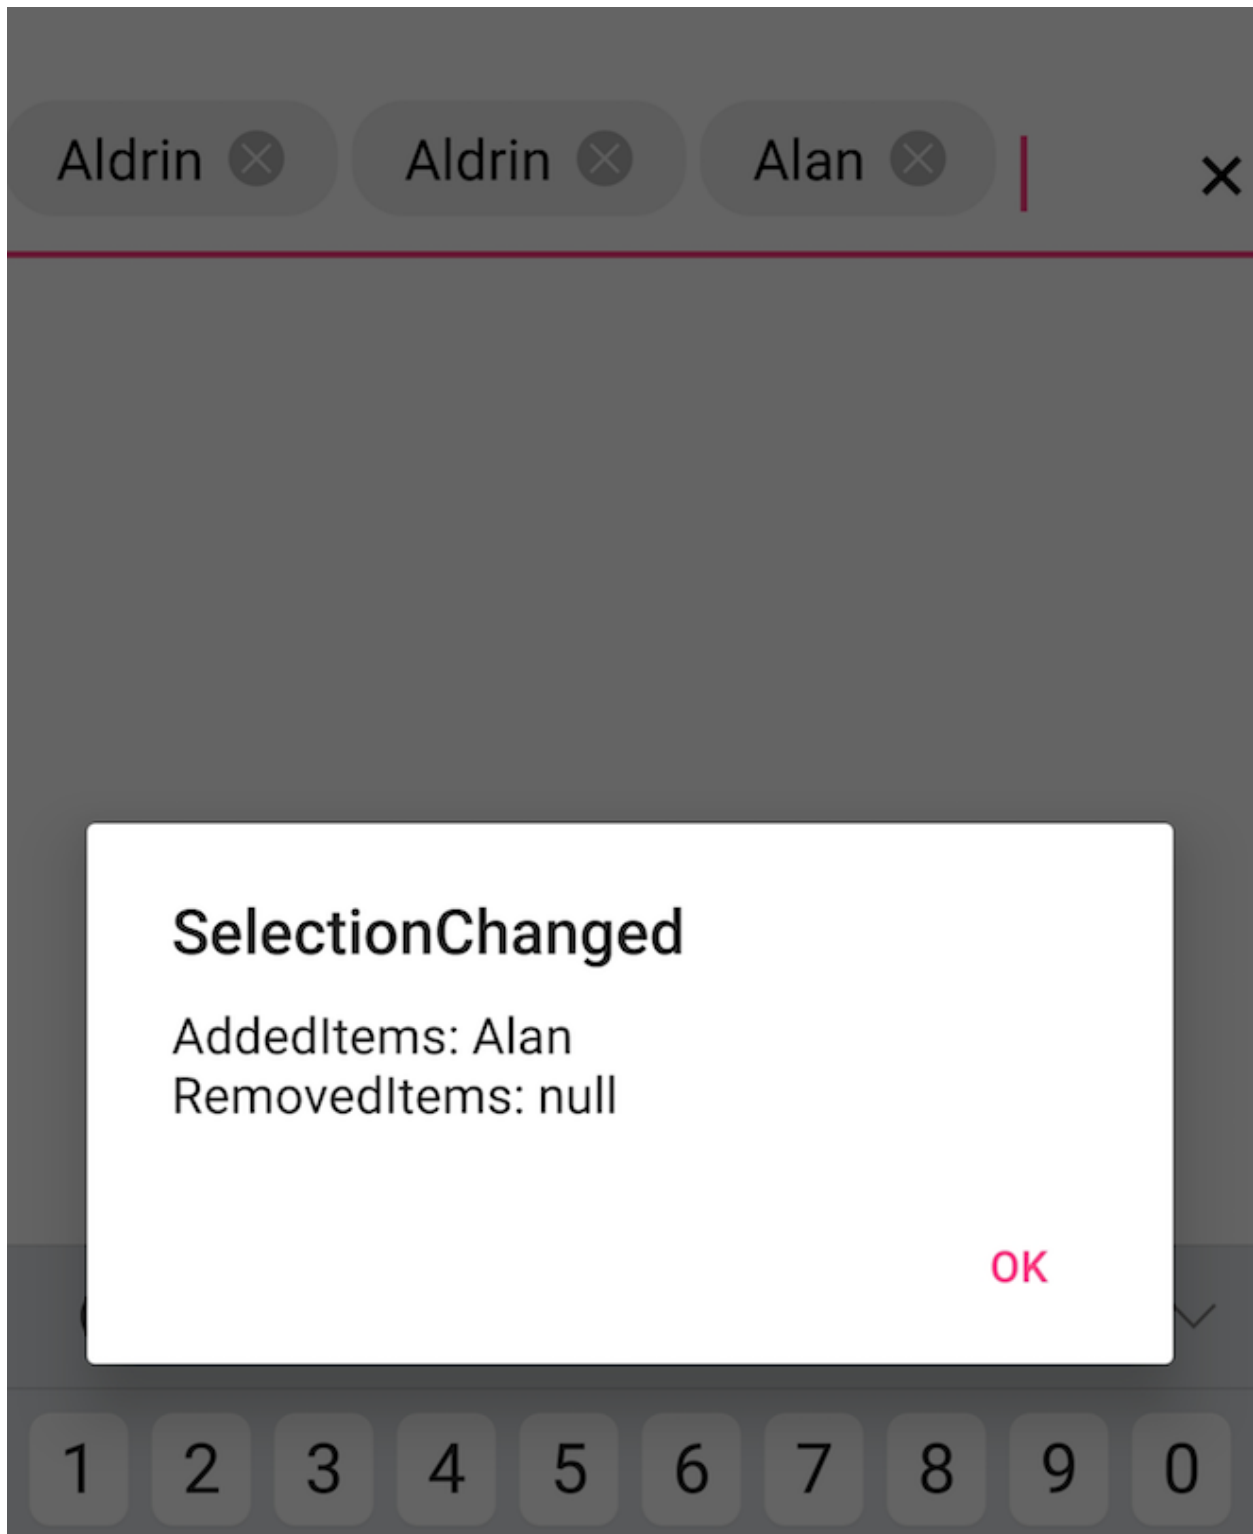

## C#

```
[C#]
using System;
using System.Collections;
using System.Collections.Generic;
using System.Collections.ObjectModel;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
namespace Events
{
    public class Employee
    {
        private int id;
        private string name;
        public int ID
        {
            get
            {
                return this.id;
            }
            set
            {
                this.id = value;
            }
        }
        public string Name
        {
            get
            {
                return this.name;
            }
            set
            {
                this.name = value;
            }
        }
    }
    public class EmployeeViewModel
```

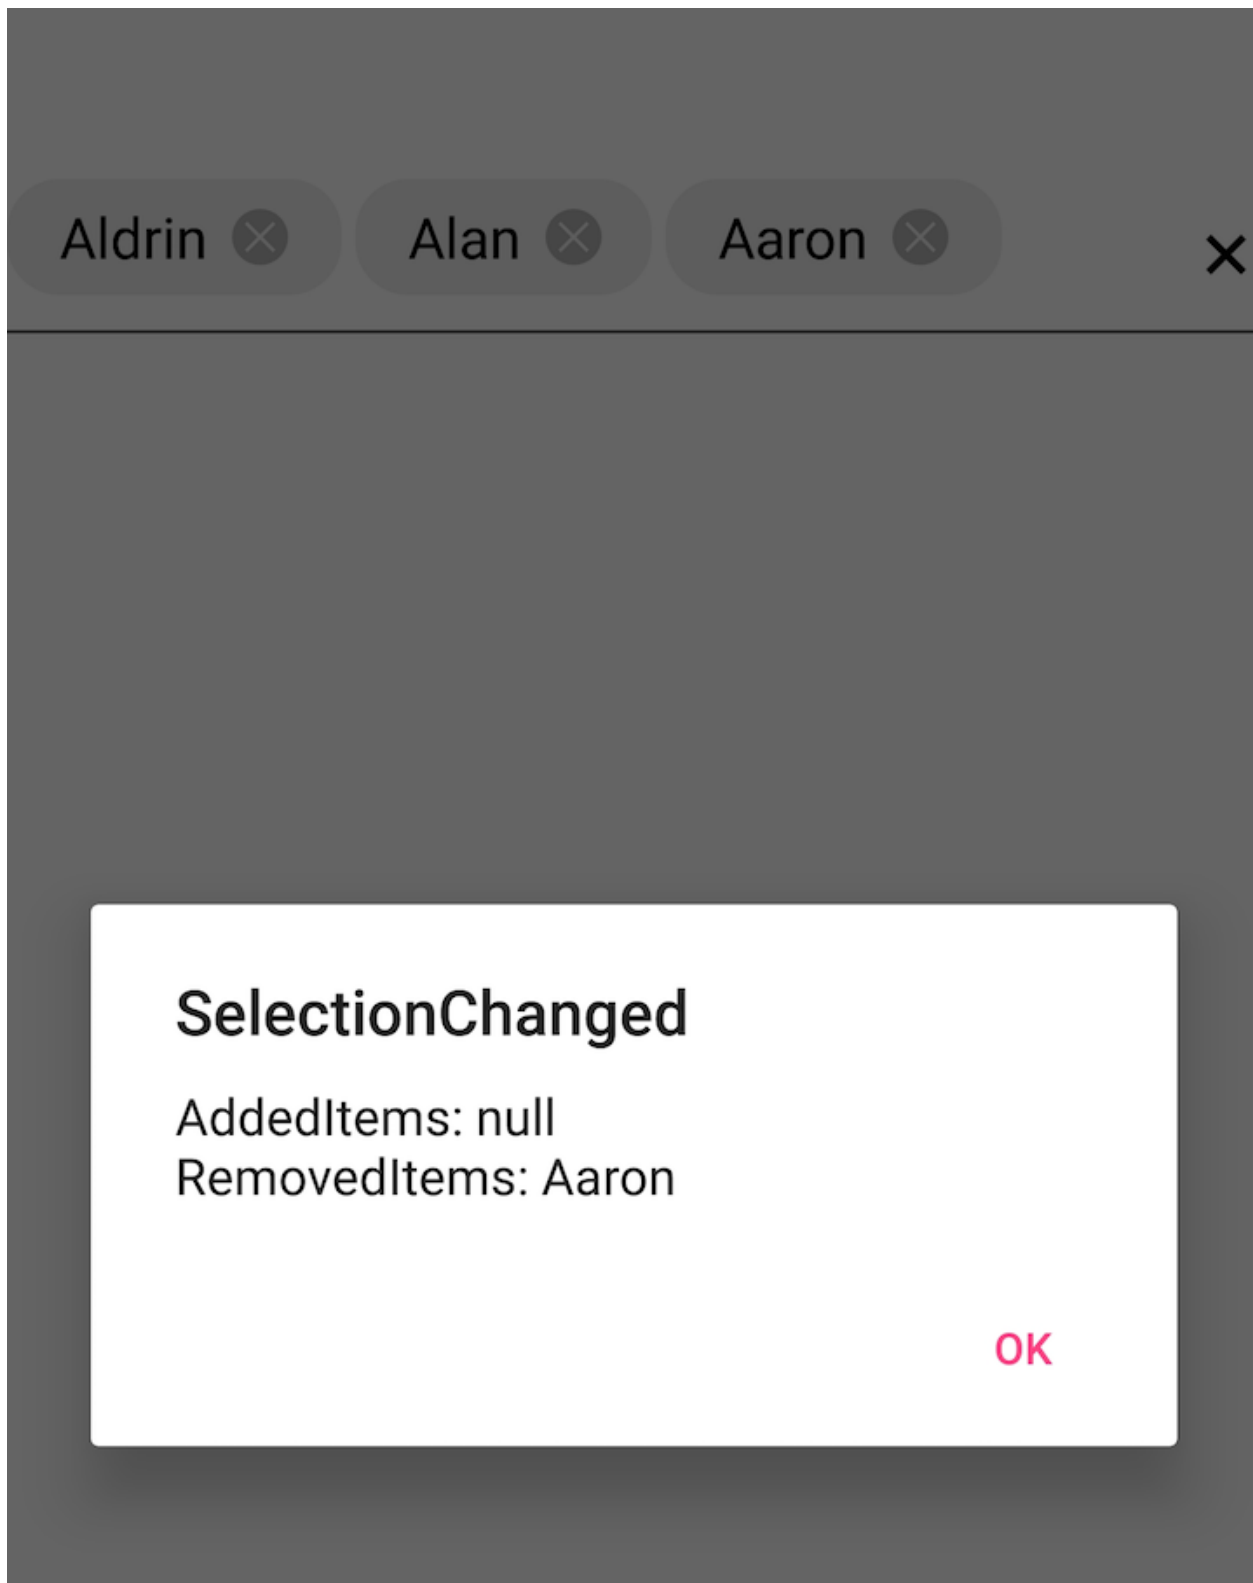

```
{
private ObservableCollection<Employee> employeeCollection;
public ObservableCollection<Employee> EmployeeCollection
{
get
{
return this.employeeCollection;
}
set
{
this.employeeCollection = value;
}
}
public EmployeeViewModel()
{
employeeCollection = new ObservableCollection<Employee>();
employeeCollection.Add(new Employee() { ID = 1, Name = "Eric" });
employeeCollection.Add(new Employee() { ID = 2, Name = "James" });
employeeCollection.Add(new Employee() { ID = 3, Name = "Jacob" });
employeeCollection.Add(new Employee() { ID = 4, Name = "Lucas" });
employeeCollection.Add(new Employee() { ID = 5, Name = "Mark" });
employeeCollection.Add(new Employee() { ID = 6, Name = "Aldan" });
employeeCollection.Add(new Employee() { ID = 7, Name = "Aldrin" });
employeeCollection.Add(new Employee() { ID = 8, Name = "Alan" });
employeeCollection.Add(new Employee() { ID = 9, Name = "Aaron" });
}
}
public partial class MainPage : ContentPage
{
void Handle_SelectionChanged(object sender,
Syncfusion.SfAutoComplete.XForms.SelectionChangedEventArgs e)
{
var addedEmployee = e.AddedItems as Employee;
string addedItems = addedEmployee != null ? addedEmployee.Name : "null";
var removedEmployee = e.RemovedItems as Employee;
string removedItems = removedEmployee != null ? removedEmployee.Name :
"null";
DisplayAlert("SelectionChanged", "AddedItems: " + addedItems + "\n" +
"RemovedItems: " + removedItems, "Ok");
}
public MainPage()
{
InitializeComponent();
}
}
}
```

The following screenshot illustrates the result of adding the item.

The following screenshot illustrates the result of removing the item.

#### AutomationId

The SfAutoComplete control has built-in `AutomationId` for inner elements. The `AutomationId` API allows the automation framework to find and interact with the inner elements of the SfAutoComplete

control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's AutomationId.

For example, If you set SfAutoComplete's AutomationId as "Employee Autocomplete", then the Automation framework will interact with the Token Close Button as "Employee Autocomplete Frank Token Close Button".

The following screenshot illustrates the AutomationIds of inner elements. The Automation framework will interact with the dropdown for scrolling the items as "Employee Autocomplete Dropdown". You can also interact with the elements inside the HeaderView and FooterView with the element's AutomationId. The Automation framework will not interact with the Input Clear Button when the MultiSelectMode is None and Delimiter mode.

## SfAvatarView

### Overview

The SfAvatarView control for Xamarin.Forms provides a graphical representation of user image that allows you to customize the view by adding image, background color, icon, text, etc.

## Key features

- Supports for adding image and initials.
- Customizes the height, width, BorderColor, BackgroundColor, and CornerRadius of the view.
- **AvatarCharacter**: Adds the default vector images.
- **GroupView**: Supports to add maximum three custom images or initials in a single view.
- Supports different types of visual styles.
- Supports **BadgeView** and **GradientBrush**.

## Getting Started

This section explains the steps required to work with the SfAvatarView control for Xamarin.Forms.

### Adding SfAvatarView reference

You can add SfAvatarView reference using one of the following methods:

#### Method 1: Adding SfAvatarView reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfAvatarView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Core](https://www.syncfusion.com/nuget-packages), and then install it.

![Xamarin Forms SfAvatarView Nuget reference](images/Adding SfAvatarView reference.png)

**Note:** Install the same version of SfAvatarView NuGet in all the projects.

### Method 2: Adding SfAvatarView reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfAvatarView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfAvatarView assemblies manually from the installed location

If you prefer to manually reference the assemblies instead of referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching an application on each platform with SfAvatarView

To use the SfAvatarView control inside an application, each platform application must initialize the SfAvatarView renderer. This initialization step varies from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, the following steps are not needed.

#### Android and UWP

The Android and UWP launch the SfAvatarView without any initialization, and it is enough to only initialize the Xamarin.Forms Framework to launch the application.

#### iOS

To launch the SfAvatarView in iOS, call the `SfAvatarView.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework has been initialized and before the `LoadApplication` is called as demonstrated in the following code example.

**C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
...
global::Xamarin.Forms.Forms.Init ();
Syncfusion.XForms.iOS.Core.SfAvatarViewRenderer.Init();
LoadApplication (new App ());
...
}
```

*Release mode issue in UWP platform*

The known Framework issue in UWP platform is that the custom controls will not be rendered when deploying an application in **Release Mode**. It can be resolved by initializing the SfBorder assemblies in the **App.xaml.cs** file in the UWP project as demonstrated in the following code example.

**C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
...
rootFrame.NavigationFailed += OnNavigationFailed;
// You will need to add `using System.Reflection;`
List<Assembly> assembliesToInclude = new List<Assembly>();
//Now, add all the assemblies your app uses
assembliesToInclude.Add(typeof(SfBorderRenderer).GetTypeInfo().Assembly);
// Replaces Xamarin.Forms.Forms.Init(e);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
...
}
```

*Creating an SfAvatarView control*

The **SfAvatarView** control is configured entirely in C# or in XAML. The following steps explain how to create an **SfAvatarView** control and configure its elements.

*Adding namespace for referred assemblies***XML**

```
xmlns:sfavatar="clr-
namespace:Syncfusion.XForms.AvatarView;assembly=Syncfusion.Core.XForms"
```

**C#**

```
using Syncfusion.XForms.AvatarView;
```

*Adding the SfAvatarView control as the content of ContentPage*

You can add a custom image for displaying in SfAvatarView using the **ImageSource** property.

**XML**

```
<ContentPage.Content>
<Grid>
```

```
<sfavatar:SfAvatarView ContentType="Custom"
ImageSource="alex.png"
VerticalOptions="Center"
HorizontalOptions="Center"
HeightRequest="50"
CornerRadius="25"
WidthRequest="50" />
</Grid>
</ContentPage.Content>
```

## C#

```
using System;
using Syncfusion.XForms.AvatarView;
using Xamarin.Forms;
namespace AvatarViewGettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            //main grid
            Grid mainGrid = new Grid();
            // Create an SfAvatarView control.
            SfAvatarView avatarview = new SfAvatarView();
            avatarview.VerticalOptions = LayoutOptions.Center;
            avatarview.HorizontalOptions = LayoutOptions.Center;
            avatarview.BackgroundColor = Color.FromHex("#ffb6c1");
            avatarview.ContentType = ContentType.Custom;
            avatarview.ImageSource = "alex.png";
            avatarview.WidthRequest = 50;
            avatarview.HeightRequest = 50;
            avatarview.CornerRadius = 25;
            mainGrid.Children.Add(avatarview);
            this.Content = mainGrid;
        }
    }
}
```

The Getting Started sample is available in this following link: [Getting Started](#).

## Avatar Types

The **SfAvatarView** control provides the following five different ways to display the view:

- **Default** - Adds the default image when initializing without any other source such as image and group.
- **AvatarName** - Set the initial value in SfAvatarView.
- **Custom** - Adds the user custom image in SfAvatarView.
- **AvatarCharacter** - Sets the default image in SfAvatarView.
- **Group** - Adds maximum three images or initials in a single **SfAvatarView**.

### Default

Automatic type avatar view is used for displaying the default vector image when initializing without the initials, custom, or group view types.

### XML

```
<sfavatar:SfAvatarView ContentType="Default"
VerticalOptions="Center"
HorizontalOptions="Center"
WidthRequest="50"
HeightRequest="50"
CornerRadius="25">
</sfavatar:SfAvatarView>
```

### C#

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.WidthRequest = 50;
avatarview.HeightRequest = 50;
avatarview.CornerRadius = 25;
avatarview.ContentType = ContentType.Default;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

## Initials

When using the `SfAvatarType` as initials, you need to set the initial character using the following properties:

- `InitialsType` - Defines the type of characters to be displayed.
- `AvatarName` - Gets or sets the value for the initials type, which displays the text in the avatar view.
- `InitialsColor` - Gets or sets the color of the initial color value that defines color for the initial string.

## InitialsType

The `InitialsType` contains the following two types:

- `SingleCharacter`
- `DoubleCharacter`

You must set the `AvatarName` string property for displaying the initial value in the `AvatarView`.

## SingleCharacter

The `SingleCharacter` is used for displaying the first character in the string you have set in the `Initials` property.

## XML

```
<sfavatar:SfAvatarView ContentType="Initials"
HorizontalOptions="Center"
VerticalOptions="Center"
InitialsType="SingleCharacter"
AvatarName="Alex"
InitialsColor="Black"
WidthRequest="50"
FontAttributes="Bold"
HeightRequest="50"
CornerRadius="25"
BackgroundColor="Bisque">
</sfavatar:SfAvatarView>
```

## C#

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.BackgroundColor = Color.Bisque;
avatarview.WidthRequest = 50;
avatarview.HeightRequest = 50;
avatarview.CornerRadius = 25;
avatarview.ContentType = ContentType.Initials;
avatarview.AvatarName = "A";
avatarview.InitialsType = InitialsType.SingleCharacter;
avatarview.InitialsColor = Color.Black;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

### DoubleCharacter

The **DoubleCharacter** is used for displaying a two-characters text you have set in the **Initials** property. If the initials contain one word, it shows the first and last letters of the single string. If it contains two or more words, it displays the first letter of the first string and last letter of the second or last string.

### XML

```
<sfavatar:SfAvatarView ContentType="Initials"
InitialsType="DoubleCharacter"
AvatarName="Alex"
InitialsColor="Black"
WidthRequest="50"
FontAttributes="Bold"
HeightRequest="50"
CornerRadius="25"
BackgroundColor="Bisque">
</sfavatar:SfAvatarView>
```

### C#

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.BackgroundColor = Color.Bisque;
avatarview.WidthRequest = 50;
avatarview.HeightRequest = 50;
avatarview.CornerRadius = 25;
avatarview.ContentType = ContentType.Initials;
avatarview.AvatarName = "AA";
avatarview.InitialsType = InitialsType.DoubleCharacter;
avatarview.InitialsColor = Color.Black;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

#### Custom image

You can add a custom user image by setting the `ImageSource` property. Refer to this [documentation](#).

#### Character avatars

You can set the default vector images that already present in avatar view by setting the `AvatarCharacter` property.

#### XML

```
<sfavatar:SfAvatarView VerticalOptions="Center"
HorizontalOptions="Center"
ContentType="AvatarCharacter"
AvatarCharacter="Avatar10"
WidthRequest="50"
HeightRequest="50"
CornerRadius="25">
</sfavatar:SfAvatarView>
```

#### C#

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.WidthRequest = 50;
avatarview.HeightRequest = 50;
avatarview.CornerRadius = 35;
avatarview.ContentType = ContentType.AvatarCharacter;
avatarview.AvatarCharacter = AvatarCharacter.Avatar10;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

### GroupView

You can add maximum three images or initials in the same view using a GroupView type.

Set the `InitialsMemberPath` for displaying the initials in the group view. For image, set the `ImageSourcePath`. The following code sample demonstrates how to add images using the `GroupView` property.

### C#

```
public class Employee
{
    private string name;
    public string Name
    {
        get { return name; }
        set { name = value; }
    }
    private string imagesource;
    public string ImageSource
    {
        get { return imagesource; }
        set { imagesource = value; }
    }
    private Color colors;
    public Color Colors
    {
        get { return colors; }
        set { colors = value; }
    }
}

public class EmployeeViewMdoel : INotifyPropertyChanged
{
    public event PropertyChangedEventHandler PropertyChanged;
    private void OnPropertyRaised(string propertyname)
    {
        if (PropertyChanged != null)
        {
            PropertyChanged(this, new PropertyChangedEventArgs(propertyname));
        }
    }
    private ObservableCollection<Employee> collectionimage;
    public ObservableCollection<Employee> CollectionImage
    {

```

```

get { return collectionimage; }
set
{
collectionimage = value;
OnPropertyRaised("CollectionImage");
}
}
public EmployeeViewMdoel()
{
CollectionImage = new ObservableCollection<Employee>();
CollectionImage.Add(new Employee { Name="Mike" , ImageSource =
"mike.png",Colors=Color.Gray });
CollectionImage.Add(new Employee { Name="Alex",ImageSource= "alex.png",
Colors = Color.Bisque });
CollectionImage.Add(new Employee { Name="Ellanaa", ImageSource=
"ellanaa.png",Colors=Color.LightCoral })
}
}

```

**XML**

```

<ContentPage.BindingContext>
<local:EmployeeViewMdoel/>
</ContentPage.BindingContext>
<sfavatar:SfAvatarView ContentType="Group"
VerticalOptions="Center"
HorizontalOptions="Center"
GroupSource="{Binding CollectionImage}"
InitialsMemberPath="Name"
BackgroundColorMemberPath="Colors"
ImageSourceMemberPath="ImageSource"
WidthRequest="50"
HeightRequest="50"
CornerRadius="25">
</sfavatar:SfAvatarView>

```

**C#**

```

public partial class MainPage : ContentPage, INotifyPropertyChanged
{
EmployeeViewMdoel emp;
public MainPage()
{
InitializeComponent();
Grid mainGrid = new Grid();
emp = new EmployeeViewMdoel();
SfAvatarView avatarview = new SfAvatarView();
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.WidthRequest = 50;
avatarview.HeightRequest = 50;
avatarview.CornerRadius = 25;
avatarview.ContentType = ContentType.Group;
avatarview.GroupSource = emp.CollectionImage;
avatarview.InitialsMemberPath = "Name";
avatarview.ImageSourceMemberPath = "ImageSource";
}
}

```

```
avatarview.BackgroundColorMemberPath = "Colors";
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
}
}
```

#### Add initials only in GroupView

You can set the initials only in the group view by setting the `InitialsMemberPath` alone. It is demonstrated in the following code sample.

#### XML

```
<sfavatar:SfAvatarView ContentType="Group"
VerticalOptions="Center"
HorizontalOptions="Center"
GroupSource="{Binding CollectionImage}"
InitialsMemberPath="Name"
BackgroundColorMemberPath="Colors"
WidthRequest="50"
HeightRequest="50"
CornerRadius="25">
</sfavatar:SfAvatarView>
```

#### C#

```
public partial class MainPage : ContentPage, INotifyPropertyChanged
{
    EmployeeViewMdoel emp;
    public MainPage()
    {
        Grid mainGrid = new Grid();
        emp = new EmployeeViewMdoel();
        SfAvatarView avatarview = new SfAvatarView();
        avatarview.VerticalOptions = LayoutOptions.Center;
        avatarview.HorizontalOptions = LayoutOptions.Center;
        avatarview.WidthRequest = 50;
        avatarview.HeightRequest = 50;
        avatarview.CornerRadius = 25;
        avatarview.ContentType = ContentType.Group;
        avatarview.GroupSource = emp.CollectionImage;
        avatarview.InitialsMemberPath = "Name";
        avatarview.BackgroundColorMemberPath = "Colors";
```

```
mainGrid.Children.Add(avatarview);  
this.Content = mainGrid;  
}  
}
```

#### Add both image and initials in a GroupView

You have to set both the image and initials based on what should be added in the collection. If the image needs to be added, set `ImageSourcePath`, or if initials need to be added, set `InitialsMemberPath`. This is demonstrated in the following code snippet.

#### C#

```
public class EmployeeViewMdoel : INotifyPropertyChanged  
{  
    public EmployeeViewMdoel()  
    {  
        CollectionImage = new ObservableCollection<Employee>();  
        CollectionImage.Add(new Employee { ImageSource="mike.png" });  
        CollectionImage.Add(new Employee { Name= "alex", Colors=Color.White });  
        CollectionImage.Add(new Employee { ImageSource= "ellanaa.png" });  
    }  
}
```

### Add GroupView using MVVM

Create model and view model for initializing and assigning a value for adding image or initials in the SfAvatarView. The following code sample demonstrates how to use the GroupView property using MVVM pattern.

#### C#

```
//Model.cs
public class Model
{
    public string Name { get; set; }
    public string Images { get; set; }
}
```

#### C#

```
//ViewModel.cs
public class AvatarViewModel
{
    /// <summary>
    /// Gets or sets the value for PeopleCollection field.
    /// </summary>
    public ObservableCollection<Model> PeopleCollection { get; set; }
    /// <summary>
    /// Gets or sets the value for the group view collections.
    /// </summary>
    public ObservableCollection<Model> GroupViewCollection { get; set; }
    /// <summary>
    /// AvatarViewModel
    /// </summary>
    /// <param name="count">Count value</param>
    public AvatarViewModel(int count)
    {
        PopulateModel();
        PopulatePeopleCollection(count);
    }
    /// <summary>
    /// Static count value.
    /// </summary>
    static int staticcount = 0;
    /// <summary>
```

```

/// Change the collections for each group.
/// </summary>
/// <param name="count">count value</param>
private void PopulatePeopleCollection(int count)
{
    PeopleCollection = new ObservableCollection<Model>();
    for (int i = 0; i < count; i++)
    {
        while (true)
        {
            if (GroupViewCollection.Count <= staticcount)
                staticcount = 0;
            var person = GroupViewCollection[staticcount++];
            if (!PeopleCollection.Contains(person))
            {
                PeopleCollection.Add(person);
                break;
            }
        }
    }
}

/// <summary>
/// To add the name and images.
/// </summary>
private void PopulateModel()
{
    GroupViewCollection = new ObservableCollection<Model>();
    GroupViewCollection.Add(new Model() { Name = "Adriana", Images =
    "Adriana.png" });
    GroupViewCollection.Add(new Model() { Name = "Aiden", Images = "Aiden.png"
    });
    GroupViewCollection.Add(new Model() { Name = "Alexander" });
    GroupViewCollection.Add(new Model() { Name = "Arianna", Images =
    "Arianna.png" });
    GroupViewCollection.Add(new Model() { Name = "Clara", Images = "Clara.png"
    });
    GroupViewCollection.Add(new Model() { Name = "Daleyza", Images =
    "Daleyza.png" });
    GroupViewCollection.Add(new Model() { Name = "Ellie", Images = "Ellie.png"
    });
    GroupViewCollection.Add(new Model() { Name = "Finley" });
    GroupViewCollection.Add(new Model() { Name = "Jackson", Images =
    "Jackson.png" });
    GroupViewCollection.Add(new Model() { Name = "Jayden" });
    GroupViewCollection.Add(new Model() { Name = "Kaylee", Images = "Kaylee.png"
    });
    GroupViewCollection.Add(new Model() { Name = "Lucy" });
}

```

## XML

```

<!--MainPage.Xaml-->
<sfavatarview:SfAvatarView ContentType="Group"
Margin="5,0,0,0"
HorizontalOptions="Center"

```

```
HeightRequest="50"  
WidthRequest="50"  
CornerRadius="25"  
VerticalOptions="Center"  
GroupSource="{Binding PeopleCollection}"  
ImageSourceMemberPath="Images"  
InitialsMemberPath="Name">  
</sfavatarview:SfAvatarView>
```

## C#

```
//MainPage.Xaml.cs  
emp = new EmployeeViewMdoel();  
SfAvatarView avatarview = new SfAvatarView();  
avatarview.VerticalOptions = LayoutOptions.Center;  
avatarview.HorizontalOptions = LayoutOptions.Center;  
avatarview.WidthRequest = 50;  
avatarview.HeightRequest = 50;  
avatarview.CornerRadius = 25;  
avatarview.ContentType = ContentType.Group;  
avatarview.GroupSource = emp.CollectionImage;  
avatarview.InitialsMemberPath = "Name";  
avatarview.BackgroundColorMemberPath = "Colors";  
mainGrid.Children.Add(avatarview);
```

The complete SfAvatarView of GroupView type using MVVM is available in this [sample](#).

## Visual Style

The **SfAvatarView** control supports customization using the following built-in visual styles:

- Custom
- Circle
- Square

### Custom

Custom type allows you to customize the control, where you can handle the size, colors, images, etc. of the control. Refer to this [documentation](#).

---

**Note:** The default visual type is custom.

---

### Circle

You can directly set value to the circle in the **SfAvatarView** using the following styles:

- ExtraLargeCircle
- LargeCircle
- MediumCircle
- SmallCircle

- ExtraSmallCircle

The following code sample demonstrates how to define visual style of circle AvatarView.

mainGrid.Children.Add(avatarview2, 3, 0);
```

```
mainGrid.Children.Add(MediumCircleLabel, 2, 1);
mainGrid.Children.Add(avatarview3, 2, 0);
mainGrid.Children.Add(SmallCircleLabel, 1, 1);
mainGrid.Children.Add(avatarview4, 1, 0);
mainGrid.Children.Add(XSmallCircleLabel, 0, 1);
mainGrid.Children.Add(avatarview5, 0, 0);
stack.Children.Add(mainGrid);
this.Content = stack;
```

## Square

You can directly set value to the square in the **SfAvatarView** using the following styles:

- ExtraLargeSquare
- LargeSquare
- MediumSquare
- SmallSquare
- ExtraSmallSquare

The following code sample demonstrates how to define visual style of square AvatarView.

## XML

```
<ContentPage.Resources>
  <ResourceDictionary>
    <Style x:Key="AvatarViewStyle" TargetType="sfavatar:SfAvatarView">
      <Setter Property="VerticalOptions" Value="Center"/>

MediumSquarelabel.VerticalTextAlignment = TextAlignment.Center;
MediumSquarelabel.FontSize = 10;
SfAvatarView avatarviewsquare3 = new SfAvatarView();
avatarviewsquare3.VerticalOptions = LayoutOptions.Center;
avatarviewsquare3.HorizontalOptions = LayoutOptions.Center;
avatarviewsquare3.AvatarShape = AvatarShape.Square;
avatarviewsquare3.AvatarSize = AvatarSize.Medium;
avatarviewsquare3.ContentType = ContentType.Default;
avatarviewsquare3.ImageSource = "ellanaa.png";
Label SmallSquarelabel = new Label();
SmallSquarelabel.Text = "SmallSquare";
SmallSquarelabel.FontSize = 12;
SmallSquarelabel.FontAttributes = FontAttributes.Bold;
SmallSquarelabel.HorizontalOptions = LayoutOptions.Center;
```

```

SmallSquarelabel.VerticalOptions = LayoutOptions.Center;
SmallSquarelabel.HorizontalTextAlignment = TextAlignment.Center;
SmallSquarelabel.VerticalTextAlignment = TextAlignment.Center;
SmallSquarelabel.FontSize = 10;
SfAvatarView avatarviewsquare4 = new SfAvatarView();
avatarviewsquare4.VerticalOptions = LayoutOptions.Center;
avatarviewsquare4.HorizontalOptions = LayoutOptions.Center;
avatarviewsquare4.AvatarShape = AvatarShape.Square;
avatarviewsquare4.AvatarSize = AvatarSize.Small;
avatarviewsquare4.ContentType = ContentType.Default;
avatarviewsquare4.ImageSource = "ellanaa.png";
Label XSmallSquarelabel = new Label();
XSmallSquarelabel.Text = "ExtraSmallSquare";
XSmallSquarelabel.FontSize = 12;
XSmallSquarelabel.FontAttributes = FontAttributes.Bold;
XSmallSquarelabel.HorizontalOptions = LayoutOptions.Center;
XSmallSquarelabel.VerticalOptions = LayoutOptions.Center;
XSmallSquarelabel.HorizontalTextAlignment = TextAlignment.Center;
XSmallSquarelabel.VerticalTextAlignment = TextAlignment.Center;
XSmallSquarelabel.FontSize = 10;
SfAvatarView avatarviewsquare5 = new SfAvatarView();
avatarviewsquare5.VerticalOptions = LayoutOptions.Center;
avatarviewsquare5.HorizontalOptions = LayoutOptions.Center;
avatarviewsquare5.AvatarShape = AvatarShape.Square;
avatarviewsquare5.AvatarSize = AvatarSize.ExtraSmall;
avatarviewsquare5.ContentType = ContentType.Default;
avatarviewsquare5.ImageSource = "ellanaa.png";
mainGrid.Children.Add(XLargeSquarelabel, 4, 1);
mainGrid.Children.Add(avatarviewsquare1, 4, 0);
mainGrid.Children.Add(LargeSquarelabel, 3, 1);
mainGrid.Children.Add(avatarviewsquare2, 3, 0);
mainGrid.Children.Add(MediumSquarelabel, 2, 1);
mainGrid.Children.Add(avatarviewsquare3, 2, 0);
mainGrid.Children.Add(SmallSquarelabel, 1, 1);
mainGrid.Children.Add(avatarviewsquare4, 1, 0);
mainGrid.Children.Add(XSmallSquarelabel, 0, 1);
mainGrid.Children.Add(avatarviewsquare5, 0, 0);
stack.Children.Add(mainGrid);
this.Content = stack;

```

The visual style sample is available in the following link: [Sample](#).

## Customization

The SfAvatarView control provides options to customize the color and size. The control can be customized using the following properties:

### Colors

Color in the SfAvatarView can be customized by the border color, the default background color, and automatic background color.

### Border color

The border color is used for setting color to the border of SfAvatarView using the **BorderColor** property.

### XML

```
<sfavatar:SfAvatarView ContentType="Default"
AvatarShape="Circle"
AvatarSize="Large"
HorizontalOptions="Center"
VerticalOptions="Center"
ImageSource="ellanaa.png"
BorderColor="Red">
</sfavatar:SfAvatarView>
```

### C#

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.ContentType = ContentType.Default;
avatarview.AvatarShape = AvatarShape.Circle;
avatarview.AvatarSize = AvatarSize.Large;
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.ImageSource = "ellanaa.png";
avatarview.BorderColor = Color.Red;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

### Default background color

The background color for the SfAvatarView control can be set using the **AvatarColorMode** property. When the **AvatarColorMode** property is set to default, it displays the background color set in the **BackgroundColor** property.

### XML

```
<sfavatar:SfAvatarView ContentType="Initials"
AvatarShape="Circle"
AvatarSize="Large"
HorizontalOptions="Center"
VerticalOptions="Center"
AvatarName="Alex"
BackgroundColor="Bisque"
AvatarColorMode="Default"
BorderColor="Black">
</sfavatar:SfAvatarView>
```

## C#

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.ContentType = ContentType.Initials;
avatarview.AvatarShape = AvatarShape.Circle;
avatarview.AvatarSize = AvatarSize.Large;
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.AvatarName = "Alex";
avatarview.BorderColor = Color.Black;
avatarview.AvatarColorMode = AvatarColorMode.Default;
avatarview.BackgroundColor = Color.Bisque;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

### Automatic background color

The **SfAvatarView** control allows automatic background color while initializing. It contains the following properties:

- **DarkBackground**: Shows a dark color for the initials and background color.
- **LightBackground**: Shows a light color for the initials and background color.

### Dark color

The dark background color can be set using **DarkBackground** in the **AvatarColorMode** property.

## XML

```
<sfavatar:SfAvatarView ContentType="Initials"  
InitialsType="DoubleCharacter"  
AvatarShape="Circle"  
AvatarSize="Large"  
HorizontalOptions="Center"  
VerticalOptions="Center"  
AvatarName="Alex"  
AvatarColorMode="DarkBackground"  
BorderColor="Black">  
</sfavatar:SfAvatarView>
```

## C#

```
Grid mainGrid = new Grid();  
SfAvatarView avatarview = new SfAvatarView();  
avatarview.VerticalOptions = LayoutOptions.Center;  
avatarview.HorizontalOptions = LayoutOptions.Center;  
avatarview.AvatarShape = AvatarShape.Circle;  
avatarview.AvatarSize = AvatarSize.Large;  
avatarview.ContentType = ContentType.Initials;  
avatarview.InitialsType = InitialsType.DoubleCharacter;  
avatarview.AvatarName = "Alex";  
avatarview.BorderColor = Color.Black;  
avatarview.AvatarColorMode = AvatarColorMode.DarkBackground;  
mainGrid.Children.Add(avatarview);  
this.Content = mainGrid;
```

## Light color

The light background color can be set using `LightBackground` in the `AvatarColorMode` property.

## XML

```
<sfavatar:SfAvatarView ContentType="Initials"  
InitialsType="DoubleCharacter"  
VerticalOptions="Center"  
AvatarName="Alex"  
AvatarShape="Circle"  
AvatarSize="Large"  
AvatarColorMode="LightBackground">
```

```

BorderColor="Black"
HorizontalOptions="Center" >
</sfavatar:SfAvatarView>

```

## C#

```

Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.AvatarShape = AvatarShape.Circle;
avatarview.AvatarSize = AvatarSize.Large;
avatarview.ContentType = ContentType.Initials;
avatarview.InitialsType = InitialsType.DoubleCharacter;
avatarview.AvatarName = "Alex";
avatarview.BorderColor = Color.Black;
avatarview.AvatarColorMode = AvatarColorMode.LightBackground;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;

```

## Gradients

You can also specify a range of colors using **BackgroundGradient** as demonstrated in the following code example.

## XML

```

xmlns:gradient="clr-
namespace:Syncfusion.XForms.Graphics;assembly=Syncfusion.Core.XForms"
.....
<sfavatar:SfAvatarView ContentType="Initials"
AvatarName="Alex"
AvatarShape="Circle"
AvatarSize="Large"
HorizontalOptions="Center"
VerticalOptions="Center"
InitialsType="DoubleCharacter">
<sfavatar:SfAvatarView.BackgroundGradient>
<gradient:SfLinearGradientBrush>
<gradient:SfLinearGradientBrush.GradientStops>
<gradient:SfGradientStop Color="#2F9BDF" Offset="0"/>
<gradient:SfGradientStop Color="#51F1F2" Offset="1"/>

```

```
</gradient:SfLinearGradientBrush.GradientStops>
</gradient:SfLinearGradientBrush>
</sfavatar:SfAvatarView.BackgroundGradient>
</sfavatar:SfAvatarView>
```

## C#

```
using Syncfusion.XForms.Graphics;
.....
SfLinearGradientBrush gradientBrush = new SfLinearGradientBrush();
gradientBrush.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.FromHex("#2F9BDF"), Offset = 0 },
    new SfGradientStop() { Color = Color.FromHex("#51F1F2"), Offset = 1 }
};
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.AvatarShape = AvatarShape.Circle;
avatarview.AvatarSize = AvatarSize.Large;
avatarview.ContentType = ContentType.Initials;
avatarview.InitialsType = InitialsType.DoubleCharacter;
avatarview.AvatarName = "Alex";
avatarview.BorderColor = Color.Black;
avatarview.BackgroundGradient = gradientBrush;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

**Note:** Here, the BackgroundGradient is a type of SfGradientBrush, so you can apply SfLinearGradientBrush on it. This SfLinearGradientBrush is available in [Syncfusion.Xamarin.Core](#) from [nuget.org](#). To know more about gradient view, refer to this [documentation](#).

## Sizing

In the SfAvatarView control, size of the view can be controlled using width, height, border width, and corner radius.

### Width

You can customize the width of the avatar view using the `WidthRequest` property.

### Height

You can customize the height of the avatar view using the `HeightRequest` property.

### Border width

You can customize the thickness of the avatar view using the `BorderWidth` property.

### XML

```
<sfavatar:SfAvatarView ContentType="Default"
AvatarShape="Circle"
AvatarSize="Large"
ImageSource="ellanaa.png"
BorderColor="Red"
VerticalOptions="Center"
BorderWidth="4"
HorizontalOptions="Center" >
</sfavatar:SfAvatarView>
```

### C#

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.AvatarShape = AvatarShape.Circle;
avatarview.AvatarSize = AvatarSize.Large;
avatarview.BorderWidth = 4;
avatarview.ContentType = ContentType.Default;
avatarview.ImageSource = "ellanaa.png";
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

### Corner radius

You can customize the corner radius of the avatar view using the `CornerRadius` property.

### XML

```
<sfavatar:SfAvatarView ContentType="Default"
ImageSource="ellanaa.png"
HorizontalOptions="Center"
VerticalOptions="Center"
WidthRequest="60"
HeightRequest="60"
CornerRadius="20">
</sfavatar:SfAvatarView>
```

**C#**

```
Grid mainGrid = new Grid();
SfAvatarView avatarview = new SfAvatarView();
avatarview.HorizontalOptions = LayoutOptions.Center;
avatarview.VerticalOptions = LayoutOptions.Center;
avatarview.WidthRequest = 60;
avatarview.HeightRequest = 60;
avatarview.CornerRadius = 20;
avatarview.ImageSource = "ellanaa.png";
avatarview.ContentType = ContentType.Default;
mainGrid.Children.Add(avatarview);
this.Content = mainGrid;
```

**How to****Set badge view to avatar**

The **SfAvatarView** control provides support for **BadgeView** to notify users of new or unread messages, notifications, or the status of something.

**XML**

```
xmlns:badge="clr-
namespace:Syncfusion.XForms.BadgeView;assembly=Syncfusion.SfBadgeView.XForms
"
.....
<badge:SfBadgeView VerticalOptions="Center"
HorizontalOptions="Center">
<badge:SfBadgeView.Content>
<sfavatar:SfAvatarView HorizontalOptions="Center"
ContentType="Custom"
ImageSource="alex.png"
VerticalOptions="Center"
```

```
WidthRequest="60"  
HeightRequest="60"  
CornerRadius="30">  
</sfavatar:SfAvatarView>  
</badge:SfBadgeView.Content>  
<badge:SfBadgeView.BadgeSettings>  
<badge:BadgeSetting Offset="-10,-10"  
BadgeAnimation="Scale"  
BadgePosition="BottomRight"  
BadgeType="Success"  
BadgeIcon="Away"/>  
</badge:SfBadgeView.BadgeSettings>  
</badge:SfBadgeView>
```

## C#

```
using Syncfusion.XForms.BadgeView;  
.....  
SfBadgeView badge = new SfBadgeView();  
badge.HorizontalOptions = LayoutOptions.Center;  
badge.VerticalOptions = LayoutOptions.Center;  
badge.BadgeSettings = new BadgeSetting();  
BadgeSetting badgeSetting = new BadgeSetting();  
badgeSetting.BadgeType = BadgeType.Success;  
badgeSetting.BadgeIcon = BadgeIcon.Available;  
badgeSetting.BadgePosition = BadgePosition.BottomRight;  
badgeSetting.BadgeAnimation = BadgeAnimation.Scale;  
badgeSetting.Offset = new Point(-10, -10);  
badge.BadgeSettings = badgeSetting;  
Grid mainGrid = new Grid();  
SfAvatarView avatarview = new SfAvatarView();  
avatarview.HorizontalOptions = LayoutOptions.Center;  
avatarview.VerticalOptions = LayoutOptions.Center;  
avatarview.WidthRequest = 60;  
avatarview.HeightRequest = 60;  
avatarview.CornerRadius = 30;  
avatarview.ImageSource = "alex.png";  
avatarview.ContentType = ContentType.Custom;  
badge.Content = avatarview;  
mainGrid.Children.Add(badge);  
this.Content = mainGrid;
```

---

**Note:** The SfBadgeView is available in [Syncfusion.Xamarin.SfBadgeView](#) from [nuget.org](#). To know more about SfBadgeView view, refer to this [documentation](#).

---

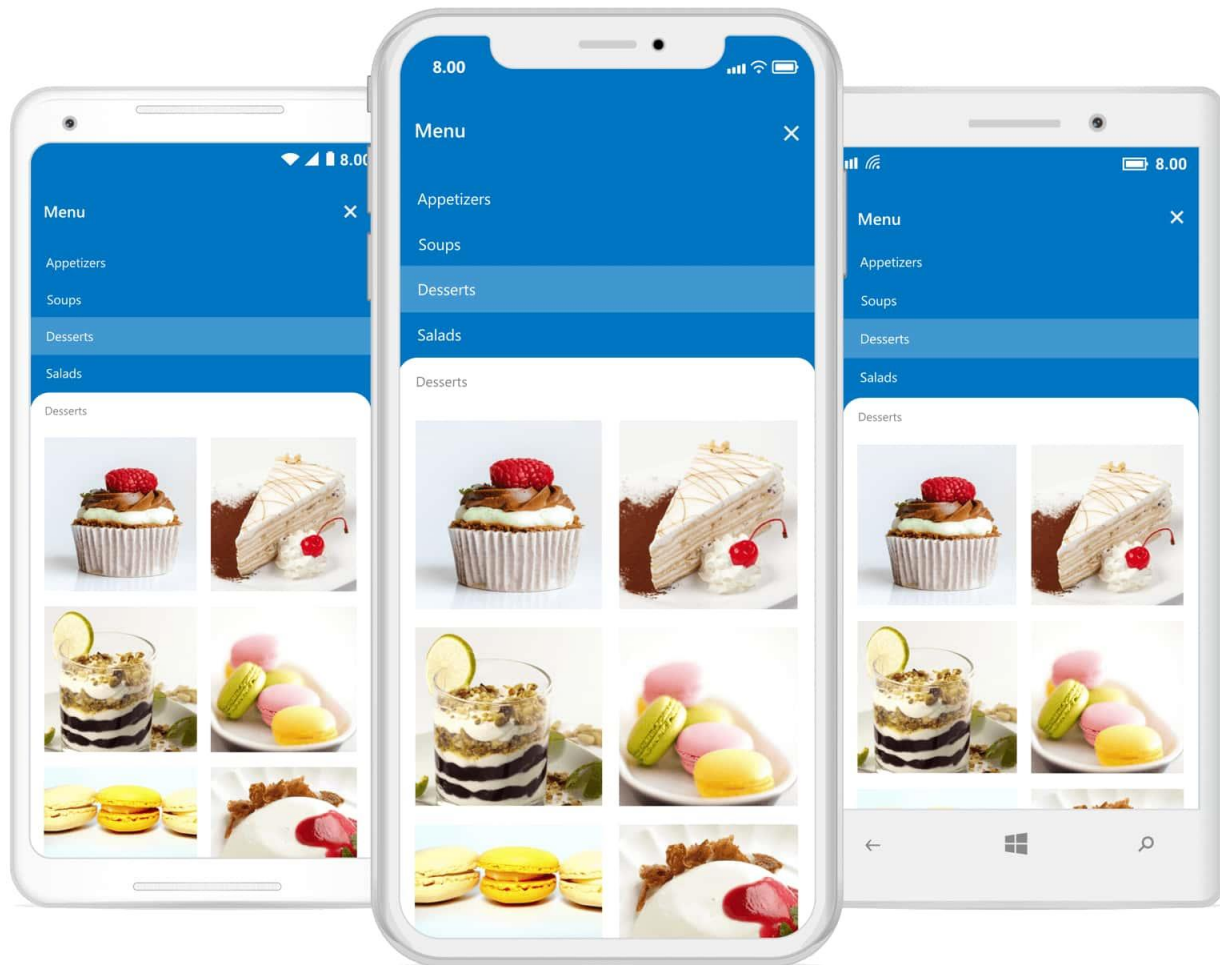

## SfBackdropPage

### Overview

The backdrop page is composed of two surfaces, a back layer and a front layer. The back layer holds actionable content (like navigation or filtration), which is relevant to the front layer.

### Key features

- Allows to add with [NavigationPage](#) and supports seamless navigation and toolbar customizations.
- Adjusts the height of back layer automatically based on its content and provides an option to expand the content to fit the screen.
- Supports curved and flat edge shapes for the front layer with corner radius customization options.
- Provides smooth animations for revealing and concealing the back layer content.
- Allows users to customize the icons of navigation header in the revealed and closed states separately.

## Getting Started

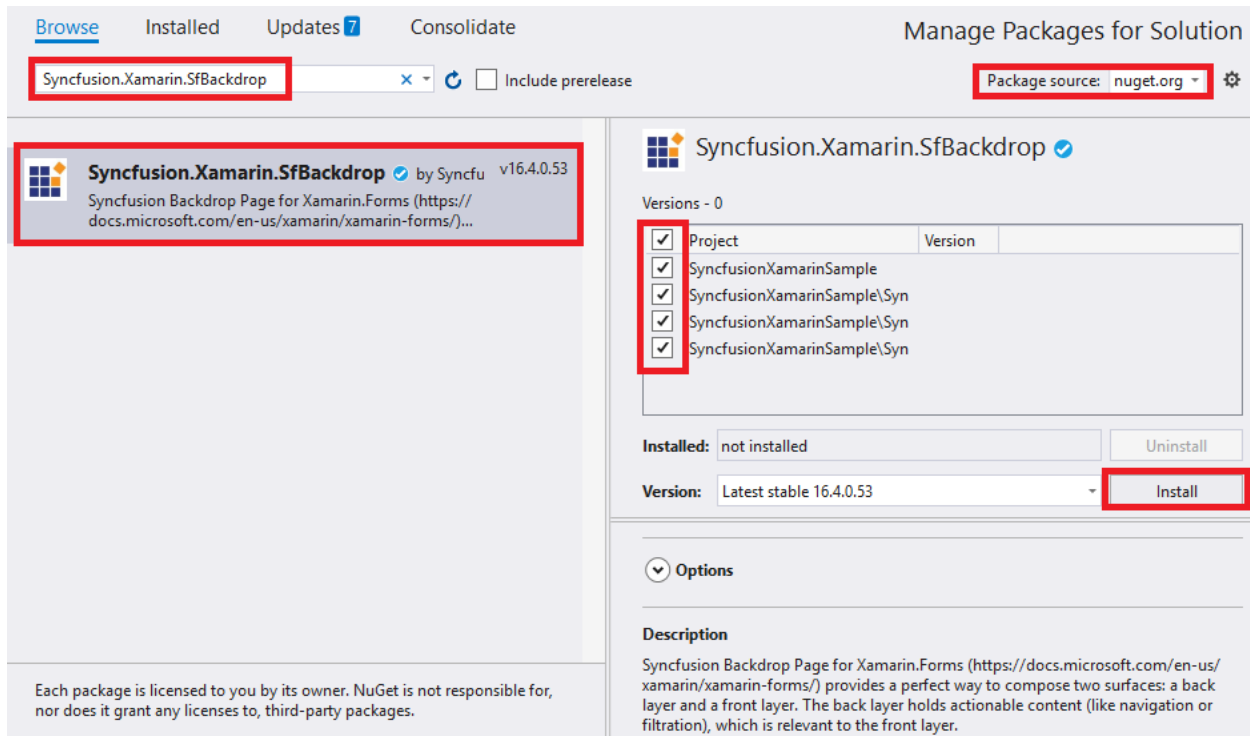

This section explains the steps required to configure the backdrop page.

### Adding SfBackdropPage reference

You can add SfBackdropPage reference using one of the following methods:

#### Method 1: Adding SfBackdropPage reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfBackdropPage to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfBackdrop](https://nuget.org/packages/Syncfusion.Xamarin.SfBackdrop), and then install it.

**Note:** Install the same version of SfBackdropPage NuGet in all the projects.

### Method 2: Adding SfBackdropPage reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfBackdropPage control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfBackdropPage assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfBackdrop.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfBackdrop.XForms.Android.dll Syncfusion.SfBackdrop.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfBackdrop.XForms.iOS.dll Syncfusion.SfBackdrop.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll

UWP	Syncfusion.SfBackdrop.XForms.UWP.dll Syncfusion.SfBackdrop.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
-----	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launch an application on each platform with backdrop page

To use the backdrop page inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and are discussed in the following sections:

**Note:** If you are adding the references from toolbox, below steps are not needed.

#### iOS

To launch the backdrop page in iOS, call the `SfBackdropPageRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    SfBackdropPageRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### Universal Windows Platform (UWP)

To deploy the backdrop page in **Release** mode, initialize the backdrop page assemblies in the `App.xaml.cs` file in the UWP project as demonstrated in the following code sample.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        assembliesToInclude.Add(typeof(SfBackdropPageRenderer).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
}
```

```
}
...
}
```

### Android

Android platform does not require any additional configuration to render the backdrop page.

### Initialize backdrop page

Create a page and import the SfBackdropPage namespace along with [XAML namespaces](#) in Xamarin.Forms.

### XML

```
<?xml version="1.0" encoding="UTF-8"?>
<backdrop:SfBackdropPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:backdrop="clr-
namespace:Syncfusion.XForms.Backdrop;assembly=Syncfusion.SfBackdrop.XForms"
x:Class="BackdropGettingStarted.BackdropSamplePage"
Title="Menu">
</backdrop:SfBackdropPage>
```

### C#

```
using Syncfusion.XForms.Backdrop;
namespace BackdropGettingStarted
{
    public partial class BackdropSamplePage : SfBackdropPage
    {
        public BackdropSamplePage ()
        {
            InitializeComponent();
            this.Title = "Menu";
        }
    }
}
```

### NOTE

[Title](#) and [ToolBarItems](#) properties of the [Page](#) can be used to customize the appearance of header.

### Configure header

Page header for the backdrop appears only when adding backdrop as a child of NavigationPage. To know more about it, refer to [header configuration](#).

### Add back layer content

The back layer holds actionable content (navigation or filtration), which is relevant to the front layer. The back layer will either fill the entire background or occupy the background based on the content height.

### XML

```
<backdrop:SfBackdropPage.BackLayer>
<backdrop:BackdropBackLayer>
```

```

<StackLayout>
  <ListView>
    <ListView.ItemsSource>
      <x:Array Type="{x:Type x:String}">
        <x:String>Appetizers</x:String>
        <x:String>Soups</x:String>
        <x:String>Desserts</x:String>
        <x:String>Salads</x:String>
      </x:Array>
    </ListView.ItemsSource>
  </ListView>
</StackLayout>
</backdrop:BackdropBackLayer>
</backdrop:SfBackdropPage.BackLayer>

```

**C#**

```

this.BackLayer = new BackdropBackLayer
{
    Content = new StackLayout
    {
        Children =
        {
            new ListView
            {
                ItemsSource = new string[] { "Appetizers", "Soups", "Desserts", "Salads" }
            }
        }
    };

```

**Add front layer content**

The front layer always appears in front of the back layer. It is displayed to the full width and holds primary content.

**XML**

```

<backdrop:SfBackdropPage.FrontLayer>
  <backdrop:BackdropFrontLayer>
    <Grid BackgroundColor="WhiteSmoke" VerticalOptions="FillAndExpand" />
  </backdrop:BackdropFrontLayer>
</backdrop:SfBackdropPage.FrontLayer>

```

**C#**

```

this.FrontLayer = new BackdropFrontLayer()
{
    Content = new Grid
    {
        BackgroundColor = Color.WhiteSmoke,
        VerticalOptions = LayoutOptions.FillAndExpand
    }
};

```

### Reveal and conceal the back layer

The following options are provided in backdrop to reveal and conceal the back layer:

- **Programmatically** - Reveals back layer by setting the [IsBackLayerRevealed](#) property to true. By default, it is set to false.
- **Touch interaction** - Reveals back layer by clicking the tool bar icon at the top-right corner of navigation bar header. The Hamburger (or menu ) icon reveals and the Close icon conceals the back layer. When adding the backdrop as a child of MasterDetailPage, the Hamburger and Close icons will be replaced by expand (or down arrow) and collapse (or up arrow) icons, respectively.
- **Swipe or fling action** - Reveals back layer by swipe/fling action on the front layer to the required direction. Swipe downwards to reveal, and swipe upwards to conceal the back layer. The swipe/fling action will be handled only on the top of the front layer to the [RevealedHeight](#).

To know more information about reveal height customization ,refer this [link](#).

**XML**

```
<backdrop:SfBackdropPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:backdrop="clr-
namespace:Syncfusion.XForms.Backdrop;assembly=Syncfusion.SfBackdrop.XForms"
x:Class="BackdropGettingStarted.BackdropSamplePage"
IsBackLayerRevealed="True">
</backdrop:SfBackdropPage>
```

**C#**

```
#region Constructor
public BackdropSamplePage ()
{
    this.IsBackLayerRevealed = true;
}
#endregion
```

You can find the complete getting started sample from this [link](#).

**Corner Shape Customization**

Backdrop allows to customize the shapes on the top corners of the front layer. Curved and cut (flat) shape options are available , it can be switched by setting [EdgeShape](#) property of the front layer.

**NOTE**

The backdrop can only be shaped on the top left and top right corners.

Both the side of the corner radius can be customized separately by setting [LeftCornerRadius](#) and [RightCornerRadius](#) properties of [BackdropFrontLayer](#).

**XML**

```
<backdrop:SfBackdropPage.FrontLayer>
<backdrop:BackdropFrontLayer LeftCornerRadius="30" RightCornerRadius="0"
EdgeShape="Flat">
<Grid />
</backdrop:BackdropFrontLayer>
</backdrop:SfBackdropPage.FrontLayer>
```

**C#**

```

this.FrontLayer = new BackdropFrontLayer()
{
    Content = new Grid(),
    LeftCornerRadius = 30,
    RightCornerRadius = 0,
    EdgeShape = EdgeShape.Flat
};

```

## Reveal Height Customization

When revealing the [back layer](#), the front layer will be moved downwards. By setting the [BackLayerRevealOption](#) property of backdrop, you can customize how far the front layer can be moved from the header when revealing the back layer.

The following options are provided to move the front layer:

[Fill](#) – Moves the front layer downwards to the entire height of the page excluding the [RevealedHeight](#).

[Auto](#) – Moves the front layer downwards to the height of the back layer content.

**XML**

```

<?xml version="1.0" encoding="UTF-8"?>
<backdrop:SfBackdropPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:backdrop="clr-
namespace:Syncfusion.XForms.Backdrop;assembly=Syncfusion.SfBackdrop.XForms"
x:Class="BackdropGettingStarted.BackdropSamplePage"
BackLayerRevealOption="Auto">
  <backdrop:SfBackdropPage.FrontLayer>
    <backdrop:BackdropFrontLayer>
      <Grid />
    </backdrop:BackdropFrontLayer>
  </backdrop:SfBackdropPage.FrontLayer>
</backdrop:SfBackdropPage>

```

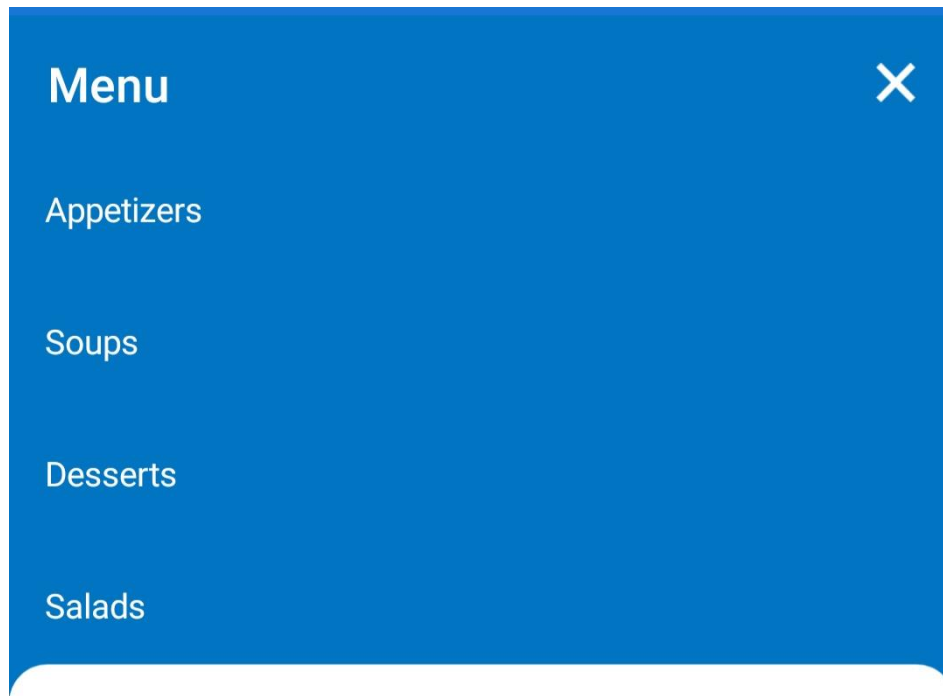

**C#**

```

using Syncfusion.XForms.Backdrop;
namespace BackdropGettingStarted
{
    public class BackdropSamplePage : SfBackdropPage
    {
        public BackdropSamplePage()
        {
            this.BackLayerRevealOption = RevealOption.Auto;
            this.FrontLayer = new BackdropFrontLayer()
            {
                Content = new Grid()
            };
        }
    }
}

```

## Events

### BackLayerStateChanged event

The **BackLayerStateChanged** event occurs when the backdrop page back layer is revealed and concealed. The event occurs in the cases mentioned in this [documentation](#).

### XML

```
<?xml version="1.0" encoding="UTF-8"?>
<backdrop:SfBackdropPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:backdrop="clr-
namespace:Syncfusion.XForms.Backdrop;assembly=Syncfusion.SfBackdrop.XForms"
x:Class="BackdropGettingStarted.MainPage"
Title="Menu"
BackLayerStateChanged="BackLayerStateChanged" >
```

### C#

```
public MainPage()
{
    InitializeComponent();
    this.BackLayerStateChanged += BackLayerStateChanged;
}
private void BackLayerStateChanged(object sender, System.EventArgs e)
{
    // handle event action.
}
```

## Header Configuration

Add backdrop page as a children of [NavigationPage](#) in App.xaml.cs class. Also, [BarBackgroundColor](#), [BarTextColor](#) and other properties of [NavigationPage](#) can be set to customize the default appearance of header.

### C#

```
// In App.xaml.cs
#region Constructor
public App()
{
    ...
    MainPage = new NavigationPage(new BackdropSamplePage());
    ...
}
#endregion
```

## NOTE

Page header for the backdrop will appear only when adding backdrop as a children of [NavigationPage](#).

### Icon customization

The default icons in the navigation header can be customized using the following ways:

*Default icons in NavigationPage*

When the backdrop page contained within the [NavigationPage](#), hamburger icon and close icon (X mark) will be used by default.

**Default icon in closed state****Default icon in revealed state***Default icons in MasterDetailsPage*

When the backdrop page placed in the [MasterDetailPage](#), down arrow icon and up arrow icon will be used by default.

**Default icon in closed state****Default icon in revealed state***Custom icons*

You can customize the default icons in the navigation header by setting the `OpenIcon` and `CloseIcon` properties in `SfBackdropPage`.

**XML**

```
<?xml version="1.0" encoding="UTF-8"?>
<backdrop:SfBackdropPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:backdrop="clr-
namespace:Syncfusion.XForms.Backdrop;assembly=Syncfusion.SfBackdrop.XForms"
x:Class="BackdropGettingStarted.BackdropSamplePage"
OpenIcon="open.png"
CloseIcon="close.png">
</backdrop:SfBackdropPage>
```

**C#**

```
using Syncfusion.XForms.Backdrop;
namespace BackdropGettingStarted
{
    public partial class BackdropSamplePage : SfBackdropPage
    {
        public BackdropSamplePage()
        {
            InitializeComponent();
            this.OpenIcon = "open.png";
            this.CloseIcon = "close.png";
        }
    }
}
```

```
}
```

### Custom icon in closed state

### Custom icon in revealed state

## SfBadgeView

### Overview

Badges are used to notify users of new or unread messages, notifications, or the status of something.

### Key features

**Position** : Position the badge text around the badge content.

**Predefined styles**: Customize the badge background with predefined colors.

**Animation**: Use animations for badge text.

**Predefined symbols**: The Badge View control provides predefined notification symbols such as available, busy, away, and delete.

## Getting Started

This section explains the steps required to configure the [SfBadgeView](#) control and customize its elements.

### Adding SfBadgeView reference

You can add SfBadgeView reference using one of the following methods:

#### Method 1: Adding SfBadgeView reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfBadgeView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfBadgeView](#), and then install it.

![Adding SfBadgeView reference from nuget](getting-started\_images/Adding SfBadgeView reference.png)

---

**Note:** Install the same version of SfBadgeView NuGet in all the projects.

---

#### Method 2: Adding SfBadgeView reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfBadgeView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfBadgeView assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfBadgeView.XForms.dll Syncfusion.Core.XForms.dll
Android	Syncfusion.SfBadgeView.XForms.dll Syncfusion.SfBadgeView.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll
iOS	Syncfusion.SfBadgeView.XForms.dll Syncfusion.SfBadgeView.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll
UWP	Syncfusion.SfBadgeView.XForms.dll Syncfusion.SfBadgeView.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the application on each platform with badge view

To use the badge view in an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the badge view in iOS, call the SfBadgeViewRenderer.Init() in the FinishedLaunching overridden method of the AppDelegate class after the Xamarin.Forms framework has been initialized and before the LoadApplication is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init();
}
```

```
// Add the below line if you are using SfBadgeView.
Syncfusion.XForms.iOS.BadgeView.SfBadgeViewRenderer.Init();
LoadApplication(new App());
...
}
```

### Universal Windows Platform (UWP)

You need to initialize the badge view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with badge view in **Release** mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        // Add the below line if you are using SfBadgeView.
        assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.BadgeView.SfBadgeViewRe
        nderer).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
    ...
}
```

### Android

The Android platform does not require any additional configuration to render the badge view.

#### Adding namespace

Add the following namespace.

#### XML

```
xmlns:badge="clr-
namespace:Syncfusion.XForms.BadgeView;assembly=Syncfusion.SfBadgeView.XForms
"
```

#### C#

```
using Syncfusion.XForms.BadgeView;
```

#### Initializing badge view

Create an instance for the badge view control, and add it as content.

#### XML

```
<badge:SfBadgeView>
</badge:SfBadgeView>
```

#### C#

```
//Initializing the badge view.  
SfBadgeView sfBadgeView = new SfBadgeView();  
Content = sfBadgeView;
```

### Adding badge text

You can add text to badge view using the [BadgeText](#) property.

#### XML

```
<badge:SfBadgeView>  
<badge:SfBadgeView BadgeText="20" />  
</badge:SfBadgeView>
```

#### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();  
//Adding text to the badge view.  
sfBadgeView.BadgeText = "20";  
Content = sfBadgeView;
```

### Adding content

You can add an image, button, or label to the badge view using the [Content](#) property.

#### XML

```
<badge:SfBadgeView HorizontalOptions="Center" VerticalOptions="Center" >  
<badge:SfBadgeView.Content>  
<Button Text="Primary" WidthRequest="120" HeightRequest="60"/>  
</badge:SfBadgeView.Content>  
</badge:SfBadgeView>
```

#### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();  
sfBadgeView.HorizontalOptions = LayoutOptions.Center;  
sfBadgeView.VerticalOptions = LayoutOptions.Center;  
//Adding image to the content of the badge view.  
Button button = new Button();  
button.Text = "Primary";  
button.WidthRequest = 120;  
button.HeightRequest = 60;  
sfBadgeView.Content = button;  
Content = sfBadgeView;
```

The following code sample gives you the complete code for badge view with badge types and text.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:badge="clr-
namespace:Syncfusion.XForms.BadgeView;assembly=Syncfusion.SfBadgeView.XForms
">
<badge:SfBadgeView HorizontalOptions="Center" VerticalOptions="Center"
BadgeText="20">
<badge:SfBadgeView.Content>
<Button Text="Primary" WidthRequest="120" HeightRequest="60"/>
</badge:SfBadgeView.Content>
</badge:SfBadgeView>
</ContentPage>
```

### C#

```
using Xamarin.Forms;
using Syncfusion.XForms.BadgeView;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBadgeView sfBadgeView = new SfBadgeView();
            sfBadgeView.HorizontalOptions = LayoutOptions.Center;
            sfBadgeView.VerticalOptions = LayoutOptions.Center;
            sfBadgeView.BadgeText = "20";
            //Adding image to the content of the badge view.
            Button button = new Button();
            button.Text = "Primary";
            button.WidthRequest = 120;
            button.HeightRequest = 60;
            sfBadgeView.Content = button;
            Content = sfBadgeView;
        }
    }
}
```

The following screenshot illustrates the result of the above code sample.

You can find the complete getting started sample from this [link](#).

### Badge Settings

The [BadgeSettings](#) property helps you customize the basic look and feel of the badge view.

[BadgeSettings](#) contains the sub elements such as badge types, positions, icons, colors, and alignments. You can customize the background color, text color, stroke color, width, offset, and font attributes.

### Font customization

The font can be customized using the [FontSize](#), [FontAttributes](#), and [FontFamily](#) properties.

### XML

```
<badge:SfBadgeView BadgeText="48" HorizontalOptions="Center"
VerticalOptions="Center">
  <badge:SfBadgeView.Content>
    <Button Text ="Primary" WidthRequest="120" HeightRequest="60" />
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting FontSize="15" FontAttributes="Bold">
      <badge:BadgeSetting.FontFamily>
        <OnPlatform x:TypeArguments="x:String" iOS="Chalkduster" Android="serif"
WinPhone="Chiller" />
      </badge:BadgeSetting.FontFamily>
    </badge:BadgeSetting>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
sfBadgeView.BadgeText = "48";
Button button = new Button();
button.Text = "Primary";
button.WidthRequest = 120;
button.HeightRequest = 60;
sfBadgeView.Content = button;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.FontAttributes = FontAttributes.Bold;
```

```

badgeSetting.FontSize = 15;
badgeSetting.FontFamily = Device.RuntimePlatform == Device.iOS ?
"Chalkduster" : Device.RuntimePlatform == Device.Android ? "serif" :
"Chiller";
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;

```

### Stroke customization

The stroke color and stroke width of the badge view can be customized using the [Stroke](#) and [StrokeWidth](#) properties, respectively.

### XML

```

<badge:SfBadgeView BadgeText="30" HorizontalOptions="Center"
VerticalOptions="Center">
  <badge:SfBadgeView.Content>
    <Button Text ="Primary" WidthRequest="120" HeightRequest="60"/>
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting Stroke="Orange" StrokeWidth="2" />
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>

```

### C#

```

SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.BadgeText = "30";
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
Button button = new Button();
button.Text = "Primary";
button.WidthRequest = 120;
button.HeightRequest = 60;
sfBadgeView.Content = button;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.Stroke = Color.Orange;
badgeSetting.StrokeWidth = 2;
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;

```

### Text customization

The text color and margin of badge view can be changed using the [TextColor](#) and [TextPadding](#) properties, respectively.

### XML

```
<badge:SfBadgeView BadgeText="45" HorizontalOptions="Center"
VerticalOptions="Center">
  <badge:SfBadgeView.Content>
    <Button Text="Primary" WidthRequest="120" HeightRequest="60"/>
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting TextColor="LightYellow" TextPadding="10"/>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
sfBadgeView.BadgeText = "45";
Button button = new Button();
button.WidthRequest = 120;
button.HeightRequest = 60;
button.Text = "Primary";
sfBadgeView.Content = button;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.TextColor = Color.LightYellow;
badgeSetting.TextPadding = 10;
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;
```

### Predefined styles

You can change the colors of the badge using the [BadgeType](#) property. The badge supports the following eight different essential colors for various situations:

- Dark
- Error
- Info
- Light
- Primary
- Secondary
- Success
- Warning

### XML

```
<badge:SfBadgeView BadgeText="8" HorizontalOptions="Center"
VerticalOptions="Center">
  <badge:SfBadgeView.Content>
    <Image Source="BadgeFacebook.png" HeightRequest="70" WidthRequest="60"/>
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting BadgeType="Error" Offset="-5,10"/>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
sfBadgeView.BadgeText = "8";
Image image = new Image();
image.Source = "BadgeFacebook.png";
image.HeightRequest = 70;
image.WidthRequest = 60;
sfBadgeView.Content = image;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.BadgeType = BadgeType.Error;
badgeSetting.Offset = new Point(-5, 10);
```

```
sfBadgeView.BadgeSettings = badgeSetting;  
Content = sfBadgeView;
```

### Badge background customization

Set the [BadgeType](#) to **None**. You can customize the color of the badge view using the [BackgroundColor](#) property.

#### XML

```
<badge:SfBadgeView BadgeText="48" HorizontalOptions="Center"  
VerticalOptions="Center" >  
  <badge:SfBadgeView.Content>  
    <Button Text="Primary" WidthRequest="120" HeightRequest="60"/>  
  </badge:SfBadgeView.Content>  
  <badge:SfBadgeView.BadgeSettings>  
    <badge:BadgeSetting BadgeType="None" BackgroundColor="Green" />  
  </badge:SfBadgeView.BadgeSettings>  
</badge:SfBadgeView>
```

#### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();  
sfBadgeView.HorizontalOptions = LayoutOptions.Center;  
sfBadgeView.VerticalOptions = LayoutOptions.Center;  
sfBadgeView.BadgeText = "48";  
Button button = new Button();  
button.Text = "Primary";  
button.HeightRequest = 60;  
button.WidthRequest = 120;  
sfBadgeView.Content = button;  
BadgeSetting badgeSetting = new BadgeSetting();  
badgeSetting.BadgeType = BadgeType.None;  
badgeSetting.BackgroundColor = Color.Green;  
sfBadgeView.BadgeSettings = badgeSetting;  
Content = sfBadgeView;
```

Setting corner radius of the badge

The [CornerRadius](#) property is used to reduce the radius of the corners.

#### **XML**

```
<badge:SfBadgeView BadgeText="100" HorizontalOptions="Center"
VerticalOptions="Center" >
  <badge:SfBadgeView.Content>
    <Button Text ="Primary" WidthRequest="120" HeightRequest="60"/>
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting CornerRadius="5"/>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

#### **C#**

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
sfBadgeView.BadgeText = "100";
Button button = new Button();
button.Text = "Primary";
button.HeightRequest = 60;
button.WidthRequest = 120;
sfBadgeView.Content = button;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.CnerRadius = 5;
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;
```

### Alignment of badge

You can align the badge view using the **Center**, **Start**, and **End** properties of [BadgeAlignment](#) property.

#### XML

```
<badge:SfBadgeView BadgeText="20" HorizontalOptions="Center"
VerticalOptions="Center" >
  <badge:SfBadgeView.Content>
    <Label Text="START" BackgroundColor="LightGray"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center"
WidthRequest="100" HeightRequest="60" TextColor="Black" />
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting BadgeAlignment="Center" CornerRadius="0"/>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

#### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
sfBadgeView.BadgeText = "20";
Label label = new Label();
label.Text = "START";
label.HeightRequest = 60;
label.WidthRequest = 100;
label.BackgroundColor = Color.LightGray;
label.HorizontalTextAlignment = TextAlignment.Center;
label.VerticalTextAlignment = TextAlignment.Center;
label.TextColor = Color.Black;
sfBadgeView.Content = label;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.BadgeAlignment = BadgeAlignment.Start;
badgeSetting.CornerRadius = 0;
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;
```

### Position customization

The default position of notification is **TopRight**. You can change the position to the **TopLeft**, **BottomLeft**, and **BottomRight** using the [BadgePosition](#) properties.

#### XML

```
<badge:SfBadgeView BadgeText="NEW" HorizontalOptions="Center"
VerticalOptions="Center">
  <badge:SfBadgeView.Content>
    <Button Text="Primary" WidthRequest="120" HeightRequest="60"/>
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting BadgePosition="TopRight"/>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

#### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
sfBadgeView.BadgeText = "NEW";
Button button = new Button();
button.Text = "Primary";
button.WidthRequest = 120;
button.HeightRequest = 60;
sfBadgeView.Content = button;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.BadgePosition = BadgePosition.TopRight;
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;
```

### Setting badge offset

You can adjust the badge text using the [Offset](#) property.

**XML**

```
<badge:SfBadgeView BadgeText="8" HorizontalOptions="Center"
VerticalOptions="Center">
  <badge:SfBadgeView.Content>
    <Image Source="BadgeImage9.png" HeightRequest="70" WidthRequest="60"/>
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting BadgeType="Success" Offset="-5,-10"
BadgePosition="BottomRight"/>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

**C#**

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
sfBadgeView.BadgeText = "8";
Image image = new Image();
image.Source = "BadgeImage9.png";
image.HeightRequest = 70;
image.WidthRequest = 60;
sfBadgeView.Content = image;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.BadgeType = BadgeType.Success;
badgeSetting.BadgePosition = BadgePosition.BottomRight;
badgeSetting.Offset = new Point(-5, -10);
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;
```

**Predefined symbols**

You can change the badge icon using the [Badgelcon](#) property. Badge icons will be visible, when you won't set the badge text. The badge supports the following types of [Badgelcon](#):

- Add
- Available
- Away
- Busy
- Delete

- Dot
- None
- Prohibit1
- Prohibit2

### XML

```
<badge:SfBadgeView HorizontalOptions="Center" VerticalOptions="Center" >
  <badge:SfBadgeView.Content>
    <Image Source="BadgeImage9.png" HeightRequest="70" WidthRequest="60"/>
  </badge:SfBadgeView.Content>
  <badge:SfBadgeView.BadgeSettings>
    <badge:BadgeSetting BadgeType="Warning" Offset="0, -10"
      BadgePosition="BottomRight" BadgeIcon="Away"/>
  </badge:SfBadgeView.BadgeSettings>
</badge:SfBadgeView>
```

### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();
sfBadgeView.HorizontalOptions = LayoutOptions.Center;
sfBadgeView.VerticalOptions = LayoutOptions.Center;
Image image = new Image();
image.Source = "BadgeImage9.png";
image.HeightRequest = 70;
image.WidthRequest = 60;
sfBadgeView.Content = image;
BadgeSetting badgeSetting = new BadgeSetting();
badgeSetting.BadgeType = BadgeType.Warning;
badgeSetting.BadgeIcon = BadgeIcon.Away;
badgeSetting.BadgePosition = BadgePosition.BottomRight;
badgeSetting.Offset = new Point(0, -10);
sfBadgeView.BadgeSettings = badgeSetting;
Content = sfBadgeView;
```

Away

Available

Add

Busy

Delete

Dot

Prohibit1

Prohibit2

## Animation

You can enable or disable the animation of the badge text using `Scale` or `None` properties of [BadgeAnimation](#) property. You can see the animation when we change the badge text.

### XML

```
<badge:SfBadgeView HorizontalOptions="Center" BadgeText="6"  
VerticalOptions="Center">  
  <badge:SfBadgeView.Content>  
    <Image Source="BadgeFacebook.png" HeightRequest="70" WidthRequest="70" />  
  </badge:SfBadgeView.Content>  
  <badge:SfBadgeView.BadgeSettings>  
    <badge:BadgeSetting BadgeType="Error" BadgeAnimation="Scale" Offset="-12,6"  
      BadgePosition="TopRight" />  
  </badge:SfBadgeView.BadgeSettings>  
</badge:SfBadgeView>
```

### C#

```
SfBadgeView sfBadgeView = new SfBadgeView();  
sfBadgeView.HorizontalOptions = LayoutOptions.Center;  
sfBadgeView.VerticalOptions = LayoutOptions.Center;  
sfBadgeView.BadgeText = "6";  
Image image = new Image();  
image.Source = "BadgeFacebook.png";  
image.HeightRequest = 70;  
image.WidthRequest = 70;  
sfBadgeView.Content = image;  
BadgeSetting badgeSetting = new BadgeSetting();  
badgeSetting.BadgeType = BadgeType.Error;  
badgeSetting.BadgeAnimation = BadgeAnimation.Scale;  
badgeSetting.Offset = new Point(-12, 6);  
badgeSetting.BadgePosition = BadgePosition.TopRight;  
sfBadgeView.BadgeSettings = badgeSetting;  
Content = sfBadgeView;
```

## SfBarcode

### OVERVIEW

**Essential Barcode** for Xamarin.Forms provides a perfect approach to encode texts using supported symbol types that comprises one dimensional barcodes and two dimensional barcodes. The basic structure of a barcode consists of one or more data characters, optionally one or two check characters, a start pattern as well as a stop pattern.

### Getting Started

This section explains how to configure a Barcode for Xamarin.Forms application. The following screenshot illustrates the final output of barcode on iOS, Android and Windows Phone devices.

To get started with Essential Barcode, go through the following steps.

#### Adding SfBarcode reference

You can add SfBarcode reference using one of the following methods:

##### Method 1: Adding SfBarcode reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](http://nuget.org). To add SfBarcode to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfBarcode](#), and then install it.

![Adding SfBarcode reference from nuget](Getting-Started\_images/getting-started/Adding SfBarcode reference.png)

---

**Note:** Install the same version of SfBarcode NuGet in all the projects.

---

##### Method 2: Adding SfBarcode reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfBarcode control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

##### Method 3: Adding SfBarcode assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfBarcode.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfBarcode.Android.dll Syncfusion.SfBarcode.XForms.Android.dll Syncfusion.SfBarcode.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfBarcode.iOS.dll Syncfusion.SfBarcode.XForms.iOS.dll Syncfusion.SfBarcode.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfBarcode.UWP.dll Syncfusion.SfBarcode.XForms.UWP.dll Syncfusion.SfBarcode.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** If you are adding the references from toolbox, this step is not needed.

Currently an additional step is required for Windows Phone and iOS projects. Create an instance of the Barcode custom renderer as mentioned.

Create an instance of `SfBarcodeRenderer` in MainPage constructor in of the Windows Phone project as shown

### C#

```
public MainPage ()
{
    ...
    new SfBarcodeRenderer();
    InitializeComponent();
    ...
}
```

Similarly, create an instance of `SfBarcodeRenderer` in Finished Launching overridden method of `AppDelegate` class in iOS Project as follows.

#### C#

```
public override bool Finished Launching (UIApplication app, NSDictionary options)
{
    ...
    new SfBarcodeRenderer ();
    return base.FinishedLaunching(app, options);
    ...
}
```

#### Configure the Barcode control

You can configure the Barcode control entirely in C# code or by using the XAML markup.

Here, the following steps illustrates how to create and configure a barcode.

1. Add reference to SfBarcode such as follows.

#### XML

```
xmlns:syncfusion="clr-namespace:Syncfusion.SfBarcode.XForms;assembly=Syncfusion.SfBarcode.XForms"
```

#### C#

```
using Syncfusion.SfBarcode.XForms;
```

2. Create an instance of `SfBarcode` in XAML or code-behind using the reference of `SfBarcode`.

#### XML

```
<syncfusion:SfBarcode/>
```

#### C#

```
SfBarcode barcode = new SfBarcode();
```

3. Then, you can assign the text that you want to encode.

#### XML

```
<syncfusion:SfBarcode Text="http://www.syncfusion.com"/>
```

#### C#

```
barcode.Text = " http://www.syncfusion.com ";
```

- Specify the required Symbology to encode the given text. By default, the given text is encoded using Code 39 Symbology.

**XML**

```
<syncfusion:SfBarcode Text="http://www.syncfusion.com" Symbology="QRCode"/>
```

**C#**

```
barcode.Symbology = BarcodeSymbolType.QRCode;
```

- For customizing the barcode, initialize the settings of corresponding barcode symbology.

**XML**

```
<syncfusion:SfBarcode Text="http://www.syncfusion.com" Symbology="QRCode">
  <syncfusion:SfBarcode.SymbologySettings>
    <Syncfusion:SfQRBarcodeSettings XDimension="6"/>
  </syncfusion:SfBarcode.SymbologySettings>
</syncfusion:SfBarcode>
```

**C#**

```
SfQRBarcodeSettings settings = new SfQRBarcodeSettings();
settings.XDimension = 6;
barcode.SymbologySettings = settings;
```

- Finally, the barcode is generated as displayed in the following screenshot for the following code example.

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  xmlns:syncfusion="clr-namespace:Syncfusion.SfBarcode.XForms;assembly=Syncfusion.SfBarcode.XForms"
  x:Class="BarcodeGettingStarted.SamplePage">
  <syncfusion:SfBarcode BackgroundColor="Gray" Text="www.wikipedia.org"
    Symbology="QRCode">
    <syncfusion:SfBarcode.SymbologySettings>
      <syncfusion:QRBarcodeSettings XDimension="6"/>
    </syncfusion:SfBarcode.SymbologySettings>
  </syncfusion:SfBarcode> </ContentPage>
```

**C#**

```
public SamplePage()
{
  InitializeComponent();
  SfBarcode barcode = new SfBarcode();
  barcode.BackgroundColor = Color.Gray;
```

```
barcode.Text = "http://www.syncfusion.com";  
barcode.Symbology = BarcodeSymbolType.QRCode;  
QRBarcodeSettings settings = new QRBarcodeSettings();  
settings.XDimension = 6;  
barcode.SymbologySettings = settings;  
this.Content = barcode;  
}
```

## SUPPORTED SYMBOLOGIES

Essential Barcode supports 10 variants of one dimensional and 2 variants of two dimensional Barcodes that are illustrated as follows.

### One Dimensional Barcodes

One dimensional Barcode is also called as linear Barcode. The bars and spaces signified for each symbol in one dimensional Barcodes are grouped in such a way to represent a specific ASCII character.

- Codabar
- Code 11
- Code 32
- Code 39
- Code 39 Extended
- Code 93
- Code 93 Extended
- Code 128A
- Code 128B

- Code 128C

### Codabar

**Codabar** is a discrete numeric symbology that is used in libraries, blood banks and a variety of other information processing applications.

- Encodes only numeric characters and some special characters like dash (-), colon (:), slash (/), plus (+).
- Each character has three bars and four spaces.
- Uses characters of A, B, C, D as start and stop characters.

### C#

```
barcode.Symbology = BarcodeSymbolType.CodaBar;
```

Codabar barcode

### Code 11

**Code11** Symbology is used mainly for labeling the telecommunications equipment and it has the following structure.

- Allows character set of digits (0-9), dash (-).
- Each character is encoded with 3 bars and 2 spaces.
- Of these five elements, there may be two wide and three narrow elements or one wide and four narrow elements.

**C#**

```
barcode.Symbology = BarcodeSymbolType.Code11;
```

Code 11 barcode

[Code 32](#)

**Code32** is mainly used for coding pharmaceuticals, cosmetics and dietetics and it contains the following structure:

- Starts with 'A' character (ASCII 65) that is not really encoded.
- Encodes only the character set of length 8.
- One digit for Checksum module 10 that is automatically calculated.

**C#**

```
barcode.Symbology = BarcodeSymbolType.Code32;
```

## Code32 barcode

### [Code 39](#)

**Code39** is a Symbology of Barcode that encodes alphanumeric characters into a series of bars. It may be of any length, although more than 25 characters begin to push the bounds. This Symbology is the only type of the Barcode in common use that does not require a checksum.

- Allows character set of digits (0-9), upper case alphabets (A-Z), and symbols like space, minus (-), plus (+), period (.), dollar sign (\$), slash (/), and percent (%).
- Always starts and ends with an asterisk (\*) symbol, termed as start and stop character.
- Each character is encoded with 5 bars and 4 spaces where 3 are wide and 6 are narrow.

### **C#**

```
barcode.Symbology = BarcodeSymbolType.Code39;
```

Code 39 barcode

[Code 39 Extended](#)

**Code39 Extended** Symbology is an extended version of **Code39** that supports full ASCII character set. So, it encodes lower case alphabets (a-z) as well as special characters in the keyboard.

**C#**

```
barcode.Symbology = BarcodeSymbolType.Code39Extended;
```

### Extended Code 39 barcode

#### [Code 93](#)

**Code93** is designed to complement and improve upon **Code39**. It represents the full ASCII character set by using the combination of 2 characters. It is a continuous, variable-length symbology and it produces denser code.

- Encodes character set of uppercase alphabets (A-Z), digits (0-9), and special characters like asterisk (\*), dash (-), dollar (\$), percent (%), Space, dot (.), slash (/), and plus (+).
- The asterisk (\*) is not a true encoding character, but it is the start and stop symbol for **Code93 Symbology**.

#### **C#**

```
barcode.Symbology = BarcodeSymbolType.Code93;
```

## Code93 barcode

### *Code 93 Extended*

**Code93** is designed to complement and improve upon Code 39. It represents the full ASCII character set by using the combination of 2 characters. It is a continuous, variable-length Symbology and it produces denser code.

- Encodes character set of uppercase alphabets (A-Z), digits (0-9), and special characters like asterisk (\*), dash (-), dollar (\$), percent (%), Space, dot (.), slash (/), and plus (+).
- The asterisk (\*) is not a true encoding character, but it is the start and stop symbol for Code 93 symbology.

### **C#**

```
barcode.Symbology = BarcodeSymbolType.Code93Extended;
```

Code93 Extended barcode

#### [Code 128](#)

**Code128** is a variable length, high density, alphanumeric, linear Barcode Symbology. It is capable of encoding full ASCII character set and extended character sets. This symbol includes a checksum digit for verification and the Barcode may also be verified character-by-character for parity of each data byte.

#### [Code 128 A](#)

**Code128A** (or Chars Set A) includes all the standard upper case U.S. alphanumeric keyboard characters and punctuation characters together with the control characters, (characters with ASCII values from 0 to 95 inclusive), and seven special characters.

#### **C#**

```
barcode.Symbology = BarcodeSymbolType.Code128A;
```

Code128A barcode

[Code128 B](#)

**Code128B** (or Chars Set B) includes all the standard upper case alphanumeric keyboard characters and punctuation characters together with the lower case alphabetic characters (characters with ASCII values from 32 to 127 inclusive), and seven special characters.

**C#**

```
barcode.Symbology = BarcodeSymbolType.Code128B;
```

#### Code128B barcode

##### [Code128 C](#)

**Code128C** (or Chars Set C) includes a set of 100 digit pairs from 00 to 99 inclusive, as well as three special characters. This allows numeric data to be encoded as two data digits per symbol character effectively twice the density of standard data.

##### **C#**

```
barcode.Symbology = BarcodeSymbology.Code128C;
```

## Code128C barcode

### *Code 128 Special characters*

The last seven characters of Code Sets A and B (character values 96 - 102) and the last three characters of Code Set C (character values 100 - 102) are special non-data characters with no ASCII character equivalents that have particular significance to the Barcode reading device.

---

#### **NOTE:**

---

When you specify that the data must be encoded by using Char Set C, then the number of characters after it must be even.

### *Two Dimensional Barcodes*

Two dimensional Barcode is a way to represent information by using two-dimensional approach. It is similar to one dimensional Barcode, but can represent more data per unit area.

- QR Code
- Data Matrix

### *QR Code*

QR Code is a two dimensional symbology that is popularly used in automotive industry. It is known for fast readability and greater storage capacity.

#### **C#**

```
barcode.Symbology = BarcodeSymbolType.QRCode;
```

## QR bar code

### *Data Matrix*

DataMatrix symbology is widely used in printed media such as labels and letters. It can be read easily by a Barcode reader and also by mobile phones. It consists of a Grid of dark and light dots or blocks forming square or rectangular symbol. The data encoded in the Barcode can be either number or alphanumeric.

### **C#**

```
barcode.Symbology = BarcodeSymbolType.DataMatrix;
```

Data Matrix bar code

---

**NOTE:**

---

By default, the width of the quiet zone on all four sides of the Barcode is equal to the dimension of the blocks.

### SYMBOLGY SETTINGS

Each and every Barcode **Symbology** can be personalized with optional settings that may affect the appearance of specific Barcode.

#### One Dimensional Barcode settings

One dimensional Barcodes can be customized by using the following properties and they are commonly used for all the categories of supported one dimensional Barcodes.

- By setting the **BarHeight** property, the height of the linear bars can be changed.
- By setting the **NarrowBarWidth** property, the width ratio of the wide and narrow bars can be customized.

One dimensional Barcodes can also have error detection settings.

- By enabling the **EncodeStartStopSymbols** property, start and stop symbols are added to signal a Barcode reader that a Barcode has been scanned.
- The **EnableCheckDigit** property enables or disables the redundancy check by using a check digit that is the decimal equivalent of a binary parity bit.

- With the help of `ShowCheckDigit` property, the check digit can be shown or hidden.

The following code example shows how to change the settings of the `Code39` linear Barcode.

#### XML

```
// Changes the settings of Code 39 linear Barcode.
<sync:SfBarcode.SymbologySettings>
<sync:Code39Setting BarHeight="45" EnableCheckDigit="False"
EncodeStartStopSymbols="True" NarrowBarWidth="1" ShowCheckDigit="False"/>
</sync:SfBarcode.SymbologySettings>
```

Similarly, you can specify the settings of other linear Barcodes corresponding to specified symbology.

#### Two Dimensional Barcode Settings

Two dimensional Barcodes are customized by using the `XDimension` property that modifies its block size and it is commonly used for all kinds of supported two dimensional Barcodes.

#### Data Matrix Settings

The `DataMatrixSetting` can be customized with the help of the following settings.

#### XML

```
//Changes the settings of Data Matrix Barcode.
<sync:SfBarcode.SymbologySettings>
sync:DataMatrixSetting XDimension="8" Encoding="ASCIINumeric"
Size="Size104x104" />
</sync:SfBarcode.SymbologySettings>
```

- The `Encoding` property is used to specify the encoding technique from enumeration of `DataMatrixEncoding` that contains encoding techniques such as ASCII, ASCIINumeric, Auto and Base256.
- The `Size` property allows you to specify the size of the Barcode from a set of predefined sizes available in the `DataMatrixSize` enumeration.

Matrix Size	Description
Auto	Size is chosen based on the input data
Size10x10	Square matrix with 10 rows and 10 columns.
Size12x12	Square matrix with 12 rows and 12 columns.
Size14x14	Square matrix with 14 rows and 14 columns.
Size16x16	Square matrix with 16 rows and 16 columns.
Size18x18	Square matrix with 18 rows and 18 columns.
Size20x20	Square matrix with 20 rows and 20 columns.
Size22x22	Square matrix with 22 rows and 22 columns.

Size24x24	Square matrix with 24 rows and 24 columns.
Size26x26	Square matrix with 26 rows and 26 columns.
Size32x32	Square matrix with 32 rows and 32 columns.
Size36x36	Square matrix with 36 rows and 36 columns.
Size40x40	Square matrix with 40 rows and 40 columns.
Size44x44	Square matrix with 44 rows and 44 columns.
Size48x48	Square matrix with 48 rows and 48 columns.
Size52x52	Square matrix with 52 rows and 52 columns.
Size64x64	Square matrix with 64 rows and 64 columns.
Size72x72	Square matrix with 72 rows and 72 columns.
Size80x80	Square matrix with 80 rows and 80 columns.
Size88x88	Square matrix with 88 rows and 88 columns.
Size96x96	Square matrix with 96 rows and 96 columns.
Size104x104	Square matrix with 104 rows and 104 columns.
Size120x120	Square matrix with 120 rows and 120 columns.
Size132x132	Square matrix with 132 rows and 132 columns.
Size144x144	Square matrix with 144 rows and 144 columns.
Size8x18	Rectangular matrix with 8 rows and 18 columns.
Size8x32	Rectangular matrix with 8 rows and 32 columns.
Size12x26	Rectangular matrix with 12 rows and 26 columns.
Size12x36	Rectangular matrix with 12 rows and 36 columns.
Size16x36	Rectangular matrix with 16 rows and 36 columns.
Size16x48	Rectangular matrix with 16 rows and 48 columns.

### QR Code Settings

The **QRCode** symbology can be customized by using the following settings.

### XML

```
//Changes the settings of QR Barcode.
<sync:SfBarcode.SymbologySettings>
  <sync:QRBarcodeSetting XDimension="8" ErrorCorrectionLevel="High"
    InputMode="BinaryMode" Version="Auto" />
</sync:SfBarcode.SymbologySettings>
```

- The **Version** property allows you to set various types of version for QR code from **QRVersion** enumeration. By default, its value is set as Auto.

QRVersion	Description
Version01	Measures 21 x 21 modules
Version02	Measures 25 x 25 modules
Version03	Measures 29 x 29 modules
Version04	Measures 33 x 33 modules
Version05	Measures 37 x 37 module
Version06	Measures 41 x 41 modules
Version07	Measures 45 x 45 modules
Version08	Measures 49 x 49 modules
Version09	Measures 53 x 53 modules
Version10	Measures 57 x 57 modules
Version11	Measures 61 x 61 modules
Version12	Measures 65 x 65 modules
Version13	Measures 69 x 69 modules
Version14	Measures 73 x 73 modules
Version15	Measures 77 x 77 modules
Version16	Measures 81 x 81 modules
Version17	Measures 85 x 85 modules
Version18	Measures 89 x 89 modules
Version19	Measures 93 x 93 modules
Version20	Measures 97 x 97 modules
Version21	Measures 101 x 101 modules
Version22	Measures 105 x 105 modules
Version23	Measures 109 x 109 modules
Version24	Measures 113 x 113 modules
Version25	Measures 117 x 117 modules
Version26	Measures 121 x 121 modules

Version27	Measures 125 x 125 modules
Version28	Measures 129 x 129 modules
Version29	Measures 133 x 133 modules
Version30	Measures 137 x 137 modules
Version31	Measures 141 x 141 modules
Version32	Measures 145 x 145 modules
Version33	Measures 149 x 149 modules
Version34	Measures 153 x 153 modules
Version35	Measures 157 x 157 modules
Version36	Measures 161 x 161 modules
Version37	Measures 165 x 165 modules
Version38	Measures 169 x 169 modules
Version39	Measures 173 x 173 modules
Version40	Measures 177 x 177 modules

- The **ErrorCorrectionLevel** property employs error correction to generate a series of error correction code words that are added to the data code word sequence in order to enable the symbol to withstand damage without loss of data. By default, its value is set as Low.

Error Correction Level	Recovery Capacity % (approx.)
Low	7
Medium	15
Quartile	25
High	30

- The **InputMode** property allows you to select specific set of input characters. You may select the most suitable input mode. By default, its value is set as BinaryMode.

Input Mode	Possible characters
NumericMode	0,1,2,3,4,5,6,7,8,9
AlphanumericMode	0 to 9, A to Z, space, \$, %, *, +, -,., /, :

BinaryMode	Shift JIS characters
------------	----------------------

## BARCODE CUSTOMIZATION

### Bar Customization

The color of the Barcode can be customized by using the properties of **DarkBarBrush** and **LightBarBrush** in the **SfBarcode**.

The **DarkBarBrush** represents the Color of the dark bar (Black color by default) and the **LightBarBrush** represents the color of the gap between two adjacent black bars (White color by default).

### C#

```
//Changes the color of darker area of Barcode.  
barcode.DarkBarColor = Color.Blue;  
//Changes the color of lighter area of Barcode.  
barcode.LightBarColor = Color.Red;
```

*Barcode with bar color customization*

### NOTE:

The **DarkBarBrush** and **LightBarBrush** customizations are applicable only for one dimensional Barcodes. In order, to recognize a Barcode symbol by a scanner, there must be an adequate contrast between the dark bars and the light spaces. All the Barcode scanners do not have support for colored Barcodes.

### Text Customization

The text representing the Barcode can be customized by using the following properties.

- The color of text can be altered by using the `TextColor` property.
- The size of text can be altered by using the `TextSize` property.
- The horizontal alignment of text can be customized with the help of the `TextPosition` property.
- The gap between Barcode and text can be adjusted by setting the property of `TextGapHeight`.
- To change the location of text vertically, you can make use of the `TextLocation` property with options of top and bottom location.

### C#

```
//Changes the color of text.
barcode.TextColor = Color.Red;
//Changes the size of text.
barcode.TextFont = Font.SystemFontOfSize(25);
//Changes the font style of text.
Typeface textStyle = Typeface.create("Times new roman",1);
barcode.TextFont = textStyle**;**
//Changes the height of gap between text and Barcode.
barcode.TextGapHeight = 30;
//Changes the location of text.
barcode.TextLocation = BarcodeTextLocation.Bottom;
//Changes the alignment of text.
barcode.TextAlignment = BarcodeTextAlignment.Center;
```

### Barcode with text customization

## SfBorder

### Overview

The Xamarin.Forms Border control is a container control that allows you to apply borders, backgrounds, border width, and corner radii

### Key Features

- Customize the background, border width, and border color of the Border control.
- Implement a circular image.
- Customize all the edges with different corner radii.

### Getting Started

This section provides an overview for working with the SfBorder control for Xamarin.Forms and explains the entire process of creating a real-world application.

### Adding SfBorder reference

You can add SfBorder reference using one of the following methods:

### Method 1: Adding SfBorder reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfBorder to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Core](#), and then install it.

![Xamarin Forms SfBorder Nuget reference](images/Adding SfBorder reference.png)

#### Note:

- Install the same version of SfBorder NuGet in all the projects.
- In addition, you need to install the [Syncfusion.Xamarin.Core.WPF]() package for Xamarin.Forms WPF platform only.

### Method 2: Adding SfBorder reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfBorder control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfBorder assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching an application on each platform with SfBorder.

To use the SfBorder control inside an application, each platform application must initialize the SfBorder renderer. This initialization step varies from platform to platform and is discussed in the following sections:

---

**Note:** If you are adding the references from toolbox, below steps are not needed.

---

#### *Android and UWP*

The Android and UWP launches the SfBorder without any initialization, and it is enough to only initialize the Xamarin.Forms Framework to launch the application.

#### *iOS*

To launch the SfBorder in iOS, call the `SfBorderRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework has been initialized and before the `LoadApplication` is called, as demonstrated in the following code example.

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.XForms.iOS.Border.SfBorderRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### *Release mode issue in UWP platform*

The known Framework issue in UWP platform is that the custom controls will not be rendered when deployed an application in Release Mode. It can be resolved by initializing the SfBorder assemblies in the `App.xaml.cs` file in the UWP project, as demonstrated in the following code example.

#### **C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Border.SfBorderRenderer)
        .GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

#### *Windows Presentation Foundation (WPF)*

To launch the border in WPF, call the `SfBorderRenderer.Init()` method in the `MainWindow` constructor of the `MainWindow` class after the Xamarin.Forms framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

**C#**

```
public partial class MainWindow : FormsApplicationPage
{
    public MainWindow()
    {
        InitializeComponent();
        Forms.Init();
        Syncfusion.XForms.WPF.Border.SfBorderRenderer.Init();
        LoadApplication(new App());
    }
}
```

## Creating SfBorder control

The **SfBorder** control is configured entirely in C# code or in XAML markup. The following steps explain how to create a **SfBorder** and configure its elements.

*Adding namespace for referred assemblies*

**XML**

```
xmlns:border="clr-
namespace:Syncfusion.XForms.Border;assembly=Syncfusion.Core.XForms"
```

**C#**

```
using Syncfusion.XForms.Border;
```

*Add the SfBorder control as the content of ContentPage.*

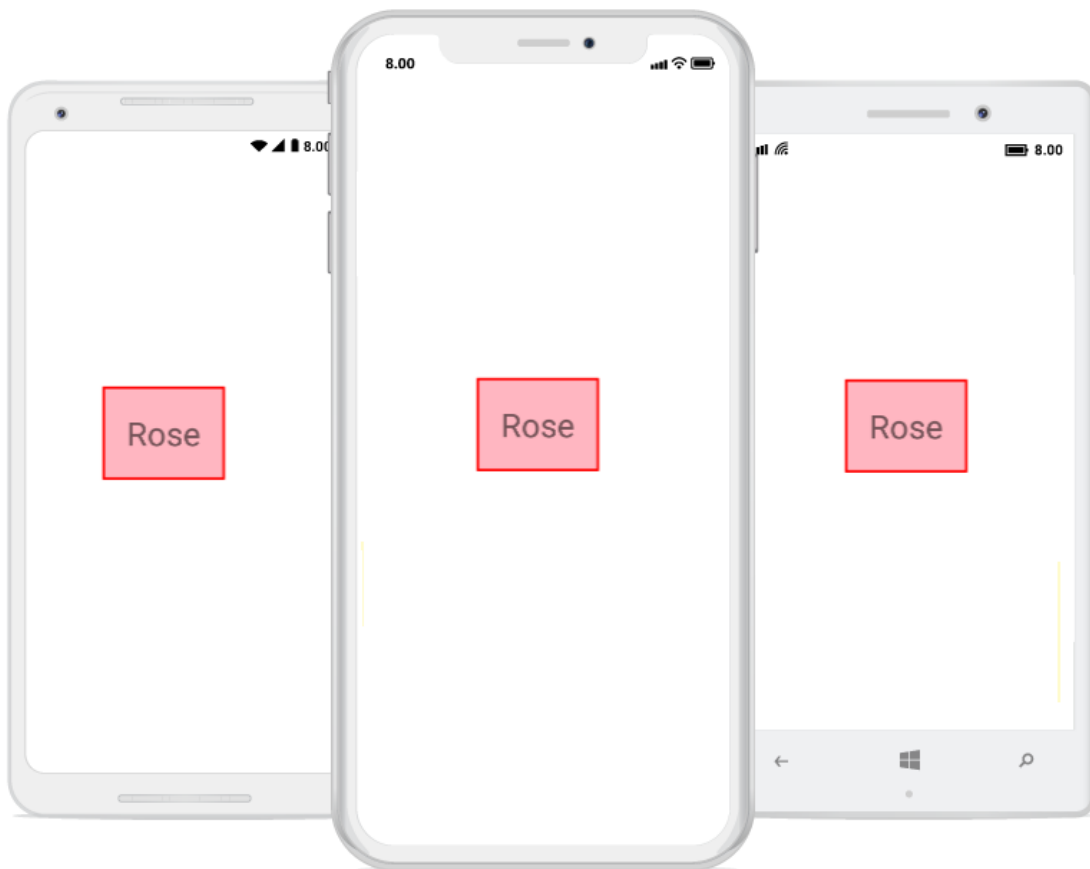

**XML**

```
<Grid>
<border:SfBorder
    BorderColor="Red"
    BackgroundColor="#ffb6c1"
    HorizontalOptions="Center"
    VerticalOptions="Center"
    BorderWidth="3">
    <Label
        Text="Rose"
        Margin="10"
        Font="15" />
    </border:SfBorder>
</Grid>
```

**C#**

```
using System;
using Syncfusion.XForms.Border;
using Xamarin.Forms;
namespace BorderGettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
    }
}
```

```
{
InitializeComponent();
Grid mainGrid = new Grid();
// Create Border control
SfBorder border = new SfBorder();
border.VerticalOptions = LayoutOptions.Center;
border.HorizontalOptions = LayoutOptions.Center;
border.BorderColor = Color.Red;
border.BackgroundColor = Color.FromHex("#ffb6c1");
//Create Label control
Label label = new Label();
label.Text = "Rose";
label.FontSize = 15;
border.Content = label;
mainGrid.Children.Add(border);
this.Content = stack;
}
}
```

The complete Getting Started sample is available in [this](#) link.

### Customization

The border control supports customizing the border color, width, corner radius, background color, and more. The border can be customized using the following properties.

### Border color

You can customize the color of the border using the **BorderColor** property.

#### XML

```
<border:SfBorder x:Name="border" BorderColor = "Red" CornerRadius="20"
BorderWidth="3">
<Label Text="James Williamson"
TextColor="Black"/>
</border:SfBorder>
```

#### C#

```
SfBorder border = new SfBorder();
border.CornerRadius = 20;
border.BorderColor = Color.Red;
border.BorderWidth = 3;
Label label = new Label();
label.Text = "James Williamson";
label.TextColor = Color.Black;
border.Content = label;
this.Content = border;
```

James Williamson

### Background color

The background color of the border control can be customized using the **BackgroundColor** property.

#### XML

```
<border:SfBorder x:Name="border" BorderColor = "Red" BackgroundColor=
"Green" CornerRadius="20" BorderWidth="3">
<Label Text="James Williamson"
TextColor="Black"/>
</border:SfBorder>
```

#### C#

```
SfBorder border = new SfBorder();
border.CornerRadius = 20;
border.BorderColor = Color.Red;
border.BorderWidth = 3;
Label label = new Label();
label.Text = "James Williamson";
label.TextColor = Color.Black;
border.Content = label;
border.BackgroundColor = Color.Green;
this.Content = border;
```

### Border width

You can customize the thickness of the border using the `BorderWidth` property.

#### XML

```
<border:SfBorder x:Name="border" BorderColor = "Red" CornerRadius="20"
BorderWidth="12">
<Label Text="James Williamson"
TextColor="Black"/>
</border:SfBorder>
```

#### C#

```
SfBorder border = new SfBorder();
border.CnerRadius = 20;
border.BorderColor = Color.Red;
border.BorderWidth = 12;
Label label = new Label();
label.Text = "James Williamson";
label.TextColor = Color.Black;
border.Content = label;
this.Content = border;
```

### Corner radius

You can customize the corner radius of the border on four sides using the `CornerRadius` property with type as `Thickness`.

#### XML

```
<border:SfBorder x:Name="border" BorderColor = "Red"
CornerRadius="0,10,10,0" BorderWidth="12">
<Label Text="James Williamson"
TextColor="Black"/>
</border:SfBorder>
```

### C#

```
SfBorder border = new SfBorder();
border.CornerRadius = new Thickness (0,10,10,0);
border.BorderColor = Color.Red;
border.BorderWidth = 12;
Label label = new Label();
label.Text = "James Williamson";
label.TextColor = Color.Black;
border.Content = label;
this.Content = border;
```

### Adding circular image

You can add any view inside the border control by adding the Content property. The following code sample demonstrates how to apply border using the `CornerRadius` property for a circular image.

### XML

```
<Grid HeightRequest="100" WidthRequest="100" HorizontalOptions="Center"
VerticalOptions="Center">
  <border:SfBorder BorderColor="Black" HorizontalOptions="Center"
VerticalOptions="Center" CornerRadius="50">
    <Image Source="plus.jpeg" />
  </border:SfBorder>
</Grid>
```

### C#

```
Grid grid = new Grid();
grid.HeightRequest = 100;
grid.WidthRequest = 100;
grid.HorizontalOptions = LayoutOptions.Center;
grid.VerticalOptions = LayoutOptions.Center;
SfBorder border = new SfBorder();
border.BorderColor = Color.Black;
border.HorizontalOptions = LayoutOptions.Center;
border.VerticalOptions = LayoutOptions.Center;
border.CornerRadius = 50;
Image image = new Image();
image.Source = "plus.jpeg";
border.Content = image;
grid.Children.Add(border);
this.Content = grid;
```

### Shadow Effect

The border control provides shadow effect support. To enable shadow effect, set the `HasShadow` property to true.

You can customize the color of shadow using the `ShadowColor` property.

### XML

```
<border:SfBorder
  HorizontalOptions="Center"
  VerticalOptions="Center"
  BackgroundColor="Green"
  HeightRequest="50"
  WidthRequest="200"
  CornerRadius="20"
  BorderWidth="0"
  HasShadow="True"
  ShadowColor="Gray">
  <Label
    Text="James Williamson"
    HorizontalTextAlignment="Center"
    VerticalTextAlignment="Center"
    TextColor="White"/>
</border:SfBorder>
```

### C#

```
SfBorder border = new SfBorder()
{
  BackgroundColor = Color.Green,
  CornerRadius = 20,
  BorderWidth = 0,
  HeightRequest = 50,
  WidthRequest = 200,
  HorizontalOptions = LayoutOptions.Center,
  VerticalOptions = LayoutOptions.Center,
  HasShadow = true,
  ShadowColor = Color.Gray
};
Label label = new Label()
{
  Text = "James Williamson",
  HorizontalTextAlignment = TextAlignment.Center,
  VerticalTextAlignment = TextAlignment.Center,
  TextColor = Color.White
};
border.Content = label;
this.Content = border;
```

---

**Note:** Shadow support has not been provided for UWP Platform.

---

James Williamson

## SfBusyIndicator

### Overview

The Essential Xamarin BusyIndicator control includes over 10 built-in animations that can be displayed within your applications. It can be used to indicate busy status during app loading, data processing, etc.

## Key Features

- Provides 10 built-in busy indicator animations
- Supports to show/hide busy indicator.
- Displays busy text with animation.
- Provides simple and easy options to size the control.
- Provides option to adjust the animation speed.

## Getting Started

This section explains you the steps to configure a SfBusyIndicator control in a real-time scenario and also provides a walk-through on some of the customization features available in SfBusyIndicator control.

### Adding SfBusyIndicator reference

You can add SfBusyIndicator reference using one of the following methods:

#### Method 1: Adding SfBusyIndicator reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfBusyIndicator to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfBusyIndicator](#), and then install it.

![Adding SfBusyIndicator reference](images/Adding SfBusyIndicator reference.png)

---

**Note:** Install the same version of SfBusyIndicator NuGet in all the projects.

---

#### Method 2: Adding SfBusyIndicator reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfBusyIndicator control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfBusyIndicator assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfBusyIndicator.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfBusyIndicator.Android.dll Syncfusion.SfBusyIndicator.XForms.Android.dll Syncfusion.SfBusyIndicator.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfBusyIndicator.iOS.dll Syncfusion.SfBusyIndicator.XForms.iOS.dll Syncfusion.SfBusyIndicator.XForms.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfBusyIndicator.UWP.dll Syncfusion.SfBusyIndicator.XForms.UWP.dll Syncfusion.SfBusyIndicator.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the SfBusyIndicator on each platform

To use SfBusyIndicator inside an application, each platform application must initialize the SfBusyIndicator renderer. This initialization step varies from platform to platform and is discussed in the following sections.

#### Android and UWP

The Android and UWP launches the SfBusyIndicator without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch SfBusyIndicator in iOS, need to create an instance of SfBusyIndicatorRenderer in FinishedLaunching overridden method of AppDelegate class in iOS Project as shown below.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    new SfBusyIndicatorRenderer();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### ReleaseMode issue in UWP platform

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfBusyIndicator assemblies in **App.xaml.cs** in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
```

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfBusyIndicatorRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a Simple SfBusyIndicator

The SfBusyIndicator control is configured entirely in C# code or by using XAML markup. The following steps explain on how to create a SfBusyIndicator and configure its elements,

- Adding namespace for the added assemblies.

#### XML

```
xmlns:busyindicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica
tor.XForms"
```

#### C#

```
using Syncfusion.SfBusyIndicator.XForms;
```

- Now add the SfBusyIndicator control with a required optimal name by using the included namespace.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica
tor.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<busyindicator:SfBusyIndicator x:Name="busyindicator" />
</ContentPage.Content>
</ContentPage>
```

#### C#

```
using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
```

```

namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator();
            this.Content = busyIndicator;
        }
    }
}

```

### Setting Animation Type

SfBusyIndicator provides 15 predefined animation types like Ball, Battery, Globe and so on. User can select any one of the animation types using `AnimationType` property.

Following example depicts the battery type animation for SfBusyIndicator.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndicator.XForms"
x:Class="GettingStarted.MainPage">
    <ContentPage.Content>
        <busyindicator:SfBusyIndicator x:Name="busyindicator"
AnimationType="Battery"
ViewBoxWidth = "150"
ViewBoxHeight="150"
TextColor="Maroon" />
    </ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.Battery,
                ViewBoxHeight = 150,
                ViewBoxWidth = 150,
                TextColor = Color.Maroon
            };
        }
    }
}

```

```
this.Content = busyIndicator;  
}  
}
```

### EnableAnimation

SfBusyIndicator provides options to enable or disable animation of the Busy Indicator. Animation can be enabled or disabled using the [EnableAnimation](#) property.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:local="clr-namespace:GettingStarted"  
xmlns:busyindicator="clr-  
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica  
tor.XForms"  
x:Class="GettingStarted.MainPage">  
<ContentPage.Content>  
<busyindicator:SfBusyIndicator x:Name="busyindicator"  
AnimationType="Battery"  
ViewBoxWidth = "150"  
ViewBoxHeight="150"  
EnableAnimation="True"/>  
</ContentPage.Content>  
</ContentPage>
```

### C#

```
using Syncfusion.SfBusyIndicator.XForms;  
using Xamarin.Forms;  
namespace GettingStarted  
{  
    public partial class MainPage : ContentPage  
    {  
        public MainPage()  
        {  
            InitializeComponent();  
            SfBusyIndicator busyIndicator = new SfBusyIndicator()  
            {  
                AnimationType = AnimationTypes.Ball,  
                ViewBoxHeight = 150,  
                ViewBoxWidth = 150,  
                EnableAnimation = true  
            };  
            this.Content = busyIndicator;  
        }  
    }  
}
```

You can find the complete getting started sample from this [link](#).

### Make Busy Animation Idle

SfBusyIndicator control provides support to determine whether an animation needs to be executed or not. Setting the `IsBusy` property to false will stop the animation and removes the control from view.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndicator.XForms"
x:Class="GettingStarted.MainPage">
  <ContentPage.Content>
    <busyindicator:SfBusyIndicator x:Name="busyindicator"
    AnimationType="Ball"
    ViewBoxWidth = "150"
    ViewBoxHeight="150"
    TextColor="Maroon"
    IsBusy="False"/>
  </ContentPage.Content>
</ContentPage>
```

#### C#

```
using Syncfusion.SfBusyIndicator.XForms;
```

```

using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.Ball,
                ViewBoxHeight = 150,
                ViewBoxWidth = 150,
                TextColor = Color.Maroon,
                IsBusy = false
            };
            this.Content = busyIndicator;
        }
    }
}

```

**Note:** The default value is true.

## Set Header

### Title

SfBusyIndicator provides option to set the text that indicates the information related to loading. This can be done using **Title** property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndicator.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<busyindicator:SfBusyIndicator x:Name="busyindicator"
AnimationType="Ball"
ViewBoxWidth = "150"
Title="Loading..."
ViewBoxHeight="150"
TextColor="Maroon"/>
</ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage

```

```

{
    public MainPage()
    {
        InitializeComponent();
        SfBusyIndicator busyIndicator = new SfBusyIndicator()
        {
            AnimationType = AnimationTypes.Ball,
            ViewBoxHeight = 150,
            ViewBoxWidth = 150,
            TextColor = Color.Maroon,
            Title = "Loading..."
        };
        this.Content = busyIndicator;
    }
}

```

### TextColor

SfBusyIndicator provides options to change the color of the text. The color of the text can be changed using the [TextColor](#) property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndicator.XForms"
x:Class="GettingStarted.MainPage">
    <ContentPage.Content>
        <busyindicator:SfBusyIndicator x:Name="busyindicator"
AnimationType="Ball"
ViewBoxWidth = "150"
Title="Loading..."
ViewBoxHeight="150"
TextColor="Maroon"/>
    </ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.Ball,

```

```

ViewBoxHeight = 150,
ViewBoxWidth = 150,
TextColor = Color.Maroon,
Title = "Loading..."
};
this.Content = busyIndicator;
}
}
}

```

### TextSize

SfBusyIndicator provides options to change the size of the text. The size of the text can be changed using the [TextSize](#) property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica
tor.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<busyindicator:SfBusyIndicator x:Name="busyindicator"
AnimationType="Battery"
ViewBoxWidth = "150"
Title="Loading..."
TextSize="10"
ViewBoxHeight="150"
TextColor="Maroon"/>
</ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.Ball,
                ViewBoxHeight = 150,
                ViewBoxWidth = 150,
                TextColor = Color.Maroon,
                Title = "Loading...",
                TextSize = 10
            };
        }
    }
}

```

```

this.Content = busyIndicator;
}
}
}

```

### TitlePlacement

SfBusyIndicator provides options to set the **Title** at the top or bottom of the Busy Indicator. The **Title** can be set using the [TitlePlacement](#) property. When the **Title** is not needed, set the **TitlePlacement** property of SfBusyIndicator to None.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica
tor.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<busyindicator:SfBusyIndicator x:Name="busyindicator"
AnimationType="Battery"
ViewBoxWidth = "150"
Title="Loading..."
TitlePlacement="None"
ViewBoxHeight="150"
TextColor="Maroon"/>
</ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.Ball,
                ViewBoxHeight = 150,
                ViewBoxWidth = 150,
                TextColor = Color.Maroon,
                Title = "Loading...",
                TitlePlacement= TitlePlacement.Top
            };
            this.Content = busyIndicator;
        }
    }
}

```

## Sizing

Drawing size can be customized in SfBusyIndicator. `ViewBoxHeight` and `ViewBoxWidth` properties can be used to set height and width of the Indicator.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica
tor.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<busyindicator:SfBusyIndicator x:Name="busyindicator"
AnimationType="SlicedCircle"
ViewBoxWidth = "20"
ViewBoxHeight="20"
TextColor="Maroon"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.SlicedCircle,
                ViewBoxHeight = 20,
                ViewBoxWidth = 20,
                TextColor = Color.Maroon
            };
            this.Content = busyIndicator;
        }
    }
}
```

![Height and width](images/heightand width.png)

## Animation Type

The **AnimationType** property for the SfBusyIndicator allows the user to set one of the 15 animations from the built-in animations.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica
tor.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<busyindicator:SfBusyIndicator x:Name="busyindicator"
Title="Loading..."
AnimationType="Ball"
ViewBoxHeight="100"
ViewBoxWidth="100"
BackgroundColor="Blue"
TextColor="White"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.Ball,
                ViewBoxWidth = 100,
                ViewBoxHeight = 100,
                Title = "Loading...",
                BackgroundColor="Blue",
                TextColor = Color.White
            };
            this.Content = busyIndicator;
        }
    }
}
```

Busy Indicator with Ball type animation

Busy Indicator with HorizontalPulsingBox type animation

Busy Indicator with Rectangle type animation

Busy Indicator with Battery type animation

Busy Indicator with Globe type animation

Busy Indicator with SingleCircle type animation

Busy Indicator with SlicedCircle type animation

Busy Indicator with DoubleCircle type animation

Busy Indicator with ECG type animation

Busy Indicator with Print type animation

Busy Indicator with Box type animation

Busy Indicator with Gear type animation

Busy Indicator with MovieTimer type animation

Busy Indicator with ZoomingTarget type animation

Busy Indicator with RollingBall type animation

### Animation duration

The **Duration** property of SfBusyIndicator indicates timeline for completing one animation cycle. Setting smaller duration value accelerates animation speed.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:busyindicator="clr-namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndicator.XForms"
x:Class="GettingStarted.MainPage">
  <ContentPage.Content>
    <busyindicator:SfBusyIndicator x:Name="busyindicator"
AnimationType="Battery"
ViewBoxHeight="100"
ViewBoxWidth="100"
Duration="0.5"/>
  </ContentPage.Content>
</ContentPage>
```

### C#

```
using Syncfusion.SfBusyIndicator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfBusyIndicator busyIndicator = new SfBusyIndicator()
            {
                AnimationType = AnimationTypes.Battery,
                ViewBoxWidth = 100,
                ViewBoxHeight = 100,
                Duration = 0.5f
            };
            this.Content = busyIndicator;
        }
    }
}
```

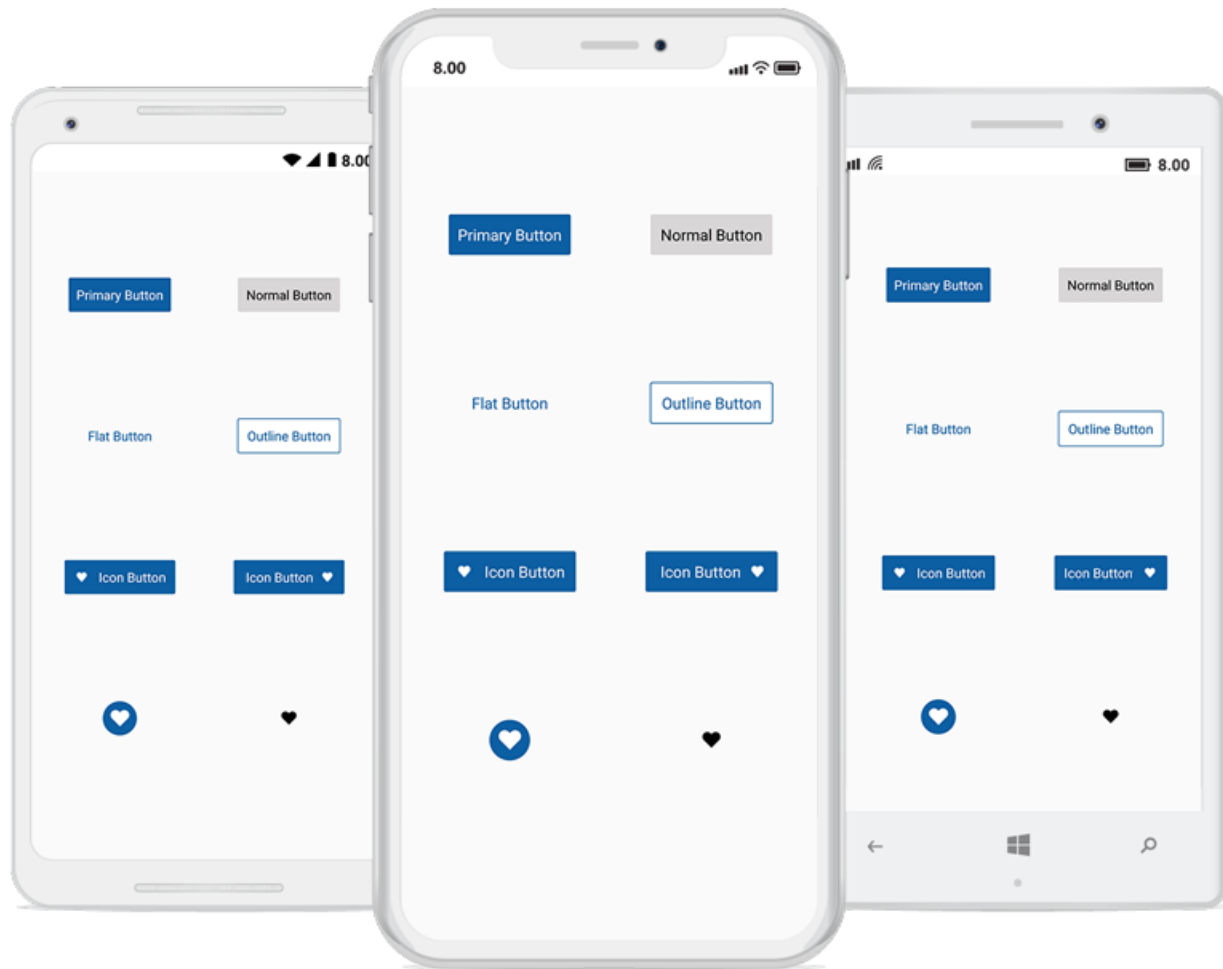

## SfButton

### Overview

The Xamarin.Forms Button is a custom button control with UI customization, toggle states, and theme support. You can set icons, background images, and corner edge radii and customize the appearance for different visual states using the visual state manager.

### Key features

- Easily customize a button as an outline, flat, circle, or icon button.
- Use visual states such as pressed, normal, checked, and unchecked.
- Display an image as the background for the control.
- Display custom content in the button control.
- Use a toggle button.

## Getting Started

This section explains the steps required to work with the button control for Xamarin.Forms.

### Adding SfButton reference

You can add SfButton reference using one of the following methods:

#### Method 1: Adding SfButton reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons). To add SfButton to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Buttons](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons), and then install it.

![Adding SfButton reference from NuGet](Images/Adding SfButton reference.png)

#### Note:

- Install the same version of SfButton NuGet in all the projects.
- In addition, you need to install the [Syncfusion.Xamarin.Buttons.WPF]() package for Xamarin.Forms WPF platform only.

#### Method 2: Adding SfButton reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfButton control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfButton assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Buttons.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll <tr&gt; <="" td=""></tr&gt;>
WPF	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.WPF.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** After adding the reference, an additional step is required for iOS and UWP projects. If you are adding the references from toolbox, this step is not needed.

*Additional step for iOS*

To launch [SfButton](#) in iOS, call `SfButtonRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class in iOS Project as demonstrated in the following code example.

**C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    SfBorderRenderer.Init();
    SfButtonRenderer.Init();
    return base.FinishedLaunching(app, options);
}
```

*Additional step for UWP*

This step is required only if the application is deployed in Release mode with .NET native tool chain enabled. It is needed for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the [SfButton](#) assembly at the `OnLaunched` overridden method of the `App` class in UWP project is the suggested work around. The following code example demonstrates initializing the [SfButton](#) assembly.

**C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    .....
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies that your app uses
    assembliesToInclude.Add(typeof(SfButtonRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfBorderRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    .....
}
```

*Additional step for WPF*

To launch the button in WPF, call the `SfButtonRenderer.Init()` method in the `MainWindow` constructor of the `MainWindow` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

**C#**

```
public partial class MainWindow : FormsApplicationPage
{
    public MainWindow()
    {
        InitializeComponent();
        Forms.Init();
        Syncfusion.XForms.WPF.Border.SfBorderRenderer.Init();
        Syncfusion.XForms.WPF.Buttons.SfButtonRenderer.Init();
    }
}
```

```
LoadApplication(new App());
}
}
```

### Creating a simple SfButton

The [SfButton](#) control is configured entirely in C# code or in XAML markup. The following steps explain how to create a [SfButton](#) and configure its elements.

#### *Adding namespace for referred assemblies*

##### **XML**

```
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
```

##### **C#**

```
using Syncfusion.XForms.Buttons;
```

#### *Referring SfButton control with declared suffix name for namespace*

##### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:SfButton"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="SfButton.MainPage">
<StackLayout HorizontalOptions="Center" VerticalOptions="Center">
<buttons:SfButton x:Name="SfButton"/>
</StackLayout>
</ContentPage>
```

##### **C#**

```
namespace SfButton
{
    using Syncfusion.XForms.Buttons;
    using Xamarin.Forms;
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout();
            stackLayout.HorizontalOptions = LayoutOptions.Center;
            stackLayout.VerticalOptions = LayoutOptions.Center;
            SfButton button = new SfButton();
            stackLayout.Children.Add(button);
            this.Content = stackLayout;
        }
    }
}
```

### Setting caption

The button caption can be defined using the [Text](#) property of [SfButton](#). This caption normally describes the meaning of the button and is displayed in button.

#### XML

```
<buttons:SfButton x:Name="SfButton" Text="Button"/>
```

#### C#

```
SfButton button = new SfButton();  
button.Text = "Button";
```

### Toggle button

The button behavior can be changed as toggle button by defining the [IsCheckable](#) property of [SfButton](#).

#### XML

```
<buttons:SfButton x:Name="SfButton" Text="Button" IsCheckable="True"/>
```

#### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.IsCheckable = true;
```

Checked state:

Unchecked state:

### Button icon

The button icon can be defined using the [ImageSource](#) and [ShowIcon](#) properties of [SfButton](#).

#### XML

```
<buttons:SfButton x:Name="SfButton" Text="Button" ShowIcon="True"  
ImageSource="button_Heart.png"/>
```

#### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.ImageSource = "button_Heart.png";
```

```
button.ShowIcon = true;
```

Button background image

The button background icon can be defined using the [BackgroundImage](#) property of [SfButton](#).

#### XML

```
<buttons:SfButton x:Name="SfButton" Text="Button"
BackgroundImage="button_background.png" CornerRadius="20"
WidthRequest="100"/>
```

#### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.WidthRequest = 100;
button.BackgroundImage = "button_background.png";
button.CornerRadius = new Thickness(20);
```

You can find the complete getting started sample here: [Getting started](#).

#### Visual States

The button visual can be customized through **VisualStates**. The [SfButton](#) control have the following four visual states:

- Normal
- Pressed
- Checked
- Unchecked

**Note:** In addition, **MouseOver** VisualState is available only in the UWP platform.

#### XML

```
<StackLayout HorizontalOptions="Center" VerticalOptions="Center">
<buttons:SfButton x:Name="SfButton" WidthRequest="100" Text="Button">
<VisualStateManager.VisualStateGroups>
<VisualStateGroup x:Name="CommonStates">
<VisualState x:Name="Normal">
<VisualState.Setters>
<Setter Property="TextColor" Value="White" />
</VisualState.Setters>
</VisualState>
<VisualState x:Name="Pressed">
<VisualState.Setters>
```

```
<Setter Property="TextColor" Value="Black" />
</VisualState.Setters>
</VisualState>
</VisualStateGroup>
</VisualStateManager.VisualStateGroups>
</buttons:SfButton>
</StackLayout>
```

## C#

```
StackLayout stackLayout = new StackLayout
{
    HorizontalOptions = LayoutOptions.Center,
    VerticalOptions = LayoutOptions.Center
};
SfButton button = new SfButton
{
    Text = "Button",
    WidthRequest = 100
};
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState normalState = new VisualState
{
    Name = "Normal"
};
normalState.Setters.Add(new Setter { Property = SfButton.TextColorProperty,
    Value = Color.White });
VisualState pressedState = new VisualState
{
    Name = "Pressed"
};
pressedState.Setters.Add(new Setter { Property = SfButton.TextColorProperty,
    Value = Color.Black });
commonStateGroup.States.Add(normalState);
commonStateGroup.States.Add(pressedState);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(button, visualStateGroupList);
stackLayout.Children.Add(button);
this.Content = stackLayout;
```

### Pressed visual state:

### Normal visual state:

## Customization

The button control supports to customize the border color, image width, corner radius, background color, and more. The button control can be customized using the following properties:

### Text Customization

The text inside the button can be customized by its text color, font size, font attributes, font family and text alignment.

#### TextColor

The [TextColor](#) property is used to customize the color of text in SfButton.

#### XML

```
<button:SfButton x:Name="button" Text="Button" TextColor = "White">
</button:SfButton>
```

#### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.TextColor = Color.White;
```

#### FontSize

The [FontSize](#) property is used to customize the size of text in SfButton.

#### XML

```
<button:SfButton x:Name="button" Text="Button" FontSize = "18">
</button:SfButton>
```

#### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.FontSize = 18;
```

#### FontAttributes

The [FontAttributes](#) property is used to customize the font style of text in SfButton.

#### XML

```
<button:SfButton x:Name="button" Text="Button" FontAttributes = "Italic">
</button:SfButton>
```

#### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.FontAttributes = FontAttributes.Italic;
```

#### FontFamily

The [FontFamily](#) property is used to customize the font family of text in SfButton.

#### XML

```
<button:SfButton x:Name="button" Text="Button" FontFamily = "Arial">  
</button:SfButton>
```

#### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.FontFamily = "Arial";
```

#### TextAlignment

The [HorizontalTextAlignment](#) and [VerticalTextAlignment](#) properties are used to customize the alignment of text in SfButton.

#### XML

```
<button:SfButton x:Name="button" Text="Button"  
HorizontalTextAlignment="Center" VerticalTextAlignment="Center">  
</button:SfButton>
```

#### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.HorizontalTextAlignment = TextAlignment.Center;  
button.VerticalTextAlignment = TextAlignment.Center;
```

#### Background Customization

The background of the button can be customized by its background color, border color, border width and corner radius.

#### BackgroundColor

The [BackgroundColor](#) property is used to customize the background color of SfButton.

#### XML

```
<button:SfButton x:Name="button" Text="Button" BackgroundColor =  
"DeepSkyBlue">
```

```
</button:SfButton>
```

### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.BackgroundColor = Color.DeepSkyBlue;
```

#### *BorderColor*

The [BorderColor](#) property is used to customize the color of border in SfButton.

### XML

```
<button:SfButton x:Name="button" Text="Button" BorderColor = "Red"  
BorderWidth="4">  
</button:SfButton>
```

### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.BorderWidth = 4;  
button.BorderColor = Color.Red;
```

#### *BorderWidth*

The [BorderWidth](#) property is used to customize the thickness of border in SfButton.

### XML

```
<button:SfButton x:Name="button" Text="Button" BorderColor = "Red"  
BorderWidth="4">  
</button:SfButton>
```

### C#

```
SfButton button = new SfButton();  
button.Text = "Button";  
button.BorderWidth = 4;  
button.BorderColor = Color.Red;
```

#### *CornerRadius*

The [CornerRadius](#) property is used to customize the rounded edges in SfButton as demonstrated in the following code sample.

### XML

```
<button:SfButton x:Name="button" Text="Button" CornerRadius="3">
</button:SfButton>
```

### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.CornerRadius = 3;
```

### Image Customization

The image can be customized by its show icon, image source, image width and image alignment.

#### ShowIcon

You can enable the Icon image using the [ShowIcon](#) property to know whether any image appears to the SfButton.

### XML

```
<button:SfButton x:Name="button" Text="Button" ImageSource="Heart.png"
ShowIcon="True">
</button:SfButton>
```

### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.ImageSource = "Heart.png";
button.ShowIcon = True;
```

#### ImageSource

The [ImageSource](#) property is used to customize the icon image of SfButton by adding a custom image.

**Note:** Enable the [ShowIcon](#) property to enable the [ImageSource](#) property.

### XML

```
<button:SfButton x:Name="button" Text="Button" ImageSource="Heart.png"
ShowIcon="True">
</button:SfButton>
```

### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.ImageSource = "Heart.png";
button.ShowIcon = True;
```

#### ImageWidth

The [ImageWidth](#) property is used to customize the width of icon image in SfButton.

**Note:** Enable the [ShowIcon](#) property to enable the [ImageSource](#) property.

#### XML

```
<button:SfButton x:Name="button" Text="Button" ImageSource="Heart.png"
ShowIcon="True" ImageWidth="50">
</button:SfButton>
```

#### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.ImageSource = "Heart.png";
button.ShowIcon = true;
button.ImageWidth = 50;
```

#### ImageAlignment

The [ImageAlignment](#) property is used to customize the alignment of icon image in SfButton.

**Note:** Enable the [ShowIcon](#) property to enable the [ImageSource](#) property.

#### XML

```
<button:SfButton x:Name="button" Text="Button" ImageSource="Heart.png"
ShowIcon="True" ImageAlignment="End">
</button:SfButton>
```

#### C#

```
SfButton button = new SfButton();
button.Text = "Button";
button.ImageSource = "Heart.png";
button.ShowIcon = true;
button.ImageAlignment = Alignment.End;
```

#### Gradient background

You can set the gradient as background of SfButton using the [BackgroundGradient](#) property. It supports the following types of gradients:

- Linear gradient
- Radial gradient

**Note:** UWP platform does not support radial gradient.

Refer to this [documentation](#) to learn more details about gradient.

### XML

```
xmlns:gradient="clr-
namespace:Syncfusion.XForms.Graphics;assembly=Syncfusion.Core.XForms"
. . .
<button:SfButton Text="Linear Gradient" CornerRadius="20">
<button:SfButton.BackgroundGradient>
<gradient:SfLinearGradientBrush>
<gradient:SfLinearGradientBrush.GradientStops>
<gradient:SfGradientStop Color="#2F9BDF" Offset="0"/>
<gradient:SfGradientStop Color="#51F1F2" Offset="1"/>
</gradient:SfLinearGradientBrush.GradientStops>
</gradient:SfLinearGradientBrush>
</button:SfButton.BackgroundGradient>
</button:SfButton>
<button:SfButton Text="Radial Gradient" CornerRadius="20">
<button:SfButton.BackgroundGradient>
<gradient:SfRadialGradientBrush Radius="1.5">
<gradient:SfRadialGradientBrush.GradientStops>
<gradient:SfGradientStop Color="#FFB57B" Offset="0"/>
<gradient:SfGradientStop Color="#FF5361" Offset="1"/>
</gradient:SfRadialGradientBrush.GradientStops>
</gradient:SfRadialGradientBrush>
</button:SfButton.BackgroundGradient>
</button:SfButton>
```

### C#

```
using Syncfusion.XForms.Graphics;
. . .
SfButton linearButton = new SfButton();
linearButton.Text = "Linear Gradient";
linearButton.CnerRadius = 20;
SfLinearGradientBrush linearGradientBrush = new SfLinearGradientBrush();
linearGradientBrush.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.FromHex("#2F9BDF"), Offset = 0 },
    new SfGradientStop() { Color = Color.FromHex("#51F1F2"), Offset = 1 }
};
linearButton.BackgroundGradient = linearGradientBrush;
SfButton radialButton = new SfButton();
radialButton.Text = "Radial Gradient";
radialButton.CnerRadius = 20;
SfRadialGradientBrush radialGradientBrush = new SfRadialGradientBrush();
radialGradientBrush.Radius = 1.5;
radialGradientBrush.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.FromHex("#FFB57B"), Offset = 0 },
    new SfGradientStop() { Color = Color.FromHex("#FF5361"), Offset = 1 }
};
radialButton.BackgroundGradient = radialGradientBrush;
```

### Command

The [Command](#) property is used to associate a command with an instance of SfButton. This property is most often set with MVVM pattern to bind callbacks back into the ViewModel.

**Note:** Default value is [null].

### XML

```
<ContentPage.BindingContext>
<local:CommandDemoViewModel />
</ContentPage.BindingContext>
<button:SfButton x:Name="button" Text="Button" BackgroundColor="{Binding
Background}" Command="{Binding ButtonCommand}">
</button:SfButton>
```

### C#

```
// ViewModel
public class CommandDemoViewModel : INotifyPropertyChanged
{
    private Color _background = Color.Accent;
    public Color Background
    {
        get { return _background; }
        set
        {
            _background = value;
            NotifyPropertyChanged();
        }
    }
    private void NotifyPropertyChanged([CallerMemberName] String propertyName =
    "")
    {
        PropertyChanged?.Invoke(this, new PropertyChangedEventArgs(propertyName));
    }
    public event PropertyChangedEventHandler PropertyChanged;
    public CommandDemoViewModel()
    {
        BackgroundColor();
        this.Background=Color.Accent;
    }
    private void BackgroundColor()
    {
        this.Background = this.Background == Color.DeepSkyBlue ? Color.Accent :
        Color.DeepSkyBlue;
    }
}
```

```
}  
public ICommand ButtonCommand => new Command(BackgroundColor);  
}
```

### Shadow Effect

The button control provides shadow effect support. To enable shadow effect, set the **HasShadow** property to true.

You can customize the color of shadow using the **ShadowColor** property.

### XML

```
<SyncfusionButton:SfButton  
HeightRequest="50"  
WidthRequest="200"  
VerticalOptions="Center"  
HorizontalOptions="Center"  
CornerRadius="25"  
HasShadow="True"  
BorderWidth="1"  
BorderColor="Gray"  
BackgroundColor="#538EEC"  
ImageSource="Basket.png"  
ShowIcon="True"  
ImageAlignment="End"  
Text="ADD To CART"/>
```

### C#

```
SfButton button = new SfButton()  
{  
    HeightRequest = 50,  
    WidthRequest = 200,  
    HorizontalOptions = LayoutOptions.Center,  
    VerticalOptions = LayoutOptions.Center,  
    CornerRadius = new Thickness(25),  
    HasShadow = true,  
    BorderWidth = 1,  
    BorderColor = Color.Gray,  
    BackgroundColor = Color.FromHex("#538EEC"),  
    ImageSource = "Basket.png",  
    ShowIcon = true,  
    ImageAlignment = Alignment.Start,  
    Text = "ADD To CART"  
};  
this.Content = button;
```

---

**Note:** Shadow support has not been provided for UWP Platform.

---

The complete customization sample: [Customization](#)

## How to

Add the custom view for button

You can customize the appearance of the button by adding your custom view in the [Content](#) property. The following code sample demonstrates how to apply the busy indicator control as custom view for a button.

## XML

```
xmlns:busyindicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica
tor.XForms"
. . .
<buttons:SfButton HeightRequest="60" CornerRadius="20"
HorizontalOptions="Center" VerticalOptions="Center">
<buttons:SfButton.Content>
<StackLayout Orientation="Horizontal">
<busyindicator:SfBusyIndicator AnimationType="SingleCircle" IsBusy="True"
TextColor="White" WidthRequest="50"/>
<Label Text="Loading..." FontSize="20" VerticalTextAlignment="Center"
TextColor="White" />
</StackLayout>
</buttons:SfButton.Content>
</buttons:SfButton>
```

## C#

```
using Syncfusion.SfBusyIndicator.XForms;
. . .
SfButton button = new SfButton();
button.HeightRequest = 60;
button.CornerRadius = 20;
button.HorizontalOptions = LayoutOptions.Center;
button.VerticalOptions = LayoutOptions.Center;
StackLayout stackLayout = new StackLayout();
stackLayout.Orientation = StackOrientation.Horizontal;
SfBusyIndicator busyindicator = new SfBusyIndicator()
{
    AnimationType = AnimationTypes.SingleCircle,
    IsBusy = true,
    TextColor = Color.White,
    WidthRequest = 50
};
Label label = new Label()
{
    Text = "Loading...",
    FontSize = 20,
```

```
VerticalTextAlignment = TextAlignment.Center,  
TextColor = Color.White  
};  
stackLayout.Children.Add(busyindicator);  
stackLayout.Children.Add(label);  
button.Content = stackLayout;
```

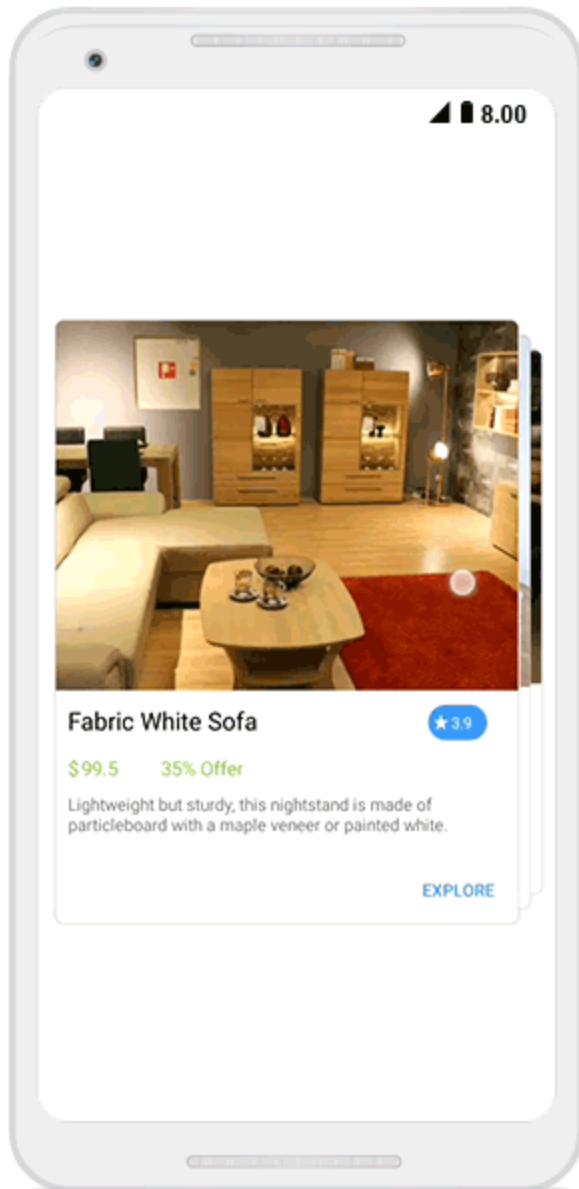

## Cards

### Overview

The new Cards control allows you to create a dismissible card or a stack of cards where one card is visible at a time until you swipe to see the next card.

### Key features

- Allows you swipe to the left or right to move the card smoothly to view the next card.
- Allows you swipe to the left or right to dismiss the card.
- Customizes the background, border width, corner radii, border color, and indicator.
- Provides elevation support in iOS and Android platforms.

## Getting Started

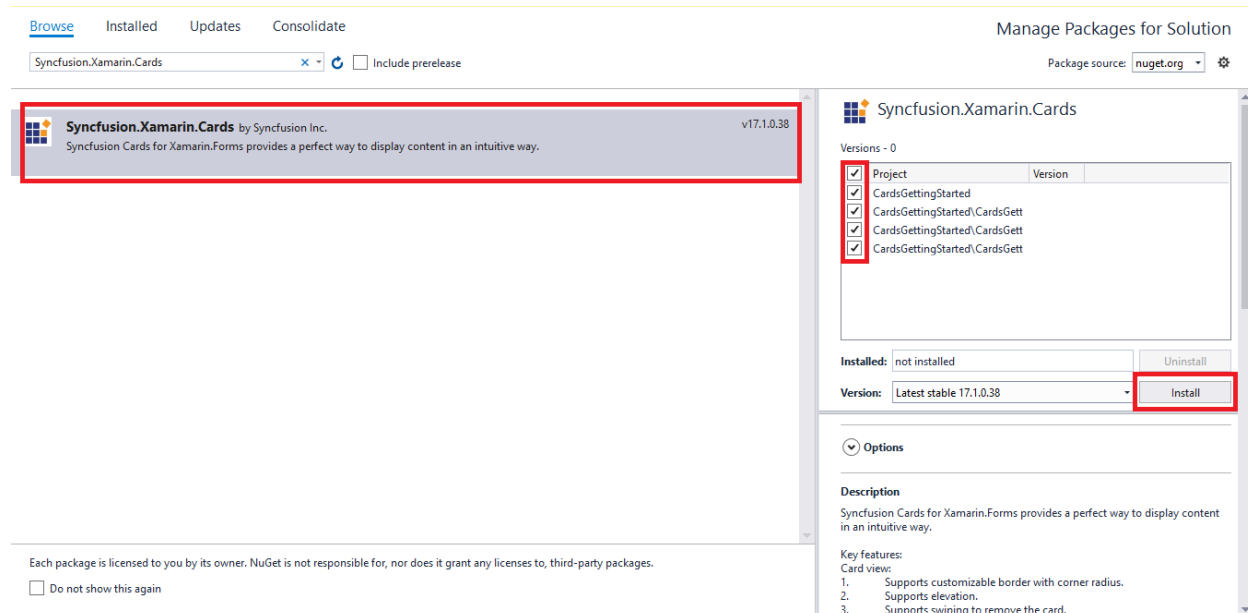

This section explains you the steps required to add content to SfCardView with indicator and add SfCardView to SCardLayout. This section covers only the minimal features needed to get started with the cards.

### Adding cards reference

You can add cards reference using one of the following methods:

#### Method 1: Adding cards reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Cards). To add cards to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Cards](https://www.nuget.org/packages/Syncfusion.Xamarin.Cards), and then install it.

**Note:** Install the same version of the cards NuGet in all the projects.

### Method 2: Adding cards reference from toolbox

Syncfusion provides Xamarin Toolbox. Using this toolbox, you can drag the SfCardView and SfCardLayout to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding Cards assemblies manually from the installed location

If you prefer to manually reference the assemblies instead of referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Cards.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Cards.XForms.Android.dll Syncfusion.Cards.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Cards.XForms.iOS.dll Syncfusion.Cards.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Cards.XForms.UWP.dll Syncfusion.Cards.XForms.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the application on each platform with cards

To use the cards inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and are discussed in the following sections:

**Note:** If you are adding the references from toolbox, below steps are not needed.

#### iOS

To launch the cards in iOS, call the `SfCardViewRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    ...
    global::Xamarin.Forms.Forms.Init();
    Syncfusion.XForms.iOS.Cards.SfCardViewRenderer.Init();
    LoadApplication(new App());
    ...
}
```

#### Universal Windows Platform (UWP)

To deploy the cards in **Release** mode, you need to initialize the cards assemblies in `App.xaml.cs` in the UWP project as shown in the below code snippets.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Cards.SfCardViewRender
er).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
    ...
}
```

### Android

The Android platform does not require any additional configuration to render the cards.

### Initialize cards

Import the [Cards](#) namespace as shown in the following code in your respective page.

#### XML

```
xmlns:cards="clr-
namespace:Syncfusion.XForms.Cards;assembly=Syncfusion.Cards.XForms"
```

#### C#

```
using Syncfusion.Cards.XForms;
```

### SfCardView

Initialize a card view with [Content](#) as shown in the following code.

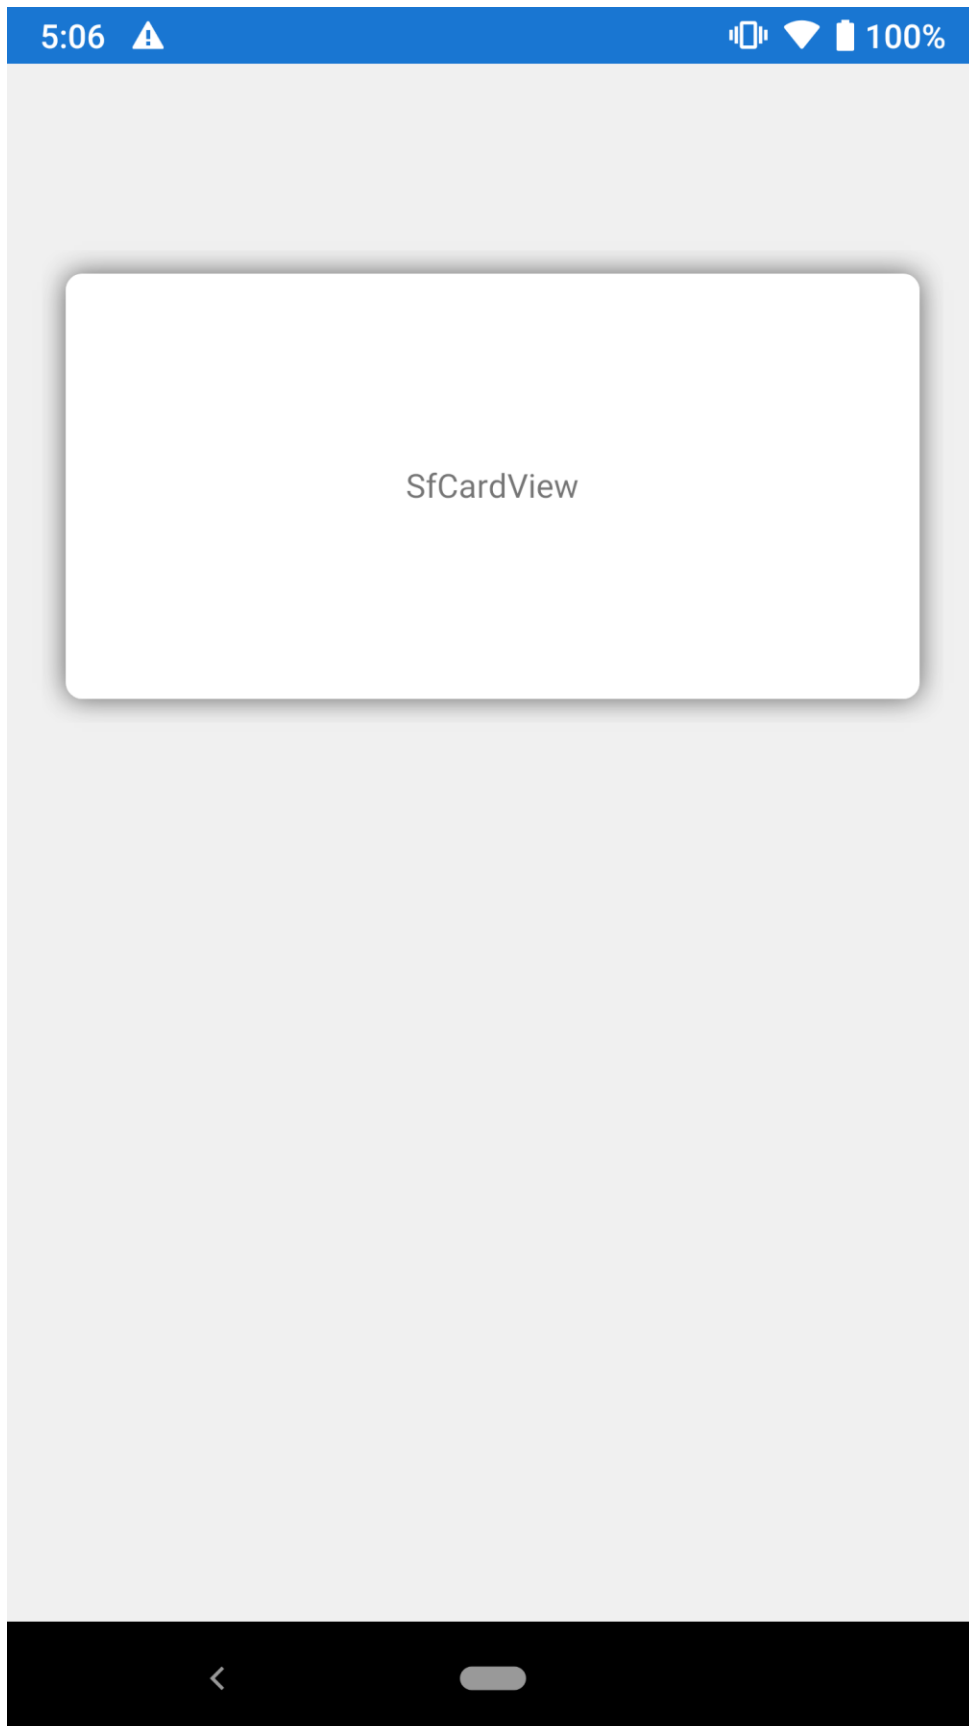

#### XML

```
<cards:SfCardView>
<Label Text="SfCardView"/>
</cards:SfCardView>
```

#### C#

```
SfCardView cardView = new SfCardView();
//set Content for card view
cardView.Content = new Label() { Text="SfCardView" };
this.Content = cardView;
```

Run the project and check if you get following output to make sure that you have configured your project properly to add [Cards](#).

### SwipeToDismiss

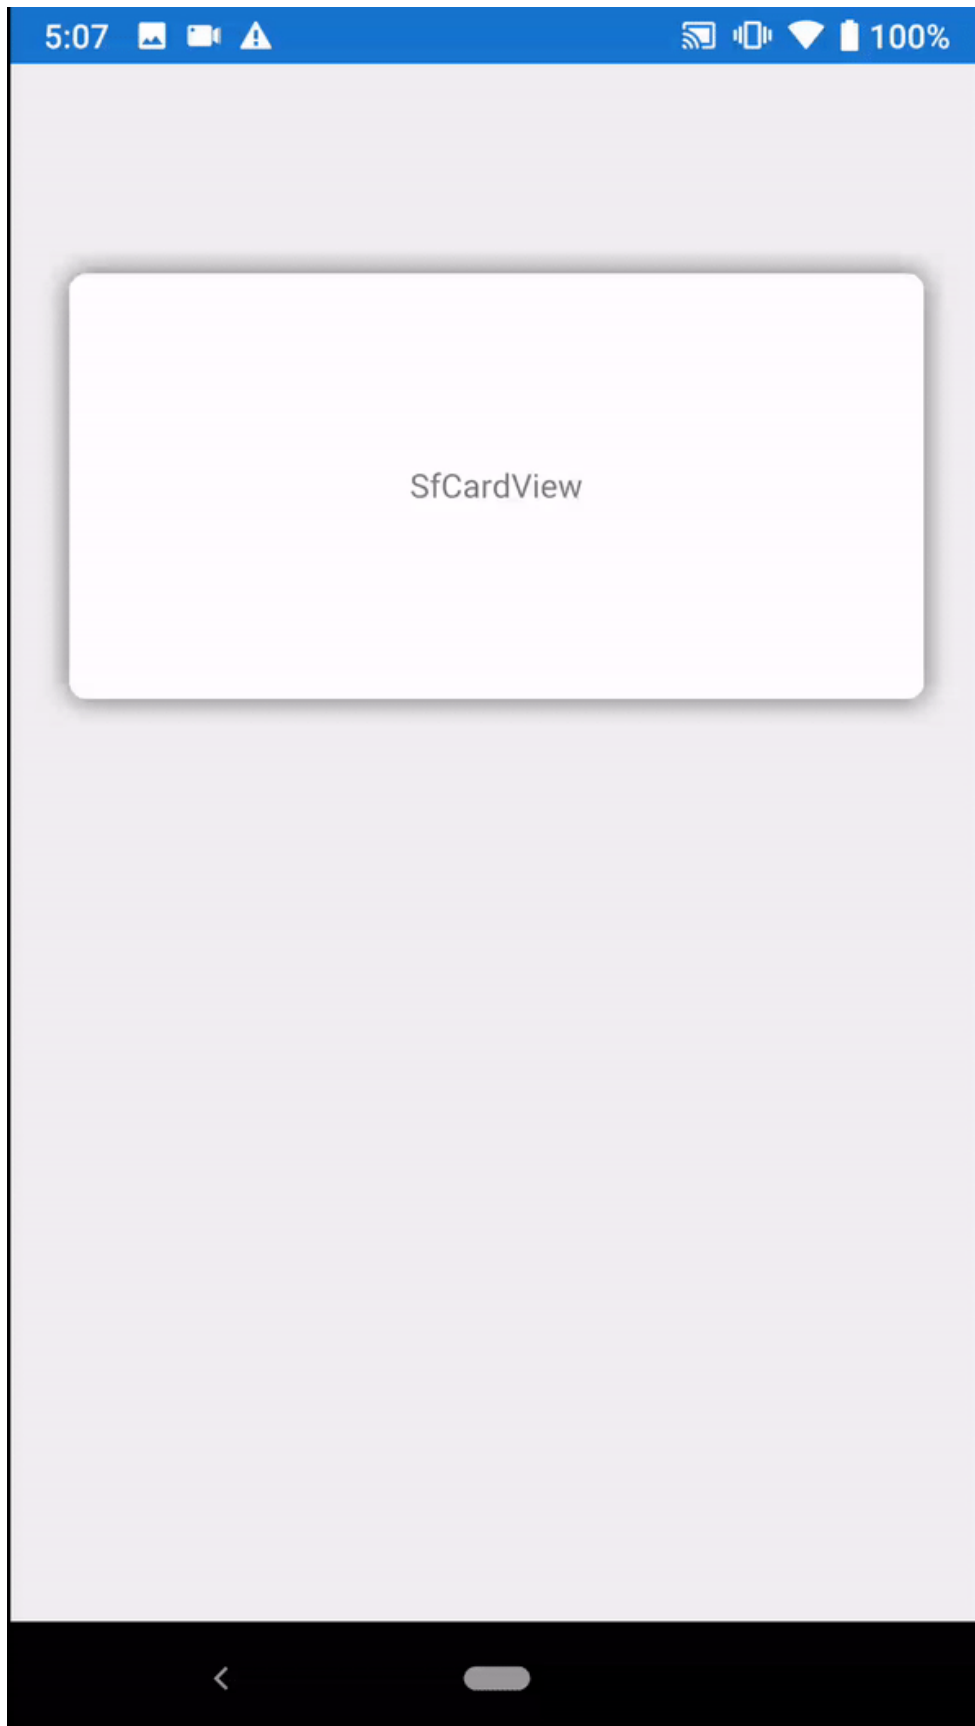

The [SwipeToDismiss](#) property is used to enable or disable swiping in SfCardView.

#### XML

```
<cards:SfCardView SwipeToDismiss="true">
  <Label Text="SfCardView"/>
</cards:SfCardView>
```

#### C#

```
SfCardView cardView = new SfCardView();
cardView.SwipeToDismiss = true;
cardView.Content = new Label() { Text="SfCardView" };
this.Content = cardView;
```

### *SfCardLayout*

Initialize a card layout with card view as shown in the following code.

#### **XML**

```
<cards:SfCardLayout SwipeDirection="Left" HeightRequest="500"
BackgroundColor="#F0F0F0">
<cards:SfCardView>
<Label Text="Cyan" BackgroundColor="Cyan"/>
</cards:SfCardView>
<cards:SfCardView>
<Label Text="Yellow" BackgroundColor="Yellow"/>
</cards:SfCardView>
<cards:SfCardView>
<Label Text="Orange" BackgroundColor="Orange"/>
</cards:SfCardView>
</cards:SfCardLayout>
```

#### **C#**

```
SfCardLayout cardLayout = new SfCardLayout();
//Add children for card layout
cardLayout.Children.Add(new SfCardView(){Content = new Label(){ Text="Cyan",
BackgroundColor=Color.Cyan }});
cardLayout.Children.Add(new SfCardView(){Content = new Label(){
Text="Yellow", BackgroundColor=Color.Yellow }});
cardLayout.Children.Add(new SfCardView(){Content = new Label(){
Text="Orange", BackgroundColor=Color.Orange }});
this.Content = cardLayout;
```

## Customization in CardLayout

### *ShowSwipedCard*

ShowSwipedCard can be enabled to show the swiped cards at the edge of card layout.

#### **XML**

```
<cards:SfCardLayout ShowSwipedCard="true">  
</cards:SfCardLayout>
```

#### **C#**

```
SfCardLayout cardLayout = new SfCardLayout();  
cardLayout.ShowSwipedCard = true;  
this.Content = cardLayout;
```

### *VisibleCardIndex*

VisibleCardIndex is used when given index of the card to be displayed in front of the card layout.

#### **XML**

```
<cards:SfCardLayout VisibleCardIndex="1">  
</cards:SfCardLayout>
```

#### **C#**

```
SfCardLayout cardLayout = new SfCardLayout();  
cardLayout.VisibleCardIndex = 1;  
this.Content = cardLayout;
```

### *SwipeDirection*

The `SwipeDirection` property indicates the swiping direction (left or right).

#### **XML**

```
<cards:SfCardLayout SwipeDirection="Right">  
</cards:SfCardLayout>
```

#### **C#**

```
SfCardLayout cardLayout = new SfCardLayout();  
cardLayout.SwipeDirection = CardSwipeDirection.Right;  
this.Content = cardLayout;
```

You can find the complete getting started sample from this [link](#).

## Customization in CardView

### *Indicator customization*

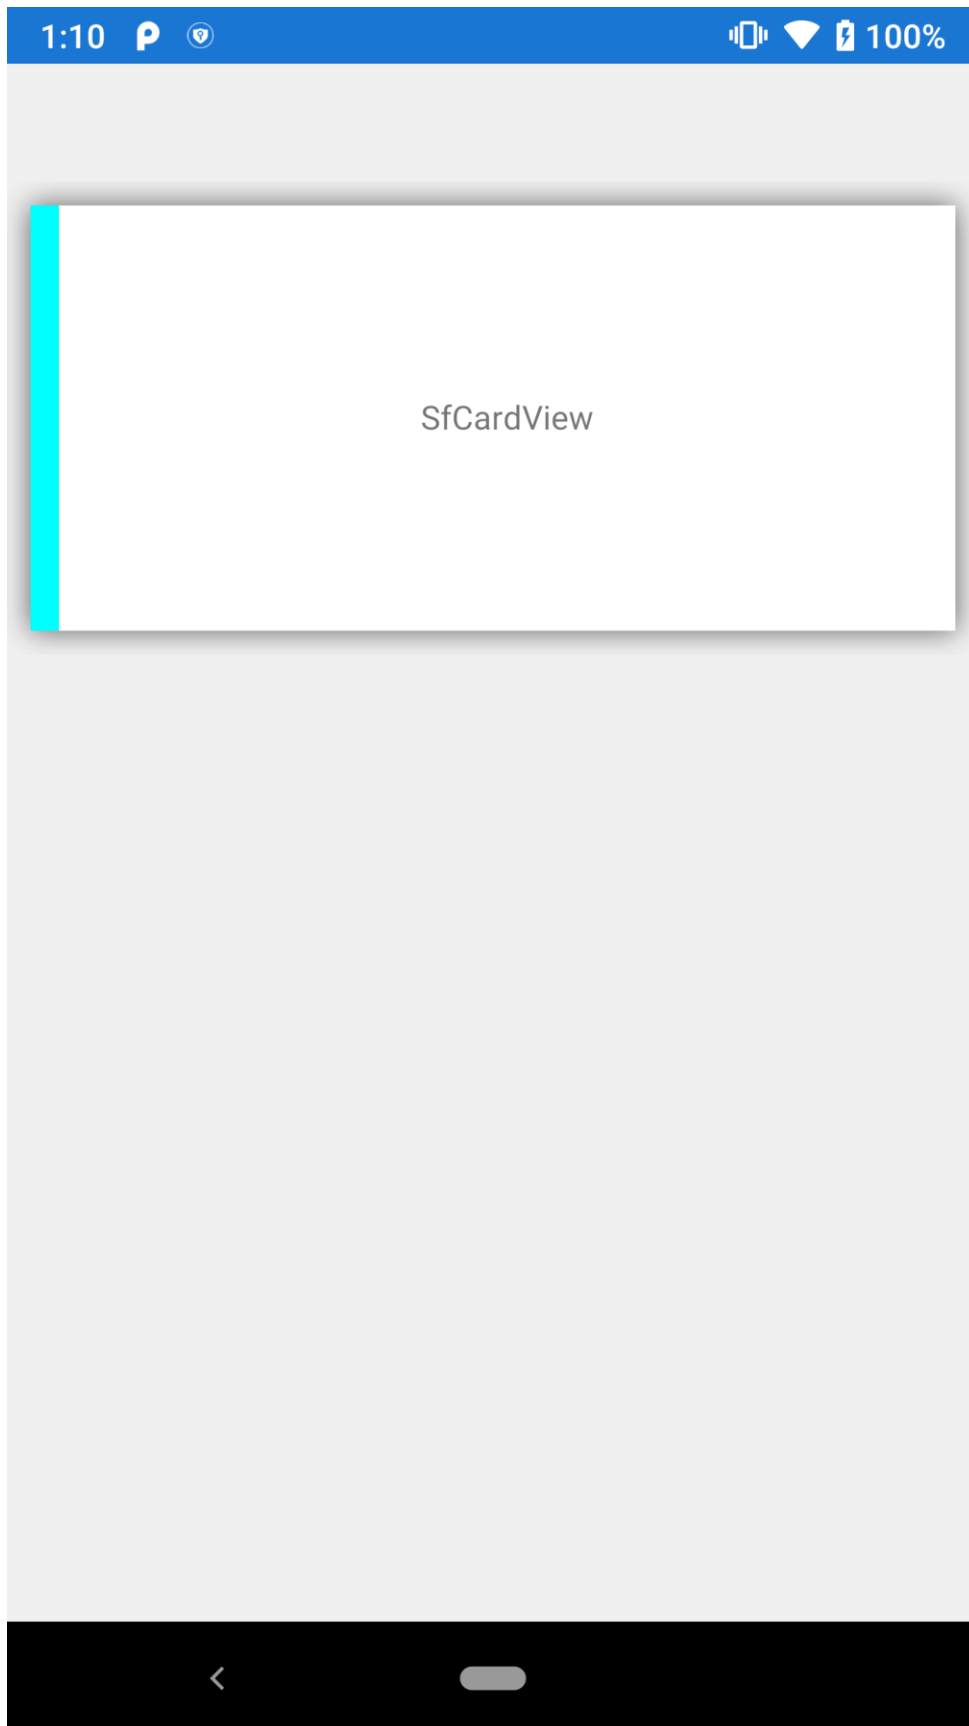

Indicators are used to indicate the state or level of something.

#### **XML**

```
<cards:SfCardView IndicatorColor="Cyan" IndicatorThickness="12"  
IndicatorPosition="Left" />
```

#### **C#**

```
SfCardView cardView = new SfCardView();  
cardView.IndicatorThickness = 12;  
cardView.IndicatorPosition = IndicatorPosition.Left;  
cardView.IndicatorColor = Color.Cyan;
```

### *FadeOutOnSwiping*

FadeOutOnSwiping can be enabled when the card view needs to be faded with respect to swiping.

#### **XML**

```
<cards:SfCardView FadeOutOnSwiping="true"/>
```

#### **C#**

```
SfCardView cardView = new SfCardView();  
cardView.FadeOutOnSwiping = true;
```

You can find the complete getting started sample from this [link](#).

From version 3.5, Xamarin.Forms has introduced a new approach, called BindableLayout, which works with all the layouts that are derived from Layout<T>. By simply setting ItemTemplate and ItemsSource, BindableLayout creates a group of UI (for the given ItemTemplate) for every data in the ItemsSource and add them as children.

Since [SfCardLayout](#) is an extended class of Layout<T>, this approach is also possible for SfCardLayout.

#### Initialize view model

Define a simple data model that represents data to be populated for [SfCardLayout](#).

#### **C#**

```
public class Model  
{  
    public IEnumerable<string> Colors { get; set; }  
}
```

Next, create a view model class and initialize a model object as demonstrated in the following code sample.

#### **C#**

```
public class ViewModel  
{  
    public Model Model { get; set; }  
    public ViewModel()  
    {  
        Model = new Model  
        {  
            Colors = new string[]  
            {  
                "Cyan", "Yellow", "Orange"  
            }  
        };  
    }  
}
```

Set the ViewModel instance as BindingContext of your page to bind properties of ViewModel to [SfCardLayout](#).

**Note:** Add namespace of ViewModel class in your XAML page if you prefer to set BindingContext in XAML.

### XML

```
<ContentPage.BindingContext>
<local:ViewModel></local:ViewModel>
</ContentPage.BindingContext>
```

### C#

```
this.BindingContext = new ViewModel();
```

Populate CardLayout with data

[SfCardLayout](#) can be populated with data by setting the ItemSource property of BindableLayout to a collection of items that can be used in [SfCardView](#).

### XML

```
<cards:SfCardLayout BindableLayout.ItemsSource="{Binding Model.Colors}">
...
</cards:SfCardLayout>
```

### C#

```
SfCardLayout cardLayout = new SfCardLayout();
BindableLayout.SetItemsSource(cardLayout, viewModel.Model.Colors);
```

Define the appearance of SfCardView

[SfCardLayout](#) accepts only [SfCardView](#) as its child. The appearance of each [SfCardView](#) can be defined by setting the BindableLayout.ItemTemplate property.

### XML

```
<cards:SfCardLayout BindableLayout.ItemsSource="{Binding Model.Colors}"
SwipeDirection="Left" VerticalOptions="Center" HeightRequest="300"
WidthRequest="300" BackgroundColor="#F0F0F0">
<BindableLayout.ItemTemplate>
<DataTemplate>
<cards:SfCardView BackgroundColor="{Binding}">
<Label Text="{Binding}" HorizontalOptions="CenterAndExpand"
VerticalTextAlignment="Center"/>
</cards:SfCardView>
</DataTemplate>
</BindableLayout.ItemTemplate>
</cards:SfCardLayout>
```

### Events

#### CardTapped

The [CardTapped](#) event occurs when any card view is tapped. The argument contains the following information:

- [CardView](#) - Gets the details of a particular card view.

### Command

The `CardTappedCommand` property is used to associate a command with an instance of `SfCardLayout`. This property is most often set with MVVM pattern to bind callbacks back into the ViewModel.

### CommandParameter

The `CardTappedCommandParameter` property is used to set the parameter reference, based on which the event argument is shown.

### NOTE

The default value of the `CardTappedCommandParameter` is `null`.

### XML

```
<cards:SfCardLayout CardTappedCommand="{Binding CardTappedCommand}"
CardTappedCommandParameter= "1">
<!--Add children for card layout-->
</cards:SfCardLayout>
```

### C#

```
public class ViewModel
{
    public ViewModel()
    {
        ItemTappedCommand = new Command<object>(CardTapped);
    }
    public ICommand CardTappedCommand { get; set; }
    private void CardTapped(object obj)
    {
        // handle event action.
    }
}
```

### VisibleCardIndexChanging

The `VisibleCardIndexChanging` event occurs when the visible card index is changing. The argument contains the following information:

- `OldCard` - Gets the details of the previous index card.
- `NewCard` - Gets the details of the next possible index card.

### XML

```
<cards:SfCardLayout VisibleCardIndexChanging="VisibleCardIndexChanging" >
<cards:SfCardView>
<Label Text="Cyan" BackgroundColor="Cyan" />
</cards:SfCardView>
<cards:SfCardView>
<Label Text="Yellow" BackgroundColor="Yellow" />
</cards:SfCardView>
<cards:SfCardView>
<Label Text="Orange" BackgroundColor="Orange" />
</cards:SfCardView>
```

```
</cards:SfCardView>
</cards:SfCardLayout>
```

**C#**

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        SfCardLayout cardLayout = new SfCardLayout();
        cardLayout.VisibleCardIndexChanging += VisibleCardIndexChanging;
        //Add children for card layout.
        cardLayout.Children.Add(new SfCardView() { Content = new Label() { Text =
"Cyan", BackgroundColor = Color.Cyan } });
        cardLayout.Children.Add(new SfCardView() { Content = new Label() { Text =
"Yellow", BackgroundColor = Color.Yellow } });
        cardLayout.Children.Add(new SfCardView() { Content = new Label() {
Text="Orange", BackgroundColor = Color.Orange } });
    }
    private void VisibleCardIndexChanging(object sender,
Syncfusion.XForms.Cards.VisibleCardIndexChangingEventArgs e)
    {
        // handle event action.
    }
}
```

**VisibleCardIndexChanged**

The **VisibleCardIndexChanged** event occurs when the visible card index is changed. The argument contains the following information:

- **OldCard** - Gets the details of the previous card.
- **NewCard** - Gets the details of the current card.

**XML**

```
<cards:SfCardLayout VisibleCardIndexChanged="VisibleCardIndexChanged" >
<cards:SfCardView>
<Label Text="Cyan" BackgroundColor="Cyan" />
</cards:SfCardView>
<cards:SfCardView>
<Label Text="Yellow" BackgroundColor="Yellow" />
</cards:SfCardView>
<cards:SfCardView>
<Label Text="Orange" BackgroundColor="Orange" />
</cards:SfCardView>
</cards:SfCardLayout>
```

**C#**

```
public partial class MainPage : ContentPage
{
    public MainPage()
```

```

{
InitializeComponent();
SfCardLayout cardLayout = new SfCardLayout();
cardLayout.VisibleCardIndexChanged += VisibleCardIndexChanged;
//Add children for card layout
cardLayout.Children.Add( new SfCardView() { Content = new Label() { Text =
"Cyan", BackgroundColor = Color.Cyan } });
cardLayout.Children.Add(new SfCardView() {Content = new Label() {
Text="Yellow", BackgroundColor = Color.Yellow } });
cardLayout.Children.Add(new SfCardView() {Content = new Label() {
Text="Orange", BackgroundColor = Color.Orange } });
}
private void VisibleCardIndexChanged(object sender
Syncfusion.XForms.Cards.VisibleCardIndexChangedEventArgs e)
{
// handle event action.
}
}

```

## Calculate

### Overview

Essential Calculate is a native .NET class library which enables to parse and compute the expression or formulas with 400+ predefined functions. It can be used in any .NET environment, including C#, VB.NET and managed C++ code.

It is a non-UI component which provides a full-fledged object model that facilitates formula calculation support without any dependency of Microsoft Office COM libraries & Microsoft Office. This library can be used in Windows Forms, WPF, ASP.NET, Xamarin and UWP application.

The range of calculations include simple algebraic expressions such as  $(1.2^3-1)/8$ , to formulas using intrinsic functions like  $4 \sqrt{\exp(8.4)}$ , to formulas relying on variables that are defined through controls on a form such as  $\cos([textBox1] \text{ pi}()/180)$ , to spreadsheet-like formulas

such as  $\text{Sum}(A2:B14)$ .

Following are the key features of Essential Calculate,

- Extensive calculation support can be added to the user's own business objects.
- It comes with a function library of more than 400+ entries of formulas.
- It provides support to named ranges, dynamic references, array formulas and formula dependencies.
- Supports cross sheet references (can work with multiple sheets).
- Supports custom functions with n-number of optional arguments.
- Culture-sensitive decimal separator and argument separator.
- It can be used in conjunction with Essential XlsIO, to fully load, manipulate and compute Excel spreadsheets.
- It does not depend upon Microsoft Excel and thus enables you to perform calculations independent of Excel.

### Getting Started

This section helps you to get started with Essential Calculate.

### Adding Calculate reference

You can add Calculate reference using one of the following methods:

#### Method 1: Adding Calculate reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Calculate). To add Calculate to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Calculate](https://www.nuget.org/packages/Syncfusion.Xamarin.Calculate), and then install it.

!{Adding Calculate reference from nuget}(Images/Adding Calculate reference.png)

---

**Note:** Install the same version of Calculate NuGet in all the projects.

---

#### Method 2: Adding Calculate reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the Calculate control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding Calculate assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Calculate.Portable.dll Syncfusion.Licensing.dll
-----	---

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Compute formula using CalcQuickBase

The [CalcQuickBase](#) will provide options to directly parse and compute a formula, or register variable names that can later be used in more complex formulas involving these variables.

[CalcQuickBase](#) is predefined derived class from [ICalcData](#).

Below example shows the computation of formula using [ParseAndCompute](#) method of [CalcQuickBase](#).

#### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();
//Computing expressions,
string formula = "(5+25)*2";
string result = calcQuick.ParseAndCompute(formula);
//Computing in built formulas,
string formula = "SUM(5,5)";
string result = calcQuick.ParseAndCompute(formula);
```

### Compute formula using ICalcData

Essential Calculate provides calculation support to arbitrary business objects through [ICalcData](#) interface.

The methods and events used in [ICalcData](#) interface are

- [GetValueRowCol](#) - A method that is used to get the value from mentioned row and column index.
- [SetValueRowCol](#) - A method that is used to set the value to mentioned row and column index.
- [WireParentObject](#) - A method that wires the ParentObject after the [CalcEngine](#) object is created or when a [RegisterGridAsSheet](#) call is made.
- [ValueChanged](#) - An event that occurs when the value is changed.

Below example shows the computation of formula using [ICalcData](#) interface.

#### Creating a Class from ICalcData

Create CalcData class derived from [ICalcData](#) interface,

#### C#

```
public class CalcData : ICalcData
{
    public event ValueChangedEventHandler ValueChanged;
    Dictionary<string, object> values = new Dictionary<string, object>();
    public object GetValueRowCol(int row, int col)
    {
        object value = null;
        var key = RangeInfo.GetAlphaLabel(col) + row;
        this.values.TryGetValue(key, out value);
        return value;
    }
    public void SetValueRowCol(object value, int row, int col)
    {
        var key = RangeInfo.GetAlphaLabel(col) + row;
        if (!values.ContainsKey(key))
            values.Add(key, value);
        else if (values.ContainsKey(key) && values[key] != value)
            values[key] = value;
    }
    public void WireParentObject() {}
    private void OnValueChanged(int row, int col, string value)
    {
        if (ValueChanged != null)
            ValueChanged(this, new ValueChangedEventArgs(row, col, value));
    }
}
```

#### Setting Value into ICalcData

The [SetValueRowCol](#) method is used to set the value to [ICalcData](#) object.

#### C#

```
calcData.SetValueRowCol("10", 1, 1);
calcData.SetValueRowCol("20", 1, 2);
```

### Evaluation of formula

The `ICalcData` object can be integrated into `CalcEngine` by passing it through constructor. Now, you can compute the expressions or equations using `CalcEngine`.

The `ParseAndComputeFormula` method of `CalcEngine` is used to evaluate the formulas using the values from `ICalcData` object by cell references.

### C#

```
calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
string formula = "SUM (A1, B1)";
string result = engine.ParseAndComputeFormula(formula);
```

### Choosing between CalcQuickBase and ICalcData

#### CalcQuickBase

The simplest way to use Essential Calculate is through an instance of its `CalcQuickBase` class. This class provides options to directly parse and compute a formula, or register variable names that can later be used in more complex formulas involving these variables. But we cannot change the values of the variables at runtime for computation. Also by default, `CalcQuickBase` does not try to track any dependencies among the variables you set, hence to enable automatic recalculation of dependent variables, users need to set the `AutoCalc` property to `True`.

For more information regarding calculating with `CalcQuickBase`, refer [here](#)

#### ICalcData

To use Essential Calculate support, we need to derive the class from `ICalcData` interface which allows the `CalcEngine` class to communicate with arbitrary data sources.

To add calculation support to classes that represent data in a row/column format like a Data Grid, then you need to derive the classes inherited from `ICalcData` interface. Since `GetValueRowCol` and `SetValueRowCol` methods

of `ICalcData` interface is used to get and set the values of the variables at runtime for computation. `CalcEngine` listens to the `ValueChanged` event of `ICalcData` interface to tracks the dependencies and compute the formulas.

For more information regarding calculating with `ICalcData`, refer [here](#)

#### Cross Sheet Reference

`CalcEngine` provides support to perform the calculation by accessing the values from the different sheets using `RegisterGridAsSheet` method.

This method registers an `ICalcData` object so it can be referenced in a formula with another `ICalcData` object. `CreateSheetFamilyID` method of `CalcEngine` is used to create a unique family identifier for the sheet.

In `RegisterGridAsSheet` method, while registering the `ICalcData` objects, users need to pass this unique identifier to mark the `ICalcData` objects are belonging to this family. Also cross reference of `ICalcData` objects can be done within the same family.

The class which is derived from `ICalcData` can be registered as a worksheet for identifying the cell references.

Below code illustrates the registering of two `ICalcData` objects and use the cell references from two objects for computation of formula.

### C#

```
//Initialization of first ICalcData object in CalcEngine,
calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
//Initialization of second ICalcData object in CalcEngine,
calcData1 = new CalcData1();
engine = new CalcEngine(calcData1);
//Create a unique family id,
int i = CalcEngine.CreateSheetFamilyID();
//Register the first ICalcData object as "Sheet1",
engine.RegisterGridAsSheet("Sheet1", calcData, i);
//Register the second ICalcData object as "Sheet2",
engine.RegisterGridAsSheet("Sheet2", calcData1, i);
//Access the two sheet references in the formula,
string formula = "SUM(Sheet1!A1, Sheet2!A1)";
//Computation of result,
string result = engine.ParseAndComputeFormula(formula);
```

### Compute formulas in different region settings

Essential Calculate have support to compute the formulas in different region settings. The two static members such as `ParseArgumentSeparator` and `ParseDecimalSeparator` of `CalcEngine` class is used to set the separators based on local region settings. By default, the value of `ParseArgumentSeparator` is comma(,) and the value of `ParseDecimalSeparator` is dot(.).

### C#

```
//Assign the current culture's decimal separator,
CalcEngine.ParseDecimalSeparator =
System.Threading.Thread.CurrentThread.CurrentCulture.NumberFormat.NumberDecimalSeparator.ToCharArray()[0];
//Assign the current culture's argument separator,
CalcEngine.ParseArgumentSeparator =
System.Threading.Thread.CurrentThread.CurrentCulture.TextInfo.ListSeparator.ToCharArray()[0];
```

## Parse and Compute

This section describes about the parse and compute functions in Essential Calculate.

### Parsing

Essential Calculate have built in formula parser to parse the formula into well-formed version to compute internally.

#### Parse Formula

The built-in formula parser will parse the formula into Reverse Polish Notation expression using `ParseFormula` method of `CalcEngine` for computing it.

The parser uses some tokens to identify the operators, operands. It recognizes and replaces the `NameRanges` with their corresponding value. The parser also recognizes library functions and tokenizes them as well.

`ParseFormula` method accepts a string formula and checks whether it is a valid formula that `CalcEngine` can understand.

After that, it returns a string that represents a parsed version of the formula that can be more readily computed.

For example,

Formula: `2+3*1`

Parsed Formula in RPN format: `"n2n3n1ma"`

In this 'n' denotes as values and 'm' denotes as multiplication and 'a' as addition.

Using `ICalcData`,

**C#**

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);  
string formula = "2+3*1";  
string parsedFormula = engine.ParseFormula(formula);
```

Using `CalcQuickBase`,

**C#**

```
CalcQuickBase calcQuick = new CalcQuickBase();  
string formula = "2+3*1";  
string parsedFormula = calcQuick.Engine.ParseFormula(formula);
```

### *Parsing Order*

The parsed formula is a Reverse Polish Notation expression using tokens to compactly represent the entered formula.

All the operands will be indexed into a stack and we need to pop out for calculation. It can be functions, references, operators or constants.

The parsing will be done from left to right and the order for parsing of operators is as follows,

1. E+ E- (handles exponential notation like 1.2e-1 or 1.2e+1 to 1.2e1)
2. ^
3. / \*
4. +(plus), -(minus)
5. < > = <= >= <>
6. &

### *Computation*

Essential Calculate provides support to calculate the formulas using various computation methods.

### *ComputeFormula*

[ComputeFormula](#) method of `CalcEngine` computes the parsed formula from `ParseFormula` method and returns the computed value.

It uses a stack oriented calculation technique to convert the parsed formula into the value that it represents.

Using `ICalcData`,

#### **C#**

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);  
string formula = "2+3*1";  
string parsedFormula = engine.ParseFormula(formula);  
string result = engine.ComputeFormula(parsedFormula);
```

Using `CalcQuickBase`,

#### **C#**

```
CalcQuickBase calcQuick = new CalcQuickBase();  
string formula = "2+3*1";  
string parsedFormula = calcQuick.Engine.ParseFormula(formula);  
string result = calcQuick.Engine.ComputeFormula(parsedFormula);
```

### *ParseAndCompute*

The [ParseAndCompute](#) method of `CalcQuickBase` parses and computes the given formula string and returns the computed value.

#### **C#**

```
CalcQuickBase calcQuick = new CalcQuickBase();  
//Computing Expressions,  
string formula = "(5+25) *2";  
string result = calcQuick.ParseAndCompute(formula);  
//Computing In-Built formulas,  
string formula = "SUM (5,5)";  
string result = calcQuick.ParseAndCompute(formula);
```

### *ParseAndComputeFormula*

The [ParseAndComputeFormula](#) method of `CalcEngine` parses and computes the given formula string passed in and returns the computed value.

Using `ICalcData`,

#### **C#**

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);  
//Computing Expressions,  
string formula = "(5+25) *2";  
string result = engine.ParseAndComputeFormula(formula);  
//Computing In-Built formulas,
```

```
string formula = "SUM (4,5,6)";  
string result = engine.ParseAndComputeFormula(formula);
```

Using CalcQuickBase,

### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();  
//Computing Expressions,  
string formula = "(5+25) *2";  
string result = calcQuick.Engine.ParseAndComputeFormula(formula);  
//Computing In-Built formulas,  
string formula = "SUM (4,5,6)";  
string result = calcQuick.Engine.ParseAndComputeFormula(formula);
```

### Error Messages

The error messages that are displayed by Essential Calculate can be found in the string arrays such as [ErrorStrings](#) and [FormulaErrorStrings](#) of [CalcEngine](#).

After a [CalcEngine](#) object has been created, the text of error messages in this array lists can be changed by altering the array values.

- [ErrorStrings](#) of [CalcEngine](#) gets or sets the list of error strings which are recognized by Excel such as "#N/A", "#VALUE!", "#REF!", "#DIV/0!", "#NUM!", "#NAME?", "#NULL!".
- [FormulaErrorStrings](#) of [CalcEngine](#) holds the list of error strings which are used within the Essential Calculate internally. Users can make changes to this internal error strings

default settings by assigning the new strings to the corresponding position. [ReloadErrorStrings](#) should be invoked to reset or modify the internal error strings.

Below shows the list of [FormulaErrorStrings](#) which are used internally,

"binary operators cannot start an expression",

"cannot parse",

"bad library",

"invalid char in front of",

"number contains 2 decimal points",

"expression cannot end with an operator",

"invalid characters following an operator",

"invalid character in number",

"mismatched parentheses",

"unknown formula name",

"requires a single argument",

"requires 3 arguments",

"invalid Math argument",

"requires 2 arguments",  
"#NAME?",  
"too complex",  
"circular reference: ",  
"missing formula",  
"improper formula",  
"invalid expression",  
"cell empty",  
"bad formula",  
"empty expression",  
"",  
"mismatched string quotes",  
"wrong number of arguments",  
"invalid arguments",  
"iterations do not converge",  
"Control named '{0}' is already registered",  
"Calculation overflow",  
"Missing sheet"

### Formatting the Computed Results

By default, the values will be returned as an object after computation. This value can be converted as a string by using `ToString` method to format the results.

To format the result of the calculations, the result can be parsed by using any of the formatting methods.

#### For example,

`int.Parse` -> For converting to integer

`double.Parse` -> For converting to double

`decimal.Parse` -> For converting to decimal

Using `ICalcData`,

#### C#

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);  
string formula = "SUM (4,5,6)";  
//Formatted as decimal value,  
string result = decimal.  
Parse(engine.ParseAndComputeFormula(formula)).ToString("0.00");  
//Formatted as double value,
```

```
string result1 =  
double.Parse(engine.ParseAndComputeFormula(formula)).ToString("0.00%");
```

Using CalcQuickBase,

### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();  
string formula = "SUM (4,5,6)";  
//Formatted as decimal value,  
string result =  
decimal.Parse(calcQuick.ParseAndCompute(formula)).ToString("0.00");  
//Formatted as double value,  
string result1 =  
double.Parse(calcQuick.ParseAndCompute(formula)).ToString("0.00%");
```

## Working with CalcQuickBase

The simplest way to use Essential Calculate is through an instance of its [CalcQuickBase](#) class. This class provides options to directly parse and compute a formula, or register variable names that can later be used in more complex formulas involving these variables.

After registering the variables, it provides options to perform manual or automatic calculations.

[CalcQuickBase](#) is predefined derived class from [ICalcData](#) interface.

### Compute using values

The [ParseAndCompute](#) method of [CalcQuickBase](#) parses and computes the given formula string and returns the computed value.

### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();  
//Computing Expressions,  
string formula = "(5+25)*2";  
string result = calcQuick.ParseAndCompute(formula);  
//Computing In-Built formulas,  
string formula = "SUM(5,5)";  
string result = calcQuick.ParseAndCompute(formula);
```

### Compute using Variables

Computation using variables is performed by evaluating the formulas or expressions with the [CalcQuickBase](#) registered variable key values.

#### Register variable names

To register the variables in [CalcQuickBase](#), it must be enclosed within square brackets "[ ]". Eg. [A]. These registered variable names are indexer keys.

A variable name must begin with an alphabetical character and can contain only letters and digits. It is not case-sensitive. To register a string as a variable name and

simply index the [CalcQuickBase](#) object with the name. To set its value, assign the value or formula to the registered variable name.

### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();  
calcQuick["A"] = "5";  
calcQuick["B"] = "6";  
calcQuick["C"] = "11";
```

### Evaluation

#### Compute directly with variables

If the user wants the variable to hold a string which is a formula or be treated as a formula, then begin that string with [FormulaCharacter](#) of `CalcQuickBase`. The default value of this `FormulaCharacter` is `"="`.

so, that it is parsed and computed through the indexing code.

Below example shows the computation of formula or expressions directly with registered variable keys.

#### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();  
calcQuick["A"] = "5";  
calcQuick["B"] = "6";  
calcQuick["C"] = "11";  
//Computing expressions,  
calcQuick["result"] = "=[A]+[B])/[C]";  
//Computing In-Built formulas,  
calcQuick["result"] = "=SUM([A],[B])"
```

#### Compute using ParseAndCompute method

The [ParseAndCompute](#) method of `CalcQuickBase` parses and computes the given formula string and returns the computed value.

Any string that is passed in `ParseAndCompute` method of `CalcQuickBase` directly will be treated as a formula, whether or not it begins with `FormulaCharacter`.

Below example shows the computation of formula or expressions using `ParseAndCompute` method of `CalcQuickBase`.

#### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();  
calcQuick["A"] = "5";  
calcQuick["B"] = "6";  
calcQuick["C"] = "11";  
//Computing expressions,  
calcQuick["result"] = calcQuick.ParseAndCompute("([A]+[B])/[C]");  
//Computing in built formulas,  
calcQuick["result"] = calcQuick.ParseAndCompute("SUM([A],[B])");
```

For more information regarding `ParseAndCompute` method, refer [here](#).

#### Automatic calculations

By default, `CalcQuickBase` does not try to track any dependencies among the variables. To enable automatic recalculation of dependent variables,

set the [AutoCalc](#) property of `CalcQuickBase` to `True`. Once this is done, the `CalcQuickBase` object maintains the required dependency information.

[RefreshAllCalculations](#) method of `CalcQuickBase` forces the recalculation of all variables registered with the `CalcQuickBase` object.

This has to be done after the `AutoCalc` property has been set to `True`, so that the dependencies between variables can be monitored.

### C#

```
//Initialize,
CalcQuickBase calcQuick = new CalcQuickBase();
//Registering keys with values,
calcQuick["A"] = "5";
calcQuick["B"] = "6";
calcQuick["C"] = "11";
//Computing in built formulas,
calcQuick["result"] = calcQuick.ParseAndCompute("SUM([A],[B],[C])");
//Setting the Auto calculation mode,
calcQuick.AutoCalc = true;
//To recompute formulas stored in CalcQuickBase object,
calcQuick.RefreshAllCalculations();
//Changing the variable "C" value to "3",
calcQuick["C"] = "3";
//Output result after the change of variable "C",
var Output = calcQuick["result"];
```

### Reset keys

Registered variables or indexer keys registered with `CalcQuickBase` object can be cleared or reset by using [ResetKeys](#) method of `CalcQuickBase` class.

### C#

```
//Initialize,
CalcQuickBase calcQuick = new CalcQuickBase();
//Registering keys with values,
calcQuick["A"] = "5";
calcQuick["B"] = "6";
calcQuick["C"] = "11";
//Clears the registered keys,
calcQuick.ResetKeys();
```

## Working with ICalcData

Essential Calculate provides calculation support to arbitrary business objects through [ICalcData](#) interface. To add calculation support to classes that represent data in a row/column format like a Data Grid, then you need to derive the classes inherited from `ICalcData` interface.

### Methods and Events in ICalcData

`ICalcData` has three methods and one event. This interface allows the [CalcEngine](#) class in Essential Calculate to communicate with arbitrary data sources that implement this interface.

### SetValueRowCol

[SetValueRowCol](#) method is used to set the value to mentioned row and column index. Essential Calculate expects any indexes (rows / column integer values) to be one-based.

An example of defining the `SetValueRowCol` method in custom class(CalcData) is explained below,

#### C#

```
//Custom class,
public class CalcData : ICalcData
{
    Dictionary<string, object> values = new Dictionary<string, object>();
    //Defining SetValueRowCol method in Custom(user defined) Class,
    public void SetValueRowCol(object value, int row, int col)
    {
        var key = RangeInfo.GetAlphaLabel(col) + row;
        if (!values.ContainsKey(key))
            values.Add(key, value);
        else if (values.ContainsKey(key) && values[key] != value)
            values[key] = value;
    }
}

//Main class,
public void Main()
{
    CalcData calcData = new CalcData();
    //To set the data value of a specified row and column,
    calcData.SetValueRowCol(90, 1, 1);
    calcData.SetValueRowCol(50, 1, 2);
}
```

### GetValueRowCol

[GetValueRowCol](#) method is used to get the value from mentioned row and column index. Essential Calculate expects any indexes (rows / column integer values) to be one-based.

An example of defining the `GetValueRowCol` method in custom class(CalcData) is explained below,

#### C#

```
//Custom class,
public class CalcData : ICalcData
{
    Dictionary<string, object> values = new Dictionary<string, object>();
    //Defining GetValueRowCol method in Custom(user defined) Class,
    public object GetValueRowCol(int row, int col)
    {
        object value = null;
        var key = RangeInfo.GetAlphaLabel(col) + row;
        this.values.TryGetValue(key, out value);
        return value;
    }
}

//Main class,
public void Main()
{
    CalcData calcData = new CalcData();
    //To get the data value of a specified row and column,
```

```
var value1 = calcData.GetValueRowCol(1, 1);
var value2 = calcData.GetValueRowCol(1, 2);
}
```

### WireParentObject

[WireParentObject](#) method that wires the ParentObject after the [CalcEngine](#) object is created or when a [RegisterGridAsSheet](#) call is made. The purpose is to give the data object

a chance to do any initialization steps it may need, such as subscribe the events to handle the changes in data notifications.

### ValueChanged

[ValueChanged](#) event of [ICalcData](#) interface occurs whenever the value is changed. The [CalcEngine](#) listens to this event and accordingly reacts to data changes.

It is through this event that formulas are processed and dependencies are tracked by the [CalcEngine](#).

### C#

```
//Custom class,
public class CalcData : ICalcData
{
    public event ValueChangedEventHandler ValueChanged;
    private void OnValueChanged(int row, int col, string value)
    {
        if (ValueChanged != null)
            ValueChanged(this, new ValueChangedEventArgs(row, col, value));
    }
}
```

### Computation using ICalcData

Below example shows the computation of formula using [ICalcData](#) interface.

#### Creating a Class from ICalcData

Create CalcData class derived from [ICalcData](#) interface,

### C#

```
public class CalcData : ICalcData
{
    public event ValueChangedEventHandler ValueChanged;
    Dictionary<string, object> values = new Dictionary<string, object>();
    public object GetValueRowCol(int row, int col)
    {
        object value = null;
        var key = RangeInfo.GetAlphaLabel(col) + row;
        this.values.TryGetValue(key, out value);
        return value;
    }
    public void SetValueRowCol(object value, int row, int col)
    {
        var key = RangeInfo.GetAlphaLabel(col) + row;
        if (!values.ContainsKey(key))
            values.Add(key, value);
        else if (values.ContainsKey(key) && values[key] != value)
            values[key] = value;
    }
}
```

```
values[key] = value;
}
public void WireParentObject() {}
private void OnValueChanged(int row, int col, string value)
{
    if (ValueChanged != null)
        ValueChanged(this, new ValueChangedEventArgs(row, col, value));
}
}
```

### Setting Value into ICalcData

The `SetValueRowCol` method is used to set the value to `ICalcData` object.

#### C#

```
CalcData calcData = new CalcData();
calcData.SetValueRowCol(10, 1, 1);
calcData.SetValueRowCol(20, 1, 2);
```

### Initialization of CalcEngine

The `ICalcData` object can be integrated into `CalcEngine` by passing it through constructor. Now, you can compute the expressions or equations using `CalcEngine`.

#### C#

```
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
```

### Evaluation of formula

The `ParseAndComputeFormula` method of `CalcEngine` is used to evaluate the formulas using the values from `ICalcData` object by cell references.

#### C#

```
CalcData calcData = new CalcData();
calcData.SetValueRowCol(10, 1, 1);
calcData.SetValueRowCol(20, 1, 2);
CalcEngine engine = new CalcEngine(calcData);
string formula = "SUM (A1, B1)";
string result = engine.ParseAndComputeFormula(formula);
```

---

**Note:** To support cross-references among several `ICalcData` objects, you must register the objects with a single instance of the `CalcEngine`.

---

For more reference, refer [here](#).

### Working with CalcEngine

`CalcEngine` encapsulates the code required to parse and compute the formulas. It manages several library functions, hash tables for Essential Calculate.

All the data's in `CalcEngine` is assumed to be part of a rectangular array reference through cell coordinates.

### Computation using CalcEngine

The [CalcEngine](#) interface allows the `CalcEngine` class to communicate with arbitrary data sources that implement this interface.

If any user defined class which implements the `ICalcData` interface needs to be integrated with `CalcEngine`, then that class's object can be passed as parameter

to the `CalcEngine` constructor.

The [ParseAndComputeFormula](#) method of `CalcEngine` parses and computes the string formula passed in and updates the computed value.

#### Using ICalcData

The `ICalcData` object can be integrated into `CalcEngine` by passing it through constructor. Now, you can compute the expressions or equations using `ParseAndComputeFormula`.

#### C#

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
//Computing Expressions,
string formula = "(5+25) *2";
string result = engine.ParseAndComputeFormula(formula);
//Computing In-Built formulas,
string formula = "SUM (4,5,6)";
string result = engine.ParseAndComputeFormula(formula);
```

#### Using CalcQuickBase

[CalcQuickBase](#) is predefined derived class from `ICalcData` interface. So, user can pass the `CalcQuickBase`'s object as parameter to the constructor of `CalcEngine` for computations.

#### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();
//Computing Expressions,
string formula = "(5+25) *2";
string result = calcQuick.Engine.ParseAndComputeFormula(formula);
//Computing In-Built formulas,
string formula = "SUM (4,5,6)";
string result = calcQuick.Engine.ParseAndComputeFormula(formula);
```

### Data Objects maintained in CalcEngine

To track information used during calculations, `CalcEngine` manages several hash tables. In `CalcEngine`, the data's are referred in cell coordinates and these references are maintained as keys in the hash tables.

Below find the list of hash tables in `CalcEngine` and a description of their keys and values.

Hash Table	Key	Value	Description
------------	-----	-------	-------------

<a href="#">FormulaInfoTable</a>	Cell reference	FormulaInfo object	Tracks formula/value information for this cell.
<a href="#">DependentCells</a>	Cell reference	Hashtable object	Tracks cells that depend on this cell.
<a href="#">DependentFormulaCells</a>	Formula cell reference	Hashtable object	Tracks cells in which the formula cell depends upon.
<a href="#">NamedRanges</a>	Name string	Value string	Associates the named range with its value.
<a href="#">LibraryFunctions</a>	Function name	LibraryFunction delegate	Associates the function name with its method.

## Properties in CalcEngine

### [ExcelLikeComputations](#)

To return the result of formula computations of Essential Calculate like Microsoft Excel computational result, this bool property [ExcelLikeComputations](#) is set to true.

### C#

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
engine.ExcelLikeComputations = true;
//Computing the DATE formula similar to excel,
string formula = "DATE(2004,5,6)";
string result = engine.ParseAndComputeFormula(formula);
```

### [AllowShortCircuitIFs](#)

To specifically avoid the computing of non-used alternative in IF function calculations, set [AllowShortCircuitIFs](#) to true.

The default value is false for code legacy consistency. But when it is set as true, only the necessary alternative of an IF function is computed which

leads to increase in performance.

### [AlwaysComputeDuringRefresh](#)

If [PullUpdatedValue](#) method is exclusively used to retrieve the computed values, then setting [AlwaysComputeDuringRefresh](#) property to false

may be more efficient as it will only recompute the value once during the calculations.

### [CalculatingSuspended](#)

[CalculatingSuspended](#) property is set to true, to suspend calculations while a series of changes are made to dependent cells either by the user or programmatically.

When the changes are complete, set this property to false, and then call [RecalculateRange](#) to recalculate the affected ranges.

### C#

```
//Class derived from ICalcData,
```

```

CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
// Turn off calculations
engine.CalculatingSuspended = true;
// Makes multiple updates to cells involved in calculation
for (int i = 0; i < 5; i++)
{
    for (int j = 0; j < 5; j++)
    {
        calcData.SetValueRowCol(random.Next(5) + 1, i, j);
    }
}
// Turn on calculations
engine.CalculatingSuspended = false;
// invoke RecalculateRange, so any formulas in the data can be computed.
engine.RecalculateRange(RangeInfo.Cells(4, 4, 2, 1), calcData);

```

### UseFormulaValues

This property is set to true, when a cell contains more dependency cells to return the formula value stored in `FormulaInfoTable` to avoid

repeated calculations.

### CheckDanglingStack

While computing certain formulas, Essential Calculate ignores the dangling value in the calculation stack and returns the computed value.

If you want this situation flagged as a invalid formula, then set [CheckDanglingStack](#) property to true. The default value is false for backward compatibility purpose.

### ForceRefreshCall

If a value changes, then the [Refresh](#) method is called recursively every time whenever the [ValueChanged](#) event of `ICalcData` is fired. Setting this [ForceRefreshCall](#) property to false will call the [Refresh](#) method for only the cells whose calculated value is actually modified.

### FormulaCharacter

In general, in order for Essential Calculate to recognize a string as containing a formula; then the string is required to start with the [FormulaCharacter](#).

A static property that gets or sets the character to identify the formula. The default value is "=".

### GetValueFromArgPreserveLeadingZeros

If you want to preserve the leading zeros in [GetValueFromArg](#) method, then set [GetValueFromArgPreserveLeadingZeros](#) to true.

## C#

```

//Class derived from ICalcData,
CalcData calcData = new CalcData();
//Assign a value with leading zeros to "A1" cell,
calcData.SetValueRowCol(04510, 1, 1);
CalcEngine engine = new CalcEngine(calcData);
//Setting this property to true, for preserving leading zeros,
engine.GetValueFromArgPreserveLeadingZeros = true;
//Returns the result with leading zeros,
string result = engine.GetValueFromArg("A1")

```

### *IterationMaxCount*

Gets or sets the maximum number of iterative calls that can be made on a cell to avoid circular exception. The default value is 0 indicating that iterative

calculation support is turned off. [ThrowCircularException](#) property will be automatically set to true when you set a non-zero value to [IterationMaxCount](#).

### *IterationMaxTolerance*

Gets or sets the success tolerance used by the **CalcEngine's** iterative calculation support. The iterations in calculation continues until either the iteration count

exceeds [IterationMaxCount](#), or two successive iteration return values have a relative difference less than [IterationMaxTolerance](#). The default value is 0.001.

### *LockDependencies*

A bool property that gets or sets whether a changed value should trigger dependent changes.

### *MaximumRecursiveCalls*

Specifies the maximum number of recursive calls that can be used to compute a cell value. This property comes into play when you have a calculated formula cell that depends on

another calculated formula that depends on another calculated formula and so on. If the depends on another formula exceeds [MaximumRecursiveCalls](#), you will see a too complex message displayed in the cell. The default value is 100, but you can set it higher or lower depending upon your expected needs.

The purpose of the limit is to avoid a circular

reference locking up your application.

### *MaxStackDepth*

Gets or sets the maximum calculation stack depth. The default value is 50. This is the number of recursive calls that can be made during calculations.

### *ParseArgumentSeparator*

A static property that gets or sets the character to be recognized by the parsing code as the delimiter for arguments in a named formula's argument list. The default value is ','.

### **C#**

```
//Assign the argument separator,  
CalcEngine.ParseArgumentSeparator = ',';
```

### *ParseDecimalSeparator*

A static property that gets or sets the character to be recognized by the parsing engine as decimal separator for numbers. The default value is '.'.

### **C#**

```
//Assign the decimal separator,  
CalcEngine.ParseDecimalSeparator = ',';
```

### *ParseDateTimeSeparator*

A static property that gets/sets the character to be recognized by the parsing engine as decimal separator for date. The default value is '/'.

**C#**

```
//Assign the date time separator,
CalcEngine.ParseDateTimeSeparator = '-';
```

*RethrowLibraryComputationExceptions*

Gets or sets whether the **CalcEngine** rethrow any exception raised during the computation of a library function. The default value is false.

*SupportLogicalOperators*

If you want to use any logical operators such as AND, OR, XOR,... in a formula, you can set [SupportLogicalOperators](#) property of **CalcEngine** as true .

**C#**

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
engine.SupportLogicalOperators = true;
string result = engine.ParseAndComputeFormula("=IF("C"="S "OR"
C"="C",1,2)");
```

*SupportsSheetRanges*

Gets or sets whether the sheet range notation is supported. The default value is true. For backward compatibility with earlier versions that did

not support the sheet range notation, you can set [SupportsSheetRanges](#) property to false.

**C#**

```
//Initialization of first ICalcData object in CalcEngine,
calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
//Initialization of second ICalcData object in CalcEngine,
calcData1 = new CalcData();
engine = new CalcEngine(calcData1);
//Create a unique family id,
int i = CalcEngine.CreateSheetFamilyID();
//Register the first ICalcData object as "Sheet1",
engine.RegisterGridAsSheet("Sheet1", calcData, i);
//Register the second ICalcData object as "Sheet2",
engine.RegisterGridAsSheet("Sheet2", calcData1, i);
engine.SupportsSheetRanges = true;
string result =
engine.ParseAndComputeFormula("=SUM(sheet1!B1:B4,sheet2!B1:B4)");
```

*ThrowCircularException*

Gets or sets whether the **CalcEngine** should throw an exception when a circular calculation is encountered. If [ThrowCircularException](#) property is true, then **CalcEngine** will throw an exception when it detects a circular calculation, else no exception is thrown and the calculation will loop recursively until [MaximumRecursiveCalls](#) is exceeded.

### *UseDependencies*

Gets or sets whether the `CalcEngine` should track dependencies or not. If you invoke [PullUpdatedValue](#) to access the computations, then setting [UseDependencies](#) property to false will make things more efficient as any requested computed value will be fully computed every time it is retrieved. In this situation, the `CalcEngine` does not need to track dependencies.

### *UseNoAmpersandQuotes*

Gets or sets whether the computational result of strings should be returned with double quotes or not.

### **C#**

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
engine.UseNoAmpersandQuotes = true;
string result =
engine.ParseAndComputeFormula("=CONCAT(\"abc\", \"sample\")");
```

### *UseDatesInCalculations*

Gets or sets whether dates can be used as operands in calculations. The default value is false. Setting [UseDatesInCalculations](#) property to true, you can compute DateTime related calculations in your application.

### **C#**

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
engine.UseDatesInCalculations = true;
calcData.SetValueRowCol("02/10/2017 11:15 am", 1, 1);
calcData.SetValueRowCol("02/12/2017 9:45 am", 2, 1);
//Computing the difference in hours between two date time values,
string result = engine.ParseAndComputeFormula("=(A2-A1)*24");
```

### *TreatStringsAsZero*

Setting the property [TreatStringsAsZero](#) as true means that if a nonempty string is encountered during an arithmetic

operation or computation, it will be treated as zero.

### Methods in CalcEngine

#### *GetValueFromArg*

This method takes the argument and checks whether it is a parsed formula, a raw number, or a cell reference. It returns the string

by computing the value based on the argument passed in.

### **C#**

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
string result = engine.GetValueFromArg("=SUM(4, 5, 6)");
```

*GetValueFromParentObject*

This method takes the argument and check whether it is a formula or a cell reference and returns either the computed value or the cell value.

**C#**

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
//Assign values,
calcData.SetValueRowCol(2, 1, 2);
calcData.SetValueRowCol(3, 2, 2);
calcData.SetValueRowCol(4, 3, 2);
calcData.SetValueRowCol("=SUM(B1,B2,B3)", 1, 4);
CalcEngine engine = new CalcEngine(calcData);
//Passing the cell reference,
string result = engine.GetValueFromParentObject("D1")
//Passing the row/column index,
string result = engine.GetValueFromParentObject(1, 4);
```

**Note:** [GetValueFromParentObject](#) does not accepts the argument as raw number or parsed formula, it only accepts the cell references whereas [GetValueFromArg](#) accepts parsed formula, a raw number, or a cell reference

*ParseAndComputeFormula*

A method that parses and computes the string formula passed in. For more reference, see [here](#).

*ParseFormula*

A method that parses the string formula passed in. For more reference, see [here](#).

*ComputeFormula*

A method that computes a parsed formula. For more reference, see [here](#).

*RegisterGridAsSheet*

A method that registers an `ICalcData` object so it can be referenced in a formula from another `ICalcData` object. For more reference, see [here](#).

*UpdateCalcID*

Every formula has a calculation ID level associated with it. Every time a formula is retrieved, its calculation ID level is compared with the `CalcEngine`

ID level. If they do not agree, the formula is recomputed. Invoking [UpdateCalcID](#) will force any formula to be recomputed the next time it is retrieved.

**C#**

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
//Assign values initially,
calcData.SetValueRowCol(2, 1, 2);
calcData.SetValueRowCol(3, 2, 2);
calcData.SetValueRowCol(4, 3, 2);
calcData.SetValueRowCol("=SUM(B1,B2,B3)", 1, 4);
CalcEngine engine = new CalcEngine(calcData);
//compute the formula,
string val = engine.ParseAndComputeFormula("D1");
//Changing the value of B2 cell,
```

```
calcData.SetValueRowCol(20, 2, 2);
//Invoking UpdateCalcID method to retrieve latest change,
engine.UpdateCalcID();
//Computing the formula with latest changes,
string val1 = engine.ParseAndComputeFormula("D1");
```

### PullUpdatedValue

This method retrieves the value in the requested cell reference by computing with latest changes of cells that affect the value of the requested cell.

### C#

```
//Initialization of first ICalcData object in CalcEngine,
calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
//Initialization of second ICalcData object in CalcEngine,
ICalcData calcData1 = new CalcData1();
engine = new CalcEngine(calcData1);
//Register the first ICalcData object as "Sheet1",
engine.RegisterGridAsSheet("Sheet1", calcData, 1);
//Register the second ICalcData object as "Sheet2",
engine.RegisterGridAsSheet("Sheet2", calcData1, 1);
//Assign a formula in the calcData1's A1 cell,
calcData1.SetValueRowCol("=SUM(Sheet1!A1, Sheet1!B2, Sheet1!C2,
Sheet1!D2)", 1, 1);
Random r = new Random();
engine.CalculatingSuspended = true;
//Set random values,
calcData.SetValueRowCol(r.Next(74) + 15, 1, 1);
calcData.SetValueRowCol(r.Next(2), 2, 2);
calcData.SetValueRowCol(r.Next(50), 3, 2);
calcData.SetValueRowCol(r.Next(15), 4, 2);
calcData.SetValueRowCol(r.Next(11), 5, 2);
calcData.SetValueRowCol(33 + r.Next(1972), 6, 2);
calcData.SetValueRowCol(r.Next(2), 7, 2);
calcData.SetValueRowCol(r.Next(20), 8, 5);
//Calculations are suspended so need to pull the computed value to make sure
it has been calculated with the latest changes,
engine.UpdateCalcID();
engine.PullUpdatedValue(engine.GetSheetID(calcData1), 1, 1);
//Get the Calculated value from calcData1 object,
string val = calcData1.GetValueRowCol(1, 1).ToString();
engine.CalculatingSuspended = false;
```

### RecalculateRange

Recalculates any formula cells in the specified range of **CalcEngine**.

### C#

```
// Creates some data object that implements ICalcData.
this.data = new ArrayCalcData(a);
// Creates a CalcEngine object using this ICalcData object.
CalcEngine engine = new CalcEngine(this.data);
//Turn off calculations.
engine.CalculatingSuspended = true;
```

```
// Makes multiple updates to this.data.
// Turn on calculations.
engine.CalculatingSuspended = false;
// Calls RecalculateRange so any formulas in the data can be computed.
engine.RecalculateRange(RangeInfo.Cells(1, 1, nRows + 1, nCols + 1), data);
```

### UpdateDependenciesAndCell

This method triggers a calculation for any cells depending upon the given cell.

### C#

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
//Assign values initially,
calcData.SetValueRowCol(2, 1, 2);
calcData.SetValueRowCol(3, 2, 2);
calcData.SetValueRowCol(4, 3, 2);
calcData.SetValueRowCol("=SUM(B1,B2,B3)", 1, 4);
CalcEngine engine = new CalcEngine(calcData);
//Add the formula in formula info hash table,
engine.FormulaInfoTable.Add("D1", new FormulaInfo{FormulaText =
"=SUM(B1,B2,B3)"});
//compute the formula,
string val = engine.ParseAndComputeFormula("D1");
//Changing the value of B2 cell,
calcData.SetValueRowCol(20, 2, 2);
//Invoke UpdateDependenciesAndCell method for the formula cell,
engine.UpdateDependenciesAndCell("D1");
//Computing the formula with latest changes,
string val1 = engine.ParseAndComputeFormula("D1");
```

## Working with Essential XlsIO

Essential XlsIO provides an Excel-like Automation-type support without having Microsoft Excel installed on the host system. This means that you can use this library

to read and write an XLS file and hold its contents in memory. But you cannot perform actual computations on the contents of the XLS file. Hence Essential Calculate

is integrated with Essential XlsIO, to calculate formulas entered at runtime without any additional references or packages.

### Open a Workbook using XlsIO

To open a workbook using XlsIO, instantiate the [ExcelEngine](#) to initialize the application object for creating or manipulating Excel documents. To open an existing workbook,

use the [Open](#) methods of [IWorkbook](#) interface.

### C#

```
//Creates a new instance for ExcelEngine.
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbook
IWorkbook workbook =
excelEngine.Excel.Workbooks.Open(@"..\..\Data\Sample.xlsx");
```

### Enable and Disable Calculations in XlsIO

To perform calculation in an Excel workbook, it is recommended to invoke [EnableSheetCalculations](#) method of [IWorksheet](#). Enabling this method will initialize

[CalcEngine](#) objects and retrieves calculated values of formulas in a worksheet.

On completion of worksheet calculation, it is also recommended to invoke [DisableSheetCalculations](#) method of [IWorksheet](#).

This will dispose all the [CalcEngine](#) objects.

### C#

```
//Creates a new instance for ExcelEngine,
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbook,
IWorkbook workbook =
excelEngine.Excel.Workbooks.Open(@"..\..\Data\Sample.xlsx");
//Accessing the worksheet,
IWorksheet sheet = workbook.Worksheets[0];
//Formula calculation is enabled for the sheet,
sheet.EnableSheetCalculations();
//Assigning values in the worksheet,
worksheet["C3"].Number = 45;
worksheet["C4"].Number = 20;
worksheet["C5"].Number = 38;
//Assigning the formula in the worksheet,
worksheet["C24"].Formula = "=SUM(C3:C4)-C5";
//Getting the calculated value,
var value = sheet.Range["C24"].CalculatedValue;
//Formula calculation is disabled for the sheet,
sheet.DisableSheetCalculations();
```

### Set and Compute the values at runtime in the Worksheet

At runtime, user can set the values in the particular [IWorksheet](#) by indexing the worksheet with the sheet name or id

and then use the appropriate row and column indexes. Invoking [UpdateCalcId](#) and [PullUpdatedValue](#) method of [CalcEngine](#)

guarantees the current/updated values in the workbook.

[CalculatingSuspended](#) method of [CalcEngine](#) is to suspend calculations while a series of changes are made to dependent cells

either by the user or programmatically. When the changes are complete, set this property to False.

### C#

```
//Creates a new instance for ExcelEngine,
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbook,
IWorkbook workbook =
excelEngine.Excel.Workbooks.Open(@"..\..\Data\Sample.xlsx");
//Accessing the worksheet,
IWorksheet sheet = workbook.Worksheets["Inputs"];
Random r = new Random();
```

```

sheet.CalcEngine.CalculatingSuspended = true;
//Set random values into the "Inputs" sheet,
sheet[1, 2].Value = (r.Next(74) + 15).ToString();
sheet[2, 2].Value = r.Next(2) == 1 ? "M" : "F";
sheet[3, 2].Value = r.Next(50);
sheet[4, 2].Value = r.Next(15).ToString();
sheet[5, 2].Value = r.Next(11).ToString();
sheet[6, 2].Value = (33 + r.Next(1972)).ToString();
sheet[7, 2].Value = r.Next(2) == 1 ? "Yes" : "No";
sheet[8, 5].Value = r.Next(20);
//Calculations are suspended so need to pull the computed value to make sure
it has been calculated with the latest changes,
sheet.CalcEngine.UpdateCalcID();
sheet.CalcEngine.PullUpdatedValue(sheet.CalcEngine.GetSheetID("Outputs"), 1,
1);
//Get the Calculated value from "Outputs" sheet,
string val = workbook.Worksheets["Outputs"][1, 1].CalculatedValue;
sheet.CalcEngine.CalculatingSuspended = false;

```

To compute particular cell in the worksheet

To compute particular cell in the worksheet, use [ParseAndComputeFormula](#) method of `CalcEngine`. For more details regarding

`ParseAndComputeFormula` method, refer [here](#).

#### C#

```

//Creates a new instance for ExcelEngine,
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbook,
IWorkbook workbook =
excelEngine.Excel.Workbooks.Open(@"..\..\Data\Sample.xlsx");
//Accessing the worksheet,
IWorksheet sheet = workbook.Worksheets["Sheet1"];
//To calculate particular cell,
sheet.CalcEngine.ParseAndComputeFormula(sheet["C5"].Formula);

```

#### Ambiguity Issue

If the `Calculate.Base` and `XlsIO.Base` references are added in the same application, it will throw conflict errors. Since `Calculate.Base` is already integrated with `XlsIO`. Hence, if `XlsIO.Base` reference has been included in the application,

there is no need to add `Calculate.Base` reference explicitly. The calculate references get reflected in the `XlsIO.Base` permanently.

But if you want both the references in your project, you can use `extern alias` to differentiate the namespaces.

For your reference, please find the MSDN [link](#) regarding

`extern alias`.

#### Table Formulas

A table is a collection of data about a specific topic that is stored in rows and columns. These tables are defined with a name and `CalcEngine` supports these table format.

For Example: =SUM(Table1[#All],[Column1]:[Column2])

A table needs to be defined with the following protocols,

- All table, column, and special item specifiers must be enclosed in matching brackets [ ]
- Expression cannot be used with these brackets. Column headers should be a text strings.
- The special characters such as comma ,, colon :, period ., left bracket [ , right bracket ], pound sign #, single quotation mark ', double quotation mark ",

left brace {, right brace }, dollar sign \$, caret ^, ampersand &, asterisk \*, plus sign +, equal sign =, minus sign -, greater than symbol >, less than symbol <, and division sign / can be used.

These table are converted into cell ranges and then it will be evaluated. The data from one row can also be taken with this table structure.

### C#

```
//Creates a new instance for ExcelEngine,
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbook,
IWorkbook workbook =
excelEngine.Excel.Workbooks.Open(@"..\..\Data\Sample.xlsx");
//Accessing the worksheet,
IWorksheet sheet = workbook.Worksheets[0];
//Formula calculation is enabled for the sheet,
sheet.EnableSheetCalculations();
//Create Table,
IListObject table1 = sheet.ListObjects.Create("Table1", sheet["A1:F6"]);
// Fill table data
sheet[1, 1].Text = "Column1";
sheet[1, 2].Text = "Column2";
sheet[1, 3].Text = "Column3";
sheet[2, 1].Number = 3;
sheet[2, 2].Number = 2;
sheet[2, 3].Number = 16.80;
sheet[3, 1].Number = 5;
sheet[3, 2].Number = 3;
sheet[3, 3].Number = 15.60;
sheet[4, 1].Number = 8;
sheet[4, 2].Number = 2;
sheet[4, 3].Number = 20.10;
string result1 =
sheet.CalcEngine.ParseAndComputeFormula("=SUM(Table1[Column1])");
string result2 =
sheet.CalcEngine.ParseAndComputeFormula("=MIN(Table1[#All])");
```

## Supported Formulas

This section shows the list of formulas supported in Essential Calculate library.

### Database Functions

Name	Description
------	-------------

DCOUNT	Returns the number of cells containing numbers in a field of a list or database that satisfy specified conditions
DCOUNTA	Returns the number of non-blank cells in a field of a list or database, that satisfy specified conditions
DAVERAGE	Calculates the average of values in a field of a list or database, that satisfy specified conditions
DGET	Returns a single value from a field of a list or database, that satisfy specified conditions
DMAX	Returns the maximum value from a field of a list or database, that satisfy specified conditions
DMIN	Returns the minimum value from a field of a list or database, that satisfy specified conditions
DSTDEVP	Calculates the standard deviation (based on an entire population) of values in a field of a list or database, that satisfy specified conditions
DSTEV	Calculates the standard deviation (based on a sample of a population) of values in a field of a list or database, that satisfy specified conditions
DVARP	Calculates the variance (based on an entire population) of values in a field of a list or database, that satisfy specified conditions
DVAR	Calculates the variance (based on a sample of a population) of values in a field of a list or database, that satisfy specified conditions
DSUM	Adds the numbers in the field (column) of records in a list or database that match the conditions you specify
DPRODUCT	Multiplies the values in the field(column) of records in a list or database that match the conditions you specify

### Date and Time Functions

Name	Description
DATE	Returns a date, from a user-supplied year, month and day
DATEVALUE	Converts a text string showing a date, to an integer that represents the date in Excel's date-time code
DAY	Returns the day (of the month) from a user-supplied date

DAYS360	Calculates the number of days between 2 dates, based on a 360-day year (12 x 30 months)
HOUR	Returns the hour part of a user-supplied time
MINUTE	Returns the minute part of a user-supplied time
SECOND	Returns the seconds part of a user-supplied time
MONTH	Returns the month from a user-supplied date
NOW	Returns the current date & time
TIME	Returns a time, from a user-supplied hour, minute and second
TIMEVALUE	Converts a text string showing a time, to a decimal that represents the time in Excel
TODAY	Returns today's date
WEEKDAY	Returns an integer representing the day of the week for a supplied date
YEAR	Returns the year from a user-supplied date
DAYS	Calculates the number of days between 2 dates
EDATE	Returns a date that is the specified number of months before or after an initial supplied start date
EOMONTH	Returns a date that is the last day of the month which is a specified number of months before or after an initial supplied start date
ISOWEEKNUM	Returns the ISO week number of the year for a given date
NETWORKDAYS.INTL	Returns the number of whole network days (excluding weekends & holidays), between two supplied dates, using parameters to specify weekend days
WEEKNUM	Returns an integer representing the week number (from 1 to 53) of the year from a user-supplied date
WORKDAY	Returns a date that is a supplied number of working days (excluding weekends & holidays) ahead of a given start date
WORKDAY.INTL	Returns a date that is a supplied number of working days (excluding weekends & holidays) ahead of a given start date, using supplied parameters to specify weekend days

YEARFRAC	Calculates the fraction of the year represented by the number of whole days between two dates
----------	---

### Engineering Functions

Name	Description
DEC2BIN	Converts a decimal number to binary
DCE2OCT	Converts a binary number to octal
DEC2HEX	Converts a decimal number to hexadecimal
BIN2DEC	Converts a binary number to hexadecimal
BIN2OCT	Converts a binary number to octal
BIN2HEX	Converts a binary number to hexadecimal
HEX2BIN	Converts a hexadecimal number to binary
HEX2DEC	Converts a hexadecimal number to a decimal
HEX2OCT	Converts a hexadecimal number to octal
OCT2BIN	Converts octal number to binary
OCT2DEC	Converts octal number to a decimal
OCT2HEX	Converts octal number to hexadecimal
IMABS	Returns the absolute value (the modulus) of a complex number
IMAGINARY	Returns the imaginary coefficient of a complex number
IMREAL	Returns the real coefficient of a complex number
COMPLEX	Converts user-supplied real and imaginary coefficients into a complex number
IMSUM	Calculates the sum of two complex numbers
IMSUB	Subtracts two complex numbers
IMPRODUCT	Returns the product of up to 255 supplied complex numbers

IMDIV	Returns the quotient of two supplied complex numbers
IMCONJUGATE	Returns the complex conjugate of a complex number
IMSQRT	Returns the square root of a complex number
IMARGUMENT	Returns the argument $\hat{\sim}$ (an angle expressed in radians) of a complex number
IMSIN	Returns the sine of a complex number
IMCSC	Returns the cosecant of a complex number
IMCOS	Returns the cosine of a complex number
IMSEC	Returns the secant of a complex number
IMTAN	Returns the tangent of a complex number
IMCOT	Returns the cotangent of a complex number
IMSINH	Returns the hyperbolic sine of a complex number
IMCSCH	Returns the hyperbolic cosecant of a complex number
IMCOSH	Returns the hyperbolic cosine of a complex number
IMSECH	Returns the hyperbolic secant of a complex number $\hat{\wedge}$
IMLOG10	Returns the base-10 logarithm of a complex number
IMLOG2	Returns the base-2 logarithm of a complex number
IMLN	Returns the natural logarithm of a complex number
IMEXP	Returns the exponential of a complex number
IMPOWER	Calculates a complex number raised to a supplied power
GESTEP	Tests whether a number is greater than a supplied threshold value
DELTA	Tests whether two supplied numbers are equal
BITAND	Returns a Bitwise 'And' of two numbers
BITOR	Returns a Bitwise 'Or' of two numbers

BITXOR	Returns a Bitwise 'Exclusive Or' of two numbers
BITLSHIFT	Returns a number shifted left by a specified number of bits
BITRSHIFT	Returns a number shifted right by a specified number of bits
ERF	Returns the error function integrated between two supplied limits
ERF.PRECISE	Returns the error function integrated between 0 and a supplied limit
ERFC.PRECISE	Returns the complementary error function integrated between a supplied lower limit and infinity
BESSELI	Calculates the modified Bessel function $I_n(x)$
BESSELJ	Calculates the Bessel function $J_n(x)$
BESSELY	Calculates the modified Bessel function $Y_n(x)$
BESSELK	Calculates the modified Bessel function $K_n(x)$
CONVERT	Converts a number from one measurement system to another

## Financial Functions

Name	Description
DB	Calculates the depreciation of an asset for a specified period, using the fixed-declining balance method
DDB	Calculates the depreciation of an asset for a specified period, using the double-declining balance method, or some other user-specified method
FV	Calculates the future value of an investment with periodic constant payments and a constant interest rate
IPMT	Calculates the interest payment for a given period of an investment, with periodic constant payments and a constant interest rate
IRR	Calculates the internal rate of return for a series of cash flows
XIRR	Calculates the internal rate of return for a schedule of cash flows
ISPMT	Returns the interest paid during a specified period of an investment

MIRR	Calculates the internal rate of return for a series of periodic cash flows, considering the cost of the investment and the interest on the reinvestment of cash
NPER	Returns the number of periods for an investment with periodic constant payments and a constant interest rate
NPV	Calculates the net present value of an investment, based on a supplied discount rate, and a series of future payments and income
PMT	Calculates the payments required to reduce a loan, from a supplied present value to a specified future value
PPMT	Calculates the payment on the principal for a given investment, with periodic constant payments and a constant interest rate
PV	Calculates the present value of an investment (i.e. the total amount that a series of future payments is worth now)
RATE	Calculates the interest rate required to pay off a specified amount of a loan, or reach a target amount on an investment over a given period
SLN	Returns the straight-line depreciation of an asset for one period
SYD	Returns the sum-of-years' digits depreciation of an asset for a specified period
VDB	Returns the depreciation of an asset for a specified period, (including partial periods), using the double-declining balance method or another user-specified method
DOLLARDE	Converts a dollar price expressed as a fraction, into a dollar price expressed as a decimal
DOLLARFR	Converts a dollar price expressed as a decimal, into a dollar price expressed as a fraction
DURATION	Calculates the Macaulay duration of a security with an assumed par value of \$100
RRI	Calculates an equivalent interest rate for the growth of an investment
FVSCHEDULE	Calculates the future value of an initial principal, after applying a series of compound interest rates
DISC	Calculates the discount rate for a security
INTRATE	Calculates the interest rate for a fully invested security
CUMIPMT	Calculates the cumulative interest paid between two specified periods
CUMPRINC	Calculates the cumulative principal paid on a loan, between two specified periods

RECEIVED	Calculates the amount received at maturity for a fully invested Security
EFFECT	Returns the effective annual interest rate
ACCRINTM	Returns the accrued interest for a security that pays interest at maturity

### Information Functions

Name	Description
ISERROR	Checks whether the value is an error and returns true or false
ISNUMBER	Checks whether the value is number and returns true or false
ISLOGICAL	Checks whether a value is logical value(TRUE/FALSE) and returns true or false
ISNA	Checks whether a value is #N/A and returns true or false
ISERR	Checks whether the value is an error except #N/A and returns true or false
ISBLANK	Checks whether the reference is to an empty cell and returns true or false
ISTEXT	Checks whether the value is text and returns true or false
ISNONTEXT	Checks whether the value is not text(blank cells are not text) and returns true or false
ISEVEN	Returns true if number is even
LEN	Returns the length of a supplied text string
FIXED	Rounds a supplied number to a specified number of decimal places, and then converts this into text
ISODD	Returns true if number is odd
ERROR.TYPE	Tests a supplied value and returns an integer relating to the supplied value's error type
N	Converts a non-number value to a number, a date to a serial number, the logical valueÂ TRUEÂ to 1 and all other values to 0
NA	Returns the Excel #N/A error
CELL	Returns information about the contents, formatting or location of a given cell
INFO	Returns information about the the current operating environment

TYPE	Returns information about the data type of a supplied value
ISFORMULA	Tests if a supplied cell contains a formula and if so, returns TRUE; Otherwise, returns FALSE

### Logical Functions

Name	Description
AND	Tests a number of user-defined conditions and returnsÂ TRUEÂ ifÂ ALLÂ of the conditions evaluate to TRUE, orFALSEÂ otherwise
OR	Tests a number of user-defined conditions and returnsÂ TRUEÂ ifÂ ANYÂ of the conditions evaluate to TRUE, orFALSEÂ otherwise
IF	Tests a user-defined condition and returns one result if the condition is TRUE, and another result if the condition is FALSE
IFERROR	Tests if an initial supplied value (or expression) returns an error, and if so, returns a supplied value; Otherwise the function returns the initial value.
FALSE	Simply returns the logical valueÂ FALSE
TRUE	Simply returns the logical valueÂ TRUE
NOT	Returns a logical value that is the opposite of a user supplied logical value or expression
IFNA	Tests if an expression returns the #N/A error and if so, returns an alternative specified value; Otherwise the function returns the value of the supplied expression
IFS	Tests a number of supplied conditions and returns a result corresponding to the first condition that evaluates to TRUE
SWITCH	Compares a number of supplied values to a supplied test expression and returns a result corresponding to the first value that matches the test expression
XOR	Returns a logical Exclusive Or of all arguments

### Lookup & Reference Functions

Name	Description
OFFSET	Returns a reference to a range of cells that is a specified number of rows and columns from an initial supplied range

LOOKUP	Searches for a specific value in one data vector, and returns a value from the corresponding position of a second data vector
HLOOKUP	Looks up a supplied value in the first row of a table, and returns the corresponding value from another row
VLOOKUP	Looks up a supplied value in the first column of a table, and returns the corresponding value from another column
MATCH	Finds the relative position of a value in a supplied array
CHOOSE	Returns one of a list of values, depending on the value of a supplied index number
COLUMN	Returns the column number of a supplied range, or of the current cell
ROW	Returns the row number of a supplied range, or of the current cell
INDIRECT	Returns a cell or range reference that is represented by a supplied text string
AREAS	Returns the number of areas in a supplied range
COLUMNS	Returns the number of columns in a supplied range
FORMULATEXT	Returns a formula as a string
HYPERLINK	Creates a hyperlink to a document in a supplied location
ADDRESS	Returns a reference, in text format, for a supplied row and column number
ROWS	Returns the number of rows in a supplied range
SHEET	Returns the sheet number of the referenced sheet
TRANSPOSE	Performs a transpose transformation on a range of cells (i.e. transforms a horizontal range of cells into a vertical range and vice versa)
SHEETS	Returns the number of sheets in reference

### Math & Trigonometry functions

Name	Description
ABS	Returns the absolute value of a number
ACOS	Returns the arccosine of a number

ACOSH	Returns the inverse hyperbolic cosine of a number
ASIN	Returns the arcsine of a number
ASINH	Returns the inverse hyperbolic sine of a number
ATAN	Returns the arctangent of a number
ATAN2	Returns the arctangent from x- and y-coordinates
ATANH	Returns the inverse hyperbolic tangent of a number
SUM	Adds its arguments
PI	Returns the value of pi
POWER	Returns the result of a number raised to a power
POW	Returns the result of a number raised to a power
SUBTOTAL	Returns a subtotal in a list or database
COS	Returns the cosine of a number
SIN	Returns the sine of the given angle
COSH	Returns the hyperbolic cosine of a number
SINH	Returns the hyperbolic sine of a number
TANH	Returns the hyperbolic tangent of a number
TAN	Returns the tangent of a number
ACOT	Returns the arc cotangent of a number, in radians in the range 0 to Pi
ACOTH	Returns the inverse hyperbolic cotangent of a number
SIGN	Returns the sign of a number
SQRT	Returns a positive square root
ROUND	Rounds a number to a specified number of digits
LOG	Returns the logarithm of a number to a specified base

LOG10	Returns the base-10 logarithm of a number
EXP	Returns e raised to the power of a given number
CEILING	Rounds a number to the nearest integer or to the nearest multiple of significance
CEILING.MATH	Returns the RoundUp of the given number to the given significance
COLUMNS	Returns the number of columns of the passed in cell reference
FLOOR	Rounds a number down, toward zero
PRODUCT	Multiplies its arguments
MOD	Returns the remainder from division
TRUNC	Truncates a number to an integer
INT	Rounds a number down to nearest integer
ISEVEN	Returns true if the number is even
SUMPRODUCT	Returns the sum of the products of corresponding array components
EXP	Returns e raised to the power of a given number
INT	Rounds a number down to the nearest integer
RAND	Returns an evenly distributed random number $\geq 0$ and $< 1$
COMBIN	Returns the number of combinations for a given number of objects
DEGREES	Converts radians to degrees
EVEN	Rounds a number up to the nearest even integer
FACT	Returns the factorial of a number
LN	Returns the natural logarithm of a number
ODD	Rounds a number up to the nearest odd integer
RADIANS	Converts degrees to radians
ROUNDDOWN	Rounds a number down, toward zero

ROUNDUP	Returns a number up, away from zero
MROUND	Returns a number rounded to the desired multiple
MULTINOMIAL	Returns the multinomial of a set of numbers
QUOTIENT	Returns the integer portion of a division
FACTDOUBLE	Returns the double factorial of a number
GCD	Returns the greatest common divisor
LCM	Returns the least common multiple
SQRTPI	Returns the square root of (number * pi)
ROMAN	Converts an Arabic numeral to Roman, as text
SUMSQ	Returns the sum of the squares of the arguments
SUMX2MY2	Returns the sum of the difference of squares of corresponding values in two arrays
SUMX2PY2	Returns the sum of the sum of squares of corresponding values in two arrays
SUMXMY2	Returns the sum of squares of differences of corresponding values in two arrays
SUMIFS	Adds the cells specified by a given set of conditions or criteria
SEC	Returns the secant of an angle
SECH	Returns the hyperbolic secant of an angle
COT	Returns the cotangent of an angle
COTH	Returns the hyperbolic cotangent of a number
CSC	Returns the cosecant of an angle
CSCH	Returns the hyperbolic cosecant of an angle
TRUNCATE	Truncates a number to an integer
COMBINA	Returns the number of combinations for a given number of objects
BASE	Converts number into text representation

DECIMAL	Converts text representation of a number in a given base into decimal number
ARABIC	Converts a roman numeral to Arabic
CEILING.MATH	Rounds a number to the nearest integer or to the nearest multiple of significance
MDETERM	Returns the matrix determinant of an array
MMULT	Returns the matrix product of two arrays
MINVERSE	Returns the matrix inverse of an array
MUNIT	Returns the unit matrix for the specified dimension

### Statistical functions

Name	Description
AVG	Returns the average of its arguments
AVERAGE	Returns the average of its arguments
MAX	Returns the maximum value in a list of arguments
MIN	Returns the minimum value in a list of arguments
MAXA	Returns the maximum value in a list of arguments, including numbers, text, and logical values
MINA	Returns the smallest value in a list of arguments, including numbers, text, and logical values
MEDIAN	Returns the median of the given numbers
CONFIDENCE.T	Returns the confidence interval for a population mean
SKEW.P	Returns the skewness of a distribution
COVARIANCE.P	Returns population covariance, the average of the products deviation for each data point pair in two data sets.
COVARIANCE.S	Returns the sample covariance, the average of the products deviation for each data point pair in two data sets.

PERCENTILE.EXC	Returns the Kth percentile of the values in a range, where K is in the range 0â€¦.1 exclusive
PERCENTILE.INC	Returns the Kth percentile of the values in a range, where K is in the range 0â€¦.1 inclusive
PERCENTRANK.EXC	Returns the rank of value in dataset as a percentage of the data set as percentage (0â€¦.1, exclusive) of the dataset
PERCENTRANK.INC	Returns the rank of value in dataset as a percentage of the data set as percentage (0â€¦.1, inclusive) of the dataset
STDEV.P	Calculates standard deviation based on the entire population
STDEV.S	Estimates standard deviation based on a sample
PERMUTATIONA	Returns the number of permutations for a given number of objects
NORM.DIST	Returns the normal cumulative distribution
NORM.INV	Returns the inverse of the normal cumulative distribution
NORM.S.DIST	Returns the standard normal cumulative distribution
NORM.S.INV	Returns the inverse of the standard normal cumulative distribution
WEIBULL.DIST	Returns the Weibull distribution
EXPON.DIST	Returns the exponential distribution
GAMMA.DIST	Returns the gamma distribution
GAMMA.INV	Returns the inverse of the gamma cumulative distribution
GAMMALN.PRECISE	Returns the natural logarithm of the gamma function, $\Gamma(x)$
T.INV	Returns the left-tailed inverse of the Student's t-distribution
F.INV.RT	Returns the inverse of the right-tailed F probability distribution for two data sets
BINOM.INV	Returns the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value
HYPGEOM.DIST	Returns the hypergeometric distribution

LOGNORM.DIST	Returns the cumulative log-normal distribution
LOGNORM.INV	Returns the inverse of the lognormal distribution
CONFIDENCE.NORM	Returns the confidence interval for a population mean, using a normal distribution
CHISQ.DIST.RT	Returns the right-tailed probability of the chi-squared distribution
F.DIST	Returns the F probability distribution
F.DIST.RT	Returns the right-tailed F probability distribution for two data sets
CHISQ.TEST	Returns the chi-squared statistical test for independence
CHISQ.INV	Returns the inverse of the left-tailed probability of the chi-squared distribution
CHISQ.INV.RT	Returns the inverse of the right-tailed probability of the chi-squared distribution
BINOM.DIST	Returns the individual term binomial distribution probability
Z.TEST	Returns the one-tailed probability value of a z-test
RANK.AVG	Returns the statistical rank of a given value, within a supplied array of values (if more than one value has same rank, the average rank is returned)
RANK.EQ	Returns the Mode (the most frequently occurring value) of a list of supplied numbers (if more than one value has same rank, the top rank of that set is returned)
NEGBINOM.DIST	Returns the negative binomial distribution
POISSON.DIST	Returns the Poisson distribution
LOGNORMDIST	Returns the cumulative log-normal distribution
QUARTILE.EXC	Returns the specified quartile of a set of supplied numbers, based on percentile value 0 - 1 (exclusive)
QUARTILE.INC	Returns the specified quartile of a set of supplied numbers, based on percentile value 0 - 1 (inclusive)
AVEDEV	Returns the average of the absolute deviations of data points from their mean

AVERAGEA	Returns the Average of a list of supplied numbers, counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
GAMMALN	Calculates the natural logarithm of the gamma function for a supplied value
GAMMADIST	Returns the gamma distribution
GAMMAINV	Returns the inverse gamma cumulative distribution
GEOMEAN	Returns the geometric mean of a set of supplied numbers
HARMEAN	Returns the harmonic mean of a set of supplied numbers
HYPGEOMDIST	Returns the hypergeometric distribution
INTERCEPT	Calculates the best fit regression line, through a supplied series of x- and y-values and returns the value at which this line intercepts the y-axis
BINOMDIST	Returns the individual term binomial distribution probability
CHIDIST	Returns the right-tailed probability of the chi-squared distribution
CHIINV	Returns the inverse of the right-tailed probability of the chi-squared distribution
CHITEST	Returns the chi-squared statistical test for independence
NORMDIST	Returns the normal cumulative distribution
NORMINV	Returns the inverse of the normal cumulative distribution
NORMSINV	Returns the inverse of the standard normal cumulative distribution
NORMSDIST	Returns the standard normal cumulative distribution
CONFIDENCE	Returns the confidence interval for a population mean, using a normal distribution
CORREL	Returns the correlation coefficient between two sets of values
COUNT	Returns the number of numerical values in a supplied set of cells or values
COUNTA	Returns the number of non-blanks in a supplied set of cells or values
COUNTBLANK	Returns the number of blank cells in a supplied range

COUNTIF	Returns the number of cells (of a supplied range), that satisfy a given criteria
COVAR	Returns population covariance (i.e. the average of the products of deviations for each pair within two supplied data sets)
CRITBINOM	Returns the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value
DEVSQ	Returns the sum of the squares of the deviations of a set of data points from their sample mean
EXPONDIST	Returns the exponential distribution
FDIST	Returns the F probability distribution (probability density or cumulative distribution function)
FINV	Returns the inverse of the right-tailed F probability distribution for two data sets
FISHER	Returns the Fisher transformation
FISHERINV	Returns the inverse of the Fisher transformation
FORECAST	Predicts a future point on a linear trend line fitted to a supplied set of x- and y-values
KURT	Returns the kurtosis of a data set
LARGE	Returns the Kth LARGEST value from a list of supplied numbers, for a given value K
LOGNORMDIST	Returns the cumulative log-normal distribution
LOGINV	Returns the inverse of the lognormal distribution
MODE	Returns the Mode (the most frequently occurring value) of a list of supplied numbers
NEGBINOMDIST	Returns the negative binomial distribution
PEARSON	Returns the Pearson product moment correlation coefficient
PERCENTILE	Returns the K'th percentile of values in a supplied range, where K is in the range 0 - 1 (inclusive)
PERCENTILERANK	Returns the rank of a value in a data set, as a percentage (0 - 1 inclusive)

PERMUT	Returns the number of permutations for a given number of objects
POISSON	Returns the Poisson distribution
PROB	Returns the probability that values in a supplied range are within given limits
QUARTILE	Returns the specified quartile of a set of supplied numbers, based on percentile value 0 - 1 (inclusive)
RANQ	Returns the Mode (the most frequently occurring value) of a list of supplied numbers (if more than one value has same rank, the top rank of that set is returned)
RSQ	Returns the square of the Pearson product moment correlation coefficient
SKEW	Returns the skewness of a distribution
COUNTIFS	Returns the number of cells (of a supplied range), that satisfy a set of given criteria
AVERAGEIF	Calculates the Average of the cells in a supplied range, that satisfy a given criteria
AVERAGEIFS	Calculates the Average of the cells in a supplied range, that satisfy multiple criteria
MODE.SNGL	Returns the Mode (the most frequently occurring value) of a list of supplied numbers
MODE.MULT	Returns a vertical array of the most frequently occurring values in an array or range of data
SLOPE	Returns the slope of the linear regression line through a supplied series of x- and y- values
MAXIFS	Returns the largest value from a subset of values in a list that are specified according to one or more criteria
MINIFS	Returns the smallest value from a subset of values in a list that are specified according to one or more criteria
BETADIST	Returns the cumulative beta probability density function
SMALL	Returns the Kth SMALLEST value from a list of supplied numbers, for a given value K
STANDARDIZE	Returns a normalized value

STDEV	Returns the standard deviation of a supplied set of values (which represent a sample of a population)
STDEVA	Returns the standard deviation of a supplied set of values (which represent a sample of a population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
STDEVP	Returns the standard deviation of a supplied set of values (which represent an entire population)
STDEVPA	Returns the standard deviation of a supplied set of values (which represent an entire population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
STEYX	Returns the standard error of the predicted y-value for each x in the regression line for a set of supplied x- and y- values
GROWTH	Returns numbers in a exponential growth trend, based on a set of supplied x- and y- values
LOGEST	Returns the parameters of an exponential trend for a supplied set of x- and y- values
TRIMMEAN	Returns the mean of the interior of a supplied set of values
VAR	Returns the variance of a supplied set of values (which represent a sample of a population)
VARA	Returns the variance of a supplied set of values (which represent a sample of a population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
VARP	Returns the variance of a supplied set of values (which represent an entire population)
VARPA	Returns the variance of a supplied set of values (which represent an entire population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
WEIBULL	Returns the Weibull distribution
ZTEST	Returns the one-tailed probability value of a z-test

## Text Functions

Name	Description
LEFT	Returns a specified number of characters from the start of a supplied text string
BAHTTEXT	Converts a number, plus the suffix "Baht" into Thai text
EXACT	Tests if two supplied text strings are exactly the same and if so, returns TRUE; Otherwise, returns FALSE. (case-sensitive)
LEN	Returns the length of a supplied text string
TRUNC	Truncates a number to an integer removing decimal part or fractional part
MID	Returns a specified number of characters from the middle of a supplied text string
RIGHT	Returns a specified number of characters from the end of a supplied text string
VALUE	Converts a text string into a numeric value
DOLLAR	Converts a supplied number into text, using a currency format
FIXED	Rounds a supplied number to a specified number of decimal places, and then converts this into text
LOWER	Converts all characters in a supplied text string to lower case
UPPER	Converts all characters in a supplied text string to upper case
TEXT	Converts a supplied value into text, using a user-specified format
TEXTJOIN	Joins together two or more text strings, separated by a delimiter
TRIM	Removes duplicate spaces, and spaces at the start and end of a text string
CLEAN	Removes all non-printable characters from a supplied text string
CONCATENATE	Joins together two or more text strings
SUBSTITUTE	Substitutes all occurrences of a search text string, within an original text string, with the supplied replacement text
T	Tests whether a supplied value is text and if so, returns the supplied text; If not, returns an empty text string.

CODE	Returns the numeric code for the first character of a supplied string
FINDB	Returns the position of a supplied character or text string from within a supplied text string (case-sensitive)
LEFTB	Returns a specified number of characters from the start of a supplied text string
LENB	Returns the length of a supplied text string
MINB	Returns the smallest value in a set of values. does not ignore logical text and values
RIGHTB	Returns a specified number of characters from the end of a supplied text string
NUMBERVALUE	Converts text to a number, in a locale-independent way
PROPER	Converts all characters in a supplied text string to proper case (i.e. letters that do not follow another letter are upper case and all other characters are lower case)
CHAR	Returns the character that corresponds to a supplied numeric value
REPLACE	Replaces all or part of a text string with another string (from a user supplied position)
REPT	Returns a string consisting of a supplied text string, repeated a specified number of times
SEARCHB	Returns the position of a supplied character or text string from within a supplied text string (non-case-sensitive)
UNICHAR	Returns the Unicode character that is referenced by the given numeric value
UNICODE	Returns the number (code point) corresponding to the first character of a supplied text string

### Web Functions

Name	Description
ENCODEURL	Returns a URL-encoded string
FILTERXML	Returns data from XML content, using a specified XPath
WEBSERVICE	Returns data from a web service on the Internet or Intranet

## Operators

The calculation type of an equation will be specified by operators. These operators will be prioritized in a default order for calculating the equation.

### Arithmetic Operators

The mathematical operations such as addition, subtraction, multiplication etc., can be performed using the arithmetic operators.

Arithmetic operator	denotation	Example
+ (plus sign)	Addition	1 + 2
- (minus sign - unary)	Negation	- 5
- (minus sign - binary)	Subtraction	4 - 2
* (asterisk)	Multiplication	2 * 5
/ (forward slash)	Division	10 / 2
^ (caret)	Exponentiation	5 ^ 2

### Logical Operators

The logical or comparison operators will be used to compare two values of the formula. The return value will be either **True** or **False**.

If you use a well-formed logical expression in a larger calculation, True evaluates to numerical 1 and False evaluates to numerical 0 for use in the calculations.

Logical operator	denotation	Example
< (less than sign)	Less than	5 < A2
> (greater than sign)	Greater than	A1 > A2
= (Equal sign)	Equal to	A1 = 4
<= (Less than or equal)	Less than or equal	A3 <= (A4 + 2)
>= (Greater than or equal)	Greater than or equal	B1 >= 30
<>(Not equal)	Not equal	C2 <>10

### Text concatenation operator (Binary literal operator)

Two or more text strings can be concatenated into one text using this operator.

Logical operator	denotation	Example
& (ampersand)	Concatenation	"Hello" & "World"

### Operator precedence

All operations are subjected to the following hierarchy of operations. The level 1 operations are done first, followed by level 2, and so on. Within the same level, the operations are performed from left to right in the order where they are encountered during the parsing of the formula.

1. (Unary Minus)
2. /
3.
  - -
4. < > = <= >= <>
5. & (Concatenation)

When the default operators' precedence need to be changed, then the parentheses will be used to explicitly indicate the operation order.

#### Examples for Operator precedence

Formulas	Computed Value
= 6 / 2 + 1	4
= 6 / (2 + 1)	2
= 2 + 4 / 2	4
= (2 + 4) / 2	3

### Equal Sign, the Formula Character

To indicate that a particular string should be treated as a formula, user must start the string with a special character, `FormulaCharacter("=")`. This property is static, so you can change the formula character within your code.

It's default value is the equal sign, (=).

In general, in order for Essential Calculate to recognize a string as containing a formula; the string is required to start with the [FormulaCharacter](#).

There is one exception though, if you explicitly call a [CalcEngine](#) Parse method like `ParseFormula` or `ParseAndComputeFormula`, including the formula character as the first character in the passed string, is optional.

### Square Brackets, indexers in CalcQuickBase class

If you are using a [CalcQuickBase](#) object to add calculation support to your business object, then you must use strings as indexers on the `CalcQuickBase` instance to get and set values.

To register the strings in `CalcQuickBase`, it must be enclosed within square brackets "[ ]". Eg. [A]. These registered variable names are indexer keys.

### C#

```
CalcQuickBase calcQuick = new CalcQuickBase();
calcQuick["A"] = "5";
calcQuick["B"] = "6";
```

```
calcQuick["C"] = "11";
```

## Named Ranges Support in Essential Calculate

Defining a name for cell, range of cells, formulas, constants or tables is called Named Ranges. By using names, users can easily identify the purpose of cell references

also make the formulas much easier to understand and maintain.

For example, the name can be defined for the cell range of "A1:D1" as "SUMRANGE".

### Syntax to define a name

- The name can be started with a letter or underscore(\_). Also, it must not be a single letter.
- The name must not be equal to cell references. For example: A1
- No space must be included and the name cannot be empty string.
- A name can contain up to 255 characters.
- The names will be case-insensitive. Thus it does not distinguish between uppercase and lowercase characters.

### Add Named Ranges

A name can be added for a cell or range of cells using [AddNamedRange](#) method of [CalcEngine](#).

#### C#

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);  
//Adding the name to the named range collection,  
engine.AddNamedRange("GROUPCELLS", "A1:C4");  
//Using the name for computing formulas,  
string formula = "SUM(GROUPCELLS)";  
string result = engine.ParseAndComputeFormula(formula);
```

### Remove Named Ranges

A name can be removed from a cell or range of cells using [RemoveNamedRange](#) method of [CalcEngine](#).

#### C#

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);  
//Removing the range from NamedRange's collection,  
engine.RemoveNamedRange("GROUPCELLS");
```

### Manage Named Ranges

The names are maintained in a collection called [NamedRanges](#). Also, the ranges of particular name can be changed or replaced using this collection.

#### C#

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);
```

```
//Total name ranges count,
int count = engine.NamedRanges.Count;
//Changing the range of particular named range,
engine.NamedRanges["GROUPCELLS"] = "A3:A8";
```

## Custom Function

Essential Calculate holds many functions from statistics, finance and mathematics, along with other general purpose functions. There are

more than 400+ entries in the library. Also, it is easy to add the own calculations with custom functions.

### LibraryFunction

A property which holds the collection of library functions in Essential Calculate is [LibraryFunctions](#). The function name in the library should only contain letters, digits or underscore. The function name serves as the hash key and the function delegate serves as the hash value.

### Add Custom Function

Adding a custom function to the Formula Library in Essential Calculate is a two step process. The first step is to write a method that actually does the calculation work for your

custom function. The second step is to register this method with the [CalcEngine](#). So, when the [CalcEngine](#) object is a member of an application, the additional

function methods can be added to the application and then these methods should be registered with the [CalcEngine](#) object after the object is created.

### Write a method

The method must have the signature specified by the delegate, [LibraryFunction](#). The method must accept a string argument and returns a string value.

For writing a custom formula method, any convention with respect to passing arguments can be used within the implementation code. Thus, arguments can be a single entry

like A1 or 153 or it can be more complex like A1:C15. The computed value will be returned as a string. The arguments can be enhanced with standard items like cell references,

numbers, other formulas, etc., using the parsing tools of [CalcEngine](#) to minimize the amount of code that is required to be written.

Below code example shows implementing the custom function of computing minimum value,

### C#

```
public string CustomMin(string args)
{
    double min = double.MaxValue;
    double d;
    var splitArgs = args.Split(new char[] { CalcEngine.ParseArgumentSeparator
});
    foreach (string s in splitArgs)
    {
        if (double.TryParse(s, NumberStyles.Number | NumberStyles.AllowExponent,
            null, out d))
        min = Math.Min(min, d);
    }
}
```

### Register the method with CalcEngine

The second step for adding the own formula is to register the custom method with the `CalcEngine` object. This is done with the help of `AddFunction` method of `CalcEngine` which accepts the string that is used when you refer the function, and the second argument is a delegate for method name. The only requirement here is that the function name should

start with an alpha character and should only contain alpha-numeric characters. Additionally, the string cannot be the name of any existing library function.

#### C#

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
//Adding custom function to the library with user defined formula name,
engine.AddFunction("CheckMin", new LibraryFunction(CustomMin));
```

### Compute the Custom Function

To compute the custom formula, you need to pass the registered custom formula in `PareAndComputeFormula` method of `CalcEngine`.

#### C#

```
//Set value 100 to variable "A1"
calcData.SetValueRowCol(100, 1, 1);
//Set value 200 to variable "B1"
calcData.SetValueRowCol(200, 1, 2);
//Set value 300 to variable "C1"
calcData.SetValueRowCol(300, 1, 2);
//compute the registered method using CalcEngine.
var r = engine.PareAndComputeFormula("=CustomMin(A1,B1,C1)");
```

### Remove Custom Function

To remove a single function from the Function Library, use `RemoveFunction` method of `CalcEngine`, passing a formula name as the string that references this function and to remove all functions, you can clear the hash table that holds them by using the `Clear` method of `LibraryFunction`.

#### C#

```
//To remove a single function from library,
engine.RemoveFunction("CheckMin");
//To remove all functions from library,
engine.LibraryFunctions.Clear();
```

### Replace Function

To replace a function with another implementation, remove the original name and add the same name again with a different method name.

#### C#

```
// Remove formula name "CheckMin" from the library,
engine.RemoveFunction("CheckMin");
```

```
//Adds formula name "Minimum" to the library,  
engine.AddFunction("Minimum", new LibraryFunction(CustomMin));
```

**Tips:** Removing unused functions from the Function Library, **reduces the memory usage and speeds up parsing** as well. Also, if you are only

using a selected few Library functions, you may want to remove the unused ones. This can be done using the `Clear` method of `LibraryFunction`.

and after clearing all functions, you can add few functions that will be used often by using `AddFunction` method of `CalcEngine`.

## Performance and Limitations

This section explains about the performance and limitations of Essential Calculate.

To improve the performance

By default, `CalcEngine` calculates the formulas quickly. But to improve the performance in Essential Calculate, user need to set the following

properties of `CalcEngine`.

### AllowShortCircuitIFs

If the application contains more nested if formulas for calculation, then setting `AllowShortCircuitIFs` property to `true` computes the formulas quickly.

### CalculatingSuspended

If there are more number of dependent cells in the formulas for calculation, then user can set `CalculatingSuspended` property to `true`,

to suspend calculations while a series of changes are made to dependent cells either by the user or programmatically.

### UseFormulaValues

To avoid the repeated calculations for a formula cell which contains more dependency cells, set `UseFormulaValues` property to `true` to

return the formula value stored in `FormulaInfoTable`.

### Parse Formula and Compute Formula

`ParseFormula` method in `CalcEngine` parses the formula in the cell and user can

reset the value of variables or dependent cell values of formula cell at runtime and get the updated result by computing the parsed formula using

`ComputeFormula` method which avoids the repeated parsing of formula.

**For Example:**

### C#

```
//Class derived from ICalcData,  
CalcData calcData = new CalcData();  
CalcEngine engine = new CalcEngine(calcData);
```

```
//Set values to the variables
calcData.SetValueRowCol(100, 1, 1);
calcData.SetValueRowCol(200, 1, 2);
calcData.SetValueRowCol(140, 2, 2);
calcData.SetValueRowCol(120, 3, 2);
calcData.SetValueRowCol(100, 4, 2);
//Parsing the formula,
var parsedFormula = engine.ParseFormula("=SUM(A1:E4)");
//Computing the value of parsed formula,
string result = engine.ComputeFormula(parsedFormula);
//Computes the nested IF formulas quickly,
engine.AllowShortCircuitIFs = true;
//To avoid the repeated calculations,
engine.UseFormulaValues = true;
// Turn off calculations,
engine.CalculatingSuspended = true;
// Makes multiple updates to cells involved in calculation
for (int i = 0; i < 5000; i++)
{
    for (int j = 0; j < 5000; j++)
    {
        calcData.SetValueRowCol(random.Next(5) + 1, i, j);
    }
}
// Turn on calculations,
engine.CalculatingSuspended = false;
//Again computing the value of parsed formula,
result = engine.ComputeFormula(parsedFormula);
```

### To avoid stack overflow exception

To avoid the stack overflow exception while computing the formulas iteratively exceeding the maximum capacity, user need to set the following properties of `CalcEngine`,

#### ThrowCircularException

Setting this property to `true` will throw an exception when the circular exception is encountered and also

avoids the recursive looping.

#### IterationMaxCount

`CalcEngine` provides an option to set iterative calculations and maximum iteration count to calculate the formula having circular references.

The default value is 0 indicating that iterative calculation support is turned off.

`ThrowCircularException` property will be automatically set

to `true` when you set a non-zero value to `IterationMaxCount`.

#### MaximumRecursiveCalls

`CalcEngine` have `MaximumRecursiveCalls` property for which value is 100 by default. So, if the recursive call during calculations exceeds more than 100,

stack overflow exception occurs which can be avoided by setting this property to required limit at the sample level.

### MaxStackDepth

CalcEngine have MaxStackDepth property for which value is 50 by default. So, if the stack size is exceeding more than 50, stack overflow exception

occurs which can be avoided by setting this property to required limit at the sample level.

#### C#

```
//Class derived from ICalcData,
CalcData calcData = new CalcData();
CalcEngine engine = new CalcEngine(calcData);
CalcEngine.MaxStackDepth = 10000;
engine.MaximumRecursiveCalls = 10000;
engine.IterationMaxCount = 10000;
```

If the *stack overflow exception* occurs even after setting these properties, user need to calculate the value in the thread by

specifying the maximum stack size (Default stack size is 1 Mb. Throws exception if exceeds).

#### C#

```
private string calValue1;
CalcEngine engine;
private void Main()
{
    //Class derived from ICalcData,
    CalcData calcData = new CalcData();
    engine = new CalcEngine(calcData);
    calValue1 = String.Empty;
    var maxSize = 10000000;
    var thread = new Thread(GetCalculatedValue, maxSize);
    thread.Start();
    thread.Join();
    MessageBox.Show("val:" + calValue1);
}
private void GetCalculatedValue()
{
    engine.UseFormulaValues = true;
    engine.MaximumRecursiveCalls = 10000;
    CalcEngine.MaxStackDepth = 10000;
    //Computing the value of formula cell "D1",
    calValue1 = engine.ParseAndComputeFormula("D1");
}
```

### Limitations

- Essential Calculate is not a UI component, but it can be added to the user's own business objects.
- Essential Calculate does not support to localize the registered formulas in the Calculate API to any specific language other

than English(en-US), which is by default. But we have support to compute the formulas in different region settings.

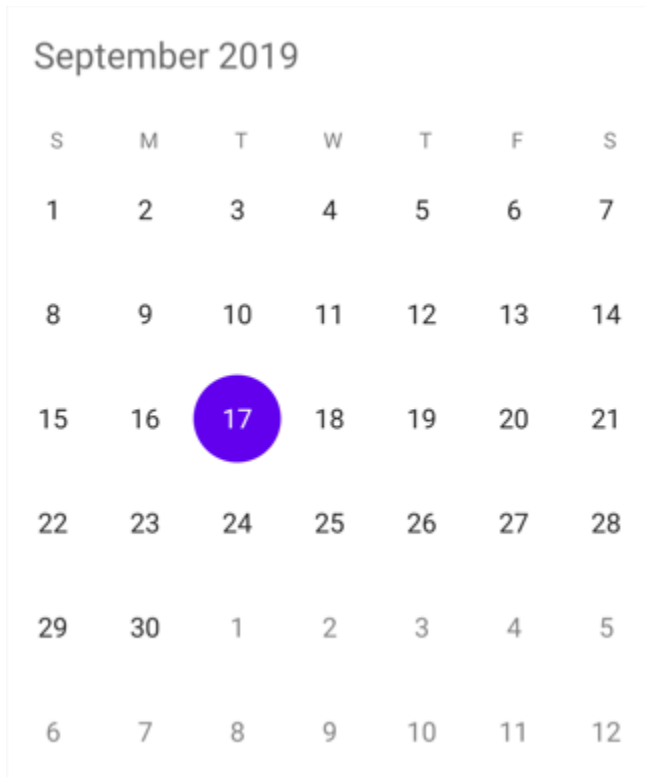

- The parameters passed in any of the function library of Essential Calculate is of type string.

## SfCalendar

### Overview

The Essential Xamarin Calendar widget provides the multi-view representation to display and select one or more dates within specified ranges. Also provides a gesture friendly UI to perform operations like navigations, events, etc.

Essential Calendar can be used in various scenarios like ticket booking, events notifying, display working days etc.

### Key Features

- **Built-in Views** – A multi-view representation to display dates in month, year, decade, century view based on the view mode.
- **Selection** – Enables users to select one or multiple dates.
- **Min Max dates** – Visible dates can be limited using the specified Minimum and Maximum dates.
- **Blackout dates** – A collection of dates with cross mark representation that cannot be interacted.

### Getting Started

This section explains how to implement simple holiday indicator application which allows user to select working days using [SfCalendar](#) control.

### Adding SfCalendar reference

You can add SfCalendar reference using one of the following methods:

#### Method 1: Adding SfCalendar reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfCalendar). To add SfCalendar to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfCalendar](https://www.nuget.org/packages/Syncfusion.Xamarin.SfCalendar), and then install it.

![Adding SfCalendar reference from NuGet](images/Adding SfCalendar reference.png)

---

**Note:** Install the same version of SfCalendar NuGet in all the projects.

---

#### Method 2: Adding SfCalendar reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfCalendar control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfCalendar assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfCalendar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfCalendar.Android.dll Syncfusion.SfCalendar.XForms.Android.dll Syncfusion.SfCalendar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfCalendar.iOS.dll Syncfusion.SfCalendar.XForms.iOS.dll Syncfusion.SfCalendar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfCalendar.XForms.UWP.dll Syncfusion.SfCalendar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

---

---

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching the SfCalendar on each platform

To use SfCalendar inside an application, each platform application must initialize the SfCalendar renderer. This initialization step varies from platform to platform and is discussed in the following sections.

#### Android and UWP

The Android and UWP launches the SfCalendar without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

#### iOS

To launch SfCalendar in iOS, need to create an instance of SfCalendarRenderer in FinishedLaunching overridden method of AppDelegate class in iOS Project as shown below.

#### C#

```
using Syncfusion.SfCalendar.XForms.iOS;
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    SfCalendarRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### ReleaseMode issue in UWP platform

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in Release Mode.

The above problem can be resolved by initializing the SfCalendar assemblies in App.xaml.cs in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfCalendarRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
}
```

### Create a Simple SfCalendar

The **SfCalendar** control is configured entirely in C# code or by using XAML markup. The following steps explain on how to create a **SfCalendar** and configure its elements,

- Adding namespace for the added assemblies.

#### XML

```
xmlns:syncfusion="clr-namespace:Syncfusion.SfCalendar.XForms;assembly=Syncfusion.SfCalendar.XForms"
```

#### C#

```
using Syncfusion.SfCalendar.XForms;
```

- Now add the SfCalendar control with a required optimal name by using the included namespace.

#### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:syncfusion="clr-namespace:Syncfusion.SfCalendar.XForms;assembly=Syncfusion.SfCalendar.XForms"
x:Class="GettingStarted.CalendarPage">
<ContentPage.Content>
<syncfusion:SfCalendar x:Name="calendar" />
</ContentPage.Content>
</ContentPage>
```

#### C#

```
using Syncfusion.SfCalendar.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class CalendarPage : ContentPage
    {
        public CalendarPage()
        {
            InitializeComponent();
            SfCalendar calendar = new SfCalendar();
            this.Content = calendar;
        }
    }
}
```

### Set Blackout Dates

**SfCalendar** control provides option to black out the desired date which is in disabled state among the visible dates. Here, holidays are blacked out in the form which cannot be selected by the user. To black out the holiday, add them into [BlackoutDates](#) list.

#### C#

```
SfCalendar calendar = new SfCalendar();
List<DateTime> black_dates = new List<DateTime>();
for (int i = 0; i < 5; i++)
{
    DateTime date = new DateTime(2018, 4, 1+i);
    black_dates.Add(date);
}
calendar.BlackoutDates = black_dates;
```

### Enable Multiple Selection

**SfCalendar** control allows user to select one or more dates at a time among the non black out dates.

To enable it set **MultiSelection** option in **SelectionMode** enumeration property.

#### XML

```
<syncfusion:SfCalendar x:Name="calendar" SelectionMode="MultiSelection" />
```

#### C#

```
SfCalendar calendar = new SfCalendar();
calendar.SelectionMode=SelectionMode.MultiSelection;
```

### Restrict Dates

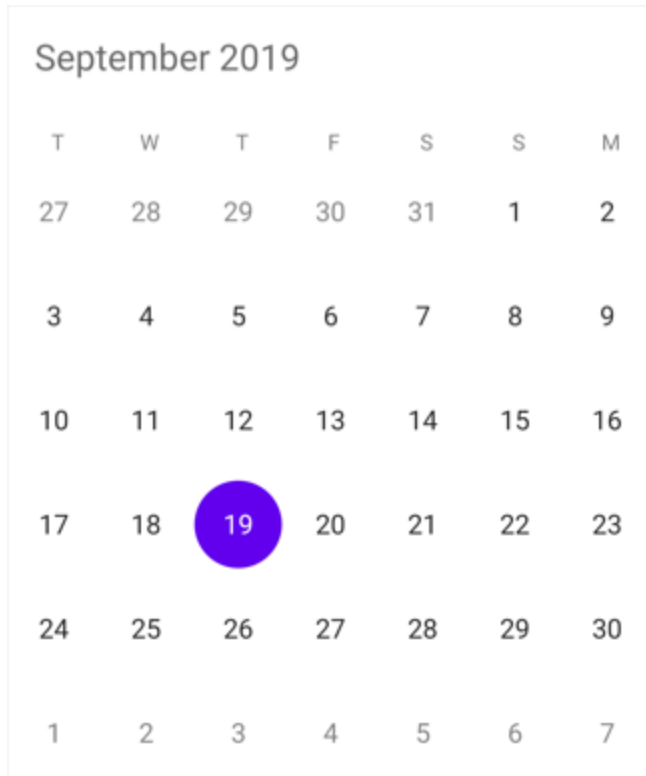

**SfCalendar** allows to select dates that falls between certain range of dates. Here, restrict user to select dates only in current year.

**Note:** To specify the range, set start date and end date to [MinDate](#) and [MaxDate](#) properties respectively.

#### C#

```
SfCalendar calendar = new SfCalendar();
calendar.MinDate = new DateTime(2019, 9, 1);
calendar.MaxDate = new DateTime(2019, 9, 30);
this.Content = calendar;
```

You can download the entire source code of this demo for Xamarin.Forms from here [CalendarGettingStarted](#)

### Calendar views

Xamarin.Forms calendar control provides 4 different types of views such month, year, decade and century. It allows users to easily select and navigate between all built-in views. This can be achieved by using [ViewMode](#) property of SfCalendar.

---

**Note:** By default calendar control is assigned with month view.

---

### Month view

This displays entire dates of a particular month, by default current month will be displayed on loading. The current date is provided with separate color different from the rest of the dates color in a month. The events availability will be denoted within the cell based on its duration.

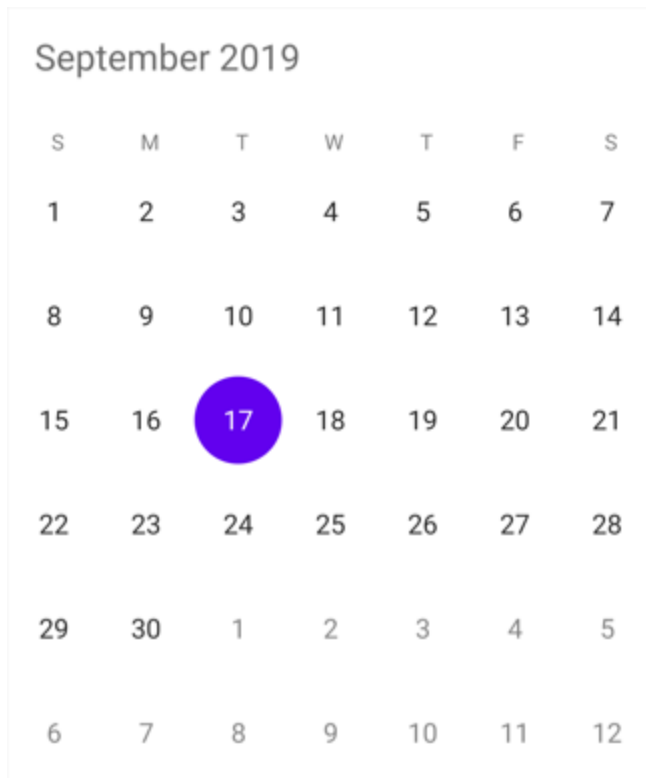

The dates in month view can be selected by four ways such as single, multiple, range and multi range selections which can be achieved using [SelectionMode](#). Refer [here](#).

### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"/>
```

### C#

```
calendar.ViewMode = ViewMode.MonthView;
```

### Trailing and leading days

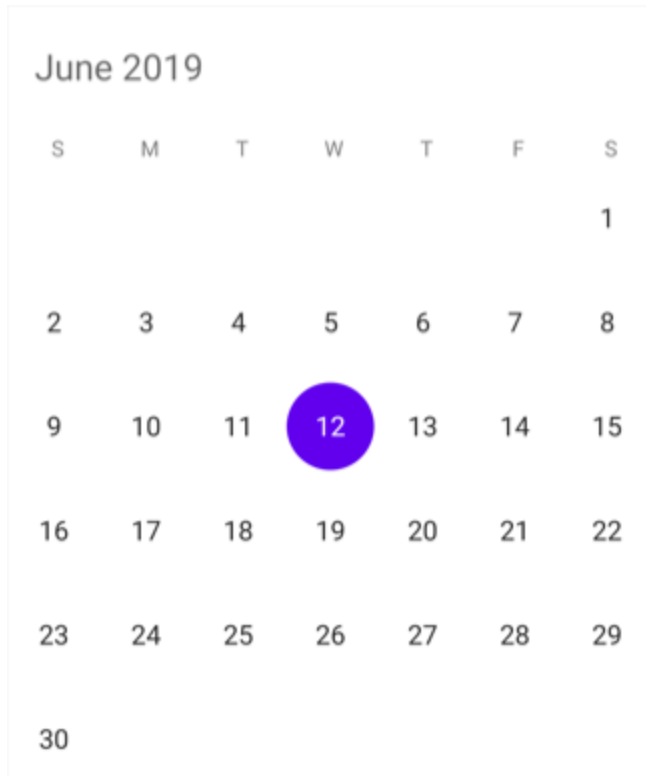

The **SfCalendar** allows you show/hide the days of the next month and previous month in calendar to enhance the appearance. This can be achieved by enabling the [ShowLeadingAndTrailingDays](#) property. The following code demonstrates how to hide the leading and trailing dates in calendar.

#### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"
ShowLeadingAndTrailingDays="False"/>
```

#### C#

```
calendar.ViewMode = ViewMode.MonthView;
calendar.ShowLeadingAndTrailingDays = False;
```

**Note:**

- The OnMonthCellLoaded event is triggered for the current month dates.
- The VisibleDates in the MonthChanged event will return the current month dates.

### Enable and disable past dates

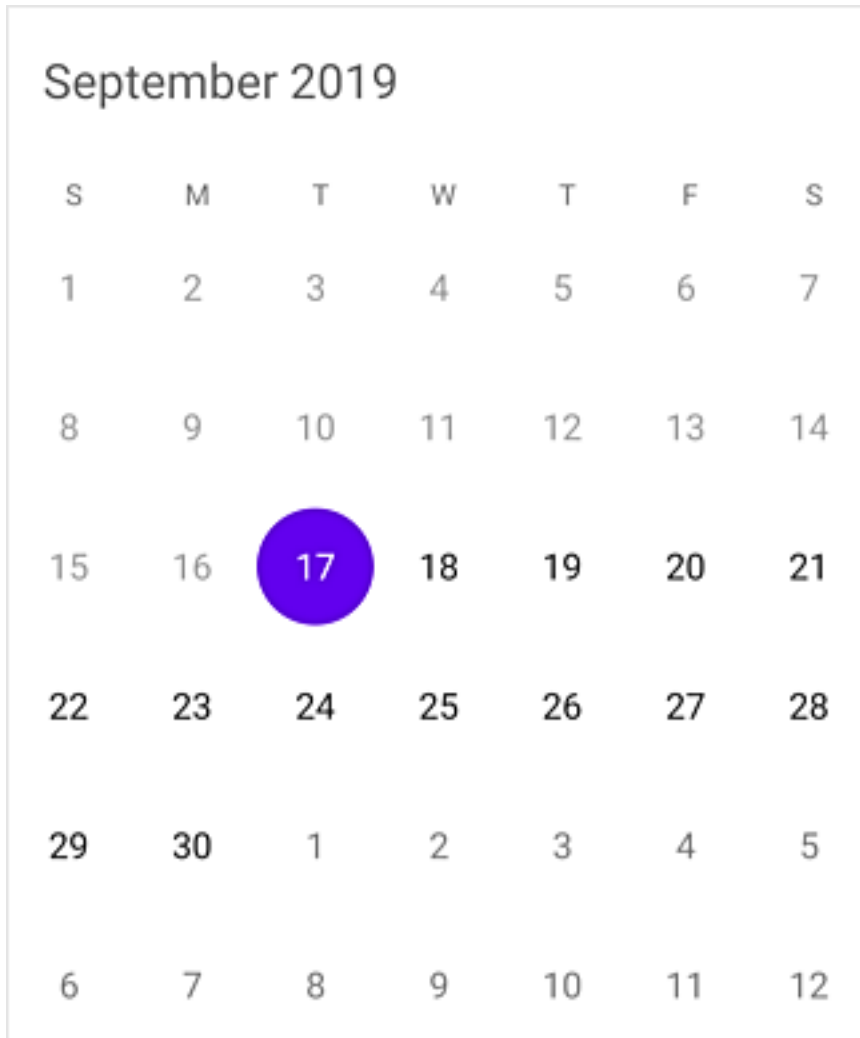

The **SfCalendar** allows you to enable/disable the past dates in MonthView. This can be achieved by changing the [EnableDatesInPast](#) property. By default, value of this property is set to true.

**XML**

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"
    EnableDatesInPast="False"/>
```

**C#**

```
calendar.ViewMode = ViewMode.MonthView;
calendar.EnableDatesInPast = False;
```

**Note:**

The `EnableDatesInPast` is not applicable for UWP.

**Month view customization**

You can customize the calendar month view by using [MonthViewSettings](#) of `SfCalendar`.

- Current day text color can be modified using [TodayTextColor](#).
- The day header format, day font size, day header font size can be modified using [DayHeaderFormat](#), [DayFontSize](#), [DayHeaderFontSize](#)
- The background color of the inline view can be modified using [InlineBackgroundColor](#) property.
- In `AgendaView` the selected date color can be modified using [AgendaSelectedDateColor](#)

**XML**

```
<syncfusion:SfCalendar x:Name="calendar">
  <syncfusion:SfCalendar.MonthViewSettings>
    <syncfusion:MonthViewSettings
      CurrentMonthBackgroundColor="#800080"
      CurrentMonthTextColor="#ffffff"
    />
  />
</syncfusion:SfCalendar>
```

```
PreviousMonthBackgroundColor="#9895F0"  
PreviousMonthTextColor="#000000"  
DateSelectionColor="#ffffff"  
SelectedDayTextColor="#000000"  
DayHeaderFormat="EEEEEE"  
DayFontSize="12"  
DayHeaderFontSize="14"  
AgendaSelectedDateColor="Blue"  
TodaySelectionBackgroundColor="Green"/>  
</syncfusion:SfCalendar.MonthViewSettings>  
</syncfusion:SfCalendar>
```

## C#

```
SfCalendar calendar = new SfCalendar();  
MonthViewSettings monthViewSettings = new MonthViewSettings();  
monthViewSettings.CurrentMonthBackgroundColor = Color.FromHex("#800080");  
monthViewSettings.CurrentMonthTextColor = Color.FromHex("#ffffff");  
monthViewSettings.PreviousMonthBackgroundColor = Color.FromHex("#9895F0");  
monthViewSettings.PreviousMonthTextColor = Color.FromHex("#000000");  
monthViewSettings.DateSelectionColor = Color.FromHex("#ffffff");  
monthViewSettings.SelectedDayTextColor = Color.FromHex("#000000");  
monthViewSettings.DayHeaderFormat = "EEEEEE";  
monthViewSettings.DayFontSize = 12;  
monthViewSettings.DayHeaderFontSize = 20;  
monthViewSettings.SelectionRadius = 15;  
monthViewSettings.TodaySelectionTextColor= Color.Black;  
monthViewSettings.TodaySelectionBackgroundColor= Color.Green;  
monthViewSettings.AgendaSelectedDateColor = Color.Blue;  
calendar.MonthViewSettings = monthViewSettings;  
this.Content = calendar;
```

**Note:** To disable the current day selection, use `TodaySelectionBackgroundColor` color as Transparent.

#### *Month view border color customization*

You can customize the border color of calendar month view using [MonthViewSettings](#). The border color of month view can be customized using the [BorderColor](#) property and the lines of month cells can be enabled using the [CellGridOptions](#) property.

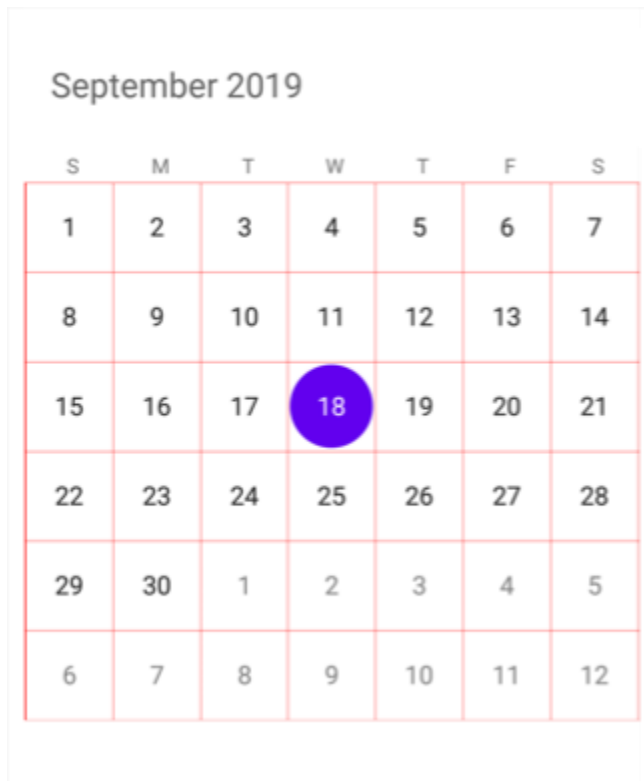

#### **XML**

```
<syncfusion:SfCalendar x:Name="calendar">
  <syncfusion:SfCalendar.MonthViewSettings>
    <syncfusion:MonthViewSettings BorderColor="#ff0000"
      CellGridOptions="Both"/>
  </syncfusion:SfCalendar.MonthViewSettings>
</syncfusion:SfCalendar>
```

#### **C#**

```
SfCalendar calendar = new SfCalendar();
MonthViewSettings monthViewSettings = new MonthViewSettings();
monthViewSettings.BorderColor = Color.FromHex("#ff0000");
monthViewSettings.CellGridOptions = CellGridOptions.Both;
```

```
calendar.MonthViewSettings = monthViewSettings;
this.Content = calendar;
```

#### Today border color customization

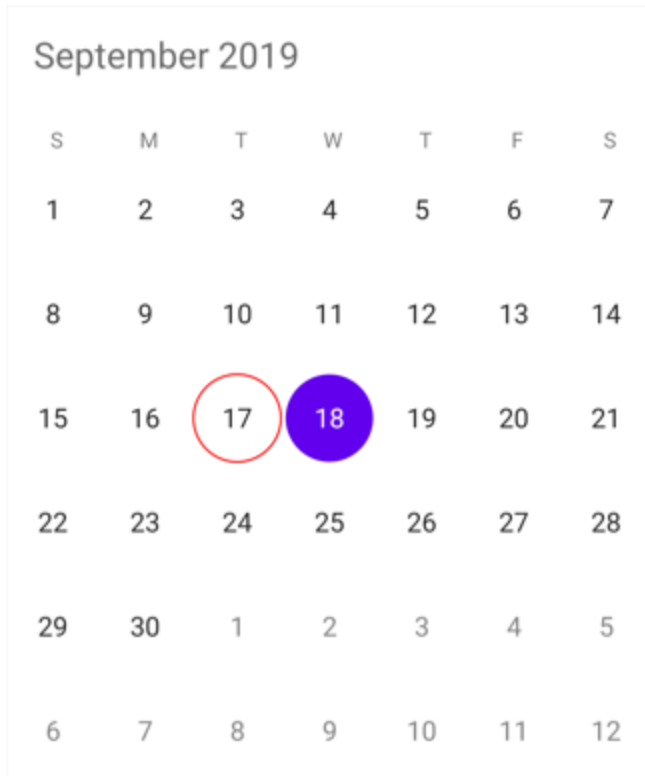

You can customize the today border color of calendar month cell using [MonthViewSettings](#). The border color of current day can be customized using the [TodayBorderColor](#) property and it is applicable for both [Fill](#) and [Circle SelectionShape](#).

#### XML

```
<syncfusion:SfCalendar x:Name="calendar">
  <syncfusion:SfCalendar.MonthViewSettings>
    <syncfusion:MonthViewSettings TodayBorderColor="#ff0000"/>
  </syncfusion:SfCalendar.MonthViewSettings>
</syncfusion:SfCalendar>
```

#### C#

```
SfCalendar calendar = new SfCalendar();
MonthViewSettings monthViewSettings = new MonthViewSettings();
monthViewSettings.TodayBorderColor = Color.FromHex("#ff0000");
calendar.MonthViewSettings = monthViewSettings;
this.Content = calendar;
```

### Week view

The number of weeks in the month view can be changed by setting the [NumberOfWeeksInView](#) property in SfCalendar. By default, `NumberOfWeeksInView` starts from current week, and this can be modified using the [MoveToDate](#) property of calendar. It also supports all existing features such as [FirstDayOfWeek](#), [MinDate](#), [MaxDate](#), and [SelectionMode](#).

### Note:

- Week number ranges from 1 to 6. If lesser or greater than these range is considered, `NumberOfWeeksInView` will be displayed as 6.
- Inline view considers `NumberOfWeeksInView` as only 6. For other count, only agenda view will be displayed in calendar.
- Dynamically changing `NumberOfWeeksInView` shows the first row of month view dates. It can be handled using the `MoveToDate` property of calendar
- [ShowLeadingAndTrailingDays](#) is not applicable if the `NumberOfWeeksInView` is lesser than 6.

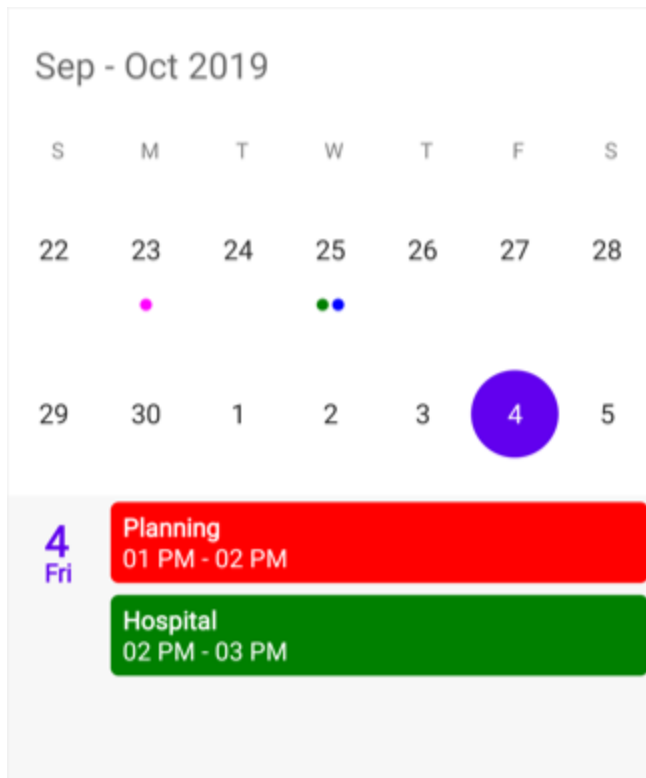

### XML

```
<syncfusion:SfCalendar x:Name="calendar" NumberOfWeeksInView="2"/>
```

### C#

```
SfCalendar calendar = new SfCalendar();
calendar.NumberOfWeeksInView = 2;
```

### Year view

This displays entire dates/month of a particular year, by default current year will be displayed on loading. The Years can be changed by swiping back and forth or [Forward](#) and [Backward](#) methods. The Months can be navigated quickly by selecting on the particular month in year view.

### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="YearView"/>
```

### C#

```
SfCalendar calendar = new SfCalendar();  
calendar.ViewMode=ViewMode.YearView;  
this.Content = calendar;
```

### Year view mode

You can set the year view as either date or month using [YearViewMode](#). By default, current year and months will be displayed.

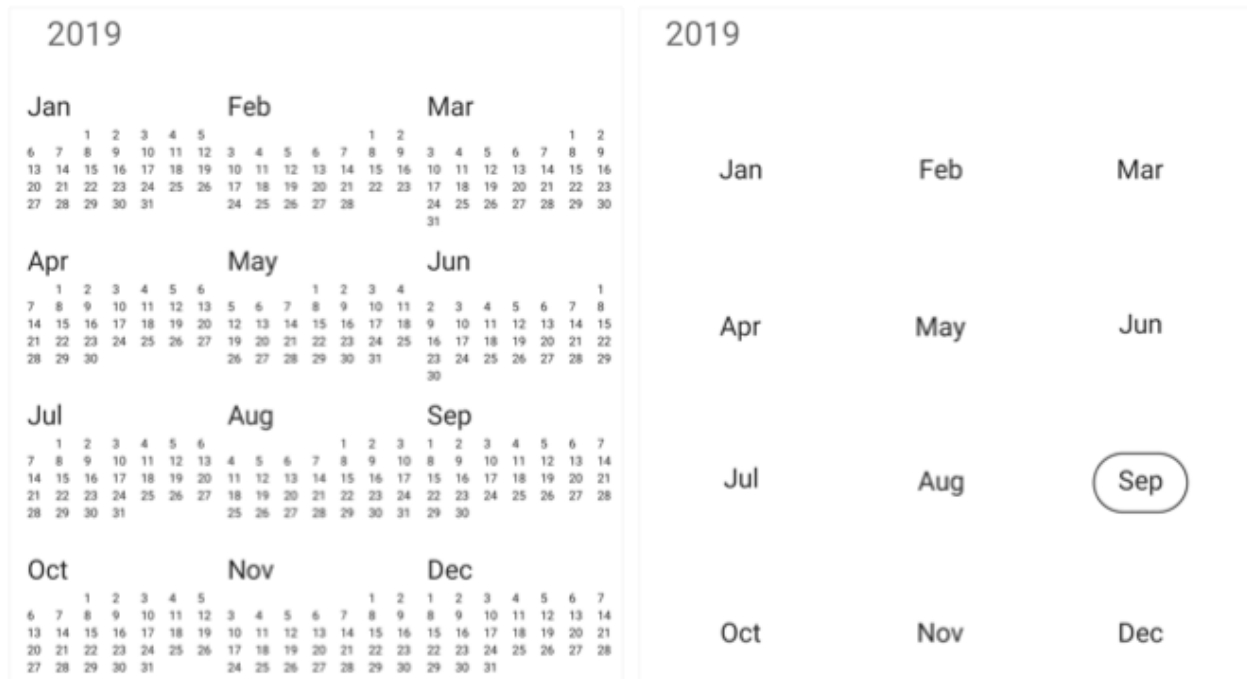

- If the `YearViewMode` is date, it will be displays all the months with dates in a particular year view.
- If the `YearViewMode` is month, it will be displays all the months in a particular year view.

### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="YearView"
YearViewMode="Date"/>
```

### C#

```
SfCalendar calendar = new SfCalendar();
calendar.ViewMode=ViewMode.YearView;
calendar.YearViewMode = YearViewMode.Date;
this.Content = calendar;
```

**Note:**

- The `YearViewMode` property is only applicable for calendar in Android and iOS platforms.

**Year view customization**

We can customize the calendar view in yearView mode by using [YearViewSettings](#) property of SfCalendar. Date text color can be modified using [DateTextColor](#). You can also customize the header, month layout in year view's text color and background color by using the [HeaderBackground](#), [LayoutBackground](#), [YearHeaderTextColor](#) properties.

**XML**

```
<syncfusion:SfCalendar x:Name="calendar">
  <syncfusion:SfCalendar.YearViewSettings>
    <syncfusion:YearViewSettings
      LayoutBackground="#ffe4b5"
      DateTextColor="#E6E6FA"
      HeaderBackground="#8B4513"
      YearHeaderTextColor="#FFFFFF"/>
    </syncfusion:SfCalendar.YearViewSettings>
  </syncfusion:SfCalendar>
```

**C#**

```
SfCalendar calendar = new SfCalendar();
YearViewSettings yearViewSettings = new YearViewSettings();
yearViewSettings.LayoutBackground = Color.FromHex("#ffe4b5");
yearViewSettings.DateTextColor = Color.FromHex("#008000");
yearViewSettings.YearHeaderTextColor = Color.FromHex("#ff0000");
calendar.YearViewSettings = yearViewSettings;
this.Content = calendar;
```

### Decade view

This view displays the period of 10 years. By default, current year range of 10 years will be displayed on loading. You can easily navigate between month/year view to decade view by tapping the calendar header. The year can be navigated quickly by selecting a particular year from decade view.

### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="Decade"/>
```

### C#

```
SfCalendar calendar = new SfCalendar();
calendar.ViewMode=ViewMode.Decade;
this.Content = calendar;
```

### Decade view customization

You can customize the decade view of calendar by using [YearViewSettings](#).

- Year text color can be modified using [MonthHeaderTextColor](#).
- You can customize the decade view header text and background color by using the [YearHeaderTextColor](#) and [HeaderBackground](#) property.
- You can customize the background of decade view by using [LayoutBackground](#) and [MonthLayoutBackground](#).

### XML

```
<syncfusion:SfCalendar x:Name="calendar">
  <syncfusion:SfCalendar.YearViewSettings>
    <syncfusion:YearViewSettings
      LayoutBackground = "#D3D3D3"
      HeaderBackground = "#F2F2F2"
      MonthHeaderTextColor = "#0000FF"
      YearHeaderTextColor = "#ff0000"
      MonthLayoutBackground = "#F2F2F2"/>
    </syncfusion:SfCalendar.YearViewSettings>
  </syncfusion:SfCalendar>
```

### C#

```
SfCalendar calendar = new SfCalendar();
YearViewSettings yearViewSettings = new YearViewSettings();
yearViewSettings.LayoutBackground = Color.FromHex("#D3D3D3");
yearViewSettings.MonthHeaderTextColor = Color.FromHex("#0000FF");
```

```
yearViewSettings.MonthLayoutBackground = Color.FromHex("#F2F2F2");
yearViewSettings.YearHeaderTextColor = Color.FromHex("#ff0000");
yearViewSettings.HeaderBackground = Color.FromHex("#F2F2F2");
calendar.YearViewSettings = yearViewSettings;
this.Content = calendar;
```

### Century view

This view displays the period of 100 years. By default, current year range of 100 years will be displayed on loading. You can easily navigate between month/year/decade view to century view by tapping the calendar header. You can easily navigate to decade view by selecting decade years in century view.

### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="Century"/>
```

### C#

```
SfCalendar calendar = new SfCalendar();
calendar.ViewMode=ViewMode.Century;
this.Content = calendar;
```

### Century view customization

You can customize the century view of calendar using [YearViewSettings](#).

- Year text color can be modified using [MonthHeaderTextColor](#).
- You can customize the century view header text and background color by using the [YearHeaderTextColor](#) and [HeaderBackground](#) property.
- You can customize the background of century view by using [LayoutBackground](#) and [MonthLayoutBackground](#).

### XML

```
<syncfusion:SfCalendar x:Name="calendar">
  <syncfusion:SfCalendar.YearViewSettings>
    <syncfusion:YearViewSettings
      LayoutBackground="#D3D3D3"
      HeaderBackground="#F2F2F2"
      MonthHeaderTextColor="#0000FF"
      YearHeaderTextColor="#ff0000"
      MonthLayoutBackground="#F2F2F2"/>
    </syncfusion:SfCalendar.YearViewSettings>
  </syncfusion:SfCalendar>
```

### C#

```
SfCalendar calendar = new SfCalendar();
YearViewSettings yearViewSettings = new YearViewSettings();
yearViewSettings.LayoutBackground = Color.FromHex("#D3D3D3");
yearViewSettings.MonthHeaderTextColor = Color.FromHex("#0000FF");
```

```

yearViewSettings.MonthLayoutBackground = Color.FromHex("#F2F2F2");
yearViewSettings.YearHeaderTextColor = Color.FromHex("#ff0000");
yearViewSettings.HeaderBackground = Color.FromHex("#F2F2F2");
calendar.YearViewSettings = yearViewSettings;
this.Content = calendar;

```

### Date Navigation

**SfCalendar** control provides option to navigate through items either programmatically or by using gesture.

#### Programmatic Navigation

By using the following methods, we can navigate the months or year in **SfCalendar** with programmatically without applying gesture.

1. Forward
2. Backward

#### Forward

By default, the date can be navigated to next view using touch gesture and swiping the control in right to left direction. The view can also be changed programmatically using **Forward** method available in **SfCalendar**. It will move to next month, next year, next period of decade years, next period of century years based on the **ViewMode**.

#### C#

```
calendar.Forward();
```

---

**Note:** It can be navigated until it reaches the MaxDate.

---

#### *Backward*

By default, the date can be navigated to previous view using touch gesture and swiping the control in left to right direction. The view can also be changed programmatically using [Backward](#) method available in `SfCalendar`. It will move to previous month, previous year, previous period of decade years, previous period century years based on the `ViewMode`.

#### **C#**

```
calendar.Backward();
```

---

**Note:** It can be navigated until it reaches the MinDate.

---

#### *Move to Date*

Visible dates can be moved to specific date using [MoveToDate](#) property available in `SfCalendar`. it will move to any specific month, year, decade, century view based on the `ViewMode`.

**Note:** The specified date should lie between MinDate and MaxDate, if the specified date is greater than MaxDate then the view will be moved to MaxDate and if the specified date is lesser than the MinDate then the view will be moved to MinDate.

#### **C#**

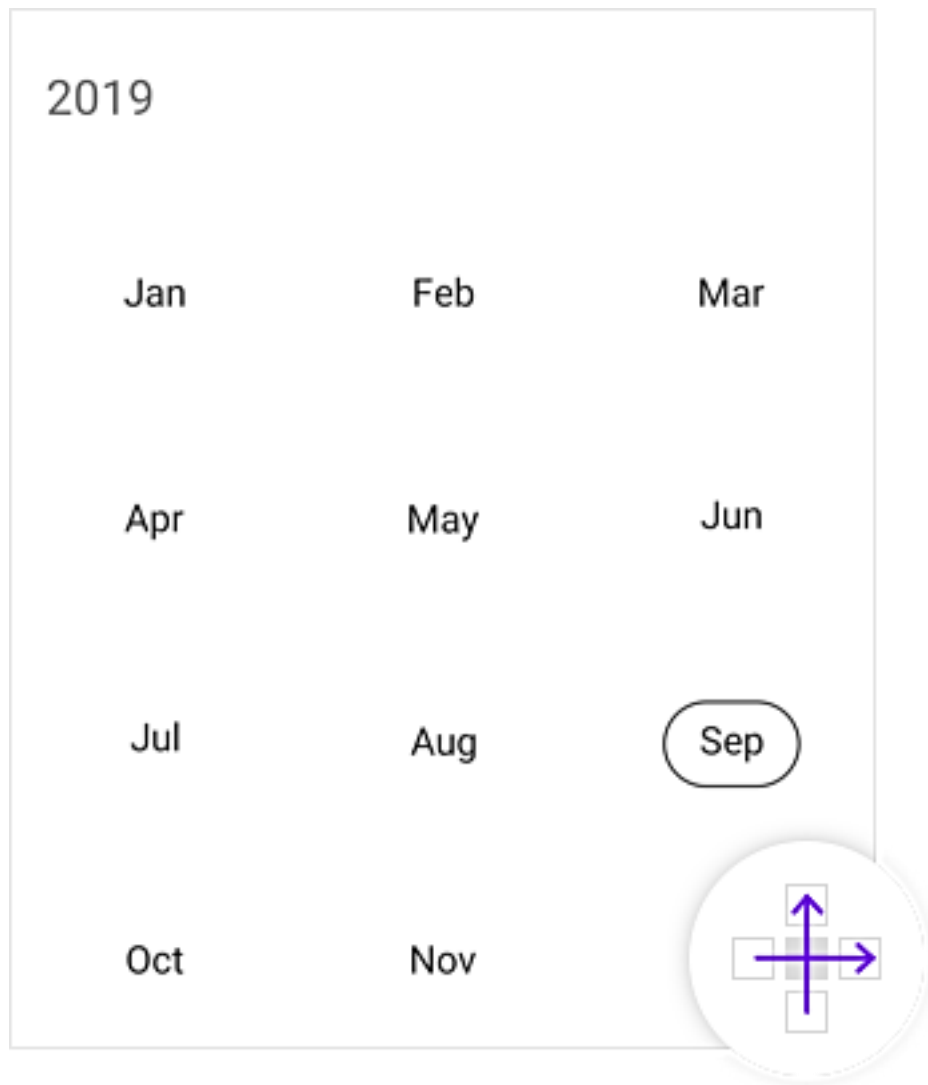

```
SfCalendar calendar = new SfCalendar();  
calendar.MoveToDate = new DateTime(2017, 5, 5);  
this.Content = calendar;
```

#### *Navigation Direction*

You can navigate the calendar `MonthView`, `YearView`, `DecadeView` and `CenturyView` either `Vertical` or `Horizontal` directions by setting the [NavigationDirection](#).

#### **C#**

```
SfCalendar calendar = new SfCalendar();  
Calendar.NavigationDirection = NavigationDirection.Vertical;
```

### Events (Appointments)

**SfCalendar** control provides support to add appointments on calendar's dates. By the way of adding collection of appointments, it will show the event with indicator on the desired dates.

Calendar's events can be added to **SfCalendar** using the following ways. [CalendarEventCollection](#) holds the details about the events to be rendered in calendar. Events contains the following attributes

1. [StartTime](#)
2. [EndTime](#)
3. [Subject](#)
4. [Color](#)

Finally add this collection of **CalendarInlineEvents** into [DataSource](#) of **SfCalendar**. The following code example will help to create an appointments on calendar's date. For events to be listed for a particular day, enable the inline feature in month view cell.

---

**Information:** Inline event support can be toggled on / off with **ShowInlineEvents** property.

---

### Month Appointment Display

You can handle the calendar month view appointment display by using [InlineViewMode](#) property of SfCalendar. By default, [InlineViewMode](#) is set as [Inline](#). Using the [InlineViewMode](#), you can set the month view appointments display as follows.

- **Inline** - Show the selected date's events in-line. In this mode, two rows of calendar will be hidden to show the events.
- **AgendaView** - Show the selected date's events below the month.

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" xmlns:local="clr-
namespace:CalendarSample" x:Class="CalendarSample.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfCalendar.XForms;assembly=Syncfusion.SfCalendar.XForms
">
<syncfusion:SfCalendar.BindingContext>
<local:CalendarViewModel/>
</syncfusion:SfCalendar.BindingContext>
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"
ShowInlineEvents="True" InlineViewMode="Inline"
MaximumEventIndicatorCount="1" DataSource="{Binding CalendarInlineEvents}">
</syncfusion:SfCalendar>
</ContentPage>
```

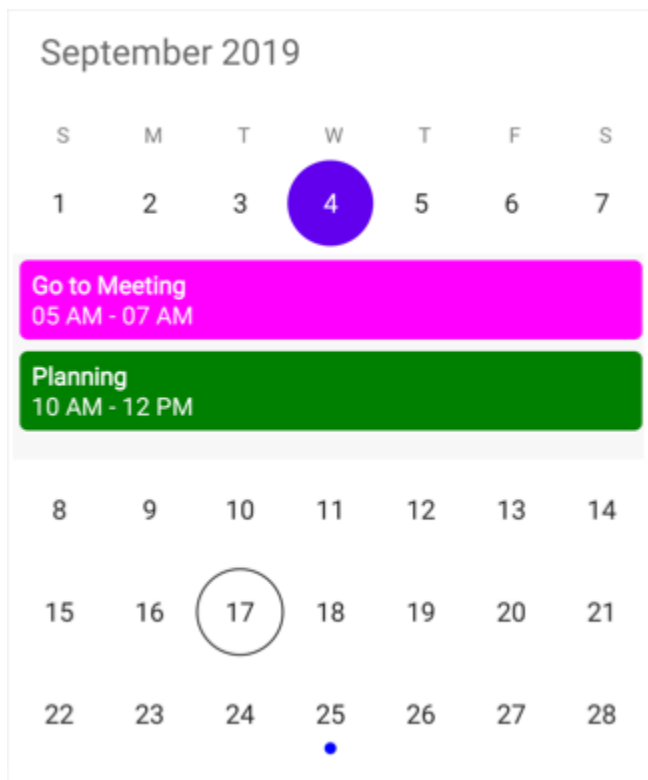

### C#

```
using System;
using Syncfusion.SfCalendar.XForms;
using Xamarin.Forms;
namespace CalendarSample
{
    public class CalendarViewModel
    {
        public CalendarEventCollection CalendarInlineEvents { get; set; } = new
        CalendarEventCollection();
        public CalendarViewModel()
        {
            CalendarInlineEvent event1 = new CalendarInlineEvent();
            event1.StartTime = new DateTime(2017, 5, 1, 5, 0, 0);
            event1.EndTime = new DateTime(2017, 5, 1, 7, 0, 0);
            event1.Subject = "Go to Meeting";
            event1.Color = Color.Fuchsia;
            CalendarInlineEvent event2 = new CalendarInlineEvent();
            event2.StartTime = new DateTime(2017, 5, 1, 10, 0, 0);
            event2.EndTime = new DateTime(2017, 5, 1, 12, 0, 0);
            event2.Subject = "Planning";
            event2.Color = Color.Green;
            CalendarInlineEvents.Add(event1);
            CalendarInlineEvents.Add(event2);
        }
    }
}
```

```
}

```

You can download the entire source code of this demo for Xamarin.Forms from here [CalendarEvents](#)

**Note:** If there is no appointment for the selected day, `Inline` view and `AgendaView` displays the text as “No Appointments”.

The `Inline` view and `AgendaView` will be available only in month view with single selection mode.

#### Month Appointment Indicator

You can customize the number of appointment indicators displayed in month cell using `MaximumEventIndicatorCount` property of ‘SfCalendar’. The default value of `MaximumEventIndicatorCount` is 5.

**Note:** If appointments count are lesser than the Appointment Indicator count value in the particular day, then according to number of appointments available, indicator will be displayed in the month cell.

#### Customize inline/agenda view using DataTemplate

The default appearance of the appointment can be customized by using the `InlineItemTemplate` property of the `MonthViewSettings`.

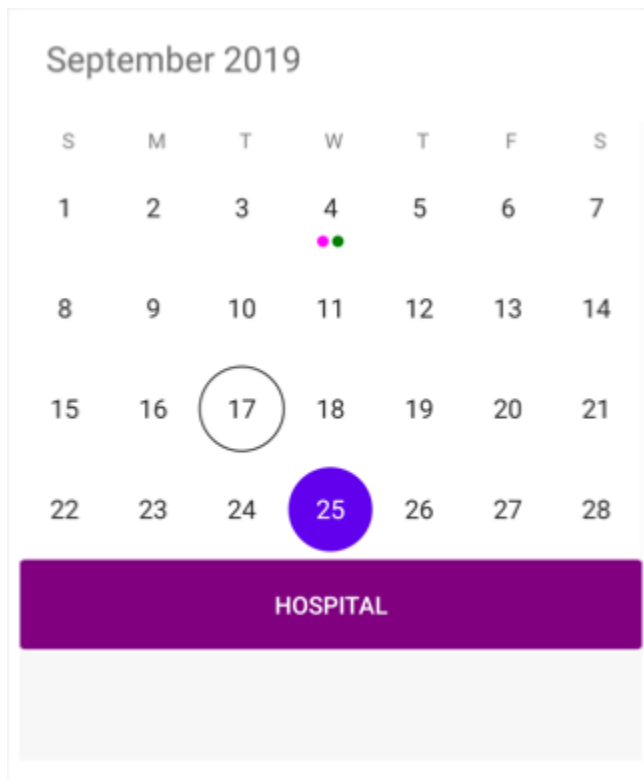

#### XML

```
<syncfusion:SfCalendar x:Name="calendar" ShowInlineEvents="True">
  <syncfusion:SfCalendar.MonthViewSettings>
    <syncfusion:MonthViewSettings>
      <syncfusion:MonthViewSettings.InlineItemTemplate>
        <DataTemplate>

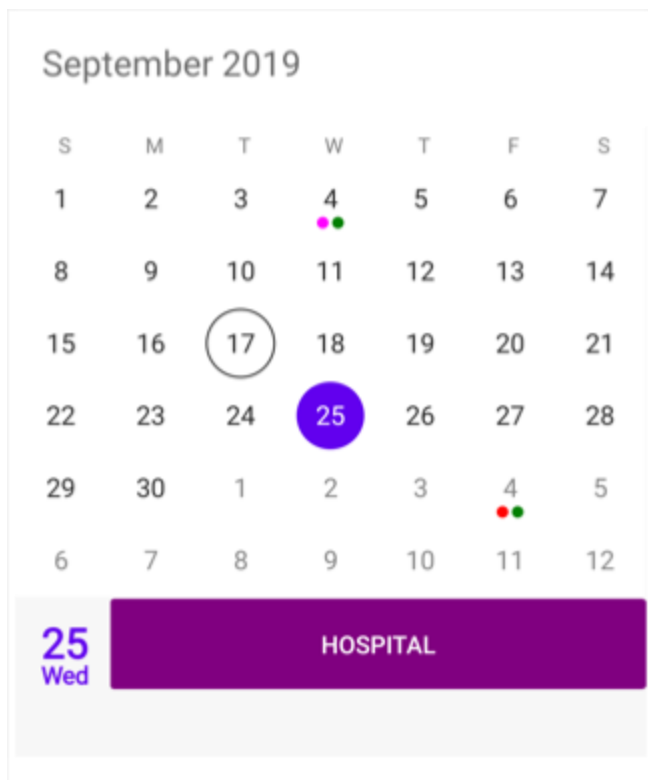

```

```
<Button BackgroundColor="Purple" Text="{Binding Subject}" TextColor="White"
/>
</DataTemplate>
</syncfusion:MonthViewSettings.InlineItemTemplate>
</syncfusion:MonthViewSettings>
</syncfusion:SfCalendar.MonthViewSettings>
</syncfusion:SfCalendar>
```

Inline view mode

Agenda view mode

### Customize inline/agenda view using Template Selector

Inline template selector can be used to choose a `DataTemplate` at runtime based on the value of a data-bound to inline appointment property through `InlineltemTemplate`. It lets you choose a different data template for each appointment, customizing the appearance of a particular inline appointment based on certain conditions. `DataTemplateSelector` for inline appointment as object and calendar as bindable object.

#### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<local:AppointmentSelector x:Key="TemplateSelector" />
</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfCalendar x:Name="calendar" ShowInlineEvents="True">
<syncfusion:SfCalendar.MonthViewSettings>
<syncfusion:MonthViewSettings InlineItemTemplate="{StaticResource
TemplateSelector}" />
</syncfusion:SfCalendar.MonthViewSettings>
</syncfusion:SfCalendar>
```

### Creating a DataTemplateSelector

#### C#

```
public class AppointmentSelector : DataTemplateSelector
{
public DataTemplate AppointmentTemplate { get; set; }
public DataTemplate AllDayAppointmentTemplate { get; set; }
public AppointmentSelector()
{
}
```

```

{
AppointmentTemplate = new DataTemplate(typeof(AppointmentTemplate));
AllDayAppointmentTemplate = new
DataTemplate(typeof(AllDayAppointmentTemplate));
}
protected override DataTemplate OnSelectTemplate(object item, BindableObject
container)
{
var calendar = (container as SfCalendar);
if (calendar == null)
{
return null;
}
if ((item as CalendarInlineEvent).IsAllDay)
{
return AllDayAppointmentTemplate;
}
else
{
return AppointmentTemplate;
}
}
}
}

```

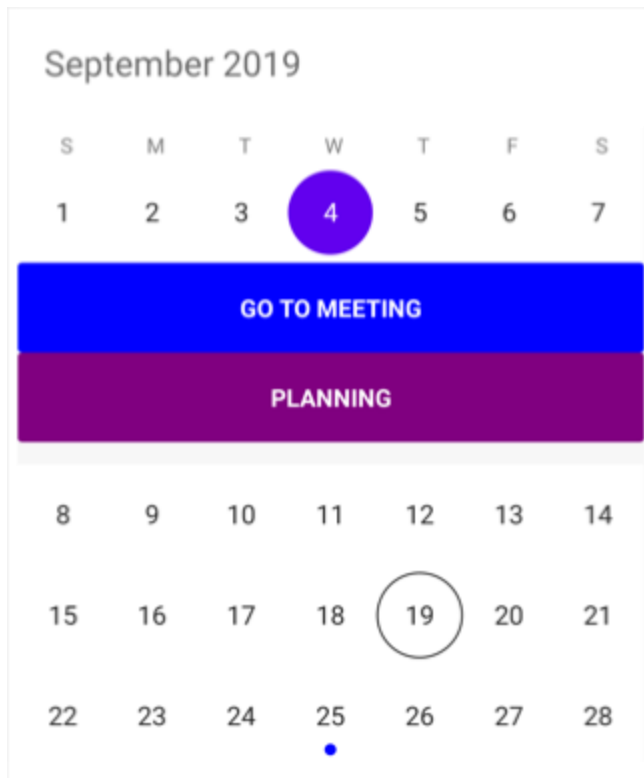

### XML

```

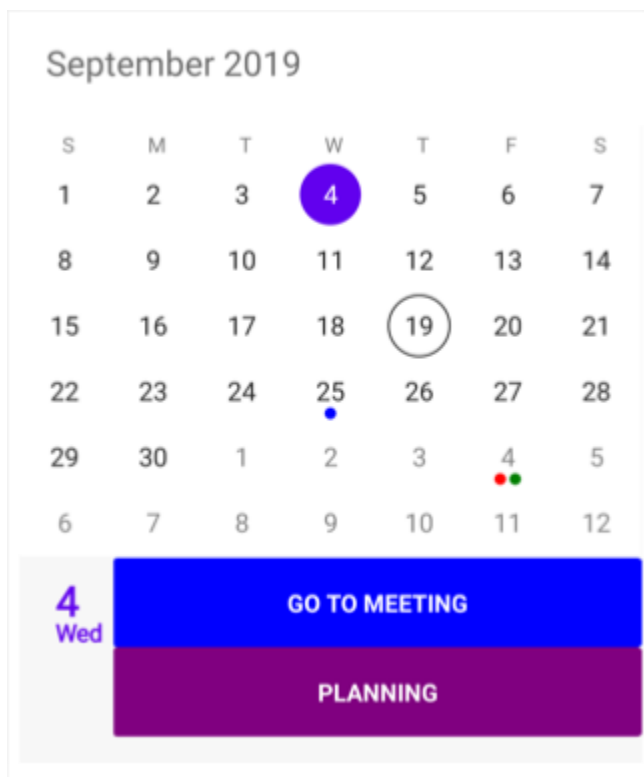

<!--<Button as Template for inline Appointment>-->
<Button xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="Calendar_Sample.AppointmentTemplate"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand"
BackgroundColor="{Binding Color}"
Text="{Binding Subject}"
FontAttributes="Bold"
TextColor="White" />
<!--<Button as Template for all day Appointment>-->
<Button xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="Calendar_Sample.AllDayAppointmentTemplate"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand"
BackgroundColor="{Binding Color}"
Text="{Binding Subject}"
FontAttributes="Bold"
TextColor="Black" />

```

Inline view mode

Agenda view mode

Getting inline/agenda view appointment details  
Using [InlineEvent](#) argument in the [InlineItemTappedEventArgs](#)

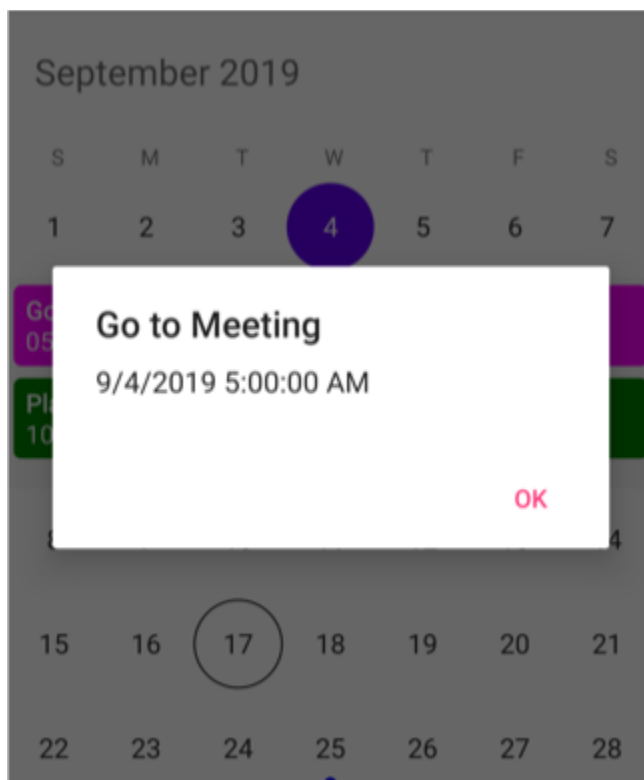

of [InlineItemTapped](#) event, you can get the month inline/agenda appointments details while tapping the specific appointment. You can do the required functions while tapping the inline/agenda appointment using this event.

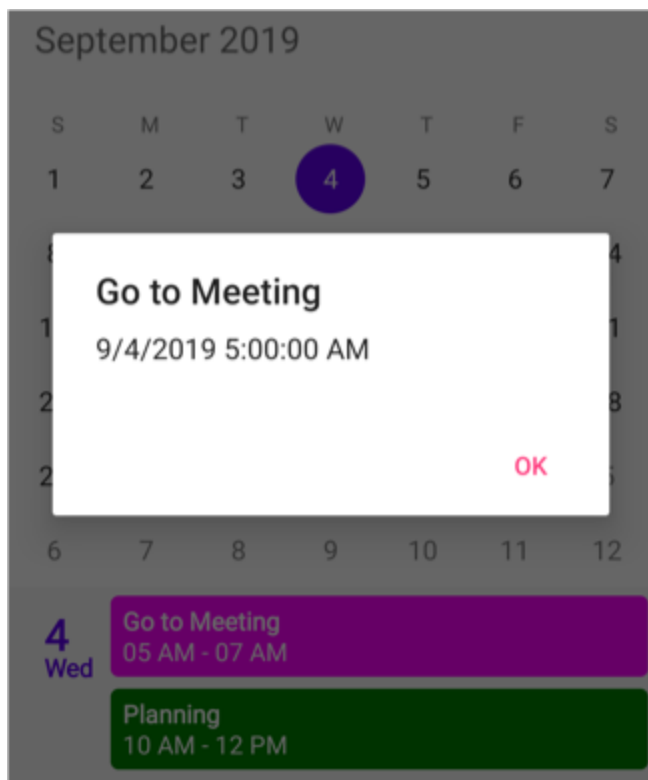

### C#

```
calendar.InlineItemTapped+= Calendar_InlineItemTapped;  
private void Calendar_InlineItemTapped(object sender,  
InlineItemTappedEventArgs e)  
{  
    var appointment = e.InlineEvent;  
    DisplayAlert(appointment.Subject, appointment.StartTime.ToString(), "ok");  
}
```

Inline view mode

Agenda view mode

### Select Multiple Dates

Dates can be selected by making a touch on month view cells. The default [SelectionMode](#) is Single which allows user to select one date at a time. **SfCalendar** provides support to select dates in two modes such as Single and Multiple selection.

- **SingleSelection** – A single date can be selected in a month view which can be equipped when user needs to select one date at a time / to view events.
- **MultiSelection** – More than one date can be selected in a random manner. Clicking again on selected dates can do deselection.
- **RangeSelection** – It allows us to select a single date range in **SfCalendar** month view.
- **MultiRangeSelection** – More than one date range can be selected in a month view.

The selected dates can be retrieved through **OnSelectionChanged** event which is raised on selecting.

### Multi selection mode

#### XML

```
<syncfusion:SfCalendar x:Name="calendar" SelectionMode="MultiSelection"/>
```

#### C#

```
SfCalendar calendar = new SfCalendar();
calendar.SelectionMode=SelectionMode.MultiSelection;
List<DateTime> selectedDates = new List<DateTime>();
selectedDates.Add(new DateTime(2019, 3, 06));
selectedDates.Add(new DateTime(2019, 3, 11));
selectedDates.Add(new DateTime(2019, 3, 15));
```

```
selectedDates.Add(new DateTime(2019, 3, 19));  
selectedDates.Add(new DateTime(2019, 3, 21));  
selectedDates.Add(new DateTime(2019, 3, 25));  
selectedDates.Add(new DateTime(2019, 3, 27));  
calendar.SelectedDates = selectedDates;  
this.Content = calendar;
```

**Note:** In range selection, navigation through swipe will be restricted and moving between months can be done by clicking on navigation button available at the top corner of SfCalendar control.

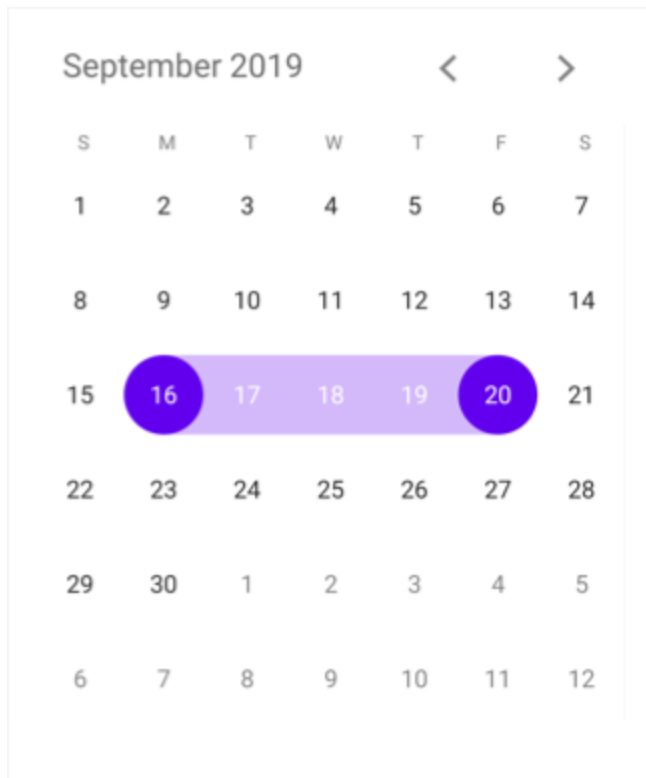

Range selection mode

#### XML

```
<syncfusion:SfCalendar x:Name="calendar" SelectionMode="RangeSelection"/>
```

#### C#

```
calendar.SelectionMode=SelectionMode.RangeSelection;
```

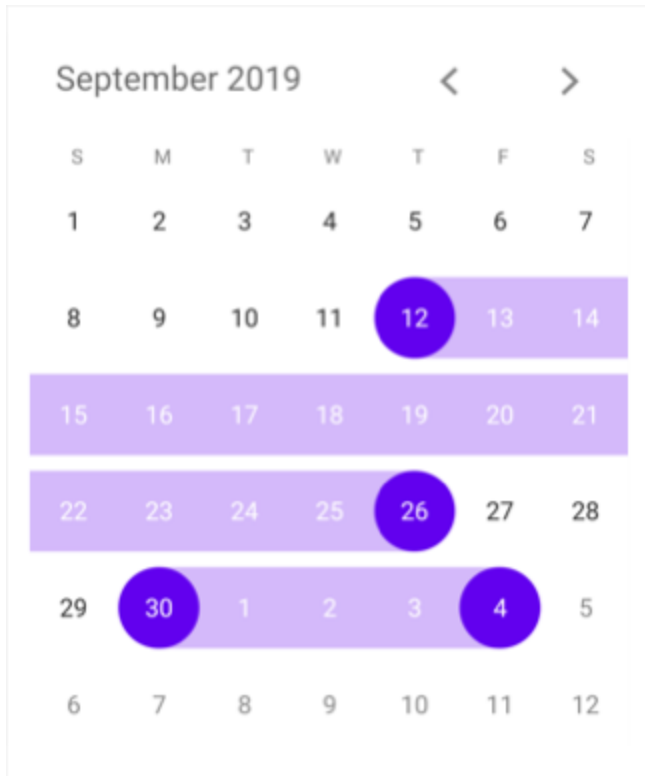

Multi range selection mode

#### **XML**

```
<syncfusion:SfCalendar x:Name="calendar"  
SelectionMode="MultiRangeSelection"/>
```

#### **C#**

```
calendar.SelectionMode=SelectionMode.MultiRangeSelection;
```

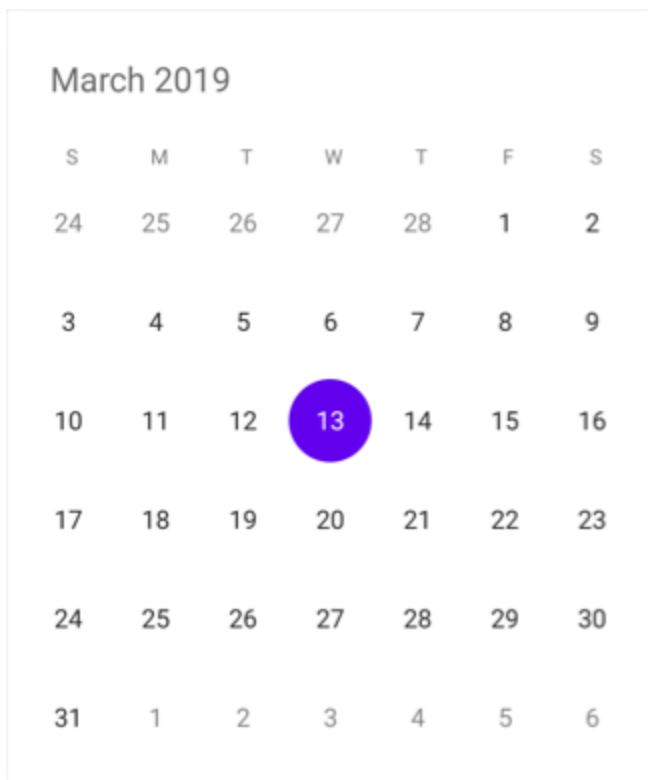

Single selection mode

#### XML

```
<syncfusion:SfCalendar x:Name="calendar" SelectionMode="SingleSelection"/>
```

#### C#

```
calendar.SelectionMode = SelectionMode.SingleSelection;
```

#### Programmatically clear the selected dates

You can clear the calendar selected dates pragmatically by using `ClearSelection` method, which is applicable for calendar `SelectionMode` such as `SingleSelection`, `MultiSelection`, `RangeSelection`, and `MultiRangeSelection`.

#### C#

```
calendar.ClearSelection();
```

#### Restrict Dates From Selection

Dates can be restricted or a collection of dates can be blacked out in `SfCalendar` Control.

##### Range of Min / Max Dates

Visible dates can be restricted between certain range of dates using `MinDate` and `MaxDate` properties available in `SfCalendar` control. It is applicable in all the calendar views.

The inline feature in month view will work only within the min max date range.

Beyond the min max date range, following restrictions will be applied.

- Date navigation features of move to date will be restricted.
- Cannot swipe the control using touch gesture.
- Selection does not work for month view.
- The tapped delegates will not be triggered while tapped on the `MonthCell`.

#### C#

```
SfCalendar calendar = new SfCalendar();
```

```
DateTime minDate=new DateTime(2015, 1, 1);
calendar.MinDate=minDate;
DateTime maxDate=new DateTime(2040, 12, 12);
calendar.MaxDate=maxDate;
this.Content = calendar;
```

### Blackout Dates

In **SfCalendar**, **BlackoutDates** refers the disabled dates that restrict the user from selecting it. These dates will be marked with slanted Stripes and Strikethrough, by using the **BlackoutDatesViewMode** property. By default, the value of this property is set to **Strikethrough**.

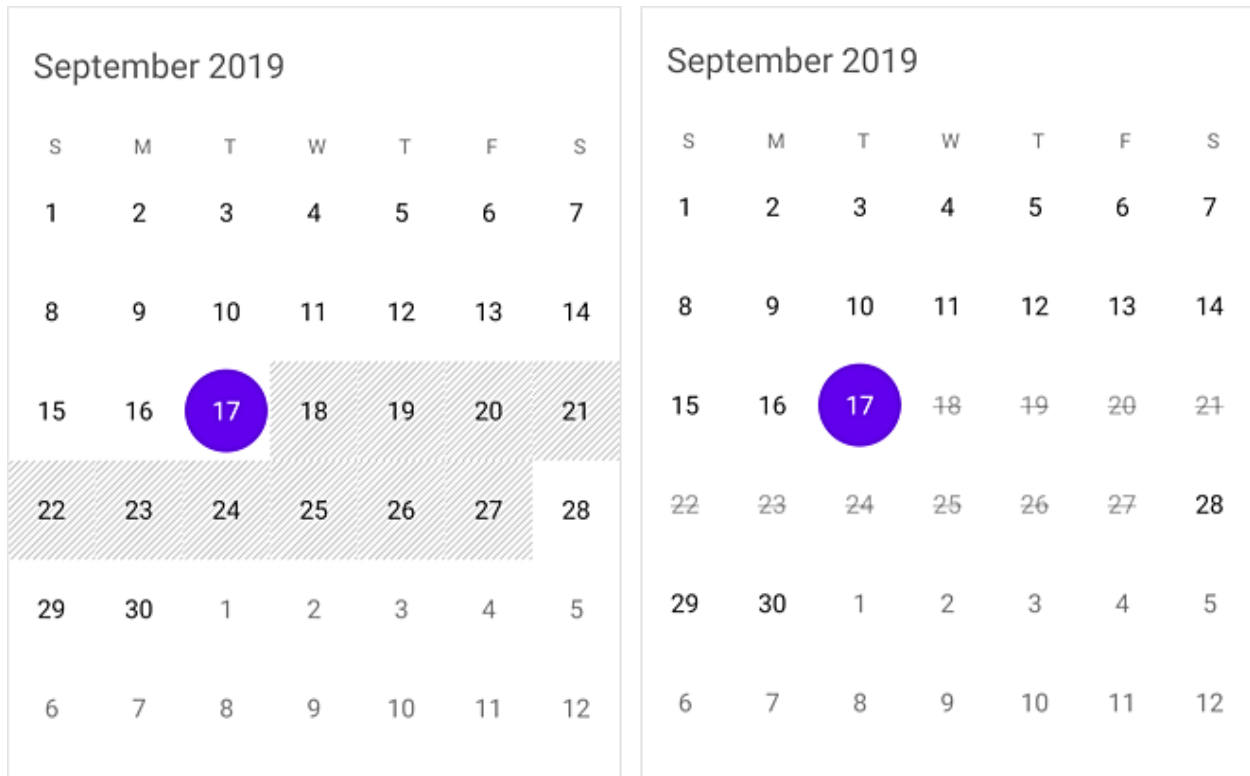

The Blackout dates can be achieved in two ways.

A date collection can be provided to set the **BlackoutDates**. This is useful when one wants to block dates where holidays or any other events occur.

By invoking the **AddDatesInPast** method, all past dates will be blacked out till current date.

### C#

```
SfCalendar calendar = new SfCalendar();
calendar.BlackoutDatesViewMode = BlackoutDatesViewMode.Stripes;
List<DateTime> black_Dates = new List<DateTime>();
black_Dates.Add(new DateTime(2019, 09, 18));
black_Dates.Add(new DateTime(2019, 09, 19));
black_Dates.Add(new DateTime(2019, 09, 20));
black_Dates.Add(new DateTime(2019, 09, 21));
black_Dates.Add(new DateTime(2019, 09, 22));
black_Dates.Add(new DateTime(2019, 09, 23));
black_Dates.Add(new DateTime(2019, 09, 24));
black_Dates.Add(new DateTime(2019, 09, 25));
black_Dates.Add(new DateTime(2019, 09, 26));
black_Dates.Add(new DateTime(2019, 09, 27));
calendar.BlackoutDates= black_Dates ;
this.Content = calendar;
```

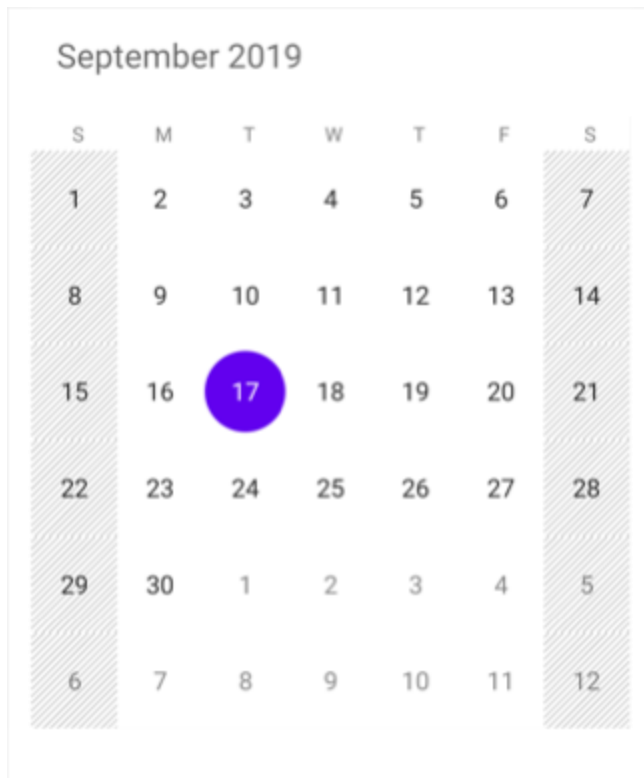

#### *Dynamic Blackout dates rendering*

Using [OnMonthCellLoaded](#) event you can render the black out dates.

#### **C#**

```
private void Calendar_OnMonthCellLoaded(object sender, EventArgs e)
{
    List<DateTime> blackoutDates = new List<DateTime>();
    var dayOfWeek = e.Date.DayOfWeek;
    if (dayOfWeek == DayOfWeek.Saturday || dayOfWeek == DayOfWeek.Sunday)
    {
        blackoutDates.Add(e.Date);
        calendar.BlackoutDates = blackoutDates;
    }
}
```

#### *Customize the blackout dates Color*

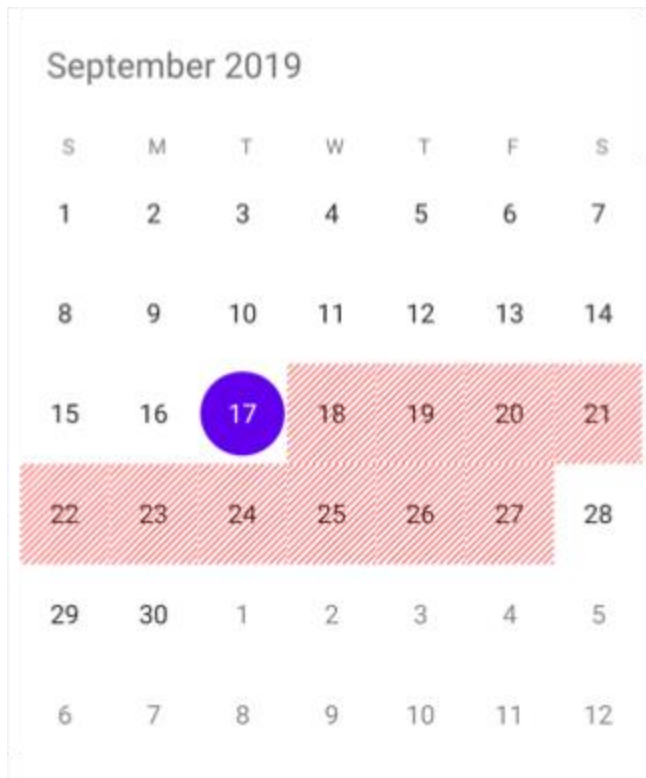

You can customize the color of [BlackoutDates](#) in month view mode using the [BlackOutColor](#) property of [MonthViewSettings](#).

#### **XML**

```
<syncfusion:SfCalendar x:Name="calendar">
  <syncfusion:SfCalendar.MonthViewSettings>
    <syncfusion:MonthViewSettings BlackOutColor="Red">
    </syncfusion:MonthViewSettings>
  </syncfusion:SfCalendar.MonthViewSettings>
</syncfusion:SfCalendar>
```

#### **C#**

```
SfCalendar calendar = new SfCalendar();
calendar.BlackoutDatesViewMode = BlackoutDatesViewMode.Stripes;
MonthViewSettings monthViewSettings = new MonthViewSettings();
monthViewSettings.BlackOutColor = Color.Red;
calendar.MonthViewSettings = monthViewSettings;
this.Content = calendar;
```

## Binding Properties in MVVM Pattern

### Binding SelectedDate

Calendar supports selecting a date programmatically by binding the [SelectedDate](#) property from your view model.

#### C#

```
calendar.SetBinding(SfCalendar.SelectedDateProperty, new  
Binding("SelectedDate", BindingMode.TwoWay));
```

#### XML

```
XAML:  
<calendar:SfCalendar x:Name="calendar"  
ShowInlineEvents="True"  
SelectionMode="SingleSelection"  
SelectedDate="{Binding SelectedDate, Mode=TwoWay}">  
</calendar:SfCalendar>
```

The following code sample demonstrates the ViewModel class.

#### C#

```
public class MainViewModel  
{  
    public DateTime SelectedDate { get; set; }  
    public MainViewModel()  
    {  
        SelectedDate = new DateTime(2019, 02, 05);  
    }  
}
```

```
}
}
```

---

**NOTE**

---

- You can bind the `SelectedDate` property only when the `SelectionMode` is set to `SingleSelection` in calendar.

### Binding SelectedDates

Calendar supports selecting dates programmatically by binding the `SelectedDates` property from your view model with the `List<DateTime>` type.

#### C#

```
calendar.SetBinding(SfCalendar.SelectedDatesProperty, new
Binding("SelectedDates", BindingMode.TwoWay));
```

#### XML

```
<calendar:SfCalendar x:Name="calendar"
ShowInlineEvents="True"
SelectionMode="MultiSelection"
SelectedDates="{Binding SelectedDates, Mode=TwoWay}">
</calendar:SfCalendar>
```

The following code sample demonstrates the ViewModel class.

#### C#

```
public class MainViewModel
{
    public List<DateTime> SelectedDates { get; set; }
    public MainViewModel()
    {
        SelectedDates = new List<DateTime>();
        SelectedDates.Add(new DateTime(2019, 02, 05));
        SelectedDates.Add(new DateTime(2019, 02, 08));
        SelectedDates.Add(new DateTime(2019, 02, 10));
        SelectedDates.Add(new DateTime(2019, 02, 14));
        SelectedDates.Add(new DateTime(2019, 02, 20));
    }
}
```

---

**NOTE**

---

- You can bind the `SelectedDates` property only when `SelectionMode` is set to `MultiSelection` in calendar.

### Binding SelectedRange

Calendar supports selecting a range of dates programmatically by binding the `SelectedRange` property with `SelectionRange` type from your view model.

**C#**

```
calendar.SetBinding(SfCalendar.SelectedRangeProperty, new  
Binding("SelectedRange", BindingMode.TwoWay));
```

**XML**

```
<calendar:SfCalendar x:Name="calendar"  
ShowInlineEvents="True"  
SelectionMode="RangeSelection"  
SelectedRange="{Binding SelectedRange, Mode=TwoWay}">  
</calendar:SfCalendar>
```

The following code sample demonstrates the ViewModel class.

**C#**

```
public class MainViewModel  
{  
    public SelectionRange SelectedRange { get; set; }  
    public MainViewModel()  
    {  
        SelectedRange = new SelectionRange();  
        SelectedRange.StartDate = new DateTime(2019, 02, 10);  
        SelectedRange.EndDate = new DateTime(2019, 02, 20);  
    }  
}
```

Calendar supports selecting multiple ranges of dates programmatically by binding the **SelectedRange** property with **ObservableCollection<SelectionRange>** type from your view model.

**C#**

```
calendar.SetBinding(SfCalendar.SelectedRangeProperty, new  
Binding("SelectedRanges", BindingMode.TwoWay));
```

**XML**

```
<calendar:SfCalendar x:Name="calendar"  
ShowInlineEvents="True"  
SelectionMode="MultiRangeSelection"  
SelectedRange="{Binding SelectedRanges, Mode=TwoWay}">  
</calendar:SfCalendar>
```

The following code sample demonstrates the ViewModel class.

**C#**

```
public class MainViewModel  
{  
    public ObservableCollection<SelectionRange> SelectedRanges { get; set; }  
    public MainViewModel()  
    {  
        SelectedRanges = new ObservableCollection<SelectionRange>();  
        SelectedRanges.Add(new SelectionRange());  
    }  
}
```

```
{
    StartDate = new DateTime(2019, 02, 10),
    EndDate = new DateTime(2019, 02, 20)
});
SelectedRanges.Add(new SelectionRange()
{
    StartDate = new DateTime(2019, 01, 31),
    EndDate = new DateTime(2019, 02, 05)
});
}
```

## NOTE

- You can bind the `SelectedRange` property only when `SelectionBinding` is set to `RangeSelection` and `MultiRangeSelection` in calendar.

## Commands

### Tap command

The [TapCommand](#) will be triggered whenever tapping the calendar cell and passing the [CalendarTappedEventArgs](#) as parameter.

## XML

```
<calendar:SfCalendar x:Name="calendar" TapCommand="{Binding
CalendarCellTapped}">
<calendar:SfCalendar.BindingContext>
<local:CalendarViewModel/>
</calendar:SfCalendar.BindingContext>
</calendar:SfCalendar>
```

## C#

```
public class CalendarViewModel
{
    private string commandText;
    public string CommandText
    {
        get { return commandText; }
        set { commandText = value; }
    }
    public ICommand CalendarCellTapped { get; set; }
    public CalendarViewModel()
    {
        CalendarCellTapped = new Command<CalendarTappedEventArgs>(CellTapped);
    }
    private void CellTapped(CalendarTappedEventArgs obj)
    {
        CommandText = obj.DateTime.ToString("dd/MM/yyyy") + " " +
        obj.SelectedAppointment.ToString();
    }
}
```

*Hold command*

The [HoldCommand](#) will be triggered whenever the calendar cell is long pressed and passing the [DayCellHoldingEventArgs](#) as parameter.

**XML**

```
<calendar:SfCalendar x:Name="calendar" HoldCommand="{Binding
OnDateCellHolding}">
<calendar:SfCalendar.BindingContext>
<local:CalendarViewModel/>
</calendar:SfCalendar.BindingContext>
</calendar:SfCalendar>
```

**C#**

```
public class CalendarViewModel
{
    private string commandText;
    public string CommandText
    {
        get { return commandText; }
        set { commandText = value; }
    }
    public ICommand OnDateCellHolding { get; set; }
    public CalendarViewModel()
    {
        OnDateCellHolding = new Command<DateTime>(DateCellHolding);
    }
    private void DateCellHolding(DateTime obj)
    {
        CommandText = obj.ToString("dd/MM/yyyy") ;
    }
}
```

*Month changed command*

The [MonthChangedCommand](#) will be triggered whenever the navigating between month and Forward()/backward() is called in calendar and passing the [MonthChangedEventArgs](#) as parameter.

**XML**

```
<calendar:SfCalendar x:Name="calendar" MonthChangedCommand="{Binding
OnMonthChanged}">
<calendar:SfCalendar.BindingContext>
<local:CalendarViewModel/>
</calendar:SfCalendar.BindingContext>
</calendar:SfCalendar>
```

**C#**

```
public class CalendarViewModel
{
    private string commandText;
    public string CommandText
    {
        get { return commandText; }
    }
}
```

```

set { commandText = value; }
}
public ICommand OnMonthChanged { get; set; }
public CalendarViewModel()
{
    OnMonthChanged = new Command<MonthChangedEventArgs>(MonthChanged);
}
private void MonthChanged(MonthChangedEventArgs obj)
{
    CommandText = " CurrentMonth -" + " " +obj.CurrentValue.ToString("dd/MM/yyyy")
    + " "+" PreviousMonth - "+" " + obj.PreviousValue.ToString("dd/MM/yyyy")
    + " "+" VisibleDate - "+" " "+"
    obj.VisibleDates[0].Date.ToString("dd/MM/yyyy");
}
}

```

### *Selection changed command*

The [SelectionChangedCommand](#) will be triggered whenever the selection is changed in calendar for the following selections and passing the [SelectionChangedEventArgs](#) as parameter.

- SingleSelection - A single date can be selected in a month view which can be equipped when user needs to select one date at a time.
- MultiSelection - More than one date can be selected.
- RangeSelection - It allows us to select a single date range in calendar month view.
- MultiRangeSelection - More than one date range can be selected in a month view.

### XML

```

<calendar:SfCalendar x:Name="calendar" SelectionChangedCommand="{Binding
OnSelectionChanged}">
<calendar:SfCalendar.BindingContext>
<local:CalendarViewModel/>
</calendar:SfCalendar.BindingContext>
</calendar:SfCalendar>

```

### C#

```

public class CalendarViewModel
{
    private string selectionChangedCommandText;
    public string SelectionChangedCommandText
    {
        get { return selectionChangedCommandText; }
        set { selectionChangedCommandText = value; }
    }
    public ICommand OnSelectionChanged { get; set; }
    public CalendarViewModel()
    {
        OnSelectionChanged = new
        Command<SelectionChangedEventArgs>(SelectionChanged);
    }
    private void SelectionChanged(SelectionChangedEventArgs obj)
    {

```

```

SelectionChangedCommandText = " DateAdded- "
+obj.DateAdded?.Count.ToString() +" "+ " DateRemoved- " +
obj.DateRemoved?.Count.ToString() + " " + " NewRangeAdded -"
+ obj.NewRangeAdded?.Count.ToString();
}
}

```

### Change First Day Of Week

By default, the starting day will be taken from the device culture. This can be modified using [FirstDayOfWeek](#) property. Changing the first day of week will be applied to both month and year view.

#### XML

```
<syncfusion:SfCalendar x:Name="calendar" FirstDayOfWeek="2"/>
```

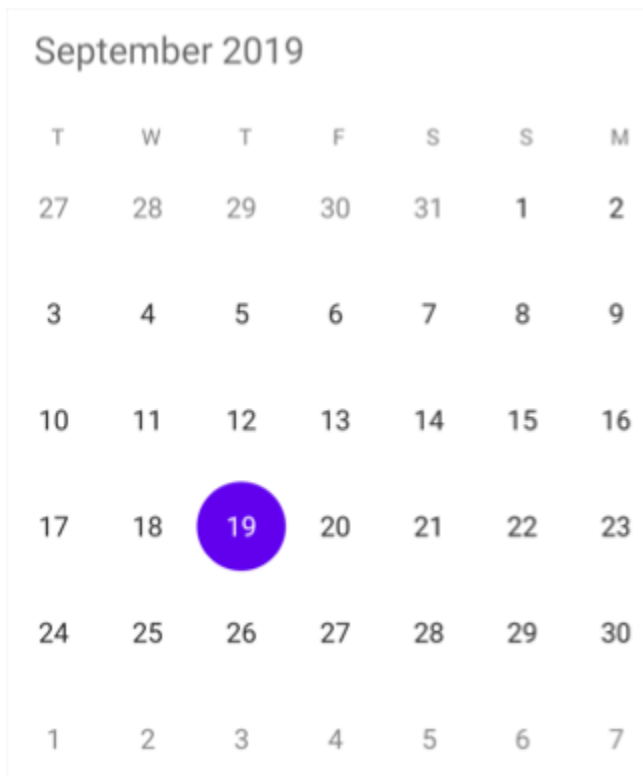

#### C#

```

SfCalendar calendar = new SfCalendar();
calendar.FirstDayOfWeek= 2;
this.Content = calendar;

```

**Note:** The value will be provided as integers starting from 0 as Sunday.

### Localization

SfCalendar control is available with complete localization support. Localization can be specified by setting the [Locale](#) property of the control using the format of Language code followed by Country code.

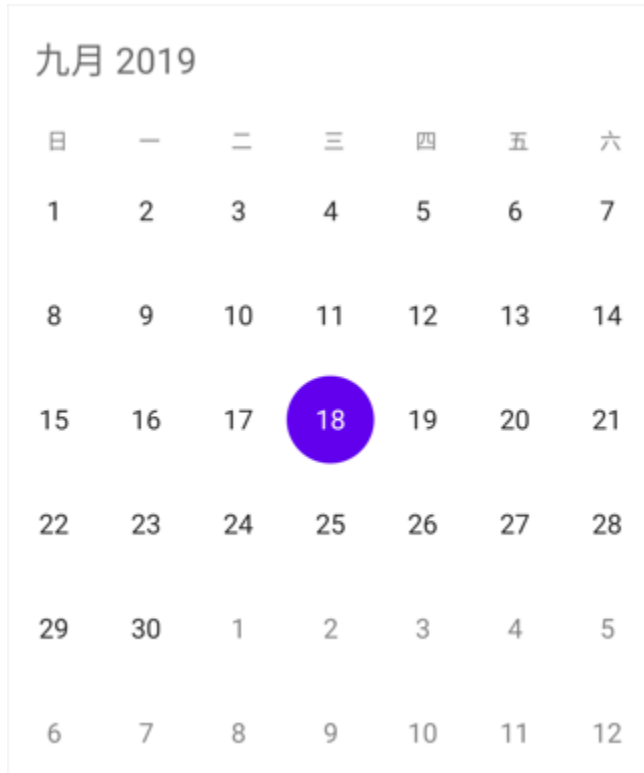

### Change default control language

Based on the locale specified, the strings in the control are localized accordingly.

#### C#

```
SfCalendar calendar = new SfCalendar ();  
calendar.Locale= new System.Globalization.CultureInfo("zh-CN");  
this.Content = calendar;
```

**Note:** By default, SfCalendar control is available with en-US locale.

### Localizing custom strings from PCL

You can localize the custom strings (All Day, No Events) used in the calendar control from PCL. It can be achieved by providing the custom strings to the specific language resx file and handling the required culture with the locale. In the below code, we have set Portugal as Calendar locale as well as custom strings.

#### C#

```
calendar.Locale = new System.Globalization.CultureInfo("pt-PT");  
CalendarResourceManager.Manager = new  
System.Resources.ResourceManager("Sample  
name.Resources.Syncfusion.SfCalendar.XForms",  
GetType().GetTypeInfo().Assembly);  
CultureInfo.CurrentUICulture = new CultureInfo("pt");
```

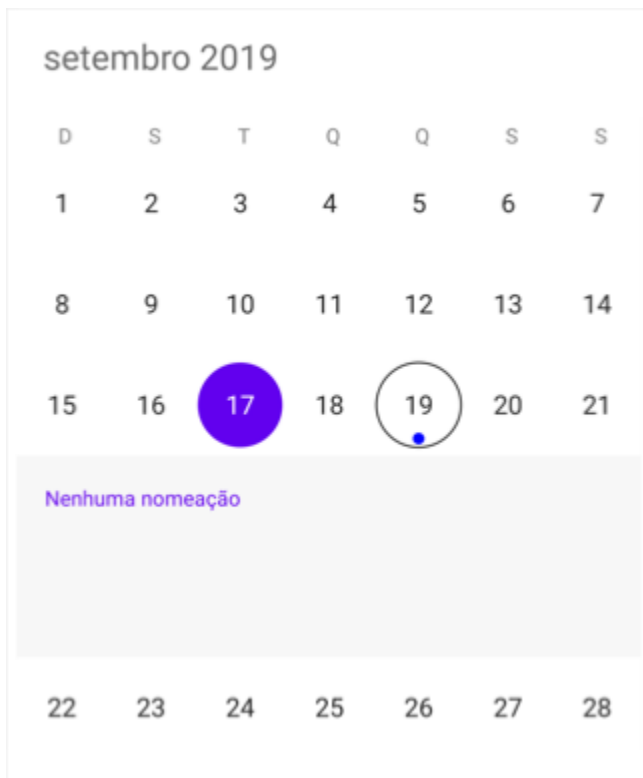

### Adding resx file

You need to add the required resx files under the Resources folder in the PCL project and the filename should be `Syncfusion.SfCalendar.Forms.LanguageCode.resx`.

Example: For Portuguese, `Syncfusion.SfCalendar.Forms.pt.resx`

Now, set the Build Action as `EmbeddedResource` for `Syncfusion.SfCalendar.Forms.pt.resx` file and Build Action as `Compile` for `Syncfusion.SfCalendar.Forms.pt.Designer.cs` file.

You can download the entire source code of this demo for Xamarin.Forms from here [LocaleFromPCL](#).

### Localizing the custom texts using platform renderer

You can localize the custom strings used in the calendar control. For that you need to configure it for each platform separately.

*Localizing custom text in Android renderer.* Localizing custom text in iOS renderer.

### Localizing custom text in Android renderer

You can localize custom text available in the control by adding equivalent localized string in the `string.xml` file.

## XML

```
<resources>
<string name="sfcalendar_inlineviewnoappointmenttext">Aucun
événement</string>
<string name="sfcalendar_inlineviewalldaytext">Toute la journée</string>
</resources>
```

Android can select and load resources from different directories, based on the current device configuration and locale, refer [here](#). For an example, if an application requires multiple languages you can follow the below steps.

The procedure for creating strings.xml files is as follows:

*Translate the strings.xml file to each language.* Create new folders under resource as values-ar, values-de, values-en and values-fr (The original values folder already exists). \* Place the translated strings.xml files in the respective folders.

## NOTE

The corresponding Locale values folder updates only when the device language changes.

### *Localizing custom text in iOS renderer*

You can localize custom text available in the control by adding equivalent localized string in the Localizable.strings file, refer [here](#).

If an application requires multiple languages you can follow the below steps:

*Translate the Localizable.Strings file to each language.* Create new .lproj folders under resource as en.lproj, fr.lproj, de.lproj. \* Place the Localizable.Strings file in the respective .lproj folders.

---

**NOTE**

The corresponding `<Language>.lproj` folder updates only when the device language changes.

You can download the entire source code of this demo for Xamarin.Forms from here [Localization](#).

### Right to left(RTL)

SfCalendar supports to change the layout direction of the control in the right-to-left direction by setting the [FlowDirection](#) to `RightToLeft` or by changing the device language.

#### XML

```
<calendar:SfCalendar FlowDirection="RightToLeft">
</calendar:SfCalendar>
```

#### C#

```
calendar.FlowDirection = FlowDirection.RightToLeft;
```

---

**Note**

For implementing the `FlowDirection` in the control, Xamarin.Forms package version must be 3.0 and above. Please refer [RightToLeft](#) to get more details about `RightToLeft` flow direction in Xamarin.Forms.

#### *Android*

For Android, add `android:supportsRtl="true"` in your application tag of `AndroidManifest.xml` file, and make sure your `MinSDKVersion` is 17+. By changing the device language / enabling the device's Force RTL layout can achieve the `RightToLeft` layout direction in Calendar.

#### XML

```
<manifest ... >
<uses-sdk android:minSdkVersion="17" ... />
<application ... android:supportsRtl="true">
</application>
</manifest>
```

#### *iOS*

For iOS, add the `RightToLeft` language in the `CFBundleLocalizations` section of your `Info.plist` file, and make sure you're targeting iOS 9+.

#### XML

```
<resources>
<key>CFBundleDevelopmentRegion</key>
<string>en</string>
<key>CFBundleLocalizations</key>
<array>
<string>en</string>
<string>ar</string>
</array>
</resources>
```

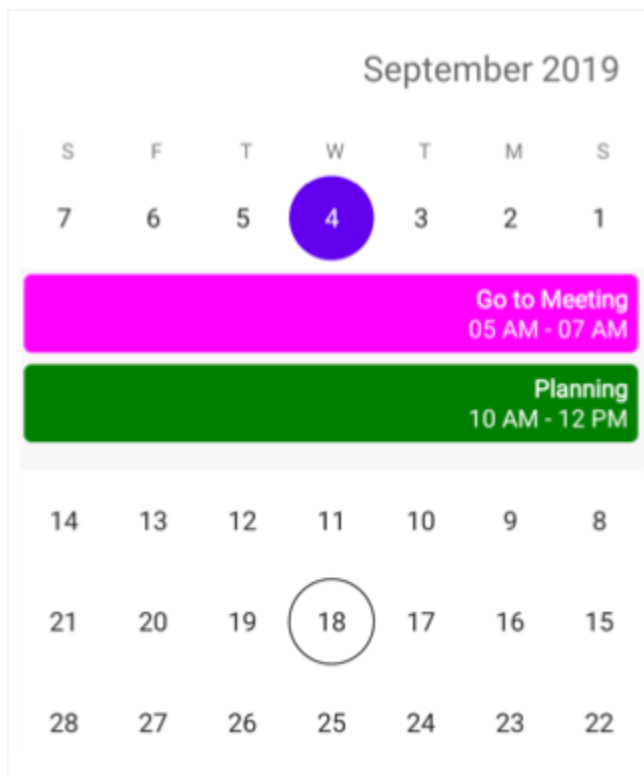

Localization native development region	String en
▼ Localizations	Array (2 items)
	String en
	String ar

### UWP

For UWP, you need to set `FlowDirection` to `RightToLeft` in the `MainPage.cs` file of the `UWP` project.

### C#

```
public MainPage()
{
    ...
    this.FlowDirection = FlowDirection.RightToLeft;
    LoadApplication (new App ());
    ...
}
```

## Customization of Calendar control

### How to Perform an Operation while a Calendar Cell is Tapped?

We can perform operation while the Calendar cell is Tapped using [CalendarTapped](#) event.

CalendarTapped event returns the date selected and the Appointments that are associated with the date selected.

Members	Description
(sender as SfCalendar)	Carries details about native control
DateTime	It shows the datetime in Calendar

### XML

```
<syncfusion:SfCalendar x:Name="calendar"
    OnCalendarTapped="Handle_OnCalendarTapped" />
```

### C#

```
void Handle_OnCalendarTapped(object sender, CalendarTappedEventArgs e)
{
    SfCalendar calendar = (sender as SfCalendar);
    DateTime date = e.datetime;
}
```

### How to Perform an Operation when the Selected Date Get Changed?

We can perform an operation when the selected date get changed using [SelectionChanged](#) event which returns the dates selected and dates deselected from the [SfCalendar](#).

Members	Description
(sender as SfCalendar)	Carries details about native control
DateAdded	Date selected from the calendar
DateRemoved	Date deselected from the calendar
NewRangeAdded	Carries details about the selected multi range

### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"
    SelectionChanged="Handle_SelectionChanged" />
```

### C#

```
void Handle_SelectionChanged(object sender, SelectionChangedEventArgs e)
{
    ////// Get added and removed dates in Single, Multi and Range selection modes.
    IList<DateTime> selectedDates = e.DateAdded;
    IList<DateTime> deselectedDates = e.DateRemoved;
```

```

//// Gets the added date range in Multi-range selection mode.
IList<SelectionRange> selectionRange = e.NewRangeAdded;
}

```

### How to Perform an Operation when Navigate to Next Month?

User defined operation can be performed using [MonthChanged](#) event when navigating to next month. This event returns the details about current value and previous value of month.

Members	Description
(sender as SfCalendar)	Carries details about native control
Args	Carries details about MonthEventParameters

### XML

```

<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"
MonthChanged="Handle_MonthChanged" />

```

### C#

```

void Handle_MonthChanged(object sender, MonthChangedEventArgs e)
{
    SfCalendar calendar = (sender as SfCalendar);
    DateTime oldMonth = e.PreviousValue;
    DateTime currentMonth = e.CurrentValue;
}

```

### How to Perform an Operation while Dealing with Appointments?

[InlineToggled](#) event returns the selected date along with the appointments it carries. Using this event user can perform operation while dealing with appointments.

Members	Description
(sender as SfCalendar)	Carries details about native control
SelectedAppointment	Appointments from the selected date

### XML

```

<syncfusion:SfCalendar x:Name="calendar"
InlineToggled="Handle_InlineToggled" />

```

### C#

```

void Handle_InlineToggled(object sender, InlineToggledEventArgs e)
{
    if ((args.SelectedAppointment as CalendarEventCollection).Count != 0)
    {
        string subject = (e.SelectedAppointment as
CalendarEventCollection)[0].Subject;
    }
}

```

```
DateTime startTime = (e.SelectedAppointment as  
CalendarEventCollection)[0].StartTime;  
DateTime endTime = (e.SelectedAppointment as  
CalendarEventCollection)[0].EndTime;  
}  
}
```

### How to Customize Cell or Month View?

[OnMonthCellLoaded](#) event allows us to customize **SfCalendar** control. It returns MonthCell args

Members	Description
Args	Carries details about MonthCell

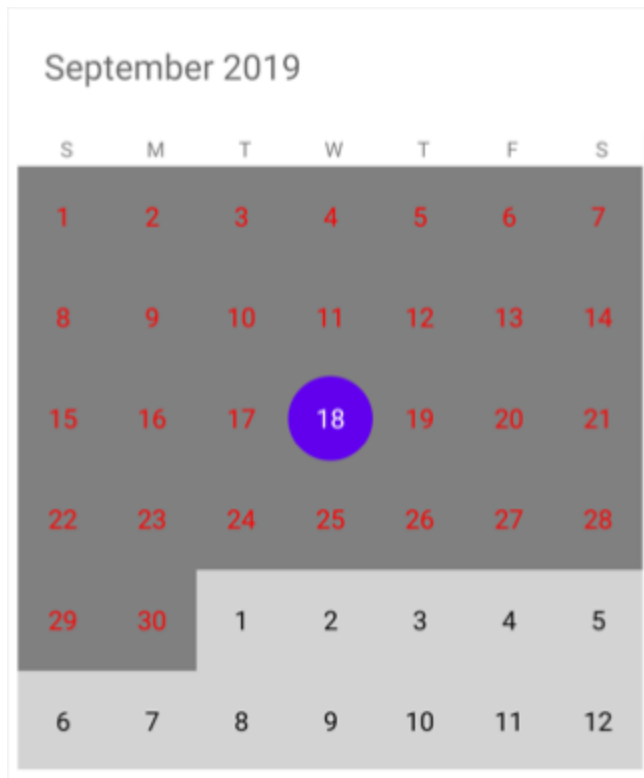

### XML

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"  
OnMonthCellLoaded="Handle_OnMonthCellLoaded" />
```

### C#

```
void Handle_OnMonthCellLoaded(object sender, MonthCellLoadedEventArgs e)  
{  
    if (e.IsCurrentMonth)  
    {  
        e.BackgroundColor = Color.Gray;  
        e.TextColor = Color.Red;  
    }  
    else  
    {  
        e.BackgroundColor = Color.LightGray;  
        e.TextColor = Color.Black;  
    }  
}
```

### Create your own custom calendar month cell view

You can customize the month view with custom view using the `View` property of `MonthCellLoadedEventArgs` in the `OnMonthCellLoaded` event `SfCalendar` control.

#### C#

```
private void Calendar_OnMonthCellLoaded(object sender,
MonthCellLoadedEventArgs e)
{
    var button = new Button();
    button.Text = e.Date.Day.ToString();
    e.View = button;
}
```

How to customize month view cell using a template?

You can customize the month cell of the **SfCalendar** using [CellTemplate](#) property of [MonthViewSettings](#).

#### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:MonthCellCustomization"
x:Class="MonthCellCustomization.MainPage"
xmlns:calendar="clr-namespace:Syncfusion.SfCalendar.XForms;assembly=Syncfusion.SfCalendar.XForms"
">
<ContentPage.Content>
<calendar:SfCalendar x:Name="calendar" ShowLeadingAndTrailingDays="true" BackgroundColor="White">
<calendar:SfCalendar.MonthViewSettings>
<calendar:MonthViewSettings>
<calendar:MonthViewSettings.CellTemplate>
<DataTemplate>
<Grid BackgroundColor="White">
<Grid.RowDefinitions>
<RowDefinition Height="*" />
```

```
<RowDefinition Height="*" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Grid.ColumnDefinitions>
<ColumnDefinition Width="*" />
<ColumnDefinition Width="*" />
<ColumnDefinition Width="*" />
</Grid.ColumnDefinitions>
<Image HorizontalOptions="Center" Source="Weather1.png" Grid.Row="0" Grid.Column="0" />
<Label Text="{Binding Day}" FontAttributes="Bold" TextColor="Black" Grid.Row="1" HorizontalTextAlignment="Center" VerticalTextAlignment="Center" Grid.Column="1" FontSize="10" />
<Image HorizontalOptions="Center" Grid.Row="2" Source="Weather2.png" Grid.Column="2" />
</Grid>
</DataTemplate>
</calendar:MonthViewSettings.CellTemplate>
</calendar:MonthViewSettings>
</calendar:SfCalendar.MonthViewSettings>
</calendar:SfCalendar>
</ContentPage.Content>
</ContentPage>
```

How to Perform the Operation while long pressing the dateCell?

[OnDateCellHolding](#) event returns the long pressed date along with the **SfCalendar** it carries. Using this event user can perform operation while long pressing the date.

Members	Description
Args	Carries details with long pressed date and Calendar

### XML

```
<syncfusion:SfCalendar x:Name="sfcalendar"
    OnDateCellHolding="Handle_OnDateCellHolding" />
```

**C#**

```
void Handle_OnDateCellHolding(object sender,
    Syncfusion.SfCalendar.XForms.DayCellHoldingEventArgs e)
{
    // do the operation while long pressing the date cell
}
```

## How to Resize the SfCalendar Control?

SfCalendar control can be resized using **WidthRequest** and **HeightRequest** properties in SfCalendarcontrol.

**C#**

```
SfCalendar calendar = new SfCalendar();
calendar.WidthRequest = 200;
calendar.HeightRequest = 200;
```

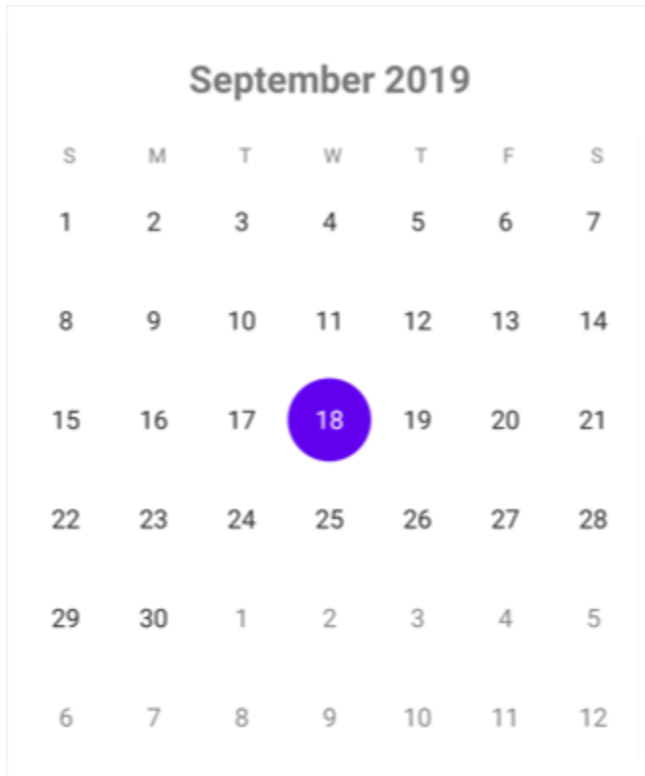

## How to Customize the SfCalendar Header?

[HeaderView](#) property of SfCalendar allows us to customize **SfCalendar** Header. It returns custom view for SfCalendarHeader

Members	Description
HeaderView	Carries custom view for Calendar Header

**XML**

```
<syncfusion:SfCalendar x:Name="calendar">
    <syncfusion:SfCalendar.HeaderView>
        <Label Text="{binding CalendarDate}" HorizontalTextAlignment="Center"
            VerticalTextAlignment="Center" FontAttributes="Bold" FontSize="Large"/>
    </syncfusion:SfCalendar.HeaderView>
</syncfusion:SfCalendar>
```

How to enable or disable the YearView in SfCalendar?

[ShowYearView](#) property of **SfCalendar** allows us to enable and disable the YearView of **SfCalendar**. The default value of ShowYearView is true.

Members	Description
ShowYearView	Carries boolean value which is used to enable or disable the YearView in SfCalendar

#### XML

```
<syncfusion:SfCalendar Grid.Row="1" ShowYearView="false" x:Name="calendar" />
```

How to enable or disable the Horizontal and Vertical cell grid lines in SfCalendar?

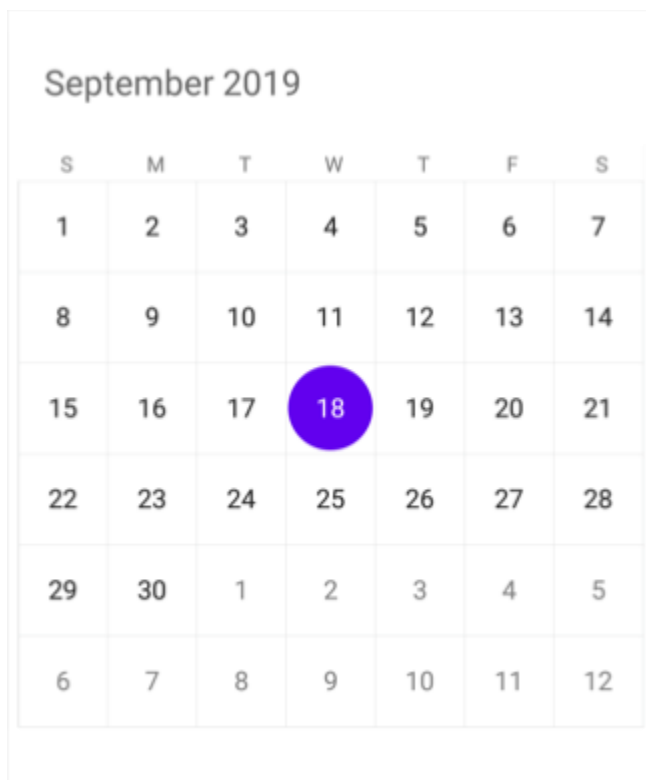

[CellGridOptions](#) property of **MonthViewSettings** allows us to enable and disable the horizontal and vertical border lines of **SfCalendar**.

Members	Description
CellGridOptions	Carries enum value which is used to enable or disable the vertical and horizontal border lines in SfCalendar
VerticalLines	This enum value of CellGridOptions is used to enable the vertical border lines in SfCalendar

HorizontalLines	This enum value of CellGridOptions is used to enable the horizontal border lines in SfCalendar
Both	This enum value of CellGridOptions is used to enable the vertical and horizontal border lines in SfCalendar
None	This enum value of CellGridOptions is used to disable the vertical and horizontal border lines in SfCalendar

**XML**

```
<syncfusion:SfCalendar x:Name="calendar" >
  <syncfusion:SfCalendar.MonthViewSettings>
    <syncfusion:MonthViewSettings CellGridOptions="Both" />
  </syncfusion:SfCalendar.MonthViewSettings>
</syncfusion:SfCalendar>
```

**Customize the year cell or year view**

You can customize the year cell of the **SfCalendar** control using the [OnYearCellLoaded](#) event, which returns [YearCellLoadedEventArgs](#). The [YearCellLoadedEventArgs](#) has the following properties to customize the year view: [BackgroundColor](#), [Font](#), [FontFamily](#), [Month](#), [MonthHeaderBackgroundColor](#), [MonthHeaderTextColor](#), [MonthLayoutBackgroundColor](#), [TextColor](#), and [View](#).

**C#**

```
private void Calendar_OnYearCellLoaded(object sender,
  YearCellLoadedEventArgs e)
```

```
{
e.BackgroundColor = Color.Red;
e.Font = Font.SystemFontOfSize(12, FontAttributes.Italic);
e.FontFamily = "Times New Roman";
e.MonthHeaderBackgroundColor = Color.Blue;
e.MonthHeaderTextColor = Color.Black;
e.MonthLayoutBackgroundColor = Color.Gray;
e.TextColor = Color.Green;
}
```

Customize the year view with custom UI

You can customize the YearView with Custom UI in the SfCalendar control using the View property of YearCellLoadedEventArgs in the OnYearCellLoaded event.

**C#**

```
private void Calendar_OnYearCellLoaded(object sender,
YearCellLoadedEventArgs e)
{
var button = new Button();
button.Text = e.Month.ToString("MMMM");
e.View = button;
}
```

### Deselect today selection on initial load

Initially, the calendar is loaded with the current day as selected date in **MonthView** when the **SelectionMode** is set to **SingleSelection**, but you can deselect the date on initial loading in **SfCalendar** by set the [SelectedDate](#) property as null.

### C#

```
calendar.SelectedDate = null;
```

### Feature Comparison across the different platforms in Xamarin.

This section covers the features of **SfCalendar** specific to Android,iOS and UWP platforms. The following comparison table help to find available features are in different platforms.

Features are in SfCalendar	Android	iOS	UWP	Achieved By
View of SfCalendar	MonthView	MonthView	MonthView	ViewMode
	YearView	YearView	YearView	
	Decade	Decade	Decade	
	Century/p>	Century/p>	Century/p>	
Date Selection	Single	Single	Single	SelectionMode
	Multiple	Multiple	Multiple	
	Range	Range	Range	
	MultiRange	MultiRange	MultiRange	
Blackout Dates	Yes	Yes	Yes	BlackoutDates

FirstDay of Week	Yes	Yes	Yes	FirstDayofWeek
Adding the appointments	Yes	Yes	Yes	DataSource
Visibility changes of SfCalendar	Yes	Yes	Yes	IsVisible
Localization support	Yes	Yes	Yes	Locale
Show Appointments	Yes	Yes	Yes	ShowInlineEvents
Move to Specific date	Yes	Yes	Yes	MoveToDate and MoveToDate(DateTime datetime)
Navigation of month Programmatically	Yes	Yes	Yes	Forward() and Backward()
Custom Day label support	Yes	Yes	Yes	CustomDayLabels
Restrict the date selection and navigation	Yes	Yes	Yes	MinDate and MaxDate
Dynamically select the dates in MultiSelection	Yes	Yes	Yes	SelectedDates
Calendar's Header height customization	Yes	Yes	Yes	HeaderHeight
Enabling and disabling the header of SfCalendar	Yes	Yes	Yes	ShowHeader
Customization of Navigation Buttons	Yes	Yes	Yes	NavigationButtonHeight NavigationButtonWidth

				NavigationArrowThickness
Enable or disable the navigation button visible	Yes	Yes	Yes	ShowNavigationButtons
Customization of MonthView	Yes	Yes	Yes	MonthViewSettings
Customization of YearView	Yes	Yes	No	YearViewSettings
Deselect the date selection in single selection mode	Yes	Yes	No	ToggleDaySelection
Customization of Month Day's text	Yes	Yes	Yes	MonthViewSettings
Option to move the next / previous month while clicking the previous/next month date in current active cell	Yes	Yes	Yes	NavigateToMonthOn- InactiveDatesSelection
Swiping behavior	Yes Swiping of SfCalendar has been restricted only with RangeSelection. With that RangeSelection mode We can swipe the month by using	Yes Swiping of SfCalendar has been restricted only with RangeSelection. With that RangeSelection mode We can swipe the month by using	Yes Swiping of SfCalendar has been restricted only with RangeSelection. With that RangeSelection mode We can swipe the month by using	—

	navigation buttons	navigation buttons	navigation buttons	
Restrict the swiping behavior	Yes	Yes	Yes	EnableSwiping
Maximum number of Inline event count indication	Yes	Yes	No	MaximumEventIndicator Count
Dynamically select the dates in RangeSelecti on  By setting the start and end range of date selection, RangeSelecti on is possible	Yes	Yes	Yes	SelectedRange
Customization of Cell Border Lines	Horizontal	Horizontal	Horizontal	CellGridOptions
	Vertical	Vertical	Vertical	
	Both	Both	Both	
	None	None	None	
Scrolling Direction	Horizontal  Vertical	Horizontal  Vertical	Horizontal  Vertical	NavigationDirection

Restrict the YearView Option	Yes	Yes	Yes	ShowYearView
Calendarâ€™s Header customization	Yes	Yes	Yes	HeaderView
Common DataTemplate	Yes	Yes	Yes	CellTemplate
DataTemplate with Custom Object on OnMonthCell	Yes	Yes	Yes	CellTemplate and CellBindingContext in an argument of OnMonthCellLoaded

## Theming

Theming is a set of resources which are used to provide the consistency look for calendar.

You can modify the default appearance of calendar using this support. By default calendar have default theme resources and it's located in `Syncfusion.Xamarin.Core` assembly. You need to merge them in your application's resource to apply the theme.

In the below code you can see the default color and key value for the default resources.

### XML

```
<Color x:Key="SfCalendarInlineTextColor">#414141</Color>
<Color x:Key="SfCalendarBlackoutColor">#C2C2C2</Color>
<Color x:Key="SfCalendarDateSelectionColor">#F5F5F5</Color>
<Color x:Key="SfCalendarInlineBackgroundColor">#F5F5F5</Color>
<Color x:Key="SfCalendarSelectedDayTextColor">#FFFFFF</Color>
<Color x:Key="SfCalendarBorderColor">#F0F0F0</Color>
<Color x:Key="SfCalendarWeekDayBackgroundColor">#FFFFFF</Color>
<Color x:Key="SfCalendarWeekDayTextColor">#707070</Color>
<Color x:Key="SfCalendarDisabledBackgroundColor">#FFFFFF</Color>
<Color x:Key="SfCalendarDisabledTextColor">#C2C2C2</Color>
<Color x:Key="SfCalendarPreviousMonthBackgroundColor">#FFFFFF</Color>
<Color x:Key="SfCalendarPreviousMonthTextColor">#C2C2C2</Color>
<Color x:Key="SfCalendarCurrentMonthBackgroundColor">#FFFFFF</Color>
<Color x:Key="SfCalendarCurrentMonthTextColor">#414141</Color>
<Color x:Key="SfCalendarWeekEndTextColor">#707070</Color>
<Color x:Key="SfCalendarDayHeaderTextColor">#707070</Color>
<Color x:Key="SfCalendarDayHeaderBackgroundColor">#FFFFFF</Color>
<Color x:Key="SfCalendarWeekEndBackgroundColor">#C2C2C2</Color>
<Color x:Key="SfCalendarHeaderBackgroundColor">#FFFFFF</Color>
<Color x:Key="SfCalendarHeaderTextColor">#707070</Color>
<Color x:Key="SfCalendarYearViewLayoutBackground">#FFFFFF</Color>
<Color x:Key="SfCalendarYearViewHeaderBackground">#FFFFFF</Color>
<Color x:Key="SfCalendarYearViewMonthLayoutBackground">#FFFFFF</Color>
<Color x:Key="SfCalendarYearViewMonthHeaderBackground">#FFFFFF</Color>
<Color x:Key="SfCalendarYearViewDateTextColor">#414141</Color>
<Color x:Key="SfCalendarYearViewHeaderTextColor">#707070</Color>
<Color x:Key="SfCalendarAgendaSelectedDateColor">#FFFFFF</Color>
```

You can apply the default theme (light theme) or customized theme to calendar.

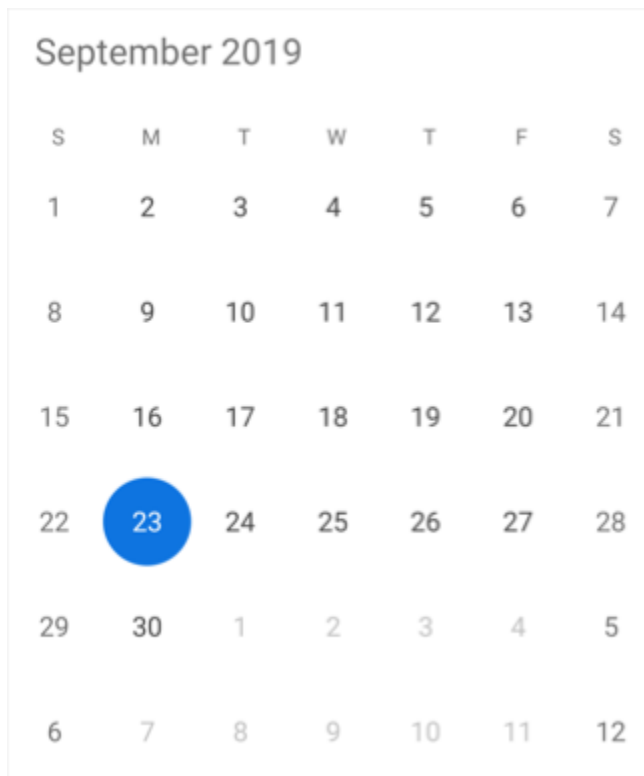

#### Default theme (light theme)

You need to apply the syncfusion theme dictionaries in your application to view the default theme (light theme).

#### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" xmlns:local="clr-
namespace:CalendarSample" x:Class="CalendarSample.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfCalendar.XForms;assembly=Syncfusion.SfCalendar.XForms
" xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms">
<ContentPage.Resources>
<syncTheme:SyncfusionThemeDictionary>
<syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
<syncTheme:LightTheme x:Name="LightTheme" />
</syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
</syncTheme:SyncfusionThemeDictionary>
</ContentPage.Resources>
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"
ShowInlineEvents="true" InlineViewMode="Inline" />
</ContentPage>
```

#### Month view

## Year view

## Customizing the default theme

You can customize the default theme by overriding the existing key and set the new value.

**XML**

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" xmlns:local="clr-
namespace:CalendarSample" x:Class="CalendarSample.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfCalendar.XForms;assembly=Syncfusion.SfCalendar.XForms
" xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms">
<ContentPage.Resources>
<ResourceDictionary>
<ResourceDictionary.MergedDictionaries>
<syncTheme:LightTheme />
<syncfusion:SfCalendarStyles />
<ResourceDictionary>
<Color x:Key="SfCalendarInlineBackgroundColor">Green</Color>
<Color x:Key="SfCalendarInlineTextColor">White</Color>
<Color x:Key="SfCalendarWeekEndBackgroundColor">Blue</Color>
<Color x:Key="SfCalendarYearViewHeaderTextColor">Blue</Color>
<Color x:Key="SfCalendarYearViewDateTextColor">Green</Color>
</ResourceDictionary>
</ResourceDictionary.MergedDictionaries>
</ResourceDictionary>
</ContentPage.Resources>
```

```
<syncfusion:SfCalendar x:Name="calendar" ViewMode="MonthView"
ShowInlineEvents="true" InlineViewMode="Inline" />
</ContentPage>
```

---

**NOTE**

---

Xamarin.Forms version should be above 3 while customize the default theme.

Month view

Year view

You can download the entire source code of this demo for Xamarin.Forms from here [CalendarTheme](#).

#### AutomationId

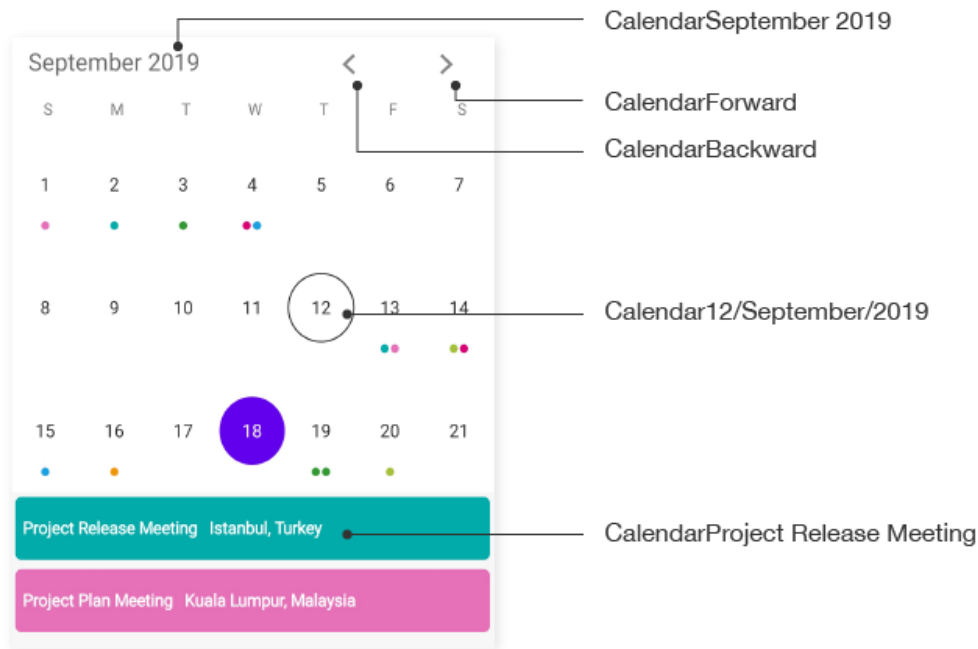

The SfCalendar control has built-in **AutomationId** for inner elements. Please find the following table of Automation IDs for inner elements.

View	AutomationId Format	Example
MonthCell	dddd dd/MMMM/yyyy	Tuesday 27/May/2018
Month Header - Month view	MMMM yyyy	May 2018
Month Header - Week view	MMMM â€” MMMM yyyy	November â€” December 2018
Left Arrow	string	Backward
Right Arrow	string	Forward
Inline View , Agenda View	subject text	Meeting
Year View - Header	yyyy	2018
Year View - Year Cell	MMMM yyyy	January 2018
Decade View - Header	yyyy - yyyy	2020 â€” 2029
Decade View - Year Cell	yyyy	2020
Century View - Header	yyyy - yyyy	2000 â€” 2099

Century View - Year Cell	yyyy	2070 – 2079
--------------------------	------	-------------

To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's AutomationId. For example, if you set SfCalendar AutomationId as SfCalendar.AutomationId = Calendar, then the Automation framework will interact with the RightArrow button as CalendarForward. The following screenshots denote the AutomationIds for inner elements.

#### Month view

*Week view*

### Century view

## SfCarousel

### Overview

The Essential Xamarin Carousel control allows navigating through image data in an interactive way so that they can be viewed or selected. Also, provides various customization options for its item arrangements.

It has been available in Xamarin.Forms, Xamarin.Android and Xamarin.iOS platforms also.

### Key Features:

- **Offset** - Support to specify the space between the unselected items in SfCarousel.
- **Rotation Angle** - Options to rotate all the items to a specified angle.
- **Duration** - Support to specify the time taken to move an item to the selected item position.

### Getting Started

This section explains how to showcase a Gallery of photos along with a Title using SfCarousel Control.

#### Adding SfCarousel reference

You can add SfCarousel reference using one of the following methods:

##### Method 1: Adding SfCarousel reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfCarousel). To add SfCarousel to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfCarousel](https://www.nuget.org/packages/Syncfusion.Xamarin.SfCarousel), and then install it.

![Adding SfCarousel reference from NuGet](images/Adding SfCarousel reference.png)

---

**Note:** Install the same version of SfCarousel NuGet in all the projects.

---

##### Method 2: Adding SfCarousel reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfCarousel control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

##### Method 3: Adding SfCarousel assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfCarousel.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfCarousel.Android.dll Syncfusion.SfCarousel.XForms.Android.dll Syncfusion.SfCarousel.XForms.dll Xamarin.Android.Support.v17.Leanback (from NuGet Packages) Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfCarousel.iOS.dll Syncfusion.SfCarousel.XForms.iOS.dll Syncfusion.SfCarousel.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll

UWP	Syncfusion.SfCarousel.UWP.dll Syncfusion.SfCarousel.XForms.UWP.dll Syncfusion.SfCarousel.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
-----	---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the SfCarousel on each platform

To use SfCarousel inside an application, each platform application must initialize the SfCarousel renderer. This initialization step varies from platform to platform and is discussed in the following sections.

#### Android and UWP

The Android and UWP launches the SfCarousel without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch SfCarousel in iOS, need to create an instance of SfCarouselRenderer in FinishedLaunching overridden method of AppDelegate class in iOS Project as shown below.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    new SfCarouselRenderer();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### ReleaseMode issue in UWP platform

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfCarousel assemblies in **App.xaml.cs** in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
}
```

```

rootFrame.NavigationFailed += OnNavigationFailed;
// you'll need to add `using System.Reflection;`
List<Assembly> assembliesToInclude = new List<Assembly>();
//Now, add all the assemblies your app uses
assembliesToInclude.Add(typeof(SfCarouselRenderer).GetTypeInfo().Assembly);
// replaces Xamarin.Forms.Forms.Init(e);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
...
}

```

### Create a Simple SfCarousel

The SfCarousel control is configured entirely in C# code or by using XAML markup. The following steps explain on how to create a SfCarousel and configure its elements,

- Adding namespace for the added assemblies.

#### XML

```

xmlns:carousel="clr-
namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms
"

```

#### C#

```

using Syncfusion.SfCarousel.XForms;

```

- Now add the SfCarousel control with a required optimal name by using the included namespace.

#### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:carousel="clr-
namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms
"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
<carousel:SfCarousel x:Name="carousel" />
</ContentPage>

```

#### C#

```

using Syncfusion.SfCarousel.XForms;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();

```

```
SfCarousel carousel = new SfCarousel();  
this.Content = carousel;  
}  
}  
}
```

### Add Carousel Items

We can populate the carousel's items by using any one of the following ways,

- Through SfCarouselItem
- Through ItemTemplate

#### Through SfCarouselItem

By passing the list of `SfCarouselItem`, we can get the view of SfCarousel control. In that we can pass Images as well as Item content.

The following code example illustrates to add list of Images in Carousel ,

#### C#

```
using Syncfusion.SfCarousel.XForms;  
using System.Collections.ObjectModel;  
using Xamarin.Forms;  
namespace CarouselSample  
{  
    public partial class MainPage : ContentPage  
    {  
        public MainPage()  
        {  
            InitializeComponent();  
            SfCarousel carousel = new SfCarousel()  
            {  
                ItemWidth = 170,  
                ItemHeight = 250  
            };  
            ObservableCollection<SfCarouselItem> carouselItems = new  
            ObservableCollection<SfCarouselItem>();  
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person1.png" });  
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person2.png" });  
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person3.png" });  
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person4.png" });  
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person5.png" });  
            carousel.ItemsSource = carouselItems;  
            this.Content = carousel;  
        }  
    }  
}
```

The following code example illustrates to add list of Item in Carousel ,

**C#**

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfCarousel carousel = new SfCarousel()
            {
                ItemWidth = 170,
                ItemHeight = 250
            };
            ObservableCollection<SfCarouselItem> carouselItems = new
            ObservableCollection<SfCarouselItem>();
            carouselItems.Add(new SfCarouselItem()
            {
                ItemContent = new Button()
                {
                    Text = "ItemContent1",
                    TextColor = Color.White,
                    BackgroundColor = Color.FromHex("#7E6E6B"),
                    FontSize = 12
                }
            });
            carouselItems.Add(new SfCarouselItem()
            {
                ItemContent = new Label()
                {
                    Text = "ItemContent2",
                    BackgroundColor = Color.FromHex("#7E6E6B"),
                    HorizontalTextAlignment = TextAlignment.Center,
                    VerticalTextAlignment = TextAlignment.Center,
                    FontSize = 12
                }
            });
            carouselItems.Add(new SfCarouselItem()
            {
                ItemContent = new Image()
                {
                    Source = "carousel_person1.png",
                    Aspect = Aspect.AspectFit
                }
            });
            carousel.ItemsSource = carouselItems;
            this.Content = carousel;
        }
    }
}
```

*Through ItemTemplate*

**ItemTemplate** property of SfCarousel control is used to customize the contents of SfCarousel items.

- Create a model view which holds image data

**C#**

```
namespace CarouselSample
{
    public class CarouselModel
    {
        public CarouselModel(string imageString)
        {
            Image = imageString;
        }
        private string _image;
        public string Image
        {
            get { return _image; }
            set { _image = value; }
        }
    }
}
```

- Populate carousel items collection in View model with the image data.

**C#**

```
using System.Collections.Generic;
namespace CarouselSample
{
    public class CarouselViewModel
    {
        public CarouselViewModel()
        {
            ImageCollection.Add(new CarouselModel("carousel_person1.png"));
            ImageCollection.Add(new CarouselModel("carousel_person2.png"));
            ImageCollection.Add(new CarouselModel("carousel_person3.png"));
            ImageCollection.Add(new CarouselModel("carousel_person4.png"));
            ImageCollection.Add(new CarouselModel("carousel_person5.png"));
        }
        private List<CarouselModel> imageCollection = new List<CarouselModel>();
        public List<CarouselModel> ImageCollection
        {
            get { return imageCollection; }
            set { imageCollection = value; }
        }
    }
}
```

The following code illustrates the way to use `ItemTemplate` in both XAML as well as C#

**XAML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
```

```

xmlns:carousel="clr-
namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms
"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
<ContentPage.BindingContext>
<local:CarouselViewModel/>
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="itemTemplate">
<Image Source="{Binding Image}"
Aspect="AspectFit"/>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<carousel:SfCarousel x:Name="carousel"
ItemTemplate="{StaticResource itemTemplate}"
ItemsSource="{Binding ImageCollection}"
HeightRequest="400"
WidthRequest="800" />
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.SfCarousel.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            CarouselViewModel carouselViewModel = new CarouselViewModel();
            SfCarousel carousel = new SfCarousel()
            {
                HeightRequest = 400,
                WidthRequest = 800
            };
            var itemTemplate = new DataTemplate(() =>
            {
                var grid = new Grid();
                var nameLabel = new Image();
                nameLabel.SetBinding(Image.SourceProperty, "Image");
                grid.Children.Add(nameLabel);
                return grid;
            });
            carousel.ItemTemplate = itemTemplate;
            carousel.ItemsSource = carouselViewModel.ImageCollection;
            this.Content = carousel;
        }
    }
}

```

```

public class CarouselModel
{
    public CarouselModel(string imageString)
    {
        Image = imageString;
    }
    private string _image;
    public string Image
    {
        get { return _image; }
        set { _image = value; }
    }
}

public class CarouselViewModel
{
    public CarouselViewModel()
    {
        ImageCollection.Add(new CarouselModel("carousel_person1.png"));
        ImageCollection.Add(new CarouselModel("carousel_person2.png"));
        ImageCollection.Add(new CarouselModel("carousel_person3.png"));
        ImageCollection.Add(new CarouselModel("carousel_person4.png"));
        ImageCollection.Add(new CarouselModel("carousel_person5.png"));
    }
    private List<CarouselModel> imageCollection = new List<CarouselModel>();
    public List<CarouselModel> ImageCollection
    {
        get { return imageCollection; }
        set { imageCollection = value; }
    }
}

```

**Information:** Carousel's Images are placed within the application folder for Android, iOS and UWP with build action Android Resource, Bundled Resource and Content respectively.

**Note:** In addition, carousel provides a support to load the Images from URL and SD Card location.

### Setting the height and width of the carousel item

ItemHeight and ItemWidth properties are used to change the height and width of carouselItem in carousel panel.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:carousel="clr-namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
<carousel:SfCarousel x:Name="carousel"
ItemHeight="170"
ItemWidth="270"/>
</ContentPage>

```

**C#**

```

using Syncfusion.SfCarousel.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfCarousel carousel = new SfCarousel()
            {
                ItemWidth = 170,
                ItemHeight = 250
            };
            ObservableCollection<SfCarouselItem> carouselItems = new
            ObservableCollection<SfCarouselItem>();
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person1.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person2.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person3.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person4.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person5.png"
            });
            carousel.ItemsSource = carouselItems;
            this.Content = carousel;
        }
    }
}

```

**Set Desire Item to be Selected**

We can bring particular item to the center of the screen using **SelectedIndex** property in SfCarousel control.

The items can be populated as described [above](#)

**XML**

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:carousel="clr-
namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms
"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
<carousel:SfCarousel x:Name="carousel"
ItemHeight="170"
ItemWidth="270"
SelectedIndex="2"/>
</ContentPage>

```

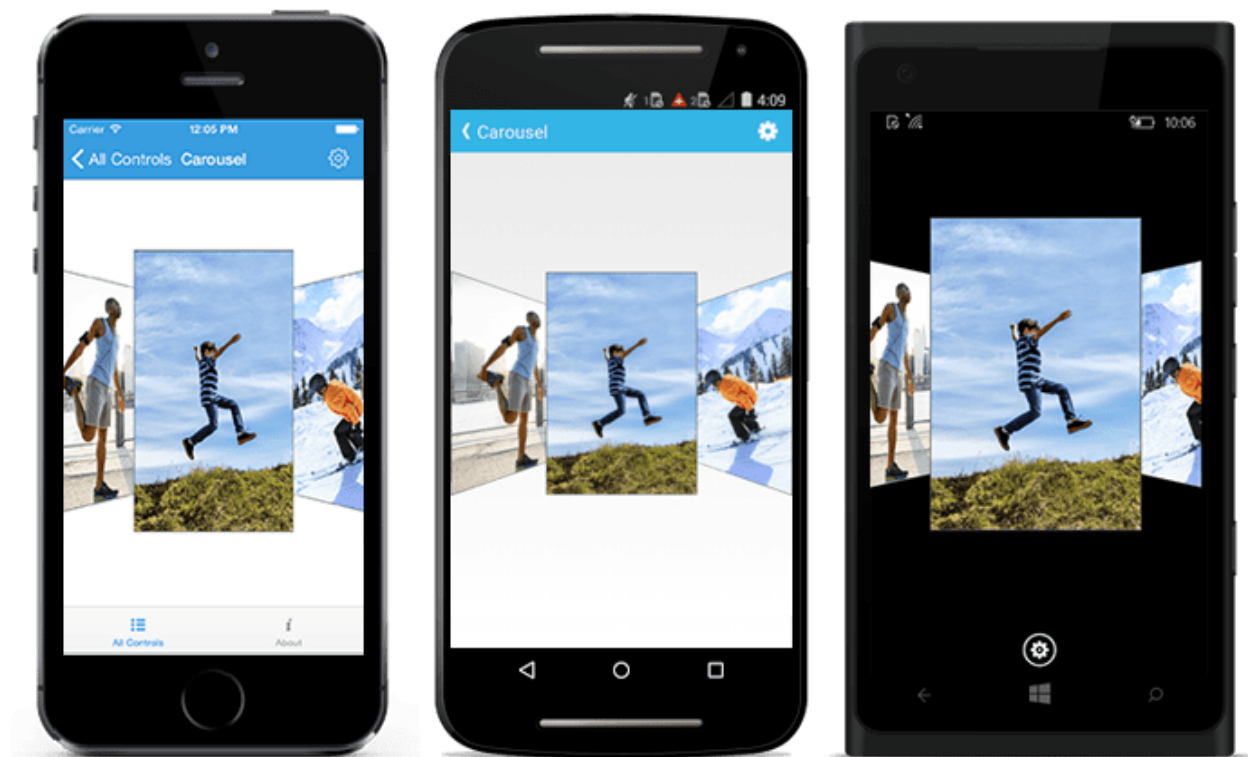

**C#**

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfCarousel carousel = new SfCarousel()
            {
                ItemWidth = 170,
                ItemHeight = 250,
                SelectedIndex = 2
            };
            ObservableCollection<SfCarouselItem> carouselItems = new
            ObservableCollection<SfCarouselItem>();
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person1.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person2.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person3.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person4.png"
            });
            carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person5.png"
            });
            carousel.ItemsSource = carouselItems;
            this.Content = carousel;
        }
    }
}
```

---

**Note:** The `SelectedIndex` property will be 0 by default.

---

You can find the complete getting started sample from this [link](#).

### Linear Arrangement

The Carousel items can be populated in the view in a stacked linear layout by setting the **ViewMode** property to Linear. The present option is **Default**.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:carousel="clr-namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
  <ContentPage.BindingContext>
    <local:CarouselViewModel/>
  </ContentPage.BindingContext>
  <ContentPage.Resources>
    <ResourceDictionary>
      <DataTemplate x:Key="itemTemplate">
        <Image Source="{Binding Image}"
Aspect="AspectFit"/>
      </DataTemplate>
    </ResourceDictionary>
  </ContentPage.Resources>
  <ContentPage.Content>
    <carousel:SfCarousel x:Name="carousel">
```

```

ItemTemplate="{StaticResource itemTemplate}"
ItemsSource="{Binding ImageCollection}"
HeightRequest="400"
WidthRequest="800"
ViewModel="Linear"/>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

using Syncfusion.SfCarousel.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            CarouselViewModel carouselViewModel = new CarouselViewModel();
            SfCarousel carousel = new SfCarousel()
            {
                HeightRequest = 400,
                WidthRequest = 800,
                ViewModel = ViewModel.Linear
            };
            var itemTemplate = new DataTemplate(() =>
            {
                var grid = new Grid();
                var nameLabel = new Image();
                nameLabel.SetBinding(Image.SourceProperty, "Image");
                grid.Children.Add(nameLabel);
                return grid;
            });
            carousel.ItemTemplate = itemTemplate;
            carousel.ItemsSource = carouselViewModel.ImageCollection;
            this.Content = carousel;
        }
    }

    public class CarouselModel
    {
        public CarouselModel(string imageString)
        {
            Image = imageString;
        }
        private string _image;
        public string Image
        {
            get { return _image; }
            set { _image = value; }
        }
    }

    public class CarouselViewModel
    {
        public CarouselViewModel()
    }

```

```
{
    ImageCollection.Add(new CarouselModel("carousel_person1.png"));
    ImageCollection.Add(new CarouselModel("carousel_person2.png"));
    ImageCollection.Add(new CarouselModel("carousel_person3.png"));
    ImageCollection.Add(new CarouselModel("carousel_person4.png"));
    ImageCollection.Add(new CarouselModel("carousel_person5.png"));
}
private List<CarouselModel> imageCollection = new List<CarouselModel>();
public List<CarouselModel> ImageCollection
{
    get { return imageCollection; }
    set { imageCollection = value; }
}
}
```

**Note:** It is important to include Xamarin.Android.Support.v17.Leanback library to use carousel linear mode in Android platform.

### Populating Data

SfCarousel control, supports binding to different data sources such as IList Data Source, Observable Collection Data Source.

### Through Binding

Items can be populated in SfCarousel control through data source and applying custom template as explained below.

#### *Create a Model with Data*

SfCarousel items can be populated with a collection of image data. For example, a user may want to create a SfCarousel control which will display a list of images.

The SfCarousel model looks as follows.

#### **C#**

```
namespace CarouselSample
{
    public class CarouselModel
    {
        public CarouselModel(string imageString)
        {
            Image = imageString;
        }
        private string _image;
        public string Image
        {
            get { return _image; }
            set { _image = value; }
        }
    }
}
```

Populate carousel items collection in View model with the image data. The below code works when the images are placed within the application folder for Android, iOS and UWP with build action Android Resource, Bundled Resource and Content respectively.

#### **C#**

```
using System.Collections.Generic;
namespace CarouselSample
{
    public class CarouselViewModel
    {
        public CarouselViewModel()
        {
            ImageCollection.Add(new CarouselModel("carousel_person1.png"));
            ImageCollection.Add(new CarouselModel("carousel_person2.png"));
            ImageCollection.Add(new CarouselModel("carousel_person3.png"));
            ImageCollection.Add(new CarouselModel("carousel_person4.png"));
            ImageCollection.Add(new CarouselModel("carousel_person5.png"));
        }
        private List<CarouselModel> imageCollection = new List<CarouselModel>();
        public List<CarouselModel> ImageCollection
        {
            get { return imageCollection; }
            set { imageCollection = value; }
        }
    }
}
```

---

**Note:** Images can also be referred in PCL and from website URL as [instructed](#)

---

### *Binding the Data with Custom Template*

SfCarousel provides support to add a custom view as carousel items by designing a view inside its ItemTemplate. This template will be applied for all its items and its data will be binded.

#### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:carousel="clr-
namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms
"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
<ContentPage.BindingContext>
<local:CarouselViewModel/>
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="itemTemplate">
<Image Source="{Binding Image}"
Aspect="AspectFit"/>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<carousel:SfCarousel x:Name="carousel"
ItemTemplate="{StaticResource itemTemplate}"
ItemsSource="{Binding ImageCollection}"
HeightRequest="400"
WidthRequest="800" />
</ContentPage.Content>
</ContentPage>
```

#### **C#**

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace CarouselSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
CarouselViewModel carouselViewModel = new CarouselViewModel();
SfCarousel carousel = new SfCarousel()
{
HeightRequest = 400,
WidthRequest = 800
};
var itemTemplate = new DataTemplate(() =>
```

```

{
    var grid = new Grid();
    var nameLabel = new Image();
    nameLabel.SetBinding(Image.SourceProperty, "Image");
    grid.Children.Add(nameLabel);
    return grid;
});
carousel.ItemTemplate = itemTemplate;
carousel.ItemsSource = carouselViewModel.ImageCollection;
this.Content = carousel;
}
}
public class CarouselModel
{
    public CarouselModel(string imageString)
    {
        Image = imageString;
    }
    private string _image;
    public string Image
    {
        get { return _image; }
        set { _image = value; }
    }
}
public class CarouselViewModel
{
    public CarouselViewModel()
    {
        ImageCollection.Add(new CarouselModel("carousel_person1.png"));
        ImageCollection.Add(new CarouselModel("carousel_person2.png"));
        ImageCollection.Add(new CarouselModel("carousel_person3.png"));
        ImageCollection.Add(new CarouselModel("carousel_person4.png"));
        ImageCollection.Add(new CarouselModel("carousel_person5.png"));
    }
    private List<CarouselModel> imageCollection = new List<CarouselModel>();
    public List<CarouselModel> ImageCollection
    {
        get { return imageCollection; }
        set { imageCollection = value; }
    }
}
}

```

- Now set the **BindingContext** for the items collection in code behind.

### C#

```
carousel.BindingContext = new CarouselViewModel();
```

### Through Carousel Item

Different set of views can be provided to every items through **ItemContent** property available in **SfCarouselItem** class.

**C#**

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfCarousel carousel = new SfCarousel()
            {
                ItemWidth = 170,
                ItemHeight = 250
            };
            ObservableCollection<SfCarouselItem> carouselItems = new
            ObservableCollection<SfCarouselItem>();
            carouselItems.Add(new SfCarouselItem() { ItemContent = new Image() { Source
            = "carousel_person1.png", Aspect = Aspect.Fill } });
            carouselItems.Add(new SfCarouselItem() { ItemContent = new Image() { Source
            = "carousel_person2.png", Aspect = Aspect.Fill } });
            carouselItems.Add(new SfCarouselItem() { ItemContent = new Image() { Source
            = "carousel_person3.png", Aspect = Aspect.Fill } });
            carouselItems.Add(new SfCarouselItem() { ItemContent = new Image() { Source
            = "carousel_person4.png", Aspect = Aspect.Fill } });
            carouselItems.Add(new SfCarouselItem() { ItemContent = new Image() { Source
            = "carousel_person5.png", Aspect = Aspect.Fill } });
            carousel.ItemsSource = carouselItems;
            this.Content = carousel;
        }
    }
}
```

and also carousel provides a support to display only the Image data with **Image** property in **SfCarouselItem** class.

**C#**

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfCarousel carousel = new SfCarousel()
            {
                ItemWidth = 170,
                ItemHeight = 250
            };
        }
    }
}
```

```

ObservableCollection<SfCarouselItem> carouselItems = new
ObservableCollection<SfCarouselItem>();
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person1.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person2.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person3.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person4.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person5.png"
});
carousel.ItemsSource = carouselItems;
this.Content = carousel;
}
}
}

```

Similar way every item can be created and customized in case of different carousel item view is needed.

### LoadMore

Virtualization can be achieved by using the Load more concept. This support is used to handle the numerous items in the carousel control. A particular items are maintained in the view port based on the `LoadMoreItemsCount` property. The LoadMore view is added after the last item in the collection of carousel view. When tapping the LoadMore view, the next set of items in the collection can be added to the carousel.

The following properties are used to achieve this support:

`AllowLoadMore` `LoadMoreItemsCount` \* `LoadMoreView`

### AllowLoadMore

By enabling the `AllowLoadMore` property, the LoadMore support works in the carousel view.

**Note:** The default value of the `AllowLoadMore` property is false.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:carousel="clr-
namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms
"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
<ContentPage.BindingContext>
<local:CarouselViewModel />
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="itemTemplate">
<Image Source="{Binding Image}"
Aspect="AspectFit"/>
</DataTemplate>
</ResourceDictionary>

```

```
</ContentPage.Resources>
<ContentPage.Content>
<carousel:SfCarousel x:Name="carousel"
ItemTemplate="{StaticResource itemTemplate}"
ItemsSource="{Binding ImageCollection}"
ItemHeight="200"
ItemWidth="200"
ItemSpacing="2"
AllowLoadMore="True"
ViewMode="Linear">
</carousel:SfCarousel>
</ContentPage.Content>
</ContentPage>
```

## C#

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            this.BindingContext = new CarouselViewModel();
            SfCarousel carousel = new SfCarousel()
            {
                ItemHeight = 200,
                ItemWidth = 200,
                ItemSpacing = 2,
                AllowLoadMore = true,
                ViewMode = ViewMode.Linear
            };
            carousel.ItemTemplate = new DataTemplate(() =>
            {
                Image image = new Image();
                image.SetBinding(Image.SourceProperty, "Image");
                image.Aspect = Aspect.AspectFit;
                return image;
            });
            carousel.SetBinding(SfCarousel.ItemsSourceProperty, "ImageCollection");
            this.Content = carousel;
        }
    }

    public class CarouselModel
    {
        public CarouselModel(string imageString)
        {
            Image = imageString;
        }
        private string _image;
        public string Image
        {
            get { return _image; }
        }
    }
}
```

```

set { _image = value; }
}
}
public class CarouselViewModel
{
public CarouselViewModel()
{
ImageCollection.Add(new CarouselModel("carousel_person1.png"));
ImageCollection.Add(new CarouselModel("carousel_person2.png"));
ImageCollection.Add(new CarouselModel("carousel_person3.png"));
ImageCollection.Add(new CarouselModel("carousel_person4.png"));
ImageCollection.Add(new CarouselModel("carousel_person5.png"));
}
private List<CarouselModel> imageCollection = new List<CarouselModel>();
public List<CarouselModel> ImageCollection
{
get { return imageCollection; }
set { imageCollection = value; }
}
}
}

```

### LoadMoreItemsCount

Number of items can be maintained in the carousel control by using the **LoadMoreItemsCount** property. By using the **LoadMoreItemsCount** property, numerous items can be separated.

---

**Note:** The default value of the **LoadMoreItemsCount** property is 3.

---

### XML

```

You can find the complete Load More sample from this [link](#).

## UI Virtualization

In UI virtualization concept, only the number of items that can be adaptable to the viewport of our device are arranged. Even, if the numerous items have been added to the collection, it loads only the viewport adaptable count of the carousel Items. Items are added at the right of the view when swiping the countable items in forward direction. At the same time, same number of items are removed at the left of the view for maintaining the same viewport items count. Similarly, items are added at the left of the view when swiping in backward direction for maintaining the same viewport items count. At the time, the same number of items are removed at the right of the view. Using this mechanism, virtualization concept is achieved in the carousel control.

The following property has been used in UIVirtualization support:

- EnableVirtualization

### EnableVirtualization

UI Virtualization concept is achieved by enabling the EnableVirtualization property.

---

**Note:** The default value of the EnableVirtualization property is false.

---

set { imageCollection = value; }
}
}
```

You can find the complete UIVirtualization sample from this [link](#).

### Transformation

The Offset between selected and unselected item can be customized in SfCarousel control. And also the items can be scaled to the specified value.

### Tilt Non Selected Items

The **RotationAngle** property in the SfCarousel control is used to tilt all the unselected items in a specified angle.

**Note:** If the angle value is positive, then the rotation is in the clockwise direction. If the angle value is negative, the rotation is in the counterclockwise direction.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:carousel="clr-namespace:Syncfusion.SfCarousel.XForms;assembly=Syncfusion.SfCarousel.XForms"
xmlns:local="clr-namespace:CarouselSample"
x:Class="CarouselSample.MainPage">
<carousel:SfCarousel x:Name="carousel"
ItemHeight="170"
ItemWidth="270"
RotationAngle="90"/>
</ContentPage>
```

### C#

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
    }
}
```

```

SfCarousel carousel = new SfCarousel()
{
    ItemWidth = 170,
    ItemHeight = 250,
    RotationAngle = 90
};
ObservableCollection<SfCarouselItem> carouselItems = new
ObservableCollection<SfCarouselItem>();
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person1.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person2.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person3.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person4.png"
});
carouselItems.Add(new SfCarouselItem() { ImageName = "carousel_person5.png"
});
carousel.ItemsSource = carouselItems;
this.Content = carousel;
}
}
}

```

### Set Gap between Items

The **Offset** property is used to specify the accurate distance between unselected items in SfCarousel panel.

**Note:** The default value is 20.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

<local:CarouselViewModel />
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="itemTemplate">
<Image Source="{Binding Image}"
Aspect="AspectFit"/>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<carousel:SfCarousel x:Name="carousel"
ItemTemplate="{StaticResource itemTemplate}"
ItemsSource="{Binding ImageCollection}"
ItemHeight="200"
ItemWidth="200"
SelectionChanged="Carousel_SelectionChanged"/>
</ContentPage.Content>
</ContentPage>

```

#### C#

```
using Syncfusion.SfCarousel.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
namespace CarouselSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            this.BindingContext = new CarouselViewModel();
            SfCarousel carousel = new SfCarousel()
            {
                ItemHeight = 200,
                ItemWidth = 200
            };
            carousel.ItemTemplate = new DataTemplate(() =>
            {
                Image image = new Image();
                image.SetBinding(Image.SourceProperty, "Image");
                image.Aspect = Aspect.AspectFit;
                return image;
            });
            carousel.SelectionChanged += Carousel_SelectionChanged;
            carousel.SetBinding(SfCarousel.ItemsSourceProperty, "ImageCollection");
            this.Content = carousel;
        }
        private void Carousel_SelectionChanged(object sender,
            SelectionChangedEventArgs e)
        {
            int count = (sender as SfCarousel).SelectedIndex + 1;
            DisplayAlert("SelectionChanged", "Carousel item:" + count + " has Selected",
                "Ok");
        }
        public class CarouselModel
        {
            public CarouselModel(string imageString)
            {
                Image = imageString;
            }
            private string _image;
            public string Image
            {
                get { return _image; }
                set { _image = value; }
            }
        }
        public class CarouselViewModel
        {
            public CarouselViewModel()
            {
                ImageCollection.Add(new CarouselModel("carousel_person1.png"));
                ImageCollection.Add(new CarouselModel("carousel_person2.png"));
                ImageCollection.Add(new CarouselModel("carousel_person3.png"));
                ImageCollection.Add(new CarouselModel("carousel_person4.png"));
                ImageCollection.Add(new CarouselModel("carousel_person5.png"));
            }
        }
    }
}
```

```
}  
private List<CarouselModel> imageCollection = new List<CarouselModel>();  
public List<CarouselModel> ImageCollection  
{  
    get { return imageCollection; }  
    set { imageCollection = value; }  
}  
}  
}
```

### AutomationId

The SfCarousel control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the SfCarousel control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's **AutomationId**.

For example, if you set SfCarouselItem's **AutomationId** as "Person", then the automation framework will interact the fourth carousel item as "Person SfCarouselItem 4 of 6" (6 denotes the total count).

The following screenshot illustrates the AutomationIds of inner elements. If the SfCarousel's **AutomationId** as Gallery, then the Automation framework will interact the LoadMore as "Gallery LoadMore. Tap to load more items". You cannot interact with the carousel item when you want to select an index that is not visible in the view.

---

**Note:** You cannot provide AutomationId when the carousel item is populated with custom template.

---

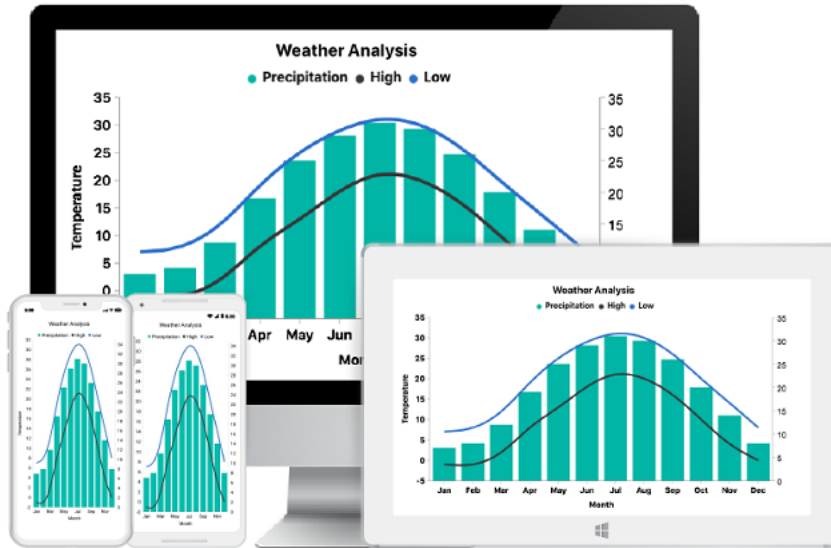

Person SfCarouselItem 4 of 6

## SfChart

### Overview

Essential Chart for Xamarin.Forms provide a perfect way to visualize data with a high level of user interactivity that focuses on development, productivity and simplicity of use. Essential Chart also provides a wide variety of charting features that are used to visualize large quantities of data, flexible data binding and user customization.

### Key features

- Chart supports more than 25 different types of series, ranging from simple bar series to complex financial charts. Each type of chart represents a unique style of representing data that is more user friendly and has greater UI visualization.
- Data can be plotted against multiple scales that helps to visualize the mixed types of data in a single chart.
- Chart provides support to render multiple series at the same time, with options to compare and visualize two different chart series, simultaneously.
- User friendly customization support. [SfChart](#) provides various options for you to customize chart features, axis, labels, legends, series, etc., and visualize them accordingly.

### Getting Started

This section explains you the steps required to populate the Chart with data, title, add data labels and tooltips to the Chart. This section covers only the minimal features that you need to know to get started with the Chart.

---

**Note:** Watch the video: [Xamarin.Forms SfChart - Getting Started \(YouTube\)](#)

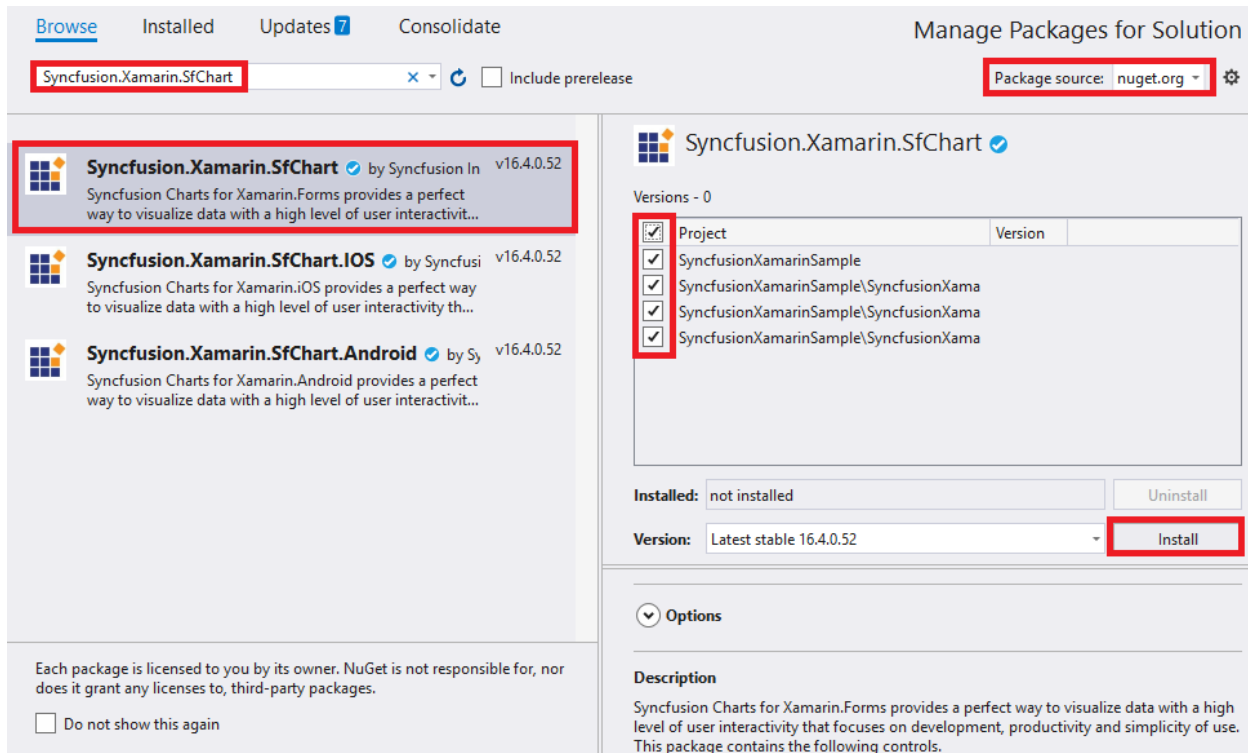

---

#### Adding SfChart reference

You can add SfChart reference using one of the following methods:

##### Method 1: Adding SfChart reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](#). To add chart to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfChart](#), and then install it.

**Note:**

- Install the same version of the chart NuGet in all the projects.
- In addition, you need to install the [Syncfusion.Xamarin.SfChart.WPF](#) package for Xamarin.Forms WPF platform only.

**Method 2: Adding SfChart reference from toolbox**

Syncfusion provides Xamarin Toolbox. Using this toolbox, you can drag the SfChart control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

**Method 3: Adding SfChart assemblies manually from the installed location**

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfChart.XForms.Android.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll

iOS	Syncfusion.SfChart.XForms.iOS.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
macOS	Syncfusion.SfChart.XForms.macOS.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.macOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfChart.UWP.dll Syncfusion.SfChart.XForms.UWP.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.SfChart.WPF.dll Syncfusion.SfChart.XForms.WPF.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### Launching the application on each platform with chart

To use the chart inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

##### iOS

To launch the chart in iOS, call the `SfChartRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework initialization and before the `LoadApplication` method is called as demonstrated in the following code sample:

**Note:** If you are adding the references from toolbox, this step is not needed.

##### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    ...
    global::Xamarin.Forms.Forms.Init();
}
```

```
Syncfusion.SfChart.XForms.iOS.Renderers.SfChartRenderer.Init();  
LoadApplication(new App());  
...  
}
```

### macOS

To launch the chart in macOS, call the `SfChartRenderer.Init()` method in the `DidFinishLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework initialization and before the `LoadApplication` method is called as demonstrated in the following code sample:

### C#

```
public override void DidFinishLaunching(NSNotification notification)  
{  
    ...  
    Forms.Init();  
    Syncfusion.SfChart.XForms.MacOS.SfChartRenderer.Init();  
    LoadApplication(new App());  
    ...  
}
```

### Windows Presentation Foundation (WPF)

To launch the chart in WPF, call the `SfChartRenderer.Init()` method in the `MainWindow` constructor of the `MainWindow` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

### C#

```
public partial class MainWindow : FormsApplicationPage  
{  
    public MainWindow()  
    {  
        InitializeComponent();  
        Forms.Init();  
        Syncfusion.SfChart.XForms.WPF.SfChartRenderer.Init();  
        LoadApplication(new App());  
    }  
}
```

### Universal Windows Platform (UWP)

To deploy the chart in **Release** mode, you need to initialize the chart assemblies in `App.xaml.cs` in UWP project as shown in the below code snippets.

### C#

```
// In App.xaml.cs  
protected override void OnLaunched(LaunchActivatedEventArgs e)  
{  
    ...  
    if (rootFrame == null)  
    {  
        List<Assembly> assembliesToInclude = new List<Assembly>();  
        assembliesToInclude.Add(typeof(Syncfusion.SfChart.XForms.UWP.SfChartRenderer)  
            .GetTypeInfo().Assembly);  
    }  
}
```

```
Xamarin.Forms.Forms.Init(e, assembliesToInclude);  
}  
...  
}
```

### Android

The Android platform does not require any additional configuration to render the chart.

### Initialize Chart

Import the [SfChart](#) namespace as shown below in your respective Page,

#### XML

```
xmlns:chart="clr-  
namespace:Syncfusion.SfChart.XForms;assembly=Syncfusion.SfChart.XForms"
```

#### C#

```
using Syncfusion.SfChart.XForms;
```

Then initialize an empty chart with [PrimaryAxis](#) and [SecondaryAxis](#) as shown below,

#### XML

```
<chart:SfChart>  
  <chart:SfChart.PrimaryAxis>  
    <chart:CategoryAxis>  
  </chart:CategoryAxis>  
  </chart:SfChart.PrimaryAxis>  
  <chart:SfChart.SecondaryAxis>  
    <chart:NumericalAxis>  
  </chart:NumericalAxis>  
  </chart:SfChart.SecondaryAxis>  
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();  
//Initializing Primary Axis  
CategoryAxis primaryAxis = new CategoryAxis();  
chart.PrimaryAxis = primaryAxis;  
//Initializing Secondary Axis  
NumericalAxis secondaryAxis = new NumericalAxis ();  
chart.SecondaryAxis = secondaryAxis;  
this.Content = chart;
```

Run the project and check if you get following output to make sure you have configured your project properly to add [SfChart](#).

### Initialize view model

Now, let us define a simple data model that represents a data point in [SfChart](#).

#### C#

```
public class Person
{
    public string Name { get; set; }
    public double Height { get; set; }
}
```

Next, create a view model class and initialize a list of `Person` objects as shown below,

#### C#

```
public class ViewModel
{
    public List<Person> Data { get; set; }
    public ViewModel()
    {
        Data = new List<Person>()
        {
            new Person { Name = "David", Height = 180 },
            new Person { Name = "Michael", Height = 170 },
            new Person { Name = "Steve", Height = 160 },
            new Person { Name = "Joel", Height = 182 }
        };
    }
}
```

Set the `ViewModel` instance as the `BindingContext` of your Page; this is done to bind properties of `ViewModel` to [SfChart](#).

**Note:** Add namespace of `ViewModel` class in your XAML page if you prefer to set `BindingContext` in XAML.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="ChartDemo.MainPage"
xmlns:chart="clr-
namespace:Syncfusion.SfChart.XForms;assembly=Syncfusion.SfChart.XForms"
xmlns:local="clr-namespace:ChartDemo">
<ContentPage.BindingContext>
<local:ViewModel></local:ViewModel>
</ContentPage.BindingContext>
</ContentPage>
```

### C#

```
this.BindingContext = new ViewModel();
```

### Populate Chart with data

As we are going to visualize the comparison of heights in the data model, add [ColumnSeries](#) to [SfChart.Series](#) property, and then bind the Data property of the above `ViewModel` to the [ColumnSeries.ItemsSource](#) property as shown below.

**Note:** You need to set [XBindingPath](#) and [YBindingPath](#) properties, so that [SfChart](#) would fetch values from the respective properties in the data model to plot the series.

### XML

```
<chart:SfChart>
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis>
<chart:CategoryAxis.Title>
<chart:ChartAxisTitle Text="Name"> </chart:ChartAxisTitle>
</chart:CategoryAxis.Title>
</chart:CategoryAxis>
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis>
<chart:NumericalAxis.Title>
<chart:ChartAxisTitle Text="Height (in cm)"></chart:ChartAxisTitle>
</chart:NumericalAxis.Title>
</chart:NumericalAxis>
</chart:SfChart.SecondaryAxis>
<chart:SfChart.Series>
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Name"
YBindingPath="Height">
</chart:ColumnSeries>
</chart:SfChart.Series>
</chart:SfChart>
```

## C#

```
//Initializing primary axis
CategoryAxis primaryAxis = new CategoryAxis();
primaryAxis.Title.Text = "Name";
chart.PrimaryAxis = primaryAxis;
//Initializing secondary Axis
NumericalAxis secondaryAxis = new NumericalAxis();
secondaryAxis.Title.Text = "Height (in cm)";
chart.SecondaryAxis = secondaryAxis;
//Initializing column series
ColumnSeries series = new ColumnSeries();
series.SetBinding(ChartSeries.ItemsSourceProperty, "Data");
series.XBindingPath = "Name";
series.YBindingPath = "Height";
chart.Series.Add(series);
```

### Add Title

You can add title to chart to provide quick information to the user about the data being plotted in the chart. You can set title using [SfChart.Title](#) property as shown below.

## XML

```
<chart:SfChart>
...
<chart:SfChart.Title>
<chart:ChartTitle Text="Chart"/>
</chart:SfChart.Title>
...
</chart:SfChart>
```

## C#

```
chart.Title.Text = "Chart";
```

Refer this [link](#) to learn more about the options available in [SfChart](#) to customize chart title.

### Enable data labels

You can add data labels to improve the readability of the chart. This can be achieved using [ChartSeries.DataMarkers](#) property as shown below.

## XML

```
<chart:SfChart>
...
<chart:ColumnSeries>
<chart:ColumnSeries.DataMarker>
<chart:ChartDataMarker/>
</chart:ColumnSeries.DataMarker>
</chart:ColumnSeries>
...
</chart:SfChart>
```

## C#

```
series.DataMarker = new ChartDataMarker();
```

Refer this [link](#) to learn more about the options available in [SfChart](#) to customize data markers.

#### Enable legend

You can enable legend using [SfChart.Legend](#) property as shown below,

#### XML

```
<chart:SfChart>
...
<chart:SfChart.Legend>
<chart:ChartLegend/>
</chart:SfChart.Legend>
...
</chart:SfChart>
```

#### C#

```
chart.Legend = new ChartLegend ();
```

Additionally, you need to set label for each series using [ChartSeries.Label](#) property, which will be displayed in corresponding legend.

#### XML

```
<chart:SfChart>
...
<chart:SfChart.Series>
<chart:ColumnSeries Label="Heights" ItemsSource="{Binding Data}"
XBindingPath="Name" YBindingPath="Height">
</chart:ColumnSeries>
</chart:SfChart.Series>
...
</chart:SfChart>
```

#### C#

```
series.Label = "Heights";
```

Refer this [link](#) to learn more about the options available in [SfChart](#) to customize legend.

#### Enable tooltip

Tooltips are used to show information about the segment, when you tap on the segment. You can enable tooltip by setting [ChartSeries.EnableTooltip](#) property to true.

#### XML

```
<chart:SfChart>
...
<chart:SfChart.Series>
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Name"
YBindingPath="Height" EnableTooltip ="True">
</chart:ColumnSeries>
```

```

</chart:SfChart.Series>
...
</chart:SfChart>

```

## C#

```
series.EnableTooltip = true;
```

Refer this [link](#) to learn more about the options available in [SfChart](#) to customize tooltip.

The following code example gives you the complete code of above configurations.

## XML

```

<ContentPage xmlns:chart="clr-
namespace:Syncfusion.SfChart.XForms;assembly=Syncfusion.SfChart.XForms"
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:local="clr-namespace:
ChartGettingStarted;assembly=ChartGettingStarted"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="ChartGettingStarted.ChartSample">
  <chart:SfChart x:Name="Chart" HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
    <chart:SfChart.BindingContext>
      <local:ViewModel/>
    </chart:SfChart.BindingContext>
    <chart:SfChart.Legend>
      <chart:ChartLegend />
    </chart:SfChart.Legend>
    <chart:SfChart.Title>
      <chart:ChartTitle Text="Chart"/>
    </chart:SfChart.Title>
    <chart:SfChart.PrimaryAxis>
      <chart:CategoryAxis>
        <chart:CategoryAxis.Title>
          <chart:ChartAxisTitle Text="Name"/>
        </chart:CategoryAxis.Title>
      </chart:CategoryAxis>
    </chart:SfChart.PrimaryAxis>
    <chart:SfChart.SecondaryAxis>
      <chart:NumericalAxis>
        <chart:NumericalAxis.Title>
          <chart:ChartAxisTitle Text="Height (in cm)"/>
        </chart:NumericalAxis.Title>
      </chart:NumericalAxis>
    </chart:SfChart.SecondaryAxis>
    <chart:SfChart.Series>
      <chart:ColumnSeries ItemsSource="{Binding Data}" Label="Heights"
XBindingPath="Name" YBindingPath="Height" EnableTooltip="True">
        <chart:ColumnSeries.DataMarker>
          <chart:ChartDataMarker/>
        </chart:ColumnSeries.DataMarker>
      </chart:ColumnSeries>
    </chart:SfChart.Series>
  </chart:SfChart>
</ContentPage>

```

**C#**

```
using Syncfusion.SfChart.XForms;
namespace ChartGettingStarted
{
    public partial class ChartSample : ContentPage
    {
        public ChartSample()
        {
            InitializeComponent();
            SfChart chart = new SfChart();
            chart.Title.Text = "Chart";
            //Initializing primary axis
            CategoryAxis primaryAxis = new CategoryAxis();
            primaryAxis.Title.Text = "Name";
            chart.PrimaryAxis = primaryAxis;
            //Initializing secondary Axis
            NumericalAxis secondaryAxis = new NumericalAxis();
            secondaryAxis.Title.Text = "Height (in cm)";
            chart.SecondaryAxis = secondaryAxis;
            //Initializing column series
            ColumnSeries series = new ColumnSeries();
            series.ItemsSource = viewModel.Data;
            series.XBindingPath = "Name";
            series.YBindingPath = "Height";
            series.Label = "Heights";
            series.DataMarker = new ChartDataMarker();
            series.EnableTooltip = true;
            chart.Legend = new ChartLegend();
            chart.Series.Add(series);
            this.Content = chart;
        }
    }
}
```

The following chart is created as a result of the above codes.

You can find the complete getting started sample from this [link](#).

## Populating Data

**SfChart** control can be configured with data points using [ItemsSource](#) property of [ChartSeries](#). There are two ways, you can create data points for chart.

### Chart Data Point

One way is to create a collection of [ChartDataPoint](#) objects and assign this collection to [ItemsSource](#) property. Here, each [ChartDataPoint](#) object represents a data point in a chart series.

**Note:** [ChartDataPoint](#) class has few overloaded constructors depending on the number of y-values required to plot a data point for a particular series type. For example, you can use a constructor with two parameters to instantiate data point for [XYDataSeries](#) like Line, Spline, and Pie etc.

Following code snippet illustrates this,

### C#

```
public class DataModel
{
    public ObservableCollection<ChartDataPoint> HighTemperature{ get; set; }
    public DataModel ()
    {
        HighTemperature = new ObservableCollection<ChartDataPoint> ();
        HighTemperature.Add (new ChartDataPoint ("Jan", 42));
        HighTemperature.Add (new ChartDataPoint ("Feb", 44));
        HighTemperature.Add (new ChartDataPoint ("Mar", 53));
        HighTemperature.Add (new ChartDataPoint ("Apr", 64));
        HighTemperature.Add (new ChartDataPoint ("May", 75));
        HighTemperature.Add (new ChartDataPoint ("Jun", 83));
        HighTemperature.Add (new ChartDataPoint ("Jul", 87));
        HighTemperature.Add (new ChartDataPoint ("Aug", 84));
        HighTemperature.Add (new ChartDataPoint ("Sep", 78));
        HighTemperature.Add (new ChartDataPoint ("Oct", 67));
    }
}
```

```
HighTemperature.Add (new ChartDataPoint ("Nov", 55));
HighTemperature.Add (new ChartDataPoint ("Dec", 45));
}
```

**XML**

```
<chart:SfChart>
<chart:SfChart.Series>
<chart:ColumnSeries ItemsSource="{Binding HighTemperature}"/>
</chart:SfChart.Series>
</chart:SfChart>
```

**C#**

```
//Adding the series to the chart and set the ItemsSource property
chart.Series.Add (new ColumnSeries () {
ItemsSource = dataModel.HighTemperature
});
```

## Custom Object

Another way is to assign a collection of custom objects to the [ItemsSource](#) property. In this case, you need to set the [XBindingPath](#) and [YBindingPath](#) properties of chart series with the property names of the custom object which contains the x-value/category and y-value respectively.

**Note:** While using custom objects, XBindingPath property is required for all types of chart series. You need to set [YBindingPath](#) property only for the [XYDataSeries](#) types which needs single y-value for a data point. For example, Line, Spline, Column, Bar, Pie etc. For [BubbleSeries](#) type, you need to set both YBindingPath and [Size](#) properties since it requires two y-values to plot a single bubble data point. In the case of financial series types like Candle and HiLoOpenClose, which requires four y-values for a single data point, you need to set [High](#), [Low](#), [Open](#) and [Close](#) properties with the property names of a custom object which contains respective values.

**C#**

```
[C#]
public class MonthDemand
{
    public MonthDemand(string demand, double year2010, double year2011)
    {
        this.Demand = demand;
        this.Year2010 = year2010;
        this.Year2011 = year2011;
    }
    public string Demand { get; set; }
    public double Year2010 { get; set; }
    public double Year2011 { get; set; }
}
public class DataModel
{
    public ObservableCollection<MonthDemand> Demands{ get; set; }
    public DataModel ()
    {
        Demands = new ObservableCollection<MonthDemand>();
    }
}
```

```

Demands.Add(new MonthDemand("Jan", 42, 27));
Demands.Add(new MonthDemand("Feb", 44, 28));
Demands.Add(new MonthDemand("Mar", 53, 35));
Demands.Add(new MonthDemand("Apr", 64, 44));
Demands.Add(new MonthDemand("May", 75, 54));
Demands.Add(new MonthDemand("Jun", 83, 63));
Demands.Add(new MonthDemand("Jul", 87, 68));
Demands.Add(new MonthDemand("Aug", 84, 66));
Demands.Add(new MonthDemand("Sep", 78, 59));
Demands.Add(new MonthDemand("Oct", 67, 48));
Demands.Add(new MonthDemand("Nov", 55, 38));
Demands.Add(new MonthDemand("Dec", 45, 29));
}
}

```

**XML**

```

<chart:SfChart>
...
<chart:SfChart.Series>
<chart:ColumnSeries ItemsSource="{Binding Demands}" XBindingPath="Demand"
YBindingPath="Year2010"/>
</chart:SfChart.Series>
</chart:SfChart>

```

**C#**

```

chart.Series.Add(new ColumnSeries() {
    ItemsSource = dataModel.Demands,
    XBindingPath = "Demand",
    YBindingPath = "Year2010"
});

```

**Title**

You can define and customize the Chart title using [Title](#) property of [SfChart](#). The [Text](#) property of [ChartTitle](#) is used to set the text for the title.

Following properties are used to customize its appearance.

- [TextColor](#) – used to change the color of the text.
- [BackgroundColor](#) – used to change the background color.
- [BorderColor](#) – used to change the border color.
- [BorderWidth](#) – used to change the border width.
- [Font](#) – used to change the text size, font family, and font weight. (This is deprecated API. Use [FontSize](#), [FontFamily](#), and [FontAttributes](#) properties instead of this.)
- [FontFamily](#) - used to change the font family for chart title.
- [FontAttributes](#) – used to change the font style for the chart title.
- [FontSize](#) - used to change the font size for the chart title.
- [Margin](#) - used to change the margin for title.

**XML**

```
<chart:SfChart>
<chart:SfChart.Title>
<chart:ChartTitle Text="Efficiency of oil-fired power production"
TextColor="Blue"/>
</chart:SfChart.Title>
</chart:SfChart>
```

## C#

```
SfChart sfChart = new SfChart();
sfChart.Title.Text = "Efficiency of oil-fired power production";
sfChart.Title.TextColor = Color.Blue;
```

## Text Alignment

You can align the title text content to the Start, Center or End of the title using the [TextAlignment](#) property of the [ChartTitle](#).

## XML

```
<chart:SfChart.Title>
<chart:ChartTitle Text="Efficiency of oil-fired power production"
TextAlignment="Start" TextColor="Blue"/>
</chart:SfChart.Title>
```

## C#

```
sfChart.Title.Text = "Efficiency of oil-fired power production";
sfChart.Title.TextAlignment = TextAlignment.Start;
sfChart.Title.TextColor = Color.Blue;
```

## Axis

Charts typically have two axes that are used to measure and categorize data: a vertical (Y) axis, and a horizontal (X) axis.

Vertical(Y) axis always uses numerical scale. Horizontal(X) axis supports the following types of scale:

- Category
- Numeric
- Date time
- Logarithmic Axis

## Category Axis

Category axis displays text labels instead of numbers.

## XML

```
<chart:SfChart.PrimaryAxis >
<chart:CategoryAxis />
</chart:SfChart.PrimaryAxis>
```

## C#

```
chart.PrimaryAxis = new CategoryAxis();
```

### Placing labels between ticks

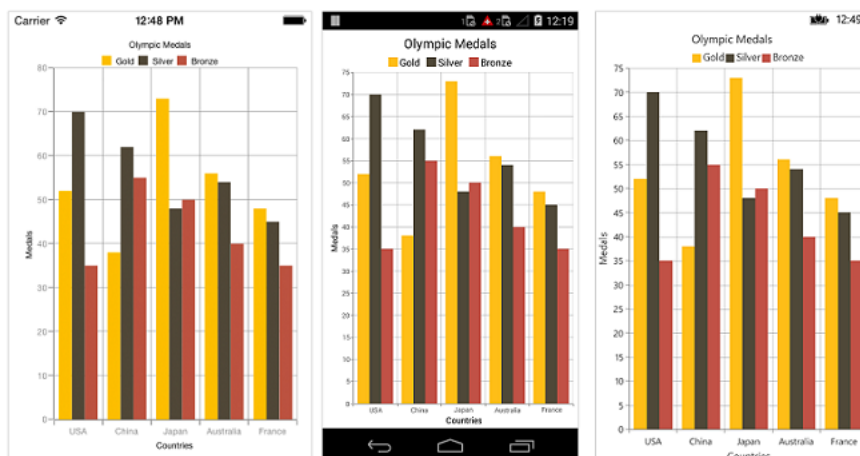

Labels in category axis can be placed between the ticks by setting [LabelPlacement](#) to [BetweenTicks](#). Default value of [LabelPlacement](#) property is [OnTicks](#) i.e. labels will be placed on the ticks by default.

### XML

```
<chart:SfChart.PrimaryAxis >
<chart:CategoryAxis LabelPlacement="BetweenTicks"/>
</chart:SfChart.PrimaryAxis>
```

### C#

```
chart.PrimaryAxis = new CategoryAxis() { LabelPlacement =
LabelPlacement.BetweenTicks };
```

### Displaying labels after a fixed interval

To display labels after a fixed interval n, you can set [Interval](#) property of [ChartAxis](#) as n. Default value of interval is 1 i.e. all the labels will be displayed by default.

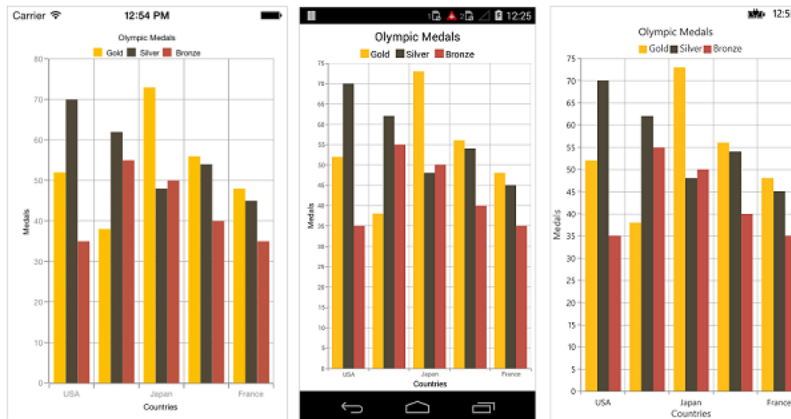

### XML

```
<chart:SfChart.PrimaryAxis >
<chart:CategoryAxis Interval="2" LabelPlacement="BetweenTicks"/>
```

```
</chart:SfChart.PrimaryAxis>
```

## C#

```
chart.PrimaryAxis = new CategoryAxis() { Interval = 2, LabelPlacement =
LabelPlacement.BetweenTicks };
```

### Indexed category axis

Category axis can also be rendered based on the index values of data source by setting the `[ArrangeByIndex]()` property to true in the axis.

## XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis ArrangeByIndex="False" />
</chart:SfChart.PrimaryAxis>
<chart:SfChart.Series>
<chart:ColumnSeries ItemsSource="{Binding Data1}" XBindingPath="Country"
YBindingPath="Year2016"/>
<chart:ColumnSeries ItemsSource="{Binding Data2}" XBindingPath="Country"
YBindingPath="Year2016"/>
</chart:SfChart.Series>
```

## C#

```
chart.PrimaryAxis = new CategoryAxis()
{
    ArrangeByIndex = false
};
ColumnSeries series1 = new ColumnSeries()
{
    ItemsSource = viewmodel.Data1,
    XBindingPath = "Country",
    YBindingPath = "Year2016"
};
ColumnSeries series2 = new ColumnSeries()
{
    ItemsSource = viewmodel.Data2,
    XBindingPath = "Country",
    YBindingPath = "Year2016",
```

```
};
chart.Series.Add(series1);
chart.Series.Add(series2);
```

## Numeric Axis

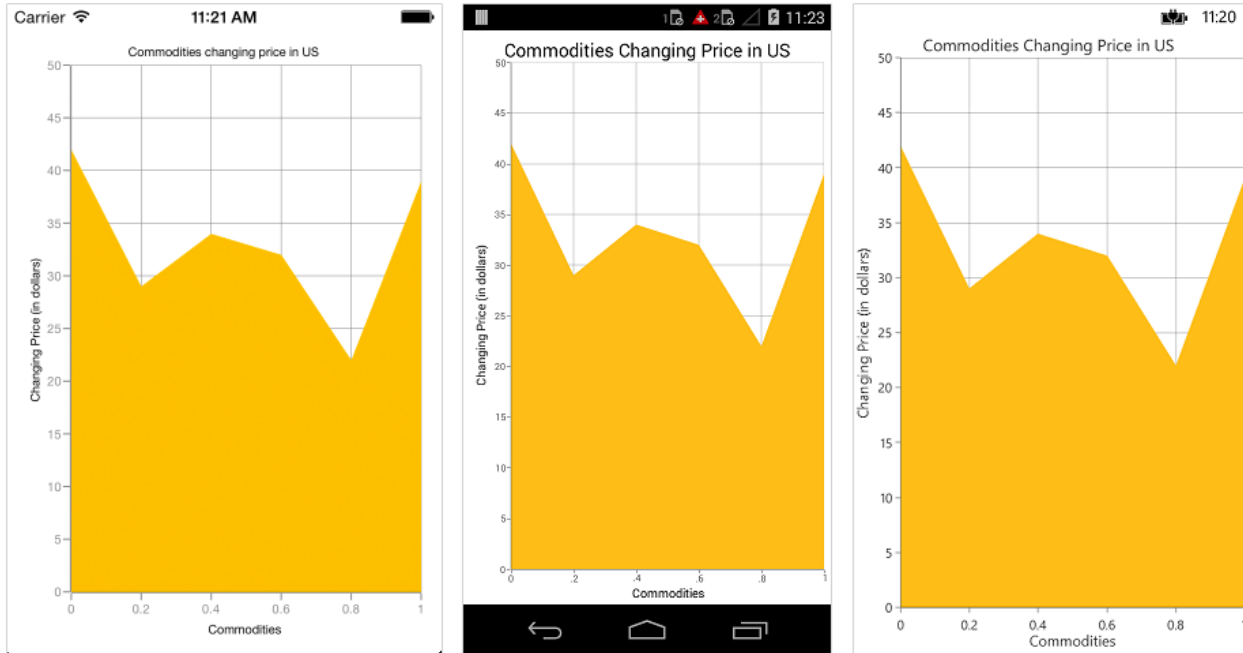

Numeric axis uses numerical scale and displays numbers as labels.

### XML

```
<chart:SfChart.PrimaryAxis >
<chart:NumericalAxis/>
</chart:SfChart.PrimaryAxis>
```

### C#

```
chart.PrimaryAxis = new NumericalAxis();
```

### Customizing numeric range

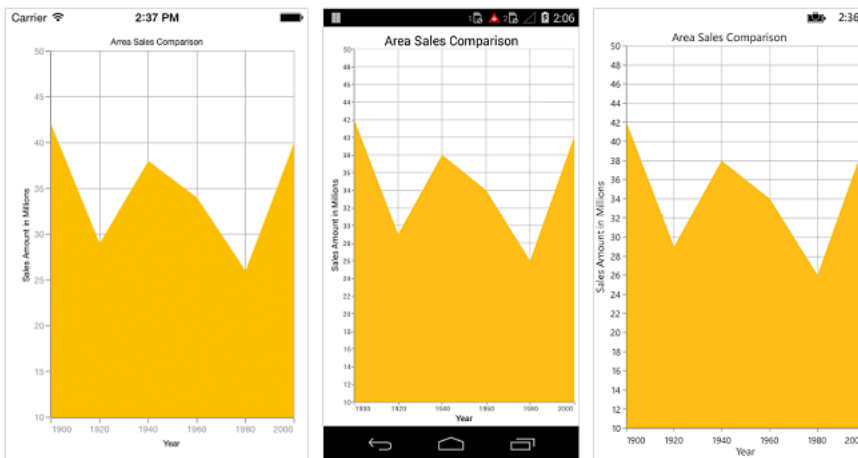

To customize the range of an axis, you can use the [Minimum](#) and [Maximum](#) properties of [NumericalAxis](#). By default, nice range will be calculated automatically based on the provided data.

### XML

```
<chart:SfChart.SecondaryAxis >
<chart:NumericalAxis Minimum="10" Maximum="50"/>
</chart:SfChart.SecondaryAxis >
```

### C#

```
chart.SecondaryAxis = new NumericalAxis() { Minimum = 10, Maximum = 50 };
```

### Customizing numeric interval

Axis interval can be customized using the [Interval](#) property of [ChartAxis](#). By default, nice interval will be calculated based on the minimum and maximum value of the provided data.

**XML**

```
<chart:SfChart.SecondaryAxis >
<chart:NumericalAxis Interval="10"/>
</chart:SfChart.SecondaryAxis >
```

**C#**

```
chart.SecondaryAxis = new NumericalAxis() { Interval = 10 };
```

*Apply padding to the range*

Padding can be applied to the minimum and maximum extremes of the axis range by using [RangePadding](#) property. Numeric axis supports the following types of padding.

- None
- Round
- Additional
- Normal

**None**

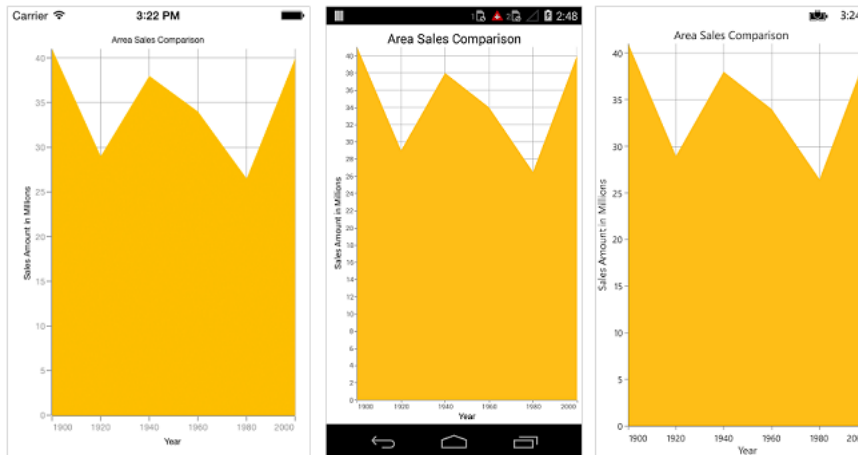

When the value of [RangePadding](#) property is [None](#), padding will not be applied to the axis. This is also the default value of [RangePadding](#) for horizontal axis.

**XML**

```
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis RangePadding="None"/>
</chart:SfChart.SecondaryAxis>
```

**C#**

```
chart.SecondaryAxis = new NumericalAxis() { RangePadding =
NumericalPadding.None };
```

### Round

When the value of [RangePadding](#) property is [Round](#), axis range will be rounded to the nearest possible value divided by the interval.

### XML

```
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis RangePadding="Round"/>
</chart:SfChart.SecondaryAxis>
```

### C#

```
chart.SecondaryAxis = new NumericalAxis() { RangePadding =
NumericalPadding.Round };
```

### Additional

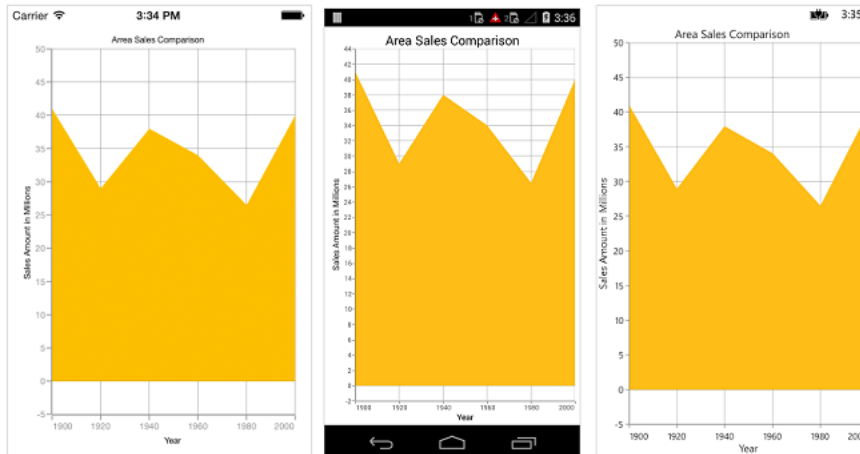

When the value of [RangePadding](#) property is [Additional](#), axis range will be rounded and an interval of the axis will be added as padding to the minimum and maximum values of the range.

**XML**

```
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis RangePadding="Additional"/>
</chart:SfChart.SecondaryAxis>
```

**C#**

```
chart.SecondaryAxis = new NumericalAxis() { RangePadding =
NumericalPadding.Additional };
```

**Normal**

When the value of [RangePadding](#) property is [Normal](#), nice range will be calculated for the axis based on the best readability of the data. This is also the default for vertical axis.

**XML**

```
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis RangePadding="Normal"/>
</chart:SfChart.SecondaryAxis>
```

**C#**

```
chart.SecondaryAxis = new NumericalAxis() { RangePadding =
NumericalPadding.Normal };
```

### Date Time Axis

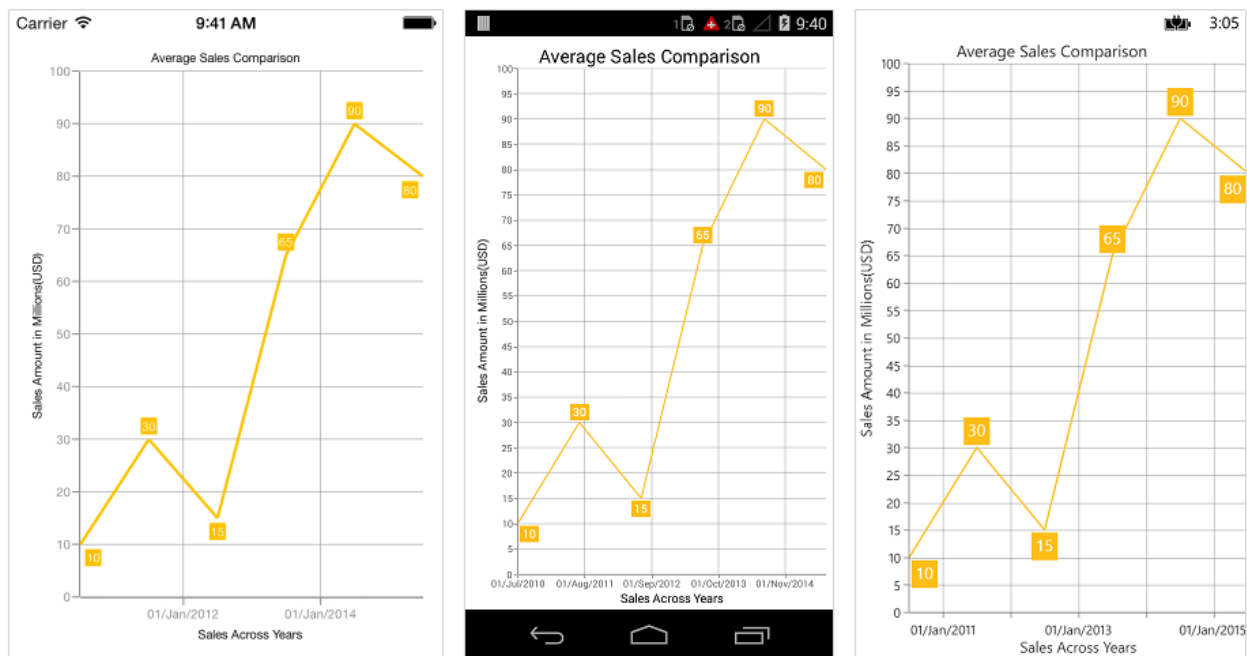

Date time axis uses date time scale and displays date time values as axis labels in specified format.

### XML

```
<chart:SfChart.PrimaryAxis >
<chart:DateTimeAxis/>
</chart:SfChart.PrimaryAxis>
```

### C#

```
chart.PrimaryAxis = new DateTimeAxis();
```

### Customizing date time range

To customize the range of an axis, you can use the [Minimum](#) and [Maximum](#) properties of [DateTimeAxis](#). By default, nice range will be calculated automatically based on the provided data.

**XML**

```

Namespace:
xmlns:sys="clr-namespace:System;assembly=mscorlib"
...
<chart:SfChart.PrimaryAxis >
<chart:DateTimeAxis>
<chart:DateTimeAxis.Minimum>
<sys:DateTime x:FactoryMethod="Parse">
<x:Arguments>
<x:String>Jan 1 2010</x:String>
</x:Arguments>
</sys:DateTime>
</chart:DateTimeAxis.Minimum>
<chart:DateTimeAxis.Maximum>
<sys:DateTime x:FactoryMethod="Parse">
<x:Arguments>
<x:String>Dec 30 2015</x:String>
</x:Arguments>
</sys:DateTime>
</chart:DateTimeAxis.Maximum>
</chart:DateTimeAxis>
</chart:SfChart.PrimaryAxis>

```

**C#**

```

chart.PrimaryAxis = new DateTimeAxis() {
Minimum = new DateTime(2010, 1, 1),
Maximum = new DateTime(2015, 12, 30)
};

```

### Date time intervals

Date time intervals can be customized using [Interval](#) and [IntervalType](#) properties of the [DateTimeAxis](#). For example, setting [Interval](#) as 2 and [IntervalType](#) as [Years](#) will consider 2 years as interval.

Essential Chart supports the following types of interval for date time axis

- Years
- Months
- Days
- Hours
- Minutes
- Seconds
- Milliseconds

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:DateTimeAxis IntervalType="Months">
<chart:DateTimeAxis.Interval>
<Double>6</Double>
</chart:DateTimeAxis.Interval>
</chart:DateTimeAxis>
</chart:SfChart.PrimaryAxis>
```

### C#

```
chart.PrimaryAxis = new DateTimeAxis() {
IntervalType = DateTimeIntervalType.Months,
Interval = 6
};
```

### Get actual interval type

The [GetActualIntervalType](#) method is used to get the interval that is calculated from actual data in [DateTimeAxis](#).

### C#

```
var intervalType = dateTimeAxis.GetActualIntervalType();
```

### Apply padding to range

Padding can be applied to the minimum and maximum extremes of range by using the [RangePadding](#) property. Date-time axis supports the following types of padding:

- None
- Round
- Additional

### None

When the value of [RangePadding](#) property is [None](#), padding will not be applied to the axis. This is also the default value of [RangePadding](#).

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:DateTimeAxis RangePadding="None"/>
</chart:SfChart.PrimaryAxis >
```

### C#

```
chart.PrimaryAxis = new DateTimeAxis() { RangePadding =
DateTimeRangePadding.None };
```

### Round

When the value of [RangePadding](#) property is [Round](#), axis range will be rounded to the nearest possible date time value.

**XML**

```
<chart:SfChart.PrimaryAxis >
<chart:DateTimeAxis RangePadding="Round"/>
</chart:SfChart.PrimaryAxis >
```

**C#**

```
chart.PrimaryAxis = new DateTimeAxis() { RangePadding =
DateTimeRangePadding.Round };
```

**Additional**

When the value of [RangePadding](#) property is [Additional](#), range will be rounded and date time interval of the axis will be added as padding to the minimum and maximum extremes of the range.

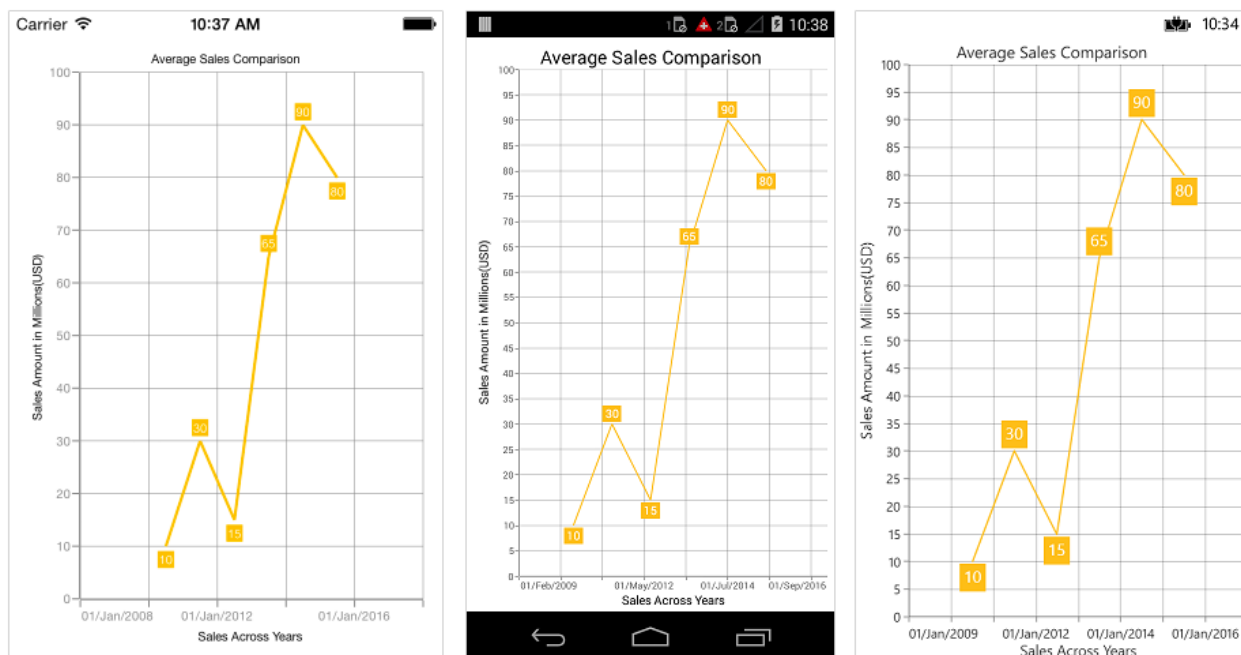

**XML**

```
<chart:SfChart.PrimaryAxis >
<chart:DateTimeAxis RangePadding="Additional"/>
</chart:SfChart.PrimaryAxis >
```

**C#**

```
chart.PrimaryAxis = new DateTimeAxis() { RangePadding =
DateTimeRangePadding.Additional };
```

### Date-time category axis

The [DateTimeCategoryAxis](#) is a unique type of axis used mainly with financial series. Like [CategoryAxis](#), all the data points are plotted with equal spaces by removing space for missing dates. Intervals and ranges for the axis are calculated similar to [DateTimeAxis](#). There will be no visual gaps between points even when the difference between two points is more than a year. The following APIs are used to customize the interval of [DateTimeCategoryAxis](#).

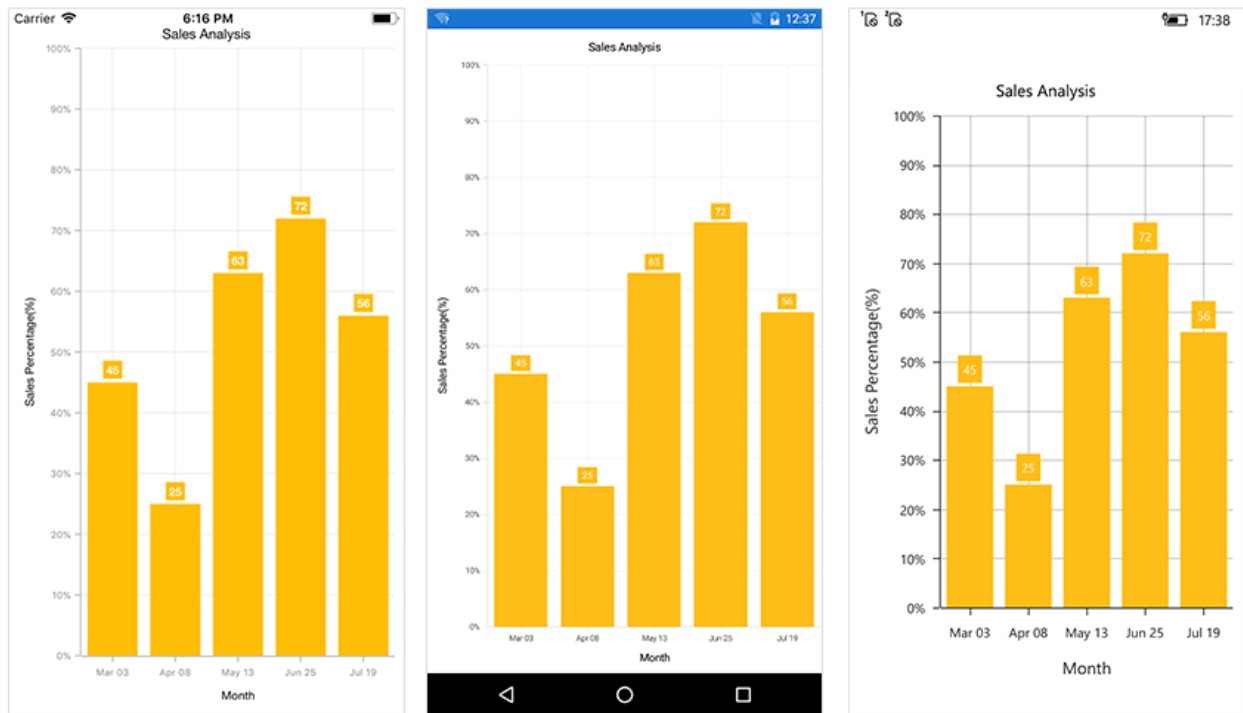

- [Interval](#) - Gets or sets the double value that represents the interval between the labels.
- [IntervalType](#) - Gets or sets the [DateTimeIntervalType](#) that represents the type of the interval to be displayed.

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:DateTimeCategoryAxis Interval="1" IntervalType="Months" />
</chart:SfChart.PrimaryAxis>
```

### C#

```
DateTimeCategoryAxis xAxis = new DateTimeCategoryAxis();
xAxis.Interval = 1;
xAxis.IntervalType = DateTimeIntervalType.Months;
chart.PrimaryAxis = xAxis;
```

### Logarithmic axis

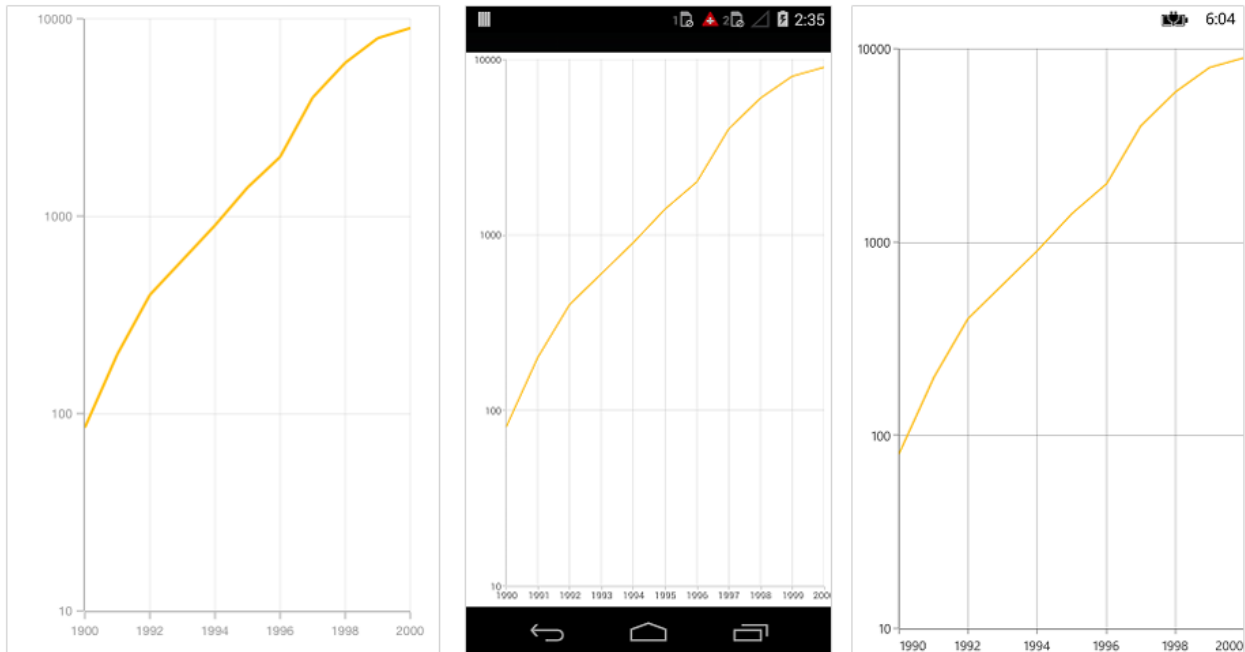

Logarithmic axis uses logarithmic scale and displays numbers as axis labels.

### XML

```
<chart:SfChart.SecondaryAxis>
<chart:LogarithmicAxis />
</chart:SfChart.SecondaryAxis>
```

### C#

```
chart.SecondaryAxis = new LogarithmicAxis ();
```

### Customizing the logarithmic range

To customize the range of log axis, you can use the [Minimum](#), [Maximum](#) and [Interval](#) properties of [LogarithmicAxis](#). By default, nice range will be calculated automatically based on the provided data.

### XML

```
<chart:SfChart.SecondaryAxis>
<chart:LogarithmicAxis >
<chart:LogarithmicAxis.Minimum>
<x:Double>100</x:Double>
</chart:LogarithmicAxis.Minimum>
<chart:LogarithmicAxis.Maximum>
<x:Double>10000</x:Double>
</chart:LogarithmicAxis.Maximum>
</chart:LogarithmicAxis>
</chart:SfChart.SecondaryAxis>
```

### C#

```
chart.SecondaryAxis = new LogarithmicAxis() {
    Minimum = 100,
    Maximum = 10000
};
```

### *Customizing the logarithmic base*

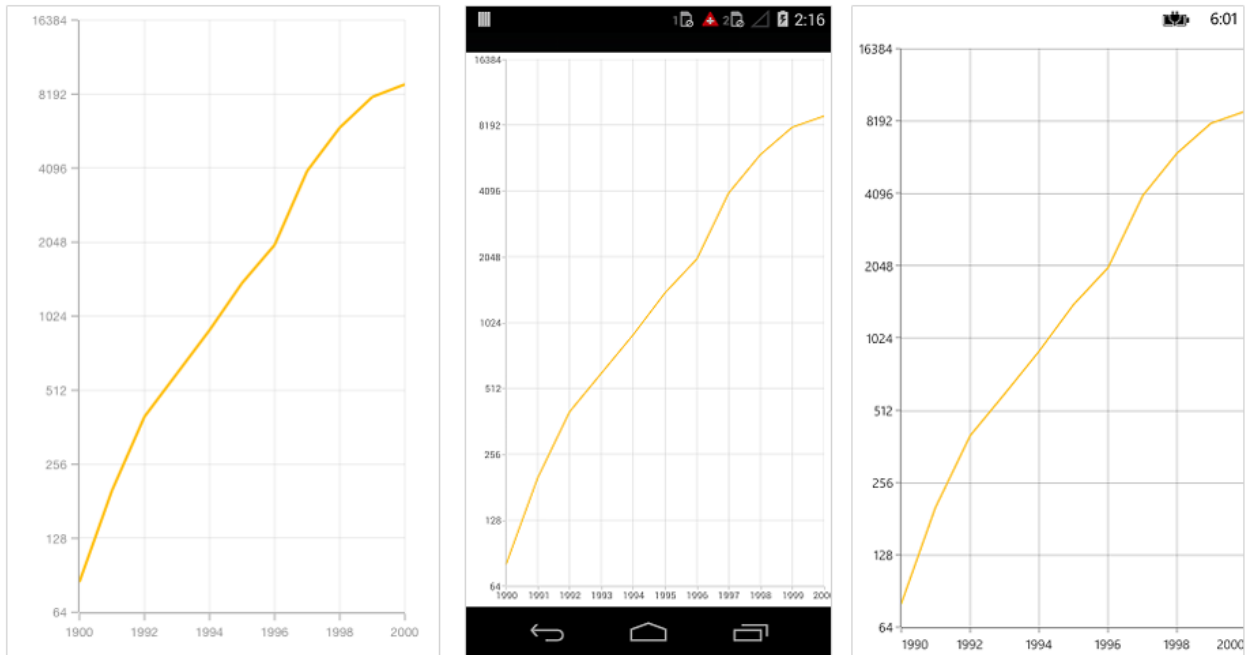

To customize the log base value, you can use [LogarithmicBase](#) property.

### **XML**

```
<chart:SfChart.SecondaryAxis>  
<chart:LogarithmicAxis LogarithmicBase="2" />  
</chart:SfChart.SecondaryAxis>
```

### **C#**

```
chart.SecondaryAxis = new LogarithmicAxis() { LogarithmicBase = 2 };
```

### Common axis features

Customization of features such as axis title, labels, grid lines and tick lines are common to all the axes. Each of these features are explained in this section.

#### Axis Visibility

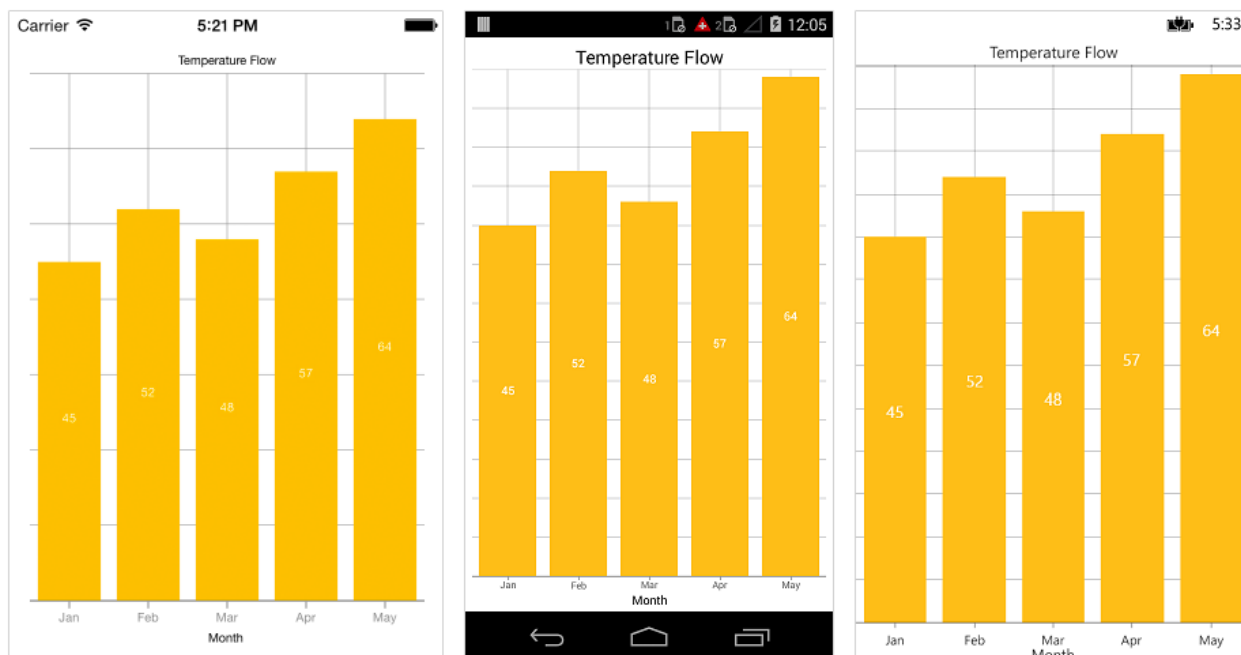

Axis visibility can be controlled using the [IsVisible](#) property of axis. Default value of [IsVisible](#) property is **True**.

#### XML

```
<chart:SfChart.SecondaryAxis>  
<chart:NumericalAxis IsVisible="False"/>  
</chart:SfChart.SecondaryAxis >
```

#### C#

```
chart.SecondaryAxis.IsVisible = false;
```

### Axis title

The [Title](#) property in axis provides options to customize the text and font of axis title. Axis does not display title by default. The title can be customized using following properties,

- [Text](#) – used to set the title for axis.
- [TextColor](#) – used to change the color of the label.
- [BackgroundColor](#) – used to change the label background color.
- [BorderColor](#) – used to change the border color.
- [BorderWidth](#) – used to change the width of the border.
- [Font](#) – used to change the text size, font family, and font weight. (This is deprecated API. Use [FontSize](#), [FontFamily](#), and [FontAttributes](#) properties instead of this.)
- [FontFamily](#) - used to change the font family for the axis title.
- [FontAttributes](#) - used to change the font style for the axis title.
- [FontSize](#) - used to change the font size for the axis title.
- [Margin](#) - used to change the margin size for labels.

Following code snippet illustrates how to enable and customize the axis title.

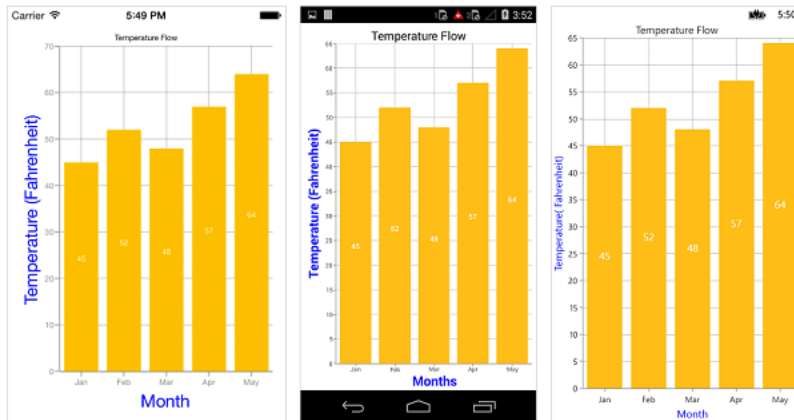

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis >
<chart:CategoryAxis.Title>
<chart:ChartAxisTitle Text="Month" TextColor="Blue" Font="Bold,20"/>
</chart:CategoryAxis.Title>
</chart:CategoryAxis >
</chart:SfChart.PrimaryAxis >
```

### C#

```
chart.PrimaryAxis.Title.Text = "Month";
```

```
chart.PrimaryAxis.Title.TextColor = Color.Blue;
chart.PrimaryAxis.Title.Font = Font.SystemFontOfSize(20,
FontAttributes.Bold);
```

### Axis label rotation

The [LabelRotationAngle](#) property of axis can be used to rotate the axis labels position. Default value of [LabelRotationAngle](#) property is 0d.

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis LabelRotationAngle="-45"/>
</chart:SfChart.PrimaryAxis>
```

### C#

```
CategoryAxis categoryAxis = new CategoryAxis();
categoryAxis.LabelRotationAngle = -45;
chart.PrimaryAxis = categoryAxis;
```

### Axis line customization

[SfChart](#) provides support to customize the style of the axis line by defining the [AxisLineStyle](#) property as shown in the below code snippet.

- [StrokeColor](#) – used to change the stroke color of axis line.
- [StrokeWidth](#) – used to change the stroke width of axis line.
- [StrokeDashArray](#) - used to render axis line series with dashes.

### XML

```

Namespace:
xmlns:sys="clr-namespace:System;assembly=mscorlib"
...
<chart:SfChart.PrimaryAxis>
<chart:DateTimeAxis>
<chart:DateTimeAxis.AxisLineStyle>
<chart:ChartLineStyle StrokeWidth="10" StrokeColor="Red">
<chart:ChartLineStyle.StrokeDashArray>
<x:Array Type="{x:Type x:Double}">
<sys:Double>5</sys:Double>
<sys:Double>6</sys:Double>
</x:Array>
</chart:ChartLineStyle.StrokeDashArray>
</chart:ChartLineStyle>
</chart:DateTimeAxis.AxisLineStyle>
</chart:DateTimeAxis>
</chart:SfChart.PrimaryAxis>

```

### C#

```

CategoryAxis primaryAxis = new CategoryAxis();
ChartLineStyle axisLineStyle = new ChartLineStyle();

```

```
axisLineStyle.StrokeColor = Color.Red;
axisLineStyle.StrokeWidth = 10;
axisLineStyle.StrokeDashArray = new double[2] { 5, 6 };
primaryAxis.AxisLineStyle = axisLineStyle;
chart.PrimaryAxis = primaryAxis;
```

### Axis line offset

The [AxisLineOffset](#) property is used to offset the rendering of axis line.

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis AxisLineOffset="20" PlotOffset="20">
<chart:CategoryAxis.AxisLineStyle>
<chart:ChartLineStyle StrokeWidth="5"/>
</chart:CategoryAxis.AxisLineStyle>
</chart:CategoryAxis>
</chart:SfChart.PrimaryAxis>
```

### C#

```
CategoryAxis primaryAxis = new CategoryAxis();
primaryAxis.PlotOffset = 20;
primaryAxis.AxisLineOffset = 20;
primaryAxis.AxisLineStyle.StrokeWidth = 5;
chart.PrimaryAxis = primaryAxis;
```

### Label customization

The [LabelStyle](#) property of axis provides options to customize the font-family, color, size and font-weight of axis labels. The axis labels can be customized using following properties:

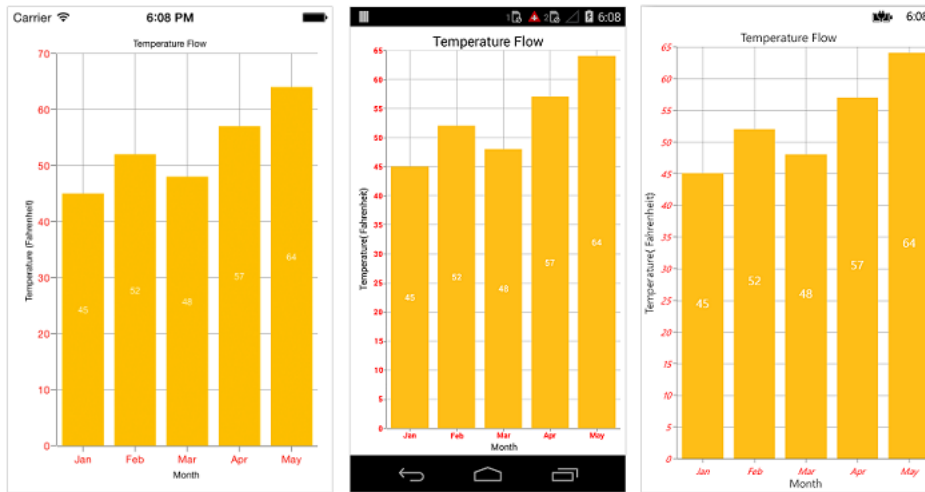

- [TextColor](#) – used to change the color of the labels.
- [BackgroundColor](#) – used to change the label background color.
- [BorderColor](#) – used to change the border color.
- [BorderThickness](#) – used to change the thickness of the border.
- [Font](#) – used to change the text size, font family and font weight.
- [Margin](#) - used to change the margin size for labels.
- [CornerRadius](#) - Used to change the corner radius of the background of labels.
- [LabelAlignment](#) - Used to align the label at the [Start](#), [Center](#), or [End](#).
- [LabelFormat](#) - used to set numeric or date time format to the chart axis label.
- [MaxWidth](#) - Provides the maximum text width of the axis label and wraps into the next line when exceeds the maximum width.
- [WrappedLabelAlignment](#) - Positions the wrapped text at the start, center, or end. The default value of the [WrappedLabelAlignment](#) property is [Start](#).

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis >
<chart:CategoryAxis.LabelStyle>
<chart:ChartAxisLabelStyle TextColor="Red" Font="Bold,20"/>
</chart:CategoryAxis.LabelStyle>
</chart:CategoryAxis>
</chart:SfChart.PrimaryAxis>
```

### C#

```
chart.PrimaryAxis.LabelStyle.Font = Font.SystemFontOfSize(20,
FontAttributes.Bold);
chart.PrimaryAxis.LabelStyle.TextColor = Color.Red;
```

### Label and tick positioning

Axis labels and ticks can be positioned [Inside](#) or [Outside](#) the chart area by using [LabelStyle.LabelsPosition](#) and [TickPosition](#) properties of ChartAxis. By default labels and ticks will be positioned outside the chart area.

### XML

```
<chart:SfChart.PrimaryAxis >
<chart:DateTimeAxis TickPosition="Inside">
<chart:DateTimeAxis.LabelStyle>
<chart:ChartAxisLabelStyle LabelsPosition="Inside"/>
</chart:DateTimeAxis.LabelStyle>
</chart:DateTimeAxis>
</chart:SfChart.PrimaryAxis >
```

### C#

```
chart.PrimaryAxis.LabelStyle.LabelsPosition = AxisElementPosition.Inside;
chart.PrimaryAxis.TickPosition = AxisElementPosition.Inside;
```

### Edge labels placement

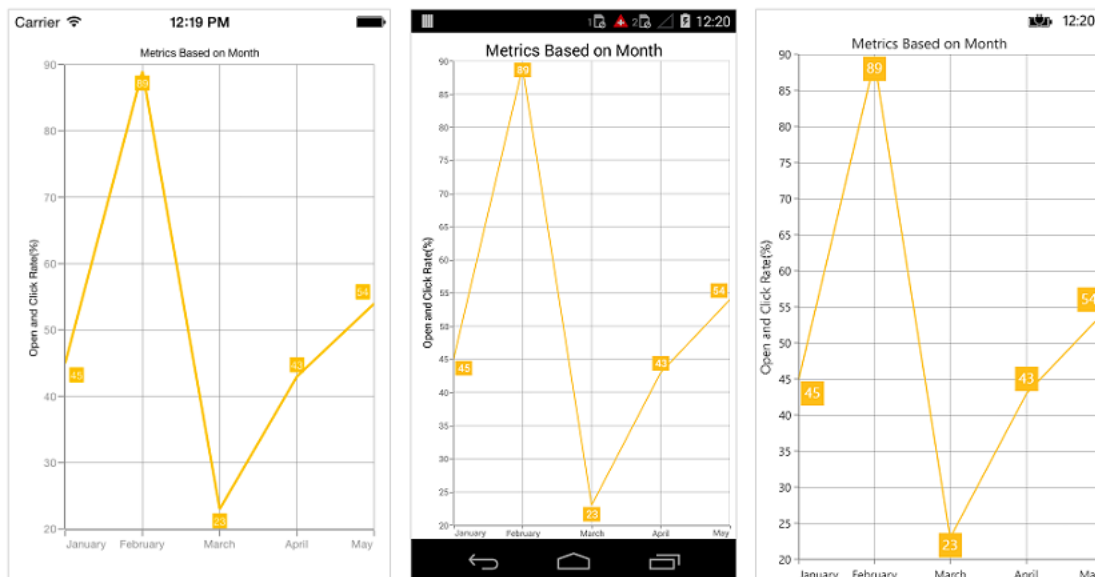

Labels with long text at the edges of an axis may appear partially outside the chart. The [EdgeLabelsDrawingMode](#) property can be used to avoid the partial appearance of labels at the corners. Default value of this property is [Center](#). Other available options of [EdgeLabelsDrawingMode](#) are [Fit](#), [Shift](#) and [Hide](#).

### XML

```
<chart:CategoryAxis EdgeLabelsDrawingMode="Shift"/>
```

### C#

```
chart.PrimaryAxis.EdgeLabelsDrawingMode = EdgeLabelsDrawingMode.Shift;
```

### Edge labels visibility

The visibility of the edge labels in an axis can be controlled using [EdgeLabelsVisibilityMode](#) property.

The following options are available in [EdgeLabelsVisibilityMode](#),

- [Default](#) - used to display the edge label based on auto interval calculations
- [Visible](#) - used to display the edge labels (first and last label) irrespective of the auto interval calculation until zooming (i.e., in normal state).
- [AlwaysVisible](#) - used to always display the edge labels even while zooming the chart.

The following code example demonstrates the AlwaysVisible option while zooming.

#### **XML**

```
<chart:SfChart.PrimaryAxis>  
<chart:NumericalAxis EdgeLabelsVisibilityMode="AlwaysVisible">  
</chart:NumericalAxis>  
</chart:SfChart.PrimaryAxis>
```

#### **C#**

```
Chart.PrimaryAxis = new NumericalAxis();  
chart.SecondaryAxis.EdgeLabelsVisibilityMode =  
EdgeLabelsVisibilityMode.AlwaysVisible;
```

#### *Label extent*

The [LabelExtent](#) property allows to set the gap between axis labels and title. This is typically used to maintain the fixed gap between axis labels and title when the digits of the axis value changed in live update.

#### **XML**

```
<chart:SfChart.PrimaryAxis>  
<chart:CategoryAxis LabelExtent="60" >  
<chart:CategoryAxis.Title>  
<chart:ChartAxisTitle Text="Month"/>  
</chart:CategoryAxis.Title>  
</chart:CategoryAxis>  
</chart:SfChart.PrimaryAxis>
```

#### **C#**

```
Chart.PrimaryAxis = new CategoryAxis();  
Chart.PrimaryAxis.LabelExtent = 60;  
Chart.PrimaryAxis.Title.Text = "Month";
```

#### Grid lines customization

The [ShowMajorGridLines](#) and [ShowMinorGridLines](#) properties are used to control the visibility of grid lines. [MajorGridLineStyle](#) and [MinorGridLineStyle](#) properties in axis are used to customize the major grid lines and minor grid lines of an axis respectively. They provide options to change the width, dashes, color of grid lines. By default minor grid lines will not be visible.

#### XML

```
<chart:SfChart.SecondaryAxis >  
  <chart:NumericalAxis ShowMajorGridLines="True" ShowMinorGridLines="True"  
    MinorTicksPerInterval="1"/>  
</chart:SfChart.SecondaryAxis >
```

#### C#

```
chart.SecondaryAxis = new NumericalAxis ()  
{  
    ShowMajorGridLines = true,  
    ShowMinorGridLines = true,  
    MinorTicksPerInterval = 1  
};
```

### *Tick lines customization*

The [MajorTickStyle](#) and [MinorTickStyle](#) properties in axis are used to customize the major tick lines of an axis and minor tick lines of an axis respectively. They provide options to change the [StrokeWidth](#), [TickSize](#), [StrokeColor](#) and [MinorTicksPerInterval](#) of tick lines. By default minor tick lines will not be visible.

### **XML**

```
<chart:SfChart.SecondaryAxis >
  <chart:NumericalAxis ShowMinorGridLines="True" MinorTicksPerInterval="1">
    <chart:NumericalAxis.MajorTickStyle >
      <chart:ChartAxisTickStyle TickSize="7" StrokeColor="Blue" StrokeWidth="3"/>
    </chart:NumericalAxis.MajorTickStyle>
    <chart:NumericalAxis.MinorTickStyle>
      <chart:ChartAxisTickStyle TickSize="5" StrokeColor="Green" StrokeWidth="2"/>
    </chart:NumericalAxis.MinorTickStyle>
    <chart:NumericalAxis/>
  </chart:SfChart.SecondaryAxis >
```

### **C#**

```
NumericalAxis numerical = new NumericalAxis();
numerical.MajorTickStyle.TickSize = 7;
numerical.MajorTickStyle.StrokeWidth = 3;
numerical.MajorTickStyle.StrokeColor = Color.Red;
numerical.ShowMinorGridLines = true;
numerical.MinorTicksPerInterval = 1;
numerical.MinorTickStyle.TickSize = 5;
numerical.MinorTickStyle.StrokeWidth = 2;
numerical.MinorTickStyle.StrokeColor = Color.Green;
chart.SecondaryAxis = numerical;
```

### Customize individual axis elements

The [RangeStyles](#) can be used to customize the gridlines, ticks and axis labels for a specific region of [ChartAxis](#). The following properties are used to customize the specific range in an axis:

- [Start](#) - Sets the start range of an axis
- [End](#) - Sets the end range of an axis
- [MajorGridLineStyle](#) - Customizes the major grid lines of an axis.
- [MinorGridLineStyle](#) - Customizes the minor grid lines of an axis.
- [MajorTickStyle](#) - Customizes the major tick lines of an axis.
- [MinorTickStyle](#) - Customizes the minor tick lines of an axis.
- [LabelStyle](#) - Customizes the axis labels for a specific range.

**Note:** Grid lines [StrokeDashArray](#) is not supported if the [RangeStyles](#) of axis is set in UWP.

### XML

```
<chart:NumericalAxis.RangeStyles>
  <chart:ChartAxisRangeStyleCollection>
    <chart:ChartAxisRangeStyle Start="15" End="21" >
      <chart:ChartAxisRangeStyle.MajorGridLineStyle>
        <chart:ChartLineStyle StrokeColor="#096EBF" StrokeWidth="3"/>
      </chart:ChartAxisRangeStyle.MajorGridLineStyle>
      <chart:ChartAxisRangeStyle.LabelStyle>
        <chart:ChartAxisLabelStyle TextColor="#096EBF" FontAttributes="Bold"/>
      </chart:ChartAxisRangeStyle.LabelStyle>
    </chart:ChartAxisRangeStyle>
    . . . .
  </chart:ChartAxisRangeStyleCollection>
</chart:NumericalAxis.RangeStyles>
```

### C#

```
NumericalAxis numericalAxis = new NumericalAxis() { Minimum = 15, Maximum = 27 };
ChartAxisRangeStyleCollection axisRangeStyles = new
ChartAxisRangeStyleCollection();
ChartAxisRangeStyle rangeStyle = new ChartAxisRangeStyle() { Start = 15, End = 21};
```

```
rangeStyle.MajorGridLineStyle = new ChartLineStyle() { StrokeColor =
Color.FromHex("#096EBF"), StrokeWidth = 3 };
rangeStyle.LabelStyle = new ChartAxisLabelStyle() { TextColor =
Color.FromHex("#096EBF"), FontAttributes = FontAttributes.Bold };
axisRangeStyles.Add(rangeStyle);
....
numericalAxis.RangeStyles = axisRangeStyles;
```

### Inverting axis

Axis can be inverted using the [IsInversed](#) property of axis. Default value of [IsInversed](#) property is `False`.

### XML

```
<chart:SfChart.SecondaryAxis >
<chart:NumericalAxis IsInversed="True">
</chart:SfChart.SecondaryAxis >
```

### C#

```
chart.SecondaryAxis.IsInversed = true;
```

### Placing axes at the opposite side

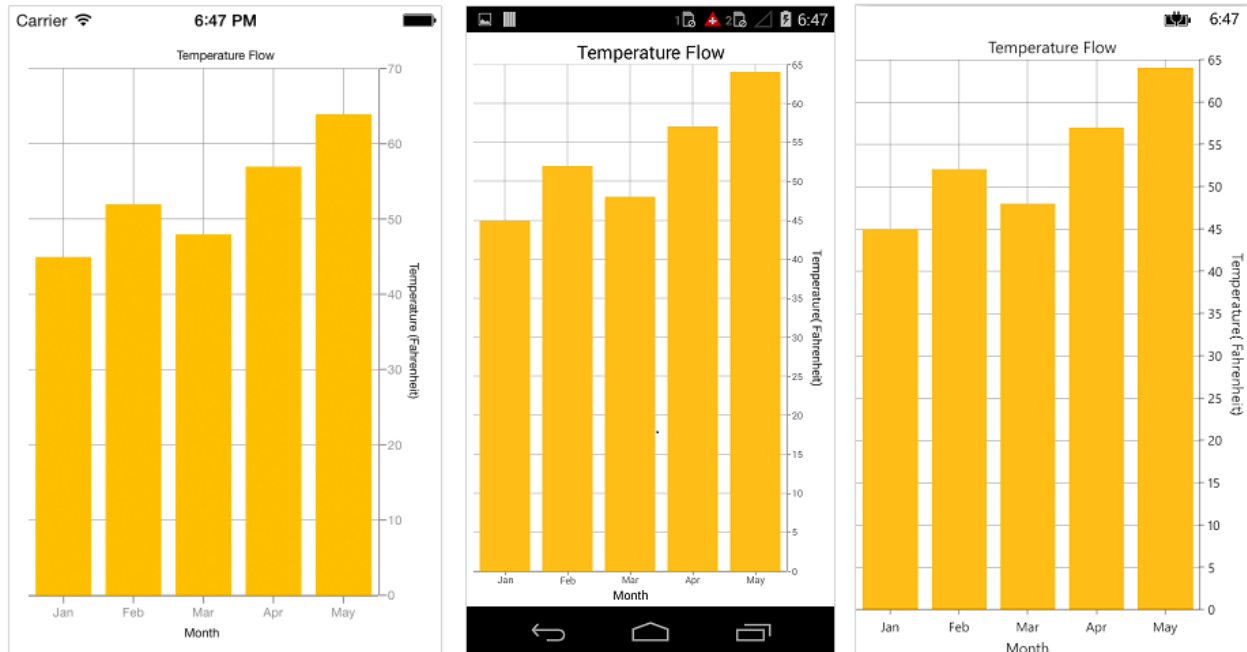

The [OpposedPosition](#) property of axis can be used to place the axis at the opposite side of its default position. Default value of [OpposedPosition](#) property is `False`.

### XML

```
<chart:SfChart.SecondaryAxis >
  <chart:NumericalAxis OpposedPosition="True">
</chart:SfChart.SecondaryAxis >
```

### C#

```
chart.SecondaryAxis.OpposedPosition = true;
```

### Offset the rendering

The [PlotOffset](#) property is used to offset the rendering of the axis at start and end position. The following code snippet demonstrates to apply the plot offset to both x and y axes.

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis PlotOffset="30" />
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis PlotOffset="30"/>
</chart:SfChart.SecondaryAxis>
```

### C#

```
Chart.PrimaryAxis = new CategoryAxis()
{
    PlotOffset = 30
};
Chart.SecondaryAxis = new NumericalAxis()
{
    PlotOffset = 30
};
```

#### Maximum number of labels per 100 pixels

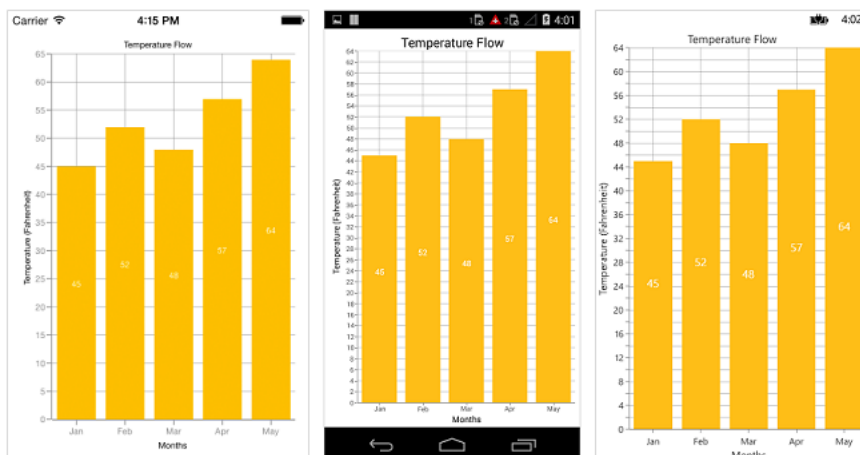

By default, a maximum of 3 labels are displayed for each 100 pixels in axis. The maximum number of labels that should be present within 100 pixels length can be customized using the [MaximumLabels](#) property of an axis. This property is applicable only for automatic range calculation and will not work if you set value for [Interval](#) property of an axis.

#### XML

```
<chart:SfChart.SecondaryAxis >
<chart:NumericalAxis MaximumLabels="5"/>
</chart:SfChart.SecondaryAxis >
```

#### C#

```
Chart.SecondaryAxis.MaximumLabels = 5;
```

### *AutoScrollingDelta*

[AutoScrollingDelta](#) is used to ensure that the specified range of data is always visible in the chart. It always shows the recently added data points at the end and scrolling will be reset to the end of the range whenever a new point is added.

By adding [ChartZoomPanBehavior](#) to the chart, you can scroll to see the previous datapoints.

### *AutoScrollingDeltaType*

In [DateTimeAxis](#), you can apply auto scrolling delta value in [Years](#), [Months](#), [Days](#), [Hours](#), [Minutes](#), [Seconds](#) and [Milliseconds](#) by setting [AutoScrollingDeltaType](#) property. Default value of this property is [Auto](#) and the delta will be calculated automatically based on range.

### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:DateTimeAxis AutoScrollingDelta="3" AutoScrollingDeltaType="Days">
</chart:SfChart.PrimaryAxis>
```

### **C#**

```
chart.PrimaryAxis = new DateTimeAxis()
{
    AutoScrollingDelta = 3,
    AutoScrollingDeltaType = DateTimeDeltaType.Days
};
```

### *AutoScrollingMode*

[AutoScrollingMode](#) property can be used to determine whether the axis should be scrolled from start position or end position. The default value of [AutoScrollingMode](#) is [End](#).

### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis AutoScrollingDelta = "3" AutoScrollingMode = "Start">
</chart:SfChart.PrimaryAxis>
```

### **C#**

```
chart.PrimaryAxis = new DateTimeAxis()
{
    AutoScrollingDelta = 3,
    AutoScrollingMode = ChartAutoScrollingMode.Start
};
```

### *VisibleMinimum*

The [VisibleMinimum](#) property of the chart axis can be used only to get the double value that represents the minimum observable value of the axis range in runtime.

### *VisibleMaximum*

The [VisibleMaximum](#) property of the chart axis can be used only to get the double value that represents the maximum observable value of the axis range in runtime.

### Axis Crossing

Axis can be positioned anywhere in the chart area by using [CrossesAt](#) property. This property specifies where the horizontal axis should intersect or cross the vertical axis or vice-versa. Default value of [CrossesAt](#) property is null.

#### XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis CrossesAt = "0" />
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis CrossesAt = "8" />
</chart:SfChart.SecondaryAxis >
```

#### C#

```
chart.PrimaryAxis = new CategoryAxis() { CrossesAt = 0 };
chart.SecondaryAxis = new NumericalAxis() { CrossesAt = 8 };
```

### Crossing in date time axis

For crossing in date time horizontal axis, date object should be provided as value for [CrossesAt](#) property of vertical axis.

#### XML

```
Namespace:
xmlns:sys="clr-namespace:System;assembly=mscorlib"
...
<chart:SfChart.PrimaryAxis>
<chart:DateTimeAxis CrossesAt="0" />
</chart:SfChart.PrimaryAxis >
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis>
```

```
<chart:NumericalAxis.CrossesAt>
<sys:Datetime x:FactoryMethod = "Parse">
<x:Arguments>
<x:String>Jan 1 2003</x:String>
</x:Arguments>
</sys:Datetime>
</chart:NumericalAxis.CrossesAt>
</chart:NumericalAxis>
</chart:SfChart.SecondaryAxis>
```

## C#

```
chart.PrimaryAxis = new DateTimeAxis() { CrossesAt = 0 };
chart.SecondaryAxis = new NumericalAxis() { CrossesAt = new DateTime(2003,
1, 1) };
```

### Positioning the axis elements while crossing

[RenderNextToCrossingValue](#) property is used to determine whether the crossing axis should be placed at crossing position or not. The default value of [RenderNextToCrossingValue](#) property is true.

## XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis CrossesAt="0" RenderNextToCrossingValue="False"/>
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis CrossesAt="5" />
</chart:SfChart.SecondaryAxis>
```

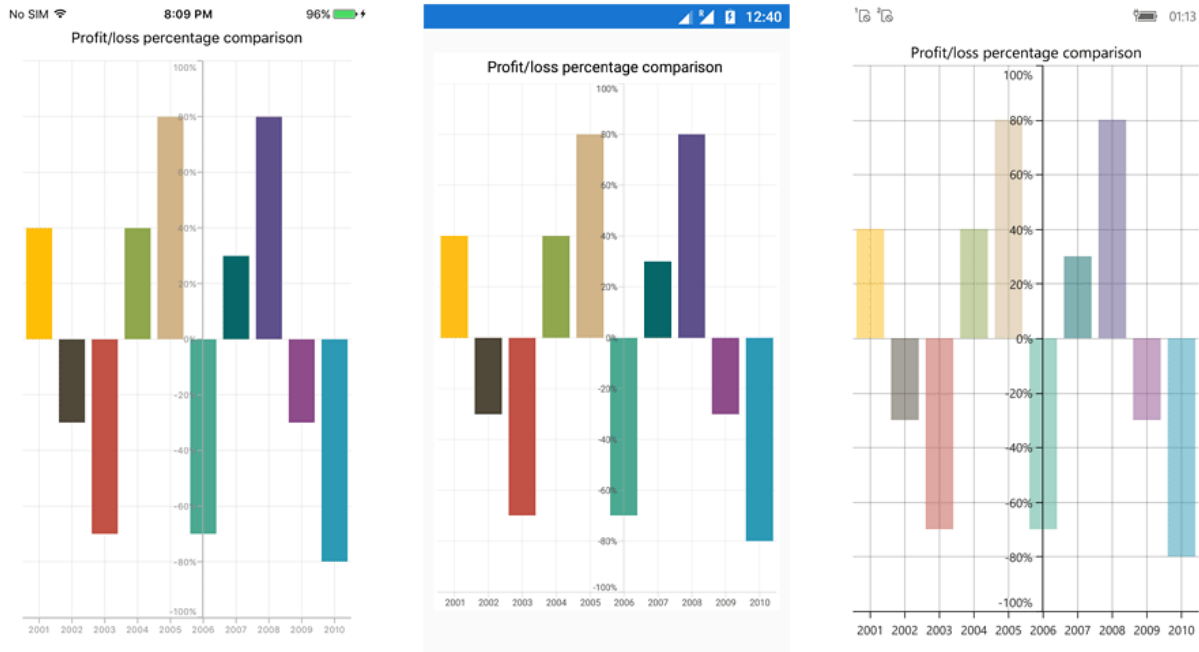

## C#

```
chart.PrimaryAxis = new CategoryAxis()
{
```

```

CrossesAt = 0,
RenderNextToCrossingValue = false
};
chart.SecondaryAxis = new NumericalAxis()
{
    CrossesAt = 5,
};

```

### Smart Axis Labels

Axis labels may overlap with each other based on chart dimensions and label size. The [LabelsIntersectAction](#) property of axis is used to avoid overlapping of axis labels. The default value of the [LabelsIntersectAction](#) is [None](#); other available values are [MultipleRows](#), [Hide](#), and [Wrap](#).

### XML

```

<chart:SfChart.PrimaryAxis >
<chart:CategoryAxis LabelsIntersectAction="MultipleRows"/>
</chart:SfChart.PrimaryAxis >

```

### C#

```

chart.PrimaryAxis.LabelsIntersectAction =
AxisLabelsIntersectAction.MultipleRows;

```

## Event

### ActualRangeChanged

The [ActualRangeChanged](#) event is triggered when the actual range of the axis is changed. The argument contains the following information.

- [ActualMinimum](#) - used to get or set the actual minimum value of the axis.
- [ActualMaximum](#) - used to get or set the actual maximum value of the axis.
- [VisibleMinimum](#) - used to get or set the visible minimum value of the axis.
- [VisibleMaximum](#) - used to get or set the visible maximum value of the axis.

---

**Note:** Actual range and visible range are similar unless the range is changed by specifying the [ZoomPosition](#) and [ZoomFactor](#) properties or zoom the chart interactively. Visible range is always the range which you see visually in the screen.

---

### LabelCreated

The [LabelCreated](#) event is triggered when the axis label is created. The argument contains the following information.

- [LabelContent](#) - Used to get or set the text of axis label based on condition.
- [Position](#) - Used to get the position of label.
- [LabelStyle](#) - Used to customize the appearance of axis labels based on condition. The properties listed in [label customization](#) can be customized using LabelStyle property.

### LabelClicked

The [LabelClicked](#) event is triggered when the axis label is clicked. The argument contains the following informations:

- [LabelContent](#) - Used to get the text of label.
- [Position](#) - Used to get the position of label.

## Chart Series

[ChartSeries](#) is the visual representation of the data. [SfChart](#) offers many types of series ranging from line series to financial series like HiLo and Candle. Based on your requirements and specifications, any type of Series can be added for data visualization.

The following APIs are common for the most of the series types:

[IsVisible](#) - controls the visibility of the series.

[ItemsSource](#) - used to set the data source for the series. Refer the [Populating Data](#) page to configure the items source and set the binding paths.

[Color](#) - used to change the color of the series.

[LegendIcon](#) - used to change the icon type in corresponding legend item.

[Label](#) - used to set the label that displays in corresponding legend item.

[IsVisibleOnLegend](#) - used to control the visibility of the series in legend.

[Opacity](#) - used to control the transparency of the series.

## Multiple Series

You can add multiple series to [Series](#) property of [SfChart](#) class. By default, all the series rendered based on the [PrimaryAxis](#) and [SecondaryAxis](#) of [SfChart](#). But if you want to plot different unit or value that is specific to particular series, you can specify the separate axis for that series using [XAxis](#) and [YAxis](#) properties of [ChartSeries](#).

## XML

```
<chart:SfChart>
...
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Country"
YBindingPath="Value"/>
<chart:ColumnSeries ItemsSource="{Binding Data1}" XBindingPath="Country"
YBindingPath="Value"/>
<chart:ColumnSeries ItemsSource="{Binding Data2}" XBindingPath="Country"
YBindingPath="Value"/>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
ColumnSeries columnSeries = new ColumnSeries() {
    ItemsSource = Data,
    XBindingPath = "Country",
    YBindingPath = "Value"
};
ColumnSeries columnSeries1 = new ColumnSeries() {
    ItemsSource = Data1,
    XBindingPath = "Country",
    YBindingPath = "Value"
};
ColumnSeries columnSeries2 = new ColumnSeries() {
    ItemsSource = Data2,
    XBindingPath = "Country",
```

```
YBindingPath = "Value"
};
chart.Series.Add(columnSeries);
chart.Series.Add(columnSeries1);
chart.Series.Add(columnSeries2);
```

Following code snippet and screenshot shows how to apply the Y axis to individual series to plot different values.

### XML

```
<chart:SfChart.Series>
<chart:ColumnSeries Label="Revenue" ItemsSource="{Binding Demands}"
XBindingPath="XValue" YBindingPath="YValue" />
<chart:LineSeries Label="Customers" ItemsSource="{Binding Demands}"
XBindingPath="XValue" YBindingPath="YValue" >
<chart:LineSeries.YAxis>
<chart:NumericalAxis OpposedPosition="true" >
<chart:NumericalAxis.Title>
<chart:ChartAxisTitle Text = "Number of Customers" />
</chart:NumericalAxis.Title>
</chart:LineSeries.YAxis>
</chart:LineSeries>
</chart:SfChart.Series>
```

### C#

```
ColumnSeries series = new ColumnSeries();
series.ItemsSource = model.Demands;
series.XBindingPath = "XValue";
series.YBindingPath = "YValue";
series.Label = "Revenue";
```

```

chart.Series.Add(series);
LineSeries lineSeries = new LineSeries();
lineSeries.ItemsSource = model.Demands;
lineSeries.XBindingPath = "XValue";
lineSeries.YBindingPath = "YValue";
lineSeries.Label = "Customers";
NumericalAxis yAxis = new NumericalAxis();
yAxis.OpposedPosition = true;
yAxis.Title.Text = "Number of Customers";
lineSeries.YAxis = yAxis;
chart.Series.Add(lineSeries);

```

### Combination Series

[SfChart](#) allows you to render the combination of different types of series.

### XML

```

<chart:SfChart>
...
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value"/>
<chart:LineSeries ItemsSource="{Binding Data1}" XBindingPath="Month"
YBindingPath="Value"/>
</chart:SfChart>

```

### C#

```

SfChart chart = new SfChart();
...
ColumnSeries columnSeries = new ColumnSeries() {
    ItemsSource = Data,

```

```

XBindingPath = "Month",
YBindingPath = "Value"
};
LineSeries lineSeries = new LineSeries() {
ItemsSource = Data1,
XBindingPath = "Month",
YBindingPath = "Value"
};
chart.Series.Add(columnSeries);
chart.Series.Add(lineSeries);

```

### Limitation of Combination Chart

- Bar, StackingBar, and StackingBar100 cannot be combined with the other Cartesian type series.
- Cartesian type series cannot be combined with Accumulation series (pie, doughnut, funnel, and pyramid).

When the combination of Cartesian and Accumulation series types are added to the [Series](#) property, the series which are similar to the first series will be rendered and other series will be ignored. Following code snippet illustrates this.

### XML

```

<chart:SfChart>
...
<chart:LineSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value"/>
<chart:PieSeries ItemsSource="{Binding Data1}" XBindingPath="Month"
YBindingPath="Value"/>
</chart:SfChart>

```

### C#

```

SfChart chart = new SfChart();
...
LineSeries lineSeries = new LineSeries() {
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
PieSeries pieSeries = new PieSeries() {
    ItemsSource = Data1,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
chart.Series.Add(lineSeries);
chart.Series.Add(pieSeries);

```

### Grouping Stacked Series

You can group and stack the similar stacked series types using [GroupingLabel](#) property of stacked series. The stacked series which contains the same [GroupingLabel](#) will be stacked in a single group.

### XML

```

<chart:SfChart>
...
<chart:StackingColumnSeries ItemsSource="{Binding Data1}"
    GroupingLabel="GroupOne"
    Label="Google" XBindingPath="Month" YBindingPath="Value"/>
<chart:StackingColumnSeries ItemsSource="{Binding Data2}"
    GroupingLabel="GroupTwo"
    Label="Bing" XBindingPath="Month" YBindingPath="Value"/>
<chart:StackingColumnSeries ItemsSource="{Binding Data3}"
    GroupingLabel="GroupOne"
    Label="Yahoo" XBindingPath="Month" YBindingPath="Value"/>
<chart:StackingColumnSeries ItemsSource="{Binding Data4}"
    GroupingLabel="GroupTwo"

```

```
Label="Ask" XBindingPath="Month" YBindingPath="Value"/>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
StackingColumnSeries stackingColumnSeries1 = new StackingColumnSeries()
{
    ItemsSource = Data1,
    GroupingLabel = "GroupOne",
    Label = "Google",
    XBindingPath = "Month",
    YBindingPath = "Value"
};
StackingColumnSeries stackingColumnSeries2 = new StackingColumnSeries()
{
    ItemsSource = Data2,
    GroupingLabel = "GroupTwo",
    Label = "Bing",
    XBindingPath = "Month",
    YBindingPath = "Value"
};
StackingColumnSeries stackingColumnSeries3 = new StackingColumnSeries()
{
    ItemsSource = Data3,
    GroupingLabel = "GroupOne",
    Label = "Yahoo",
    XBindingPath = "Month",
    YBindingPath = "Value"
};
StackingColumnSeries stackingColumnSeries4 = new StackingColumnSeries()
{
    ItemsSource = Data4,
    GroupingLabel = "GroupTwo",
    Label = "Ask",
    XBindingPath = "Month",
    YBindingPath = "Value"
};
chart.Series.Add(stackingColumnSeries1);
chart.Series.Add(stackingColumnSeries2);
chart.Series.Add(stackingColumnSeries3);
chart.Series.Add(stackingColumnSeries4);
```

### Animation

[SfChart](#) provides animation support for data series. [Series](#) will be animated whenever the items source changes. Animation can be enabled by setting the [EnableAnimation](#) property to `true`. You can also control the duration of the animation using [AnimationDuration](#) property.

### XML

```
<chart:SfChart>
...
<chart:ColumnSeries
ItemsSource="{Binding ColumnData}"
EnableAnimation = "true"
AnimationDuration="0.8"
XBindingPath="Name"
YBindingPath="Value" />
</chart:SfChart>
```

### C#

```
ColumnSeries column = new ColumnSeries ();
column.ItemsSource = viewModel.ColumnData;
column.XBindingPath = "Name";
column.YBindingPath = "Value";
column.EnableAnimation = true;
column.AnimationDuration = 0.8;
```

### Transpose the Series (Vertical Chart)

The [IsTransposed](#) property of [CartesianSeries](#) is used to plot the chart vertically and view the data in a different perspective.

### XML

```
<chart:SfChart.Series>
```

```
<chart:LineSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value" IsTransposed="True"/>
</chart:SfChart.Series>
```

**C#**

```
SfChart chart = new SfChart();
...
LineSeries lineSeries = new LineSeries();
lineSeries.XBindingPath = "Month";
lineSeries.YBindingPath = "Value";
lineSeries.ItemsSource = Data;
lineSeries.IsTransposed = true;
chart.Series.Add(lineSeries);
```

**Methods**

[GetDataPointIndex\(float pointX, float pointY\)](#)

The [GetDataPointIndex](#) method is used to get the actual data point index for corresponding screen point.

**C#**

```
ColumnSeries series = new ColumnSeries();
int index = series.GetDataPointIndex(400, 400);
```

**Note:** The output of this method will be -1 if there is no data point under the given x and y positions.

**Chart Types****Line Chart**

To render a line chart, create an instance of [LineSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the appearance.

- [Color](#) – used to change the color of the line.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the line.

### XML

```
<chart:SfChart>
...
<chart:LineSeries ItemsSource="{Binding Data}" XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
LineSeries lineSeries = new LineSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(lineSeries);
```

### Fast Line Chart

[FastLineSeries](#) is a line chart, but it loads faster than [LineSeries](#). You can use this when there are large number of points to be loaded in chart. To render a fast line chart, create an instance of [FastLineSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the fast line segment appearance.

- [Color](#) – used to change the color of the series.

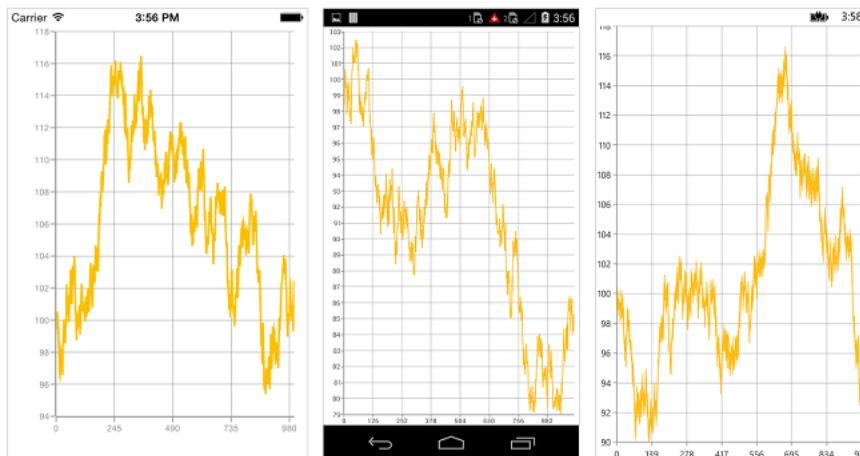

- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.

**XML**

```
<chart:SfChart>
...
<chart:FastLineSeries ItemsSource="{Binding Data}" XBindingPath="XValue"
YBindingPath="YValue"/>
</chart:SfChart>
```

**C#**

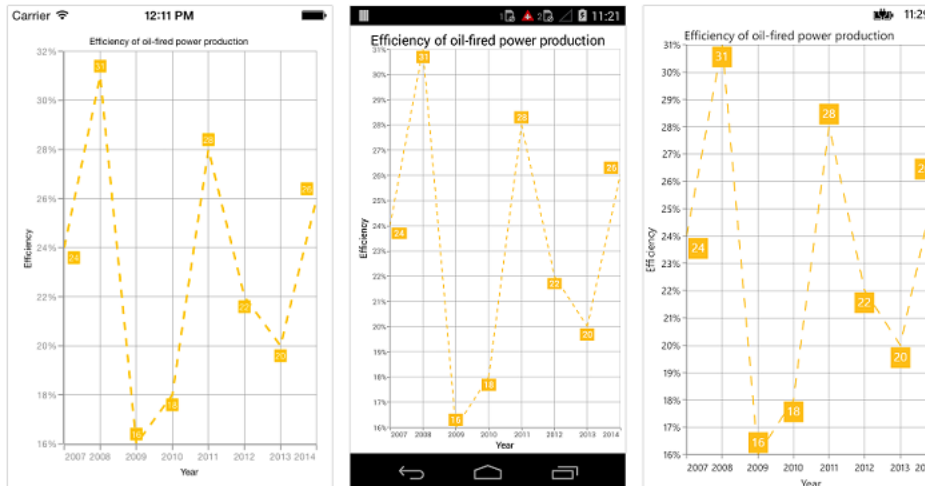

```
SfChart chart = new SfChart();
...
FastLineSeries fastLineSeries = new FastLineSeries()
{
    ItemsSource = Data,
    XBindingPath = "XValue",
    YBindingPath = "YValue"
};
chart.Series.Add(fastLineSeries);
```

*Dashed Lines*

[StrokeDashArray](#) property of the [FastLineSeries](#) is used to render fast line series with dashes.

**C#**

```
[C#]
FastLineSeries fastLineSeries = new FastLineSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
fastLineSeries.StrokeDashArray = new double[2] { 2, 3 };
```

### EnableAntiAliasing

Since [FastLineSeries](#) can be loaded with a large number of points, the rendering of series should be smooth. This requirement can be achieved by setting [EnableAntiAliasing](#) property of [FastLineSeries](#) as false.

### Area Chart

To render an area chart, create an instance of [AreaSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

### XML

```
<chart:SfChart>
...
<chart:AreaSeries ItemsSource="{Binding Data}" XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
AreaSeries areaSeries = new AreaSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(areaSeries);
```

### Spline Area Chart

To render a spline area chart, create an instance of [SplineAreaSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the spline area appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

### XML

```
<chart:SfChart>
...
<chart:SplineAreaSeries ItemsSource="{Binding Data}" XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
SplineAreaSeries splineAreaSeries = new SplineAreaSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(splineAreaSeries);
```

### Spline Rendering Types

[SplineType](#) allows you to change the spline area curve in series.

The following types are used in [SplineAreaSeries](#) as

- [Natural](#)
- [Monotonic](#)
- [Cardinal](#)
- [Clamped](#)

By default [SplineType](#) value is [Natural](#).

The following code shows how to set the [SplineType](#) value as [Cardinal](#)

### XML

```
<chart:SfChart>
...
<chart:SplineAreaSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value" SplineType="Cardinal" />
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
SplineAreaSeries splineAreaSeries = new SplineAreaSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value",
    SplineType = SplineType.Cardinal
};
```

```
chart.Series.Add(splineAreaSeries);
```

### Step Area Chart

To render a step area chart, create an instance of [StepAreaSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the appearance.

- [Color](#) - used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) - used to change the stroke width of the series.
- [StrokeColor](#) - used to change the stroke color of the series.

### XML

```
<chart:SfChart>
...
<chart:StepAreaSeries ItemsSource="{Binding Data}" XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
StepAreaSeries stepAreaSeries = new StepAreaSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(stepAreaSeries);
```

### Range Area Chart

To render a range area chart, create an instance of [RangeAreaSeries](#) and add to the [Series](#) collection property of [SfChart](#).

Since the [RangeAreaSeries](#) requires two Y values for a point, your data should contain high and low values. High and low value specifies the maximum and minimum range of the point.

There are two ways you can provide data to range area chart,

1. You can use [ChartDataPoint's](#) three parameter constructor to pass [XValue](#), [High](#) and [Low](#) values to [RangeAreaSeries](#),

#### C#

```
[C#]
SfChart chart = new SfChart();
...
ObservableCollection<ChartDataPoint> data = new
ObservableCollection<ChartDataPoint>()
{
    new ChartDataPoint("Jan/10", 30, 18),
    new ChartDataPoint("Feb/10", 24, 12),
    new ChartDataPoint("Mar/10", 29, 15),
    new ChartDataPoint("Apr/10", 24, 10),
    new ChartDataPoint("May/10", 30, 18),
    new ChartDataPoint("Jun/10", 24, 10),
};
RangeAreaSeries rangeAreaSeries = new RangeAreaSeries()
{
    ItemsSource = data
};
chart.Series.Add(rangeAreaSeries);
```

2. Or else you can use [High](#) and [Low](#) properties of [RangeAreaSeries](#) to map the high and low values from custom object to chart.

#### XML

```
<chart:SfChart>
...
<chart:SfChart.Series>
<chart:RangeAreaSeries ItemsSource="{Binding RangeAreaData}"
XBindingPath="Name" High="High" Low="Low"/>
</chart:SfChart.Series>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
...
RangeAreaSeries rangeAreaSeries = new RangeAreaSeries()
{
    ItemsSource = RangeAreaData,
    XBindingPath = "Name",
    High = "High",
    Low = "Low"
```

```
};
chart.Series.Add(rangeAreaSeries);
```

You can use the following properties to customize the appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

### Spline Range Area Chart

To render a spline range area chart, create an instance of the [SplineRangeAreaSeries](#), and add that instance to the [Series](#) collection property of [SfChart](#).

Since the [SplineRangeAreaSeries](#) requires two Y values for a point, data should contain high and low values. The high and low values specify the maximum and minimum ranges of a point.

The data can be provided to a spline range area chart by using the following two ways:

1. Using the [ChartDataPoint's](#) three parameter constructor to pass [XValue](#), [High](#), and [Low](#) values to the [SplineRangeAreaSeries](#).

### C#

```
[C#]
SfChart chart = new SfChart();
...
ObservableCollection<ChartDataPoint> data = new
ObservableCollection<ChartDataPoint>()
{
    new ChartDataPoint("Jan", 30, 18),
    new ChartDataPoint("Feb", 24, 12),
    new ChartDataPoint("Mar", 29, 15),
```

```
new ChartDataPoint("Apr", 24, 10),
new ChartDataPoint("May", 30, 18),
new ChartDataPoint("Jun", 24, 10),
};
SplineRangeAreaSeries splineRangeAreaSeries = new SplineRangeAreaSeries()
{
    ItemsSource = data
};
chart.Series.Add(splineRangeAreaSeries);
```

2.Or else, using the [high](#) and [low](#) properties of [SplineRangeAreaSeries](#) to map the high and low values from custom object to chart.

### XML

```
<chart:SfChart>
...
<chart:SfChart.Series>
<chart:SplineRangeAreaSeries ItemsSource="{Binding SplineRangeAreaData}"
XBindingPath="Name" High="High" Low="Low"/>
</chart:SfChart.Series>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
SplineRangeAreaSeries splineRangeAreaSeries = new SplineRangeAreaSeries()
{
    ItemsSource = SplineRangeAreaData,
    XBindingPath = "Name",
    High = "High",
    Low = "Low"
};
chart.Series.Add(splineRangeAreaSeries);
```

### *Spline Rendering Types*

[SplineType](#) property allows you to change the spline range area curve in series.

The following types can be used for SplineRangeAreaSeries

*Natural Monotonic Cardinal Clamped*

By default [SplineType](#) value is Natural.

The following code shows how to set the [SplineType](#) value as Cardinal.

### **XML**

```
<chart:SfChart>
...
<chart:SplineRangeAreaSeries ItemsSource="{Binding SplineRangeAreaData}"
XBindingPath="Name" High="High" Low="Low" SplineType="Cardinal"/>
</chart:SfChart>
```

### **C#**

```
SplineRangeAreaSeries splineRangeAreaSeries = new SplineRangeAreaSeries
{
    ItemsSource = SplineRangeAreaData,
    XBindingPath = "Name",
    High = "High",
    Low = "Low",
    SplineType = SplineType.Cardinal
};
chart.Series.Add(splineRangeAreaSeries);
```

### Stacked Area Chart

To render a stacked area chart, create an instance of [StackingAreaSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the stacked area appearance.

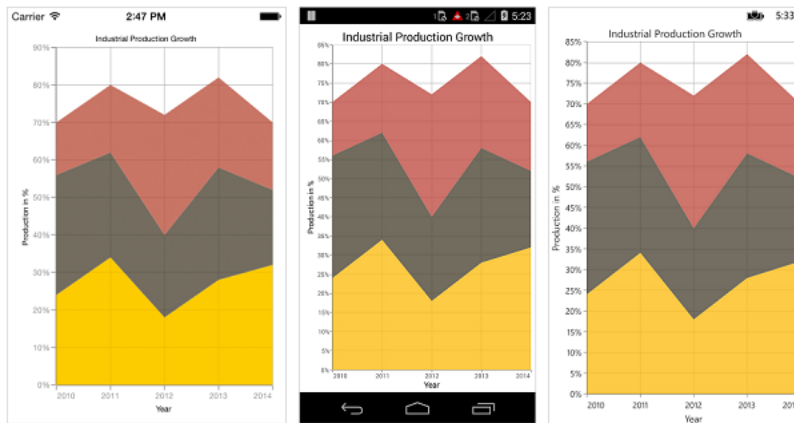

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

### XML

```
<chart:SfChart>
...
<chart:StackingAreaSeries ItemsSource="{Binding Data1}" XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingAreaSeries ItemsSource="{Binding Data2}" XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingAreaSeries ItemsSource="{Binding Data3}" XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
StackingAreaSeries stackingAreaSeries1 = new StackingAreaSeries()
{
    ItemsSource = Data1,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
StackingAreaSeries stackingAreaSeries2 = new StackingAreaSeries()
{
    ItemsSource = Data2,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
StackingAreaSeries stackingAreaSeries3 = new StackingAreaSeries()
{
    ItemsSource = Data3,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(stackingAreaSeries1);
chart.Series.Add(stackingAreaSeries2);
chart.Series.Add(stackingAreaSeries3);
```

### 100% Stacked Area Chart

To render a 100% stacked area chart, create an instance of [StackingArea100Series](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the 100% stacked area appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

### XML

```
<chart:SfChart>
...
<chart:StackingArea100Series ItemsSource="{Binding Data1}"
XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingArea100Series ItemsSource="{Binding Data2}"
XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingArea100Series ItemsSource="{Binding Data3}"
XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

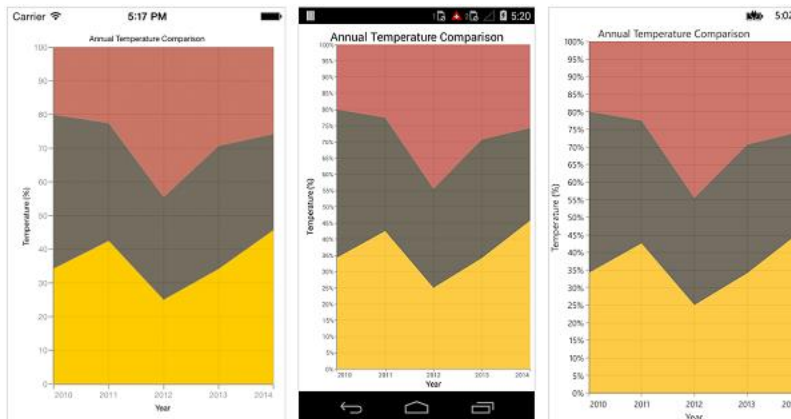

### C#

```
SfChart chart = new SfChart();
...
StackingArea100Series stackingArea100Series1 = new StackingArea100Series()
{
    ItemsSource = Data1,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
StackingArea100Series stackingArea100Series2 = new StackingArea100Series()
{
    ItemsSource = Data2,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
```

```

};
StackingArea100Series stackingArea100Series3 = new StackingArea100Series()
{
    ItemsSource = Data3,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(stackingArea100Series1);
chart.Series.Add(stackingArea100Series2);
chart.Series.Add(stackingArea100Series3);

```

### Column Chart

To render a column chart, create an instance of [ColumnSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CornerRadius](#) - used to add the rounded corners to the rectangle. The [TopLeft](#), [TopRight](#), [BottomLeft](#) and [BottomRight](#) of [ChartCornerRadius](#) properties are used to set the radius value for each corner.
- [DataMarkerPosition](#) - used to position the data marker at [Bottom](#), [Top](#) and [Center](#) of the rectangle.
- [Spacing](#) - used to change the spacing between two segments. The default value of spacing is 0, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available space, respectively.
- [Width](#) - used to change the width of the rectangle. The default value of the width is 0.8, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available width, respectively.

### XML

```

<chart:SfChart>
...
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Country"
YBindingPath="Value"/>
</chart:SfChart>

```

**C#**

```
SfChart chart = new SfChart();
...
ColumnSeries columnSeries = new ColumnSeries()
{
    ItemsSource = Data,
    XBindingPath = "Country",
    YBindingPath = "Value"
};
chart.Series.Add(columnSeries);
```

*Overlapped placement*

By default, all the column series which has the same x and y axes are placed side by side in a chart. If you want place the series one over the other (overlapped), set the [SideBySideSeriesPlacement](#) property of [SfChart](#) to false and configure the [Width](#) property to differentiate the series. The following code snippet and screenshot illustrate the overlapped placement of column series.

**XML**

```
<chart:SfChart x:Name="Chart" SideBySideSeriesPlacement="False" >
    . . .
    <chart:SfChart.Series>
        <chart:ColumnSeries ItemsSource="{Binding Data1}" Label="2014"
            XBindingPath="Month" YBindingPath="Year2014">
        </chart:ColumnSeries>
        <chart:ColumnSeries Width="0.5" ItemsSource="{Binding Data2}" Label="2015"
            XBindingPath="Month" YBindingPath="Year2015" >
        </chart:ColumnSeries>
    </chart:SfChart.Series>
    . . .
</chart:SfChart>
```

**C#**

```
SfChart chart = new SfChart()
```

```

{
    SideBySideSeriesPlacement = false
};
chart.PrimaryAxis = new CategoryAxis();
chart.SecondaryAxis = new NumericalAxis();
ColumnSeries series1 = new ColumnSeries()
{
    ItemsSource = view.Data1,
    XBindingPath = "Month",
    YBindingPath = "Year2014"
};
ColumnSeries series2 = new ColumnSeries()
{
    ItemsSource = view.Data2,
    XBindingPath = "Month",
    YBindingPath = "Year2015",
    Width="0.5"
};
chart.Series.Add(series1);
chart.Series.Add(series2);

```

### Histogram Chart

To render a histogram chart, create an instance of [HistogramSeries](#), and add it to the series collection of [SfChart](#).

Histogram chart provides a visual display of large amount of data that are difficult to understand in a tabular or data grid form.

You can customize intervals using the [Interval](#) property and collapse the normal distribution curve using the [ShowNormalDistributionCurve](#) property. You can use the following properties to customize the appearance.

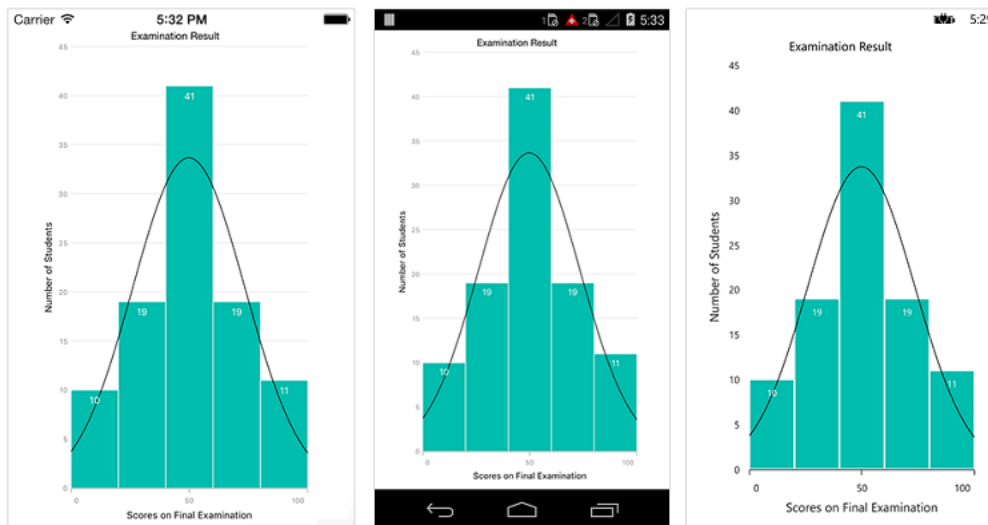

- [Color](#) – used to change the color of the series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CurveColor](#) – used to change the color of the normal distribution curve.
- [DataMarkerPosition](#) - used to position the data marker at Bottom, Top and Center of the rectangle.

## XML

```
<chart:SfChart>
...
<chart:HistogramSeries ItemsSource="{Binding Data}" XBindingPath="XValue"
YBindingPath="YValue" Interval="20"/>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
HistogramSeries histogramSeries = new HistogramSeries()
{
    ItemsSource = Data,
    XBindingPath = "XValue",
    YBindingPath = "YValue",
    Interval = 20
};
chart.Series.Add(histogramSeries);
```

## Range Column Chart

To render a range column chart, create an instance of [RangeColumnSeries](#) and add to the [Series](#) collection property of [SfChart](#).

Since the [RangeColumnSeries](#) requires two Y values for a point, your data should contain high and low values. High and low value specifies the maximum and minimum range of the point.

There are two ways you can provide data to RangeColumn chart,

1.You can use [ChartDataPoint's](#) three parameter constructor to pass [XValue](#), [High](#) and [Low](#) values to [RangeColumnSeries](#),

### C#

```
[C#]
SfChart chart = new SfChart();
...
ObservableCollection<ChartDataPoint> data = new
ObservableCollection<ChartDataPoint>()
{
    new ChartDataPoint("Jan", 7.6, 1.8),
    new ChartDataPoint("Feb", 10, 3),
    new ChartDataPoint("Mar", 7.5, 1.7),
    new ChartDataPoint("Apr", 7.8, 4.5),
    new ChartDataPoint("May", 11.4, 5),
    new ChartDataPoint("Jun", 10.1, 4.2),
};
RangeColumnSeries rangeColumnSeries = new RangeColumnSeries()
{
    ItemsSource = data
};
chart.Series.Add(rangeColumnSeries);
```

2.Or else you can use [High](#) and [Low](#) properties of [RangeColumnSeries](#) to map the high and low values from custom object to chart.

### XML

```
<chart:SfChart>
...
<chart:RangeColumnSeries ItemsSource="{Binding Data}"
XBindingPath="Month"
High="Value1"
Low="Value2"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
RangeColumnSeries rangeColumnSeries = new RangeColumnSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    High = "Value1",
    Low = "Value2"
};
chart.Series.Add(rangeColumnSeries);
```

Following properties are used to customize the range column segment appearance,

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.

- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CornerRadius](#) - used to add the rounded corners to the rectangle. The [TopLeft](#), [TopRight](#), [BottomLeft](#) and [BottomRight](#) of [ChartCornerRadius](#) properties are used to set the radius value for each corner.
- [Spacing](#) - used to change the spacing between two segments. The default value of spacing is 0, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available space, respectively.
- [Width](#) - used to change the width of the rectangle. The default value of the width is 0.8, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available width, respectively.

### Stacked Column Chart

To render a stacked column chart, create an instance of [StackingColumnSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the stacked column segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CornerRadius](#) - used to add the rounded corners to the rectangle. The [TopLeft](#), [TopRight](#), [BottomLeft](#) and [BottomRight](#) of [ChartCornerRadius](#) properties are used to set the radius value for each corner.
- [DataMarkerPosition](#) - used to position the data marker at [Bottom](#), [Top](#) and [Center](#) of the rectangle.
- [Spacing](#) - used to change the spacing between two segments. The default value of spacing is 0, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available space, respectively.

- [Width](#) - used to change the width of the rectangle. The default value of the width is 0.8, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available width, respectively.

### XML

```
<chart:SfChart>
...
<chart:StackingColumnSeries ItemsSource="{Binding Data1}"
XBindingPath="Month"
YBindingPath="Value"/>
<chart:StackingColumnSeries ItemsSource="{Binding Data2}"
XBindingPath="Month"
YBindingPath="Value"/>
<chart:StackingColumnSeries ItemsSource="{Binding Data3}"
XBindingPath="Month"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
StackingColumnSeries stackingColumnSeries1 = new StackingColumnSeries()
{
    ItemsSource = Data1,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
StackingColumnSeries stackingColumnSeries2 = new StackingColumnSeries()
{
    ItemsSource = Data2,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
StackingColumnSeries stackingColumnSeries3 = new StackingColumnSeries()
{
    ItemsSource = Data3,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
chart.Series.Add(stackingColumnSeries1);
chart.Series.Add(stackingColumnSeries2);
chart.Series.Add(stackingColumnSeries3);
```

### 100% Stacked Column Chart

To render a 100% stacked column chart, create an instance of [StackingColumn100Series](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the series appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CornerRadius](#) - used to add the rounded corners to the rectangle. The [TopLeft](#), [TopRight](#), [BottomLeft](#) and [BottomRight](#) of [ChartCornerRadius](#) properties are used to set the radius value for each corner.
- [DataMarkerPosition](#) - used to position the data marker at [Bottom](#), [Top](#) and [Center](#) of the rectangle.
- [Spacing](#) - used to change the spacing between two segments. The default value of spacing is 0, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available space, respectively.
- [Width](#) - used to change the width of the rectangle. The default value of the width is 0.8, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available width, respectively.

### XML

```
<chart:SfChart>
...
<chart:StackingColumn100Series ItemsSource="{Binding Data1}"
XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingColumn100Series ItemsSource="{Binding Data2}"
XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingColumn100Series ItemsSource="{Binding Data3}"
XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

**C#**

```

SfChart chart = new SfChart();
...
StackingColumn100Series stackingColumn100Series1 = new
StackingColumn100Series()
{
    ItemsSource = Data1,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
StackingColumn100Series stackingColumn100Series2 = new
StackingColumn100Series()
{
    ItemsSource = Data2,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
StackingColumn100Series stackingColumn100Series3 = new
StackingColumn100Series()
{
    ItemsSource = Data3,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(stackingColumn100Series1);
chart.Series.Add(stackingColumn100Series2);
chart.Series.Add(stackingColumn100Series3);

```

**Bar Chart**

To render a bar chart, create an instance of [BarSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the bar segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CornerRadius](#) - used to add the rounded corners to the rectangle. The [TopLeft](#), [TopRight](#), [BottomLeft](#) and [BottomRight](#) of [ChartCornerRadius](#) properties are used to set the radius value for each corner.
- [DataMarkerPosition](#) - used to position the data marker at left, right and center of the rectangle.
- [Spacing](#) - used to change the spacing between two segments. The default value of spacing is 0, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available space, respectively.
- [Width](#) - used to change the width of the rectangle. The default value of the width is 0.8, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available width, respectively.

### **XML**

```
<chart:SfChart>
...
<chart:BarSeries ItemsSource="{Binding Data}" XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### **C#**

```
SfChart chart = new SfChart();
...
BarSeries barSeries = new BarSeries ()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(barSeries);
```

### Stacked Bar Chart

To render a stacked bar chart, create an instance of [StackingBarSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the stacked bar segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CornerRadius](#) - used to add the rounded corners to the rectangle. The [TopLeft](#), [TopRight](#), [BottomLeft](#) and [BottomRight](#) of [ChartCornerRadius](#) properties are used to set the radius value for each corner.
- [DataMarkerPosition](#) - used to position the data marker at left, right and center of the rectangle.
- [Spacing](#) - used to change the spacing between two segments. The default value of spacing is 0 and the value ranges from 0 to 1. Here 1 and 0 corresponds to 100% and 0% of available space respectively.
- [Width](#) - used to change the width of the rectangle. The default value of width is 0.8 and the value ranges from 0 to 1. Here 1 and 0 corresponds to 100% and 0% of available width respectively.

### XML

```
<chart:SfChart>
...
<chart:StackingBarSeries ItemsSource="{Binding Data1}" XBindingPath="Month"
YBindingPath="Value"/>
<chart:StackingBarSeries ItemsSource="{Binding Data2}" XBindingPath="Month"
YBindingPath="Value"/>
<chart:StackingBarSeries ItemsSource="{Binding Data3}" XBindingPath="Month"
YBindingPath="Value"/>
</chart:SfChart>
```

**C#**

```

SfChart chart = new SfChart();
...
StackingBarSeries stackingBarSeries1 = new StackingBarSeries()
{
    ItemsSource = Data1,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
StackingBarSeries stackingBarSeries2 = new StackingBarSeries()
{
    ItemsSource = Data2,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
StackingBarSeries stackingBarSeries3 = new StackingBarSeries()
{
    ItemsSource = Data3,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
chart.Series.Add(stackingBarSeries1);
chart.Series.Add(stackingBarSeries2);
chart.Series.Add(stackingBarSeries3);

```

**100% Stacked Bar Chart**

To render a 100% stacked bar chart, create an instance of [StackingBar100Series](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the series appearance.

- [Color](#) – used to change the color of the series.

- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [CornerRadius](#) - used to add the rounded corners to the rectangle. The [TopLeft](#), [TopRight](#), [BottomLeft](#) and [BottomRight](#) of [ChartCornerRadius](#) properties are used to set the radius value for each corner.
- [DataMarkerPosition](#) - used to position the data marker at left, right and center of the rectangle.
- [Spacing](#) - used to change the spacing between two segments. The default value of spacing is 0 and the value ranges from 0 to 1. Here 1 and 0 corresponds to 100% and 0% of available space respectively.
- [Width](#) - used to change the width of the rectangle. The default value of width is 0.8 and the value ranges from 0 to 1. Here 1 and 0 corresponds to 100% and 0% of available width respectively.

### XML

```
<chart:SfChart>
...
<chart:StackingBar100Series ItemsSource="{Binding Data1}"
XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingBar100Series ItemsSource="{Binding Data2}"
XBindingPath="Year"
YBindingPath="Value"/>
<chart:StackingBar100Series ItemsSource="{Binding Data3}"
XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
StackingBar100Series stackingBar100Series1 = new StackingBar100Series()
{
    ItemsSource = Data1,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
StackingBar100Series stackingBar100Series2 = new StackingBar100Series()
{
    ItemsSource = Data2,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
StackingBar100Series stackingBar100Series3 = new StackingBar100Series()
{
    ItemsSource = Data3,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(stackingBar100Series1);
chart.Series.Add(stackingBar100Series2);
chart.Series.Add(stackingBar100Series3);
```

## Spline Chart

To render a spline chart, create an instance of [SplineSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the spline segment appearance.

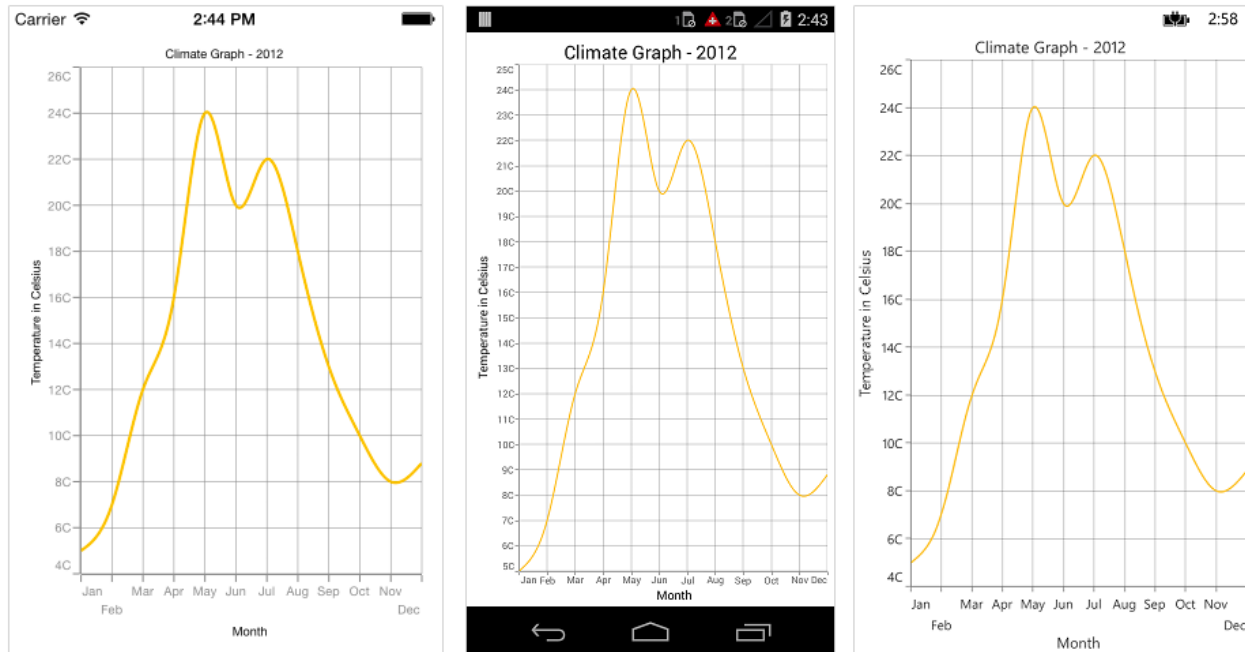

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.

## XML

```
<chart:SfChart>
...
<chart:SplineSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value"/>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
SplineSeries splineSeries = new SplineSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
chart.Series.Add(splineSeries);
```

### Dashed Lines

[StrokeDashArray](#) property of the [SplineSeries](#) is used to render spline series with dashes.

### XML

```
<chart:SplineSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value">
  <chart:SplineSeries.StrokeDashArray>
    <x:Array Type="{x:Type x:Double}">
      <sys:Double>5</sys:Double>
      <sys:Double>6</sys:Double>
    </x:Array>
  </chart:SplineSeries.StrokeDashArray>
</chart:SplineSeries>
```

### C#

```
SplineSeries splineSeries = new SplineSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
splineSeries.StrokeDashArray = new double[2] { 5, 6 };
chart.Series.Add(splineSeries);
```

### Spline Rendering Types

[SplineType](#) allows you to change the spline curve in series.

The following types are used in [SplineSeries](#) as

- Natural
- Monotonic

- Cardinal
- Clamped

By default [SplineType](#) value is [Natural](#).

The following code shows how to set the [SplineType](#) value as [Cardinal](#)

### XML

```
<chart:SfChart>
...
<chart:SplineSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value" SplineType="Cardinal" />
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
SplineSeries splineSeries = new SplineSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value",
    SplineType = SplineType.Cardinal
};
chart.Series.Add(splineSeries);
```

### Cardinal

### Monotonic

### Clamped

### Step Line Chart

To render a step line chart, create an instance of [StepLineSeries](#) and add to the [Series](#) collection property of

[SfChart](#). You can use the following properties to customize the spline segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.

**XML**

```
<chart:SfChart.Series>
<chart:StepLineSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value" />
</chart:SfChart.Series>
```

**C#**

```
SfChart chart = new SfChart();
...
StepLineSeries stepLine = new StepLineSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
chart.Series.Add(stepLine);
```

**Bubble Chart**

To render a bubble chart, create an instance of [BubbleSeries](#) and add to the [Series](#) collection property of [SfChart](#).

Bubble chart requires 3 fields (X, Y and Size) to plot a point. Here [Size](#) is used to specify the size of each bubble segment.

There are two ways you can provide data to bubble chart,

1. You can use [ChartDataPoint's](#) three parameter constructor to pass [XValue](#), [YValue](#) and [Size](#) values to [BubbleSeries](#),

**C#**

```
[C#]
```

```
SfChart chart = new SfChart();
...
ObservableCollection<ChartDataPoint> data = new
ObservableCollection<ChartDataPoint>()
{
    new ChartDataPoint(64, 14.4, 20),
    new ChartDataPoint(71, 2, 15),
    new ChartDataPoint(74, 7, 30),
    new ChartDataPoint(80, 4, 22),
    new ChartDataPoint(82, 10.3, 28),
    new ChartDataPoint(94, 1, 8),
    new ChartDataPoint(96, 6, 18),
    new ChartDataPoint(98, 12.3, 28),
};
BubbleSeries bubbleSeries = new BubbleSeries()
{
    ItemsSource = data
};
chart.Series.Add(bubbleSeries);
```

2.Or else you can use [YBindingPath](#) and [Size](#) properties of [BubbleSeries](#) to map the Y value and size from custom object to chart.

#### XML

```
<chart:SfChart>
...
<chart:BubbleSeries ItemsSource="{Binding Data}"
XBindingPath="XValue"
YBindingPath="YValue"
Size="Size"/>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
...
BubbleSeries bubbleSeries = new BubbleSeries()
{
    ItemsSource = Data,
    XBindingPath = "XValue",
    YBindingPath = "YValue",
    Size = "Size"
};
chart.Series.Add(bubbleSeries);
```

Following properties are used to customize the bubble segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [MinimumRadius](#) – used to change the minimum size of the series.

- [MaximumRadius](#) – used to change the maximum size of the series.

### Scatter Chart

To render a scatter chart, create an instance of [ScatterSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the scatter segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [ScatterWidth](#) – used to change the width of the series.
- [ScatterHeight](#) – used to change the height of the series.
- [ShapeType](#) - used to change the rendering shape of scatter series. The available shapes are [Cross](#), [Diamond](#), [Ellipse](#), [Hexagon](#), [InvertedTriangle](#), [Pentagon](#), [Plus](#), [Rectangle](#) and [Triangle](#).

### XML

```
<chart:SfChart>
...
<chart:ScatterSeries ScatterHeight="15"
ScatterWidth="15"
ShapeType="Ellipse"
ItemsSource="{Binding Data}"
XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
```

```
ScatterSeries scatterSeries = new ScatterSeries ()
{
    ItemsSource = Data,
    ScatterHeight = 15,
    ScatterWidth = 15,
    ShapeType = ChartScatterShapeType.Ellipse,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(scatterSeries);
```

### Fast Scatter Chart

The [FastScatterSeries](#) is a special kind of scatter series that renders a collection with a huge number of data points. You can use the following properties to customize the appearance of a fast scatter point.

- [Color](#) – used to change the color of series.
- [Opacity](#) – used to control the transparency of chart series.
- [StrokeWidth](#) – used to change the stroke width of series.
- [StrokeColor](#) – used to change the stroke color of series.
- [ScatterWidth](#) – used to change the width of series.
- [ScatterHeight](#) – used to change the height of series.
- [ShapeType](#) – used to change the rendering shape of fast scatter series. The available shapes are [Cross](#), [Diamond](#), [Ellipse](#), [Hexagon](#), [InvertedTriangle](#), [Pentagon](#), [Plus](#), [Rectangle](#) and [Triangle](#).
- [EnableAntiAliasing](#) – Enables or disables the smoothness of series. Default value of [EnableAntiAliasing](#) property is true.

### XML

```
<chart:SfChart>
...
<chart:FastScatterSeries ScatterHeight="15"
```

```
ScatterWidth="15"
ShapeType="Ellipse"
ItemsSource="{Binding Data}"
XBindingPath="Year"
YBindingPath="Value"/>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
FastScatterSeries fastScatterSeries = new FastScatterSeries ()
{
    ItemsSource = Data,
    ScatterHeight = 15,
    ScatterWidth = 15,
    ShapeType = ChartScatterShapeType.Ellipse,
    XBindingPath = "Year",
    YBindingPath = "Value"
};
chart.Series.Add(fastScatterSeries);
```

## OHLC Chart

To render an OHLC chart, create an instance of [HiLoOpenCloseSeries](#) and add to the [Series](#) collection property of [SfChart](#).

OHLC chart requires five values (X, Open, High, Low and Close) to plot a point.

There are two ways you can provide data to an OHLC chart,

1. You can use [ChartDataPoint's](#) five parameter constructor to pass [XValue](#), [Open](#), [High](#), [Low](#), [Close](#), [Volume](#) values to [HiLoOpenCloseSeries](#) and [technical indicators](#).

**C#**

```
[C#]
SfChart chart = new SfChart();
...
ObservableCollection<ChartDataPoint> data = new
ObservableCollection<ChartDataPoint>()
{
    new ChartDataPoint("2010", 873.8, 878.85, 855.5, 860.5),
    new ChartDataPoint("2011", 861, 868.4, 835.2, 843.45),
    new ChartDataPoint("2012", 846.15, 853, 838.5, 847.5),
    new ChartDataPoint("2013", 846, 860.75, 841, 855),
    new ChartDataPoint("2014", 841, 845, 827.85, 838.65)
};
HiLoOpenCloseSeries hiLoOpenCloseSeries = new HiLoOpenCloseSeries()
{
    ItemsSource = data
};
chart.Series.Add(hiLoOpenCloseSeries);
```

2.Or else you can use [Open,High,Low](#) and [Close](#) properties of [HiLoOpenCloseSeries](#) to map Open, High, Low and Close values from custom object to chart.

**XML**

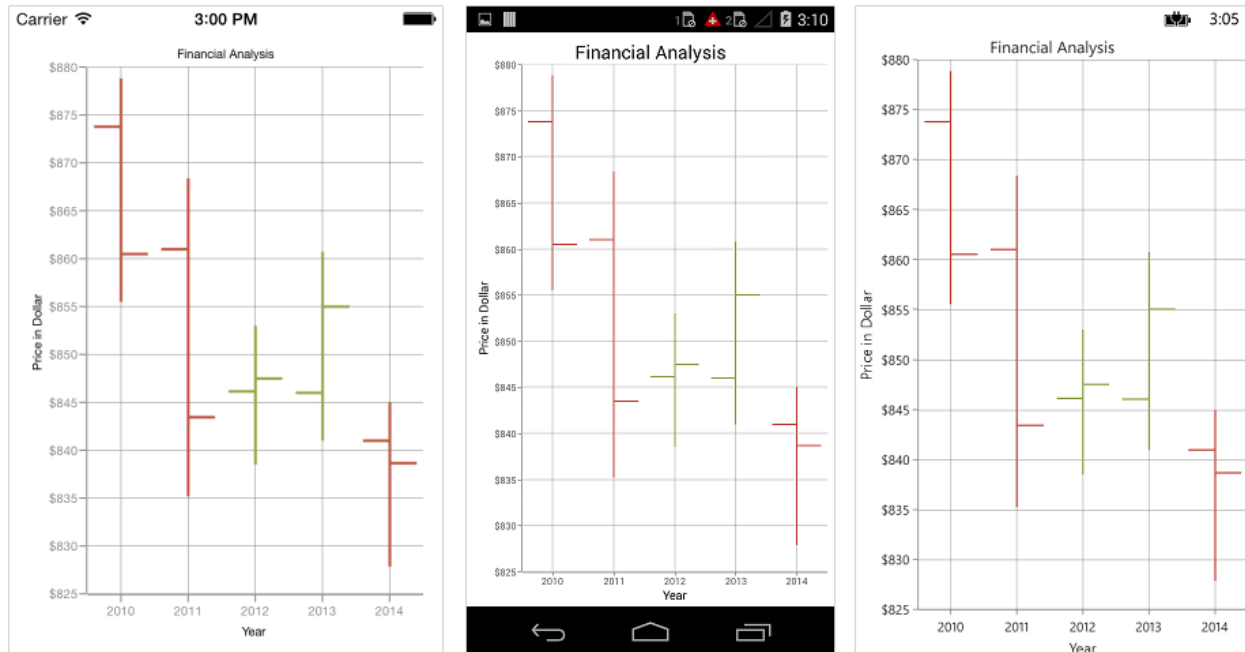

```
<chart:SfChart>
...
<chart:HiLoOpenCloseSeries ItemsSource="{Binding Data}" XBindingPath="Year"
High="Value1" Low="Value2"
Open="Value3" Close="Value4"/>
</chart:SfChart>
```

**C#**

```
SfChart chart = new SfChart();
...
HiLoOpenCloseSeries hiLoOpenCloseSeries = new HiLoOpenCloseSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    Open = "Value1",
    High = "Value2",
    Low = "Value3",
    Close = "Value4"
};
chart.Series.Add(hiLoOpenCloseSeries);
```

You can use the following properties to customize the [HiLoOpenCloseSeries](#) segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [Spacing](#) - used to change the spacing between two segments.
- [Width](#) - used to change the width of the rectangle.

### Bull and Bear Color

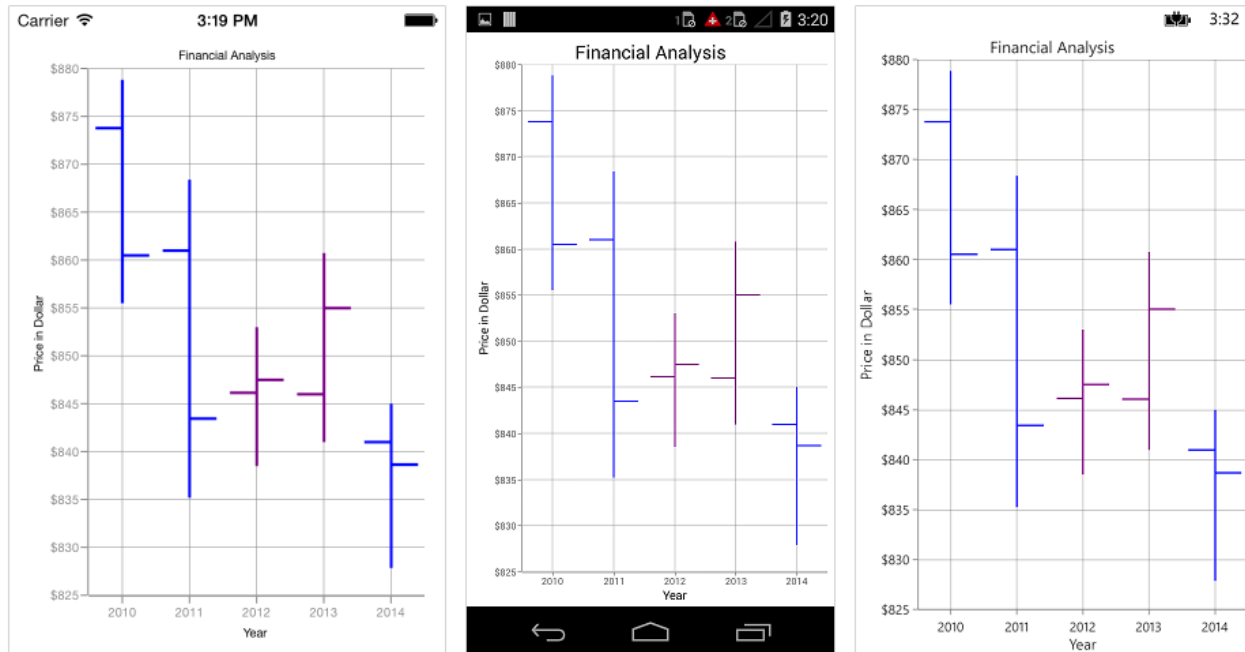

In OHLC chart, [BullFillColor](#) property is used to specify a fill color for the segments that indicates an increase in stock price in the measured time interval and [BearFillColor](#) property is used to specify a fill color for the segments that indicates a decrease in stock price in the measured time interval.

### XML

```
<chart:HiLoOpenCloseSeries BearFillColor="Blue"
BullFillColor="Purple"
ItemsSource="{Binding Data}"
XBindingPath="Year"
High="Value1"
Low="Value2"
Open="Value3"
Close="Value4"/>
```

### C#

```
HiLoOpenCloseSeries hiLoOpenCloseSeries = new HiLoOpenCloseSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    Open = "Value1",
    High = "Value2",
    Low = "Value3",
    Close = "Value4",
    BearFillColor = Color.Blue,
    BullFillColor = Color.Purple
};
```

### Candle Chart

To render a candle chart, create an instance of [CandleSeries](#) and add to the [Series](#) collection property of [SfChart](#).

Candle chart requires five values (X, Open, High, Low and Close) to plot a point.

There are two ways you can provide data to an candle chart,

1. You can use [ChartDataPoint's](#) five parameter constructor to pass [XValue](#), [Open](#), [High](#), [Low](#) and close values to [CandleSeries](#),

### C#

```
[C#]
SfChart chart = new SfChart();
...
ObservableCollection<ChartDataPoint> data = new
ObservableCollection<ChartDataPoint>()
{
    new ChartDataPoint("2010", 873.8, 878.85, 855.5, 860.5),
    new ChartDataPoint("2011", 861, 868.4, 835.2, 843.45),
    new ChartDataPoint("2012", 846.15, 853, 838.5, 847.5),
    new ChartDataPoint("2013", 846, 860.75, 841, 855),
    new ChartDataPoint("2014", 841, 845, 827.85, 838.65)
};
CandleSeries candleSeries = new CandleSeries ()
{
    ItemsSource = data
};
chart.Series.Add(candleSeries);
```

2. Or else you can use [Open, High, Low](#) and [Close](#) property of [CandleSeries](#) to map Open, High, Low and Close values from custom object to chart.

**XML**

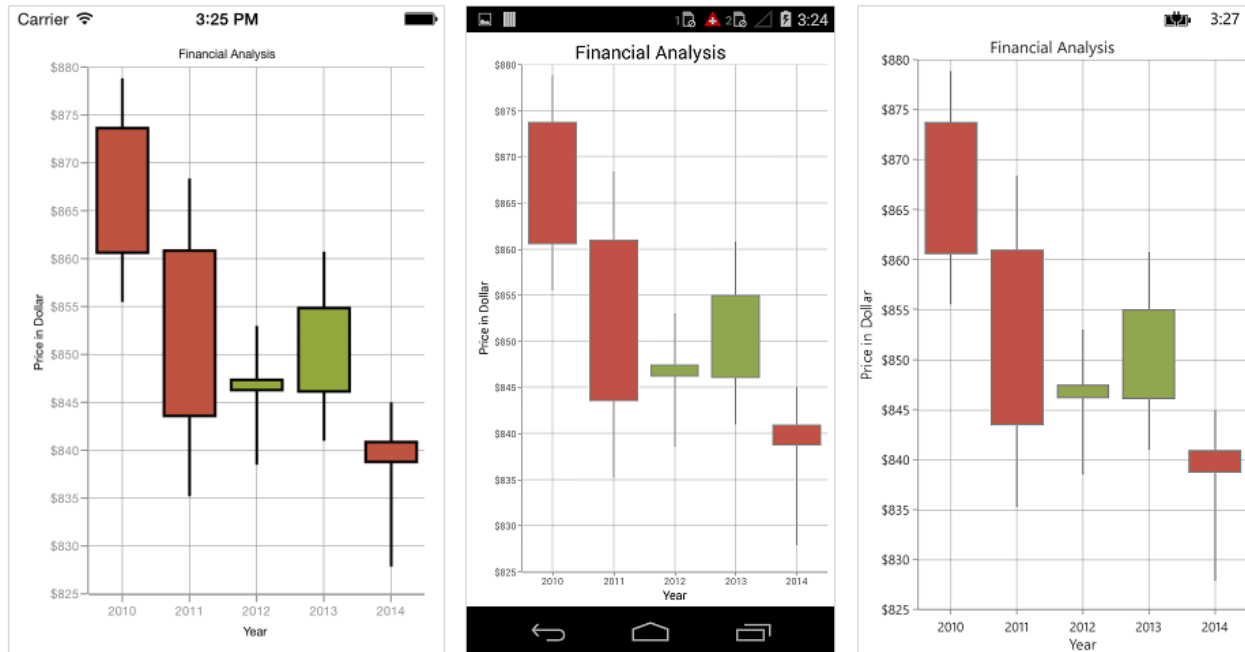

```
<chart:SfChart>
...
<chart:CandleSeries ItemsSource="{Binding Data}"
XBindingPath="Year"
High="Value1"
Low="Value2"
Open="Value3"
Close="Value4"/>
</chart:SfChart>
```

**C#**

```
SfChart chart = new SfChart();
...
CandleSeries candleSeries = new CandleSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    Open = "Value1",
    High = "Value2",
    Low = "Value3",
    Close = "Value4"
};
chart.Series.Add(candleSeries);
```

You can use the following properties to customize the candle segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

### Bull and Bear Color

In Candle chart, [BullFillColor](#) property is used to specify a fill color for the segments that indicates an increase in stock price in the measured time interval and [BearFillColor](#) property is used to specify a fill color for the segments that indicates a decrease in stock price in the measured time interval.

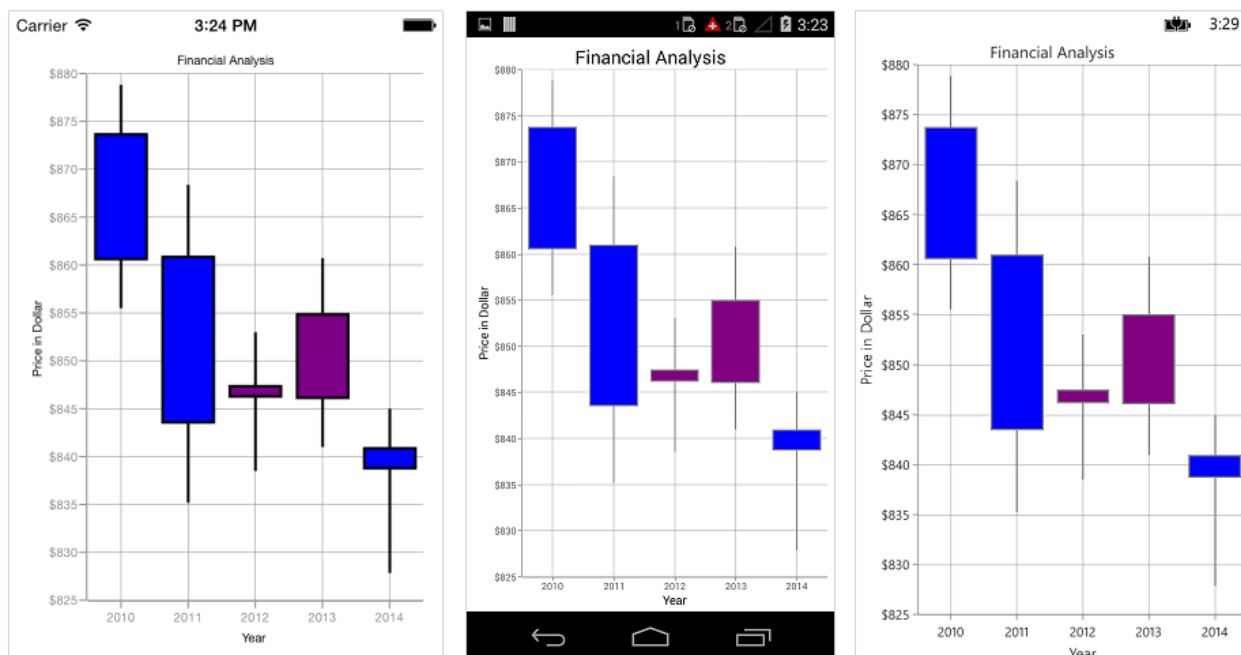

### XML

```
<chart:CandleSeries BearFillColor="Blue"
BullFillColor="Purple"
ItemsSource="{Binding Data}"
XBindingPath="Year"
High="Value1"
Low="Value2"
Open="Value3"
Close="Value4" />
```

### C#

```
CandleSeries candleSeries = new CandleSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    Open = "Value1",
    High = "Value2",
    Low = "Value3",
    Close = "Value4",
    BearFillColor = Color.Blue,
    BullFillColor = Color.Purple
};
```

### EnableSolidCandles

In Candle Series, [EnableSolidCandles](#) property is used to specify whether the candle segment should be filled or hollow. The default value of this property is false.

### XML

```
<chart:SfChart>
...
<chart:SfChart.Series>
<chart:CandleSeries ItemsSource="{Binding FinancialData}"
EnableSolidCandles="True"/>
</chart:SfChart.Series>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart()
{
...
Series =
{
new CandleSeries()
{
ItemsSource = viewModel.FinancialData,
EnableSolidCandles = true,
}
};
```

### Radar Chart

To render a radar chart, create an instance of [RadarSeries](#) and add to the [Series](#) collection property of [SfChart](#).

### Draw type

[DrawType](#) property is used to specify the radar series rendering type. Following are the two options you can set to this property,

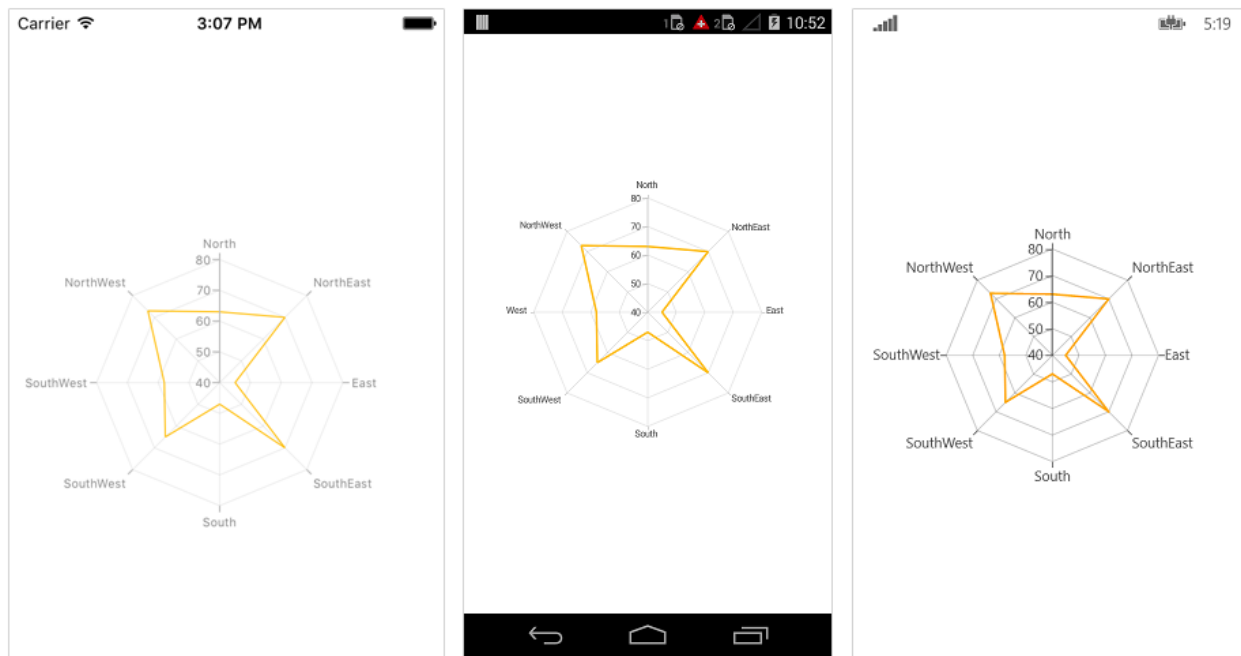

- [Line](#) – data points are visualized using line series.
- [Area](#) – data points are visualized using area series.

### XML

```
<chart:RadarSeries ItemsSource="{Binding RadarData}" DrawType="Line"
XBindingPath="Name" YBindingPath="Value" />
```

### C#

```
RadarSeries radar = new RadarSeries ();
radar.ItemsSource = viewModel.RadarData;
radar.XBindingPath = "Name";
radar.YBindingPath = "Value";
radar.DrawType = PolarRadarSeriesDrawType.Line;
```

### Customize the appearance

You can use the following properties to customize the appearance.

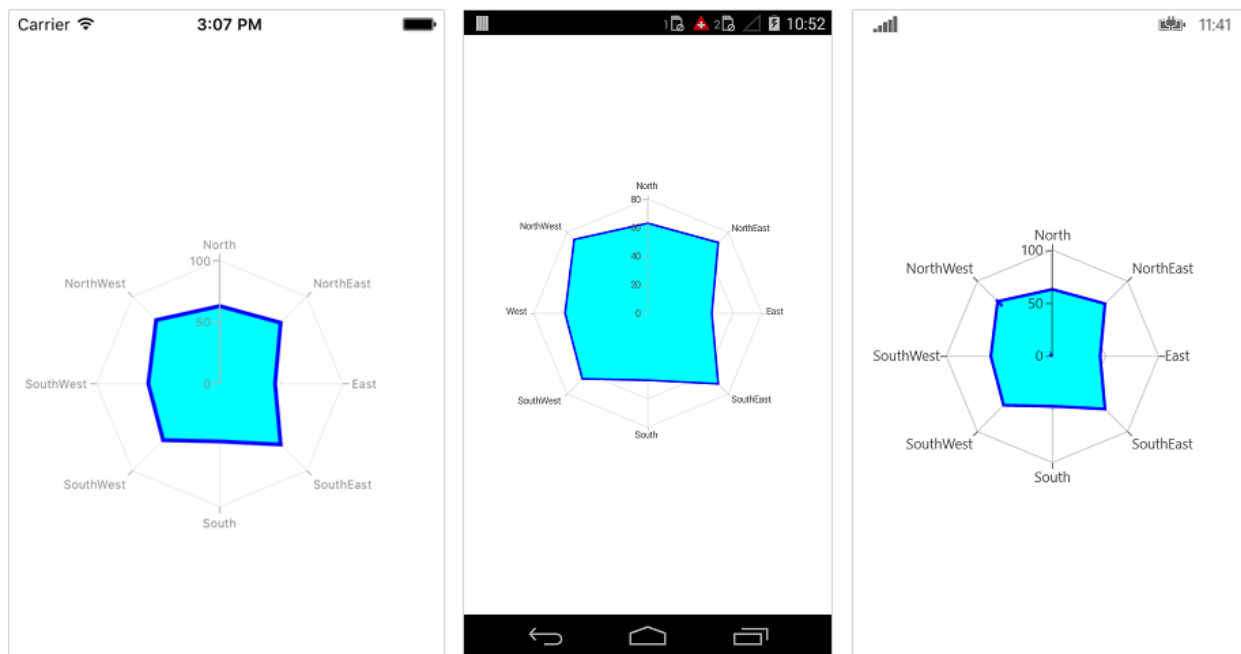

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series when draw types is set to **Area**
- [StrokeDashArray](#) – used to render lines with dashes when the draw type is set to **Line**.

### XML

```
<chart:RadarSeries ItemsSource="{Binding RadarData}" Color="Aqua" StrokeColor="Blue"
StrokeWidth="3" XBindingPath="Name" YBindingPath="Value" />
```

**C#**

```
RadarSeries radar = new RadarSeries ();
radar.ItemsSource = viewModel.RadarData;
radar.XBindingPath = "Name";
radar.YBindingPath = "Value";
radar.Color = Color.Aqua;
radar.StrokeColor = Color.Blue;
radar.StrokeWidth = 3;
```

*Closed*

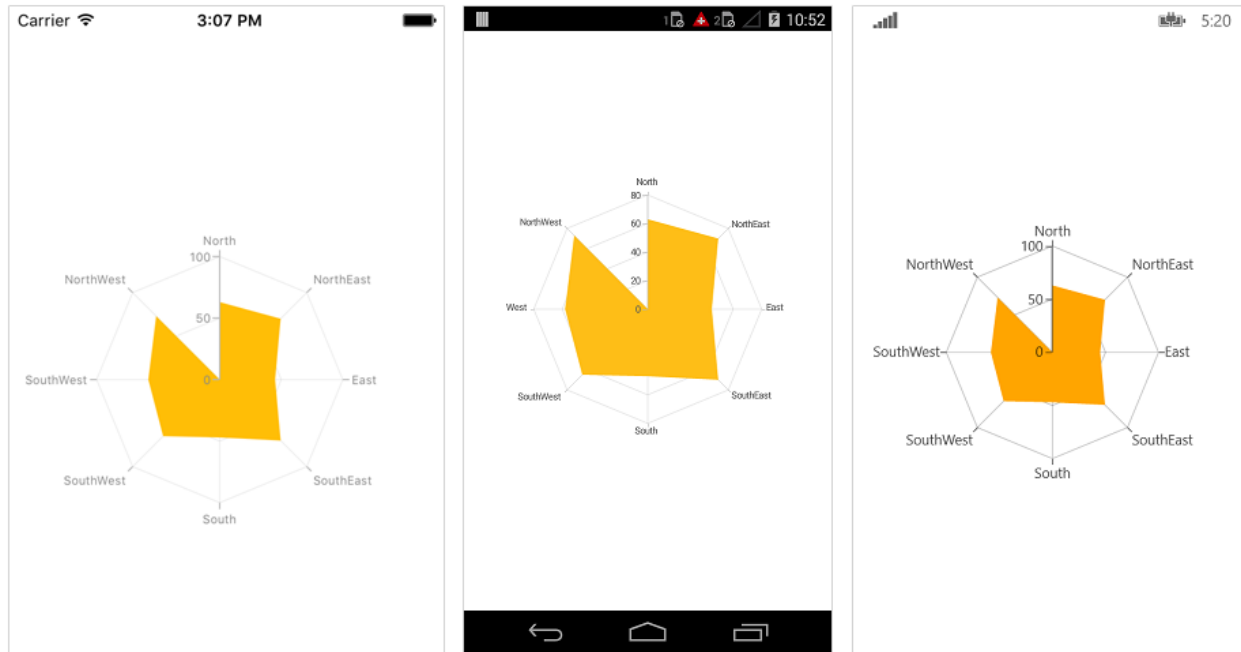

**Closed** property is used to determine, whether to connect the first and last data point of the series. By default, the property is set to **true**.

**XML**

```
<chart:RadarSeries ItemsSource="{Binding RadarData}" IsClosed="false"
XBindingPath="Name" YBindingPath="Value" />
```

**C#**

```
RadarSeries radar = new RadarSeries ();
radar.ItemsSource = viewModel.RadarData;
radar.XBindingPath = "Name";
radar.YBindingPath = "Value";
radar.IsClosed = false;
```

#### *Radar start angle for primary axis*

The start position of the radar series can be set by using [PolarAngle](#) property of axis. Default value of [PolarAngle](#) property is [Rotate270](#). [PolarAngle](#) property can be set for primary axis, secondary axis, or both axes

#### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis PolarAngle = "Rotate0"/>
</chart:SfChart.PrimaryAxis >
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis/>
</chart:SfChart.SecondaryAxis >
```

#### **C#**

```
chart.PrimaryAxis = new CategoryAxis(){ PolarAngle =
ChartPolarAngle.Rotate0 };
chart.SecondaryAxis = new NumericalAxis();
```

*Radar start angle for secondary axis*

#### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis/>
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis PolarAngle="Rotate0"/>
</chart:SfChart.SecondaryAxis>
```

#### **C#**

```
chart.PrimaryAxis = new CategoryAxis();
chart.SecondaryAxis = new NumericalAxis() { PolarAngle =
ChartPolarAngle.Rotate0 };
```

*Radar start angle for both axis*

#### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis PolarAngle = "Rotate0" />
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis PolarAngle = "Rotate0" />
</chart:SfChart.SecondaryAxis >
```

#### **C#**

```
chart.PrimaryAxis = new CategoryAxis() { PolarAngle =
ChartPolarAngle.Rotate0 };
chart.SecondaryAxis = new NumericalAxis() { PolarAngle =
ChartPolarAngle.Rotate0 };
```

### Polar Chart

To render a polar chart, create an instance of [PolarSeries](#) and add to the [Series](#) collection property of [SfChart](#).

#### Draw type

[DrawType](#) property is used to specify the polar series rendering type. Following are the two options you can set to this property,

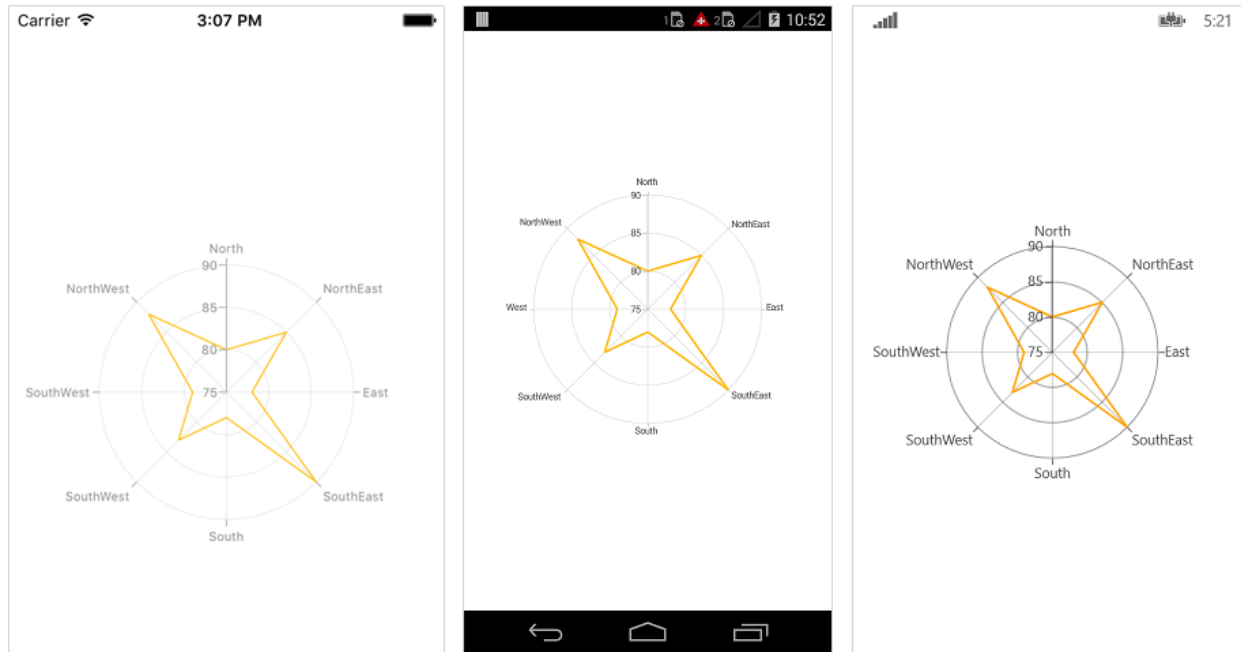

- [Line](#) – data points are visualized using line series.
- [Area](#) – data points are visualized using area series.

### XML

```
<chart:PolarSeries ItemsSource="{Binding PolarData}" DrawType="Line"
XBindingPath="Name" YBindingPath="Value" />
```

### C#

```
PolarSeries polar = new PolarSeries ();
polar.ItemsSource = viewModel.PolarData;
polar.XBindingPath = "Name";
polar.YBindingPath = "Value";
polar.DrawType = PolarRadarSeriesDrawType.Line;
```

### Customize the appearance

You can use the following properties to customize the appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series when draw types is set to [Area](#)
- [StrokeDashArray](#) – used to render lines with dashes when the draw type is set to [Line](#)

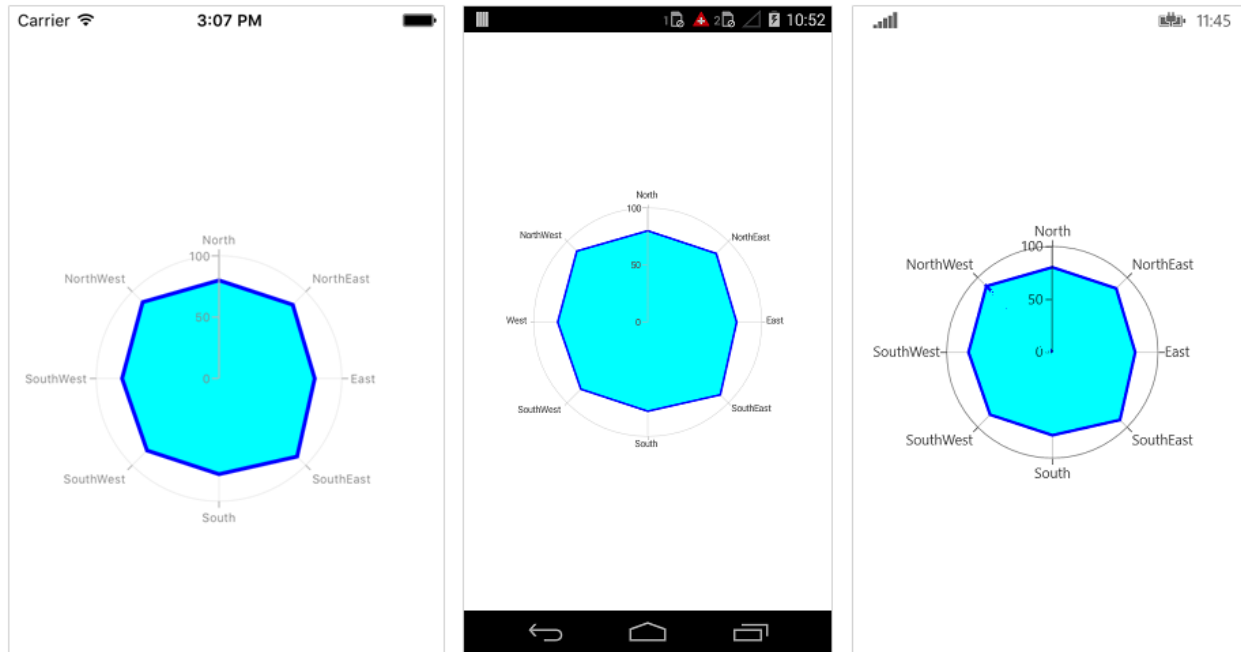

### XML

```
<chart:PolarSeries ItemsSource="{Binding PolarData}" StrokeColor="Blue" Color="Aqua"
StrokeWidth="3" XBindingPath="Name" YBindingPath="Value" />
```

### C#

```
PolarSeries polar = new PolarSeries ();
polar.ItemsSource = viewModel.PolarData;
polar.XBindingPath = "Name";
polar.YBindingPath = "Value";
polar.Color = Color.Aqua;
polar.StrokeColor = Color.Blue;
polar.StrokeWidth = 3;
```

### Closed

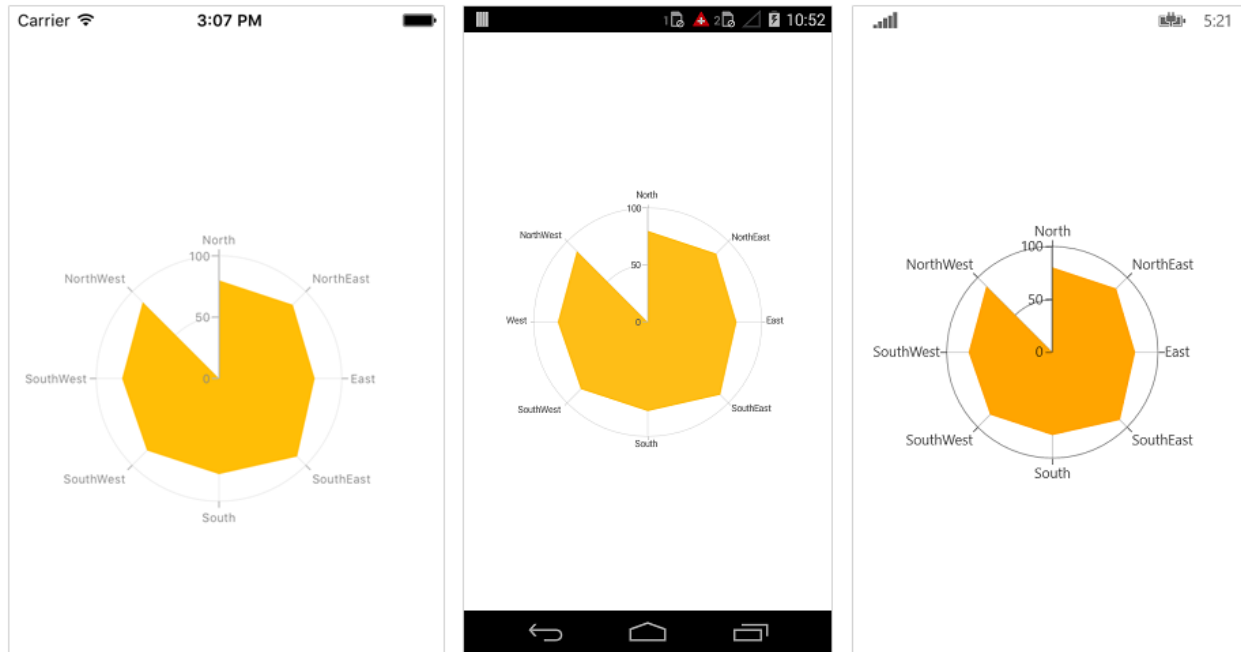

[Closed](#) property is used to determine, whether to connect the first and last data point of the series. By default, the property is set to `true`.

### XML

```
<chart:PolarSeries ItemsSource="{Binding PolarData}" IsClosed="false"
XBindingPath="Name" YBindingPath="Value" />
```

### C#

```
PolarSeries polar = new PolarSeries ();
polar.ItemsSource = viewModel.PolarData;
polar.XBindingPath = "Name";
polar.YBindingPath = "Value";
polar.IsClosed = false;
```

### *Polar start angle for primary axis*

The start position of the polar series can be set by using [PolarAngle](#) property of axis. Default value of [PolarAngle](#) property is [Rotate270](#). [PolarAngle](#) property can be set for primary axis, secondary axis, or both axes.

### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis PolarAngle = "Rotate0"/>
</chart:SfChart.PrimaryAxis >
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis/>
</chart:SfChart.SecondaryAxis >
```

### **C#**

```
chart.PrimaryAxis = new CategoryAxis(){ PolarAngle =
ChartPolarAngle.Rotate0 };
chart.SecondaryAxis = new NumericalAxis();
```

*Polar start angle for secondary axis*

#### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis/>
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis PolarAngle="Rotate0"/>
</chart:SfChart.SecondaryAxis>
```

#### **C#**

```
chart.PrimaryAxis = new CategoryAxis();
chart.SecondaryAxis = new NumericalAxis() { PolarAngle =
ChartPolarAngle.Rotate0 };
```

*Polar start angle for both axis*

#### **XML**

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis PolarAngle = "Rotate0" />
</chart:SfChart.PrimaryAxis >
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis PolarAngle = "Rotate0" />
</chart:SfChart.SecondaryAxis >
```

#### **C#**

```
chart.PrimaryAxis = new CategoryAxis() { PolarAngle =
ChartPolarAngle.Rotate0 };
chart.SecondaryAxis = new NumericalAxis() { PolarAngle =
ChartPolarAngle.Rotate0 };
```

### Pie Chart

To render a pie chart, create an instance of [PieSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the pie segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [DataMarkerPosition](#) - used to change the position of data marker at [Inside](#), [Outside](#) or [OutsideExtended](#).
- [ConnectorLinePosition](#) - used to change the position of the connector line at [Auto](#) and [Center](#).

**Note:** ConnectorLinePosition provides better alignment to the straight connector lines with outside extended label position for the minimum number of data points.

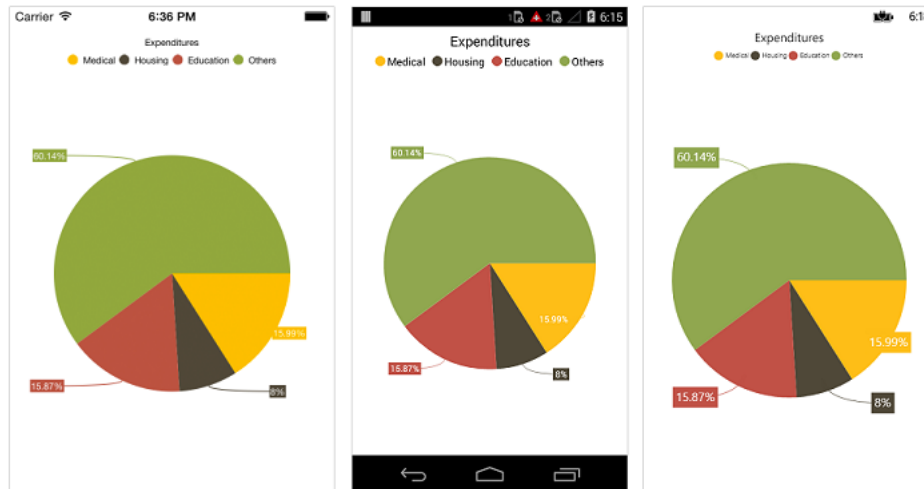

### XML

```
<chart:SfChart>
...
<chart:PieSeries ItemsSource="{Binding Data}" XBindingPath="Expense"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
PieSeries pieSeries = new PieSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value"
```

```
};
chart.Series.Add(pieSeries);
```

### Changing the pie size

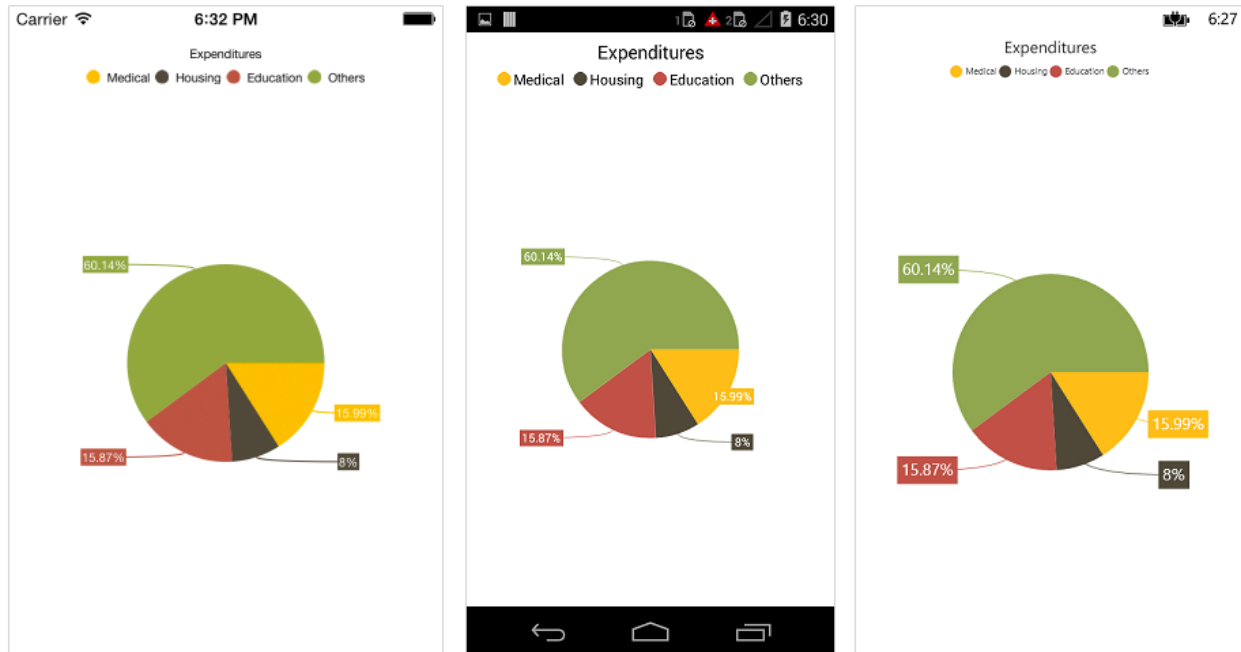

You can use [CircularCoefficient](#) property to change the diameter of the pie chart with respect to the plot area. It ranges from 0 to 1 and the default value is 0.8.

### XML

```
<chart:PieSeries CircularCoefficient="0.5"
ItemsSource="{Binding Data}"
XBindingPath="Expense"
YBindingPath="Value"/>
```

### C#

```
PieSeries pieSeries = new PieSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    CircularCoefficient = 0.5
};
```

### Exploding a pie segment

You can explode a pie segment using [ExplodeIndex](#) property and specify the explode radius using [ExplodeRadius](#) property of [PieSeries](#).

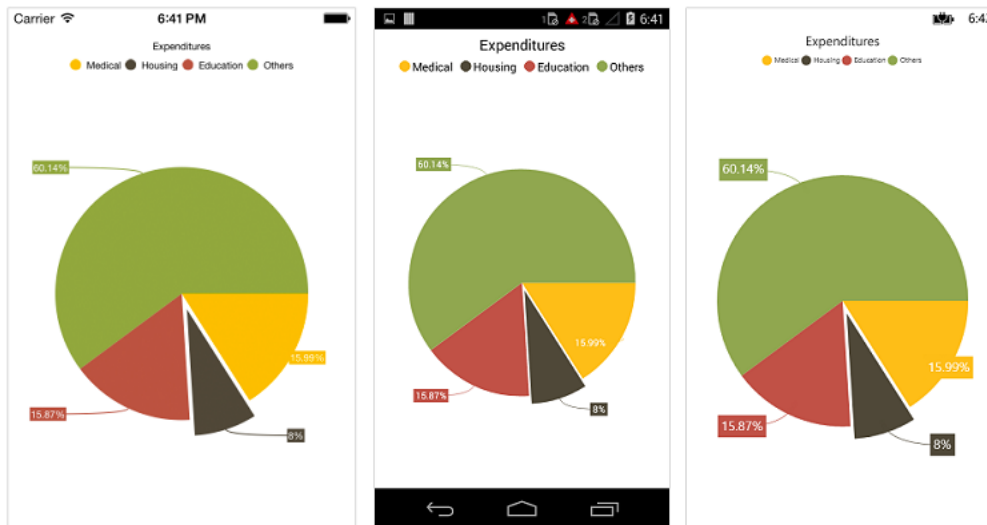

### XML

```
<chart:PieSeries ExplodeIndex="1"
ItemsSource="{Binding Data}"
XBindingPath="Expense"
YBindingPath="Value"/>
```

### C#

```
PieSeries pieSeries = new PieSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    ExplodeIndex = 1
};
```

Also, the segments can be exploded by touch using [ExplodeOnTouch](#) property of [PieSeries](#). Default value of this property is false.

### Exploding all the segments

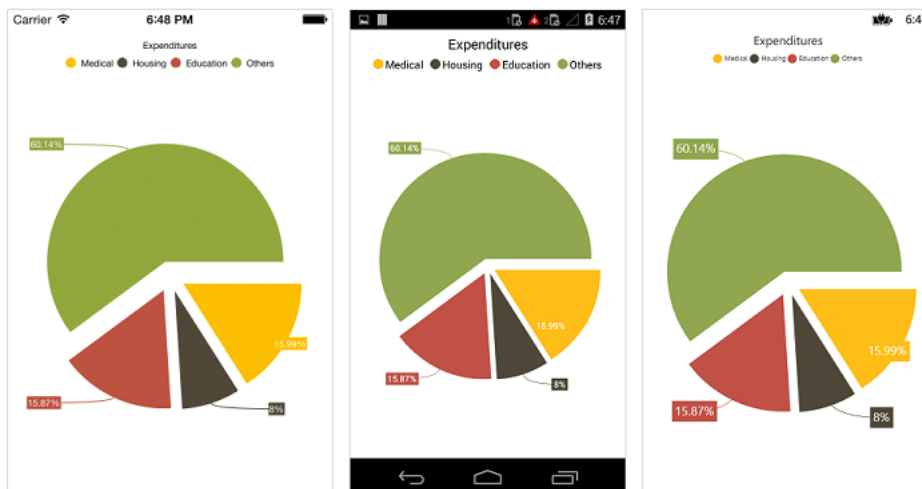

Using [ExplodeAll](#) property of [PieSeries](#), you can explode all the pie segments.

### XML

```
<chart:PieSeries ExplodeAll="True" ItemsSource="{Binding Data}"
  XBindingPath="Expense"
  YBindingPath="Value"/>
```

### C#

```
PieSeries pieSeries = new PieSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    ExplodeAll = true
};
```

### Sector of Pie

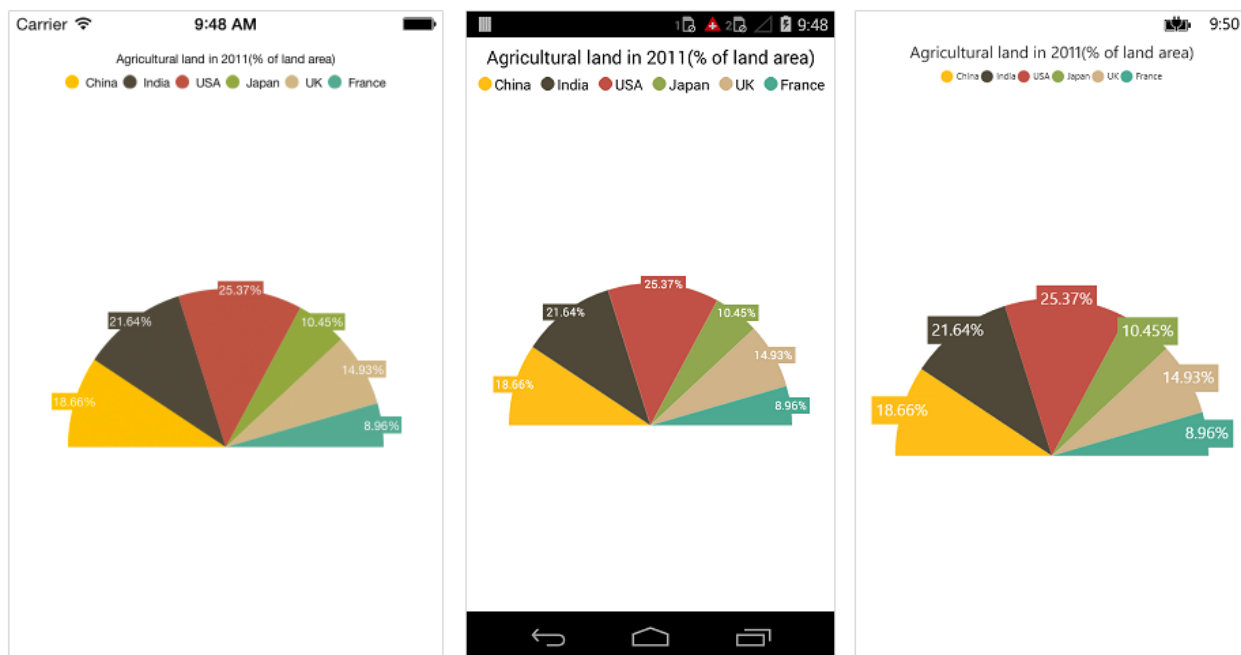

SfChart allows you to render all the data points/segments in semi-pie, quarter-pie or in any sector using [StartAngle](#) and [EndAngle](#) properties.

### XML

```
<chart:PieSeries StartAngle="180"
EndAngle="360"
ItemsSource="{Binding Data}"
XBindingPath="Expense"
YBindingPath="Value"/>
```

### C#

```
PieSeries pieSeries = new PieSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    StartAngle = 180,
    EndAngle = 360
};
```

### Group small data points into "others"

The small segments in the pie chart can be grouped into "others" category using the [GroupTo](#) and [GroupMode](#) properties of PieSeries. The [GroupMode](#) property is used to specify the grouping type based on slice [Angle](#), actual data point value, or [Percentage](#), and the [GroupTo](#) property is used to set the limit to group data points into a single slice. The grouped segment is labeled as "Others" in legend and toggled as any other segment. The default value of the [GroupTo](#) property is [double.NaN], and [GroupMode](#) property is Value.

## Doughnut Chart

To render a doughnut chart, create an instance of [DoughnutSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the doughnut segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.
- [DataMarkerPosition](#) - used to change the position of data marker at [Inside](#), [Outside](#) or [OutsideExtended](#).
- [ConnectorLinePosition](#) - used to change the position of the connector line at [Auto](#) and [Center](#).

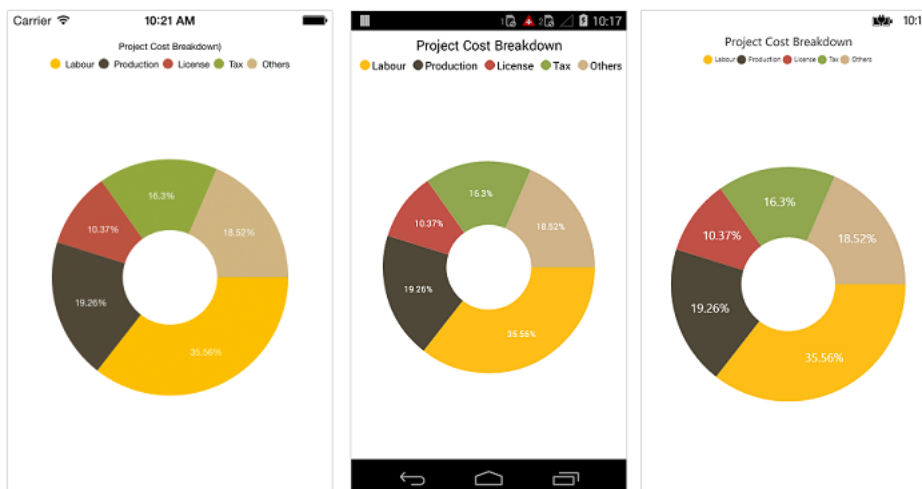

**Note:** ConnectorLinePosition provides better alignment to the straight connector lines with outside extended label position for the minimum number of data points.

## XML

```
<chart:SfChart>
...
<chart:DoughnutSeries ItemsSource="{Binding Data}"
XBindingPath="Expense"
YBindingPath="Value"/>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value"
};
chart.Series.Add(doughnutSeries);
```

### Stacked doughnut

Doughnut segments can be separated as individual circles using the [IsStackedDoughnut](#) property. The following properties are used to customize the stacked doughnut chart:

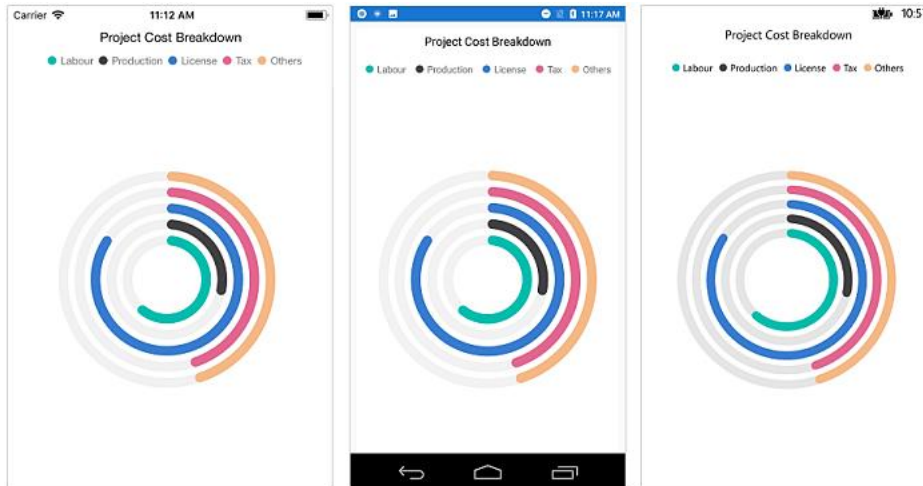

- [CapStyle](#) - Specifies the shape of the start and end points of the circular segment. The supported values are `BothFlat`, `BothCurve`, `StartCurve`, and `EndCurve`. The default value of the this property is `BothFlat`.
- [Spacing](#) - Changes the spacing between two individual segments. The default value of spacing is 0, and the value ranges from 0 to 1. Here, 1 and 0 correspond to 100% and 0% of the available space, respectively.
- [MaximumValue](#) - Represents the entire span of an individual circle. The default value of the this property is `double.NaN`.
- [TrackColor](#) - Changes the color of the track area.
- [TrackBorderColor](#) - Changes the color of the track border.
- [TrackBorderWidth](#) - Changes the width of the track border.

### XML

```
<chart:SfChart>
...
<chart:DoughnutSeries ItemsSource="{Binding Data}"
XBindingPath="Expense"
YBindingPath="Value"
IsStackedDoughnut="true"
CapStyle="BothCurve"
Spacing="0.4"
MaximumValue="100" />
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    IsStackedDoughnut = true,
    CapStyle = DoughnutCapStyle.BothCurve,
    Spacing = 0.4,
    MaximumValue = 100
};
chart.Series.Add(doughnutSeries);
```

### Changing Doughnut inner radius

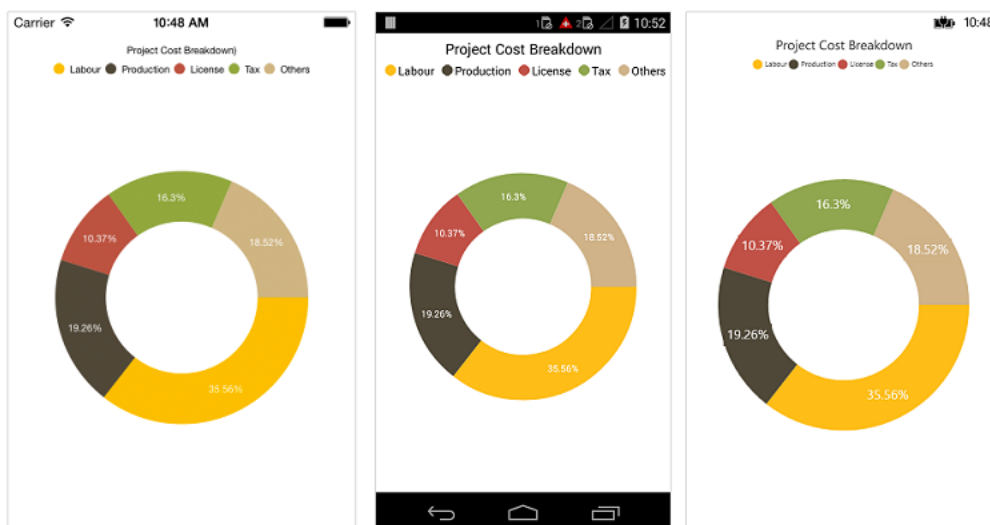

You can change the doughnut chart inner radius using [DoughnutCoefficient](#) with respect to the plot area. It ranges from 0 to 1 and the default value is 0.4.

### XML

```
<chart:DoughnutSeries DoughnutCoefficient="0.6"
ItemsSource="{Binding Data}"
XBindingPath="Expense"
YBindingPath="Value" />
```

### C#

```
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    DoughnutCoefficient = 0.6
};
```

*Changing the doughnut size*

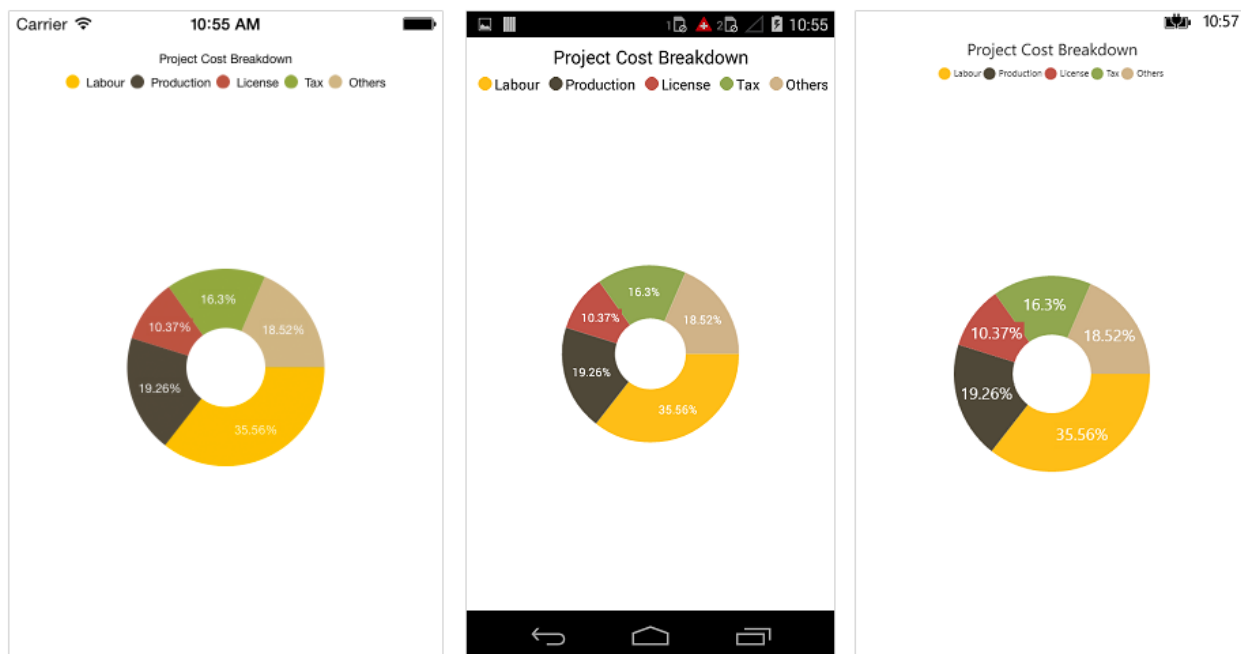

You can use the [CircularCoefficient](#) property to change the diameter of the doughnut chart with respect to the plot area. It ranges from 0 to 1 and the default value is 0.8.

**XML**

```
<chart:DoughnutSeries CircularCoefficient="0.5"
  ItemsSource="{Binding Data}"
  XBindingPath="Expense"
  YBindingPath="Value"/>
```

**C#**

```
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
  ItemsSource = Data,
  XBindingPath = "Expense",
  YBindingPath = "Value",
  CircularCoefficient = 0.5
};
```

*Exploding a doughnut segment*

Exploding a specific doughnut segment, you have to set the index to be exploded using [ExplodeIndex](#) property of the series.

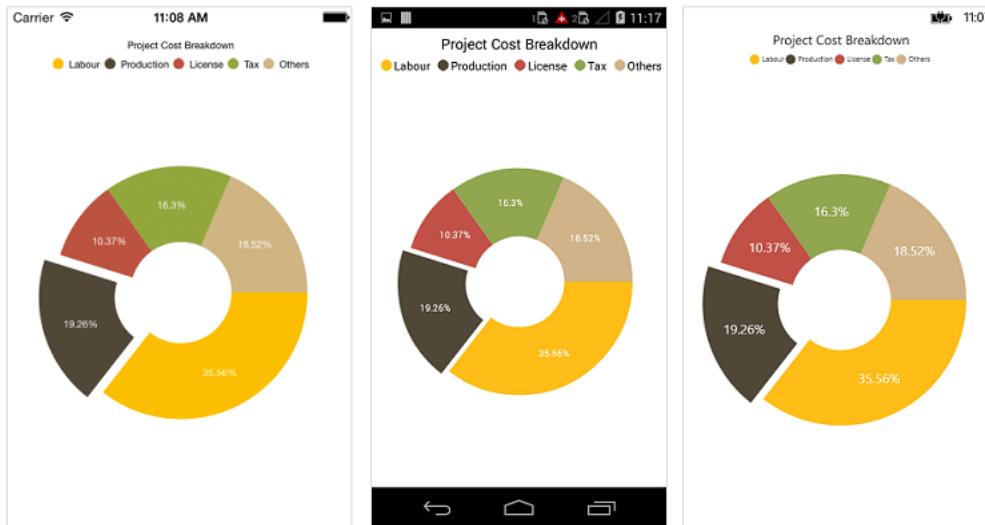

**XML**

```
<chart:DoughnutSeries ExplodeIndex="1" ItemsSource="{Binding Data}"
  XBindingPath="Expense"
  YBindingPath="Value" />
```

**C#**

```
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    ExplodeIndex = 1
};
```

Also, the segments can be exploded by touch using [ExplodeOnTouch](#) property of [DoughnutSeries](#). Default value of this property is false.

#### *Exploding all the segments*

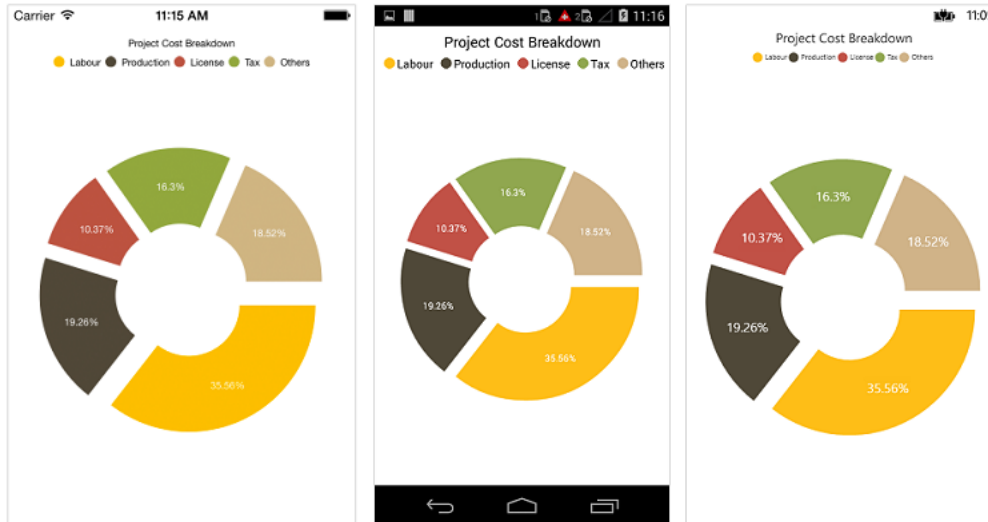

To explode all the segments, you have to enable [ExplodeAll](#) property of the series.

#### **XML**

```
<chart:DoughnutSeries ExplodeAll="True" ItemsSource="{Binding Data}"
    XBindingPath="Expense"
    YBindingPath="Value" />
```

#### **C#**

```
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    ExplodeAll = true
};
```

### Sector of Doughnut

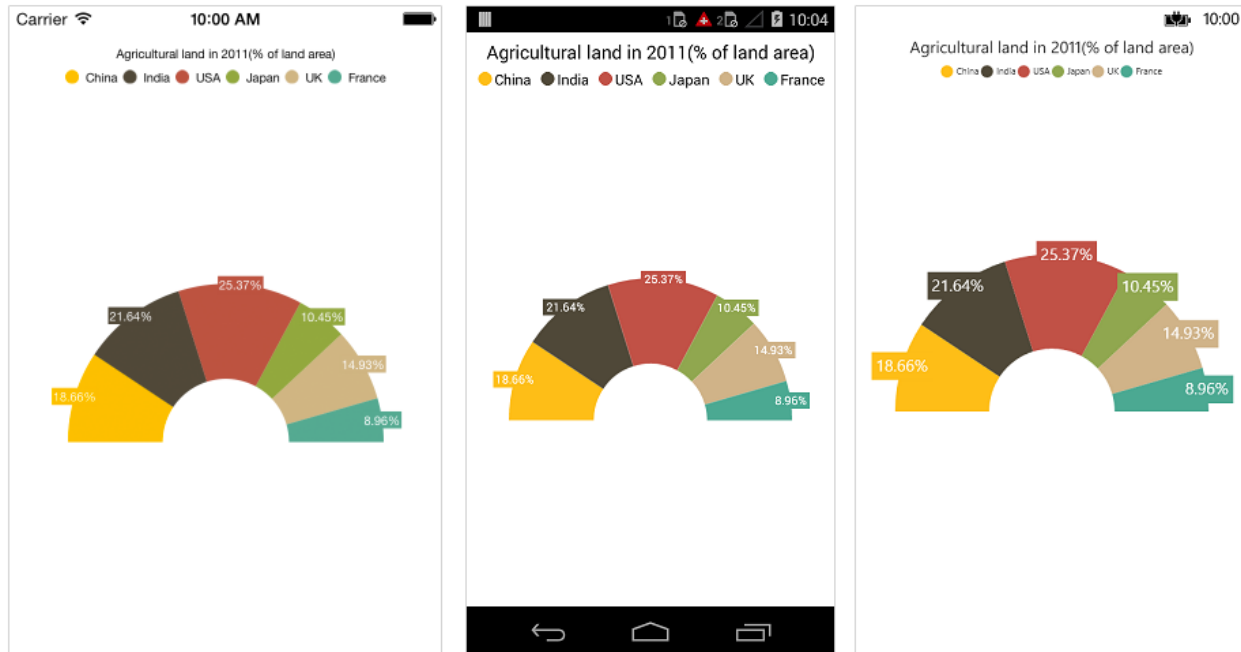

[SfChart](#) allows you to render all the data points/segments in semi-doughnut, quarter- doughnut or in any sector using [StartAngle](#) and [EndAngle](#) properties.

### XML

```
<chart:DoughnutSeries StartAngle="180" EndAngle="360" ItemsSource="{Binding
Data}"
XBindingPath="Expense" YBindingPath="Value" />
```

### C#

```
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    StartAngle = 180,
    EndAngle = 360
};
```

#### Group small data points into "others"

The small segments in the doughnut chart can be grouped into "others" category using the [GroupTo](#) and [GroupMode](#) properties of [DoughnutSeries](#). The [GroupMode](#) property is used to specify the grouping type based on slice angle, actual data point value, or percentage, and the [GroupTo](#) property is used to set the limit to group data points into a single slice. The grouped segment is labeled as "Others" in legend and toggled as any other segment. The default value of the [GroupTo](#) property is [double.NAN], and [GroupMode](#) property is Value.

#### Add view to the center of doughnut chart

Any view can be added to the center of doughnut chart using the [CenterView](#) property of [DoughnutSeries](#). The binding context of the [CenterView](#) will be the respective [DoughnutSeries](#).

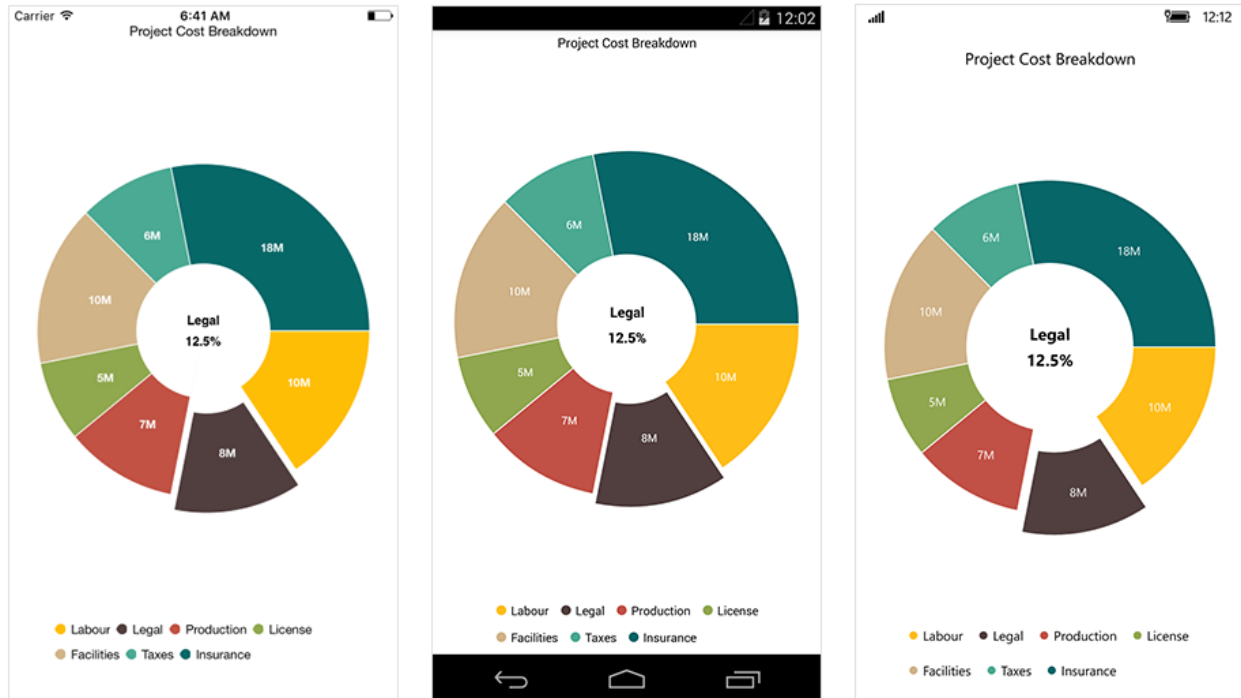

#### XML

```
<chart:DoughnutSeries>
...
<chart:DoughnutSeries.CenterView>
<StackLayout HorizontalOptions = "FillAndExpand"
VerticalOptions = "FillAndExpand">
...
</StackLayout>
</chart:DoughnutSeries.CenterView>
...
</chart:DoughnutSeries>
```

#### C#

```
DoughnutSeries doughnutSeries = new DoughnutSeries()
{
...
}
doughnutSeries.CenterView = new Label() { Text = "CenterView" };
```

### InnerRadius

The [InnerRadius](#) property of [DoughnutSeries](#) is used to get only the inner radius. Using this [InnerRadius](#) value, you can provide [CentreView](#) for series to avoid the view from being cropped outside the series.

### Pyramid Chart

To render a pyramid chart, create an instance of [PyramidSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the pyramid segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

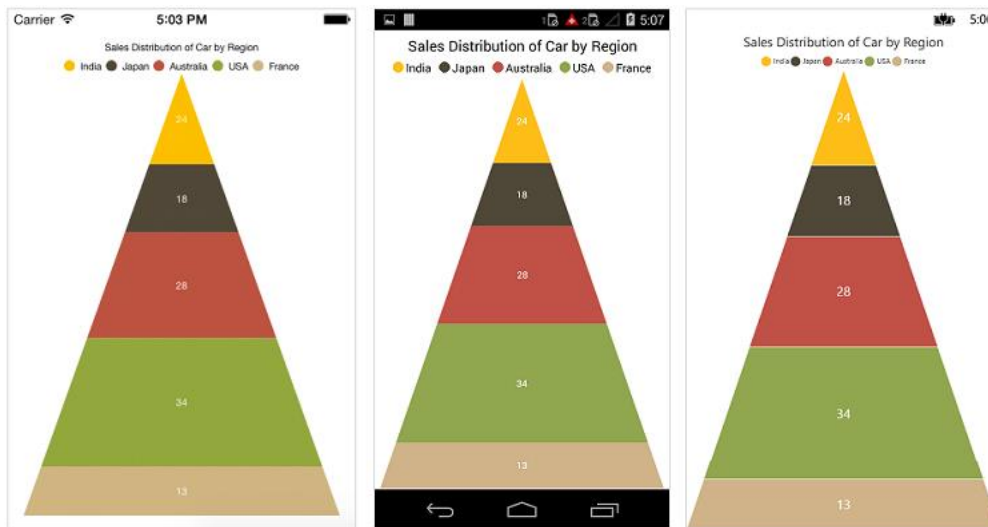

### XML

```
<chart:SfChart>
...
<chart:PyramidSeries ItemsSource="{Binding Data}" XBindingPath="Country"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
PyramidSeries pyramidSeries = new PyramidSeries()
{
    ItemsSource = Data,
    XBindingPath = "Country",
    YBindingPath = "Value"
};
```

```
chart.Series.Add(pyramidSeries);
```

### Pyramid Mode

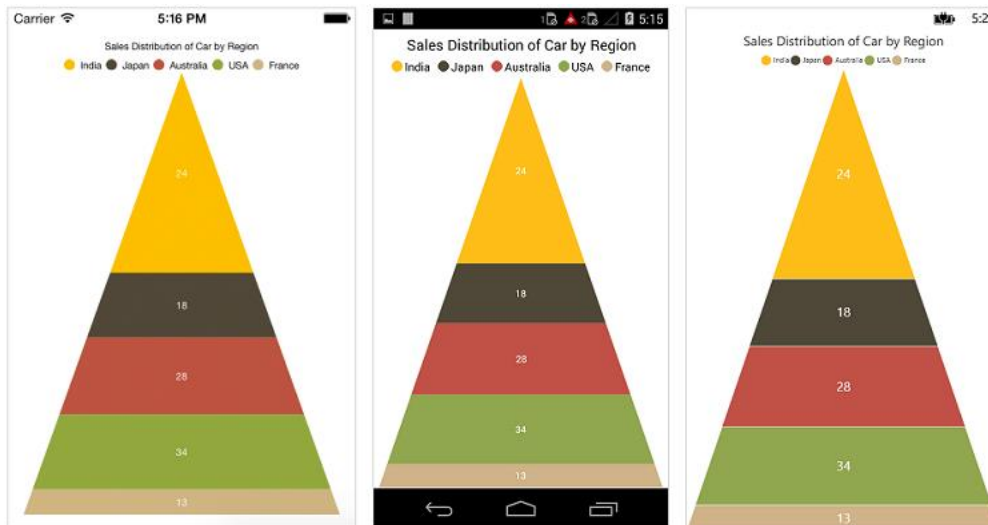

You can render the pyramid series as linear or surface mode. In linear mode, height of the pyramid segment is based on the Y value and in surface mode, area of the pyramid segment is based on the Y values. The default value of [PyramidMode](#) property is [Linear](#).

### XML

```
<chart:PyramidSeries ItemsSource="{Binding Data}" PyramidMode="Surface"
XBindingPath="Country"
YBindingPath="Value"/>
```

### C#

```
PyramidSeries pyramidSeries = new PyramidSeries ()
{
    ItemsSource = Data,
    XBindingPath = "Country",
    YBindingPath = "Value",
    PyramidMode = ChartPyramidMode.Surface
};
```

### *Gap between the segments*

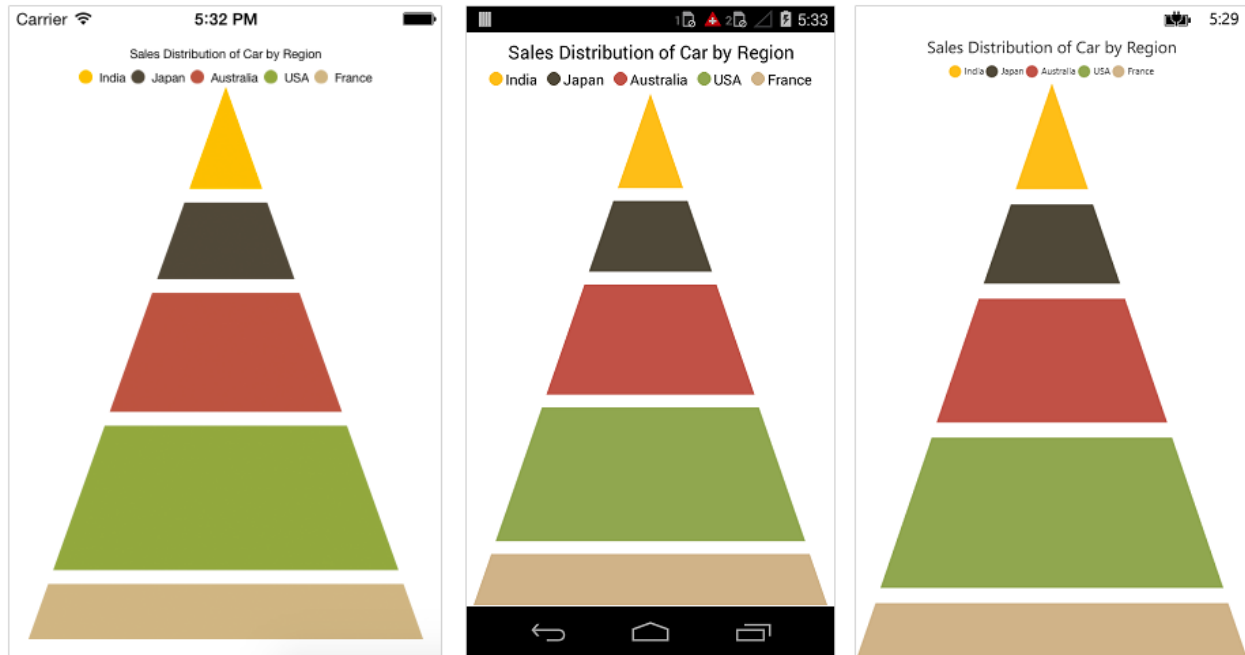

You can control the gap between the two segments using [GapRatio](#) property. Its ranges from 0 to 1.

### **XML**

```
<chart:PyramidSeries ItemsSource="{Binding Data}" GapRatio="0.1"
XBindingPath="Country"
YBindingPath="Value"/>
```

### **C#**

```
PyramidSeries pyramidSeries = new PyramidSeries()
{
    ItemsSource = Data,
    XBindingPath = "Country",
    YBindingPath = "Value",
    GapRatio = 0.1
};
```

#### *Exploding a pyramid segment*

You can explode a pyramid segment using [ExplodeIndex](#) property, and [ExplodeOffset](#) property is used to specify the exploded segment's distance.

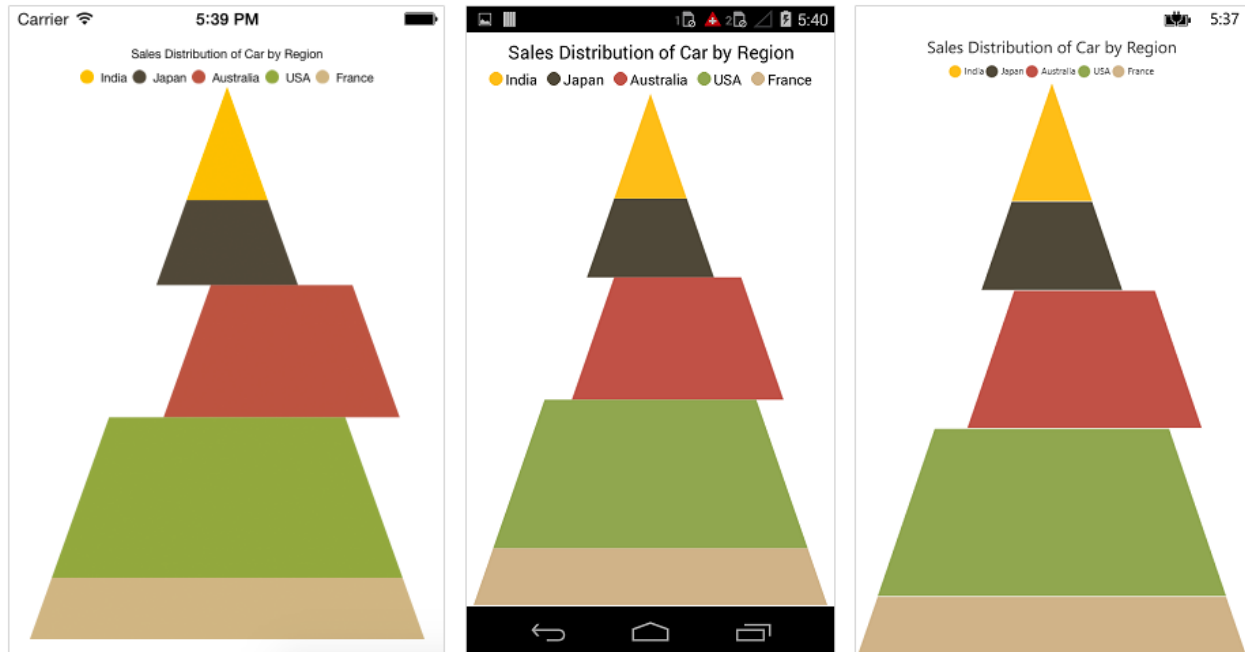

#### **XML**

```
<chart:PyramidSeries ItemsSource="{Binding Data}" ExplodeIndex="2"
XBindingPath="Country"
YBindingPath="Value" />
```

#### **C#**

```
PyramidSeries pyramidSeries = new PyramidSeries()
{
    ItemsSource = Data,
    XBindingPath = "Country",
    YBindingPath = "Value",
    ExplodeIndex = 2
};
```

Also, the segments can be exploded by touch using [ExplodeOnTouch](#) property of [PyramidSeries](#). Default value of this property is false.

### Funnel Chart

To render a funnel chart, create an instance of [FunnelSeries](#) and add to the [Series](#) collection property of [SfChart](#). You can use the following properties to customize the funnel segment appearance.

- [Color](#) – used to change the color of the series.
- [Opacity](#) - used to control the transparency of the chart series.
- [StrokeWidth](#) – used to change the stroke width of the series.
- [StrokeColor](#) – used to change the stroke color of the series.

### XML

```
<chart:SfChart>
...
<chart:FunnelSeries ItemsSource="{Binding Data}" XBindingPath="Status"
YBindingPath="Value"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
FunnelSeries funnelSeries = new FunnelSeries()
{
    ItemsSource = Data,
    XBindingPath = "Status",
    YBindingPath = "Value"
};
chart.Series.Add(funnelSeries);
```

### *Gap between the segments*

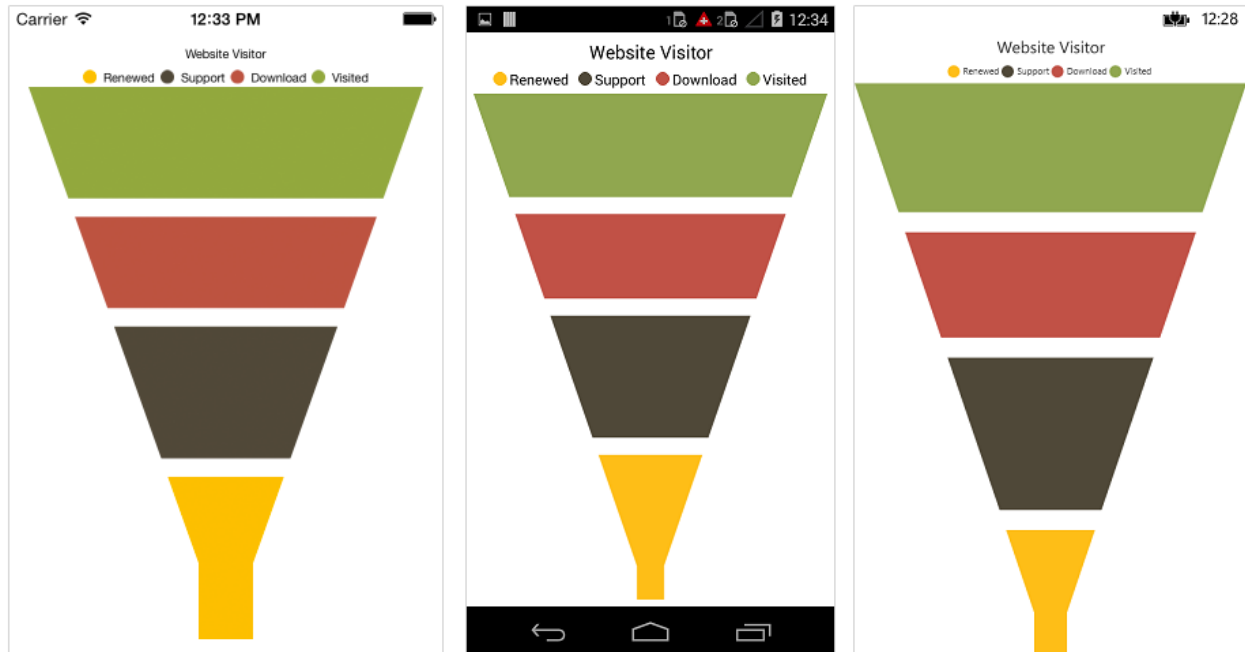

You can control the gap between the two segments using [GapRatio](#) property. Its ranges from 0 to 1.

### **XML**

```
<chart:FunnelSeries ItemsSource="{Binding Data}" GapRatio="0.1"
XBindingPath="Year"
YBindingPath="Value"/>
```

### **C#**

```
FunnelSeries funnelSeries = new FunnelSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value",
    GapRatio = 0.1
};
```

#### Exploding a funnel segment

You can explode a pyramid segment using [ExplodeIndex](#) property and [ExplodeOffset](#) property is used to specify the exploded segment's distance.

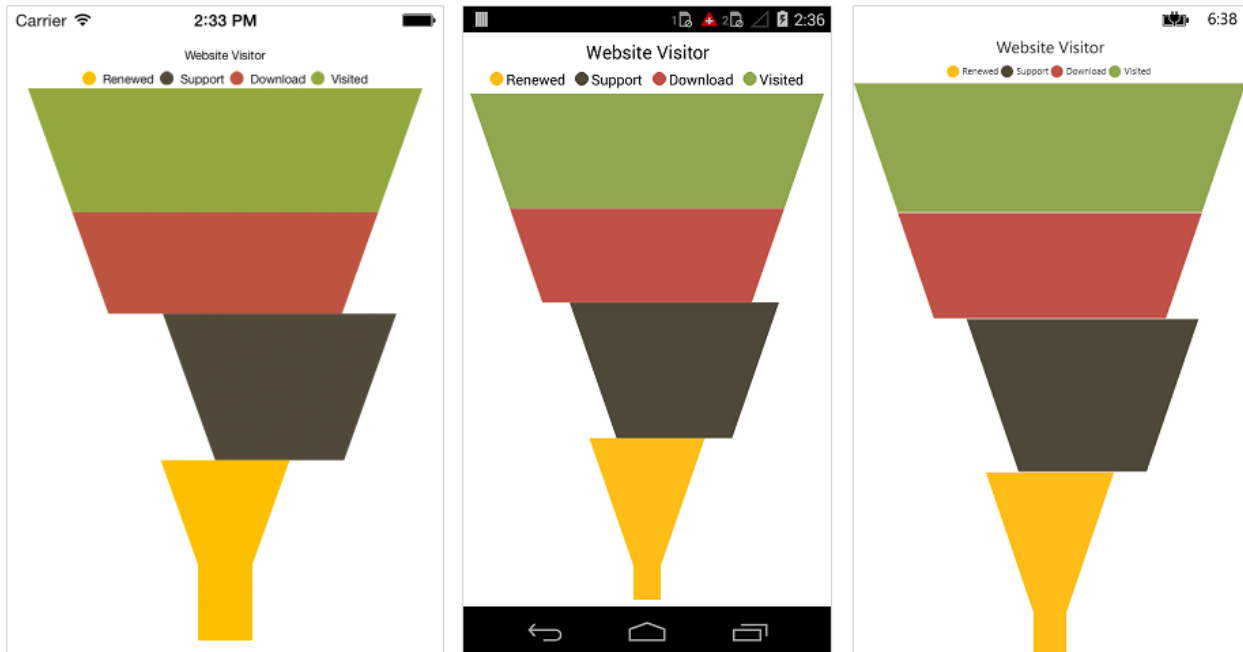

#### XML

```
<chart:FunnelSeries ItemsSource="{Binding Data}" ExplodeIndex="1"
XBindingPath="Status"
YBindingPath="Value" />
```

#### C#

```
FunnelSeries funnelSeries = new FunnelSeries()
{
    ItemsSource = Data,
    XBindingPath = "Status",
    YBindingPath = "Value",
    ExplodeIndex = 1
};
```

Also, the segments can be exploded by touch using [ExplodeOnTouch](#) property of [FunnelSeries](#). Default value of this property is false.

#### *Changing the minimum width of the funnel*

You can change the minimum width of the funnel neck using [MinWidth](#) property of [FunnelSeries](#). Default value of minWidth is 40.

#### **XML**

```
<chart:FunnelSeries ItemsSource="{Binding Data}" MinWidth="20"
XBindingPath="Year"
YBindingPath="Value"/>
```

#### **C#**

```
FunnelSeries funnelSeries = new FunnelSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value",
    MinWidth = 20
};
```

### Waterfall Chart

[WaterfallSeries](#) clarifies the cumulative effect of a set of provided positive and negative values. The series is represented by a rectangle and a connector between the rectangles.

- [SummaryBindingPath](#) – Gets or sets the string value that indicates the sum of previous segments in series.
- [SummarySegmentColor](#) – Changes the color of summary segment in series.
- [NegativeSegmentColor](#) – Changes the color of negative segment in series.
- [AllowAutoSum](#) – Enables or disables the segment that has been drawn based on the sum value of previous segments. By default, the value of this property is true. When disabling this property, it renders the segment by using the y-value of provided ItemsSource collection.
- [ShowConnectorLine](#) – Enables or disables the connector line of series. By default, value of this property is true.
- [ConnectorLineStyle](#) – Customizes the appearance of connector line style.

### XML

```
<chart:WaterfallSeries ItemsSource="{Binding RevenueDetails}"
XBindingPath="Category"
YBindingPath="Value"
AllowAutoSum="True"
SummaryBindingPath="IsSummary"
NegativeSegmentColor="#F14C72"
SummarySegmentColor="#8C8C8C"
ShowConnectorLine="True">
</chart:WaterfallSeries>
```

### C#

```
WaterfallSeries waterfallSeries = new WaterfallSeries()
{
    ItemsSource = RevenueDetails,
    XBindingPath = "Category",
    YBindingPath = "Value",
    AllowAutoSum = true,
```

```

SummaryBindingPath = "IsSummary",
NegativeSegmentColor = Color.FromHex("#F14C72"),
SummarySegmentColor = Color.FromHex("#8C8C8C"),
ShowConnectorLine = true
};
chart.Series.Add(waterfallSeries);

```

## Data Markers

Data markers are used to provide information about the data points to the user. You can add a shape and label to adorn each data point. This can be enabled using following code snippet,

### XML

```

<chart:LineSeries>
<chart:LineSeries.DataMarker>
<chart:ChartDataMarker/>
</chart:LineSeries.DataMarker>
</chart:LineSeries>

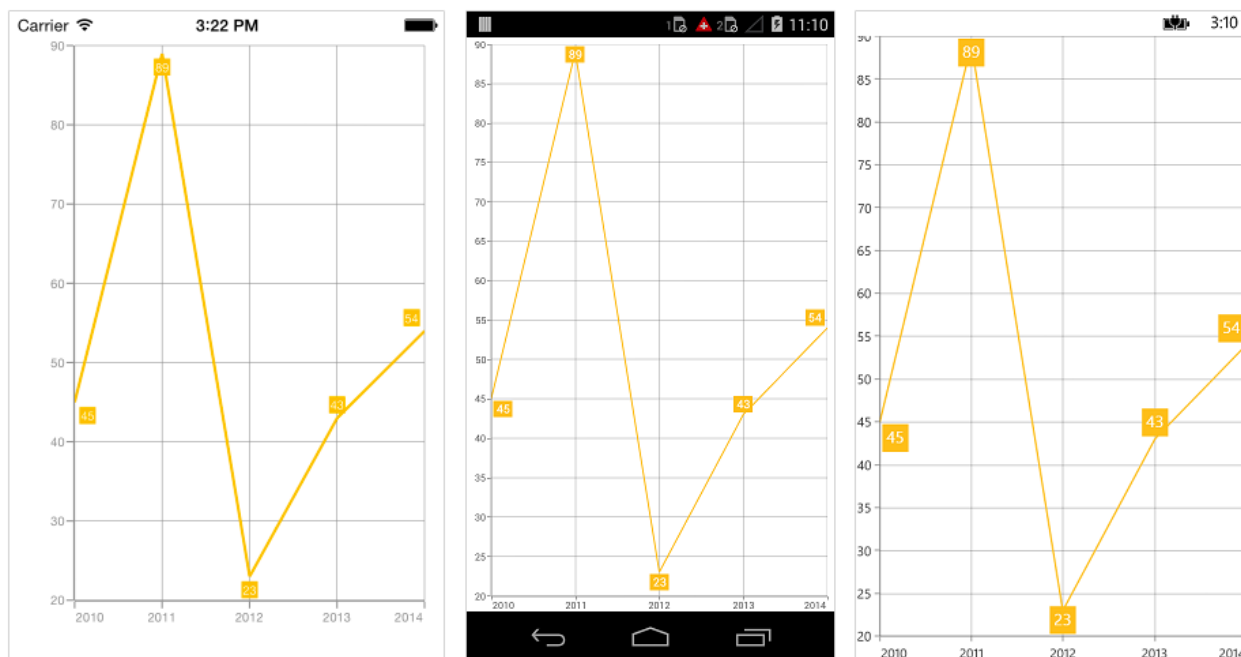

```

### C#

```

lineSeries.DataMarker = new ChartDataMarker();

```

### Customizing labels

Data labels are enabled by default but you can also change the visibility of the labels using [ShowLabel](#) property of [ChartDataMarker](#). The label appearance can be customized using [LabelStyle](#) property.

- [TextColor](#) – used to change the color of the label.
- [BackgroundColor](#) – used to change the label background color.
- [BorderColor](#) – used to change the border color.
- [BorderThickness](#) – used to change the thickness of the border.
- [Font](#) – used to change the text size, font family and font weight.
- [Margin](#) – used to change the margin size for labels.
- [Angle](#) – used to rotate the labels.
- [LabelPadding](#) – used to move the data label in the respective direction. For example, the positive labels in column series will be moved upwards and negative labels in column series will be moved downwards.

Following code snippet illustrates the customization of label and its background,

### XML

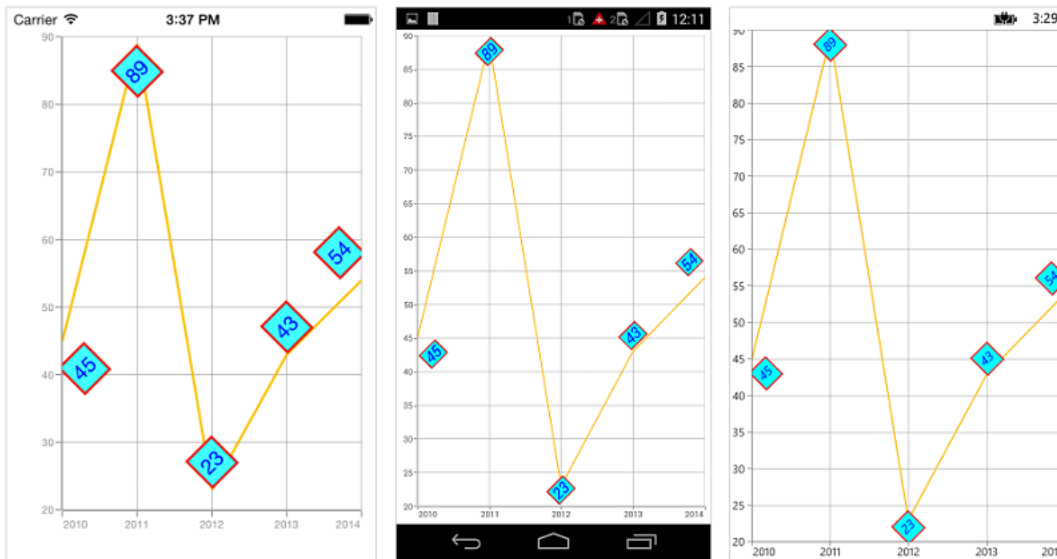

```
<chart:LineSeries.DataMarker>
  <chart:ChartDataMarker ShowLabel="True">
    <chart:ChartDataMarker.LabelStyle>
      <chart:DataMarkerLabelStyle TextColor="Blue"
        BorderColor="Red"
        BorderThickness="2"
        BackgroundColor="Aqua"
        Angle="315"
        Margin="5"
        Font="Italic,18"/>
    </chart:ChartDataMarker.LabelStyle>
  </chart:ChartDataMarker>
</chart:LineSeries.DataMarker>
```

**C#**

```

lineSeries.DataMarker = new ChartDataMarker();
lineSeries.DataMarker.ShowLabel = true;
lineSeries.DataMarker.LabelStyle.TextColor = Color.Blue;
lineSeries.DataMarker.LabelStyle.BorderColor = Color.Red;
lineSeries.DataMarker.LabelStyle.BorderThickness = 2;
lineSeries.DataMarker.LabelStyle.BackgroundColor = Color.Aqua;
lineSeries.DataMarker.LabelStyle.Angle = 315;
lineSeries.DataMarker.LabelStyle.Margin = 5;
lineSeries.DataMarker.LabelStyle.Font = Font.SystemFontOfSize(18,
FontAttributes.Italic);

```

**Formatting label content**

You can customize the content of the label using [LabelContent](#) property. Following are the two options that are supported now,

- [Percentage](#) – This will show the percentage value of corresponding data point Y value, this is often used in pie, doughnut, funnel and pyramid series types.
- [YValue](#) – This will show the corresponding Y value.

**XML**

```

<chart:PieSeries>
<chart:PieSeries.DataMarker>
<chart:ChartDataMarker LabelContent="Percentage"/>
</chart:PieSeries.DataMarker>
</chart:PieSeries>

```

**C#**

```

pieSeries.DataMarker.LabelContent = LabelContent.Percentage;

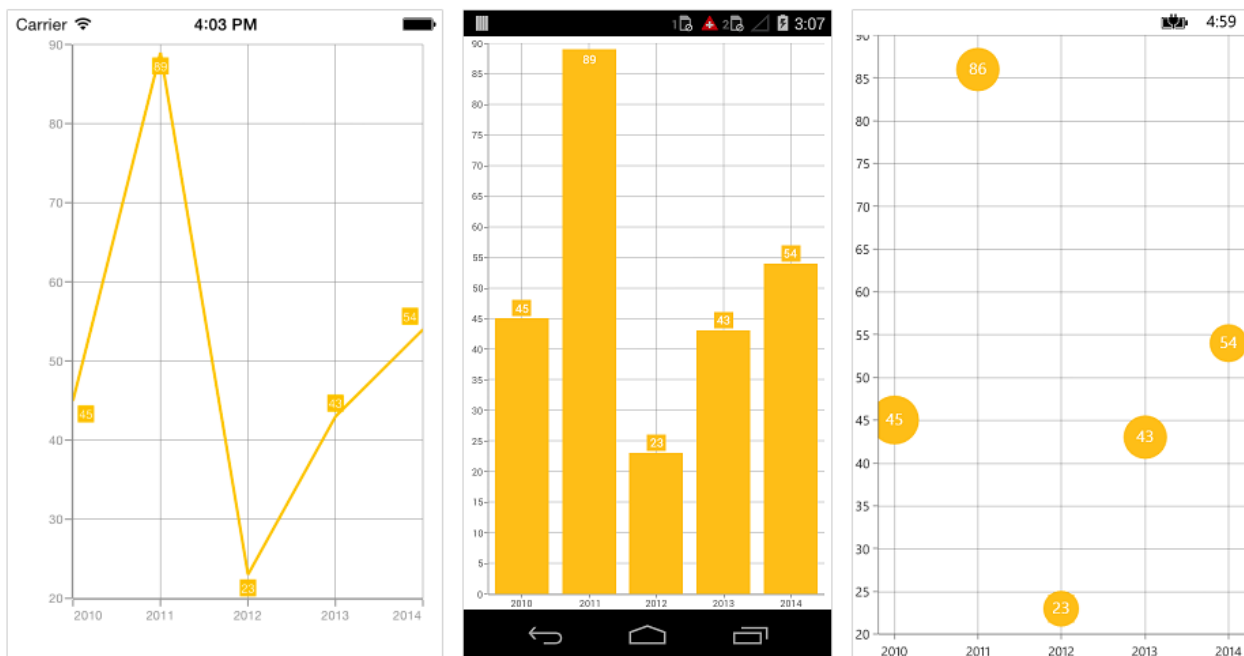

```

### Label position

The [LabelPosition](#) property is used to position the data marker labels at [Center](#), [Inner](#) and [Outer](#) position of the actual data point position. By default, labels are positioned based on the series types for better readability. You can move the labels horizontally and vertically using [OffsetX](#) and [OffsetY](#) properties respectively.

The following screenshot illustrates the default position of data marker labels,

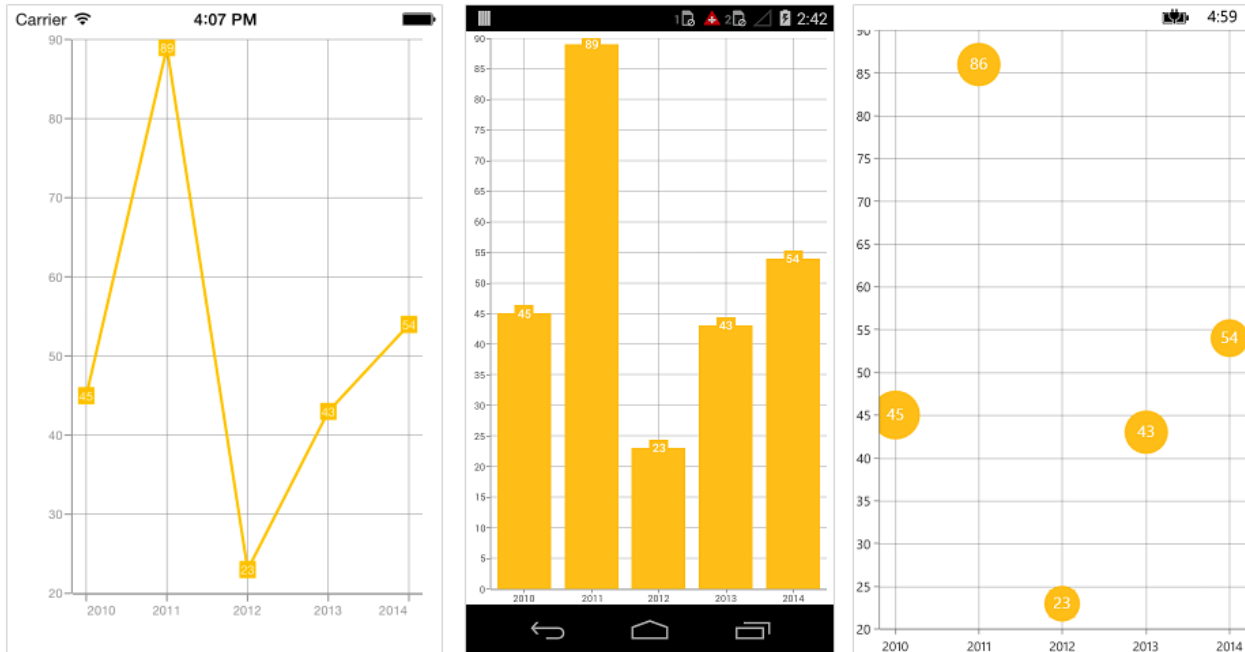

The following code sample illustrates the center position of data marker labels,

### XML

```
<chart:ChartDataMarker>
  <chart:ChartDataMarker.LabelStyle>
    <chart:DataMarkerLabelStyle LabelPosition="Center"/>
  </chart:ChartDataMarker.LabelStyle>
</chart:ChartDataMarker>
```

**C#**

```
series.DataMarker.LabelStyle.LabelPosition = DataMarkerLabelPosition.Center;
```

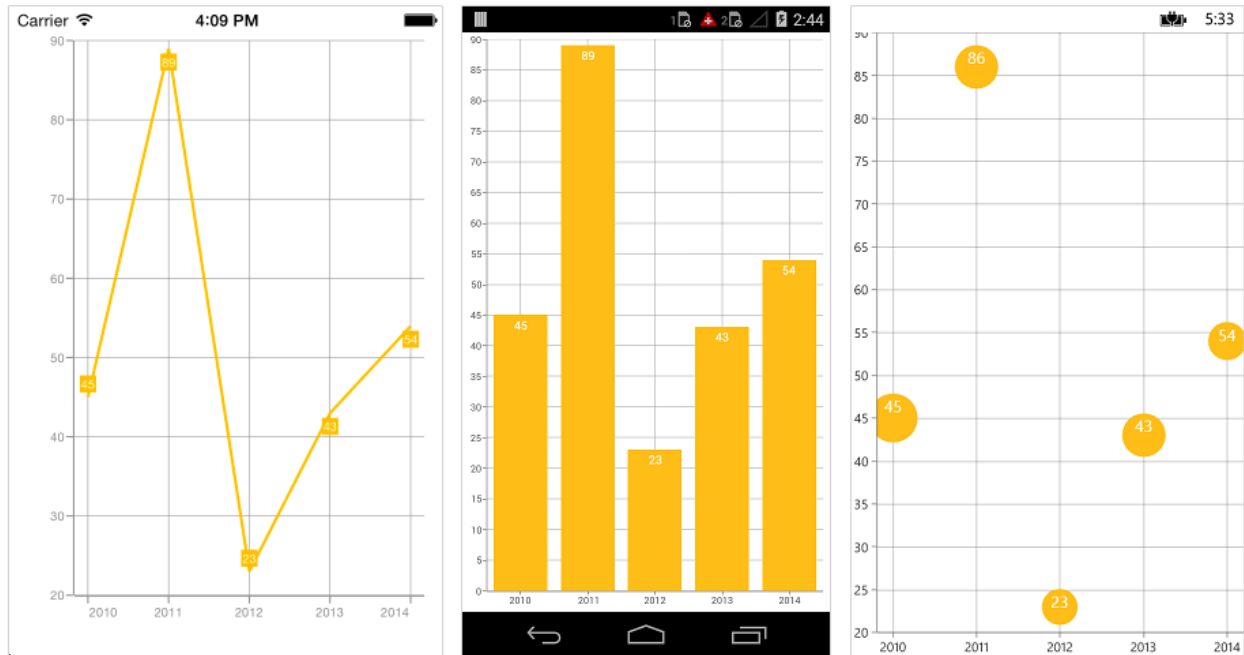

The following code sample illustrates the Inner position of data marker labels,

**XML**

```
<chart:ChartDataMarker>
  <chart:ChartDataMarker.LabelStyle>
    <chart:DataMarkerLabelStyle LabelPosition="Inner"/>
  </chart:ChartDataMarker.LabelStyle>
</chart:ChartDataMarker>
```

**C#**

```
series.DataMarker.LabelStyle.LabelPosition = DataMarkerLabelPosition.Inner;
```

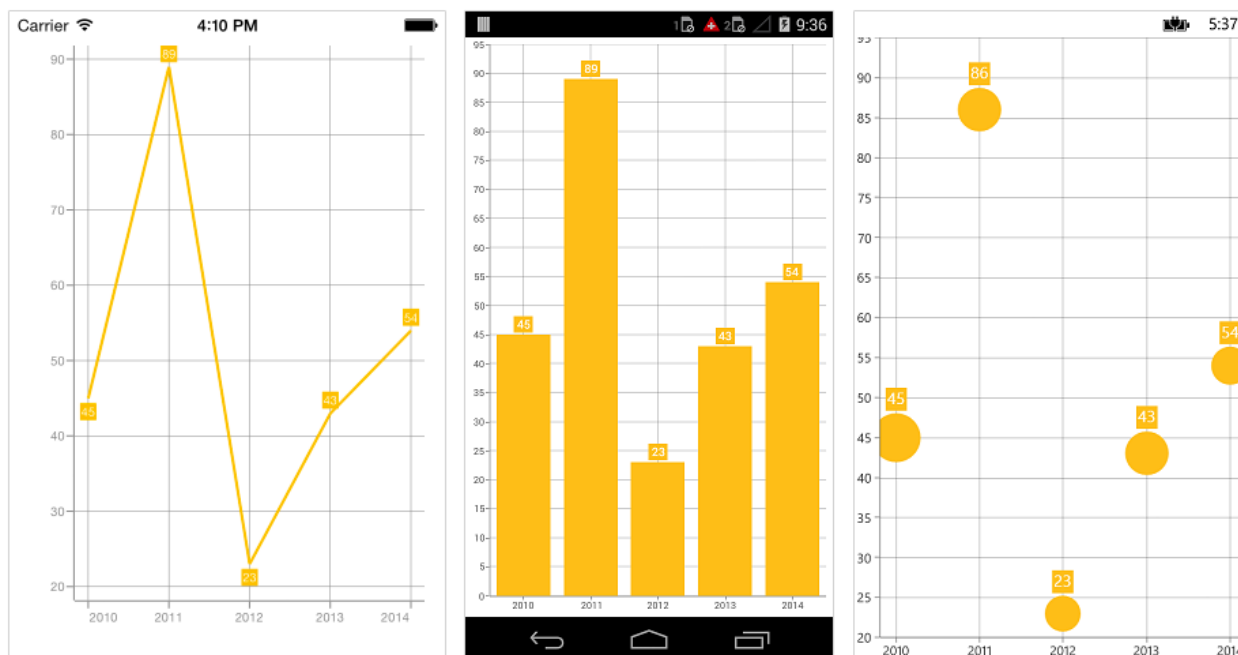

The following code sample illustrates the outer position of data marker labels,

#### XML

```
<chart:ChartDataMarker>
  <chart:ChartDataMarker.LabelStyle>
    <chart:DataMarkerLabelStyle LabelPosition="Outer"/>
  </chart:ChartDataMarker.LabelStyle>
</chart:ChartDataMarker>
```

#### C#

```
series.DataMarker.LabelStyle.LabelPosition = DataMarkerLabelPosition.Outer;
```

### Smart labels

This feature is used to arrange the data marker labels smartly and avoid the intersection when there is overlapping of labels. The property [EnableSmartLabels](#) in [CircularSeries](#), is used to arrange the data marker labels smartly. By default, it is false, we need to enable this property.

The following code sample illustrates how to enable the smart labels.

### XML

```
<chart:SfChart.Series>
  <chart:PieSeries ItemsSource="{Binding Data}"
    XBindingPath="Expense"
    YBindingPath="Value"
    StartAngle="75"
    EndAngle="435"
    EnableSmartLabels="True"
    ConnectorLineType="Bezier"
    DataMarkerPosition="OutsideExtended">
    <chart:PieSeries.DataMarker>
      <chart:ChartDataMarker />
    </chart:PieSeries.DataMarker>
  </chart:PieSeries>
</chart:SfChart.Series>
```

### C#

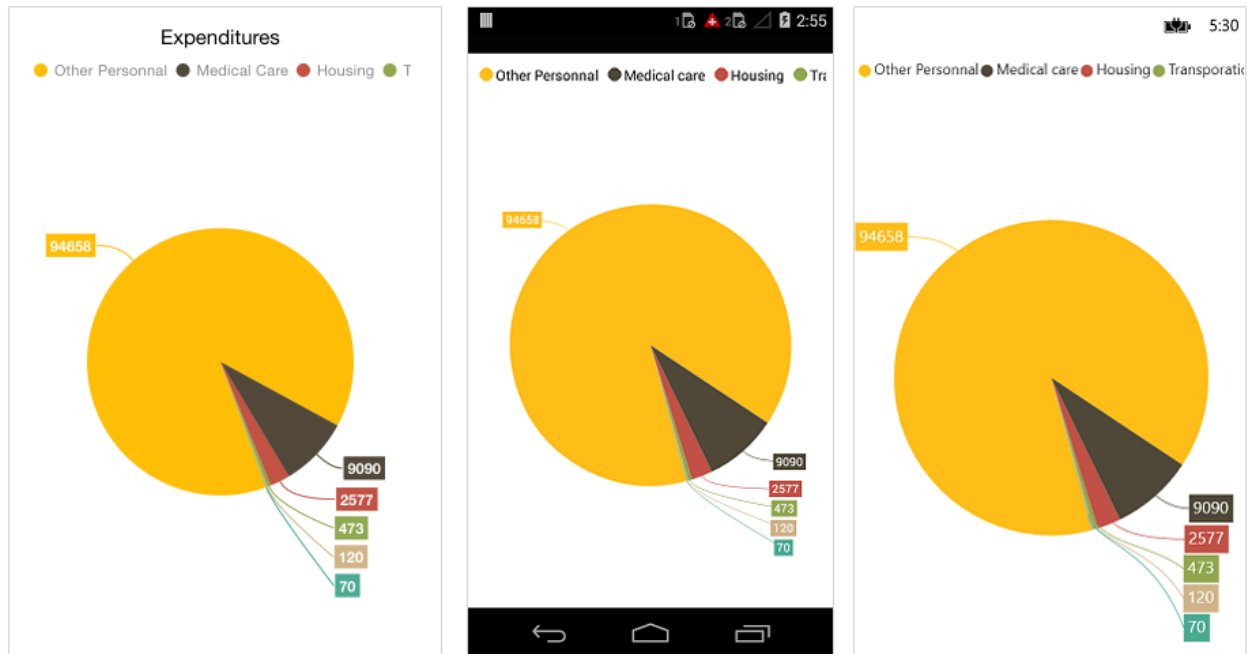

```
SfChart chart = new SfChart();
...
PieSeries pieSeries = new PieSeries()
{
    ItemsSource = Data,
    XBindingPath = "Expense",
    YBindingPath = "Value",
    EnableSmartLabels = true,
```

```

DataMarkerPosition = CircularSeriesDataMarkerPosition.OutsideExtended,
ConnectorLineType= ConnectorLineType.Bezier,
StartAngle=75,
EndAngle=435,
DataMarker=new ChartDataMarker(),
};
chart.Series.Add(pieSeries);

```

### Customizing marker shapes

Shapes can be added to chart data marker by setting the [ShowMarker](#) property to `true`. There are different shapes you can set to the chart using [MarkerType](#) property such as [Triangle](#), [Circle](#), [Diamond](#) etc. Following properties are used to customize marker appearance,

- [MarkerWidth](#) - used to change the width of the marker
- [MarkerHeight](#) - used to change the height of the marker
- [MarkerColor](#) - used to change the color of the marker
- [MarkerBorderColor](#) - used to change the border color of the shape
- [MarkerBorderWidth](#) – used to change the marker border thickness

The following code example shows how to enable marker and specify its types,

### XML

```

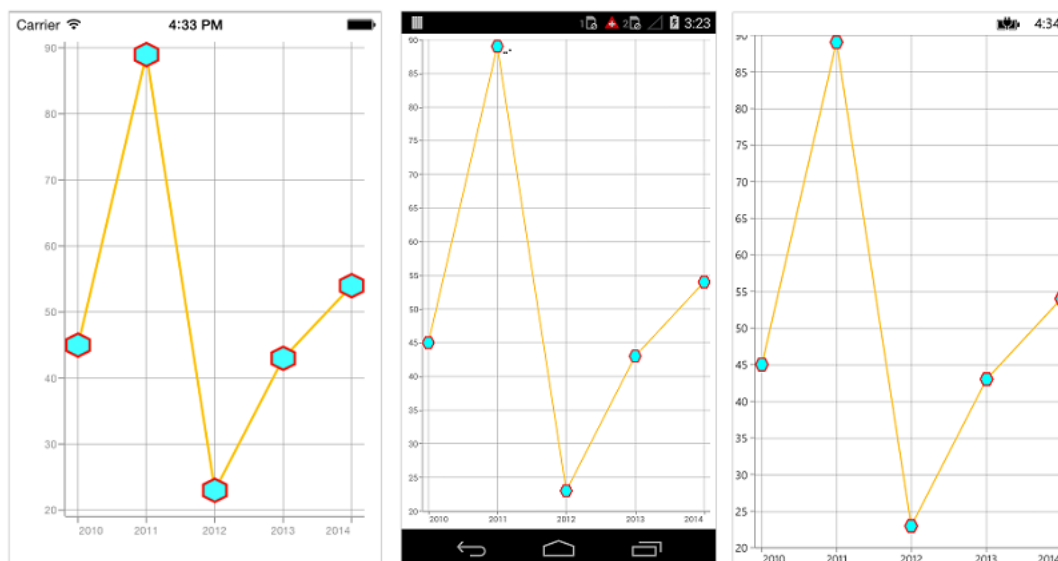

<chart:LineSeries.DataMarker>
<chart:ChartDataMarker ShowLabel="False"
ShowMarker="True"
MarkerType="Hexagon"
MarkerWidth="20"
MarkerHeight="20"
MarkerColor="Aqua"
MarkerBorderColor="Red"
MarkerBorderWidth="2"/>

```

```
</chart:LineSeries.DataMarker>
```

### C#

```
lineSeries.DataMarker = new ChartDataMarker();
lineSeries.DataMarker.ShowLabel = false;
lineSeries.DataMarker.ShowMarker = true;
lineSeries.DataMarker.MarkerType = DataMarkerType.Hexagon;
lineSeries.DataMarker.MarkerWidth = 20;
lineSeries.DataMarker.MarkerHeight = 20;
lineSeries.DataMarker.MarkerColor = Color.Aqua;
lineSeries.DataMarker.MarkerBorderColor = Color.Red;
lineSeries.DataMarker.MarkerBorderWidth = 2;
```

### Apply series color

The [UseSeriesPalette](#) property is used to apply the series color to background color of data marker labels. The default value of this property is true.

### XML

```
<chart:ColumnSeries>
  <chart:ColumnSeries.DataMarker>
    <chart:ChartDataMarker UseSeriesPalette="False"/>
  </chart:ColumnSeries.DataMarker>
</chart:ColumnSeries>
```

### C#

```
columnSeries.DataMarker = new ChartDataMarker();
columnSeries.DataMarker.UseSeriesPalette = false;
```

### Connector line

This feature is used to connect label and data point using a line. It can be enabled for any chart types but this is often used with Pie and Doughnut chart types. The [ConnectorLineStyle](#) property used to customize the connector line.

- [StrokeColor](#) – used to change the color of the line
- [StrokeWidth](#) – used to change the stroke thickness of the line
- [StrokeDashArray](#) – used to set the dashes for the line
- [ConnectorHeight](#) - used to set the height of the line.
- [ConnectorRotationAngle](#) - used to set the rotation angle of the line.

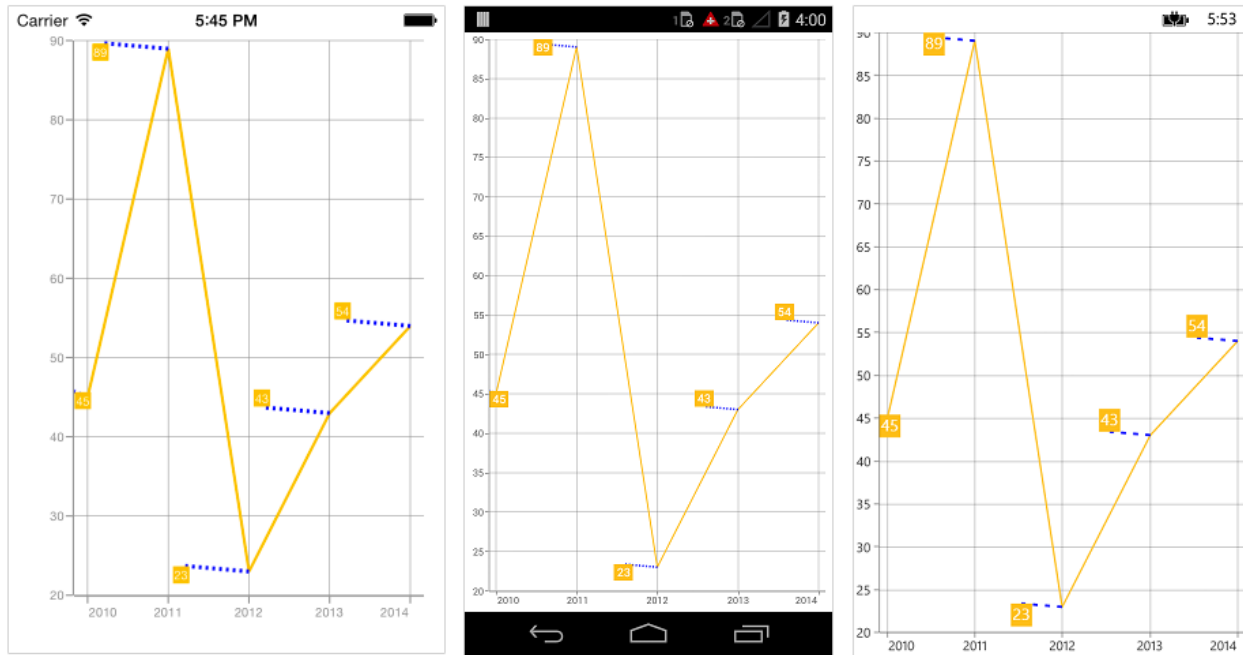

The following code illustrates how to specify the connector height and its angle,

#### XML

```
<chart:LineSeries.DataMarker>
<chart:ChartDataMarker>
<chart:ChartDataMarker.ConnectorLineStyle>
<chart:ConnectorLineStyle ConnectorHeight="50"
ConnectorRotationAngle="175"
StrokeColor="Blue"
StrokeWidth="3"/>
</chart:ChartDataMarker.ConnectorLineStyle>
</chart:ChartDataMarker>
</chart:LineSeries.DataMarker>
```

#### C#

```
lineSeries.DataMarker.ConnectorLineStyle.ConnectorHeight = 50;
lineSeries.DataMarker.ConnectorLineStyle.ConnectorRotationAngle = 175;
lineSeries.DataMarker.ConnectorLineStyle.StrokeColor = Color.Blue;
lineSeries.DataMarker.ConnectorLineStyle.StrokeWidth = 3;
lineSeries.DataMarker.ConnectorLineStyle.StrokeDashArray = new double[2] {
2, 3 };
```

**Note:** For Pie and Doughnut series, you can set different connector line types such as [Line](#), [StraightLine](#) and [Bezier](#) curve using the [ConnectorType](#) property of pie and doughnut series.

### Label template

You can customize the appearance of the data marker label with your own template using the [LabelTemplate](#) property of [ChartDataMarker](#).

**Note:** The BindingContext of template is the corresponding underlying model provided in the items source of chart series. You can also bind the corresponding [ChartDataMarkerLabel](#) class object using the [LabelContent](#) property set as [DataMarkerLabel](#).

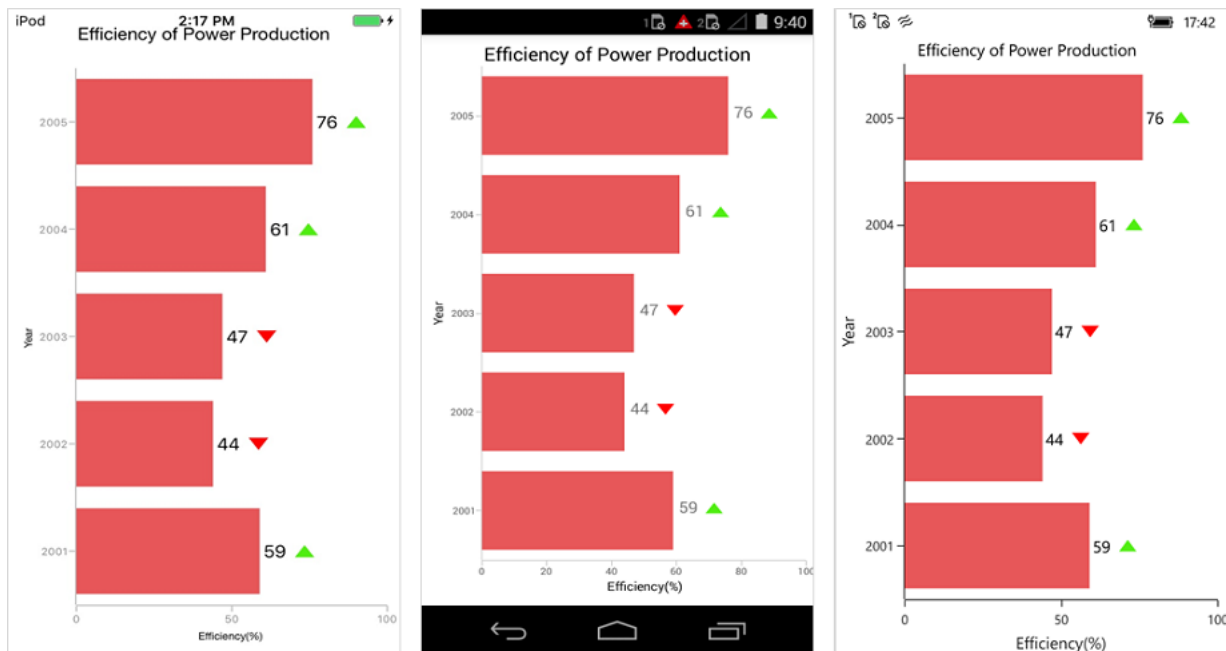

### XML

```
<ContentPage.Resources>
  <ResourceDictionary>
    <DataTemplate x:Key="dataMarkerTemplate">
      <StackLayout Orientation="Horizontal">
        <Label Text="{Binding Value}" VerticalOptions="Center" FontSize = "15"/>
        <Image Source="Down.jpg" WidthRequest="30" HeightRequest="30"/>
      </StackLayout>
    </DataTemplate>
  </ResourceDictionary>
</ContentPage.Resources>
<chart:SfChart.Series>
  <chart:BarSeries ItemsSource="{Binding Data}" XBindingPath="Name"
    YBindingPath="Value">
    <chart:BarSeries.DataMarker>
      <chart:ChartDataMarker ShowLabel="True" LabelTemplate="{StaticResource
        dataMarkerTemplate}">
      <chart:ChartDataMarker.LabelStyle>
        <chart:DataMarkerLabelStyle LabelPosition="Outer" />
      </chart:ChartDataMarker.LabelStyle>
    </chart:ChartDataMarker>
  </chart:BarSeries.DataMarker>
</chart:BarSeries.DataMarker>
```

```
</chart:BarSeries>  
</chart:SfChart.Series>
```

## C#

```
SfChart chart = new SfChart ();  
...  
var barSeries = new BarSeries();  
barSeries.Color = Color.FromRgb(231, 87, 89);  
barSeries.ItemsSource = Data;  
barSeries.XBindingPath = "Name";  
barSeries.YBindingPath = "Value";  
barSeries.DataMarker = new ChartDataMarker();  
barSeries.DataMarker.ShowLabel = true;  
barSeries.DataMarker.LabelStyle.LabelPosition =  
DataMarkerLabelPosition.Outer;  
DataTemplate dataMarkerTemplate = new DataTemplate(() =>  
{  
    StackLayout stack = new StackLayout();  
    stack.Orientation = StackOrientation.Horizontal;  
    Label label = new Label();  
    label.SetBinding(Label.TextProperty, "Value");  
    label.FontSize = 15;  
    label.VerticalOptions = LayoutOptions.Center;  
    Image image = new Image();  
    image.Source = "Down.jpg";  
    image.WidthRequest = 30;  
    image.HeightRequest = 30;  
    stack.Children.Add(label);  
    stack.Children.Add(image);  
    return stack;  
});  
barSeries.DataMarker.LabelTemplate = dataMarkerTemplate;  
chart.Series.Add(barSeries);
```

## Event

### [DataMarkerLabelCreated](#)

The [DataMarkerLabelCreated](#) event occurs when the data marker label is created. This argument contains object of the [ChartDataMarkerLabel](#). The following properties are available in [DataMarkerLabel](#) to customize the appearance of data markers based on condition.

- [Label](#) – Gets or sets the text of data marker.
- [BackgroundColor](#) – Gets the background color of data marker label.
- [Index](#) – Gets the data point index of data marker label.
- [XPosition](#) – Gets the x-position of data marker label.
- [YPosition](#) – Gets the y-position of data marker label.
- [LabelStyle](#) – Gets or sets the label style to customize the appearance of individual data marker label.
- [MarkerWidth](#) – Gets or sets the marker width.
- [MarkerHeight](#) – Gets or sets the marker height.
- [MarkerBorderWidth](#) – Gets or sets the border width of marker symbol.
- [MarkerBorderColor](#) – Gets or sets the border color of marker symbol.
- [MarkerColor](#) – Gets or sets the marker color.
- [MarkerType](#) – Gets or sets the shape type of marker. The available shapes are ellipse, diamond, hexagon, cross, HorizontalLine, VerticalLine, InvertedTriangle, triangle, pentagon, plus, and square.
- [Data](#) - Gets the underlying data of data marker label.

## Legend

The [Legend](#) contains list of chart series/data points in chart. The information provided in each legend item helps to identify the corresponding data series in chart.

The following code example shows how to enable legend in chart.

### **XML**

```
<chart:SfChart>
<chart:SfChart.Legend>
<chart:ChartLegend/>
</chart:SfChart.Legend>
</chart:SfChart>
```

**C#**

```
chart.Legend = new ChartLegend();
```

**Customizing labels**

The [Label](#) property of [ChartSeries](#) is used to define the label for the corresponding series legend item. The appearance of the label can be customized using the [LabelStyle](#) property.

- [TextColor](#) – used to change the color of the label.
- [Font](#) – used to change the text size, font family, and font weight.
- [Margin](#) - used to change the margin size of labels.

**XML**

```
<chart:SfChart.Legend>
<chart:ChartLegend>
<chart:ChartLegend.LabelStyle>
<chart:ChartLegendLabelStyle TextColor="Blue" Margin="5" Font="Bold,18"/>
</chart:ChartLegend.LabelStyle>
</chart:ChartLegend>
</chart:SfChart.Legend>
```

**C#**

```
chart.Legend = new ChartLegend();
chart.Legend.LabelStyle.TextColor = Color.Blue;
chart.Legend.LabelStyle.Font = Font.SystemFontOfSize(18,
FontAttributes.Bold);
chart.Legend.LabelStyle.Margin = 5;
```

### Legend icons

The legend icons are enabled by default. However, you can control its visibility using the [IsIconVisible](#) property. The icon type also can be specified using the [LegendIcon](#) property such as [Rectangle](#), [Circle](#) and [Diamond](#), etc., The [IconWidth](#) and [IconHeight](#) properties are used to adjust the width and height of the legend icons, respectively.

### XML

```
<chart:SfChart>
  <chart:SfChart.Legend>
    <chart:ChartLegend IsIconVisible="True" IconHeight="20" IconWidth="20"/>
  </chart:SfChart.Legend>
  <chart:PieSeries ItemsSource="{Binding Data1}" LegendIcon="SeriesType"/>
</chart:SfChart>
```

### C#

```
chart.Legend = new ChartLegend();
chart.Legend.IconHeight = 20;
chart.Legend.IconWidth = 20;
chart.Legend.IsIconVisible = true;
pieSeries.LegendIcon = ChartLegendIcon.SeriesType;
```

### Legend title

The following properties are used to define and customize the [Title](#) of legend.

- [Text](#) – used to change the text of the title.
- [TextColor](#) – used to change the color of the title text.
- [Font](#) – used to change the text size, font family, and font weight of the title. (This is deprecated API. Use [FontSize](#), [FontFamily](#), and [FontAttributes](#) properties instead of this.)
- [FontFamily](#) - used to change the font family for the legend label.
- [FontAttributes](#) - used to change the font style for the legend label.
- [FontSize](#) - used to change the font size for the legend label.
- [Margin](#) – used to change the margin size of title.
- [TextAlignment](#) – used to change the alignment of the title text; it can be start, end, or center.
- [BackgroundColor](#) – used to change the title background color.
- [BorderColor](#) – used to change the border color.
- [BorderWidth](#) – used to adjust the border width of title.

### XML

```
<chart:SfChart.Legend>
<chart:ChartLegend>
<chart:ChartLegend.Title >
<chart:ChartTitle Text="Years" TextColor="Maroon" TextAlignment="Center"
BackgroundColor="Silver" BorderWidth="3" BorderColor="Blue" Font="Bold,20"/>
</chart:ChartTitle>
</chart:ChartLegend.Title>
</chart:ChartLegend>
</chart:SfChart.Legend>
```

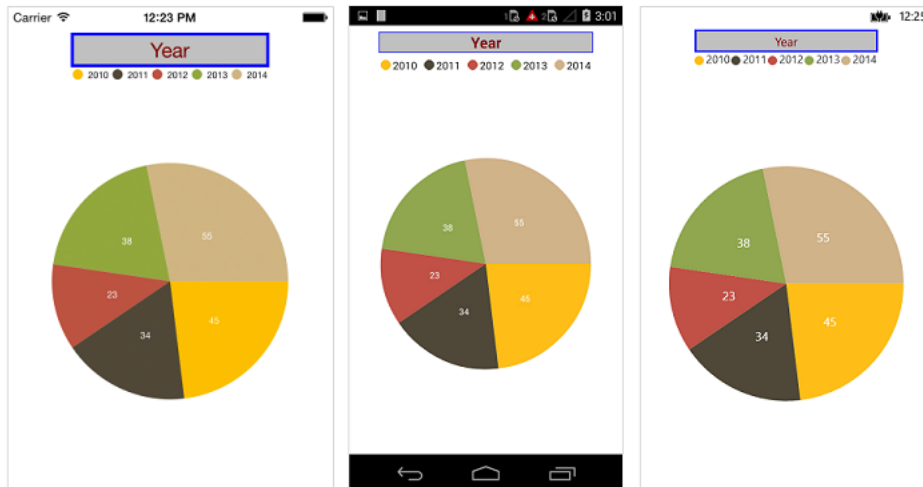

### C#

```
chart.Legend = new ChartLegend();
```

```

chart.Legend.Title.Text = "Year";
chart.Legend.Title.TextColor = Color.Maroon;
chart.Legend.Title.Font = Font.SystemFontOfSize(20, FontAttributes.Bold);
chart.Legend.Title.TextAlignment = TextAlignment.Center;
chart.Legend.Title.BackgroundColor = Color.Silver;
chart.Legend.Title.BorderWidth = 3;
chart.Legend.Title.BorderColor = Color.Blue;

```

### Toggle the series visibility

You can control the visibility of the series by tapping the legend item. You can enable this feature by enabling the [ToggleSeriesVisibility](#) property.

### XML

```

<chart:SfChart>
  <chart:SfChart.Legend>
    <chart:ChartLegend ToggleSeriesVisibility="True"/>
  </chart:SfChart.Legend>
</chart:SfChart>

```

### C#

```

chart.Legend = new ChartLegend();
chart.Legend.ToggleSeriesVisibility = true;

```

### Legend visibility

The [IsVisible](#) property of `ChartLegend` is used to toggle the visibility of legend.

### XML

```

<chart:SfChart>
  <chart:SfChart.Legend>
    <chart:ChartLegend IsVisible="False"/>
  </chart:SfChart.Legend>
</chart:SfChart>

```

### C#

```
chart.Legend = new ChartLegend();  
chart.Legend.IsVisible = false;
```

### Legend item visibility

You can control the visibility of a particular series' legend item using the [IsVisibleOnLegend](#) property of series. The default value of the [IsVisibleOnLegend](#) property is true.

#### XML

```
<chart:ColumnSeries ItemsSource="{Binding ColumnData}" XBindingPath="Name"  
YBindingPath="Value" IsVisibleOnLegend="true" >  
</chart:ColumnSeries>
```

#### C#

```
ColumnSeries column = new ColumnSeries();  
column.XBindingPath = "Name";  
column.YBindingPath = "Value";  
column.ItemsSource = viewModel.ColumnData;  
column.IsVisibleOnLegend = true;
```

### Item margin

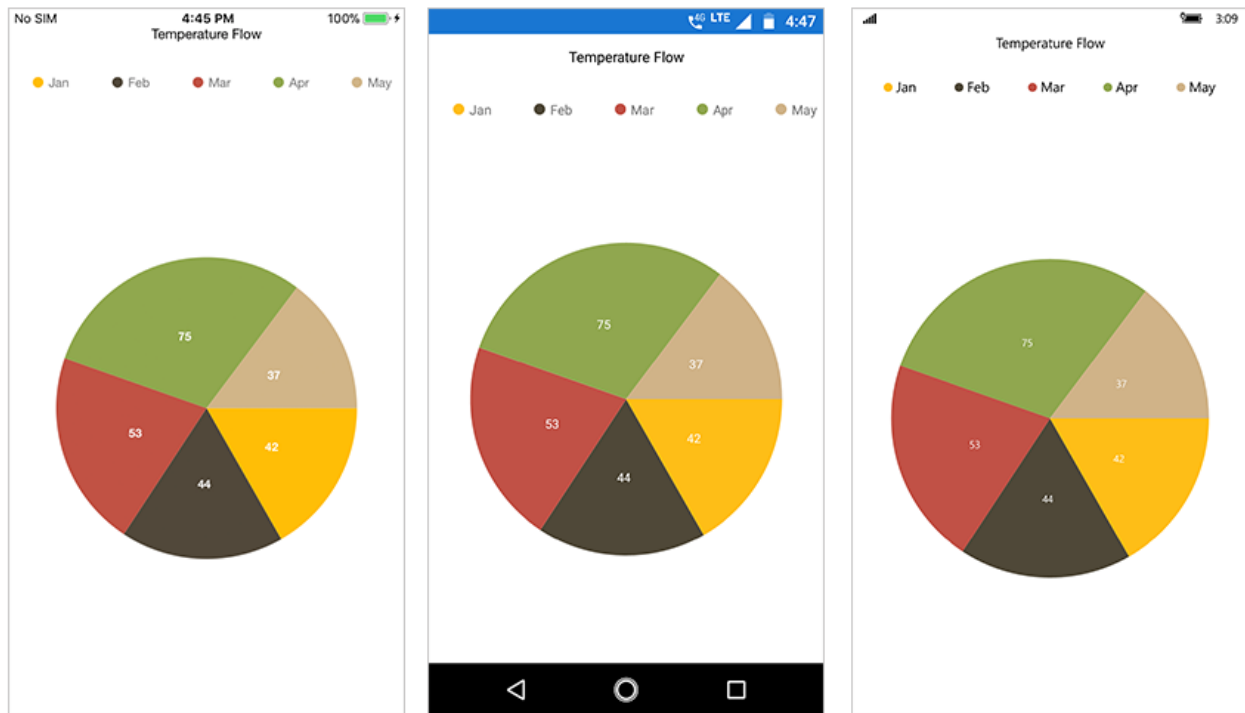

The [ItemMargin](#) property is used to set the spacing between the legend items.

#### XML

```
<chart:SfChart.Legend>  
<chart:ChartLegend ItemMargin="20"/>  
</chart:SfChart.Legend>
```

#### C#

```
chart.Legend = new ChartLegend();  
chart.Legend.ItemMargin = 20;
```

### Legend wrap

The legend items can be placed in multiple rows using the [OverflowMode](#) property if size of the total legend exceeds the available size. The default value of the [OverflowMode](#) property is [Scroll](#).

### XML

```
<chart:SfChart.Legend>
<chart:ChartLegend OverflowMode="Wrap" />
</chart:SfChart.Legend>
```

### C#

```
chart.Legend = new ChartLegend()
{
    OverflowMode = ChartLegendOverflowMode.Wrap
};
```

### Legend width

The legend width can be specified using the [MaxWidth](#) property. This property works only when the [OverflowMode](#) is [Wrap](#). The default value of the [MaxWidth](#) property is double.NAN.

### XML

```
<chart:SfChart>
  <chart:SfChart.Legend>
    <chart:ChartLegend OverflowMode = "Wrap" MaxWidth = "750" />
  </chart:SfChart.Legend>
</chart:SfChart>
```

### C#

```
chart.Legend = new ChartLegend()
{
    OverflowMode = ChartLegendOverflowMode.Wrap,
    MaxWidth = 750
};
```

### Positioning the legend

You can position the legend anywhere inside the chart. The following properties are used to customize the position of legend:

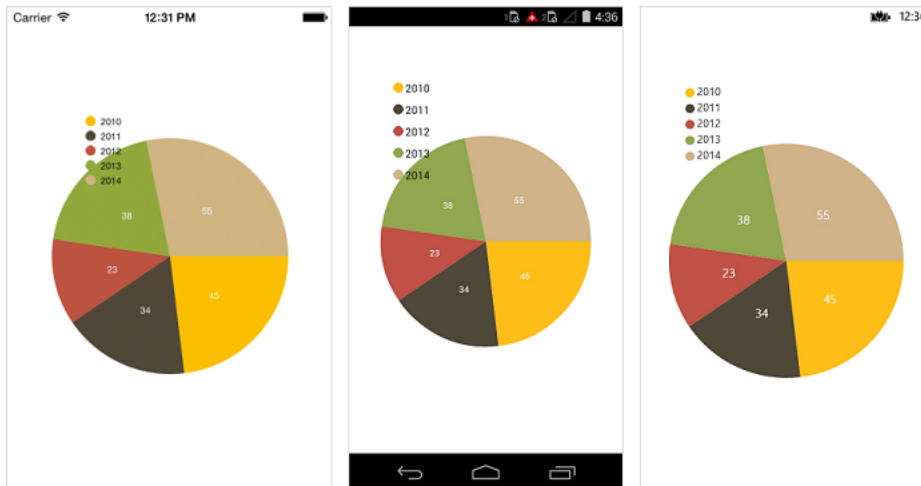

- [DockPosition](#) – used to position the legend relatively. The available options are [Left](#), [Right](#), [Top](#), [Bottom](#), and [Floating](#). If the DockPosition is Floating, you can position the legend using the x and y-coordinates.
- [OffsetX](#) – used to move the legend on x-coordinate by the given offset value.
- [OffsetY](#) - used to move the legend on y-coordinate by the given offset value.
- [Orientation](#) - used to change the orientation of the legend, the default value is Auto, orientation of the legend items will be changed based on its dock position. Also, you can manually set [Horizontal](#) or [Vertical](#).

### XML

```
<chart:SfChart>
  <chart:SfChart.Legend>
    <chart:ChartLegend DockPosition="Floating" OffsetX="70" OffsetY="90"
      Orientation="Vertical">
    </chart:SfChart.Legend>
  </chart:SfChart>
```

### C#

```
chart.Legend = new ChartLegend();
chart.Legend.DockPosition = LegendPlacement.Floating;
chart.Legend.Orientation = ChartOrientation.Vertical;
chart.Legend.OffsetX = 70;
chart.Legend.OffsetY = 90;
```

Populate the data based legend items for all series

The [Series](#) property of [ChartLegend](#) is used to populate the legend items based on the data points which are present in the assigned series.

The following code example shows how to enable datapoint-based legend for Cartesian series.

#### XML

```
<chart:SfChart>
...
<chart:ChartLegend x:Name="chartLegend" Series="{Binding Source={
x:Reference Series}}"/>
...
<chart:SfChart.Series>
<chart:ColumnSeries x:Name="Series" ItemsSource="{Binding CategoryData}"
XBindingPath="Name" YBindingPath="Value"/>
...
</chart:SfChart>
```

#### C#

```
...
ColumnSeries series = new ColumnSeries()
{
    ItemsSource = model.CategoryData,
    XBindingPath = "XValue",
    YBindingPath = "YValue",
};
Chart.Legend = new ChartLegend();
Chart.Legend.Series = series;
Chart.Series.Add(series);
...
```

#### ItemTemplate

You can customize the appearance of legend items with your template by using [ItemTemplate](#) property of [ChartLegend](#).

**Note:** The BindingContext of the template is the corresponding underlying legend item that provided in the ChartLegendItem class.

### XML

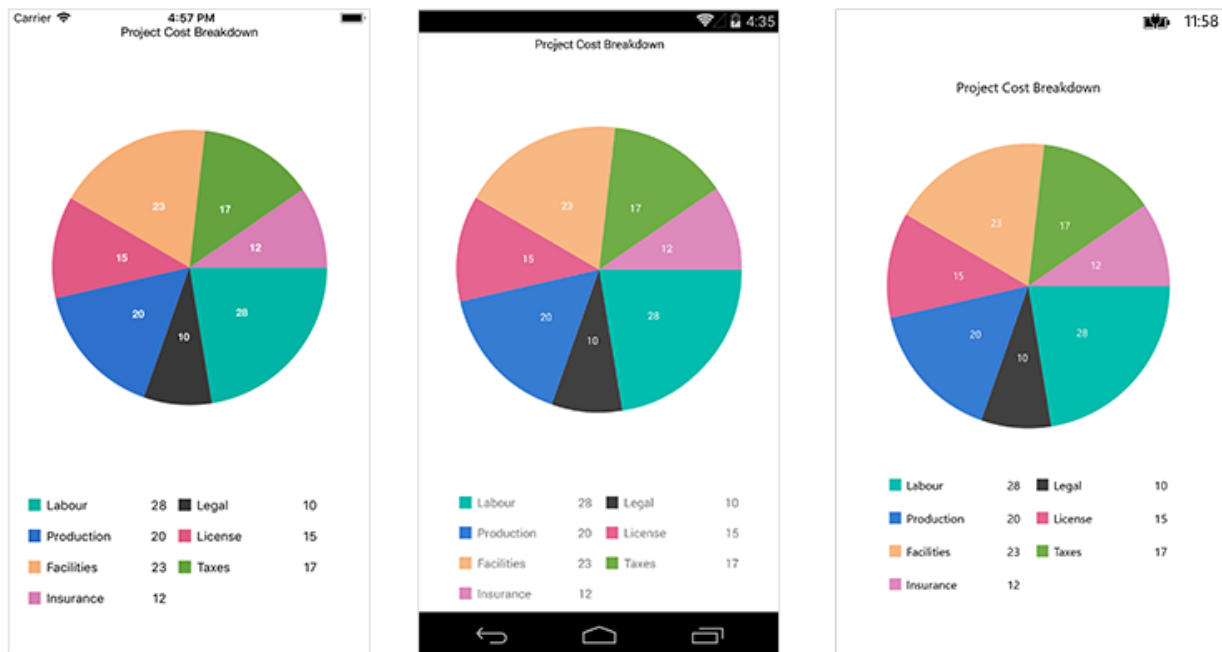

```
<chart:PieSeries ItemsSource="{Binding Data}" XBindingPath="Name"
YBindingPath="Value">
....
</chart:PieSeries>
<chart:SfChart.Legend>
....
<chart:ChartLegend.ItemTemplate>
<DataTemplate>
<StackLayout Orientation="Horizontal" WidthRequest="143">
<BoxView Color="{Binding IconColor}" HorizontalOptions="Center"
VerticalOptions="Center" HeightRequest="13" WidthRequest="13" />
<Label FontSize="13" VerticalTextAlignment="Center" Text="{Binding
DataPoint.Name}"/>
<Label HorizontalTextAlignment="End" VerticalTextAlignment="Center"
HorizontalOptions="EndAndExpand" FontSize="13" Text="{Binding
DataPoint.Value}"/>
</StackLayout>
</DataTemplate>
</chart:ChartLegend.ItemTemplate>
</chart:SfChart.Legend>
```

### C#

```
ChartLegend legend = new ChartLegend();
chart.Legend = legend;
legend.ItemTemplate = new DataTemplate ( () =>
{
    StackLayout stack = new StackLayout()
    {
        Orientation = StackOrientation.Horizontal, WidthRequest = 143
    };
    BoxView boxView = new BoxView()
    {
        HorizontalOptions = LayoutOptions.Center, VerticalOptions =
        LayoutOptions.Center, WidthRequest = 13, HeightRequest = 13
    };
    boxView.SetBinding(BoxView.BackgroundColorProperty, "IconColor");
    Label name = new Label()
    {
        VerticalTextAlignment = TextAlignment.Center, FontSize = 13
    };
    name.SetBinding(Label.TextProperty, "DataPoint.Name");
    Label value = new Label()
    {
        HorizontalTextAlignment = TextAlignment.End, VerticalTextAlignment =
        TextAlignment.Center, FontSize = 13
    };
    value.HorizontalOptions = LayoutOptions.EndAndExpand;
    value.SetBinding(Label.TextProperty, "DataPoint.Value");
    stack.Children.Add(boxView);
    stack.Children.Add(name);
}
```

```
stack.Children.Add(value);
return stack;
});
```

## Event

### LegendItemClicked

The [LegendItemClicked](#) event is triggered when the chart legend item is clicked. This argument contains the following information.

- [LegendItem](#) – Used to customize the label and appearance of individual legend item.

### LegendItemCreated

The [LegendItemCreated](#) event is triggered when the chart legend item is created. This argument contains the following information.

- [LegendItem](#) – Used to customize the label and appearance of individual legend item.

You can customize the legend item using following properties of [ChartLegendItem](#):

- [Label](#) – Get or sets the legend item label.
- [LabelStyle](#) – Customizes the appearance of legend labels. The properties listed in [customizing label](#) can be customized using the [LabelStyle](#) property.
- [IconColor](#) – Gets or sets the legend icon color.
- [Index](#) – Gets the legend item index.
- [IsEnabled](#) – Gets the visibility of the series if the series is the type of [CartesianSeries](#) and get the visibility of the data point if the series is type of [AccumulationSeries](#).
- [DataPoint](#) – Gets the legend item data point for accumulation series only.
- [Series](#) – Gets respective chart series.

## Color Palette

### Apply palette for Chart

[ColorModel](#) property of [SfChart](#) is used to define the colors for each series. [ColorModel](#) contains the following color palettes.

### Predefined Palettes

Currently, Chart supports only [Metro](#) palette and it is the default palette for [SfChart](#). The following screenshot shows the default appearance of multiple series.

### Custom Palette

Chart will use the colors from [CustomBrushes](#) property if [ColorModel.Palette](#) is set to [Custom](#).

Following code illustrates how to set the custom colors.

### XML

```
<ContentPage.Resources>
  <ResourceDictionary>
    <chart:ChartColorCollection x:Key="Colors">
      <Color>Red</Color>
      <Color>Gray</Color>
      <Color>Blue</Color>
      <Color>Maroon</Color>
      <Color>Pink</Color>
    </chart:ChartColorCollection>
  </ResourceDictionary>
</ContentPage.Resources>
<chart:SfChart>
  <chart:SfChart.ColorModel>
    <chart:ChartColorModel Palette="Custom" CustomBrushes="{StaticResource
Colors}"/>
  </chart:SfChart.ColorModel>
  ...
</chart:SfChart>
```

```
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart()
{
    ColorModel = new ChartColorModel()
    {
        Palette = ChartColorPalette.Custom,
        CustomBrushes = new ChartColorCollection()
        {
            Color.Red,
            Color.Gray,
            Color.Blue,
            Color.Maroon,
            Color.Pink,
        }
    },
    ...
};
```

## None Palette

[None](#) palette will not apply any color to the series. So in order to define the color for any series, you can use the [Color](#) property or the [ColorModel](#) property of [ChartSeries](#) (The ColorModel of Series will be explained later in this document).

## Apply palette for Series

[ColorModel](#) property of [ChartSeries](#) is used to define the colors for each data point. Following palettes are used to define the colors.

## Predefined Palettes

Currently, Chart supports only [Metro](#) palette.

### XML

```
<chart:SfChart>
...
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Country"
YBindingPath="Value">
<chart:ColumnSeries.ColorModel>
<chart:ChartColorModel Palette="Metro"/>
</chart:ColumnSeries.ColorModel>
</chart:ColumnSeries>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
ColumnSeries columnSeries = new ColumnSeries() {
    ItemsSource = Data,
    XBindingPath = "Country",
    YBindingPath = "Value"
};
columnSeries.ColorModel.Palette = ChartColorPalette.Metro;
chart.Series.Add(columnSeries);
```

### Custom Palette

Series will use the colors from [CustomBrushes](#) property if the [ColorModel.Palette](#) property of series is set to [Custom](#).

Following code illustrates how to set the custom colors.

### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<chart:ChartColorCollection x:Key="Colors">
<Color>Red</Color>
<Color>Gray</Color>
<Color>Blue</Color>
<Color>Maroon</Color>
<Color>Pink</Color>
</chart:ChartColorCollection>
</ResourceDictionary>
</ContentPage.Resources>
<chart:SfChart>
...
<chart:SfChart.Series>
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Name"
YBindingPath="Height">
<chart:ColumnSeries.ColorModel>
<chart:ChartColorModel Palette="Custom" CustomBrushes="{StaticResource
Colors}"/>
</chart:ColumnSeries.ColorModel>
</chart:ColumnSeries>
</chart:SfChart.Series>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart()
{
...
Series =
{
new ColumnSeries()
{
ItemsSource = viewModel.Data,
XBindingPath = "Name",
YBindingPath = "Height",
ColorModel = new ChartColorModel()
{
Palette = ChartColorPalette.Custom,
CustomBrushes = new ChartColorCollection()
{
Color.Red,
Color.Gray,
Color.Blue,
Color.Maroon,
Color.Pink,
}
}
}
}
};
```

### None Palette

[None](#) palette will not apply any color to the data points. So in order to define the color for the data points, you can use the [Color](#) property of [ChartSeries](#).

### Gradient Colors

The [CustomGradientColors](#) property of [ChartColorModel](#) is used to define the gradient colors, the colors from this property is used for series or chart if the [Palette](#) property of [ChartColorModel](#) is [Custom](#) and the [CustomBrushes](#) property is null. The following properties are used to define the gradient color for the chart.

The [StartPoint](#) and [EndPoint](#) properties of [ChartGradientColor](#) is used to configure the direction of gradient color, [GradientStops](#) property is used to set the color based on the offset.

The [Color](#) and [Offset](#) properties of [ChartGradientStop](#) is used to configure the color and offset position of each color.

Following code snippets and screenshot illustrates how to apply the gradient color to the chart series.

### XML

```
<chart:ColumnSeries.ColorModel>
<chart:ChartColorModel Palette="Custom">
<chart:ChartColorModel.CustomGradientColors>
<chart:ChartGradientColor StartPoint="0.5,1" EndPoint="0.5, 0">
<chart:ChartGradientColor.GradientStops>
<chart:ChartGradientStop Color="#FFE7C7" Offset= "0"/>
<chart:ChartGradientStop Color="#FCB69F" Offset= "1"/>
</chart:ChartGradientColor.GradientStops>
</chart:ChartGradientColor>
<chart:ChartGradientColor StartPoint="0.5,1" EndPoint="0.5, 0">
<chart:ChartGradientColor.GradientStops>
<chart:ChartGradientStop Color="#DCFA97" Offset= "0"/>
<chart:ChartGradientStop Color="#96E6A1" Offset= "1"/>
</chart:ChartGradientColor.GradientStops>
</chart:ChartGradientColor>
```

```

</chart:ChartGradientColor>
<chart:ChartGradientColor StartPoint="0.5,1" EndPoint="0.5, 0">
<chart:ChartGradientColor.GradientStops>
<chart:ChartGradientStop Color="#DDD6F3" Offset= "0"/>
<chart:ChartGradientStop Color="#FAACA8" Offset= "1"/>
</chart:ChartGradientColor.GradientStops>
</chart:ChartGradientColor>
<chart:ChartGradientColor StartPoint="0.5,1" EndPoint="0.5, 0">
<chart:ChartGradientColor.GradientStops>
<chart:ChartGradientStop Color="#A8EAE" Offset= "0"/>
<chart:ChartGradientStop Color="#7BB0F9" Offset= "1"/>
</chart:ChartGradientColor.GradientStops>
</chart:ChartGradientColor>
</chart:ChartColorModel.CustomGradientColors>
</chart:ChartColorModel>
</chart:ColumnSeries.ColorModel>

```

## C#

```

series.ColorModel.Palette = ChartColorPalette.Custom;
ChartGradientColor gradientColor1 = new ChartGradientColor() { StartPoint =
new Point(0.5, 1), EndPoint = new Point(0.5, 0) };
ChartGradientStop stop1 = new ChartGradientStop() { Color =
Color.FromHex("#FFE7C7"), Offset = 0 };
ChartGradientStop stop2 = new ChartGradientStop() { Color =
Color.FromHex("#FCB69F"), Offset = 1 };
gradientColor1.GradientStops.Add(stop1);
gradientColor1.GradientStops.Add(stop2);
ChartGradientColor gradientColor2 = new ChartGradientColor() { StartPoint =
new Point(0.5, 1), EndPoint = new Point(0.5, 0) };
ChartGradientStop stop21 = new ChartGradientStop() { Color =
Color.FromHex("#DCFA97"), Offset = 0 };
ChartGradientStop stop22 = new ChartGradientStop() { Color =
Color.FromHex("#96E6A1"), Offset = 1 };
gradientColor2.GradientStops.Add(stop21);
gradientColor2.GradientStops.Add(stop22);
ChartGradientColor gradientColor3 = new ChartGradientColor() { StartPoint =
new Point(0.5, 1), EndPoint = new Point(0.5, 0) };
ChartGradientStop stop31 = new ChartGradientStop() { Color =
Color.FromHex("#DDD6F3"), Offset = 0 };
ChartGradientStop stop32 = new ChartGradientStop() { Color =
Color.FromHex("#FAACA8"), Offset = 1 };
gradientColor3.GradientStops.Add(stop31);
gradientColor3.GradientStops.Add(stop32);
ChartGradientColor gradientColor4 = new ChartGradientColor() { StartPoint =
new Point(0.5, 1), EndPoint = new Point(0.5, 0) };
ChartGradientStop stop41 = new ChartGradientStop() { Color =
Color.FromHex("#A8EAE"), Offset = 0 };
ChartGradientStop stop42 = new ChartGradientStop() { Color =
Color.FromHex("#7BB0F9"), Offset = 1 };
gradientColor4.GradientStops.Add(stop41);
gradientColor4.GradientStops.Add(stop42);
ChartGradientColorCollection gradientColors = new
ChartGradientColorCollection()
{
gradientColor1,

```

```

gradientColor2,
gradientColor3,
gradientColor4
};
series.ColorModel.CustomGradientColors = gradientColors;

```

Following code snippet and screenshot illustrates how to apply the gradient color to the chart area.

### XML

```

<chart:SfChart.ColorModel>
  <chart:ChartColorModel Palette="Custom">
    <chart:ChartColorModel.CustomGradientColors>
      <chart:ChartGradientColor StartPoint="0.5,1" EndPoint="0.5,0">
        <chart:ChartGradientColor.GradientStops>
          <chart:ChartGradientStop Color="#FFE7C7" Offset="0"/>
          <chart:ChartGradientStop Color="#FCB69F" Offset="1"/>
        </chart:ChartGradientColor.GradientStops>
      </chart:ChartGradientColor>
    </chart:ChartColorModel.CustomGradientColors>
  </chart:ChartColorModel>
</chart:SfChart.ColorModel>

```

### C#

```

chart.ColorModel.Palette = ChartColorPalette.Custom;
ChartGradientColor gradientColor = new ChartGradientColor() { StartPoint =
new Point(0.5, 1), EndPoint = new Point(0.5, 0) };
ChartGradientStop stop1 = new ChartGradientStop() { Color =
Color.FromHex("#FFE7C7"), Offset = 0 };
ChartGradientStop stop2 = new ChartGradientStop() { Color =
Color.FromHex("#FCB69F"), Offset = 1 };

```

```
gradientColor.GradientStops.Add(stop1);
gradientColor.GradientStops.Add(stop2);
chart.ColorModel.CustomGradientColors.Add(gradientColor);
```

### Plotting Area Customization

[SfChart](#) provides the [AreaBackgroundColor](#), [AreaBorderColor](#), and [AreaBorderWidth](#) properties to customize the plot area.

The following code samples demonstrate the usage of these properties:

#### XML

```
<chart:SfChart
AreaBackgroundColor="Cyan"
AreaBorderColor="Gray"
AreaBorderWidth="3"/>
```

#### C#

```
SfChart chart = new SfChart();
chart.AreaBackgroundColor = Color.Cyan;
chart.AreaBorderColor = Color.Gray;
chart.AreaBorderWidth = 3;
```

### Zooming and Panning

#### Enable Zooming

Chart allows you to zoom in to view the data clearly. To enable this feature, you need to add an instance of [ChartZoomPanBehavior](#) to the [ChartBehaviors](#) collection property of [SfChart](#).

Following properties are used to configure the zooming feature,

- [EnableZooming](#) – used to enable/disable the pinch zooming. Default value is true.
- [EnableDirectionalZooming](#) - Enables or disables the pinch zooming based on pinch gesture direction. The default value of this property is false.
- [EnableDoubleTap](#) – when you enable this property, you can double tap on the chart to reset it to the original size or zoom in by one level.
- [EnableSelectionZooming](#) – when this property is set to true, you can double tap and drag to select a range on the chart to be zoomed in.
- [EnablePanning](#) – used to enable/disable the panning. Default value is true.
- [MaximumZoomLevel](#) - used to determine the maximum zoom level of the chart.
- [SelectionRectStrokeWidth](#) - used to change the stroke width of selection rectangle
- [SelectionRectStrokeColor](#) - used to change the stroke color of selection rectangle.
- [SelectionRectStrokeDashArray](#) - used to change the stroke dashes of selection rectangle.
- [SelectionRectFillColor](#) - used to change the stroke fill color of selection rectangle.

---

**Note:** EnableDirectionalZooming is not supported in the macOS platform.

---

Following code snippet illustrates how to enable zooming.

#### XML

```
<chart:SfChart>
<chart:SfChart.ChartBehaviors>
<chart:ChartZoomPanBehavior/>
</chart:SfChart.ChartBehaviors>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
ChartZoomPanBehavior zoomPanBehavior = new ChartZoomPanBehavior();
chart.ChartBehaviors.Add(zoomPanBehavior);
```

Following code snippet illustrates how to enable the box selection zooming,

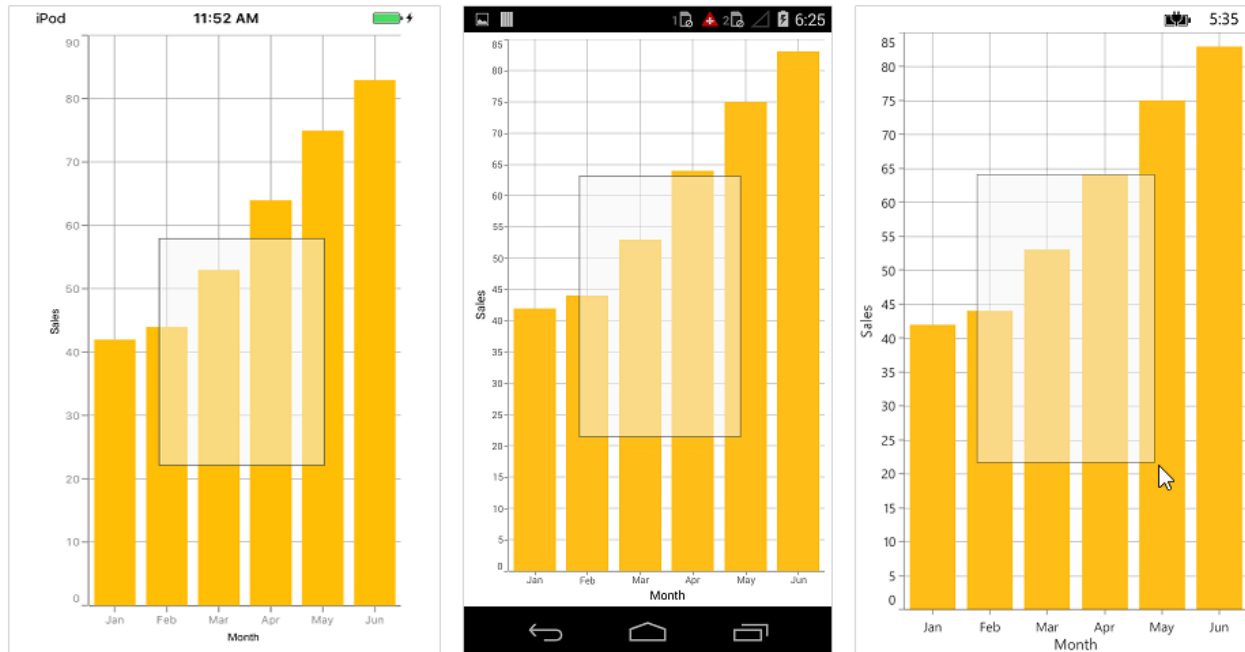

#### XML

```
<chart:SfChart>
<chart:SfChart.ChartBehaviors>
<chart:ChartZoomPanBehavior EnableSelectionZooming="True"/>
</chart:SfChart.ChartBehaviors>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
ChartZoomPanBehavior zoomPanBehavior = new ChartZoomPanBehavior();
zoomPanBehavior.EnableSelectionZooming = true;
chart.ChartBehaviors.Add(zoomPanBehavior);
```

Following screenshot shows the box selection on chart area,

Following screenshot shows the zoomed area,

### Zoom Mode

The [ZoomMode](#) property specifies whether chart should be allowed to scale along horizontal axis or vertical axis or along both axis. The default value of [ZoomMode](#) is [XY](#) (both axis).

Following code example illustrates how to restrict the chart to be zoomed only along horizontal axis,

### XML

```
<chart:SfChart.ChartBehaviors>
  <chart:ChartZoomPanBehavior ZoomMode="X"/>
</chart:SfChart.ChartBehaviors>
```

**C#**

```
ChartZoomPanBehavior zoomPanBehavior = new ChartZoomPanBehavior();  
zoomPanBehavior.ZoomMode = ZoomMode.X;
```

**Auto Interval On Zooming**

[EnableAutoIntervalOnZooming](#) property determines the update of axis interval based on the current visible range while zooming the chart. Default value of this property is true. If this property is false, the nice interval will not be calculated for new range after zoom in and actual interval will be sustained.

**Events****ZoomStart**

The [ZoomStart](#) event is triggered when the user starts zooming the chart through pinch gesture, and this is a cancelable event. The argument contains the following information.

- [Axis](#) – the zoom start event will be triggered for all the axis in the Chart.
- [CurrentZoomFactor](#) – used to get the new zoom factor of the corresponding axis.
- [CurrentZoomPosition](#) – used to get the new zoom position of the corresponding axis.
- [Cancel](#) – used to set the value indicating whether the zooming should be canceled.

**ZoomDelta**

The [ZoomDelta](#) event is triggered while zooming, and this is a cancelable event. The argument contains the following information.

- [Axis](#) – Instance of the axis whose range is changed because of zooming. This event is triggered for each axis in the chart.
- [PreviousZoomFactor](#) – used to get the previous zoom factor of the axis.
- [PreviousZoomPosition](#) – used to get the previous zoom position of the axis.
- [CurrentZoomFactor](#) – used to get the current zoom factor of the axis.
- [CurrentZoomPosition](#) – used to get the current zoom position of the axis.
- [Cancel](#) – used to set the value indicating whether the zooming should be canceled.

### ZoomEnd

The [ZoomEnd](#) event is triggered after the zooming is stopped. The argument contains the following information.

- [Axis](#) – Instance of the axis whose range is changed because of zooming. This event is triggered for each axis in the chart.
- [CurrentZoomFactor](#) – the axis zoom factor after zoom.
- [CurrentZoomPosition](#) – the axis zoom position after zoom.

### SelectionZoomStart

The [SelectionZoomStart](#) event is triggered when the user starts the box selection zooming. The argument contains the following information.

- [ZoomRect](#) – used to get the initial bounds of the box selection.

### SelectionZoomDelta

The [SelectionZoomDelta](#) event is triggered while selecting a region to be zoomed, and this is a cancelable event. The argument contains the following information.

- [ZoomRect](#) – contains the bounds of the currently selected region.
- [Cancel](#) – used to set the value indicating whether the box selection zooming should be canceled.

### SelectionZoomEnd

The [SelectionZoomEnd](#) event is triggered after selection zooming ends. The argument contains the following information.

- [ZoomRect](#) – used to get the final bounds of the zoomed region.

### Scroll

The [Scroll](#) event is triggered while panning, and this is a cancelable event. The argument contains the following information.

- [Axis](#) – Instance of the axis whose range is changed while panning. This event is triggered for each axis in the chart.
- [ZoomPosition](#) – the current zoom position of the axis.
- [Cancel](#) – used to set a value indicating whether the scrolling should be canceled.

### ResetZoom

The [ResetZoom](#) event is triggered after the chart is reset on double tap. The argument contains the following information.

- [Axis](#) – Instance of the axis whose range is changed because of this event. This event is triggered for each axis in the chart.
- [PreviousZoomFactor](#) – used to get the previous zoom factor.
- [PreviousZoomPosition](#) – used to get the previous zoom position.

## Methods

Zooming and panning can be performed programmatically with the following methods:

### *ZoomIn*

[ZoomIn](#) method is used to increase the magnification of the plot area to view the data clearly.

#### **C#**

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();  
zoomPan.ZoomIn();
```

### *ZoomOut*

[ZoomOut](#) is used to decrease the magnification of the plot area to reset the default view.

#### **C#**

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();  
zoomPan.ZoomOut();
```

### *Zoom*

#### **Zoom(factor)**

[Zoom\(factor\)](#) method is used to change the zoom level by using zoom factor.

#### **C#**

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();  
zoomPan.Zoom(0.5f);
```

#### **Zoom(Rect)**

[Zoom\(Rect\)](#) method is used to zoom the chart for a given rectangle value. Create an instance of Rect by passing [Top](#), [Left](#), [Bottom](#), and [Right](#) positions and pass it to zoom method.

#### **C#**

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();  
zoomPan.Zoom(new Rect(10, 10, 200, 350));
```

#### **Zoom(chartAxis, cumulativeLevel, origin)**

[Zoom\(chartAxis, cumulativeLevel, origin\)](#) method is used to change the zoom level of given axis to the specified level and origin.

#### **C#**

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();  
zoomPan.Zoom(axis, 0.5f, 0.5f);
```

### *ZoomByRange*

#### **ZoomByRange(chartAxis, start, end)**

[ZoomByRange\(chartAxis, start, end\)](#) method is used to zoom the given axis to the given range.

#### **C#**

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();
zoomPan.ZoomByRange(axis, 20, 25);
```

### ZoomByRange(dateTimeAxis, start, end)

[ZoomByRange\(dateTimeAxis, start, end\)](#) method is used to zoom the given axis to the given date time range.

#### C#

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();
zoomPan.ZoomByRange(axis, new DateTime(2017, 3, 1), new DateTime(2017, 5, 1));
```

### [ZoomToFactor\(chartAxis, zoomPosition, zoomFactor\)](#)

[ZoomToFactor](#) method is used to change the zoom level by using zoom position and zoom factor. Zoom position value specifies the starting point of zooming, and zoom factor value specifies the level of zooming.

#### C#

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();
zoomPan.ZoomToFactor(axis, 0.5f, 0.5f);
```

### [Reset](#)

[Reset](#) method is used to return the plot area back to its original position after zooming.

#### C#

```
ChartZoomPanBehavior zoomPan = new ChartZoomPanBehavior();
zoomPan.Reset();
```

### [Override Methods](#)

The following override methods are available in ChartZoomPanBehavior to customize zooming actions.

- [OnScaleStart](#) - It gets called when the user start to zoom on the chart.
- [OnScaleDelta](#) - It gets called while performing the zoom action.
- [OnScaleEnd](#) - It gets called after end the zoom action.
- [OnScroll](#) - It gets called while scrolling the chart.

#### C#

```
public class ChartZoomPanBehaviorExt : ChartZoomPanBehavior
{
    protected override void OnScaleStart(float manipulationX, float
manipulationY, float scaleFactor)
    {
        base.OnScaleStart(manipulationX, manipulationY, scaleFactor);
    }
    protected override void OnScaleDelta(float manipulationX, float
manipulationY, float scaleFactor)
    {
        base.OnScaleDelta(manipulationX, manipulationY, scaleFactor);
    }
}
```

```
protected override void OnScaleEnd(float manipulationX, float manipulationY,
float scaleFactor)
{
    base.OnScaleEnd(manipulationX, manipulationY, scaleFactor);
}
protected override void OnScroll(float pointX, float pointY, float
distanceX, float distanceY)
{
    base.OnScroll(pointX, pointY, distanceX, distanceY);
}
}
```

## Selection

[SfChart](#) supports selection that enables you to select a segment in a series or series itself.

### Data Point Selection

You can select a data point by tapping on it. To enable the selection feature, set [EnableDataPointSelection](#) property as `true` for [Series](#).

### XML

```
<chart:ColumnSeries EnableDataPointSelection="True" ItemsSource="{Binding
Data}" XBindingPath="Month" YBindingPath="Value"/>
```

### C#

```
ColumnSeries columnSeries = new ColumnSeries()
{
    ItemsSource = Data,
    XBindingPath = "Month",
    YBindingPath = "Value"
};
columnSeries.EnableDataPointSelection = true;
```

Following properties are used to configure the selection feature,

- [SelectedDataPointIndex](#) – used to programmatically select a data point.
- [SelectedDataPointColor](#) – used to change the selected data point color.

### XML

```
<chart:ColumnSeries EnableDataPointSelection="True"
SelectedDataPointIndex="2" SelectedDataPointColor="Red" ItemsSource
="{Binding Data}" />
```

### C#

```
ColumnSeries columnSeries = new ColumnSeries();
columnSeries.SelectedDataPointIndex = 2;
columnSeries.SelectedDataPointColor = Color.Red;
```

**Note:** For Accumulation series like pie, doughnut, pyramid and funnel, when you select a data point, the corresponding legend item also will be selected.

### Series Selection

Series selection is used in case of multiple series when you want to highlight a particular series. Series Selection can be enabled by setting [EnableSeriesSelection](#) property to True. The [SeriesSelectionColor](#) property is used to set the color to highlight the series.

### XML

```
<chart:SfChart x:Name="Chart" EnableSeriesSelection="True">
    ...
</chart:SfChart>
<chart:SfChart.Series>
<chart:ColumnSeries x:Name="series1" ItemsSource="{Binding Data}"
XBindingPath="XValue" YBindingPath="YValue" Color="#b2ebe7">
</chart:ColumnSeries>
<chart:ColumnSeries x:Name="series2" ItemsSource="{Binding Data1}"
XBindingPath="XValue" YBindingPath="YValue" Color="#d3bee5">
</chart:ColumnSeries>
<chart:ColumnSeries x:Name="series2" ItemsSource="{Binding Data2}"
XBindingPath="XValue" YBindingPath="YValue" Color="#c0d8f0">
</chart:ColumnSeries>
</chart:SfChart.Series>
```

### C#

```
chart.EnableSeriesSelection = true;
ColumnSeries columnSeries = new ColumnSeries()
{
    ItemsSource = Data,
    XBindingPath = "XValue",
    YBindingPath = "YValue",
    Color = Color.FromRgb(178, 235, 231);
};
```

```

ColumnSeries columnSeries1 = new ColumnSeries()
{
    ItemsSource = Data1,
    XBindingPath = "XValue",
    YBindingPath = "YValue",
    Color = Color.FromRgb(211, 190, 229);
};
ColumnSeries columnSeries2 = new ColumnSeries()
{
    ItemsSource = Data2,
    XBindingPath = "XValue",
    YBindingPath = "YValue",
    Color = Color.FromRgb(192, 216, 240);
};

```

To set the series selection color,

### XML

```

<chart:SfChart x:Name="Chart" EnableSeriesSelection="True"
SeriesSelectionColor="Red">
...
</chart:SfChart>

```

### C#

```
chart.SeriesSelectionColor = Color.Red;
```

### Events

#### SelectionChanging

The [SelectionChanging](#) event is triggered before the data point is selected. You can restrict a data point from being selected, by canceling this event, by setting [Cancel](#) property in the event argument to true. The argument contains the following information,

- [SelectedSeries](#) – used to get the series of selected data point.
- [SelectedDataPointIndex](#) – used to get the selected data point index.
- [PreviousSelectedIndex](#) – used to get the previous selected data point index.
- [PreviousSelectedSeries](#) - used to get the previous selected series.
- [Cancel](#) – used to set the value indicating whether the selection should be canceled.

### SelectionChanged

The [SelectionChanged](#) event triggered after a data point is selected. The argument contains the following information,

- [SelectedSeries](#) - Gets the series of selected data point.
- [SelectedDataPointIndex](#) - Gets the selected data point index.
- [PreviousSelectedIndex](#) - Gets the previous selected data point index.
- [PreviousSelectedSeries](#) - Gets the previous selected series.

### Methods

#### OnSelectionChanging

The [OnSelectionChanging](#) method of chart selection behavior is used to perform the operations, before the data point is selected, by extending the [ChartSelectionBehavior](#) class. This method argument contains the following information:

- [SelectedSeries](#) - Gets the series of selected data point.
- [SelectedDataPointIndex](#) - Gets the selected data point index.
- [PreviousSelectedIndex](#) - Gets the previous selected data point index.
- [PreviousSelectedSeries](#) - Gets the previous selected series.
- [Cancel](#) -Sets the value that indicates whether the selection should be canceled.

### C#

```
public class ChartSelectionBehaviorExt : ChartSelectionBehavior
{
    protected override void OnSelectionChanging(ChartSelectionChangingEventArgs
args)
    {
        var selectedSeries = args.SelectedSeries;
        var dataPointIndex = args.SelectedDataPointIndex;
        var previousSelectedIndex = args.PreviousSelectedIndex;
        var previousSelectedSeries = args.PreviousSelectedSeries;
    }
}
```

#### OnSelectionChanged

The [OnSelectionChanged](#) method of the [ChartSelectionBehavior](#) is used to perform the operations after a data point is selected. This method argument contains the following information:

- [SelectedSeries](#) - Gets the series of selected data point.
- [SelectedDataPointIndex](#) - Gets the selected data point index.
- [PreviousSelectedIndex](#) - Gets the previous selected data point index.
- [PreviousSelectedSeries](#) - Gets the previous selected series.

**C#**

```
public class ChartSelectionBehaviorExt : ChartSelectionBehavior
{
    protected override void OnSelectionChanged(ChartSelectionEventArgs args)
    {
        var selectedSeries = args.SelectedSeries;
        var dataPointIndex = args.SelectedDataPointIndex;
        var previousSelectedIndex = args.PreviousSelectedIndex;
        var previousSelectedSeries = args.PreviousSelectedSeries;
    }
}
```

**Trackball**

Trackball feature displays the tooltip for the data points that are closer to the point where you touch on the chart area. This feature, especially, can be used instead of data label feature when you cannot show data labels for all data points due to space constraint. To enable this feature, add an instance of [ChartTrackballBehavior](#) to the [ChartBehaviors](#) collection property of [SfChart](#). Trackball will be activated once you long-press anywhere on the chart area. Once it is activated, it will appear in the UI and move based on your touch movement until you stop touching on the chart.

You can use the following properties to show/hide the line and labels.

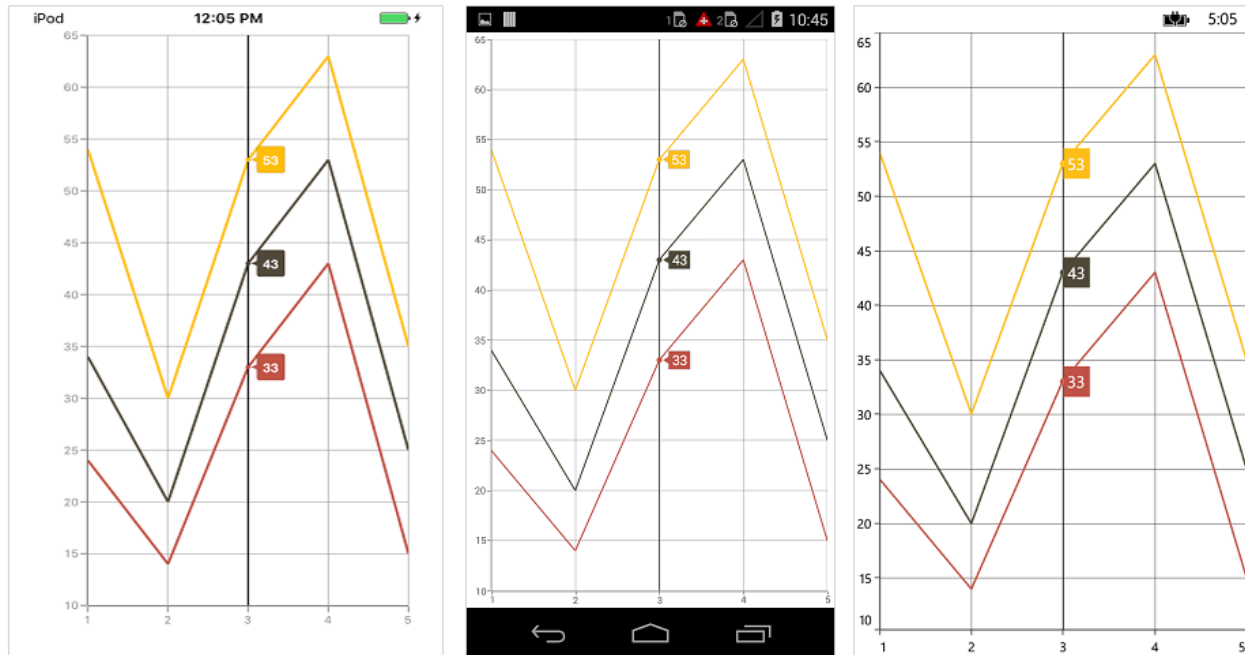

- [ShowLabel](#) – Shows/hides trackball label. Default value is true.
- [ShowLine](#) – Shows/hides the trackball line. Default value is true.

**XML**

```
<chart:SfChart>
...
<chart:SfChart.ChartBehaviors>
<chart:ChartTrackballBehavior ShowLabel="True" ShowLine="True"/>
</chart:SfChart.ChartBehaviors>
</chart:SfChart>
```

**C#**

```
SfChart chart = new SfChart();
...
ChartTrackballBehavior trackballBehavior = new ChartTrackballBehavior();
trackballBehavior.ShowLabel = true;
trackballBehavior.ShowLine = true;
chart.ChartBehaviors.Add(trackballBehavior);
```

### Label Display Mode

[TrackballLabelDisplayMode](#) property is used to specify whether to display label for all the data points along the vertical line or display only single label. Following are the two options you can set to this property,

- [FloatAllPoints](#) – Displays label for all the data points along the vertical line.
- [NearestPoint](#) – Displays label for single data point that is nearer to the touch contact position.
- [GroupAllPoints](#) – Displays label for all the data points grouped and positioned at the top of the chart area.

### XML

```
<chart:ChartTrackballBehavior LabelDisplayMode="NearestPoint"
ShowLine="False"/>
```

### C#

```
ChartTrackballBehavior trackballBehavior = new ChartTrackballBehavior();
trackballBehavior.ShowLine = false;
trackballBehavior.LabelDisplayMode = TrackballLabelDisplayMode.NearestPoint;
```

In the following screenshot, trackball label is shown for only single data point,

### Activation mode

The [ActivationMode](#) property is used to restrict the visibility of trackball based on the touch actions. The default value of this property is [ChartTrackballActivationMode.LongPress](#).

The [ChartTrackballActivationMode](#) enum contains the following values:

- [LongPress](#) – Activates trackball only when performing the long press action.
- [TouchMove](#) – Activates trackball only when performing touch move action.
- [None](#) – Hides the visibility of trackball when setting activation mode to [None](#). It will be activated when calling the [Show](#) method.

---

**Note:** The default value of [ActivationMode](#) property is [ChartTrackballActivationMode.LongPress](#) for Android and iOS platform and default value for MacOS and UWP platform is [ChartTrackballActivationMode.TouchMove](#).

---

### Customizing appearance

#### Customize Trackball Labels

The [LabelStyle](#) property provides options to customize the trackball labels.

- [BorderColor](#) – used to change the label border color.
- [BackgroundColor](#) – used to change the label background color.
- [BorderThickness](#) – used to change label border thickness.
- [TextColor](#) – used to change the text color.
- [Font](#) – used to change label font size, family and weight.

### XML

```
<chart:SfChart>
...
</chart:SfChart>
<chart:SfChart.ChartBehaviors>
```

```

<chart:ChartTrackballBehavior>
<chart:ChartTrackballBehavior.LabelStyle>
<chart:ChartTrackballLabelStyle BorderColor="Maroon" BackgroundColor="Aqua"
BorderThickness="2" TextColor="Red" Font="Italic,18"/>
</chart:ChartTrackballBehavior.LabelStyle>
</chart:ChartTrackballBehavior>
</chart:SfChart.ChartBehaviors>
</chart:SfChart>

```

## C#

```

SfChart chart = new SfChart();
...
ChartTrackballBehavior trackBallBehavior = new ChartTrackballBehavior();
trackBallBehavior.LabelStyle.BorderColor = Color.Maroon;
trackBallBehavior.LabelStyle.BorderThickness = 2;
trackBallBehavior.LabelStyle.Font = Font.SystemFontOfSize(18,
FontAttributes.Italic);
trackBallBehavior.LabelStyle.BackgroundColor = Color.Aqua;
trackBallBehavior.LabelStyle.TextColor = Color.Red;
chart.ChartBehaviors.Add(trackballBehavior);

```

## Customize Trackball Marker

The [MarkerStyle](#) property provides options to customize the trackball markers.

Following properties are used to customize the trackball marker.

- [ShowMarker](#) – used to enable / disable the marker. Default value is true.
- [BorderColor](#) – used to change the marker border color.
- [Color](#) – used to change the marker background color.
- [BorderWidth](#) – used to change the width of the marker border.
- [Width](#) – used to change the width of the marker.
- [Height](#) – used to change the height of the marker.

## XML

```

<chart:SfChart HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
...
<chart:SfChart.ChartBehaviors>
<chart:ChartTrackballBehavior>
<chart:ChartTrackballBehavior.MarkerStyle>
<chart:ChartTrackballMarkerStyle BorderColor="Purple" ShowMarker="True"
BorderWidth="1" Width="8" Height="8" Color="Green"/>
</chart:ChartTrackballBehavior.MarkerStyle>
</chart:ChartTrackballBehavior>
</chart:SfChart.ChartBehaviors>
</chart:SfChart>

```

## C#

```

SfChart chart = new SfChart();
...

```

```

ChartTrackballBehavior trackBallBehavior = new ChartTrackballBehavior();
trackBallBehavior.MarkerStyle.BorderWidth = 1;
trackBallBehavior.MarkerStyle.BorderColor = Color.Purple;
trackBallBehavior.MarkerStyle.Width = 8;
trackBallBehavior.MarkerStyle.Height = 8;
trackBallBehavior.MarkerStyle.Color = Color.Green;
trackBallBehavior.MarkerStyle.ShowMarker = true;
chart.ChartBehaviors.Add(trackballBehavior);

```

### Customize Trackball Line

The [LineStyle](#) property provides options to customize the trackball line.

- [ShowLine](#) – used to enable / disable the line. Default value is true.
- [StrokeWidth](#) – used to change the stroke width of the line.
- [StrokeColor](#) – used to change the stroke color of the line.
- [StrokeDashArray](#) – Specifies the dashes to be applied on the line.

### XML

```

<chart:SfChart HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
...
<chart:SfChart.ChartBehaviors>
<chart:ChartTrackballBehavior>
<chart:ChartTrackballBehavior.LineStyle>
<chart:ChartLineStyle StrokeColor="Blue" StrokeWidth="2"/>
</chart:ChartTrackballBehavior.LineStyle>
</chart:ChartTrackballBehavior>
</chart:SfChart.ChartBehaviors>
</chart:SfChart>

```

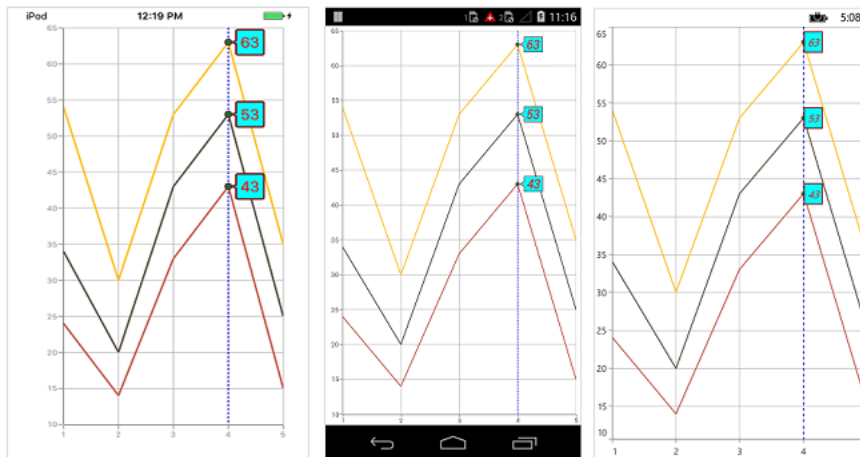

### C#

```

SfChart chart = new SfChart();
...
ChartTrackballBehavior trackBallBehavior = new ChartTrackballBehavior();
trackBallBehavior.ShowLine = true;
trackBallBehavior.LineStyle.StrokeWidth = 2;
trackBallBehavior.LineStyle.StrokeColor = Color.Blue;
trackBallBehavior.LineStyle.StrokeDashArray = new double[2] { 2, 3 };
chart.ChartBehaviors.Add(trackballBehavior);

```

Following screenshot illustrates the customization of trackball elements.

Show/hide the trackball label in axis

This feature is used to highlight the respective axis label when the trackball is moving across the axis.

[ChartAxis.ShowTrackballInfo](#) property is used show/hide the trackball label of the axis.

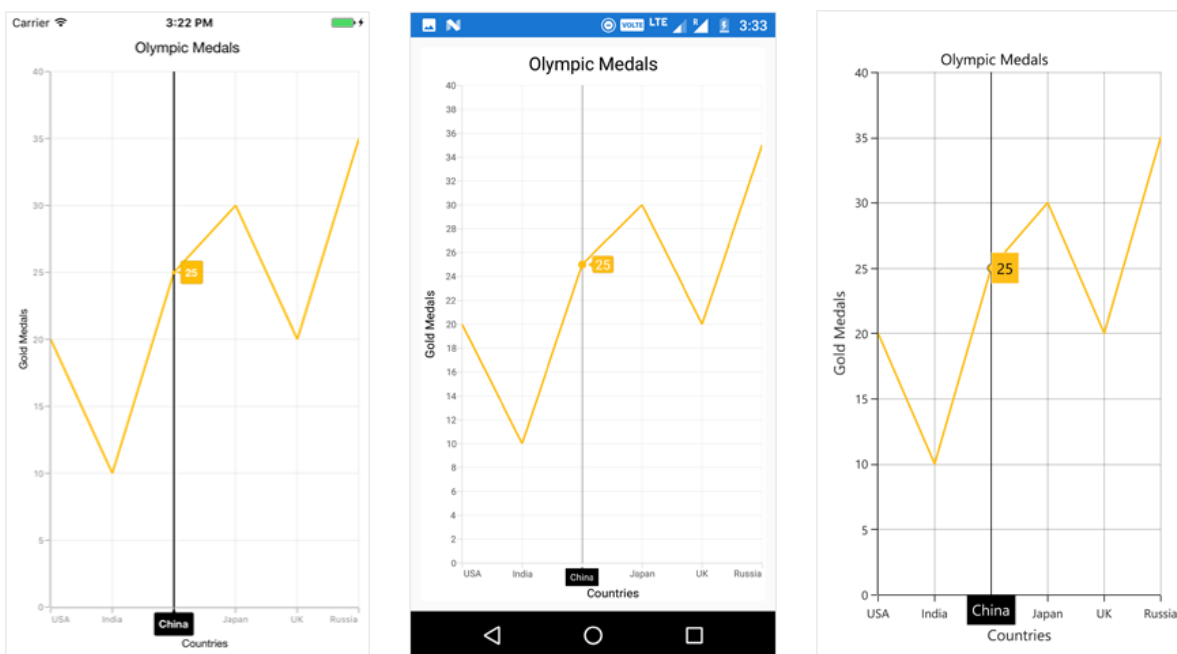

[ChartAxis.TrackballLabelStyle](#) property is used to customize its appearance. Default value of [ChartAxis.ShowTrackballInfo](#) is `False`.

### XML

```
<chart:SfChart.PrimaryAxis >
<chart:CategoryAxis ShowTrackballInfo = "true" />
</chart:SfChart.PrimaryAxis >
```

### C#

```
chart.PrimaryAxis.ShowTrackballInfo = true;
```

### Axis label alignment

The position of trackball's axis label can be changed using the [AxisLabelAlignment](#) property of [ChartTrackballAxisLabelStyle](#). The following options are available in [AxisLabelAlignment](#).

\* [Far](#) - The label will be positioned below the tick in vertical axis and right of the tick in horizontal axis. \*

[Near](#) - The label will be positioned above the tick in vertical axis and left of the tick in horizontal axis. \*

[Center](#) - The label will be positioned at the center of tick. This is the default value.

The following code snippet and screenshot demonstrate the placement of label at the left to tick line.

#### XML

```
<chart:SfChart>
...
<chart:CategoryAxis.TrackballLabelStyle>
<chart:ChartTrackballAxisLabelStyle AxisLabelAlignment="Near"/>
</chart:CategoryAxis.TrackballLabelStyle>
...
</chart:SfChart>
```

#### C#

```
primaryAxis.TrackballLabelStyle.AxisLabelAlignment =
ChartLabelAlignment.Near;
```

![Label alignment support for trackball axis label in Xamarin.Forms

Chart](trackball\_images/AxisLabelAlignment-Near.png)

### Show/hide the series label

This feature is used to show/hide the trackball label of the series by using

[CartesianSeries.ShowTrackballInfo](#) property. Default value of [CartesianSeries.ShowTrackballInfo](#) property is `True`.

## XML

```
<chart:SfChart>
...
<chart:LineSeries ItemsSource="{Binding Data}" XBindingPath="Year"
YBindingPath="Value" ShowTrackballInfo="false" />
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
LineSeries lineSeries = new LineSeries()
{
    ItemsSource = Data,
    XBindingPath = "Year",
    YBindingPath = "Value",
    ShowTrackballInfo = false
};
chart.Series.Add(lineSeries);
```

## Label Template

You can customize the appearance of the Trackball label with your own template by using [TrackballLabelTemplate](#) property of [ChartSeries](#).

## XML

```
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="trackballTemplate">
<StackLayout Orientation="Horizontal">
<Label Text="{Binding Value}" TextColor="White" FontSize="15"
VerticalTextAlignment="Center"/>
```

```

<Image Source ="grain.jpg" WidthRequest="30" HeightRequest="30"/>
</StackLayout>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<chart:SfChart.Series>
<chart:LineSeries TrackballLabelTemplate="{StaticResource
trackballTemplate}" ItemsSource="{Binding Data1}" XBindingPath="Name"
YBindingPath="Value"/>
<chart:LineSeries TrackballLabelTemplate="{StaticResource
trackballTemplate}" ItemsSource="{Binding Data2}" XBindingPath="Name"
YBindingPath="Value"/>
</chart:SfChart.Series>
<chart:SfChart.ChartBehaviors>
<chart:ChartTrackballBehavior/>
</chart:SfChart.ChartBehaviors>

```

## C#

```

SfChart chart = new SfChart ();
...
var lineSeries1 = new LineSeries();
lineSeries1.ItemsSource = Data1;
lineSeries1.XBindingPath = "Name";
lineSeries1.YBindingPath = "Value";
var lineSeries2 = new LineSeries();
lineSeries2.ItemsSource = Data2;
lineSeries2.XBindingPath = "Name";
lineSeries2.YBindingPath = "Value";
DataTemplate trackBallTemplate = new DataTemplate(() =>
{
    StackLayout stack = new StackLayout();
    stack.Orientation = StackOrientation.Horizontal;
    Label label = new Label();
    label.SetBinding(Label.TextProperty, "Value");
    label.FontSize = 15;
    label.VerticalTextAlignment = TextAlignment.Center;
    label.TextColor = Color.White;
    Image image = new Image();
    image.Source = "grain.jpg";
    image.WidthRequest = 30;
    image.HeightRequest = 30;
    stack.Children.Add(label);
    stack.Children.Add(image);
    return stack;
});
lineSeries1.TrackballLabelTemplate = trackBallTemplate;
lineSeries2.TrackballLabelTemplate = trackBallTemplate;
chart.Series.Add(lineSeries1);
chart.Series.Add(lineSeries2);
chart.ChartBehaviors.Add(new ChartTrackballBehavior());

```

### Customize the Axis Label with DataTemplate

Customize the appearance of axis label of trackball using [TrackballLabelTemplate](#) property of [ChartAxis](#).

#### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="axisLabelTemplate">
<Label WidthRequest="50" HeightRequest="20" HorizontalTextAlignment="Center"
BackgroundColor="Blue" Text="{Binding }" TextColor="White" FontSize="15" />
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis ShowTrackballInfo="True"
TrackballLabelTemplate="{StaticResource axisLabelTemplate}">
<chart:CategoryAxis.TrackballLabelStyle>
<chart:ChartTrackballAxisLabelStyle BackgroundColor="Transparent"/>
</chart:CategoryAxis.TrackballLabelStyle>
</chart:CategoryAxis>
</chart:SfChart.PrimaryAxis>
<chart:SfChart.ChartBehaviors>
<chart:ChartTrackballBehavior />
</chart:SfChart.ChartBehaviors>
```

#### C#

```
Chart.PrimaryAxis = new CategoryAxis();
Chart.PrimaryAxis.ShowTrackballInfo = true;
Chart.PrimaryAxis.TrackballLabelStyle.BackgroundColor = Color.Transparent;
DataTemplate axisLabelTemplate = new DataTemplate(() =>
{
    Label label = new Label();
    label.SetBinding(Label.TextProperty, ".");
```

```
label.FontSize = 15;
label.HorizontalTextAlignment = TextAlignment.Center;
label.TextColor = Color.White;
label.BackgroundColor = Color.Blue;
label.WidthRequest = 50;
label.HeightRequest = 20;
return label;
});
Chart.PrimaryAxis.TrackballLabelTemplate = axisLabelTemplate;
Chart.ChartBehaviors.Add(new ChartTrackballBehavior());
```

## Methods

### Show method

The [Show](#) method is used to activate the trackball at the specified location.

#### C#

```
trackball.Show(pointX, pointY);
```

### Hide method

The [Hide](#) method is used to hide the trackball programmatically.

#### C#

```
trackball.Hide();
```

### HitTest method

The [HitTest](#) method is used to check whether the point is in trackball or not.

#### C#

```
[C#]  
trackball.HitTest(pointX, pointY);
```

## Events

### *TrackballCreated*

The [TrackballCreated](#) event occurs when the trackball moves from one data point to another. This argument contains object of [ChartPointsInfo](#). The following properties are available in ChartPointInfo class to customize the appearance of trackball label based on condition.

- [Label](#) - Gets or sets the text of trackball label.
- [IsVisible](#) - Gets or sets the visibility of trackball.
- [Series](#) - Gets the series of the data point in which trackball is activated.
- [LabelStyle](#) - Customizes the appearance of trackball label.
- [DataPoint](#) - Gets the respective underlying object of the data in which trackball is activated.
- [DataPointIndex](#) - Gets the index of the selected data point.
- [XPosition](#) - Gets the x-position of trackball label.
- [YPosition](#) - Gets the y-position of trackball label.
- [BackgroundColor](#) - Gets the default background color of trackball label.

## Tooltip

[SfChart](#) provides tooltip support for all series. It is used to show information about the segment, when you tap on the segment. To enable the tooltip, you need to set [EnableTooltip](#) property as `true`.

### XML

```
<chart:SfChart.Series>  
<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Month"  
YBindingPath="Value" EnableTooltip="True"/>  
</chart:SfChart.Series>
```

### C#

```
ColumnSeries column = new ColumnSeries ();  
column.XBindingPath = "Month";  
column.YBindingPath = "Value";  
column.ItemsSource = Data;  
column.EnableTooltip = true;  
chart.Series.Add(column);
```

### Customizing appearance

You can customize the tooltip label. For customizing, you need to add an instance of [ChartTooltipBehavior](#) to the [ChartBehaviors](#) collection property of [SfChart](#). Following properties are used to customize the tooltip label which are available in [ChartTooltipBehavior](#).

- [BorderColor](#) – used to change the label border color
- [BorderWidth](#) – used to change the label border width
- [BackgroundColor](#) – used to change the label background color
- [Margin](#) – used to change label border thickness
- [TextColor](#) – used to change the text color
- [Font](#) – used to change the label font size, family, and weight. (This is deprecated API. Use [FontSize](#), [FontFamily](#), and [FontAttributes](#) properties instead of this.)
- [FontFamily](#) – used to change the font family for the tooltip text.
- [FontAttributes](#) – used to change the font style for the tooltip text.
- [FontSize](#) – used to change the font size for the tooltip text.
- [LabelFormat](#) – used to format the label
- [Duration](#) – used to set the visible duration of label
- [OffsetX](#) – used to move the label horizontally
- [OffsetY](#) – used to move the label vertically

### XML

```
<chart:SfChart.ChartBehaviors>
  <chart:ChartTooltipBehavior BackgroundColor="Blue" BorderWidth="3"
    BorderColor="Aqua" TextColor="White" Margin="5" Duration="10" Font="Times
    New Roman, 15"/>
</chart:ChartTooltipBehavior>
</chart:SfChart.ChartBehaviors>
```

### C#

```

SfChart chart = new SfChart();
...
ChartTooltipBehavior tool = new ChartTooltipBehavior();
tool.BackgroundColor = Color.Blue;
tool.BorderWidth = 3;
tool.BorderColor = Color.Aqua;
tool.TextColor = Color.White;
tool.Margin = new Thickness(5, 5, 5, 5);
tool.Duration = 10;
tool.Font = Font.OfSize("Times New Roman", 15);
chart.ChartBehaviors.Add(tool);

```

### Tooltip Template

You can customize the appearance of the tooltip with your own template by using the [TooltipTemplate](#) property of [Series](#). The BindingContext in the data template will be the respective underlying object from ItemsSource.

### XML

```

<chart:ColumnSeries ItemsSource="{Binding Data}" XBindingPath="Month"
YBindingPath="Value" EnableTooltip="True">
  <chart:ColumnSeries.TooltipTemplate>
    <DataTemplate>
      <StackLayout Orientation="Vertical">
        <StackLayout Orientation="Horizontal">
          <Label Text="Month : " />
          <Label Text="{Binding Month}" />
        </StackLayout>
        <StackLayout Orientation="Horizontal">
          <Label Text="Value : " />
          <Label Text="{Binding Value}" />
        </StackLayout>
      </StackLayout>
    </DataTemplate>
  </chart:ColumnSeries.TooltipTemplate>
</chart:ColumnSeries>

```

```
</DataTemplate>
</chart:ColumnSeries.TooltipTemplate>
</chart:ColumnSeries>
<chart:SfChart.ChartBehaviors>
<chart:ChartTooltipBehavior BorderWidth="3" BorderColor="Maroon"/>
</chart:SfChart.ChartBehaviors>
```

## C#

```
ColumnSeries column = new ColumnSeries();
column.ItemsSource = viewModel.Data;
column.XBindingPath = "Month";
column.YBindingPath = "Value";
column.EnableTooltip = true;
ChartTooltipBehavior tooltip = new ChartTooltipBehavior();
tooltip.BorderColor = Color.Maroon;
tooltip.BorderWidth = 3;
chart.ChartBehaviors.Add(tooltip);
DataTemplate template = new DataTemplate(() =>
{
    StackLayout stack = new StackLayout() { Orientation =
    StackOrientation.Vertical };
    StackLayout first = new StackLayout() { Orientation =
    StackOrientation.Horizontal };
    Label label = new Label() { Text = "Month:" };
    Label xValue = new Label();
    xValue.SetBinding(Label.TextProperty, new Binding("Month"));
    first.Children.Add(label);
    first.Children.Add(xValue);
    StackLayout second = new StackLayout() { Orientation =
    StackOrientation.Horizontal };
    Label label1 = new Label() { Text = "Value:" };
    Label yValue = new Label();
    yValue.SetBinding(Label.TextProperty, "Value");
    second.Children.Add(label1);
    second.Children.Add(yValue);
    stack.Children.Add(first);
    stack.Children.Add(second);
    return stack;
});
column.TooltipTemplate = template;
chart.Series.Add(column);
```

## Methods

You can show or hide the chart tooltip programmatically by using the show or hide method.

### Show method

The [Show](#) method is used to activate the tooltip at the specified location.

## XML

```
<Button Text="Show tooltip" Clicked="ShowTooltip" />
. . .
<chart:SfChart.ChartBehaviors>
<chart:ChartTooltipBehavior x:Name="tooltipBehavior" />
</chart:SfChart.ChartBehaviors>
```

## C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
    private void ShowTooltip(object sender, EventArgs e)
    {
        //pointX - determines the x position of tooltip, pointY - determines the y
        position of tooltip and bool value determines whether the tooltip should be
        animated while displaying.
        tooltipBehavior.Show(pointX, pointY, true);
    }
}
```

---

**Note:** The tooltip will be activated at the specified location only if there is any data point under the specified location.

---

#### Hide method

The [Hide](#) method is used to hide the tooltip programmatically.

#### C#

```
//The argument determines whether the tooltip should be animated while hiding.
tooltip.Hide(true);
```

## Strip Lines

### What is strip line?

Strip lines are used to shade the different ranges in plot area in different colors to improve the readability of the chart. You can annotate it with text to indicate what that particular region indicates. You can also enable the strip lines to be drawn repeatedly at regular intervals – this will be useful when you want to mark an event that occurs recursively along the timeline of the chart.

### How to add strip lines?

Strip line is classified into **NumericalStripLine** and **DateTimeStripLine** based on the type of input you provide to draw the strip line. Since strip lines are drawn based on the axis, you have to add strip line instance using the [StripLines](#) property of the respective axis. You can also add multiple [StripLines](#) to an axis.

Following properties are used to configure the strip line.

- [Start](#) – used to change the [Start](#) position of the strip line.
- [Width](#) – used to change how long strip line should expand.
- [WidthType](#) - used to change the date time unit of the value specified in the width property. The values can be [Year](#), [Month](#), [Day](#), [Hour](#), [Minute](#), [Second](#) and [Millisecond](#).
- [Text](#) – used to change the text of the strip line.
- [FillColor](#) – used to change the fill color of the strip line.
- [StrokeWidth](#) – used to change the stroke width of the strip line.
- [StrokeColor](#) – used to change the stroke color of the strip line.
- [IsVisible](#) - used to change the visibility of the strip line in chart axis.
- [IsPixelWidth](#) - used to specify the unit type for [Width](#) property, whether it will be screen point or chart value.

### Numerical StripLine

[NumericalStripLine](#) are used to draw strip lines for [NumericalAxis](#) and [CategoryAxis](#). To add a strip line, create an instance of [NumericalStripLine](#) and add to the [StripLines](#) collection property of the respective axis.

#### XML

```
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis Maximum="52" Minimum="28">
<chart:NumericalAxis>
<chart:NumericalStripLine Start="36" Width ="8" Text="Average Temperature"
FillColor="#F4C762"/>
```

```

</chart:NumericalAxis.StripLines>
</chart:NumericalAxis>
</chart:SfChart.SecondaryAxis>

```

## C#

```

NumericalAxis numericalAxis = new NumericalAxis()
{
    Minimum=28,
    Maximum=52
};
chart.SecondaryAxis = numericalAxis;
NumericalStripLine stripLine1 = new NumericalStripLine()
{
    Start = 36,
    Width = 8,
    Text = "Average Temperature",
    FillColor = Color.FromHex("#F4C762")
};
numericalAxis.StripLines.Add(stripLine1);

```

## DateTime StripLine

As the name indicates, [DateTimeStripLine](#) are used to draw strip lines for [DateTimeAxis](#). To add a strip line for [DateTimeAxis](#), create an instance of [DateTimeStripLine](#) and add to the [StripLines](#) collection property of [DateTimeAxis](#).

## XML

```

Namespace:
xmlns:sys="clr-namespace:System;assembly=mscorlib"
...
<chart:SfChart.PrimaryAxis >

```

```

<chart:DateTimeAxis>
<chart:DateTimeAxis.StripLines>
<chart:DateTimeStripLine WidthType="Month" Width="3" Text="Quarter-2"
FillColor="#3FAA38">
<chart:DateTimeStripLine.Start>
<sys:DateTime x:FactoryMethod="Parse">
<x:Arguments>
<x:String>Apr 01 2000</x:String>
</x:Arguments>
</sys:DateTime>
</chart:DateTimeStripLine.Start>
</chart:DateTimeStripLine >
</chart:DateTimeAxis.StripLines>
</chart:DateTimeAxis>
</chart:SfChart.PrimaryAxis>

```

**C#**

```

DateTimeAxis dateTimeAxis = new DateTimeAxis()
{
    Interval = 3,
    IntervalType = DateTimeIntervalType.Months,
    Minimum = new DateTime(2000, 01, 01),
    Maximum = new DateTime(2000, 12, 30)
};
chart.PrimaryAxis = dateTimeAxis;
DateTimeStripLine stripLine = new DateTimeStripLine()
{
    Start = new DateTime(2000, 04, 01),
    WidthType = DateTimeComponent.Month,
    Width = 3,
    Text = "Quarter-2",
    FillColor = Color.FromHex("#3FAA38")
};
dateTimeAxis.StripLines.Add(stripLine);

```

### Strip Line Recurrence

This feature is used to enable the strip lines to be drawn repeatedly at the regular intervals – this will be useful when you want to mark an event that occurs recursively along the timeline of the chart. Following properties are used to configure this feature.

- [RepeatEvery](#) – used to change the frequency of the strip line being repeated.
- [RepeatUntil](#) – specifies the end value at which point strip line has to stop repeating.

Following code snippet and screenshot demonstrates this feature by highlighting weekends.

### XML

```
<chart:SfChart.PrimaryAxis>
<chart:NumericalAxis>
<chart:NumericalAxis.StripLines>
<chart:NumericalStripLine Start="6" Width="1" RepeatEvery="7"
Text="Weekend" FillColor="#ECE6F1">
<chart:NumericalStripLine.LabelStyle>
<chart:ChartStripLineLabelStyle Angle="270" TextColor="Red"/>
</chart:NumericalStripLine.LabelStyle>
</chart:NumericalStripLine>
</chart:NumericalAxis.StripLines>
</chart:NumericalAxis>
</chart:SfChart.PrimaryAxis>
```

### C#

```
NumericalAxis numericalAxis = new NumericalAxis()
{
    EdgeLabelsDrawingMode = EdgeLabelsDrawingMode.Shift
};
sfChart.PrimaryAxis = numericalAxis;
NumericalStripLine stripLine = new NumericalStripLine();
```

```
stripLine.FillColor = Color.FromHex("FFECE6F1");
stripLine.Start = 6;
stripLine.Width = 1;
stripLine.RepeatEvery = 7;
stripLine.Text = "Weekend";
stripLine.LabelStyle.Angle = 270;
stripLine.LabelStyle.TextColor = Color.Red;
numericalAxis.StripLines.Add(stripLine);
```

### Customize Text

The [LabelStyle](#) property provide options to customize the font-family, color, size and font-weight of strip line text. Following are the options available,

- [TextColor](#) – used to change the color of the text.
- [BackgroundColor](#) – used to change the label background color.
- [BorderColor](#) – used to change the border color.
- [BorderThickness](#) – used to change the thickness of the border.
- [Font](#) – used to change the text size, font family and font weight.
- [Margin](#) - used to change the margin size for text.
- [Angle](#) – used to rotate the text.
- [HorizontalAlignment](#) – used to change the horizontal alignment of text.
- [VerticalAlignment](#) - used to change the vertical alignment of text.

### XML

```
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis Maximum="30" Minimum="48">
<chart:NumericalAxis.StripLines>
```

```
<chart:NumericalStripLine Start="42" Width="6" Text="High Temperature"
FillColor="#EF7878">
<chart:NumericalStripLine.LabelStyle>
<chart:ChartStripLineLabelStyle HorizontalAlignment="Near"
VerticalAlignment="Center" TextColor="Blue" Font="20"/>
</chart:NumericalStripLine.LabelStyle>
</chart:NumericalStripLine>
</chart:NumericalAxis.StripLines>
</chart:NumericalAxis>
</chart:SfChart.SecondaryAxis>
```

**C#**

```
NumericalAxis numericalAxis = new NumericalAxis()
{
    Minimum=30,
    Maximum=48
};
chart.SecondaryAxis = numericalAxis;
chart.SecondaryAxis.Title.Text = "Temperature in Celsius";
NumericalStripLine stripLine = new NumericalStripLine()
{
    Start = 42,
    Width = 6,
    Text = "High Temperature",
    FillColor = Color.FromHex("#EF7878")
};
stripLine.LabelStyle.TextColor = Color.Blue;
stripLine.LabelStyle.Font = Font.SystemFontOfSize(20);
stripLine.LabelStyle.HorizontalAlignment = ChartLabelAlignment.Near;
stripLine.LabelStyle.VerticalAlignment = ChartLabelAlignment.Center;
numericalAxis.StripLines.Add(stripLine);
```

### Segmented StripLine

Typically, if you draw a strip line for a vertical axis, the height of the strip line is determined by the [Start](#) and [Width](#) properties and width of the strip line is equivalent to the width of its associated horizontal axis i.e., strip line is drawn horizontally to the entire stretch of its associated horizontal axis. Similarly, for horizontal axis, width is determined by [Start](#) and [Width](#) properties, and vertically, it is drawn to the entire stretch of the associated vertical axis.

Suppose, you want to draw a strip line that should not stretch along its associated axis, you have to set [SegmentStart](#) and [SegmentEnd](#) properties. Values provided in these two properties correspond to its associated axis specified by [SegmentAxisName](#) property. Finally, you need to set [IsSegmented](#) property to true to indicate that strip line should be drawn as a segment.

- [IsSegmented](#) – Used to enable / disable the segmented strip line.
- [SegmentStart](#) – Used to change the segment start value. Value correspond to associated axis.
- [SegmentEnd](#) – Used to change the segment end value. Value correspond to associated axis.
- [SegmentAxisName](#) – Used to specify the name of the associated axis name.
- [Name](#) - Used to specify the unique name for the axis.

---

**Note:** You can set the double or DateTime value for SegmentStart and SegmentEnd properties based on the associated axis type.

---

Following code snippet shows how to set the segment start and end value if the associated axis type is numerical.

#### XML

```
<chart:SfChart.PrimaryAxis>
<chart:CategoryAxis EdgeLabelsDrawingMode="Shift" Interval="3">
<chart:CategoryAxis.StripLines>
<chart:NumericalStripLine IsSegmented="True" SegmentAxisName="Amount"
SegmentStart="40" SegmentEnd="46" Start="3" Width ="3" Text="Quarter-2"
FillColor="#EF7878"/>
</chart:CategoryAxis.StripLines>
</chart:CategoryAxis>
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis Minimum="30" Maximum="48" Name="Amount"/>
</chart:SfChart.SecondaryAxis>
```

#### C#

```
NumericalStripLine stripLine = new NumericalStripLine()
{
    Start = 3,
    Width = 3,
    Text = "Quarter-2",
    FillColor = Color.FromHex("#EF7878"),
    IsSegmented = true,
    SegmentAxisName = "Amount",
    SegmentStart = 40,
    SegmentEnd = 46
};
CategoryAxis categoryAxis = new CategoryAxis()
{
```

```

EdgeLabelsDrawingMode = EdgeLabelsDrawingMode.Shift,
Interval = 3
};
NumericalAxis numericalAxis = new NumericalAxis()
{
    Minimum = 30,
    Maximum = 48,
    Name = "Amount"
};
categoryAxis.StripLines.Add(stripLine);
chart.PrimaryAxis = categoryAxis;
chart.SecondaryAxis = numericalAxis;

```

Following code snippet shows how to set the segment start and end value if the associated axis type is date time.

### XML

```

<chart:SfChart.PrimaryAxis>
<chart:DateTimeAxis EdgeLabelsDrawingMode="Shift" Name="Period"/>
</chart:SfChart.PrimaryAxis>
<chart:SfChart.SecondaryAxis>
<chart:NumericalAxis>
<chart:NumericalAxis.StripLines>
<chart:NumericalStripLine IsSegmented="True" SegmentAxisName="Period"
Start="42" Width="4" Text="Quarter-2" FillColor="#3FAA38">
<chart:NumericalStripLine.SegmentStart>
<sys:DateTime x:FactoryMethod="Parse">
<x:Arguments>
<x:String>Jan 1 2000</x:String>
</x:Arguments>
</sys:DateTime>
</chart:NumericalStripLine.SegmentStart>
<chart:NumericalStripLine.SegmentEnd>

```

```
<sys:DateTime x:FactoryMethod="Parse">
<x:Arguments>
<x:String>Jun 30 2000</x:String>
</x:Arguments>
</sys:DateTime>
</chart:NumericalStripLine.SegmentEnd>
</chart:NumericalStripLine>
</chart:NumericalAxis.StripLines>
</chart:NumericalAxis>
</chart:SfChart.SecondaryAxis>
```

## C#

```
NumericalStripLine stripLine = new NumericalStripLine()
{
    Start = 42,
    Width = 4,
    Text = "Quarter-2",
    FillColor = Color.FromHex("#3FAA38"),
    IsSegmented = true,
    SegmentAxisName = "Period",
    SegmentStart = new DateTime(2000, 4, 1),
    SegmentEnd = new DateTime(2000, 6, 30)
};
chart.PrimaryAxis = new DateTimeAxis()
{
    EdgeLabelsDrawingMode = EdgeLabelsDrawingMode.Shift,
    Name = "Period"
};
NumericalAxis numericalAxis = new NumericalAxis()
{
    Minimum = 30,
    Maximum = 48
};
chart.SecondaryAxis = numericalAxis;
numericalAxis.StripLines.Add(stripLine);
```

## Performance

Following are the key points that can be used to boost the performance of the chart when there is a need to plot high volume data.

- When there are large number of points to load in line series, you can use [FastLineSeries](#) series instead of [LineSeries](#). To render a fast line chart, create an instance of [FastLineSeries](#) and add to the [Series](#) collection property of [SfChart](#).

## XML

```
<chart:SfChart>
...
<chart:FastLineSeries ItemsSource="{Binding Data}" XBindingPath="XValue"
YBindingPath="YValue"/>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
FastLineSeries fastLineSeries = new FastLineSeries()
{
    ItemsSource = Data,
    XBindingPath = "XValue",
    YBindingPath = "YValue"
};
chart.Series.Add(fastLineSeries);
```

**Note:** If you have minimal set of data points, the recommended approach is to use normal line series to visualize those data using line chart. Because the normal line series has provisions to customize the color and shape of individual line.

- Instead of enabling data markers and labels when there are large number of data points, you can use [Trackball](#) to view the point information.
- The default stroke width of the [FastLineSeries](#) is 2, reducing this to 1 will improve the performance. Refer the following code snippet to configure the stroke width of FastLineSeries.

### XML

```
<chart:SfChart>
...
<chart:FastLineSeries ItemsSource="{Binding Data}" XBindingPath="XValue"
YBindingPath="YValue" StrokeWidth="1"/>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
FastLineSeries fastLineSeries = new FastLineSeries()
{
    ItemsSource = Data,
    XBindingPath = "XValue",
    YBindingPath = "YValue",
    StrokeWidth = 1
};
chart.Series.Add(fastLineSeries);
```

- When the underlying data object implements [INotifyPropertyChanged](#), you need to enable the [ListenPropertyChange](#) property of the series, to make the chart listen to the property changes of your data object. However enabling this property registers [PropertyChanged](#) event of every object in the data source. Due to this, chart's loading time is affected when there are a large number of points. By default, [ListenPropertyChange](#) is set to false in order to avoid the event registration unnecessarily.
- Whenever there is a new data point is added to the [ItemsSource](#) property of [ChartSeries](#), the chart will be refreshed with new data point if the [ItemsSource](#) property contains [ObservableCollection](#). In order to avoid the chart rendering for each update in [ItemsSource](#), you can suspend the chart using [SuspendSeriesNotification](#) method of chart and the [ResumeSeriesNotification](#) should be called once the required data points are added to the collection and the chart should be refreshed with data points that have been added between these two method calls.

### C#

```
Chart.SuspendSeriesNotification();
// ...
// Add the data points to ItemsSource property.
// ...
Chart.ResumeSeriesNotification();
```

Similarly, you can use [SuspendNotification](#) and [ResumeNotification](#) methods of [ChartSeries](#) to suspend and resume the update of the respective series.

## C#

```
series.SuspendNotification();  
// ...  
// Add the data points to ItemsSource property.  
// ...  
series.ResumeNotification();
```

## Annotation

[SfChart](#) supports annotations which allows you to mark the specific area of interest in the chart area. You can add text, images, and custom views.

The following annotations are supported in [SfChart](#):

- Text annotation
- Shape annotation
- View annotation

## Adding Annotations

You can create an instance for any type of annotations and it can be added to [ChartAnnotations](#) collection. Here for an instance, the [EllipseAnnotation](#) is added.

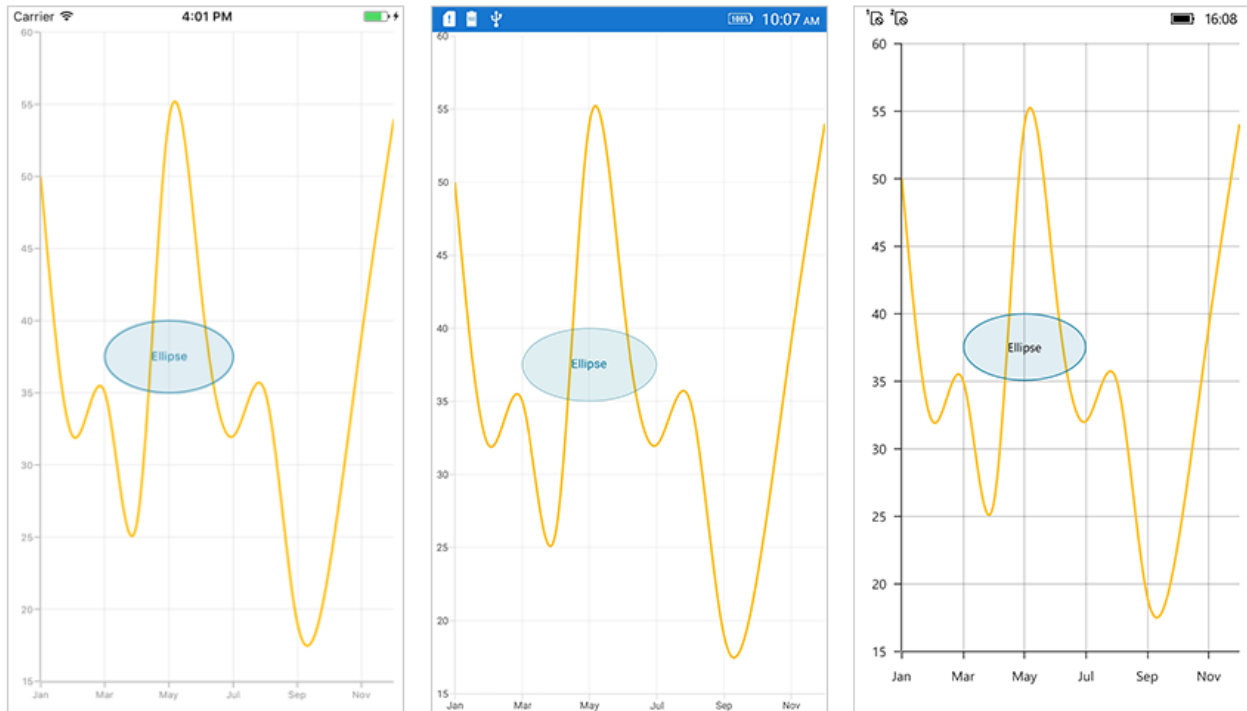

## XML

```
<chart:SfChart>  
...  
<chart:SfChart.ChartAnnotations>  
<chart:EllipseAnnotation X1="2" Y1="35" X2="6" Y2="40" Text="Ellipse" />  
</chart:SfChart.ChartAnnotations>  
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();  
...  
EllipseAnnotation annotation = new EllipseAnnotation()  
{  
    X1 = 2,  
    Y1 = 35,  
    X2 = 6,  
    Y2 = 40,  
    Text = "Ellipse"  
};  
chart.ChartAnnotations.Add(annotation);
```

### Positioning the annotation

Annotations can be positioned in plot area based on [X1](#) and [Y1](#) properties. For shape annotations, specify [X2](#) and [Y2](#) properties, if needed. The [X](#) and [Y](#) values can be specified with axis units or pixel units, and these can be identified by using [CoordinateUnit](#) property.

#### Positioning based on *CoordinateUnit* as axis

To position the annotation based on axis, set the [X1](#) and [Y1](#), [X2](#) and [Y2](#) properties based on axis range values, if needed, set the [CoordinateUnit](#) value as [Axis](#).

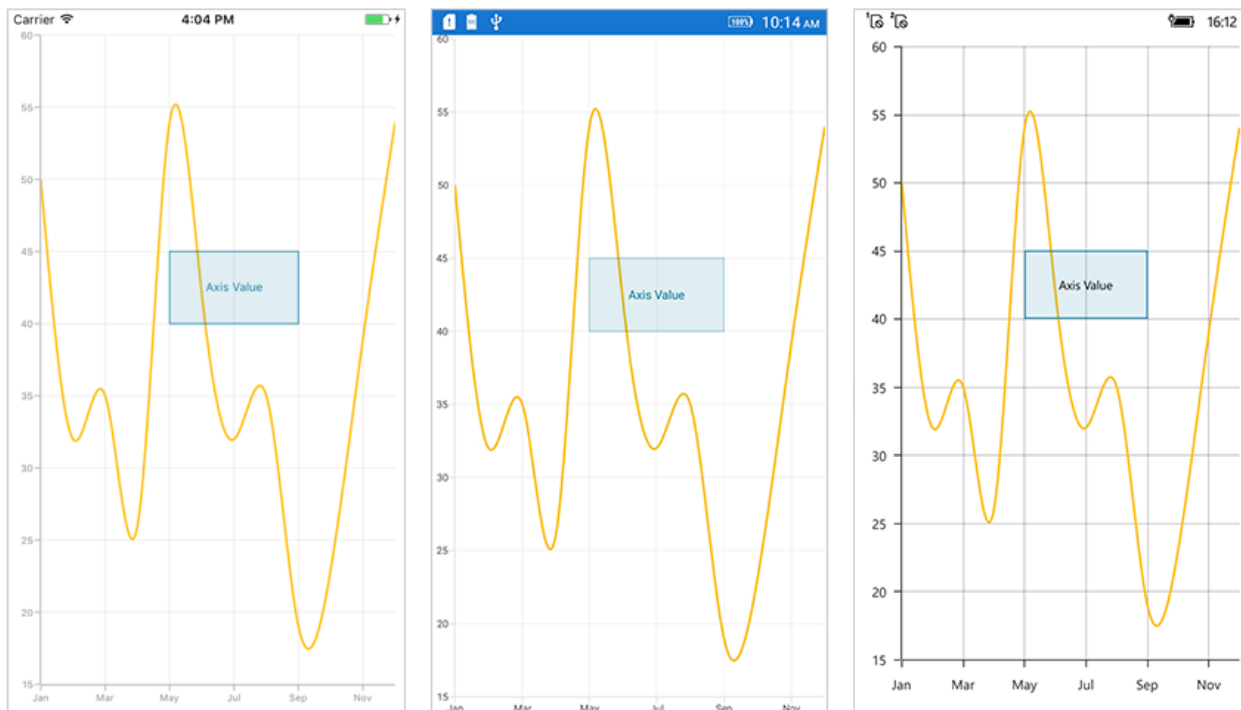

### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:RectangleAnnotation X1="4" Y1="40" X2="8" Y2="45" Text="Axis Value"
CoordinateUnit="Axis" />
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
RectangleAnnotation annotation = new RectangleAnnotation()
{
    X1 = 4,
    Y1 = 40,
    X2 = 8,
    Y2 = 45,
    Text = "Axis Value",
    CoordinateUnit = ChartCoordinateUnit.Axis
}
```

```
};
chart.ChartAnnotations.Add(annotation);
```

#### Positioning based on *CoordinateUnit* as pixels

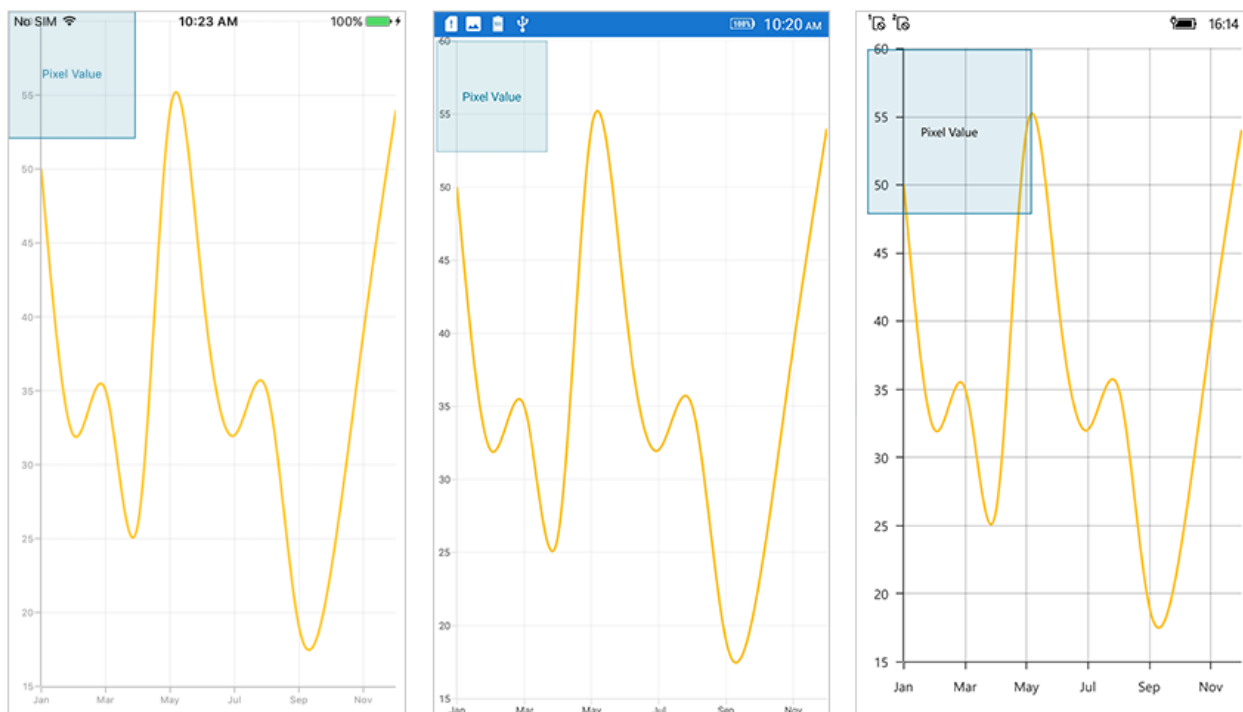

To position the annotation based on the pixel values, set the [CoordinateUnit](#) value as [Pixels](#), and the pixel values in [X1](#) and [Y1](#), [X2](#) and [Y2](#) properties of annotation are shown in the following code snippet,

#### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:RectangleAnnotation X1="1" Y1="1" X2="150" Y2="150" Text="Pixel
Value" CoordinateUnit="Pixels" />
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
...
RectangleAnnotation annotation = new RectangleAnnotation()
{
    X1 = 1,
    Y1 = 1,
    X2 = 150,
    Y2 = 150,
    Text = "Pixel Value",
    CoordinateUnit = ChartCoordinateUnit.Pixels
};
chart.ChartAnnotations.Add(annotation);
```

### Adding annotation for multiple axes

When there are multiple axes, annotation also can be added for a particular axis by using the [XAxisName](#) and [YAxisName](#) properties. It can be shown in the below code snippet,

#### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:EllipseAnnotation X1="4" Y1="30" X2="8" Y2="35" YAxisName="Yaxis"/>
</chart:SfChart.ChartAnnotations>
<chart:SfChart.Series>
<chart:SplineSeries ItemsSource="{Binding Data}" XBindingPath="Name"
YBindingPath="Value">
<chart:SplineSeries.YAxis>
<chart:NumericalAxis Name="Yaxis" OpposedPosition="true"/>
</chart:SplineSeries.YAxis>
</chart:SplineSeries>
</chart:SfChart.Series>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
...
EllipseAnnotation annotation = new EllipseAnnotation()
{
    X1 = 4,
    Y1 = 30,
    X2 = 8,
```

```

Y2 = 35,
YAxisName = "YAxis"
};
chart.ChartAnnotations.Add(annotation);
SplineSeries series = new SplineSeries()
{
    ItemsSource = model.Data,
    XBindingPath = "Name",
    YBindingPath = "Value",
    YAxis = new NumericalAxis()
    {
        OpposedPosition = true,
        Name = "YAxis"
    }
};
chart.Series.Add(series);

```

### Text annotation

The [TextAnnotation](#) is used to add simple text with the help of [Text](#) property in specific points over the [Chart](#) area.

### XML

```

<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:TextAnnotation X1="7" Y1="35" Text="August" />
</chart:SfChart.ChartAnnotations>
</chart:SfChart>

```

### C#

```

SfChart chart = new SfChart();
...
TextAnnotation annotation = new TextAnnotation()
{
    X1 = 7,
    Y1 = 35,
    Text = "August"
};
chart.ChartAnnotations.Add(annotation);

```

### Customizing text annotation

The [TextAnnotation](#) can be customized by using the [LabelStyle](#) property. The following properties are used to customize the text:

- [TextColor](#) - Used to change the text color.
- [BackgroundColor](#) - Used to change the background color of the text.
- [Margin](#) - Used to set the margin for text.
- [BorderThickness](#) - Used to change the text border thickness.
- [BorderColor](#) - Used to change the border color of the text.
- [Font](#) - Used to change text font size, family and weight.
- [HorizontalTextAlignment](#) - Used to align the text horizontally at the [Start](#), [Center](#) and [End](#).
- [VerticalTextAlignment](#) - Used to align the text vertically at the [Start](#), [Center](#) and [End](#).

### XML

```

<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:TextAnnotation X1="7" Y1="35" Text="August">

```

```

<chart:TextAnnotation.LabelStyle>
<chart:ChartAnnotationLabelStyle Margin="5" Font="Italic,16"
BorderColor="Red" BorderThickness="2" BackgroundColor="Teal"
TextColor="White" VerticalTextAlignment="Start"/>
</chart:TextAnnotation.LabelStyle>
</chart:TextAnnotation>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>

```

## C#

```

SfChart chart = new SfChart();
...
TextAnnotation annotation = new TextAnnotation()
{
    X1 = 7,
    Y1 = 35,
    Text = "August"
};
annotation.LabelStyle = new ChartAnnotationLabelStyle()
{
    Margin = new Thickness(5),
    Font = Font.SystemFontOfSize(16, FontAttributes.Italic),
    BorderColor = Color.Red,
    BorderThickness = new Thickness(2),
    BackgroundColor = Color.Teal,
    TextColor = Color.White,
    VerticalTextAlignment = ChartAnnotationAlignment.Start
};
chart.ChartAnnotations.Add(annotation);

```

### Shape annotation

The [ShapeAnnotation](#) allows you to add annotations in the form of shapes such as rectangle, ellipse, horizontal line, vertical line, etc., at the specific area of interest in the chart area.

- [RectangleAnnotation](#) - Used to draw a rectangle over the chart area.
- [EllipseAnnotation](#) - Used to draw a circle or an ellipse over the chart area.
- [LineAnnotation](#) - Used to draw a line over the chart area.
- [VerticalLineAnnotation](#) - Used to draw a vertical line across the chart area.
- [HorizontalLineAnnotation](#) - Used to draw a horizontal line across the chart area.

The following APIs are commonly used in all [ShapeAnnotation](#):

- [X2](#) - Represents the X2 coordinate of the shape annotation.
- [Y2](#) - Represents the Y2 coordinate of the shape annotation.
- [FillColor](#) - Represents the inside background color of the shape annotation.
- [StrokeColor](#) - Represents the stroke color of the shape annotation.
- [StrokeWidth](#) - Represents the stroke width of the shape annotation.
- [StrokeDashArray](#) - Represents the stroke dashes of the shape annotation.
- [Text](#) - Represents the annotation text of the shape annotation.
- [LabelStyle](#) - Represents the style for customizing the annotation text of shape annotation.

### Rectangle annotation

The [RectangleAnnotation](#) is used to draw a rectangle or a square in specific points over the chart area.

#### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:RectangleAnnotation X1="4" Y1="20" X2="6" Y2="55"/>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
...
RectangleAnnotation annotation = new RectangleAnnotation()
{
    X1 = 4,
    Y1 = 20,
    X2 = 6,
    Y2 = 55,
};
chart.ChartAnnotations.Add(annotation);
```

### Ellipse annotation

The [EllipseAnnotation](#) is used to draw an oval or a circle in specific points over the chart area. You can also specify the height and width of [EllipseAnnotation](#) by using the [Height](#) and [Width](#) properties respectively.

### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:EllipseAnnotation X1="6" Y1="32" Height="30" Width="30"/>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
EllipseAnnotation annotation = new EllipseAnnotation()
{
    X1 = 6,
    Y1 = 32,
    Height = 30,
    Width = 30
};
chart.ChartAnnotations.Add(annotation);
```

**Note:** When X2 and Y2 properties of [EllipseAnnotation](#) are set, the [Height](#) and [Width](#) properties do not work.

### Line annotation

The [LineAnnotation](#) is used to draw a line in specific points over the chart area.

#### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:LineAnnotation X1="2" Y1="35" X2="8" Y2="45" Text="Line"/>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart();
...
LineAnnotation annotation = new LineAnnotation()
{
    X1 = 2,
    Y1 = 35,
    X2 = 8,
    Y2 = 45,
    Text = "Line"
};
chart.ChartAnnotations.Add(annotation);
```

#### Adding arrow to line annotation

To display single headed arrow, set the [LineCap](#) property to [Arrow](#). The default value of the [LineCap](#) property is [None](#).

#### XML

```

<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:LineAnnotation X1="2" Y1="40" X2="10" Y2="40" LineCap="Arrow"/>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>

```

## C#

```

SfChart chart = new SfChart();
...
LineAnnotation annotation = new LineAnnotation()
{
    X1 = 2,
    Y1 = 40,
    X2 = 10,
    Y2 = 40,
    LineCap = ChartLineCap.Arrow
};
chart.ChartAnnotations.Add(annotation);

```

### Vertical and Horizontal line annotation

The [VerticalLineAnnotation](#) and [HorizontalLineAnnotation](#) are used to draw vertical and horizontal lines in specific points over the chart area.

## XML

```

<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:VerticalLineAnnotation X1="6" />

```

```
<chart:HorizontalLineAnnotation Y1="35" />
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
VerticalLineAnnotation vertical = new VerticalLineAnnotation()
{
    X1 = 6,
};
chart.ChartAnnotations.Add(vertical);
HorizontalLineAnnotation horizontal = new HorizontalLineAnnotation()
{
    Y1 = 35
};
chart.ChartAnnotations.Add(horizontal);
```

## Displaying axis label for vertical and horizontal line annotations

The [VerticalLineAnnotation](#) and [HorizontalLineAnnotation](#) display the axis labels in which the line is placed. This feature can be enabled by setting the [ShowAxisLabel](#) property to `true` as shown in the below code snippet,

## XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:VerticalLineAnnotation X1="6" ShowAxisLabel="true"/>
```

```
<chart:HorizontalLineAnnotation Y1="35" ShowAxisLabel="true"/>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart();
...
VerticalLineAnnotation vertical = new VerticalLineAnnotation()
{
    X1 = 6,
    ShowAxisLabel = true
};
chart.ChartAnnotations.Add(vertical);
HorizontalLineAnnotation horizontal = new HorizontalLineAnnotation()
{
    Y1 = 35,
    ShowAxisLabel = true
};
chart.ChartAnnotations.Add(horizontal);
```

## Customizing axis label

The default appearance of the axis label also can be customized by using the [AxisLabelStyle](#) property. The following properties are used to customize the axis label:

- [TextColor](#) - Used to change the text color.
- [BackgroundColor](#) - Used to change the background color of the text.
- [Margin](#) - Used to set the margin for text.
- [BorderThickness](#) - Used to change the text border thickness.

- [BorderColor](#) - Used to change the border color of the text.
- [Font](#) - Used to change text font size, family, and weight.

### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:VerticalLineAnnotation X1="6" ShowAxisLabel="true">
<chart:VerticalLineAnnotation.AxisLabelStyle>
<chart:ChartLabelStyle Margin="5" Font="Italic,12" BorderColor="Blue"
BorderThickness="2" BackgroundColor="Red" TextColor="White"/>
</chart:VerticalLineAnnotation.AxisLabelStyle>
</chart:VerticalLineAnnotation>
<chart:HorizontalLineAnnotation Y1="35" ShowAxisLabel="true">
<chart:HorizontalLineAnnotation.AxisLabelStyle>
<chart:ChartLabelStyle Margin="5" Font="Italic,12" BorderColor="Blue"
BorderThickness="2" BackgroundColor="Red" TextColor="White"/>
</chart:HorizontalLineAnnotation.AxisLabelStyle>
</chart:HorizontalLineAnnotation>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
VerticalLineAnnotation vertical = new VerticalLineAnnotation()
{
    X1 = 6,
    ShowAxisLabel = true
};
vertical.AxisLabelStyle = new ChartLabelStyle()
{
    Margin = new Thickness(5),
    Font = Font.SystemFontOfSize(12, FontAttributes.Italic),
    BorderColor = Color.Blue,
    BorderThickness = new Thickness(2),
    BackgroundColor = Color.Red,
    TextColor = Color.White
};
chart.ChartAnnotations.Add(vertical);
HorizontalLineAnnotation horizontal = new HorizontalLineAnnotation()
{
    Y1 = 35,
    ShowAxisLabel = true
};
horizontal.AxisLabelStyle = new ChartLabelStyle()
{
    Margin = new Thickness(5),
    Font = Font.SystemFontOfSize(12, FontAttributes.Italic),
    BorderColor = Color.Blue,
    BorderThickness = new Thickness(2),
    BackgroundColor = Color.Red,
    TextColor = Color.White
};
```

```
chart.ChartAnnotations.Add(horizontal);
```

### Adding arrow to vertical and horizontal line annotations

To display the single headed arrow, set the [LineCap](#) property to `Arrow`. The default value of the [LineCap](#) property is `None`.

### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart: VerticalLineAnnotation X1="6" LineCap="Arrow"/>
<chart:HorizontalLineAnnotation Y1="35" LineCap="Arrow"/>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
VerticalLineAnnotation vertical = new VerticalLineAnnotation()
{
    X1 = 6,
    LineCap = ChartLineCap.Arrow
};
chart.ChartAnnotations.Add(vertical);
HorizontalLineAnnotation horizontal = new HorizontalLineAnnotation()
{
    Y1 = 35,
    LineCap = ChartLineCap.Arrow
};
```

```
chart.ChartAnnotations.Add(horizontal);
```

#### *Adding text in shape annotation*

For all the shape annotations, the text can be displayed by using the [Text](#) property.

#### **Customizing text in shape annotation**

The [Text](#) in shape annotation also can be customized by using the [LabelStyle](#) property. The following properties are used to customize the text:

- [TextColor](#) - Used to change the text color.
- [BackgroundColor](#) - Used to change the background color of the text.
- [Margin](#) - Used to set the margin for text.
- [BorderThickness](#) - Used to change the text border thickness.
- [BorderColor](#) - Used to change the text border color.
- [Font](#) - Used to change text font size, family, and weight.
- [HorizontalTextAlignment](#) - Used to align the text horizontally.
- [VerticalTextAlignment](#) - Used to align the text vertically.

#### **XML**

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:EllipseAnnotation X1="2" Y1="30" X2="6" Y2="35" Text="Ellipse" >
<chart:EllipseAnnotation.LabelStyle>
<chart:ChartAnnotationLabelStyle Margin="5" Font="Italic,16"
BorderColor="Red" BorderThickness="2" BackgroundColor="Blue"
TextColor="White"/>
</chart:EllipseAnnotation.LabelStyle>
```

```

</chart:EllipseAnnotation>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>

```

## C#

```

SfChart chart = new SfChart();
...
EllipseAnnotation annotation = new EllipseAnnotation()
{
    X1 = 2,
    Y1 = 30,
    X2 = 6,
    Y2 = 35,
    Text = "Ellipse"
};
annotation.LabelStyle = new ChartAnnotationLabelStyle()
{
    Margin = new Thickness(5),
    Font = Font.SystemFontOfSize(16, FontAttributes.Italic),
    BorderColor = Color.Red,
    BorderThickness = new Thickness(2),
    BackgroundColor = Color.Blue,
    TextColor = Color.White,
};
chart.ChartAnnotations.Add(annotation);

```

### View annotation

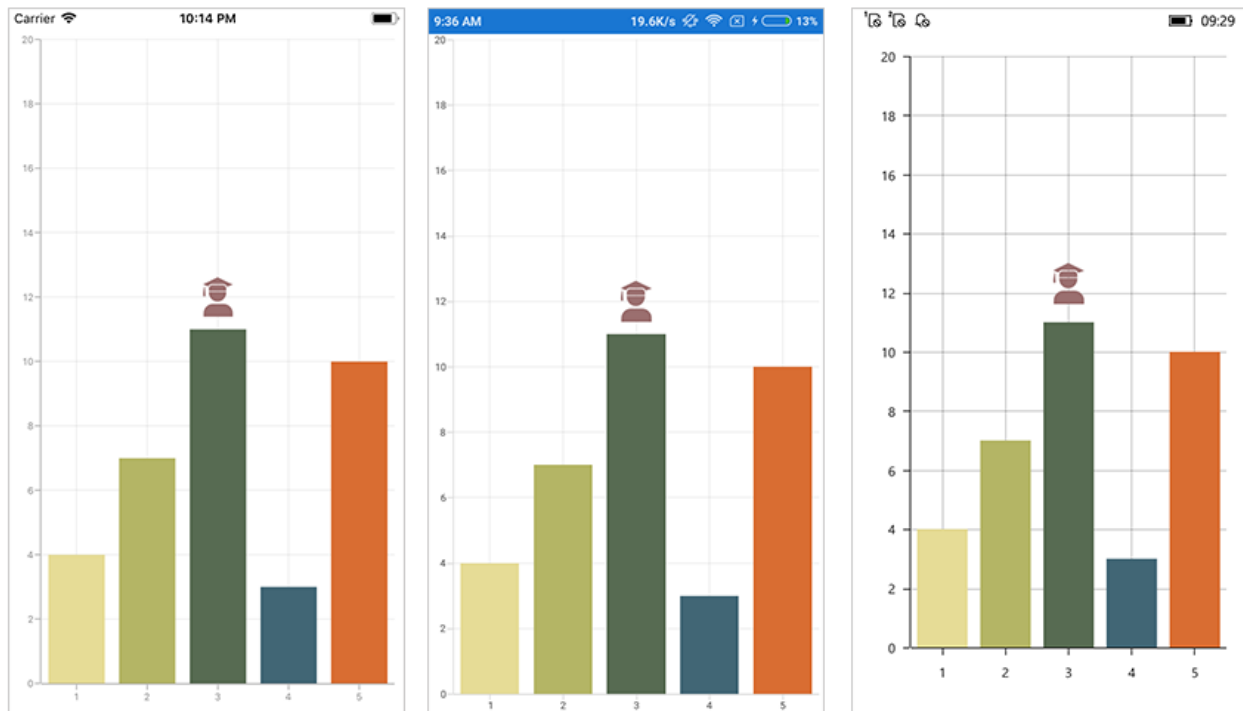

The [ViewAnnotation](#) allows you to add annotations in the form of own custom view with the help of [View](#) property at the specific area of interest in the chart area. The [ViewAnnotation](#) also can be aligned by using the [VerticalAlignment](#) and [HorizontalAlignment](#) properties.

### XML

```
<chart:SfChart>
...
<chart:SfChart.ChartAnnotations>
<chart:ViewAnnotation X1="3" Y1="12" VerticalAlignment="Start" >
<chart:ViewAnnotation.View>
<StackLayout>
<Image Source="Graduate.png" WidthRequest="70" HeightRequest="70" />
</StackLayout>
</chart:ViewAnnotation.View>
</chart:ViewAnnotation>
</chart:SfChart.ChartAnnotations>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
ViewAnnotation annotation = new ViewAnnotation()
{
    X1 = 3,
    Y1 = 12,
    VerticalAlignment = ChartAnnotationAlignment.Start
};
StackLayout layout = new StackLayout();
Image image = new Image();
image.Source = "Graduate.png";
image.HeightRequest = 70;
image.WidthRequest = 70;
layout.Children.Add(image);
annotation.View = layout;
chart.ChartAnnotations.Add(annotation);
```

## Event

### AnnotationClicked

The [AnnotationClicked](#) event is triggered when the user has clicked the annotation. The argument contains the following information.

- [Annotation](#) – used to get the instance of annotation which is clicked.
- [X](#) – used to get the x position of touch point on annotation.
- [Y](#) – used to get the y position of touch point on annotation..

## Get the touch position in annotation

Following are the override methods that are available in annotation to send the information about touch interactions.

- [OnTouchDown](#) – occurs when touch down inside the annotation.
- [OnTouchMove](#) – occurs while moving the finger or mouse inside the annotation.
- [OnTouchUp](#) – occurs when touch up inside the annotation.

## C#

```
public class TextAnnotationExt : TextAnnotation
{
    protected override void OnTouchDown(float pointX, float pointY)
    {
        base.OnTouchDown(pointX, pointY);
    }
    protected override void OnTouchMove(float pointX, float pointY)
    {
        base.OnTouchMove(pointX, pointY);
    }
}
```

```
protected override void OnTouchUp(float pointX, float pointY)
{
    base.OnTouchUp(pointX, pointY);
}
```

## Technical Indicators

The different types of technical indicators available in chart are follows:

- [AverageTrueIndicator](#)
- [SimpleMovingAverageIndicator](#)
- [RSITechnicalIndicator](#)
- [AccumulationDistributionIndicator](#)
- [MomentumIndicator](#)
- [StochasticIndicator](#)
- [ExponentialMovingAverageIndicator](#)
- [TriangularMovingAverageIndicator](#)
- [BollingerBandIndicator](#)
- [MACDIndicator](#)

Adding technical indicators to chart

The following section illustrates how to add technical indicators to chart.

### Initializing indicator

Create an instance for any technical indicator, and add it to the [TechnicalIndicators](#) collection.

Here, for an instance, the [AccumulationDistributionIndicator](#) is added.

### XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:AccumulationDistributionIndicator />
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart();
...
AccumulationDistributionIndicator indicator= new
AccumulationDistributionIndicator();
chart.TechnicalIndicators.Add(indicator);
```

### Binding data

Set the [ItemsSource](#) and binding paths ([Open](#), [High](#), [Low](#), [Close](#), [XBindingPath](#) and [Trigger](#)) to fetch the values from model.

### XML

```

<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:AccumulationDistributionIndicator ItemsSource="{Binding
TechnicalIndicatorData}" XBindingPath="XValue" Open="Open" High="High"
Low="Low" Close="Close" Volume="Volume"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>

```

**C#**

```

SfChart chart = new SfChart()
{
...
TechnicalIndicators =
{
new AccumulationDistributionIndicator()
{
ItemsSource = viewModel.TechnicalIndicatorData,
XBindingPath = "XValue",
Open = "Open",
High = "High",
Low = "Low",
Close = "Close"
}
}
};

```

**Binding the items source of chart series**

By setting [Name](#) property of [FinancialSeriesBase](#) to the [SeriesName](#) property of [FinancialTechnicalIndicator](#) you can bind the items source of chart series to technical indicators, including x and y axis.

**XML**

```

<chart:SfChart>
...
<chart:SfChart.Series>
<chart:HiLoOpenCloseSeries Name="OHLC" ItemsSource="{Binding
TechnicalIndicatorData}" XBindingPath="XValue" Open="Open" High="High"
Low="Low" Close="Close"/>
</chart:SfChart.Series>
<chart:SfChart.TechnicalIndicators>
<chart:AccumulationDistributionIndicator SeriesName="OHLC"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>

```

**C#**

```

SfChart chart = new SfChart()
{
...
Series =
{

```

```

new HiLoOpenCloseSeries()
{
    ItemsSource = viewModel.TechnicalIndicatorData,
    XBindingPath = "XValue",
    Open = "Open",
    High = "High",
    Low = "Low",
    Close = "Close",
    Name = "OHLC"
},
TechnicalIndicators =
{
    new AccumulationDistributionIndicator()
    {
        SeriesName = "OHLC"
    }
}
};

```

Technical indicators have the below properties as common;

- [Period](#) - used to indicates the moving average period.
- [SignalLineColor](#) - used to defines the color for the respective indicator line.
- [StrokeWidth](#) - used to change the stroke width of the indicator.

### Adding axis

The [XAxis](#) and [YAxis](#) properties of technical indicators are used to set the x and y-axes.

You can define the axis using the following code example.

### XML

```

<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:AccumulationDistributionIndicator SeriesName="OHLC">
<chart:AccumulationDistributionIndicator.XAxis>
<chart:NumericalAxis/>
</chart:AccumulationDistributionIndicator.XAxis>
</chart:AccumulationDistributionIndicator>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>

```

### C#

```

SfChart chart = new SfChart()
{
    ...
    TechnicalIndicators =
    {
        new AccumulationDistributionIndicator()
        {
            SeriesName = "OHLC",

```

```
XAxis = new NumericalAxis()
}
}
};
```

## Animation

[SfChart](#) provides animation support for technical indicators. Technical indicators will be animated whenever the ItemsSource changes. Animation can be enabled by setting the [EnableAnimation](#) property to true. You can also control the duration of the animation using the [AnimationDuration](#) property.

## XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:AccumulationDistributionIndicator SeriesName="OHLC"
EnableAnimation="True" AnimationDuration="0.8"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart()
{
...
TechnicalIndicators =
{
new AccumulationDistributionIndicator()
{
SeriesName = "OHLC",
EnableAnimation = true,
AnimationDuration = 0.8
}
}
};
```

## Indicator visibility

The [IsVisible](#) property of [FinancialTechnicalIndicator](#) is used to controls the visibility of the indicator.

## XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:AccumulationDistributionIndicator SeriesName="OHLC"
IsVisible="False"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart()
{
...
};
```

```
TechnicalIndicators =
{
    new AccumulationDistributionIndicator()
    {
        SeriesName = "OHLC",
        IsVisible = false
    }
}
};
```

### Average true range indicator

ATR indicator is a technical analysis volatility indicator. This indicator does not provide an indication of price trend; simply the degree of price volatility. The average true range is an N-day smoothed moving average (SMMA) of the true range values.

You can define the [AverageTrueIndicator](#) using the following code example.

### XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:AverageTrueIndicator ItemsSource="{Binding TechnicalIndicatorData}"
Period="14" SignalLineColor="Blue" XBindingPath="XValue" High="High"
Low="Low" Open="Open" Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart()
{
    ...
    TechnicalIndicators =
    {
        new AverageTrueIndicator()
        {
            Period = 14,
            SignalLineColor = Color.Blue,
            ItemsSource = viewModel.TechnicalIndicatorData,
            XBindingPath = "XValue",
            Open = "Open",
            High = "High",
            Low = "Low",
            Close = "Close",
        }
    }
};
```

The following screenshot illustrates an ATR indicator.

### Simple moving average indicator

A SMA indicator is a simple, arithmetic moving average that is calculated by adding the closing price for number of time periods and dividing the total value by the number of time periods.

The following code example demonstrates the usage of [SimpleMovingAverageIndicator](#).

#### XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:SimpleMovingAverageIndicator ItemsSource="{Binding
TechnicalIndicatorData}" Period="14" SignalLineColor="Blue"
XBindingPath="XValue" High="High" Low="Low" Open="Open" Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart()
{
...
TechnicalIndicators =
{
new SimpleMovingAverageIndicator()
{
Period = 14,
SignalLineColor = Color.Blue,
ItemsSource = viewModel.TechnicalIndicatorData,
XBindingPath = "XValue",
Open = "Open",
High = "High",
Low = "Low",
```

```

Close = "Close",
}
}
};

```

The following screenshot illustrates an SMA indicator.

### Relative strength index indicator

The RSI indicator has additional two lines other than signal line; they indicate the overbought and oversold region.

The [UpperLineColor](#) property is used to define the color for the line that indicates overbought region, and the [LowerLineColor](#) property is used to define the color for the line that indicates oversold region.

To define the [RSITechnicalIndicator](#), use the following code example.

#### XML

```

<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:RSIIndicator ItemsSource="{Binding TechnicalIndicatorData}"
Period="14" SignalLineColor="Blue" UpperLineColor="Teal"
LowerLineColor="Red" XBindingPath="XValue" High="High" Low="Low" Open="Open"
Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>

```

#### C#

```

SfChart chart = new SfChart()
{

```

```

...
TechnicalIndicators =
{
    new RSIIndicator()
    {
        Period = 14,
        SignalLineColor = Color.Blue,
        UpperLineColor = Color.Teal,
        LowerLineColor = Color.Red,
        ItemsSource = viewModel.TechnicalIndicatorData,
        XBindingPath = "XValue",
        Open = "Open",
        High = "High",
        Low = "Low",
        Close = "Close",
    }
}
};

```

The following screenshot illustrates an RSI technical indicator.

#### Accumulation distribution indicator

Accumulation distribution indicator is a volume-based indicator designed to measure the accumulative flow of money into and out of a security. It requires [Volume](#) property additionally with the data source to calculate the signal line.

The following code example helps you to add [AccumulationDistributionIndicator](#).

#### XML

```

<chart:SfChart>
...

```

```
<chart:SfChart.TechnicalIndicators>
<chart:AccumulationDistributionIndicator ItemsSource="{Binding
TechnicalIndicatorData}" SignalLineColor="Blue" XBindingPath="XValue"
Open="Open" High="High" Low="Low" Close="Close" Volume="Volume"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart()
{
    ...
    TechnicalIndicators =
    {
        new AccumulationDistributionIndicator()
        {
            SignalLineColor = Color.Blue,
            ItemsSource = viewModel.TechnicalIndicatorData,
            XBindingPath = "XValue",
            Open = "Open",
            High = "High",
            Low = "Low",
            Close = "Close",
            Volume = "Volume"
        }
    }
};
```

The following screenshot illustrates an accumulation distribution indicator.

### Momentum indicator

This indicator is having two lines, momentum line and center line. The [SignalLineColor](#) property and [UpperLineColor](#) property is used to define the color for the momentum and center line respectively.

You can define [MomentumIndicator](#) using the following code example.

#### XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:MomentumIndicator ItemsSource="{Binding TechnicalIndicatorData}"
Period="14" SignalLineColor="Blue" UpperLineColor="Red"
XBindingPath="XValue" High="High" Low="Low" Open="Open" Close="Close">
</chart:MomentumIndicator>
</chart:SfChart.TechnicalIndicators>
...
</chart:SfChart>
```

#### C#

```
SfChart chart = new SfChart()
{
...
TechnicalIndicators =
{
new MomentumIndicator()
{
Period = 14,
SignalLineColor = Color.Blue,
UpperLineColor = Color.Red,
ItemsSource = viewModel.TechnicalIndicatorData,
XBindingPath = "XValue",
Open = "Open",
High = "High",
Low = "Low",
Close = "Close",
}
}
};
```

### Stochastic indicator

This indicator is used to measure the range and momentum of price movements. It contains [KPeriod](#) and [DPeriod](#) property defining the 'K' percentage and 'D' percentage respectively. No signal line in this indicator.

The [UpperLineColor](#), [LowerLineColor](#) and [PeriodLineColor](#) property are used to define the color for the Stochastic indicator lines.

You can define [StochasticIndicator](#) using the following code example.

### XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:StochasticIndicator ItemsSource="{Binding TechnicalIndicatorData}"
Period="14" SignalLineColor="Yellow" UpperLineColor="Red"
LowerLineColor="Teal" PeriodLineColor="DarkBlue" KPeriod="8" DPeriod="5"
XBindingPath="XValue" High="High" Low="Low" Open="Open" Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart()
{
...
TechnicalIndicators =
{
new StochasticIndicator()
{
Period = 14,
SignalLineColor = Color.Yellow,
```

```

UpperLineColor = Color.Red,
LowerLineColor = Color.Teal,
PeriodLineColor = Color.DarkBlue,
KPeriod = 8,
DPeriod = 5,
ItemsSource = viewModel.TechnicalIndicatorData,
XBindingPath = "XValue",
Open = "Open",
High = "High",
Low = "Low",
Close = "Close",
}
}
};

```

Exponential moving average indicator

The [ExponentialMovingAverageIndicator](#) is similar to [SimpleMovingAverageIndicator](#) and this can be defined using the following code examples.

#### XML

```

<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:ExponentialMovingAverageIndicator ItemsSource="{Binding
TechnicalIndicatorData}" Period="14" SignalLineColor="Blue"
XBindingPath="XValue" High="High" Low="Low" Open="Open" Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>

```

#### C#

```

SfChart chart = new SfChart()
{
    ...
    TechnicalIndicators =
    {
        new ExponentialMovingAverageIndicator()
        {
            Period = 14,
            SignalLineColor = Color.Blue,
            ItemsSource = viewModel.TechnicalIndicatorData,
            XBindingPath = "XValue",
            Open = "Open",
            High = "High",
            Low = "Low",
            Close = "Close",
        }
    }
};

```

### Triangular moving average indicator

A Triangular moving average is simply a double-smoothed simple moving average of data calculated over a period of time where the middle portion of the data has more weight.

The [TriangularMovingAverageIndicator](#) can be defined as in the following code example.

### XML

```

<chart:SfChart>
    ...
    <chart:SfChart.TechnicalIndicators>

```

```
<chart:TriangularMovingAverageIndicator ItemsSource="{Binding
TechnicalIndicatorData}" Period="14" SignalLineColor="Blue"
XBindingPath="XValue" High="High" Low="Low" Open="Open" Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

## C#

```
SfChart chart = new SfChart()
{
    ...
    TechnicalIndicators =
    {
        new TriangularMovingAverageIndicator()
        {
            Period = 14,
            SignalLineColor = Color.Blue,
            ItemsSource = viewModel.TechnicalIndicatorData,
            XBindingPath = "XValue",
            Open = "Open",
            High = "High",
            Low = "Low",
            Close = "Close",
        }
    }
};
```

## Bollinger band indicator

This indicator also having [UpperLineColor](#), [LowerLineColor](#) and [SignalLineColor](#) property for defining the brushes for the indicator lines.

Also, we can specify standard deviation values for BollingerBand indicator using [StandardDeviation](#) property.

You can define the [BollingerBandIndicator](#) using the following code example.

#### **XML**

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:BollingerBandIndicator ItemsSource="{Binding TechnicalIndicatorData}"
Period="14" SignalLineColor="Blue" UpperLineColor="Red"
LowerLineColor="Teal" XBindingPath="XValue" High="High" Low="Low"
Open="Open" Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

#### **C#**

```
SfChart chart = new SfChart()
{
...
TechnicalIndicators =
{
new BollingerBandIndicator()
{
Period = 14,
SignalLineColor = Color.Blue,
UpperLineColor = Color.Red,
LowerLineColor = Color.Teal,
ItemsSource = viewModel.TechnicalIndicatorData,
XBindingPath = "XValue",
Open = "Open",
High = "High",
Low = "Low",
Close = "Close",
}
}
};
```

### MACD indicator

This is mostly using indicator having [ShortPeriod](#) and [LongPeriod](#) for defining the motion of the indicator.

Also you can draw [Line](#), [Histogram](#) MACD or [Both](#) using the [MACDType](#) property, which defines the type of MACD to be drawn.

The [MACDLineColor](#) property is used to define the color for the MACD line and the [HistogramLineColor](#) property is used to define the color for the MACD histogram.

You can specify the MACD indicator using the following code example.

### XML

```
<chart:SfChart>
...
<chart:SfChart.TechnicalIndicators>
<chart:MACDIndicator ItemsSource="{Binding TechnicalIndicatorData}"
MACDType="Both" ShortPeriod="2" LongPeriod="10" Trigger="14"
SignalLineColor="Blue" HistogramColor="LightSkyBlue" MACDLineColor="Orange"
XBindingPath="XValue" High="High" Low="Low" Open="Open" Close="Close"/>
</chart:SfChart.TechnicalIndicators>
</chart:SfChart>
```

### C#

```
SfChart chart = new SfChart()
{
...
TechnicalIndicators =
{
new MACDIndicator()
{
```

```

MACDType = MACDType.Both,
ShortPeriod = 2,
LongPeriod = 10,
Trigger = 14,
SignalLineColor = Color.Blue,
HistogramColor = Color.LightSkyBlue,
MACDLineColor = Color.Orange,
ItemsSource = viewModel.TechnicalIndicatorData,
XBindingPath = "XValue",
Open = "Open",
High = "High",
Low = "Low",
Close = "Close",
}
}
};

```

## Exporting

### Export as an image

You can export the Chart as a JPG image using [SaveAsImage](#) method of [SfChart](#).

### C#

```

SfChart chart = new SfChart();
...
chart.SaveAsImage("ChartSample.jpg");

```

The exported image will be saved in the different location across the platforms.

**Android** – The image will be saved inside the Pictures directory.

**iOS** – The image will be saved inside the “Photos/Album” directory.

**Windows Phone** – The image will be saved inside the “/Pictures/ Saved Pictures” directory.

---

**Note:** In order to save the image in Android and Windows Phone, you have to enable the permission to write the file in device storage.

---

### Get the stream of Chart

'[SfChart](#)' contains the following methods to get the chart stream.

#### GetStream

The [GetStream](#) method of SfChart is used to get the chart as stream. The output stream can be passed as an input of any other components which accept the stream such as pdf, excel, word etc. This method is only applicable for Android and iOS platforms only.

#### C#

```
SfChart chart = new SfChart();  
...  
chart.GetStream();
```

#### GetStreamAsync

The [GetStreamAsync](#) method of SfChart is used to get the chart as stream asynchronously.

---

**Note:** This method will work only when the SfChart view in UI.

---

The following code snippet demonstrates the usage of this method:

#### C#

```
SfChart chart = new SfChart();  
...  
var stream = await chart.GetStreamAsync();
```

### How to

Transform axis value to pixel value and vice-versa

[SfChart](#) offers two utility methods to transform the pixel to chart point and vice-versa.

- [ValueToPoint\(ChartAxis axis, double value\)](#) - Converts the data point value to screen point.
- [PointToValue\(ChartAxis axis, Point point\)](#) - Converts the screen point to chart value.

#### C#

```
double xValue = Chart.PointToValue(Chart.PrimaryAxis, screenPoint);  
double yValue = Chart.PointToValue(Chart.SecondaryAxis, screenPoint);  
double chartPointX = Chart.ValueToPoint(Chart.PrimaryAxis, xValue);  
double chartPointY = Chart.ValueToPoint(Chart.SecondaryAxis, yValue);
```

Use the [ValueToPoint](#) and [PointToValue](#) methods, which are available in [ChartAxis](#), to convert the screen point within the rendered area of the series.

---

**Note:** You can convert the actual axis value to 0 to 1 coefficient using the [ValueToCoefficient\(double value\)](#) and [CoefficientToValue\(double value\)](#) methods of [ChartAxis](#).

---

### Get the touch position in chart

ChartBehavior provides the following override methods to get the x and y positions when touch the [Chart](#).

- [OnTouchUp](#) - Called when touch up on the chart area with respective x and y position.
- [OnTouchMove](#) - Called when touch move on the chart area with respective x and y position.
- [OnTouchDown](#) - Called when touch down on the chart area with respective x and y position.
- [DoubleTap](#) - Called when double tap on the chart area with respective x and y position.

### C#

```
public class ChartTooltipBehaviorExt : ChartTooltipBehavior
{
    protected override void OnTouchUp(float pointX, float pointY)
    {
        base.OnTouchUp(pointX, pointY);
    }
    protected override void OnTouchMove(float pointX, float pointY)
    {
        base.OnTouchMove(pointX, pointY);
    }
    protected override void OnTouchDown(float pointX, float pointY)
    {
        base.OnTouchDown(pointX, pointY);
    }
    protected override void DoubleTap(float pointX, float pointY)
    {
        base.DoubleTap(pointX, pointY);
    }
}
```

### Get the data point collection based on region

[CartesianSeries](#) provides the following methods to get a collection of data under a particular region.

- [GetDataPoints\(Rectangle rect\)](#) - Gets the collection of data that fall inside the given rectangle region.
- [GetDataPoints\(double startX, double endX, double startY, double endY\)](#) - Gets the collection of data from the given ChartAxis visible range.

### C#

```
List<object> dataPoints = Series.GetDataPoints(rectangle);
or
List<object> dataPoints = Series.GetDataPoints(startX, endX, startY, endY);
```

**Note:** You can get the visible plotting region of the series in the chart using [SeriesBounds](#) property in run time.

### Adding duplicate axis in SfChart

Duplicate axis can be added in the [SfChart](#) using the chart [Axes](#) collection property. The axis added in the [Axes](#) collection will be aligned to the horizontal position by default. The axis position can be changed

using the [IsVertical](#) bool property of [ChartAxis](#). When the [IsVertical](#) property is set true, the axis will be placed vertically and vice versa.

The following code sample demonstrates this.

### C#

```
SfChart chart = new SfChart();  
...  
chart.Axes.Add(new NumericalAxis()  
{  
    Minimum = 0,  
    Maximum = 70,  
    IsVertical = true,  
    OpposedPosition = true  
});
```

### Note:

- The [ChartAxis](#) added in the [Axes](#) collection will not be removed until removing it from the [Axes](#) collection.
- The [Axes](#) collection does not support the clear method.
- Same axis cannot be added more than once in [Axes](#); only distinct axis will be added to the [Axes](#) collection.

### Customize the SfChart padding

By default, padding is applied to all the sides of chart to avoid the cropping of axis labels and leaving some space between nearby views and chart. However, it can be removed or changed using the [ChartPadding](#) property of [SfChart](#).

The following code example shows how to customize the padding of chart.

#### XML

```
<chart:SfChart x:Name="Chart" ChartPadding ="5,5,5,5">
...
</chart:SfChart>
```

#### C#

```
...
SfChart chart = new SfChart()
{
    ChartPadding = new Thickness(5)
};
...
```

#### Adding custom labels to SfChart axis

To add a custom label to chart axis, write a class derived from `NumericalAxis` class. You need to override the [OnCreatedLabels](#) method, which will be called whenever new labels are generated, and add, remove, or modify the labels using the [VisibleLabels](#) property.

The following code sample demonstrates this.

#### C#

```
public class NumericalAxisExt : NumericalAxis
{
    protected override void OnCreateLabels()
    {
        base.OnCreateLabels();
        //Using VisibleLabels collection you can define your custom labels
        VisibleLabels.Clear();
        ViewModel viewModel = BindingContext as ViewModel;
        for (int i = 0; i < viewModel.Data.Count; i++)
        {
            var data = viewModel.Data[i];
            VisibleLabels.Add(new ChartAxisLabel(data.XValue, data.XValue.ToString()));
        }
    }
}
```

**Note:**

- This is applicable for all types of axis.
- Labels are rendered only if the label position presents within the visible range.
- The labels should be created only if users call the base of [OnCreateLabels](#).

### Localization

You can localize [SfChart](#) in all the platforms by adding a .resx file in a .NET Standard project alone. The following steps describe how to localize SfChart in a project and you can download the complete sample from this [link](#).

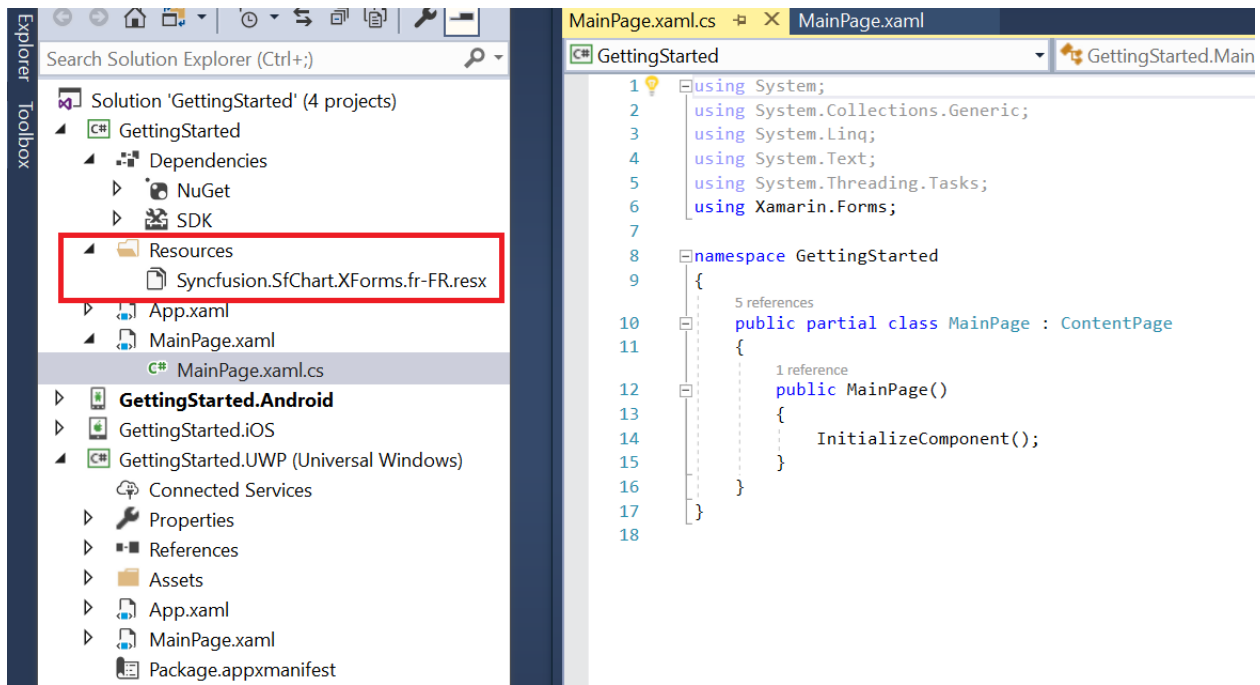

---

**Note:** Here, the resources have been already created for some cultures and shared them on [Syncfusion GitHub](#) for your convenience.

---

1. Add a new folder in the .NET Standard project named Resources.
2. Add resource files for the languages you wish to support, and set their Build Action to EmbeddedResource. The name of the resource file should be \$name of the Syncfusion component\$+\$language code\$.resx. For example, if you add a resource file for the French culture, add the Syncfusion.SfChart.XForms.fr-FR.resx file to Resources folder as illustrated in the following screenshot.

3. Provide the French values for each key in the respective .resx files. Here, “Close” and “High” are the keys, and “Fermer” and “Haute” are their respective French values.

### XML

```
<data name="Close" xml:space="preserve">
<value>Fermer</value>
</data>
<data name="High" xml:space="preserve">
<value>Haute</value>
</data>
```

4. Set the resource manager to '[ChartResourceManager.Manager](#)' as demonstrated in the following code to get the resource manager from the users. For more details, refer [Localization](#).

### C#

```
ChartResourceManager.Manager = new
ResourceManager("GettingStarted.Resources.Syncfusion.SfChart.XForms",
Application.Current.GetType().Assembly);
```

### Localize at application level

You can also localize the text at application-level regardless of the language selected on the device. The following platform-specific codes are needed to localize the text at application-level. Use the [DependencyServices](#) to set this from .NET Standard project.

### C#

```
//For Android and iOS,
```

```
Thread.CurrentThread.CurrentUICulture = new CultureInfo("fr-FR");  
//For UWP,  
CultureInfo.CurrentUICulture = new CultureInfo("fr-FR");
```

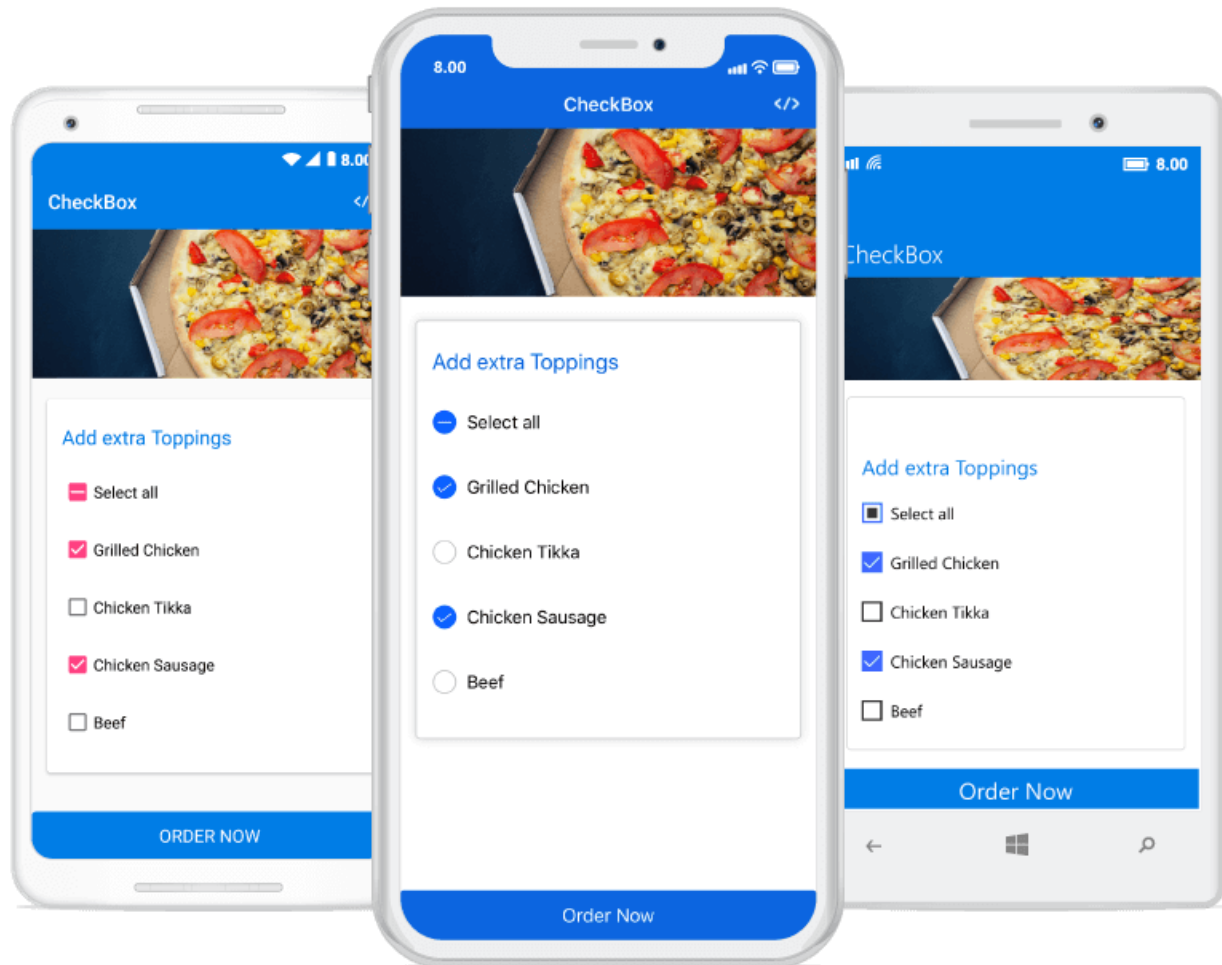

## SfCheckBox

### Overview

The check box is a selection control that allows users to select one or more options from a set. The three states of check box are checked, unchecked and indeterminate.

### Key features

- Supports three states.
- Allow users to select and clear the control by tapping.
- Supports check box color, shape and label text customization.

## Getting Started

This section explains the steps required to configure the `SfCheckBox` control in a real-time scenario and provides a walk-through on some of the customization features available in `SfCheckBox` control.

### Adding `SfCheckBox` reference

You can add `SfCheckBox` reference using one of the following methods:

#### Method 1: Adding `SfCheckBox` reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons). To add `SfCheckBox` to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Buttons](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons), and then install it.

![Xamarin.Forms CheckBox NuGet](Images/Adding SfCheckBox reference.png)

#### Note:

- Install the same version of `SfCheckBox` NuGet in all the projects.
- In addition, you need to install the `[Syncfusion.Xamarin.Buttons.WPF]()` package for Xamarin.Forms WPF platform only.

#### Method 2: Adding `SfCheckBox` reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfCheckBox control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfCheckBox assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Buttons.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.WPF.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** If you are adding the references from toolbox, this step is not needed.

#### *Additional step for iOS*

To launch SfCheckBox in iOS, call the SfCheckBoxRenderer.Init() in FinishedLaunching overridden method of AppDelegate class in iOS Project, as demonstrated in the following code example.

**C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    SfCheckBoxRenderer.Init();
    return base.FinishedLaunching(app, options);
}
```

*Additional step for UWP*

This step is required only if the application is deployed in Release mode with .NET native tool chain enabled. It is for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the SfCheckBox assembly at OnLaunched overridden method of the App class in UWP project is the suggested work around, as demonstrated in the following code example.

**C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    .....
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies that your app uses
    assembliesToInclude.Add(typeof(SfCheckBoxRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    .....
}
```

*Additional step for WPF*

To launch the check box in WPF, call the SfCheckBoxRenderer.Init() method in the MainWindow constructor of the MainWindow class after the Xamarin.Forms framework has been initialized and before the LoadApplication method is called as demonstrated in the following code sample.

**C#**

```
public partial class MainWindow : FormsApplicationPage
{
    public MainWindow()
    {
        InitializeComponent();
        Forms.Init();
        Syncfusion.XForms.WPF.Buttons.SfCheckBoxRenderer.Init();
        LoadApplication(new App());
    }
}
```

### Create a Simple SfCheckBox

The **SfCheckBox** control is configured entirely in C# code or by using XAML markup. The following steps explain how to create a **SfCheckBox** and configure its elements.

*Add namespace for referred assemblies*

#### **XML**

```
xmlns:syncfusion="clr-  
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
```

#### **C#**

```
using Syncfusion.XForms.Buttons;
```

*Refer SfCheckBox control with declared suffix name for Namespace*

#### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:local="clr-namespace:GettingStarted"  
xmlns:syncfusion="clr-  
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"  
x:Class="GettingStarted.MainPage">  
  <ContentPage.Content>  
    <StackLayout>  
      <syncfusion:SfCheckBox x:Name="checkBox"/>  
    </StackLayout>  
  </ContentPage.Content>  
</ContentPage>
```

#### **C#**

```
using Syncfusion.XForms.Buttons;  
using Xamarin.Forms;  
namespace GettingStarted  
{  
  public partial class MainPage : ContentPage  
  {  
    public MainPage()  
    {  
      InitializeComponent();  
      StackLayout stackLayout = new StackLayout();  
      SfCheckBox checkBox = new SfCheckBox();  
      stackLayout.Children.Add(checkbox);  
      this.Content = stackLayout;  
    }  
  }  
}
```

### Setting caption

The check box caption can be defined using the **Text** property of **SfCheckBox**. This caption normally describes the meaning of the check box and it displays next to check box.

**XML**

```
<syncfusion:SfCheckBox x:Name="checkBox" IsChecked="True" Text="CheckBox"/>
```

**C#**

```
SfCheckBox checkBox = new SfCheckBox();  
checkBox.IsChecked = true;  
checkBox.Text = "CheckBox";
```

CheckBox

This demo can be downloaded from this [link](#).

[Change the check box state](#)

The three visual states of **SfCheckBox** are:

- Checked
- Unchecked
- Indeterminate

CheckBox

CheckBox

CheckBox

You can change the state of the check box using the `IsChecked` property of `SfCheckBox`. In checked state, a tick mark is added to the visualization of check box.

State	Property	Value
checked	<code>IsChecked</code>	true
unchecked	<code>IsChecked</code>	false
indeterminate	<code>IsChecked</code>	null

**Note:** For the check box, to report the indeterminate state, set the `IsThreeState` property to true.

Check box can be used as a single or as a group. A single check box mostly used for a binary yes/no choice, such as "Remember me?", login scenario, or a terms of service agreement.

#### XML

```
<syncfusion:SfCheckBox x:Name="checkBox" Text="I agree to the terms of
services for this site" IsChecked="True"/>
```

#### C#

```
SfCheckBox checkBox = new SfCheckBox();
checkBox.Text = "I agree to the terms of services for this site";
checkBox.IsChecked = true;
```

I agree to the terms of services for this site

Multiple check boxes can be used as a group for multi-select scenarios in which a user chooses one or more items from the group of choices that are not mutually exclusive.

#### XML

```
<Label x:Name="label" Text="Pizza Toppings" />
<syncfusion:SfCheckBox x:Name="pepperoni" Text="Pepperoni"/>
<syncfusion:SfCheckBox x:Name="beef" Text="Beef" IsChecked="True"/>
<syncfusion:SfCheckBox x:Name="mushroom" Text="Mushrooms"/>
<syncfusion:SfCheckBox x:Name="onion" Text="Onions" IsChecked="True"/>
```

#### C#

```
Label label = new Label();
label.Text = "Pizza Toppings";
SfCheckBox pepperoni= new SfCheckBox();
pepperoni.Text = "Pepperoni";
SfCheckBox beef= new SfCheckBox();
beef.Text = "Beef";
beef.IsChecked = true;
```

```
SfCheckBox mushroom = new SfCheckBox();  
mushroom.Text = "Mushrooms";  
SfCheckBox onion = new SfCheckBox();  
onion.Text = "Pepperoni";  
onion.IsChecked = true;
```

## Pizza Toppings

☐ Pepperoni

☒ Beef

☐ Mushrooms

☒ Onions

This demo can be downloaded from this [link](#).

### Indeterminate

The **SfCheckBox** allows an indeterminate state in addition to the checked and unchecked state. The indeterminate state of the check box is enabled by setting the **IsThreeState** property of the control to **True**.

---

**Note:** When the **IsThreeState** property is set to **False** and **IsChecked** property is set to **null** then the check box will be in unchecked state.

---

The indeterminate state is used when a group of sub-choices has both checked and unchecked states. In the following example, the "Select all" checkbox has the **IsThreeState** property set to **true**. The "Select all" checkbox is checked if all child elements are checked, unchecked if all the child elements are unchecked, and indeterminate otherwise.

### XML

```
<syncfusion:SfCheckBox x:Name="selectAll" Text="Select All"  
IsChecked="{x:Null}" StateChanged="SelectAll_StateChanged"/>  
<syncfusion:SfCheckBox x:Name="pepperoni" Text="Pepperoni"  
StateChanged="CheckBox_StateChanged"/>
```

```

<syncfusion:SfCheckBox x:Name="beef" Text="Beef" IsChecked="True"
StateChanged="CheckBox_StateChanged"/>
<syncfusion:SfCheckBox x:Name="mushroom" Text="Mushrooms"
StateChanged="CheckBox_StateChanged"/>
<syncfusion:SfCheckBox x:Name="onion" Text="Onions" IsChecked="True"
StateChanged="CheckBox_StateChanged"/>
bool skip = false;
private void SelectAll_StateChanged(object sender, StateChangedEventArgs e)
{
    if (!skip)
    {
        skip = true;
        pepperoni.IsChecked = beef.IsChecked = mushroom.IsChecked = onion.IsChecked
        = e.IsChecked;
        skip = false;
    }
}
private void CheckBox_StateChanged(object sender, StateChangedEventArgs e)
{
    if (!skip)
    {
        skip = true;
        if (pepperoni.IsChecked.Value && beef.IsChecked.Value &&
            mushroom.IsChecked.Value && onion.IsChecked.Value)
            selectAll.IsChecked = true;
        else if (!pepperoni.IsChecked.Value && !beef.IsChecked.Value &&
            !mushroom.IsChecked.Value && !onion.IsChecked.Value)
            selectAll.IsChecked = false;
        else
            selectAll.IsChecked = null;
        skip = false;
    }
}

```

**C#**

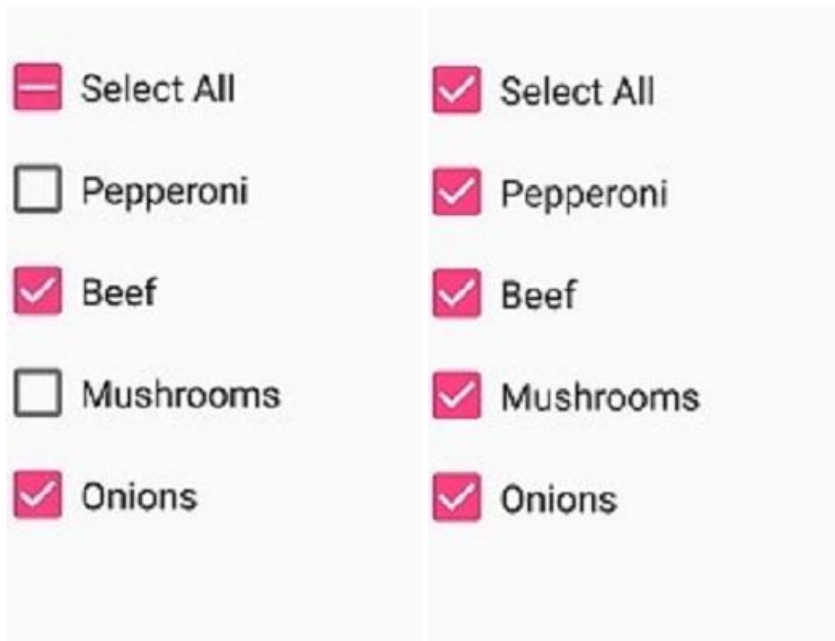

```

bool skip = false;
SfCheckBox selectAll, pepperoni, beef, mushroom, onion;
selectAll = new SfCheckBox();
selectAll.StateChanged += SelectAll_StateChanged;
selectAll.Text = "Select All";
pepperoni = new SfCheckBox();
pepperoni.StateChanged += CheckBox_StateChanged;
pepperoni.Text = "Pepperoni";
beef = new SfCheckBox();
beef.StateChanged += CheckBox_StateChanged;
beef.Text = "Beef";
beef.IsChecked = true;
mushroom = new SfCheckBox();
mushroom.StateChanged += CheckBox_StateChanged;
mushroom.Text = "Mushrooms";
onion = new SfCheckBox();
onion.StateChanged += CheckBox_StateChanged;
onion.Text = "Onions";
onion.IsChecked = true;
private void SelectAll_StateChanged(object sender, StateChangedEventArgs e)

```

```
{
    if (!skip)
    {
        skip = true;
        pepperoni.IsChecked = beef.IsChecked = mushroom.IsChecked = onion.IsChecked
        = e.IsChecked;
        skip = false;
    }
}

private void CheckBox_StateChanged(object sender, StateChangedEventArgs e)
{
    if (!skip)
    {
        skip = true;
        if (pepperoni.IsChecked.Value && beef.IsChecked.Value &&
            mushroom.IsChecked.Value && onion.IsChecked.Value)
            selectAll.IsChecked = true;
        else if (!pepperoni.IsChecked.Value && !beef.IsChecked.Value &&
            !mushroom.IsChecked.Value && !onion.IsChecked.Value)
            selectAll.IsChecked = false;
        else
            selectAll.IsChecked = null;
        skip = false;
    }
}
```

This demo can be downloaded from this [link](#).

## Visual Customization

### Customizing shape

The check box shape can be customized using the `CornerRadius` property. This property specifies uniform radius value for every corner of the check box.

**XML**

```
<syncfusion:SfCheckBox x:Name="checkBox" Text="CheckBox" IsChecked="True"
    CornerRadius="5.0"/>
```

**C#**

```
SfCheckBox checkBox = new SfCheckBox();
checkBox.Text = "CheckBox";
checkBox.IsChecked = true;
checkBox.CornerRadius = 5.0f;
```

**Customizing state color**

The default state colors can be customized using the `CheckedColor` and `UncheckedColor` properties. The checked/indeterminate state color is updated to the `CheckedColor` property value when the state is changed to the checked/indeterminate. The unchecked state color is updated to `UncheckedColor` property value when the state is changed to unchecked.

**XML**

```
<syncfusion:SfCheckBox x:Name="check" Text="CheckBox" IsChecked="True"
    CheckedColor="Green"/>
<syncfusion:SfCheckBox x:Name="uncheck" Text="CheckBox"
    UncheckedColor="Violet"/>
<syncfusion:SfCheckBox x:Name="indeterminate " Text="CheckBox"
    IsThreeState="True" IsChecked="{x:Null}" CheckedColor="Purple"/>
```

**C#**

```
SfCheckBox check= new SfCheckBox();
check.Text = "CheckBox";
check.IsChecked = true;
check.CheckedColor = Color.Green;
SfCheckBox uncheck = new SfCheckBox();
uncheck.Text = "CheckBox";
uncheck.UncheckedColor = Color.Violet;
SfCheckBox indeterminate = new SfCheckBox();
indeterminate.IsChecked = null;
indeterminate.IsThreeState = true;
indeterminate.Text = "CheckBox";
indeterminate.CheckedColor = Color.Purple;
```

### Setting caption text appearance

You can customize the display text appearance of the **SfCheckBox** control using the following properties:

- **TextColor**: Changes the color of the text.
- **HorizontalTextAlignment**: Changes the horizontal alignment of the caption text.
- **FontFamily**: Changes the font family of the caption text.
- **FontAttributes**: Sets font attributes(bold/italic/none) of the caption text.
- **FontSize**: Sets font size of the caption text.

### XML

```
<syncfusion:SfCheckBox x:Name="caption" Text="CheckBox" IsChecked="True"
TextColor="Violet" HorizontalTextAlignment="Center" FontFamily="Arial"
FontAttributes="Bold" FontSize="20"/>
```

### C#

```
SfCheckBox caption = new SfCheckBox();
caption.IsChecked = true;
caption.Text = "CheckBox";
caption.TextColor = Color.Violet;
caption.HorizontalTextAlignment = TextAlignment.Center;
caption.FontFamily = "Arial";
caption.FontAttributes = FontAttributes.Bold;
caption.FontSize = 20;
```

**CheckBox**

### LineBreakMode

The **LineBreakMode** allows you to wrap or truncate the text. The default value of this property is **NoWrap**. The following other options are available in **LineBreakMode**:

- **NoWrap** - Avoids the text wrap.
- **WordWrap** - Wraps the text by words.
- **CharacterWrap** - Wraps the text by character.
- **HeadTruncation** - Truncates the text at the start.
- **MiddleTruncation** - Truncates the text at the center.
- **TailTruncation** - Truncates the text at the end.

### TickColor Customization

The **TickColor** property customizes the color of the tick in SfCheckBox.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="CheckBoxCustomization.checkbox">
<ContentPage.Content>
<StackLayout>
<syncfusion:SfCheckBox x:Name="checkBox" IsChecked="True"
CheckedColor="Aqua" TickColor="Fuchsia" Text="CheckBox" />
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace CheckBoxCustomization
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout();
SfCheckBox checkBox = new SfCheckBox();
checkBox.IsChecked = true;
checkBox.Text = "CheckBox";
checkBox.CheckedColor = Color.Aqua;
checkBox.TickColor = Color.Fuchsia;
stackLayout.Children.Add(checkBox);
this.Content = stackLayout;
}
```

**Note:** The `TickColor` is not applicable for Android Platform. The default value of `TickColor` is `[Color.White]`.

This demo can be downloaded from this [link](#).

### Visual States

The visual of `CheckBox` can be customized using `VisualStates`. The `SfCheckBox` control contains the following three visual states:

- Checked
- Unchecked
- Intermediate

### XML

```
<buttons:SfCheckBox Text="CheckBox">
  <VisualStateManager.VisualStateGroups>
    <VisualStateGroup x:Name="CommonStates">
      <VisualState x:Name="Checked">
        <VisualState.Setters>
          <Setter Property="TextColor" Value="Accent"/>
          <Setter Property="CheckedColor" Value="Accent"/>
        </VisualState.Setters>
      </VisualState>
      <VisualState x:Name="Unchecked">
        <VisualState.Setters>
          <Setter Property="TextColor" Value="#ea3737"/>
          <Setter Property="UncheckedColor" Value="#ea3737"/>
        </VisualState.Setters>
      </VisualState>
      <VisualState x:Name="Intermediate">
        <VisualState.Setters>
          <Setter Property="Text" Value="Intermediate State"/>
        </VisualState.Setters>
      </VisualState>
    </VisualStateGroup>
  </VisualStateManager.VisualStateGroups>
</buttons:SfCheckBox>
```

### C#

```
SfCheckBox checkBox = new SfCheckBox() { Text = "CheckBox" };
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState checkedState = new VisualState
{
    Name = "Checked"
};
checkedState.Setters.Add(new Setter { Property =
SfCheckBox.TextColorProperty, Value = Color.Accent });
checkedState.Setters.Add(new Setter { Property =
SfCheckBox.CheckedColorProperty, Value = Color.Accent });
VisualState uncheckedState = new VisualState
{
    Name = "Unchecked"
```

```

};
uncheckedState.Setters.Add(new Setter { Property =
SfCheckBox.TextColorProperty, Value = Color.FromHex("#ea3737") });
uncheckedState.Setters.Add(new Setter { Property =
SfCheckBox.UncheckedColorProperty, Value = Color.FromHex("#ea3737") });
VisualState intermediateState = new VisualState
{
    Name = "Intermediate"
};
intermediateState.Setters.Add(new Setter { Property =
SfCheckBox.TextProperty, Value = "Intermediate State" });
commonStateGroup.States.Add(checkedImageState);
commonStateGroup.States.Add(uncheckedState);
commonStateGroup.States.Add(intermediateState);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(checkBox, visualStateGroupList);

```

**Checked visual state:****Unchecked visual state:****Intermediate visual state:****Event****StateChanged event**

Occurs when the value(state) of the `IsChecked` property is changed by either touching the check box or setting the value to the `IsChecked` property using XAML or C# code. The event arguments are of type `StateChangedEventArgs` and expose the following property:

- `IsChecked`: The new value(state) of the `IsChecked` property.

**XML**

```

<syncfusion:SfCheckBox x:Name="checkBox" Text="Unchecked State"
IsThreeState="True" StateChanged="CheckBox_StateChanged"/>
private void CheckBox_StateChanged(object sender, StateChangedEventArgs e)
{
    if (e.IsChecked.HasValue && e.IsChecked.Value)
    {

```

```
checkBox.Text = "Checked State";  
}  
else if(e.IsChecked.HasValue && !e.IsChecked.Value)  
{  
    checkBox.Text = "Unchecked State";  
}  
else  
{  
    checkBox.Text = "Indeterminate State";  
}  
}
```

## C#

```
SfCheckBox checkBox = new SfCheckBox();  
checkBox.Text = "Unchecked State";  
checkBox.IsThreeState = true;  
checkBox.StateChanged += CheckBox_StateChanged;  
private void CheckBox_StateChanged(object sender, StateChangedEventArgs e)  
{  
    if (e.IsChecked.HasValue && e.IsChecked.Value)  
    {  
        checkBox.Text = "Checked State";  
    }  
    else if(e.IsChecked.HasValue && !e.IsChecked.Value)  
    {  
        checkBox.Text = "Unchecked State";  
    }  
    else  
    {  
        checkBox.Text = "Indeterminate State";  
    }  
}
```

☐ Unchecked State

☒ Checked State

☐ Indeterminate State

This demo can be downloaded from this [link](#).

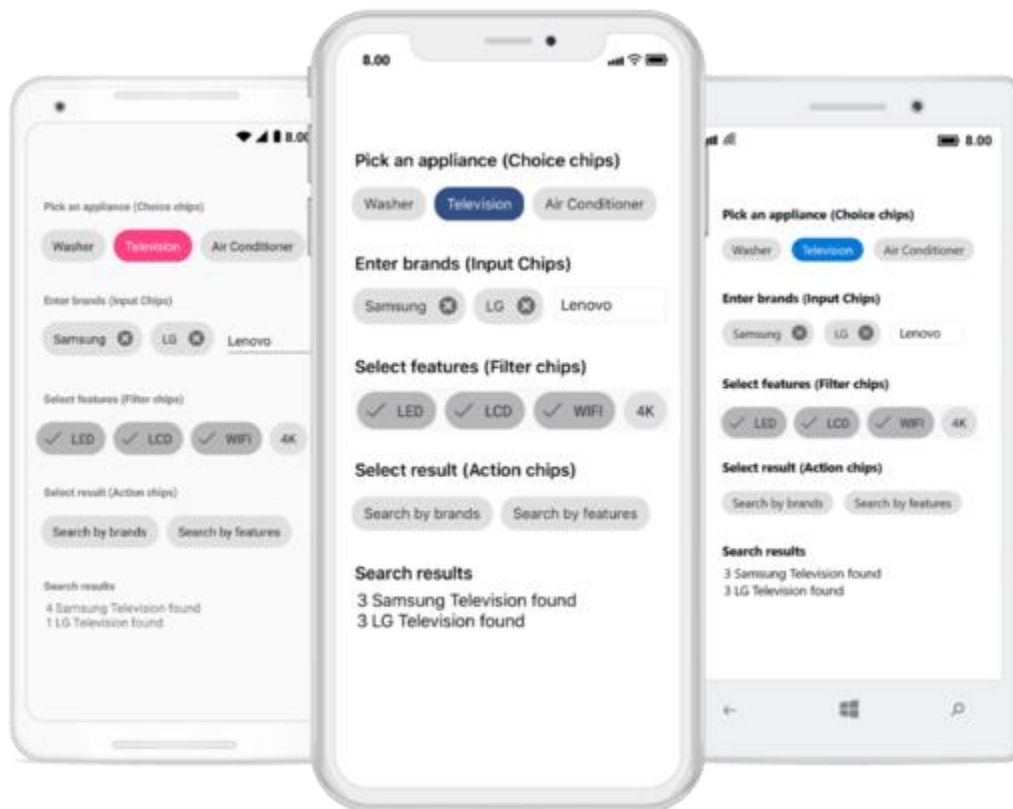

## Chips

### Overview

The chips control for Xamarin.Forms presents information in an interactive and customizable layout. It also arranges multiple chips in a user-preferred layout and groups them to make selections.

### Key Features

- Supports using StackLayout, FlexLayout, Grid, AbsoluteLayout, and RelativeLayout as a layout for adding and arranging chips.
- Provides options to choose from four different types: Input, Choice, Filter, and Action, each chip has different behavior as a group.
- Allows you make single and multiple selections in the Choice and Filter chips, respectively.
- Provides a way to add a view at the end of the group using the Input type chips.
- Has Command support for the chip group and individual chips in Action chips type.
- Provides user-friendly customization support to customize the corner radius, border color, border thickness, text color, background color, close button color, selection indicator color, etc.

### Getting started

This section explains the steps required to create chips and arrange them in a layout for performing action. This section covers only the minimal features that you needed to know to get started with the chips.

### Adding Chips reference

You can add Chips reference using one of the following methods:

#### Method 1: Adding Chips reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons). To add Chips to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Buttons](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons), and then install it.

![Adding Chips reference from NuGet](images/action-type-chip/Adding Chips reference.png)

#### Note:

- Install the same version of Chips NuGet in all the projects.
- In addition, you need to install the [Syncfusion.Xamarin.Buttons.WPF]() package for Xamarin.Forms WPF platform only.

#### Method 2: Adding Chips reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the Chips control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding Chips assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Buttons.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.WPF.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching an application on each platform with chips

To use the chips control inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and are discussed in the following sections:

#### iOS

**Note:** If you are adding the references from toolbox, this step is not needed.

#### For SfChip

To launch the **SfChip** in iOS, call the **SfChipRenderer.Init()** method in the **FinishedLaunching** overridden method of the **AppDelegate** class after the **Xamarin.Forms** framework has been initialized and before the **LoadApplication** method is called as demonstrated in the following code sample:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init();
    Syncfusion.XForms.iOS.Buttons.SfChipRenderer.Init();
    LoadApplication(new App());
    ...
}
```

#### For SfChipGroup

To launch the **SfChipGroup** in iOS, call the **SfChipGroupRenderer.Init()** method in the **FinishedLaunching** overridden method of the **AppDelegate** class after the **Xamarin.Forms** framework has been initialized and before the **LoadApplication** method is called as demonstrated in the following code sample:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init();
    Syncfusion.XForms.iOS.Buttons.SfChipGroupRenderer.Init();
    LoadApplication(new App());
    ...
}
```

### Universal Windows Platform (UWP)

#### For SfChip

To deploy the SfChip in Release mode, you need to initialize the SfChip assemblies in the App.xaml.cs file in the UWP project as shown in the following code sample.

#### C#

```
// In App.xaml.cs
using Syncfusion.XForms.UWP.Buttons;
using Syncfusion.XForms.UWP.Border;
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        assembliesToInclude.Add(typeof(SfButtonRenderer).GetTypeInfo().Assembly);
        assembliesToInclude.Add(typeof(SfChipRenderer).GetTypeInfo().Assembly);
        assembliesToInclude.Add(typeof(SfBorderRenderer).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
    ...
}
```

#### For SfChipGroup

To deploy the SfChipGroup in Release mode, you need to initialize the SfChipGroup assemblies in the App.xaml.cs file in the UWP project as shown in the following code sample.

#### C#

```
// In App.xaml.cs
using Syncfusion.XForms.UWP.Buttons;
using Syncfusion.XForms.UWP.Border;
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        assembliesToInclude.Add(typeof(SfButtonRenderer).GetTypeInfo().Assembly);
        assembliesToInclude.Add(typeof(SfChipGroupRenderer).GetTypeInfo().Assembly);
        assembliesToInclude.Add(typeof(SfBorderRenderer).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
    ...
}
```

### Windows Presentation Foundation (WPF)

To launch the chip group and chip in WPF, call the SfChipGroupRenderer.Init() and SfChipRenderer.Init() methods in the MainWindow constructor of the MainWindow class after the Xamarin.Forms framework has been initialized and before the LoadApplication method is called as demonstrated in the following code sample.

#### C#

```
public partial class MainWindow : FormsApplicationPage
{
    public MainWindow()
    {
        InitializeComponent();
        Forms.Init();
        Syncfusion.XForms.WPF.Border.SfBorderRenderer.Init();
        //For chip group
        Syncfusion.XForms.WPF.Buttons.SfChipGroupRenderer.Init();
        // For chip
        Syncfusion.XForms.WPF.Buttons.SfChipRenderer.Init();
        LoadApplication(new App());
    }
}
```

### Android

The Android platform does not require any additional configuration to render the chips control.

### Initialize chips

Import the [SfChipGroup](#) namespace in respective page.

### XML

```
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
```

### C#

```
using Syncfusion.XForms.Buttons;
```

Then initialize an empty SfChipGroup as shown in the following code:

### XML

```
<ContentPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Chips"
x:Class="Chips.GettingStarted">
    <ContentPage.Content>
        <Grid>
            <buttons:SfChipGroup/>
        </Grid>
    </ContentPage.Content>
</ContentPage>
```

### C#

```
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace Chips
{
    public partial class GettingStarted: ContentPage
```

```
{
public GettingStarted()
{
InitializeComponent();
Grid grid = new Grid();
grid.Children.Add(new SfChipGroup());
this.Content = grid;
}
}
}
```

### Set layout for the control

Any layout can be used to arrange the chips in the chips control using `ChipLayout` property. The chips control creates chip for each object and arranges chips in a `StackLayout` with horizontal orientation. Any layout can be used to arrange the chips in the chips control. In the following example, the `FlexLayout` has been used.

### XML

```
<ContentPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Chips"
x:Class="Chips.GettingStarted">
<ContentPage.Content>
<Grid>
<buttons:SfChipGroup>
<buttons:SfChipGroup.ChipLayout>
<FlexLayout
HorizontalOptions="Start"
VerticalOptions="Center"
Direction="Row"
Wrap="Wrap"
JustifyContent="Start"
AlignContent="Start"
AlignItems="Start"/>
</buttons:SfChipGroup.ChipLayout>
</buttons:SfChipGroup>
</Grid>
</ContentPage.Content>
</ContentPage >
```

### C#

```
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace Chips
{
public partial class GettingStarted: ContentPage
{
public GettingStarted()
{
InitializeComponent();
}
```

```
Grid grid = new Grid();
SfChipGroup chipGroup = new SfChipGroup();
grid.Children.Add(chipGroup);
FlexLayout layout = new FlexLayout()
{
    Direction = FlexDirection.Row,
    Wrap = FlexWrap.Wrap,
    HorizontalOptions = LayoutOptions.Start,
    VerticalOptions = LayoutOptions.Center,
    AlignContent = FlexAlignContent.Start,
    JustifyContent = FlexJustify.Start,
    AlignItems = FlexAlignItems.Start,
};
chipGroup.ChipLayout = layout;
this.Content = grid;
}
```

### Populating business objects

Now, define a simple data model of person with the name and image properties. Create a view model class and initialize a collection of persons as shown in the following code sample.

#### C#

```
namespace Chips
{
    //Model class for chips
    public class Person
    {
        public string Name
        {
            get;
            set;
        }
    }
}
```

#### C#

```
using System.Collections.ObjectModel;
using System.ComponentModel;
namespace Chips
{
    //View model class for chips
    public class ViewModel : INotifyPropertyChanged
    {
        private ObservableCollection<Person> employees;
        public ObservableCollection<Person> Employees
        {
            get
            {
                return employees;
            }
            set
            {
            }
        }
    }
}
```

```

{
    Employees = value;
    OnPropertyChanged("Employees");
}
}
public ViewModel()
{
    employees = new ObservableCollection<Person>();
    employees.Add(new Person() { Name = "John" });
    employees.Add(new Person() { Name = "James" });
    employees.Add(new Person() { Name = "Linda" });
    employees.Add(new Person() { Name = "Rose" });
    employees.Add(new Person() { Name = "Mark" });
}
public event PropertyChangedEventHandler PropertyChanged;
public void OnPropertyChanged(string property)
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(property));
    }
}
}
}

```

Create an instance of ViewModel class, and then set it as the **BindingContext**. Bind the **ItemsSource** property with a collection, and then set the **DisplayMemberPath** property:

#### XML

```

<ContentPage
    xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:buttons="clr-namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
    xmlns:local="clr-namespace:Chips"
    x:Class="Chips.GettingStarted">
    <ContentPage.BindingContext>
    <local:ViewModel x:Name="viewModel"/>
    </ContentPage.BindingContext>
    <ContentPage.Content>
    <Grid>
    <buttons:SfChipGroup
        ItemsSource="{Binding Employees}"
        ChipPadding="8,8,0,0"
        DisplayMemberPath="Name">
    <buttons:SfChipGroup.ChipLayout>
    <FlexLayout
        HorizontalOptions="Start"
        VerticalOptions="Center"
        Direction="Row"
        Wrap="Wrap"
        JustifyContent="Start"
        AlignContent="Start"
        AlignItems="Start"/>
    </buttons:SfChipGroup.ChipLayout>
    </Grid>
    </ContentPage.Content>
</ContentPage>

```

```

</buttons:SfChipGroup>
</Grid>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.XForms.Buttons;
using System.Collections.ObjectModel;
using System.ComponentModel;
namespace Chips
{
    public partial class GettingStarted: ContentPage
    {
        public GettingStarted()
        {
            InitializeComponent();
            Grid grid = new Grid();
            SfChipGroup chipGroup = new SfChipGroup();
            grid.Children.Add(chipGroup);
            FlexLayout layout = new FlexLayout()
            {
                Direction = FlexDirection.Row,
                Wrap = FlexWrap.Wrap,
                HorizontalOptions = LayoutOptions.Start,
                VerticalOptions = LayoutOptions.Center,
                AlignContent = FlexAlignContent.Start,
                JustifyContent = FlexJustify.Start,
                AlignItems = FlexAlignItems.Start,
            };
            chipGroup.ChipLayout = layout;
            this.BindingContext = new ViewModel();
            chipGroup.SetBinding(SfChipGroup.ItemsSourceProperty, "Employees");
            chipGroup.DisplayMemberPath = "Name";
            chipGroup.ChipPadding = new Thickness(8, 8, 0, 0);
            this.Content = grid;
        }
    }
}

```

### Set types of chip group

The functionality of chips control differ based on its [Type](#) property.

By default type of chips control have Input type. Input chip types have close button, using it chip can be removed dynamically from children and the layout.

The following code example uses the **Action** type. In Action type, **Command** property of **SfChipGroup** is executed when any chip in the group is tapped. Here the Employee name of corresponding chip is set as label text when the Command is executed.

### XML

```
<ContentPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Chips"
x:Class="Chips.GettingStarted">
  <ContentPage.BindingContext>
    <local:ViewModel/>
  </ContentPage.BindingContext>
  <ContentPage.Content>
    <StackLayout>
      <buttons:SfChipGroup
        Command="{Binding ActionCommand}"
        ItemsSource="{Binding Employees}"
        Type="Action">
      </buttons:SfChipGroup>
      <StackLayout Orientation="Horizontal">
        <Label
          Text="Name:"
          FontAttributes="Bold"
          FontSize="14" />
        <Label
          Text="{Binding Result}"
          FontAttributes="Bold"
          FontSize="14" />
      </StackLayout>
    </StackLayout>
  </ContentPage.Content>
</ContentPage>
```

### C#

```
using System;
using System.Collections.Generic;
using System.Collections.ObjectModel;
using System.ComponentModel;
using System.Windows.Input;
using Xamarin.Forms;
namespace Chips
{
    public class ViewModel : INotifyPropertyChanged
    {
        private ICommand actionCommand;
        private ObservableCollection<Person> employees;
        private string result;
        public ICommand ActionCommand
        {
            get
            {
            }
```

```
return actionCommand;
}
set
{
    actionCommand = value;
}
}
public ObservableCollection<Person> Employees
{
    get
    {
        return employees;
    }
    set
    {
        Employees = value;
        OnPropertyChanged("Employees");
    }
}
public string Result
{
    get
    {
        return result;
    }
    set
    {
        result = value;
        OnPropertyChanged("Result");
    }
}
public ViewModel()
{
    ActionCommand = new Command(HandleAction);
    employees = new ObservableCollection<Person>();
    employees.Add(new Person() { Name = "John" });
    employees.Add(new Person() { Name = "James" });
    employees.Add(new Person() { Name = "Linda" });
    employees.Add(new Person() { Name = "Rose" });
    employees.Add(new Person() { Name = "Mark" });
}
public event PropertyChangedEventHandler PropertyChanged;
public void OnPropertyChanged(string property)
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(property));
    }
}
private void HandleAction(object obj)
{
    Result = (obj as Person).Name.ToString();
}
}
```

Name: John

You can find the complete getting started sample from this [link](#).

### Populating chips

Chips can be populated with either business objects and SfChip. This section explain how to populate the chips control with business objects and SfChip.

#### Populating business objects as items

Business objects can be populated in Chips using the `ItemsSource` property.

Refer to this [documentation](#) to know more details about populating the chips control with list of employee details.

#### Populating SfChip as items

Chips control also provides support to create and set SfChip as item. It can be achieved using the `Items` property.

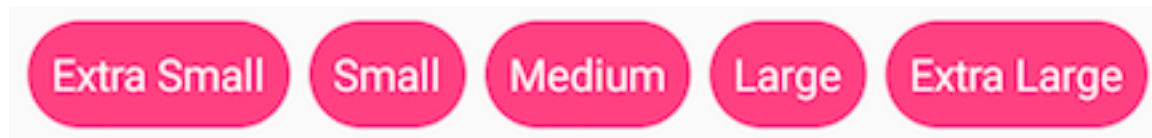

#### XML

```
<ContentPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Chips"
x:Class="Chips.GettingStarted">
<ContentPage.Content>
<buttons:SfChipGroup Type="Action">
<buttons:SfChipGroup.Items>
<buttons:SfChip Text="Extra Small"/>
<buttons:SfChip Text="Small"/>
<buttons:SfChip Text="Medium"/>
<buttons:SfChip Text="Large"/>
<buttons:SfChip Text="Extra Large"/>
</buttons:SfChipGroup.Items>
</buttons:SfChipGroup>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace Chips
{
    public partial class GettingStarted: ContentPage
    {
        public GettingStarted()
        {
            InitializeComponent();
            Grid grid = new Grid();
```

```
var chipGroup = new SfChipGroup() {Type = SfChipsType.Action};
grid.Children.Add(chipGroup);
chipGroup.Items.Add(new SfChip() {Text="Extra Small"});
chipGroup.Items.Add(new SfChip() {Text="Small"});
chipGroup.Items.Add(new SfChip() {Text="Medium"});
chipGroup.Items.Add(new SfChip() {Text="Large"});
chipGroup.Items.Add(new SfChip() {Text="Extra Large"});
this.Content = grid;
}
```

### Set the type for chip group

The functionality of chips control differ based on its **Type** property. No operation can be performed in a chip group unless the Type property is set. The chips control provides four different types, and each has its own functionality. The types are,

- Action
- Choice
- Filter
- Input

#### Input

Arranges the chips in a layout and enables the close button for each chip. Using the close button, a chip can be removed from children and layout as well. It additionally has support to add an optional **InputView** at the end of the layout, from which users can obtain the chip text for creating a chip at run time.

#### Choice

Allows users to select a single chip from a group of items. Selecting a chip will automatically deselect the previously selected chips. The selected chip color can be customized using the **SelectedChipBackgroundColor** and **SelectedChipTextColor** properties. The **SelectedItem** property holds the instance of recently selected chip.

#### Filter

Allows users to select more than one chip in a group of chips. The selected chips are indicated by selection indicator in this type. The selection indicator can be customized using the **SelectionIndicatorColor** property. Use the **SelectedItems** property to get the list of selected chips.

#### Action

Executes the **Command** of ChipGroup and raises the Clicked event when a chip is clicked.

In this example, the Input chip is used to add an employee at run time. To get the employee name as input, an entry is added as **InputView**.

#### XML

```

<ContentPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Chips"
x:Class="Chips.GettingStarted">
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<ContentPage.Content>
<buttons:SfChipGroup
x:Name="chipGroup"
ItemsSource="{Binding Employees}"
ChipPadding="8,8,0,0"
DisplayMemberPath="Name">
<buttons:SfChipGroup.ChipLayout>
<FlexLayout
HorizontalOptions="Start"
VerticalOptions="Center"
Direction="Row"
Wrap="Wrap"
JustifyContent="Start"
AlignContent="Start"
AlignItems="Start"/>
</buttons:SfChipGroup.ChipLayout>
<buttons:SfChipGroup.InputView>
<Entry
Margin="10,10,0,0"
WidthRequest="110"
Completed="Entry_Completed"/>
</buttons:SfChipGroup.InputView>
</buttons:SfChipGroup>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

using Syncfusion.XForms.Buttons;
using System.Collections.ObjectModel;
using System.ComponentModel;
namespace Chips
{
public partial class GettingStarted: ContentPage
{
public GettingStarted()
{
InitializeComponent();
Grid grid = new Grid();
SfChipGroup chipGroup = new SfChipGroup();
grid.Children.Add(chipGroup);
FlexLayout layout = new FlexLayout()
{
Direction = FlexDirection.Row,
Wrap = FlexWrap.Wrap,
HorizontalOptions = LayoutOptions.Start,

```

```

VerticalOptions = LayoutOptions.Center,
AlignContent = FlexAlignContent.Start,
JustifyContent = FlexJustify.Start,
AlignItems = FlexAlignItems.Start,
};
var entry= new Entry { Margin = new Thickness(10, 10, 0, 0), WidthRequest = 110 };
entry.Completed += Entry_Completed;
chipGroup.InputView = entry;
chipGroup.ChipLayout = layout;
this.BindingContext = new ViewModel();
chipGroup.SetBinding(SfChipGroup.ItemsSourceProperty, "Employees");
chipGroup.DisplayMemberPath = "Name";
chipGroup.ChipPadding = new Thickness(8, 8, 0, 0);
this.Content = grid;
}
}
}

```

The following code example demonstrates the dynamic addition of chips into a chip group with the completed event in entry.

### C#

```

using Xamarin.Forms;
using Syncfusion.XForms.Buttons;
namespace Chips
{
    public partial class GettingStarted : ContentPage
    {
        public GettingStarted()
        {
            InitializeComponent();
        }
        private void Entry_Completed(object sender, System.EventArgs e)
        {
            Entry entry = sender as Entry;
            if (entry != null && !string.IsNullOrEmpty(entry.Text))
            {
                viewModel.Employees.Add(new Person() { Name = entry.Text });
            }
        }
    }
}

```

---

**Note:** The `InputView` is visible only in Input type.

---

### Customization of SfChip

The chip control supports to customize the background color, border color, close button color, and more. The chip control can be customized using the following properties:

#### ShowCloseButton

The [ShowCloseButton](#) property sets the visible state of close button in SfChip.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="ChipCustomization.MainPage">
<ContentPage.Content>
<StackLayout Margin="8,8,8,8" >
<buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
ShowCloseButton="true" >
</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout();
SfChip chip = new SfChip();
chip.Text = "James";
chip.WidthRequest = 150;
chip.HorizontalOptions = LayoutOptions.Center;
chip.VerticalOptions = LayoutOptions.Center;
chip.ShowCloseButton = true;
stackLayout.Children.Add(chip);
this.Content = stackLayout;
}
}
}
```

**Note:** The default value of ShowCloseButton is [false].

**ShowSelectionIndicator**

The [ShowSelectionIndicator](#) property sets the visible state of selection indicator in SfChip.

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="ChipCustomization.MainPage">
<ContentPage.Content>
<StackLayout Margin="8,8,8,8" >
<buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
ShowCloseButton="true"
ShowSelectionIndicator="true"
>
</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout();
            SfChip chip = new SfChip();
            chip.Text = "James";
            chip.WidthRequest = 150;
            chip.HorizontalOptions = LayoutOptions.Center;
            chip.VerticalOptions = LayoutOptions.Center;
            chip.ShowCloseButton = true;
            chip.ShowSelectionIndicator = true;
            stackLayout.Children.Add(chip);
            this.Content = stackLayout;
        }
    }
}
```

**Note:** The default value of ShowSelectionIndicator is [false].

## CloseButtonColor

The [CloseButtonColor](#) property customizes the color of the close button in SfChip.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="ChipCustomization.MainPage">
<ContentPage.Content>
<StackLayout Margin="8,8,8,8" >
<buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
ShowCloseButton="true"
CloseButtonColor="White"
>
</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

### C#

```
using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout();
            SfChip chip = new SfChip();
            chip.Text = "James";
            chip.WidthRequest = 150;
            chip.HorizontalOptions = LayoutOptions.Center;
            chip.VerticalOptions = LayoutOptions.Center;
            chip.ShowCloseButton = true;
            chip.CloseButtonColor = Color.White;
            stackLayout.Children.Add(chip);
            this.Content = stackLayout;
        }
    }
}
```

**Note:** The default value of CloseButtonColor is [Color.FromHex("#6b6b6b")].

#### SelectionIndicatorColor

The [SelectionIndicatorColor](#) property customizes the selection indicator color in SfChip.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="ChipCustomization.MainPage">
  <ContentPage.Content>
    <StackLayout Margin="8,8,8,8" >
      <buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
ShowCloseButton="true"
ShowSelectionIndicator="true"
CloseButtonColor = "White"
SelectionIndicatorColor = "White"
      >
    </buttons:SfChip>
  </StackLayout>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
  public partial class MainPage : ContentPage
  {
    public MainPage()
    {
      InitializeComponent();
      StackLayout stackLayout = new StackLayout();
      SfChip chip = new SfChip();
      chip.Text = "James";
      chip.WidthRequest = 150;
      chip.HorizontalOptions = LayoutOptions.Center;
      chip.VerticalOptions = LayoutOptions.Center;
      chip.ShowCloseButton = true;
      chip.ShowSelectionIndicator = true;
      chip.CloseButtonColor = Color.White;
    }
  }
}
```

```
chip.SelectionIndicatorColor = Color.White;
stackLayout.Children.Add(chip);
this.Content = stackLayout;
}
}
```

**Note:** The default value of SelectionIndicatorColor is [Color.FromHex("#6b6b6b")].

### BackgroundColor

The [BackgroundColor](#) property customizes the background color of SfChip.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="ChipCustomization.MainPage">
  <ContentPage.Content>
    <StackLayout Margin="8,8,8,8" >
      <buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
ShowCloseButton="true"
ShowSelectionIndicator="true"
CloseButtonColor = "White"
SelectionIndicatorColor = "White"
BackgroundColor="Aqua"
>
    </buttons:SfChip>
  </StackLayout>
</ContentPage.Content>
</ContentPage>
```

### C#

```
using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
    }
}
```

```

StackLayout stackLayout = new StackLayout();
SfChip chip = new SfChip();
chip.Text = "James";
chip.WidthRequest = 150;
chip.HorizontalOptions = LayoutOptions.Center;
chip.VerticalOptions = LayoutOptions.Center;
chip.ShowSelectionIndicator = true;
chip.CloseButtonColor = Color.White;
chip.SelectionIndicatorColor = Color.White;
chip.BackgroundColor = Color.Aqua;
stackLayout.Children.Add(chip);
this.Content = stackLayout;
}
}
}

```

**Note:** The default value of BackgroundColor is [Color.Accent].

#### BorderColor

The [BorderColor](#) property customizes the color of border in SfChip.

#### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="ChipCustomization.MainPage">
<ContentPage.Content>
<StackLayout Margin="8,8,8,8" >
<buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
BorderWidth="4"
BorderColor="Black"
>
</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

#### C#

```

using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization

```

```

{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout();
SfChip chip = new SfChip();
chip.Text = "James";
chip.WidthRequest = 150;
chip.HorizontalOptions = LayoutOptions.Center;
chip.VerticalOptions = LayoutOptions.Center;
chip.BorderWidth = 4;
chip.BorderColor = Color.Black;
stackLayout.Children.Add(chip);
this.Content = stackLayout;
}
}
}

```

**Note:** The default value of BorderColor is [Color.Transparent].

#### BorderWidth

The [BorderWidth](#) property customizes the thickness of border in SfChip.

#### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"

x:Class="ChipCustomization.MainPage">
<ContentPage.Content>
<StackLayout Margin="8,8,8,8" >
<buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
BorderWidth="8"
BorderColor="Black"
>
</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout();
            SfChip chip = new SfChip();
            chip.Text = "James";
            chip.WidthRequest = 150;
            chip.HorizontalOptions = LayoutOptions.Center;
            chip.VerticalOptions = LayoutOptions.Center;
            chip.BorderWidth = 8;
            chip.BorderColor = Color.Black;
            stackLayout.Children.Add(chip);
            this.Content = stackLayout;
        }
    }
}

```

---

**Note:** Default value of BorderWidth

---

Android : [0d]

iOS : [0d]

UWP : [2d]

**CornerRadius**

The **CornerRadius** property is used to customize the rounded edges in SfChip as demonstrated in the following code sample.

**XML**

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="ChipCustomization.MainPage">
    <ContentPage.Content>

```

```
<StackLayout Margin="8,8,8,8" >
<buttons:SfChip Text="James"
WidthRequest="150"
HorizontalOptions="Center"
VerticalOptions="Center"
BorderWidth="4"
CornerRadius = "4"
BorderColor="Black"
>
</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout();
SfChip chip = new SfChip();
chip.Text = "James";
chip.WidthRequest = 150;
chip.HorizontalOptions = LayoutOptions.Center;
chip.VerticalOptions = LayoutOptions.Center;
chip.BorderWidth = 4;
chip.CornerRadius = 4;
chip.BorderColor = Color.Black;
stackLayout.Children.Add(chip);
this.Content = stackLayout;
}
}
}
```

**Note:** The default value of CornerRadius is [Thickness(0)].

## FontAttributes

The [FontAttributes](#) property customizes the font style of text in SfChip.

## XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace ChipCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout();
            SfChip chip = new SfChip();
            chip.Text = "James";
            chip.WidthRequest = 150;
            chip.HorizontalOptions = LayoutOptions.Center;
            chip.VerticalOptions = LayoutOptions.Center;
            chip.BackgroundColor = Color.Aqua;
            chip.TextColor = Color.Black;
            chip.ImageSource = "ChipUserContact.png";
            chip.ImageAlignment = Alignment.End;
            chip.ImageWidth = 25;
            chip.ShowIcon = true;
            stackLayout.Children.Add(chip);
            this.Content = stackLayout;
        }
    }
}

```

**Note:** The default value of ImageAlignment is [Alignment.Start].

## Command

The [Command](#) property associates a command with an instance of SfChip. This property is most often set with MVVM pattern to bind callbacks back into the ViewModel.

## XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ChipCustomization"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"

```

```

x:Class="ChipCustomization.MainPage">
<ContentPage.BindingContext>
<local:CommandDemoViewModel />
</ContentPage.BindingContext>
<ContentPage.Content>
<StackLayout Margin="8,8,0,0">
<buttons:SfChip x:Name="Chip"
Text="Chip"
HorizontalOptions="Center"
VerticalOptions="Center"
WidthRequest="150"
ShowCloseButton="true"
BackgroundColor="{Binding Background}"
Command="{Binding ButtonCommand}">
</buttons:SfChip>
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

// ViewModel class for Command Demo.
public class CommandDemoViewModel : INotifyPropertyChanged
{
    private Color _background = Color.Accent;
    public Color Background
    {
        get { return _background; }
        set
        {
            _background = value;
            NotifyPropertyChanged();
        }
    }
    private void NotifyPropertyChanged([CallerMemberName] String propertyName =
        "")
    {
        PropertyChanged?.Invoke(this, new PropertyChangedEventArgs(propertyName));
    }
    public event PropertyChangedEventHandler PropertyChanged;
    public CommandDemoViewModel()
    {
        BackgroundColor();
        this.Background=Color.Accent;
    }
    private void BackgroundColor()
    {
        this.Background = this.Background == Color.DeepSkyBlue ? Color.Accent :
        Color.DeepSkyBlue;
    }
    public ICommand ButtonCommand => new Command(BackgroundColor);
}

```

**Note:** The default value of Command is [null].

### Customization of SfChipGroup

The chip group supports to customize the chip's background color, border color, text color, and more. The chip group can be customized using the following properties:

### InputView

The [InputView](#) property allows to provide a view to the input chip. In this example, the input chip is used to add an employee at run time. To get the employee name as input, an entry is added as InputView.

### XML

```
<ContentPage
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:buttons="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Chips"
x:Class="Chips.GettingStarted">
  <ContentPage.BindingContext>
  <local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<ContentPage.Content>
  <buttons:SfChipGroup
x:Name="chipGroup"
ItemsSource="{Binding Employees}"
ChipPadding="8,8,0,0"
DisplayMemberPath="Name">
  <buttons:SfChipGroup.ChipLayout>
  <FlexLayout
HorizontalOptions="Start"
VerticalOptions="Center"
Direction="Row"
Wrap="Wrap"
JustifyContent="Start"
AlignContent="Start"
AlignItems="Start"/>
  </buttons:SfChipGroup.ChipLayout>
  <buttons:SfChipGroup.InputView>
  <Entry
Margin="10,10,0,0"
WidthRequest="110"
Completed="Entry_Completed"/>
  </buttons:SfChipGroup.InputView>
  </buttons:SfChipGroup>
</ContentPage.Content>
</ContentPage>
```

### C#

```

using System;
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace Chips
{
    public partial class GettingStarted: ContentPage
    {
        public GettingStarted()
        {
            InitializeComponent();
            Grid grid = new Grid();
            SfChipGroup chipGroup = new SfChipGroup();
            grid.Children.Add(chipGroup);
            FlexLayout layout = new FlexLayout()
            {
                Direction = FlexDirection.Row,
                Wrap = FlexWrap.Wrap,
                HorizontalOptions = LayoutOptions.Start,
                VerticalOptions = LayoutOptions.Center,
                AlignContent = FlexAlignContent.Start,
                JustifyContent = FlexJustify.Start,
                AlignItems = FlexAlignItems.Start,
            };
            var entry= new Entry { Margin = new Thickness(10, 10, 0, 0), WidthRequest = 110 };
            entry.Completed += Entry_Completed;
            chipGroup.InputView = entry;
            chipGroup.ChipLayout = layout;
            this.BindingContext = new ViewModel();
            chipGroup.SetBinding(SfChipGroup.ItemsSourceProperty, "Employees");
            chipGroup.DisplayMemberPath = "Name";
            chipGroup.ChipPadding = new Thickness(8, 8, 0, 0);
            this.Content = grid;
        }
    }
}

```

**Note:** The InputView is visible only in the Input type. The default value of InputView is [null].

[SelectedChipBackgroundColor](#)

The [SelectedChipBackgroundColor](#) property customizes the background color of the selected chip.

#### XML

            StackLayout stack = new StackLayout();
            SfChipGroup chipGroup = new SfChipGroup();
            stack.Children.Add(chipGroup);
            FlexLayout layout = new FlexLayout()
            {
                Direction = FlexDirection.Row,
                Wrap = FlexWrap.Wrap,
                HorizontalOptions = LayoutOptions.Start,
                VerticalOptions = LayoutOptions.Center,
                AlignContent = FlexAlignContent.Start,
                JustifyContent = FlexJustify.Start,
                AlignItems = FlexAlignItems.Start,
            };
            chipGroup.ChipLayout = layout;
            this.BindingContext = new ViewModel();
            chipGroup.SetBinding(SfChipGroup.ItemsSourceProperty, "Employees");
            chipGroup.DisplayMemberPath = "Name";
            chipGroup.ImageMemberPath = "Image";
            chipGroup.ChipImageWidth = 30;
            chipGroup.ChipBackgroundColor = Color.Aqua;
            chipGroup.Type = SfChipsType.Choice;
            chipGroup.ShowIcon = true;
            this.Content = stack;
        }
    }
    // Model Class
    public class Person
    {
        public string Name
        {
            get;
            set;
        }
        public string Image
        {
            get;
            set;
        }
    }
    //ViewModel Class
    public class ViewModel : INotifyPropertyChanged
    {
        private ObservableCollection<Person> employees;
        public ObservableCollection<Person> Employees
        {
            get
            {
                return employees;
            }
        }
    }
}
```

```
set
{
    Employees = value;
    OnPropertyChanged("Employees");
}
}
public ViewModel()
{
    employees = new ObservableCollection<Person>();
    employees.Add(new Person() { Image = "ChipUserContact.png", Name = "John"
    });
    employees.Add(new Person() { Image = "ChipUserContact.png", Name = "James"
    });
}
public event PropertyChangedEventHandler PropertyChanged;
public void OnPropertyChanged(string property)
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(property));
    }
}
}
```

**Note:** The default value of `ChipImageWidth` is [26].

## SfCircularGauge

### Overview

Essential Gauge for Xamarin.Forms helps you to visualize the numeric values over a circular scale. The appearance of the gauge is fully customized to integrate your applications without fault.

### Key features

[SfCircularGauge](#) is a composed control of several scales. Scales will be an integrated UI part of the circular gauge.

[SfCircularGauge](#) is a composite UI element with the following subparts:

- Scales
- Ranges
- Pointers
- Headers
- Annotations

The circular gauge control is highly customizable control with variety of simple APIs to modify its basic look and feel. You can position ranges, ticks, labels, and range pointers as needed.

### Scales

Circular gauge scale contains labels, tick marks, and a rim to customize its basic look and feel. It defines the start angle, sweep direction, sweep angle, overall minimum and maximum values, the frequency of labels, and tick marks.

**Ranges**

Range is a visual element that depicts the start and end values of inner divisions within the scale's range. Each scale is capable of displaying one or more ranges, and each range can depict different zones or regions of same metrics, such as high, low, and average temperatures.

**Pointers**

Pointer is an element that points out the values of the bound property on a scale. A circular scale will have one or more pointers that can be used to measure different values. Each pointer has the **Value** property, which informs the current value to the user visually.

**Headers**

Header can be used to set a unique header for the circular gauge. The user can add text as the header in a circular gauge.

**Annotations**

Annotations allows you to mark the specific area of interest in a circular gauge. You can place custom views, text, and images as annotations by using the annotations feature.

## Getting Started

This section explains the steps required to configure the [SfCircularGauge](#), and also explains the steps required to add basic elements to [SfCircularGauge](#) through various APIs available within it.

To get start quickly with Xamarin Circular Gauge control, you can check on this video:

```
<style>#XamarinGaugeVideoTutorial{width : 90% !important; height: 300px !important }</style>
```

```
<iframe id='XamarinGaugeVideoTutorial'  
src='https://www.youtube.com/embed/Rjd9NxDFoWo'></iframe>
```

## Adding SfCircularGauge reference

You can add SfCircularGauge reference using one of the following methods:

### Method 1: Adding SfCircularGauge reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfCircularGauge to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfGauge](#), and then install it.

![Adding SfCircularGauge reference from NuGet](getting-started\_images/Adding SfCircularGauge reference.png)

---

**Note:** Install the same version of SfCircularGauge NuGet in all the projects.

---

### Method 2: Adding SfCircularGauge reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfCircularGauge control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfCircularGauge assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfGauge.Android.dll Syncfusion.SfGauge.XForms.Android.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfGauge.iOS.dll Syncfusion.SfGauge.XForms.iOS.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfGauge.UWP.dll Syncfusion.SfGauge.XForms.UWP.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching an application on each platform with SfCircularGauge.

To use the SfCircularGauge control inside an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

### iOS

To launch the SfCircularGauge in iOS, call the `SfGaugeRenderer.Init()` in the `FinishedLaunching` overridden method of the AppDelegate class after the Xamarin.Forms Framework has been initialized and before the `LoadApplication` is called, as demonstrated in the following code example.

### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.SfGauge.XForms.iOS.SfGaugeRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

### Universal Windows Platform (UWP)

You need to initialize the circular gauge view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with circular gauge in Release mode in UWP platform.

### C#

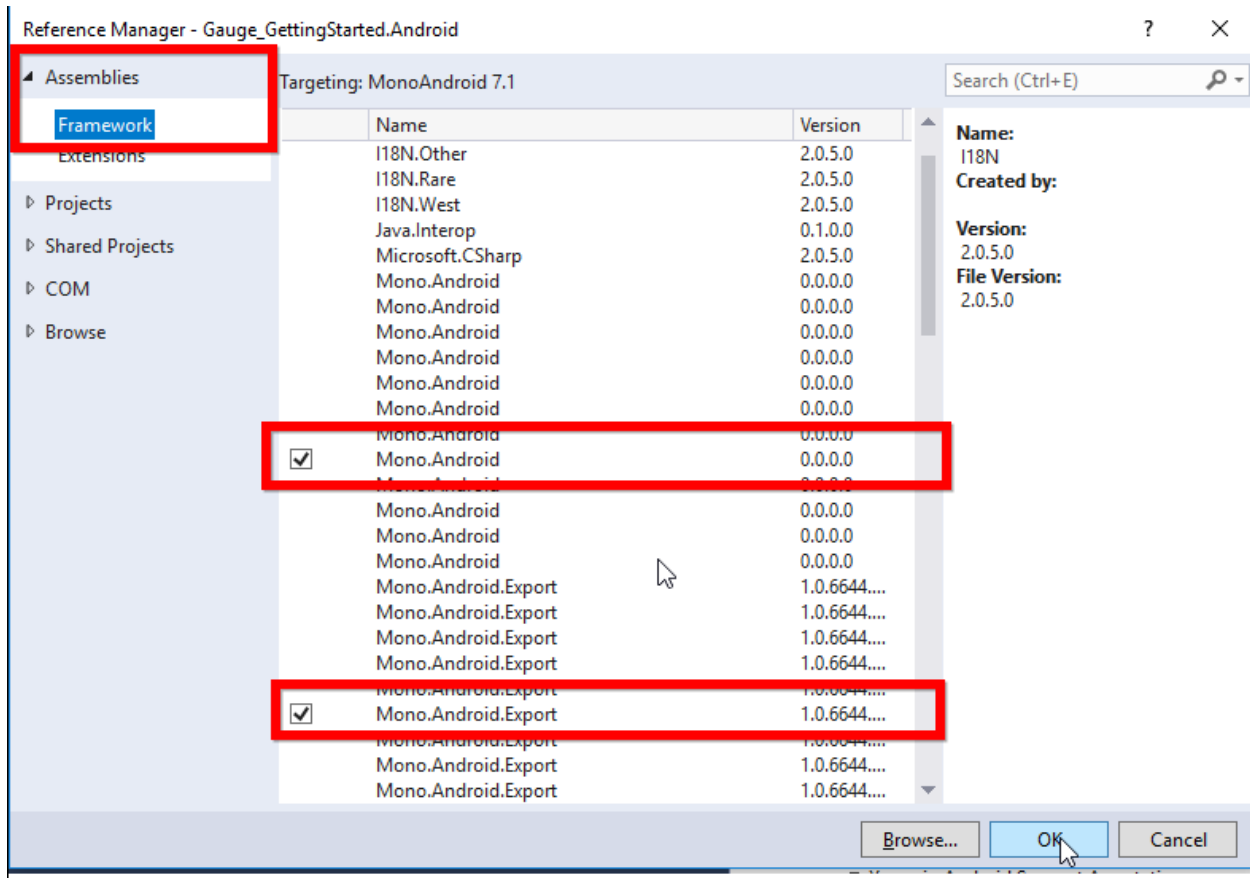

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    // Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfGauge.XForms.UWP.SfGaugeRenderer)
        .GetTypeInfo().Assembly);
    // Replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Android

The Android platform does not require any additional configuration to render the circular gauge.

### Reference Mono.Android.Export

1. In the Solution Explorer in the Android project, right-click on References and choose Add Reference.
2. In the Add Reference window, select the Assemblies tab and choose the Framework.
3. In the Framework tab, ensure Mono.Android and Mono.Android.Export is checked and click ok.

*Adding namespace for the assemblies*

#### **XML**

```
xmlns:gauge="clr-namespace:Syncfusion.SfGauge.XForms;assembly=Syncfusion.SfGauge.XForms"
```

#### **C#**

```
using Syncfusion.SfGauge.XForms;
```

#### Initialize gauge

You can initialize the [SfCircularGauge](#) control with a required optimal name by using the included namespace.

#### **XML**

```
<gauge:SfCircularGauge/>
```

#### **C#**

```
SfCircularGauge circularGauge = new SfCircularGauge ();  
this.Content = circularGauge;
```

### Adding header

You can assign a unique header to [SfCircularGauge](#) by using the [Header](#) property and position it by using the [Position](#) property as you want.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="Speedometer" ForegroundColor="Black" TextSize="20" />
  </gauge:SfCircularGauge.Headers>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
Header header = new Header();
header.Text = "Speedometer";
header.ForegroundColor = Color.Black;
header.TextSize = 20;
circularGauge.Headers.Add(header);
```

### Configuring scales

You can configure the [Scale](#) elements by using following APIs, which are available in [SfCircularGauge](#):

- StartAngle
- SweepAngle
- StartValue
- EndValue
- Interval
- RimThickness
- RimColor

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale />
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
ObservableCollection<Scale> scales = new ObservableCollection<Scale>>();
Scale scale = new Scale();
scales.Add(scale);
circularGauge.Scales = scales;
```

### Adding ranges

You can add ranges to [SfCircularGauge](#) by creating ranges collection using the [Range](#) property.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Ranges>
        <gauge:Range StartValue="0" EndValue="40"/>
      </gauge:Scale.Ranges>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
Range range = new Range();
range.StartValue = 0;
range.EndValue = 40;
scale.Ranges.Add(range);
scales.Add(scale);
circularGauge.Scales = scales;
```

### Adding a needle pointer

Create a [Needle Pointer](#), and associate it with a scale that is to be displayed the current value.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:NeedlePointer Value="60" />
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 60;
scale.Pointers.Add(needlePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

### Adding a range pointer

[Range Pointer](#) provides an alternative way to indicate the current value.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
```

```
<gauge:RangePointer Value="60" />
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
ObservableCollection<Scale> scales = new ObservableCollection<Scale>>();
Scale scale = new Scale();
RangePointer rangePointer = new RangePointer();
rangePointer.Value = 60;
scale.Pointers.Add(rangePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

Adding a marker pointer

[Marker Pointer](#) points the current value in scale.

**XML**

```
<gauge:SfCircularGauge>
<gauge:SfCircularGauge.Scales>
<gauge:Scale>
<gauge:Scale.Pointers>
<gauge:MarkerPointer Value="70" />
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale=new Scale();
MarkerPointer markerPointer = new MarkerPointer();
markerPointer.Value = 70;
scale.Pointers.Add(markerPointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

The following code example gives you the complete code of above configurations.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:gauge="clr-
namespace:Syncfusion.SfGauge.XForms;assembly=Syncfusion.SfGauge.XForms"
xmlns:local="clr-namespace:CircularGauge;assembly=CircularGauge"
x:Class="CircularGauge.UGSample">
<gauge:SfCircularGauge VerticalOptions="FillAndExpand"
HorizontalOptions="FillAndExpand" Margin="10">
<gauge:SfCircularGauge.Headers>
```

```

<gauge:Header Text="Speedometer" ForegroundColor="Black" TextSize="20" />
</gauge:SfCircularGauge.Headers>
<gauge:SfCircularGauge.Scales>
<gauge:Scale>
<gauge:Scale.Ranges>
<gauge:Range StartValue="0" EndValue="40"/>
</gauge:Scale.Ranges>
<gauge:Scale.Pointers>
<gauge:NeedlePointer Value="60" />
<gauge:RangePointer Value="60" />
<gauge:MarkerPointer Value="70" />
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
</ContentPage>

```

**C#**

```

using Syncfusion.SfGauge.XForms;
namespace CircularGauge
{
public partial class UGSample : ContentPage
{
public UGSample()
{
InitializeComponent();
//Initializing circular gauge
SfCircularGauge circularGauge = new SfCircularGauge();
circularGauge.Margin = 10;
//Adding header
Header header = new Header();
header.Text = "Speedometer";
header.ForegroundColor = Color.Black;
header.TextSize = 20;
circularGauge.Headers.Add(header);
//Initializing scales for circular gauge
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scales.Add(scale);
//Adding range
Range range = new Range();
range.StartValue = 0;
range.EndValue = 40;
scale.Ranges.Add(range);
//Adding needle pointer
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 60;
scale.Pointers.Add(needlePointer);
//Adding range pointer
RangePointer rangePointer = new RangePointer();
rangePointer.Value = 60;
scale.Pointers.Add(rangePointer);
//Adding marker pointer
MarkerPointer markerPointer = new MarkerPointer();
markerPointer.Value = 70;

```

```
scale.Pointers.Add(markerPointer);  
scales.Add(scale);  
circularGauge.Scales = scales;  
this.Content = circularGauge;  
}  
}  
}
```

The following circular gauge is created as a result of the above codes.

You can find the complete getting started sample from this [link](#).

## Scales

Scales contain a collection of [Scale](#) elements, which integrates labels, tick marks, and a rim to customize the basic look and feel of the circular gauge.

## Scale

[Scale](#) contains the sub elements such as rim, ticks, labels, ranges, and pointers. It defines the radius, start angle, sweep direction, sweep angle, overall minimum and maximum values, frequency of labels, and tick marks. It will have multiple ranges.

A range is a visual element, which begins and ends at specified values within a [Scale](#). It will have one or more pointers to point out the values in scale.

#### XML

```
<gauge:SfCircularGauge>  
  <gauge:SfCircularGauge.Scales>  
    <gauge:Scale/>  
  </gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scales.Add(scale);  
circularGauge.Scales = scales;
```

Setting start and end values for scale

The [StartValue](#) and [EndValue](#) properties allow you to set the start and end values for scale.

#### XML

```
<gauge:SfCircularGauge>  
  <gauge:SfCircularGauge.Scales>  
    <gauge:Scale StartValue="-30" EndValue="50"/>  
  </gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scale.StartValue = -30;  
scale.EndValue = 50;  
scales.Add(scale);  
circularGauge.Scales = scales;
```

Setting start and sweep angles for scale

The [StartAngle](#) and [SweepAngle](#) properties allow you to set the start and end angles for scale.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale StartAngle="185" SweepAngle="270"/>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.StartAngle = 185;
scale.SweepAngle = 270;
scales.Add(scale);
circularGauge.Scales = scales;
```

Setting interval for scale

The [Interval](#) property allows you to set the interval for scale.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale StartValue = "0" EndValue = "500" Interval = "100" />
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scale.StartValue = 0;  
scale.EndValue = 500;  
scale.Interval = 100;  
scales.Add(scale);  
circularGauge.Scales = scales;
```

**Setting auto interval for scale**

By default, the interval value is calculated by 10. By using the [EnableAutoInterval](#) property, you can set auto interval based on the start and end values.

**XML**

```
<gauge:SfCircularGauge>  
  <gauge:SfCircularGauge.Scales>  
    <gauge:Scale StartValue="0" EndValue="500" EnableAutoInterval = "True"/>  
  </gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scale.StartValue = 0;  
scale.EndValue = 500;  
scale.EnableAutoInterval = true;  
scales.Add(scale);  
circularGauge.Scales = scales;
```

### Setting scale direction for scale

The [Direction](#) property allows you to render the gauge scale in either clockwise or counterclockwise direction.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale Direction="AntiClockwise"/>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.Direction = ScaleDirection.AntiClockwise;
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting maximum labels

The [MaximumLabels](#) property defines the count of the scale labels in 100 pixels. By default, the count of maximum labels for 100 pixels is 3.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale EndValue="200" MaximumLabels="4" MinorTicksPerInterval="1" />
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge sfCircularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.EndValue = 200;
scale.MaximumLabels = 4;
scale.MinorTicksPerInterval = 1;
scales.Add(scale);
sfCircularGauge.Scales = scales;
Content = sfCircularGauge;
```

### Setting multiple scales for scale

It helps you to add multiple scales to the same circular gauge. You can customize all the scales in a [Scales](#) collection.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale x:Name="scale1"
      StartValue="0" EndValue="240" Interval="20" MinorTicksPerInterval="1"
      RimColor="#C62E0A"
      LabelOffset="0.88" LabelColor="#C62E0A" ScaleStartOffset="0.7"
      ScaleEndOffset="0.69">
      <gauge:Scale.MajorTickSettings>
        <gauge:TickSettings StartOffset="0.7" EndOffset="0.77" Thickness="2"
          Color="#C62E0A"/>
      </gauge:Scale.MajorTickSettings>
      <gauge:Scale.MinorTickSettings>
        <gauge:TickSettings StartOffset="0.7" EndOffset="0.75" Thickness="2"
          Color="#C62E0A"/>
      </gauge:Scale.MinorTickSettings>
    </gauge:Scale>
    <gauge:Scale x:Name="scale2"
      StartValue="0" EndValue="160" Interval="40" MinorTicksPerInterval="1"
      RimColor="#333333"
      LabelOffset="0.45" LabelColor="#333333" ScaleStartOffset="0.65"
      ScaleEndOffset="0.64">
      <gauge:Scale.MajorTickSettings>
        <gauge:TickSettings StartOffset="0.64" EndOffset="0.57" Thickness="2"
          Color="#333333"/>
      </gauge:Scale.MajorTickSettings>
      <gauge:Scale.MinorTickSettings>
        <gauge:TickSettings StartOffset="0.64" EndOffset="0.59" Thickness="2"
          Color="#333333"/>
      </gauge:Scale.MinorTickSettings>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

```
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.StartValue = 0;
scale.EndValue = 240;
scale.Interval = 20;
scale.MinorTicksPerInterval = 1;
scale.RimColor = Color.FromHex("#C62E0A");
scale.LabelOffset = 0.88;
scale.LabelColor = Color.FromHex("#C62E0A");
scale.ScaleStartOffset = 0.7;
scale.ScaleEndOffset = 0.69;
TickSettings majorTicks = new TickSettings();
majorTicks.StartOffset = 0.7;
majorTicks.EndOffset = 0.77;
majorTicks.Thickness = 2;
majorTicks.Color = Color.FromHex("#C62E0A");
scale.MajorTickSettings = majorTicks;
TickSettings minorTicks = new TickSettings();
minorTicks.StartOffset = 0.7;
minorTicks.EndOffset = 0.75;
minorTicks.Thickness = 2;
minorTicks.Color = Color.FromHex("#C62E0A");
scale.MinorTickSettings = minorTicks;
scales.Add(scale);
Scale circularScale = new Scale();
circularScale.StartValue = 0;
circularScale.EndValue = 160;
circularScale.Interval = 40;
circularScale.MinorTicksPerInterval = 1;
circularScale.RimColor = Color.FromHex("#333333");
circularScale.LabelOffset = 0.45;
circularScale.LabelColor = Color.FromHex("#333333");
circularScale.ScaleStartOffset = 0.65;
circularScale.ScaleEndOffset = 0.64;
TickSettings majorTick = new TickSettings();
majorTick.StartOffset = 0.64;
majorTick.EndOffset = 0.57;
majorTick.Thickness = 2;
majorTick.Color = Color.FromHex("#333333");
circularScale.MajorTickSettings = majorTick;
TickSettings minorTick = new TickSettings();
minorTick.StartOffset = 0.64;
minorTick.EndOffset = 0.59;
minorTick.Thickness = 2;
minorTick.Color = Color.FromHex("#333333");
circularScale.MinorTickSettings = minorTick;
scales.Add(circularScale);
circularGauge.Scales = scales;
```

## Events

You can change the default label by hooking the [LabelCreated](#) event. Based on your requirements, the labels can be changed by using the `LabelContent` property of `LabelCreatedEventArgs`.

## XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale x:Name="scale" StartAngle="270" StartValue="0" EndValue="16"
      Interval="2"
      SweepAngle="360" MinorTicksPerInterval="1" ShowLastLabel="False"
      LabelCreated="scale_LabelCreated" />
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

## C#

```
private void scale_LabelCreated(object sender, LabelCreatedEventArgs args)
{
    switch ((string)args.LabelContent)
    {
        case "0":
            args.LabelContent = "N";
            break;
        case "2":
            args.LabelContent = "NE";
            break;
        case "4":
            args.LabelContent = "E";
            break;
        case "6":
            args.LabelContent = "SE";
            break;
        case "8":
            args.LabelContent = "S";
            break;
        case "10":
            args.LabelContent = "SW";
            break;
        case "12":
            args.LabelContent = "W";
            break;
        case "14":
            args.LabelContent = "NW";
            break;
    }
}
```

```
}
}
```

## Rim

Scale determines the structure of a circular gauge by using the circular rim. By setting the [StartAngle](#) and [SweepAngle](#) properties, you can change the shape of the circular gauge into a full circular gauge, half circular gauge, or quarter circular gauge.

The [StartValue](#) and [EndValue](#) properties will determine the overall range of the circular rim.

## XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale StartAngle="270" SweepAngle="360" StartValue="0" EndValue="360"
      Interval="20" MinorTicksPerInterval="0" ShowFirstLabel="False"/>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.StartAngle = 270;
scale.SweepAngle = 360;
scale.StartValue = 0;
scale.EndValue = 360;
scale.Interval = 20;
scale.MinorTicksPerInterval = 0;
scale.ShowFirstLabel = false;
scales.Add(scale);
circularGauge.Scales = scales;
```

### Rim customization

The color and thickness of rim can be set by using the [RimColor](#) and [RimThickness](#) properties. To increase the [RimThickness](#), set the [RadiusFactor](#).

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale RadiusFactor="1" RimThickness="40" RimColor="SkyBlue"
      LabelOffset = "0.6">
      <gauge:Scale.MajorTickSettings>
        <gauge:TickSettings Offset = "0.75"/>
      </gauge:Scale.MajorTickSettings>
      <gauge:Scale.MinorTickSettings>
        <gauge:TickSettings Offset = "0.75"/>
      </gauge:Scale.MinorTickSettings>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.RadiusFactor = 1;
scale.RimThickness = 40;
scale.LabelOffset = 0.6;
scale.MajorTickSettings.Offset = 0.75;
scale.MinorTickSettings.Offset = 0.75;
scale.RimColor = Color.SkyBlue;
scales.Add(scale);
circularGauge.Scales = scales;
```

Setting position for rim

You can customize the position of [Scales](#) in the following two ways:

1. [RadiusFactor](#) with the [RimThickness](#) property.
2. The [ScaleStartOffset](#) and [ScaleEndOffset](#) properties.

*Setting radius factor for rim*

#### XML

```
<gauge:SfCircularGauge>  
  <gauge:SfCircularGauge.Scales>  
    <gauge:Scale RadiusFactor = "0.7" RimThickness = "30">  
    </gauge:Scale>  
  </gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scale.RadiusFactor = 0.7;  
scale.RimThickness = 30;  
scales.Add(scale);  
circularGauge.Scales = scales;
```

*Setting scale start and end offsets for rim*

#### XML

```
<gauge:SfCircularGauge>  
  <gauge:SfCircularGauge.Scales>  
    <gauge:Scale ScaleStartOffset="0.6" ScaleEndOffset = "0.7">  
    </gauge:Scale>  
  </gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

```
</gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge circularGauge = new SfCircularGauge();  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scale.ScaleStartOffset = 0.6;  
scale.ScaleEndOffset = 0.7;  
scales.Add(scale);  
circularGauge.Scales = scales;
```

## Show rim

The [ShowRim](#) property is a Boolean property, which is used to enable or disable the rim in circular gauge.

## XML

```
<gauge:SfCircularGauge>  
  <gauge:SfCircularGauge.Scales>  
    <gauge:Scale ShowRim = "False">  
    </gauge:Scale>  
  </gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge circularGauge = new SfCircularGauge();  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scale.ShowRim = false;  
scales.Add(scale);  
circularGauge.Scales = scales;
```

## Tick Setting

The **TickSettings** property helps you to identify the gauge's data value by marking the gauge scale in regular increments.

### Show ticks for scale

The [ShowTicks](#) property allows you to enable or disable the ticks of circular gauge.

## XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale ShowTicks="False"/>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.ShowTicks = false;
scales.Add(scale);
circularGauge.Scales = scales;
```

## Ticks customization

The [Interval](#) property is used to calculate the tick counts for a scale. Similar to ticks, minor ticks are calculated by using the [MinorTicksPerInterval](#) property.

Color and thickness of the tick are set by using the [Color](#) and [Thickness](#) UI properties. You can also customize the length of the ticks by using the [Length](#) property. First, you should set the **Offset** property for ticks, then increase the length of the ticks.

### Customize major ticks for scale

## XML

```

<gauge:SfCircularGauge>
<gauge:SfCircularGauge.Scales>
<gauge:Scale>
<gauge:Scale.MajorTickSettings>
<gauge:TickSettings Color ="Brown" Thickness="4" Length="15" Offset="0.97"/>
</gauge:Scale.MajorTickSettings>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

**C#**

```

SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
TickSettings majorTicks = new TickSettings();
majorTicks.Length = 15;
majorTicks.Color = Color.Brown;
majorTicks.Thickness = 4;
majorTicks.Offset = 0.97;
scale.MajorTickSettings = majorTicks;
scales.Add(scale);
circularGauge.Scales = scales;

```

Customize minor ticks for scale

**XML**

```

<gauge:SfCircularGauge>
<gauge:SfCircularGauge.Scales>
<gauge:Scale>
<gauge:Scale.MinorTickSettings>
<gauge:TickSettings Color ="SkyBlue" Thickness="4" Length="4" Offset =
"0.97" />
</gauge:Scale.MinorTickSettings>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

**C#**

```

SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
TickSettings minorTicks = new TickSettings();
minorTicks.Length = 4;

```

```

minorTicks.Color = Color.SkyBlue;
minorTicks.Thickness = 4;
minorTicks.Offset = 0.97;
scale.MinorTickSettings = minorTicks;
scales.Add(scale);
circularGauge.Scales = scales;

```

### Setting position for ticks

The major and minor ticks can be positioned far away from the rim by using the following two ways:

1. **Offset** property.
2. **StartOffset** and **EndOffset** properties.

### Setting offset for scale

#### XML

```

<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.MajorTickSettings>
        <gauge:TickSettings Offset = "0.5"/>
      </gauge:Scale.MajorTickSettings>
      <gauge:Scale.MinorTickSettings>
        <gauge:TickSettings Offset = "0.5"/>
      </gauge:Scale.MinorTickSettings>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

#### C#

```

SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
TickSettings majorTicks = new TickSettings();
majorTicks.Offset = 0.5;
scale.MajorTickSettings = majorTicks;
TickSettings minorTicks = new TickSettings();
minorTicks.Offset = 0.5;
scale.MinorTickSettings = minorTicks;
scales.Add(scale);
circularGauge.Scales = scales;

```

*Setting scale start and end offset for scale*

#### **XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.MajorTickSettings>
        <gauge:TickSettings StartOffset = "0.3" EndOffset = "0.4"/>
      </gauge:Scale.MajorTickSettings>
      <gauge:Scale.MinorTickSettings>
        <gauge:TickSettings StartOffset = "0.3" EndOffset = "0.35"/>
      </gauge:Scale.MinorTickSettings>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### **C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
TickSettings majorTicks = new TickSettings();
majorTicks.StartOffset = 0.3;
majorTicks.EndOffset = 0.4;
scale.MajorTickSettings = majorTicks;
TickSettings minorTicks = new TickSettings();
minorTicks.StartOffset = 0.3;
minorTicks.EndOffset = 0.35;
scale.MinorTickSettings = minorTicks;
scales.Add(scale);
circularGauge.Scales = scales;
```

## Labels

The [Scale](#) labels associate a numeric value with major scale tick marks.

### Label color customization

The label color can be changed using the [LabelColor](#) property.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale LabelColor= "Blue"/ >
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.LabelColor = Color.Blue;
scales.Add(scale);
circularGauge.Scales = scales;
```

### Label font customization

The label font can be customized by using the [LabelFontSize](#), [FontAttribute](#), and [FontFamily](#) properties.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale FontAttributes = "Bold" LabelFontSize = "20" >
    <gauge:Scale.FontFamily>
      <OnPlatform x:String iOS = "Chalkduster" Android =
        "algerian.ttf" WinPhone="Chiller" />
    </gauge:Scale.FontFamily>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
```

```
scale.FontAttributes = FontAttributes.Bold;
scale.FontFamily = Device.RuntimePlatform == Device.iOS ? "Chalkduster" :
Device.RuntimePlatform == Device.Android ? "algerian.ttf" : "Chiller";
scale.LabelFontSize = 20;
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting position for labels

The labels can be positioned far away from the ticks by using the [LabelOffset](#) property.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale LabelOffset = "0.4"/>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.LabelOffset = 0.4;
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting number of decimal digits for labels

The [NumberOfDecimalDigits](#) property is used to set the number of decimal digits to be displayed in the scale labels.

#### XML

```
<gauge:SfCircularGauge>
```

```
<gauge:SfCircularGauge.Scales>
<gauge:Scale NumberOfDecimalDigits = "3"/>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.NumberOfDecimalDigits = 3;
scales.Add(scale);
circularGauge.Scales = scales;
```

## Setting postfix and prefix for labels

You can postfix/prefix values to the scale labels by using the [LabelPostfix](#) and [LabelPrefix](#) properties, respectively.

*Label postfix*

**LabelPostfix** property allows you to postfix the values to the scale labels.

**XML**

```
<gauge:SfCircularGauge>
<gauge:SfCircularGauge.Scales>
<gauge:Scale LabelPostfix = "$" />
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.LabelPostfix = "$";
scales.Add(scale);
circularGauge.Scales = scales;
```

### Label prefix

**LabelPrefix** property allows you to prefix the values to the scale labels.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale LabelPrefix = "$" />
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.LabelPrefix = "$";
scales.Add(scale);
circularGauge.Scales = scales;
```

### Edge label customization

You can customize the edge label by using the [ShowFirstLabel](#) and [ShowLastLabel](#) properties, which are Boolean properties. The [ShowFirstLabel](#) property is used to enable or disable first label, and the [ShowLastLabel](#) property is used to enable or disable the last label in circular gauge.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale ShowFirstLabel = "False" StartValue = "0" EndValue = "12"
      Interval = "1" MinorTicksPerInterval = "5" StartAngle = "270" SweepAngle =
        "360" />
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

```
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.StartValue = 0;
scale.Interval = 1;
scale.MinorTicksPerInterval = 5;
scale.EndValue = 12;
scale.StartAngle = 270;
scale.SweepAngle = 360;
scale.ShowFirstLabel = false;
scales.Add(scale);
circularGauge.Scales = scales;
```

**Show labels**

The [ShowLabels](#) property is a Boolean property, which is used to enable or disable the labels in circular gauge.

**XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale ShowLabels = "False"/>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.ShowLabels = false;
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting auto angle for label

Scale labels can be rotated automatically based on the current angle. To enable or disable the auto angle, use the [EnableAutoAngle](#) property.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale EnableAutoAngle = "True"/>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.EnableAutoAngle = true;
scales.Add(scale);
circularGauge.Scales = scales;
```

### Custom labels for circular gauge

Circular scale also supports custom label format using the [CustomLabels](#) property.

You can give labels in an array that you want to place in scale.

#### XML

```
Namespace:
xmlns:sys="clr-namespace:System;assembly=mcorlib"
...
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.CustomLabels>
```

```
<x:Array Type="{x:Type x:Double}">
  <sys:Double>0</sys:Double>
  <sys:Double>23</sys:Double>
  <sys:Double>45</sys:Double>
  <sys:Double>67</sys:Double>
  <sys:Double>85</sys:Double>
  <sys:Double>100</sys:Double>
</x:Array>
</gauge:Scale.CustomLabels>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.CustomLabels = new double[] { 0, 23, 45, 67, 85, 100 };
scales.Add(scale);
circularGauge.Scales = scales;
Content = circularGauge;
```

## Ranges

Range is a visual element, which begins and ends at specified values within a scale.

Setting start and end values for range

Start and end values of ranges are set by using the [StartValue](#) and [EndValue](#) properties.

## XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Ranges>
        <gauge:Range StartValue="0" EndValue="50" />
      </gauge:Scale.Ranges>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

```

</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

## C#

```

SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
Range range = new Range();
range.StartValue = 0;
range.EndValue = 50;
scale.Ranges.Add(range);
scales.Add(scale);
circularGauge.Scales = scales;

```

## Range customization

An UI of a range is customized by using the [Color](#) and [Thickness](#) properties. First, you should set the [Offset](#) property for range, then increase the thickness of the range.

## XML

```

<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale RimThickness="10" RimColor="#E0E0E0" LabelColor="#424242"
      LabelOffset="0.9" MinorTicksPerInterval="3">
      <gauge:Scale.MajorTickSettings>
        <gauge:TickSettings Thickness="3" Length="10" Offset="0.8"/>
      </gauge:Scale.MajorTickSettings>
      <gauge:Scale.MinorTickSettings>
        <gauge:TickSettings Length="5" Offset="0.8"/>
      </gauge:Scale.MinorTickSettings>
      <gauge:Scale.Ranges>
        <gauge:Range StartValue="0" EndValue="50" Thickness="70" Offset="0.8"
          Color = "Pink"/>
      </gauge:Scale.Ranges>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

## C#

```

SfCircularGauge circularGauge = new SfCircularGauge();

```

```
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.RimThickness = 10;
scale.RimColor = Color.FromHex("#E0E0E0");
scale.LabelColor = Color.FromHex("#424242");
scale.MajorTickSettings.Thickness = 3;
scale.LabelOffset = 0.9;
scale.MinorTickSettings.Length = 5;
scale.MajorTickSettings.Length = 10;
scale.MajorTickSettings.Offset = 0.8;
scale.MinorTickSettings.Offset = 0.8;
scale.MinorTicksPerInterval = 3;
Range range = new Range();
range.StartValue = 0;
range.EndValue = 50;
range.Thickness = 70;
range.Offset = 0.8;
range.Color = Color.Pink;
scale.Ranges.Add(range);
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting position for range

The range can be placed inside the scale, outside the scale, or on the scale by using the following two ways:

1. The [Offset](#) property with the [Thickness](#) property.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Ranges>
        <gauge:Range StartValue = "0" EndValue = "100" Offset = "0.3" Thickness =
"20" />
      </gauge:Scale.Ranges>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
```

```
Scale scale = new Scale();
Range range = new Range();
range.StartValue = 0;
range.EndValue = 100;
range.Offset = 0.3;
range.Thickness = 20;
scale.Ranges.Add(range);
scales.Add(scale);
circularGauge.Scales = scales;
```

2.The [InnerStartOffset](#), [InnerEndOffset](#), [OuterStartOffset](#), and [OuterEndOffset](#) properties.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Ranges>
        <gauge:Range StartValue="10" EndValue="80" InnerStartOffset = "0.83"
          InnerEndOffset = "0.6" OuterStartOffset = "0.85" OuterEndOffset =" 0.8"/>
      </gauge:Scale.Ranges>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
Range range = new Range();
range.StartValue = 10;
range.EndValue = 80;
range.InnerStartOffset = 0.83;
range.InnerEndOffset = 0.6;
range.OuterStartOffset = 0.85;
range.OuterEndOffset = 0.8;
scale.Ranges.Add(range);
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting range color for labels

You can set range colors to labels using the [UseRangeColorForLabels](#) property.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale UseRangeColorForLabels="True">
      <gauge:Scale.Ranges>
        <gauge:Range StartValue = "0" EndValue = "100" Thickness = "20" />
      </gauge:Scale.Ranges>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.UseRangeColorForLabels = true;
Range range = new Range();
range.StartValue = 0;
range.EndValue = 100;
range.Thickness = 20;
scale.Ranges.Add(range);
scales.Add(scale);
circularGauge.Scales = scales;
this.Content = circularGauge;
```

### Setting multiple ranges

In addition to the default range, you can add n number of ranges to a scale by using the [Ranges](#) property.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="Poor" Position="0.1,0.55" TextSize="20"
      ForegroundColor="#F03E3E" FontAttributes = "Bold"/>
    <gauge:Header Text="Good" Position="0.87,0.55" TextSize="20"
      ForegroundColor="#27beb7" FontAttributes = "Bold"/>
  </gauge:SfCircularGauge.Headers>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale StartValue = "0" EndValue = "100" StartAngle = "180"
      SweepAngle = "180" Interval = "10"
      ShowLabels = "False" ShowTicks = "False" ShowRim = "False" RimThickness =
        "40"
      RadiusFactor = "0.9" RimColor = "#e0e0e0">
      <gauge:Scale.Pointers>
        <gauge:NeedlePointer Value="70" KnobRadius="0" KnobStrokeColor = "#0682F6"
          KnobStrokeWidth = "6"
          Color="OrangeRed" KnobColor="White" LengthFactor="0.66" Type="Triangle"
          Thickness = "10"/>
      </gauge:Scale.Pointers>
      <gauge:Scale.Ranges>

          "0.6">
          <gauge:Range.GradientStops>
            <gauge:GaugeGradientStop Value="0" Color="#30B32D"/>
            <gauge:GaugeGradientStop Value="50" Color="#FFDD00"/>
            <gauge:GaugeGradientStop Value="80" Color="#F03E3E"/>
          </gauge:Range.GradientStops>
        </gauge:Range>
      </gauge:Scale.Ranges>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

#### C#

```

SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new
ObservableCollection<Syncfusion.SfGauge.XForms.Scale>();
Scale scale = new Syncfusion.SfGauge.XForms.Scale();

```

```

scale.StartValue = 0;
scale.EndValue = 100;
scale.Interval = 10;
scale.LabelFontSize = 16;
scale.LabelOffset = 0.95;
scale.RimThickness = 28;
scale.ShowRim = false;
scale.MinorTicksPerInterval = 4;
TickSettings major = new TickSettings();
major.Thickness = 1;
major.EndOffset = 0.83;
major.StartOffset = 0.75;
major.Length = 8;
scale.MajorTickSettings = major;
TickSettings minor = new TickSettings();
minor.Thickness = 0.7;
minor.EndOffset = 0.79;
minor.StartOffset = 0.75;
scale.MinorTickSettings = minor;
scales.Add(scale);
circularGauge.Scales = scales;
Range range = new Range();
range.Offset = 0.6;
range.Thickness = 30;
range.StartValue = 0;
range.EndValue = 100;
scale.Ranges.Add(range);
ObservableCollection<GaugeGradientStop> gradientColor1 = new
ObservableCollection<GaugeGradientStop>();
GaugeGradientStop gaugeGradientStop = new GaugeGradientStop();
gaugeGradientStop.Value = 0;
gaugeGradientStop.Color = Color.FromHex("#30B32D");
gradientColor1.Add(gaugeGradientStop);
GaugeGradientStop gaugeGradientStop1 = new GaugeGradientStop();
gaugeGradientStop1.Value = 50;
gaugeGradientStop1.Color = Color.FromHex("#FFDD00");
gradientColor1.Add(gaugeGradientStop1);
GaugeGradientStop gaugeGradientStop2 = new GaugeGradientStop();
gaugeGradientStop2.Value = 80;
gaugeGradientStop2.Color = Color.FromHex("#F03E3E");
gradientColor1.Add(gaugeGradientStop2);
range.GradientStops = gradientColor1;
circularGauge.Scales = scales;

```

## Pointers

You can add multiple pointers to the gauge to point multiple values on the same scale. It is used to show low and high values at the same time. The value of the pointer is set by using the [Value](#) property.

### Needle pointer

[Needle Pointer](#) contains three parts, namely needle, knob, and tail and that can be placed on a gauge to mark the values.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:NeedlePointer Value="70" />
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 70;
scale.Pointers.Add(needlePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting needle pointer type

The appearance of the needle pointer can be customized by using the [Type](#) property. The default value of this property is [BarPointer](#). This is an enum property, and it has the following options:

1. Bar
2. Triangle

### Setting bar pointer type

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
```

```
<gauge:Scale.Pointers>
<gauge:NeedlePointer Value="60" Type="Bar"/>
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 60;
needlePointer.Type = PointerType.Bar;
scale.Pointers.Add(needlePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

*Setting needle pointer type*

**XML**

```
<gauge:SfCircularGauge>
<gauge:SfCircularGauge.Scales>
<gauge:Scale>
<gauge:Scale.Pointers>
<gauge:NeedlePointer Value="60" Type="Triangle"/>
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 60;
needlePointer.Type = PointerType.Triangle;
scale.Pointers.Add(needlePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

### Needle pointer customization

The length of the needle is controlled by using the [LengthFactor](#) property. The [LengthFactor](#) property's minimum and maximum bounds are 0 and 1. The needle's UI is customized by using the [Color](#) and [Thickness](#) properties.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:NeedlePointer Value="60" Color="DeepSkyBlue" LengthFactor="0.7"
          Thickness="7"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 60;
needlePointer.Color = Color.DeepSkyBlue;
needlePointer.Thickness = 7;
needlePointer.LengthFactor = 0.7;
scale.Pointers.Add(needlePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

*Knob customization*

Knob of the needle pointer can be customized by using the [KnobColor](#), [KnobRadius](#), [KnobRadiusFactor](#), [KnobStrokeColor](#), and [KnobStrokeWidth](#) properties. You can set the radius of knob to pixel and percentage values by using the [KnobRadius](#) and [KnobRadiusFactor](#) properties.

**XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:NeedlePointer Value="10" KnobRadius="15" KnobStrokeColor="#007DD1"
          KnobStrokeWidth="8" KnobColor="White" KnobRadiusFactor="0.1"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 10;
needlePointer.KnobRadius = 15;
needlePointer.KnobStrokeColor = Color.FromHex("#007DD1");
needlePointer.KnobColor = Color.White;
needlePointer.KnobStrokeWidth = 8;
needlePointer.KnobRadiusFactor = 0.1;
scale.Pointers.Add(needlePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

*Setting tail for needle pointer*

Tail of the needle pointer can be customized by using the [TailColor](#), [TailLengthFactor](#), [TailStrokeColor](#), and [TailStrokeWidth](#) properties.

**XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
```

```
<gauge:NeedlePointer Value="90" KnobRadius = "15" TailColor="#757575"
TailLengthFactor="0.2" TailStrokeWidth="1" TailStrokeColor="#757575" />
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 90;
needlePointer.KnobRadius = 15;
needlePointer.TailColor = Color.FromHex("#757575");
needlePointer.TailLengthFactor = 0.2;
needlePointer.TailStrokeWidth = 1;
needlePointer.TailStrokeColor = Color.FromHex("#757575");
scale.Pointers.Add(needlePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

**Range pointer**

A range pointer is an accenting line or shaded background range that can be placed on a gauge to mark the values. The [RangeStart](#) property allows you to set the starting value of the range pointer.

**XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:RangePointer RangeStart="15" Value="85" />
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
RangePointer rangePointer = new RangePointer();
```

```
rangePointer.RangeStart = 15;
rangePointer.Value = 85;
scale.Pointers.Add(rangePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

### *Range pointer customization*

The range pointer's UI is customized by using the [Color](#) and [Thickness](#) properties. First, you should set the [Offset](#) property for range pointer, and then increase the thickness of the range pointer.

### **XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:RangePointer Value="60" Color="DarkCyan" Thickness="30"
          Offset="0.7"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### **C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
RangePointer rangePointer = new RangePointer();
rangePointer.Value = 60;
rangePointer.Color = Color.DarkCyan;
rangePointer.Thickness = 30;
rangePointer.Offset = 0.7;
scale.Pointers.Add(rangePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

### Setting position for range pointer

The [RangePointer](#) in the scale can be placed inside or outside of the scale by using the following two ways:

1. The [Offset](#) property.
2. The [StartOffset](#) and [EndOffset](#) properties.

### Setting offset for range pointer

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:RangePointer Value="100" Offset="0.3" Thickness = "30"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
RangePointer rangePointer = new RangePointer();
rangePointer.Value = 100;
rangePointer.Offset = 0.3;
rangePointer.Thickness = 30;
scale.Pointers.Add(rangePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

Setting start and end offset for range pointer

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:RangePointer RangeStart="15" Value="85" StartOffset="0.5"
EndOffset="0.7"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
RangePointer rangePointer = new RangePointer();
rangePointer.RangeStart = 15;
rangePointer.Value = 85;
rangePointer.StartOffset = 0.5;
rangePointer.EndOffset = 0.7;
scale.Pointers.Add(rangePointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

Setting range cap for range pointer

The [RangeCap](#) property provides options to position the range cap of the [RangePointer](#), which contains the start, end, both, and none options. The [RangeCap](#) property is an enum property.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale LabelOffset="0.75" ScaleStartOffset="0.9" ScaleEndOffset="1">
      <gauge:Scale.MajorTickSettings>
        <gauge:TickSetting Offset="0.9"/>
      </gauge:Scale.MajorTickSettings>
      <gauge:Scale.MinorTickSettings>
        <gauge:TickSetting Offset="0.9"/>
      </gauge:Scale.MinorTickSettings>
      <gauge:Scale.Pointers>
        <gauge:RangePointer RangeStart="20" Value="80" RangeCap="End"
StartOffset="0.9" EndOffset="1"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

```

</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

## C#

```

SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.MajorTickSettings.Offset = 0.9;
scale.MinorTickSettings.Offset = 0.9;
scale.LabelOffset = 0.75;
scale.ScaleStartOffset = 0.9;
scale.ScaleEndOffset = 1;
RangePointer rangePointer = new RangePointer();
rangePointer.RangeStart = 20;
rangePointer.StartOffset = 0.9;
rangePointer.EndOffset = 1;
rangePointer.Value = 80;
rangePointer.RangeCap = RangeCap.End;
scale.Pointers.Add(rangePointer);
scales.Add(scale);
circularGauge.Scales = scales;

```

## Marker pointer

The different types of marker shapes are used to mark the pointer values in a scale. You can change the marker shape by using the [MarkerShape](#) property. Gauge supports the following types of marker shapes:

- Circle
- Rectangle
- Triangle
- Inverted triangle
- Diamond
- Image

The image is used to denote the pointer value instead of rendering the marker shape. It can be achieved by setting the [MarkerShape](#) to Image, and assigning the image path to [ImageSource](#) in pointer.

## XML

```

<gauge:SfCircularGauge>
<gauge:SfCircularGauge.Scales>
<gauge:Scale>
<gauge:Scale.Pointers>

```

```
<gauge:MarkerPointer Value="70" MarkerShape = "Triangle"/>
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
MarkerPointer markerPointer = new MarkerPointer();
markerPointer.Value = 70;
markerPointer.MarkerShape = MarkerShape.Triangle;
scale.Pointers.Add(markerPointer);
scales.Add(scale);
circularGauge.Scales = scales;
```

*Setting image marker shape***XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:MarkerPointer Value="40" MarkerShape = "Image" ImageSource =
"icon.png"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
```

```

Scale scale = new Scale();
ObservableCollection<Pointer> pointers = new
ObservableCollection<Pointer>();
MarkerPointer markerPointer = new MarkerPointer();
markerPointer.Value = 40;
markerPointer.MarkerShape = MarkerShape.Image;
markerPointer.ImageSource = "icon.png";
pointers.Add(markerPointer);
scale.Pointers = pointers;
scales.Add(scale);
circularGauge.Scales = scales;

```

#### Marker pointer customization

The marker can be customized in terms of color, width, and height by using the [Color](#), [MarkerWidth](#), and [MarkerHeight](#) properties in pointer. First, you should set the [Offset](#) property for marker pointer, then increase the height and width of the marker pointer.

#### XML

```

<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:MarkerPointer Value="70" Color="Pink" MarkerHeight="20"
MarkerWidth="20" Offset="1"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

#### C#

```

SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
MarkerPointer markerPointer = new MarkerPointer();
markerPointer.Value = 70;
markerPointer.Color = Color.Pink;
markerPointer.MarkerHeight = 20;
markerPointer.MarkerWidth = 20;
markerPointer.Offset = 1;
scale.Pointers.Add(markerPointer);
scales.Add(scale);
circularGauge.Scales = scales;

```

### Setting multiple pointers

In addition to the default pointer, you can add n number of pointers to a scale by using the [Pointers](#) property.

#### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Pointers>
        <gauge:MarkerPointer Value="60" />
      </gauge:Scale.Pointers>
    </gauge:Scale>
    <gauge:Scale ShowTicks ="False" ShowLabels ="False" ScaleStartOffset ="0.5"
      ScaleEndOffset = "0.6">
      <gauge:Scale.Pointers>
        <gauge:NeedlePointer Value="40" LengthFactor = "0.3"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
ObservableCollection<Pointer> pointers = new
ObservableCollection<Pointer>();
MarkerPointer markerPointer = new MarkerPointer();
markerPointer.Value = 40;
pointers.Add(markerPointer);
Scale scale1 = new Scale();
scale1.ShowLabels = false;
scale1.ShowTicks = false;
scale1.ScaleStartOffset = 0.5;
scale1.ScaleEndOffset = 0.6;
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 60;
needlePointer.LengthFactor = 0.3;
pointers.Add(needlePointer);
scale1.Pointers = pointers;
scale.Pointers = pointers;
scales.Add(scale);
scales.Add(scale1);
circularGauge.Scales = scales;
```

### Setting animation for pointer

The [EnableAnimation](#) property is a Boolean property that enables or disables the animation of the pointers in circular gauge.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale RimColor="LightGray" RimThickness="30" RadiusFactor="1"
      ShowTicks="False"
      StartValue="0" EndValue="100" Interval="10" LabelOffset="0.75"
      LabelColor="#424242"
      LabelFontSize="15" >
      <gauge:Scale.Pointers>
        <gauge:RangePointer Color="Orange" Thickness="30" Offset="1"
          EnableAnimation="True"
          AnimationDuration="5" Value="80" />
        <gauge:NeedlePointer Thickness="7" LengthFactor="0.55" Color="LightGray"
          KnobColor="White" TailColor="LightGray" TailLengthFactor="0.2"
          Type="Triangle" KnobRadius="12" Value="80"
          AnimationDuration="5" TailStrokeWidth="2" TailStrokeColor="LightGray"
          KnobStrokeColor="LightGray" KnobStrokeWidth="8" />
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new
ObservableCollection<Syncfusion.SfGauge.XForms.Scale>();
Scale scale = new Syncfusion.SfGauge.XForms.Scale();
scale.RimColor = Color.LightGray;
scale.RimThickness = 30;
scale.RadiusFactor = 1;
scale.ShowTicks = false;
scale.StartValue = 0;
scale.EndValue = 100;
scale.Interval = 10;
scale.LabelOffset = 0.75;
scale.LabelColor = Color.FromHex("#424242");
scale.LabelFontSize = 15;
RangePointer pointer1 = new RangePointer();
pointer1.Color = Color.Orange;
```

```

pointer1.Thickness = 30;
pointer1.Offset = 1;
pointer1.EnableAnimation = true;
pointer1.AnimationDuration = 5;
pointer1.Value = 80;
scale.Pointers.Add(pointer1);
NeedlePointer pointer2 = new NeedlePointer();
pointer2.Thickness = 7;
pointer2.LengthFactor = 0.55;
pointer2.Color = Color.LightGray;
pointer2.KnobColor = Color.White;
pointer2.TailColor = Color.LightGray;
pointer2.TailLengthFactor = 0.2;
pointer2.Type = PointerType.Triangle;
pointer2.KnobRadius = 15;
pointer2.KnobRadius = 12;
pointer2.Value = 80;
pointer2.AnimationDuration = 5;
pointer2.TailStrokeWidth = 2;
pointer2.TailStrokeColor = Color.LightGray;
pointer2.KnobStrokeColor = Color.LightGray;
pointer2.KnobStrokeWidth = 8;
scale.Pointers.Add(pointer2);
circularGauge.Scales.Add(scale);

```

#### Setting pointer drag

Pointers can be dragged over the scale value. It can be achieved by clicking and dragging the pointer. To enable or disable the pointer drag, use the `EnableDragging` property.

#### XML

```

<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale RimColor="DeepSkyBlue" RimThickness="20" RadiusFactor="1"
      ShowTicks="False"

```

```
StartValue="0" EndValue="100" Interval="10" LabelOffset="0.75"  
LabelColor="#424242"  
LabelFontSize="15">  
<gauge:Scale.Pointers>  
<gauge:MarkerPointer MarkerShape="InvertedTriangle" MarkerHeight="18"  
MarkerWidth="18"  
Value="30" EnableAnimation="False" EnableDragging="True"/>  
</gauge:Scale.Pointers>  
</gauge:Scale>  
</gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge circularGauge = new SfCircularGauge(this);  
CircularScale scale = new CircularScale();  
scale.RimColor = Color.DeepSkyBlue;  
scale.RimWidth = 20;  
scale.RadiusFactor = 1;  
scale.ShowTicks = false;  
scale.StartValue = 0;  
scale.EndValue = 100;  
scale.Interval = 10;  
scale.LabelOffset = 0.75;  
scale.LabelColor = Color.ParseColor("#424242");  
scale.LabelTextSize = 15;  
MarkerPointer pointer1 = new MarkerPointer();  
pointer1.MarkerShape =  
Com.Syncfusion.Gauges.SfCircularGauge.Enums.MarkerShape.InvertedTriangle;  
pointer1.Color = Color.DarkBlue;  
pointer1.MarkerHeight = 18;  
pointer1.MarkerWidth = 18;  
pointer1.Value = 30;  
pointer1.EnableAnimation = false;  
pointer1.EnableDragging = true;  
scale.CircularPointers.Add(pointer1);  
circularGauge.CircularScales.Add(scale);
```

## Header

The [Header](#) support allows you to show text inside the gauge control. A circular gauge can be made self-descriptive about the data. It can be measured with use of the header.

Adding header in circular gauge

### Header

The [Header](#) can be used to set a unique header for the circular gauge. You can add text as headers in a circular gauge. Multiple headers also can be added in a circular gauge.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="Speedometer" ForegroundColor="Black" />
  </gauge:SfCircularGauge.Headers>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
Header header = new Header();
header.Text = "Speedometer";
header.ForegroundColor = Color.Black;
circularGauge.Headers.Add(header);
```

### Setting position for header

The [Position](#) property is used to place the header in a circular gauge. The value for [Position](#) should be specified in offset value. In the Point value, which has been given for the [Position](#), first value represent x-coordinate and second value represents y-coordinate. By default, it is placed at (0.5, 0.7).

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="Speedometer" Position="0.5,0.5" ForegroundColor="Black"
  />
  </gauge:SfCircularGauge.Headers>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge circularGauge = new SfCircularGauge();
Header header = new Header();
header.Text = "Speedometer";
header.ForegroundColor = Color.Black;
header.Position = new Point(0.5, 0.5);
circularGauge.Headers.Add(header);
```

### Customization of header

You can customize the header's text by using the [FontFamily](#), [FontAttribute](#) and [TextSize](#) properties.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="Speedometer" TextSize="20" ForegroundColor="Blue"
    FontAttributes="Bold">
    <gauge:Header.FontFamily>
```

```
<OnPlatform x:TypeArguments="x:String" iOS="Chalkduster"
Android="algerian.ttf" WinPhone="Chiller" />
</gauge:Header.FontFamily>
</gauge:Header>
</gauge:SfCircularGauge.Headers>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
Header header = new Header();
header.Text = "Speedometer";
header.TextSize = 20;
header.FontAttributes = FontAttributes.Bold;
header.FontFamily = Device.RuntimePlatform == Device.iOS ? "Chalkduster" :
Device.RuntimePlatform == Device.Android ? "algerian.ttf" : "Chiller";
header.ForegroundColor = Color.Blue;
circularGauge.Headers.Add(header);
this.content = circularGauge;
```

**Alignment of header**

You can align header to the **Start**, **Center** and **End** using the [HorizontalHeaderPosition](#) and [VerticalHeaderPosition](#) properties.

*Setting horizontal header position*

**XML**

```
<gauge:SfCircularGauge>
<gauge:SfCircularGauge.Headers>
<gauge:Header Text="Speedometer" ForegroundColor="Black"
HorizontalHeaderPosition="Start"/>
</gauge:SfCircularGauge.Headers>
</gauge:SfCircularGauge>
```

**C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
Header header = new Header();
header.Text = "Speedometer";
header.ForegroundColor = Color.Black;
header.HorizontalHeaderPosition = ViewAlignment.Start;
circularGauge.Headers.Add(header);
```

```
Content = circularGauge;
```

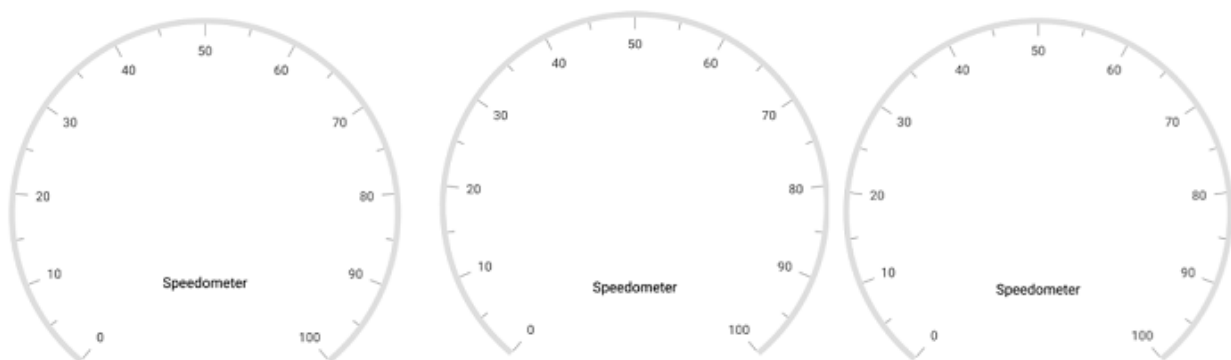

*Setting vertical header position*

#### **XML**

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="Speedometer" ForegroundColor="Black"
      VerticalHeaderPosition="Start"/>
  </gauge:SfCircularGauge.Headers>
</gauge:SfCircularGauge>
```

#### **C#**

```
SfCircularGauge circularGauge = new SfCircularGauge();
Header header = new Header();
header.Text = "Speedometer";
header.ForegroundColor = Color.Black;
header.VerticalHeaderPosition = ViewAlignment.Start;
circularGauge.Headers.Add(header);
Content = circularGauge;
```

#### **Annotations**

[SfCircularGauge](#) supports [Annotations](#), which allows you to mark the specific area of interest in circular gauge. You can place custom views as annotations. The text and images also can be added by using [Annotations](#) property.

### Setting view annotation

When the annotation allows you to place custom elements, a gauge can be initialized to the element, and this can be used to place the annotation in another gauge. The Following properties are used to customize the Annotations:

- [Angle](#): Used to place the View at the given Angle.
- [Offset](#): Used to move the View from the center to edge of the circular gauge. The value should be range from 0 to 1.

The following code is used to create the Annotations.

### XML

```
<gauge:SfCircularGauge HeightRequest="80" WidthRequest="80">
  <gauge:SfCircularGauge.Annotations>
    <gauge:GaugeAnnotation Angle="90" Offset="0.5">
      <gauge:GaugeAnnotation.View>
        <gauge:SfCircularGauge HeightRequest="80" WidthRequest="80">
          <gauge:SfCircularGauge.Annotations>
            <gauge:GaugeAnnotation Angle="270" Offset="0.5">
              <gauge:GaugeAnnotation.View>
                <Label Text="10s" FontSize="12" HeightRequest="20" WidthRequest="35"
                  TextColor="Black"
                  HorizontalTextAlignment="Center" VerticalTextAlignment="Center"/>
              </gauge:GaugeAnnotation.View>
            </gauge:GaugeAnnotation>
          </gauge:SfCircularGauge.Annotations>
        </gauge:SfCircularGauge.Scales>
        <gauge:Scale StartAngle="270" SweepAngle="360" ShowLabels="False"

header1.FontAttributes = FontAttributes.Bold;
header1.TextSize = 12;
gauge.Headers.Add(header1);
Header header2 = new Header();
header2.Text = "F";
header2.Position = new Point(0.58, 0.6);
header2.ForegroundColor = Color.FromHex("#424242");
header2.FontAttributes = FontAttributes.Bold;
header2.TextSize = 20;
gauge.Headers.Add(header2);
```

```
GaugeAnnotation annotation = new GaugeAnnotation();
Image image = new Image();
image.Source = "weather.jpg";
image.HeightRequest = 100;
image.WidthRequest = 100;
annotation.View = image;
annotation.Angle = 270;
annotation.Offset = 0.2;
gauge.Annotations.Add(annotation);
gauge.Scales = scales;
```

#### Setting text annotation

You can add any text over the gauge control to enhance the readability. You can add multiple text instances in single control.

#### XML

```
<gauge:SfCircularGauge HeightRequest="500" WidthRequest="500">
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="13M" Position="0.5, 0.5" ForegroundColor="#0682F6"
      FontAttributes="Bold" TextSize="20"/>
  </gauge:SfCircularGauge.Headers>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale ShowLabels="False" ShowTicks="False" ShowRim="False"
      StartAngle="160" SweepAngle="270" StartValue="0" EndValue="15" >
      <gauge:Scale.Pointers>
        <gauge:RangePointer Value="13" Offset="0.8" Thickness="30" RangeCap="Start"
          Color="#0682F6"/>
        <gauge:MarkerPointer MarkerShape="Image" ImageSource="shot.jpg"
          MarkerWidth="60" MarkerHeight="60"
          Value="0" Offset="0.8"/>
        <gauge:MarkerPointer MarkerShape="Circle" MarkerWidth="40" MarkerHeight="40"
          Color="#9e9e9e"
          Value="13" Offset="0.8"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
    <gauge:Scale ShowLabels="False" ShowTicks="False" ShowRim="False"
      StartAngle="0" SweepAngle="360" >
      </gauge:Scale>
    </gauge:SfCircularGauge.Scales>
```

```
</gauge:SfCircularGauge>
```

## C#

```
SfCircularGauge gauge = new SfCircularGauge();
gauge.HeightRequest = 500;
gauge.WidthRequest = 500;
ObservableCollection<Scale> scales = new
ObservableCollection<Syncfusion.SfGauge.XForms.Scale>();
Scale scale = new Syncfusion.SfGauge.XForms.Scale();
scale.StartAngle = 160;
scale.SweepAngle = 270;
scale.StartValue = 0;
scale.EndValue = 15;
scale.ShowLabels = false;
scale.ShowRim = false;
scale.ShowTicks = false;
RangePointer range = new RangePointer();
range.Color = Color.FromHex("#0682F6");
range.Offset = 0.8;
range.Value = 13;
range.RangeCap = RangeCap.Start;
range.Thickness = 30;
scale.Pointers.Add(range);
Scale scale1 = new Syncfusion.SfGauge.XForms.Scale();
scale1.StartAngle = 0;
scale1.SweepAngle = 360;
scale1.RimColor = Color.FromHex("#e0e0e0");
scale1.RadiusFactor = 0.8;
scale1.RimThickness = 30;
scale1.ShowTicks = false;
scale1.ShowRim = false;
scale1.ShowLabels = false;
scales.Add(scale1);
Header header = new Header();
header.FontAttributes = FontAttributes.Bold;
header.TextSize = 20;
header.Text = "13M";
header.Position = new Point(0.5, 0.5);
header.ForegroundColor = Color.FromHex("#0682F6");
gauge.Headers.Add(header);
MarkerPointer pointer1 = new MarkerPointer();
pointer1.MarkerShape = MarkerShape.Image;
pointer1.ImageSource = "shot.jpg";
pointer1.MarkerWidth = 60;
pointer1.MarkerHeight = 60;
pointer1.Value = 0;
pointer1.Offset = 0.8;
scale.Pointers.Add(pointer1);
MarkerPointer pointer2 = new MarkerPointer();
pointer2.MarkerShape = MarkerShape.Circle;
pointer2.MarkerWidth = 40;
pointer2.MarkerHeight = 40;
pointer2.Color = Color.FromHex("#9e9e9e");
pointer2.Value = 13;
pointer2.Offset = 0.8;
```

```
scale.Pointers.Add(pointer2);
scales.Add(scale);
gauge.Scales = scales;
```

### Set margin to annotation

You can adjust annotation by specifying the [ViewMargin](#) property in pixel, which adjusts annotation elements from their current position.

### XML

```
<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Annotations>
    <gauge:GaugeAnnotation ViewMargin="10,50">
      <gauge:GaugeAnnotation.View>
        <Label Text="800 GB" TextColor="Black" FontSize="25"/>
      </gauge:GaugeAnnotation.View>
    </gauge:GaugeAnnotation>
  </gauge:SfCircularGauge.Annotations>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale ShowLabels="False" ShowTicks="False" RimThickness="25"
      RadiusFactor="1" RimColor="#e0e0e0"
      StartAngle="90" SweepAngle="360" StartValue="0" EndValue="100"
      Interval="10">
      <gauge:Scale.Pointers>
        <gauge:RangePointer Value="80" Offset="1" Thickness="25" RangeCap="Both"
          Color="#01bdae"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

### C#

```
SfCircularGauge gauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.ShowLabels = false;
scale.ShowTicks = false;
scale.RimThickness = 25;
scale.RadiusFactor = 1;
scale.RimColor = Color.FromHex("#e0e0e0");
scale.StartAngle = 90;
```

```

scale.SweepAngle = 360;
scale.StartValue = 0;
scale.EndValue = 100;
scale.Interval = 10;
RangePointer pointer = new RangePointer();
pointer.Value = 80;
pointer.Offset = 1;
pointer.Thickness = 25;
pointer.RangeCap = RangeCap.Both;
pointer.Color = Color.FromHex("#01bdae");
scale.Pointers.Add(pointer);
scales.Add(scale);
GaugeAnnotation annotation = new GaugeAnnotation();
annotation.ViewMargin = new Point(10, 50);
Label label = new Label();
label.Text = "800 GB";
label.FontSize = 25;
label.TextColor = Color.Black;
annotation.View = label;
gauge.Annotations.Add(annotation);
gauge.Scales = scales;
Content = gauge;

```

#### Alignment of annotation

You can align annotations to the **Start**, **Center** and **End** using the [HorizontalAlignment](#) and [VerticalAlignment](#) properties.

#### Setting horizontal alignment

##### XML

```

<gauge:SfCircularGauge>
  <gauge:SfCircularGauge.Annotations>
    <gauge:GaugeAnnotation HorizontalAlignment="Start">

```

```

<gauge:GaugeAnnotation.View>
<Label Text="800 GB" TextColor="Black" FontSize="25"/>
</gauge:GaugeAnnotation.View>
</gauge:GaugeAnnotation>
</gauge:SfCircularGauge.Annotations>
<gauge:SfCircularGauge.Scales>
<gauge:Scale ShowLabels="False" ShowTicks="False" RimThickness="25"
RadiusFactor="1" RimColor="#e0e0e0" StartAngle="90"
SweepAngle="360" StartValue="0" EndValue="100"
Interval="10">
<gauge:Scale.Pointers>
<gauge:RangePointer Value="80" Offset="1" Thickness="25" RangeCap="Both"
Color="#01bdae"/>
</gauge:Scale.Pointers>
</gauge:Scale>
</gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

**C#**

```

SfCircularGauge gauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.ShowLabels = false;
scale.ShowTicks = false;
scale.RimThickness = 25;
scale.RadiusFactor = 1;
scale.RimColor = Color.FromHex("#e0e0e0");
scale.StartAngle = 90;
scale.SweepAngle = 360;
scale.StartValue = 0;
scale.EndValue = 100;
scale.Interval = 10;
RangePointer pointer = new RangePointer();
pointer.Value = 80;
pointer.Offset = 1;
pointer.Thickness = 25;
pointer.RangeCap = RangeCap.Both;
pointer.Color = Color.FromHex("#01bdae");
scale.Pointers.Add(pointer);
scales.Add(scale);
GaugeAnnotation annotation = new GaugeAnnotation();
annotation.HorizontalAlignment = ViewAlignment.Start;
Label label = new Label();
label.Text = "800 GB";
label.FontSize = 25;
label.TextColor = Color.Black;
annotation.View = label;
gauge.Annotations.Add(annotation);
gauge.Scales = scales;
Content = gauge;

```

*Setting vertical alignment*

#### **XML**

```
<gauge:SfCircularGauge BackgroundColor="White" Margin="20">
  <gauge:SfCircularGauge.Annotations>
    <gauge:GaugeAnnotation VerticalAlignment="Start">
      <gauge:GaugeAnnotation.View>
        <Label Text="800 GB" TextColor="Black" FontSize="25"/>
      </gauge:GaugeAnnotation.View>
    </gauge:GaugeAnnotation>
  </gauge:SfCircularGauge.Annotations>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale ShowLabels="False" ShowTicks="False" RimThickness="25"
      RadiusFactor="1" RimColor="#e0e0e0"
      StartAngle="90" SweepAngle="360" StartValue="0" EndValue="100"
      Interval="10">
      <gauge:Scale.Pointers>
        <gauge:RangePointer Value="80" Offset="1" Thickness="25" RangeCap="Both"
          Color="#01bdae"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>
```

#### **C#**

```
SfCircularGauge gauge = new SfCircularGauge();
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
scale.ShowLabels = false;
scale.ShowTicks = false;
scale.RimThickness = 25;
scale.RadiusFactor = 1;
scale.RimColor = Color.FromHex("#e0e0e0");
scale.StartAngle = 90;
scale.SweepAngle = 360;
scale.StartValue = 0;
scale.EndValue = 100;
scale.Interval = 10;
RangePointer pointer = new RangePointer();
pointer.Value = 80;
pointer.Offset = 1;
```

```

pointer.Thickness = 25;
pointer.RangeCap = RangeCap.Both;
pointer.Color = Color.FromHex("#01bdae");
scale.Pointers.Add(pointer);
scales.Add(scale);
GaugeAnnotation annotation = new GaugeAnnotation();
annotation.VerticalAlignment = ViewAlignment.Start;
Label label = new Label();
label.Text = "800 GB";
label.FontSize = 25;
label.TextColor = Color.Black;
annotation.View = label;
gauge.Annotations.Add(annotation);
gauge.Scales = scales;
Content = gauge;

```

## How to

### Changing the gauge size

The [CircularCoefficient](#) property is used to change the diameter of the gauge.

It ranges from 0 to 1, and the default value is 1.

### XML

```

<gauge:SfCircularGauge CircularCoefficient="0.7">
  <gauge:SfCircularGauge.Headers>
    <gauge:Header Text="Speedometer" ForegroundColor="Black" />
  </gauge:SfCircularGauge.Headers>
  <gauge:SfCircularGauge.Scales>
    <gauge:Scale>
      <gauge:Scale.Ranges>
        <gauge:Range StartValue="0" EndValue="50" />
      </gauge:Scale.Ranges>
      <gauge:Scale.Pointers>
        <gauge:NeedlePointer Value="70" />
        <gauge:RangePointer RangeStart="15" Value="85" />
        <gauge:MarkerPointer Value="70" MarkerShape = "Triangle"/>
      </gauge:Scale.Pointers>
    </gauge:Scale>
  </gauge:SfCircularGauge.Scales>
</gauge:SfCircularGauge>

```

**C#**

```

SfCircularGauge sfCircularGauge = new SfCircularGauge();
sfCircularGauge.CircularCoefficient = 0.7f;
Header header = new Header();
header.Text = "Speedometer";
header.ForegroundColor = Color.Black;
sfCircularGauge.Headers.Add(header);
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();
Scale scale = new Scale();
NeedlePointer needlePointer = new NeedlePointer();
needlePointer.Value = 70;
scale.Pointers.Add(needlePointer);
scales.Add(scale);
RangePointer rangePointer = new RangePointer();
rangePointer.RangeStart = 15;
rangePointer.Value = 85;
scale.Pointers.Add(rangePointer);
MarkerPointer markerPointer = new MarkerPointer();
markerPointer.Value = 70;
markerPointer.MarkerShape = MarkerShape.Triangle;
scale.Pointers.Add(markerPointer);
Range range = new Range();
range.StartValue = 0;
range.EndValue = 50;
scale.Ranges.Add(range);
sfCircularGauge.Scales = scales;
Content = sfCircularGauge;

```

**Gauge alignment**

The [IsCenterAligned](#) property is used to align the gauge to the center. In semi-circular gauge, bottom space will be removed using the [IsCenterAligned](#) property.

**XML**

```

<gauge:SfCircularGauge IsCenterAligned="True">

```

```
<gauge:SfCircularGauge.Scales>  
<gauge:Scale StartAngle="180" SweepAngle="180"/>  
</gauge:SfCircularGauge.Scales>  
</gauge:SfCircularGauge>
```

## C#

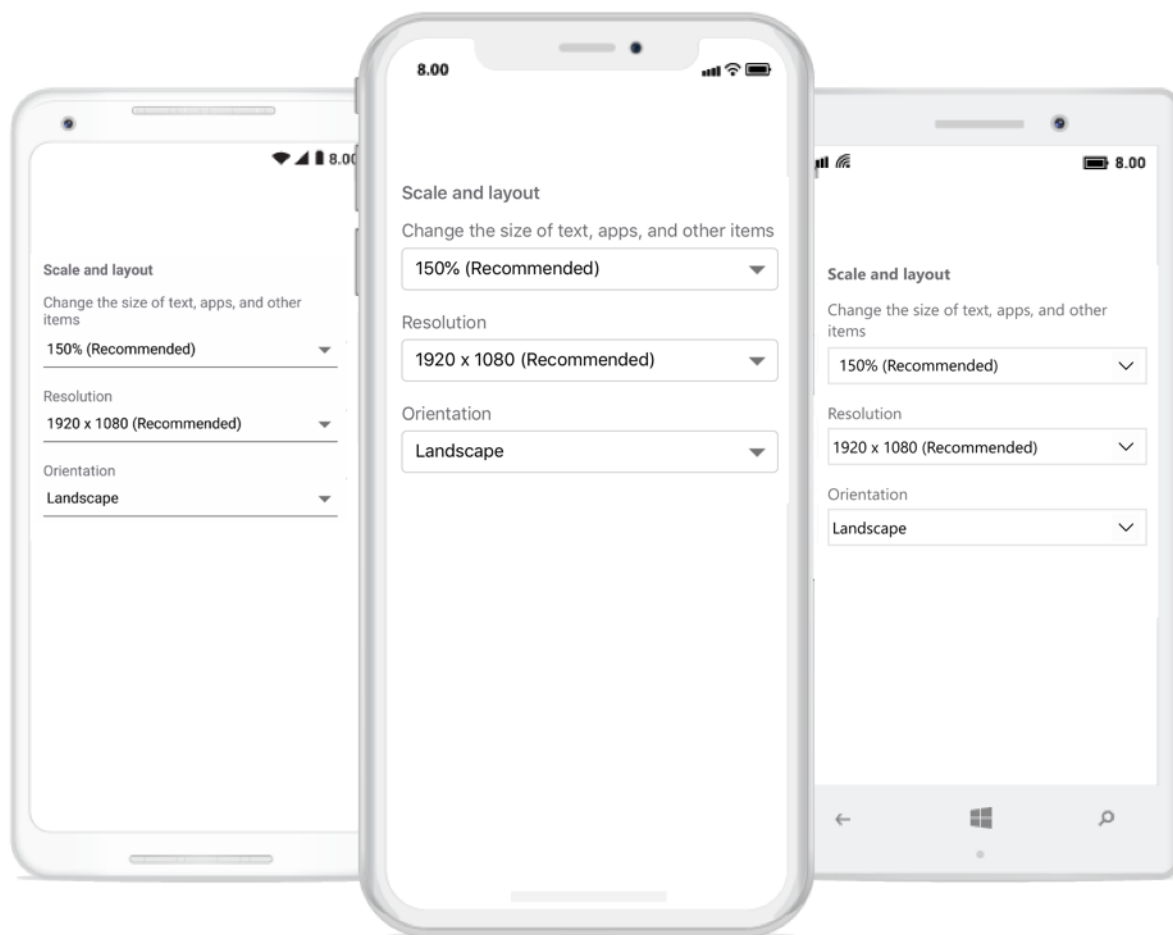

```
SfCircularGauge sfCircularGauge = new SfCircularGauge();  
sfCircularGauge.IsCenterAligned = true;  
ObservableCollection<Scale> scales = new ObservableCollection<Scale>();  
Scale scale = new Scale();  
scale.StartAngle = 180;  
scale.SweepAngle = 180;  
scales.Add(scale);  
sfCircularGauge.Scales = scales;  
Content = sfCircularGauge;
```

## SfComboBox

### Overview

The combo box is a textbox component that allows users to type a value or choose an option from the list of predefined options. This control has several out of box features such as data binding, filtering, UI customization, and more.

## Key features

- Editable mode – Supports both editable and non-editable text box to choose selected item from given data source.
- Filtering mode – Provides options to support both filtering and non-filtering suggestion lists. Provides three ways to display filtered suggestions. These include displaying suggestions using the drop-down list, which appends the first suggestion to text, and a combination of both.
- Suggestion modes – Suggestions can be filtered in different modes, such as StartsWith, EndWith, Contains, Equals, Custom and more. ComboBox provides both case-sensitive and case-insensitive modes. The items only filter the Allow Filtering property has enabled.
- MultiSelection – Provides two different ways to select multiple items from the suggestion list. They are using Token representation and Delimiter. In Token mode, the text can be wrapped in two ways. They are Wrap and None. In Wrap mode text will be wrapped to next line. When using None, the text will be wrapped horizontally.
- Customization Support – Provide options to customize both the Entry and Suggestion drop down.
- Header and Footer – Header and Footer content can be given in the top and bottom of the Suggestion list in SfComboBox
- Highlighting Text – Highlights the matching text in the suggestion list based on the input given in it.

- **Watermark** – Supports explanatory text inside the combo box control until the user inputs text. Watermark is restored again if user clears the text in control.

## Getting Started

This section explains the steps required to create the combo box control, populate it with data and filter the suggestions. This section covers only the minimal features that are needed to get started with the control.

### Adding SfComboBox reference

You can add SfComboBox reference using one of the following methods:

#### Method 1: Adding SfComboBox reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfComboBox). To add SfComboBox to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfComboBox](https://www.nuget.org/packages/Syncfusion.Xamarin.SfComboBox), and then install it.

![Adding SfComboBox reference from NuGet](images/Getting-Started/Adding SfComboBox reference.png)

---

**Note:** Install the same version of SfComboBox NuGet in all the projects.

---

#### Method 2: Adding SfComboBox reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfComboBox control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfComboBox assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfComboBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.UWP.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** If you are adding the references from toolbox, this step is not needed.

#### *Additional Step for iOS*

Create an instance of the `SfComboBoxRenderer` in `FinishedLaunching` overridden method of an `AppDelegate` class in iOS project as shown in the following codes:

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    new Syncfusion.XForms.iOS.ComboBox.SfComboBoxRenderer();
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### *Additional step for UWP*

This step is required only if the application is deployed in release mode with .NET native tool chain enabled. This is for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the `SfComboBox` assembly at `OnLaunched` overridden method of the `App` class in UWP project is the suggested workaround. The following code example show to resolve this issue.

#### **C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    #if DEBUG
    if (System.Diagnostics.Debugger.IsAttached)
    {
        this.DebugSettings.EnableFrameRateCounter = true;
    }
    #endif
    Frame rootFrame = Window.Current.Content as Frame;
    if (rootFrame == null)
    {
        rootFrame = new Frame();
        rootFrame.NavigationFailed += OnNavigationFailed;
        List<System.Reflection.Assembly> assembliesToInclude = new
        List<System.Reflection.Assembly>();
        // Add all the renderer assemblies your app uses
        assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.ComboBox.SfComboBoxRender
        er).GetTypeInfo().Assembly);
    }
```

```
// Replace the Xamarin.Forms.Forms.Init(e);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
if (e.PreviousExecutionState == ApplicationExecutionState.Terminated)
{
    //TODO: Load state from previously suspended application
}
// Place the frame in the current Window
Window.Current.Content = rootFrame;
}
if (rootFrame.Content == null)
{
    // When the navigation stack isn't restored navigate to the first page,
    // configuring the new page by passing required information as a navigation
    // parameter
    rootFrame.Navigate(typeof(MainPage), e.Arguments);
}
// Ensure the current window is active
Window.Current.Activate();
}
```

### Initializing ComboBox

Import the SfComboBox namespace in respective page as shown in the following code.

#### XML

```
xmlns:combobox="clr-
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
```

#### C#

```
using Syncfusion.XForms.ComboBox;
```

Then initialize an empty combobox as shown in the following code,

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:combobox="clr-
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
xmlns:local="clr-namespace:NamespaceName"
x:Class="NamespaceName.ClassName">
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"/>
</StackLayout>
</ContentPage>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
```

```
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
layout.Children.Add(comboBox);
Content = layout;
```

### Populating ComboBox with data

Now, a list of string with resolution list is created and added to the SfComboBox data source property. This list is populated as suggestion list by setting the 'DataSource' property based on text entry. You can customize the drop-down height using the MaximumDropDownHeight property. Add the DataSource for the SfComboBox as shown in the following code.

### XML

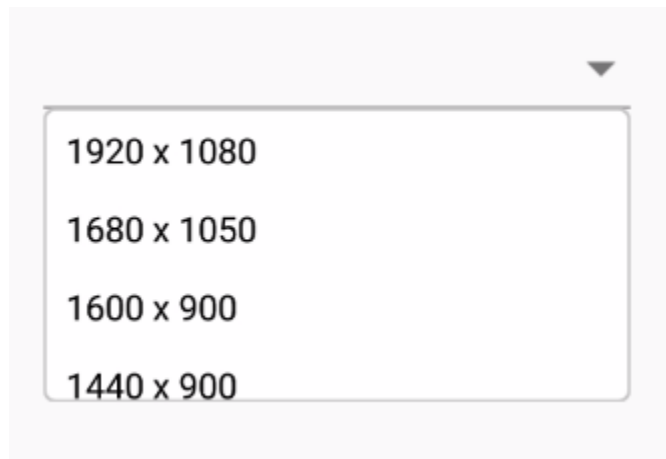

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:combobox="clr-
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
xmlns:local="clr-namespace:NamespaceName"
x:Class="NamespaceName.ClassName">
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox">
<combobox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String> 1920 x 1080 </x:String>
<x:String> 1680 x 1050 </x:String>
<x:String> 1600 x 900 </x:String>
<x:String> 1440 x 900 </x:String>
<x:String> 1400 x 1050 </x:String>
<x:String> 1366 x 768 </x:String>
<x:String> 1360 x 768 </x:String>
<x:String> 1280 x 1024 </x:String>
<x:String> 1280 x 960 </x:String>
<x:String> 1280 x 720 </x:String>
<x:String> 854 x 480 </x:String>
<x:String> 800 x 480 </x:String>
<x:String> 480 x 640 </x:String>
<x:String> 480 x 320 </x:String>
<x:String> 432 x 240 </x:String>
<x:String> 360 x 640 </x:String>
<x:String> 320 x 240 </x:String>
</ListCollection:List>
</combobox:SfComboBox.ComboBoxSource>
</combobox:SfComboBox>
```

```
</StackLayout>
</ContentPage>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> resolutionList = new List<String>();
resolutionList.Add("1920 x 1080");
resolutionList.Add("1680 x 1050");
resolutionList.Add("1600 x 900");
resolutionList.Add("1440 x 900");
resolutionList.Add("1400 x 1050");
resolutionList.Add("1366 x 768");
resolutionList.Add("1360 x 768");
resolutionList.Add("1280 x 1024");
resolutionList.Add("1280 x 960");
resolutionList.Add("1280 x 720");
resolutionList.Add("854 x 480");
resolutionList.Add("800 x 480");
resolutionList.Add("480 x 640");
resolutionList.Add("480 x 320");
resolutionList.Add("432 x 240");
resolutionList.Add("360 x 640");
resolutionList.Add("320 x 240");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.ComboBoxSource = resolutionList;
layout.Children.Add(comboBox);
Content = layout;
```

Refer [this](#) link to learn more about the options available in SfComboBox to populate data.

### ComboBox modes

The combo box control supports both editable and non-editable text boxes to choose selected items in given data source. You can select an item from the suggestion list.

N > The default value of the `IsEditableMode` property is false.

#### Non-editable combo box

Non-editable mode prevents users from typing and allows them to select items from the drop-down list. In non-editable mode, the suggestion box can be displayed by clicking the control or drop-down button.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    MaximumDropDownHeight="200" IsEditableMode="false">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> 1920 x 1080 </x:String>
        <x:String> 1680 x 1050 </x:String>
        <x:String> 1600 x 900 </x:String>
        <x:String> 1440 x 900 </x:String>
        <x:String> 1400 x 1050 </x:String>
        <x:String> 1366 x 768 </x:String>
        <x:String> 1360 x 768 </x:String>
        <x:String> 1280 x 1024 </x:String>
        <x:String> 1280 x 960 </x:String>
        <x:String> 1280 x 720 </x:String>
        <x:String> 854 x 480 </x:String>
        <x:String> 800 x 480 </x:String>
        <x:String> 480 X 640 </x:String>
        <x:String> 480 x 320 </x:String>
        <x:String> 432 x 240 </x:String>
        <x:String> 360 X 640 </x:String>
        <x:String> 320 x 240 </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

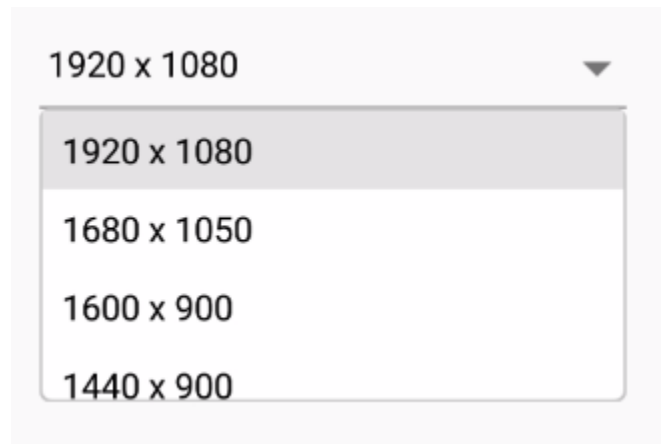

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> resolutionList = new List<String>();
resolutionList.Add("1920 x 1080");
resolutionList.Add("1680 x 1050");
resolutionList.Add("1600 x 900");
resolutionList.Add("1440 x 900");
resolutionList.Add("1400 x 1050");
resolutionList.Add("1366 x 768");
resolutionList.Add("1360 x 768");
resolutionList.Add("1280 x 1024");
```

```

resolutionList.Add("1280 x 960");
resolutionList.Add("1280 x 720");
resolutionList.Add("854 x 480");
resolutionList.Add("800 x 480");
resolutionList.Add("480 x 640");
resolutionList.Add("480 x 320");
resolutionList.Add("432 x 240");
resolutionList.Add("360 x 640");
resolutionList.Add("320 x 240");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.MaximumDropDownHeight = 200;
comboBox.IsEditableMode = false;
comboBox.ComboBoxSource = resolutionList;
layout.Children.Add(comboBox);
Content = layout;

```

#### Editable combo box

In editable mode, the combo box allows users to edit in the text box that shows suggestions in drop-down list based on the input. With the previous codes, the 'IsEditableMode' property can be set to true. This helps users to edit the combo box control.

#### XML

```

<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    MaximumDropDownHeight="200" IsEditableMode="true">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> 1920 x 1080 </x:String>
        <x:String> 1680 x 1050 </x:String>
        <x:String> 1600 x 900 </x:String>
        <x:String> 1440 x 900 </x:String>
        <x:String> 1400 x 1050 </x:String>
        <x:String> 1366 x 768 </x:String>
        <x:String> 1360 x 768 </x:String>
        <x:String> 1280 x 1024 </x:String>
        <x:String> 1280 x 960 </x:String>
        <x:String> 1280 x 720 </x:String>
        <x:String> 854 x 480 </x:String>
        <x:String> 800 x 480 </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>

```

```
<x:String> 480 X 640 </x:String>
<x:String> 480 x 320 </x:String>
<x:String> 432 x 240 </x:String>
<x:String> 360 X 640 </x:String>
<x:String> 320 x 240 </x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> resolutionList = new List<String>();
resolutionList.Add("1920 x 1080");
resolutionList.Add("1680 x 1050");
resolutionList.Add("1600 x 900");
resolutionList.Add("1440 x 900");
resolutionList.Add("1400 x 1050");
resolutionList.Add("1366 x 768");
resolutionList.Add("1360 x 768");
resolutionList.Add("1280 x 1024");
resolutionList.Add("1280 x 960");
resolutionList.Add("1280 x 720");
resolutionList.Add("854 x 480");
resolutionList.Add("800 x 480");
resolutionList.Add("480 X 640");
resolutionList.Add("480 x 320");
resolutionList.Add("432 x 240");
resolutionList.Add("360 X 640");
resolutionList.Add("320 x 240");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.MaximumDropDownHeight = 200;
comboBox.IsEditableMode = true;
comboBox.ComboBoxSource = resolutionList;
layout.Children.Add(comboBox);
Content = layout;
```

### Retrieving selected values

When selecting an item from the drop-down list, the selection changed event will be called. Using the following code snippet, a dialogue box will be displayed when a new item is selected from the suggestion box.

### XML

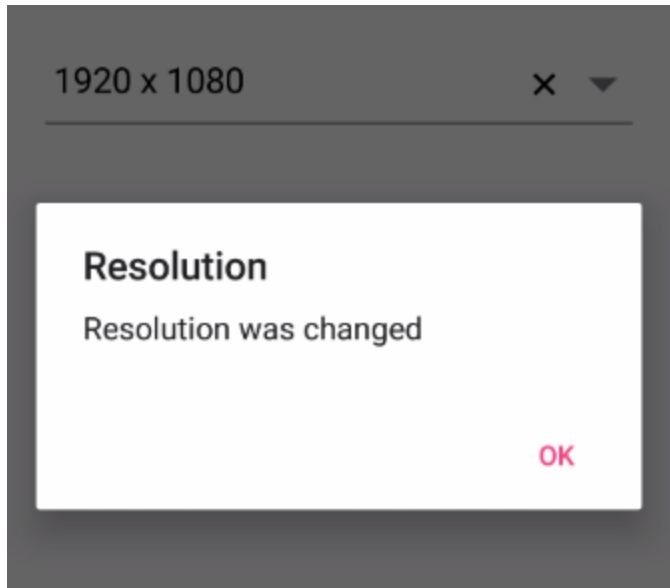

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    MaximumDropDownHeight="200" IsEditableMode="true"
    SelectionChanged="ComboBox_SelectionChanged">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> 1920 x 1080 </x:String>
        <x:String> 1680 x 1050 </x:String>
        <x:String> 1600 x 900 </x:String>
        <x:String> 1440 x 900 </x:String>
        <x:String> 1400 x 1050 </x:String>
        <x:String> 1366 x 768 </x:String>
        <x:String> 1360 x 768 </x:String>
        <x:String> 1280 x 1024 </x:String>
        <x:String> 1280 x 960 </x:String>
        <x:String> 1280 x 720 </x:String>
        <x:String> 854 x 480 </x:String>
        <x:String> 800 x 480 </x:String>
        <x:String> 480 X 640 </x:String>
        <x:String> 480 x 320 </x:String>
        <x:String> 432 x 240 </x:String>
        <x:String> 360 X 640 </x:String>
        <x:String> 320 x 240 </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
```

```
HorizontalOptions = LayoutOptions.Start,
Padding = new Thickness(30)
};
List<String> resolutionList = new List<String>();
resolutionList.Add("1920 x 1080");
resolutionList.Add("1680 x 1050");
resolutionList.Add("1600 x 900");
resolutionList.Add("1440 x 900");
resolutionList.Add("1400 x 1050");
resolutionList.Add("1366 x 768");
resolutionList.Add("1360 x 768");
resolutionList.Add("1280 x 1024");
resolutionList.Add("1280 x 960");
resolutionList.Add("1280 x 720");
resolutionList.Add("854 x 480");
resolutionList.Add("800 x 480");
resolutionList.Add("480 x 640");
resolutionList.Add("480 x 320");
resolutionList.Add("432 x 240");
resolutionList.Add("360 x 640");
resolutionList.Add("320 x 240");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.MaximumDropDownHeight = 200;
comboBox.IsEditableMode = true;
comboBox.ComboBoxSource = resolutionList;
comboBox.SelectionChanged += ComboBox_SelectionChanged;
layout.Children.Add(comboBox);
Content = layout;
}

private void ComboBox_SelectionChanged(object sender,
Syncfusion.XForms.ComboBox.SelectionChangedEventArgs e)
{
    Xamarin.Forms.Application.Current.MainPage.DisplayAlert("Resolution",
"Resolution was changed", "OK");
}
```

The complete Getting Started sample is available in [this](#) link.

### Populating data

SfComboBox control can be populated with a list of string or business objects, which assists the users when typing. Users can choose one item from the filtered suggestion list.

The [DataSource] property is used to populate data in the combo box control. This section explains how to populate the combo box control with list of string and list of employee details separately.

### Populating string data

Create an instance of string list and populate items as shown in the following codes.

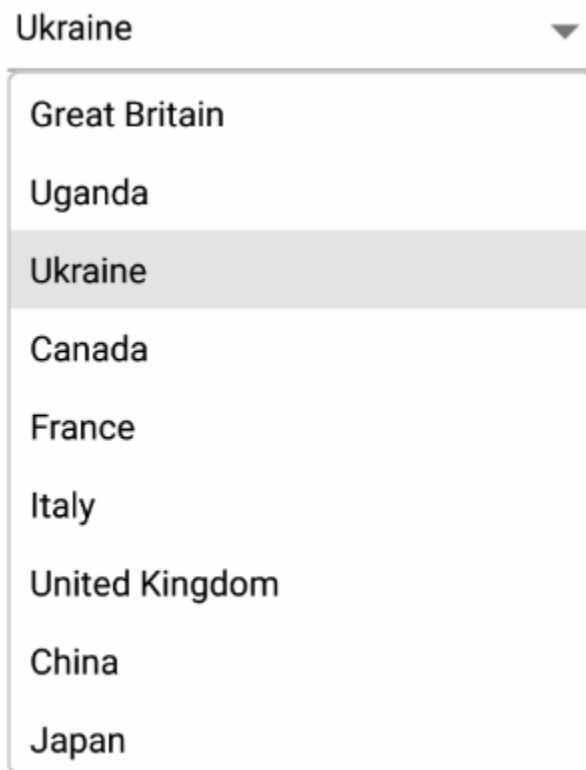

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Great Britain </x:String>
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> Canada </x:String>
        <x:String> France </x:String>
        <x:String> Italy </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> China </x:String>
        <x:String> Japan </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
```

```
VerticalOptions = LayoutOptions.Start,  
HorizontalOptions = LayoutOptions.Start,  
Padding = new Thickness(30)  
};  
List<String> countryNames = new List<String>();  
countryNames.Add("Great Britain");  
countryNames.Add("Uganda");  
countryNames.Add("Ukraine");  
countryNames.Add("Canada");  
countryNames.Add("France");  
countryNames.Add("Italy");  
countryNames.Add("United Kingdom");  
countryNames.Add("China");  
countryNames.Add("Japan");  
SfComboBox comboBox = new SfComboBox();  
comboBox.HeightRequest = 40;  
comboBox.ComboBoxSource = countryNames;  
layout.Children.Add(comboBox);  
Content = layout;
```

### Populating business objects

Apart from string data, SfComboBox can deal business object data also. Now create Model and ViewModel classes to populate the combo box control with employee details.

#### Create and Initialize business models

Define a simple model class employee with fields ID and name, and then populate employee data in ViewModel.

**C#**

```

public class Employee
{
    private int id;
    public int ID
    {
        get { return id; }
        set { id = value; }
    }
    private string name;
    public string Name
    {
        get { return name; }
        set { name = value; }
    }
}

public class EmployeeViewModel
{
    private ObservableCollection<Employee> employeeCollection;
    public ObservableCollection<Employee> EmployeeCollection
    {
        get { return employeeCollection; }
        set { employeeCollection = value; }
    }
    public EmployeeViewModel()
    {
        employeeCollection = new ObservableCollection<Employee>();
        employeeCollection.Add(new Employee() { ID = 1, Name = "Frank" });
        employeeCollection.Add(new Employee() { ID = 2, Name = "James" });
        employeeCollection.Add(new Employee() { ID = 3, Name = "Steve" });
        employeeCollection.Add(new Employee() { ID = 4, Name = "Lucas" });
        employeeCollection.Add(new Employee() { ID = 5, Name = "Mark" });
        employeeCollection.Add(new Employee() { ID = 6, Name = "Michael" });
        employeeCollection.Add(new Employee() { ID = 7, Name = "Aldrin" });
        employeeCollection.Add(new Employee() { ID = 8, Name = "Jack" });
        employeeCollection.Add(new Employee() { ID = 9, Name = "Howard" });
    }
}

```

*Populate data in ComboBox*

Now populate this EmployeeViewModel data in SfComboBox control by binding with `[DataSource]` property.

**XML**

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:combobox="clr-namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
xmlns:local="clr-namespace:NamespaceName"
x:Class="NamespaceName.ClassName">
    <ContentPage.BindingContext>
        <local:EmployeeViewModel/>
    </ContentPage.BindingContext>
    <StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">

```

```
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"  
DataSource="{Binding EmployeeCollection}" DisplayMemberPath="Name" />  
</StackLayout>  
</ContentPage>
```

## C#

```
StackLayout layout = new StackLayout()  
{  
    VerticalOptions = LayoutOptions.Start,  
    HorizontalOptions = LayoutOptions.Start,  
    Padding = new Thickness(30)  
};  
EmployeeViewModel employee = new EmployeeViewModel();  
SfComboBox comboBox = new SfComboBox();  
comboBox.HeightRequest = 40;  
comboBox.BindingContext = employee;  
comboBox.DataSource = employee.EmployeeCollection;  
comboBox.DisplayMemberPath = "Name";  
layout.Children.Add(comboBox);  
Content = layout;
```

**Note:** Set the EmployeeViewModel instance as the BindingContext of your control; this is done to bind properties of EmployeeViewModel to SfComboBox.

### Setting DisplayMemberPath

The combo box control is populated with a list of employees. But the employee model contains two properties ID and Name, So it is necessary to intimate by which property it should filter suggestions. The [DisplayMemberPath] property specifies the property path with type of filtering is done on business objects.

## C#

```
comboBox.DisplayMemberPath = "Name";
```

### Setting ItemTemplate

The [ItemTemplate] property helps to decorate suggestion items with custom templates. The following code explains the steps to add an image to the suggestion list item.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
DisplayMemberPath="Name" DataSource="{Binding EmployeeCollection}">
<combobox:SfComboBox.ItemTemplate>
<DataTemplate>
<StackLayout Orientation="Horizontal">
<Image Source="User.png" WidthRequest="12"/>
<Label Text="{Binding Name}" />
</StackLayout>
</DataTemplate>
</combobox:SfComboBox.ItemTemplate>
</combobox:SfComboBox>
</StackLayout>
```

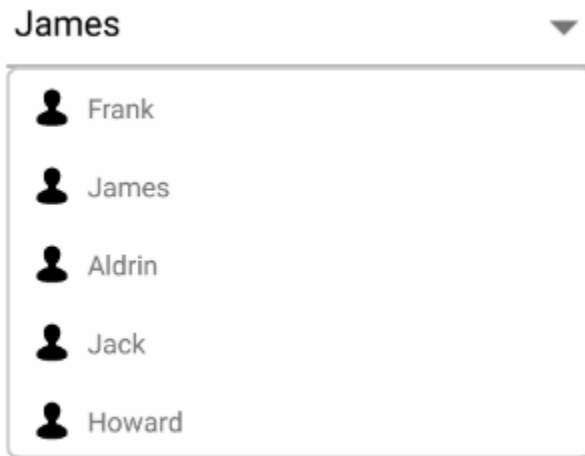

The ItemTemplate in the previous XAML code is translated to C# which is shown in the following code.

#### C#

```
DataTemplate itemTemplate = new DataTemplate(() =>
{
    StackLayout stack;
    Image image;
    Label label;
    stack = new StackLayout();
    stack.Orientation = StackOrientation.Horizontal;
    image = new Image();
    image.Source = (FileImageSource) ImageSource.FromFile("User.png");
    label = new Label();
    label.SetBinding(Label.TextProperty, "Name");
    stack.Children.Add(image);
    stack.Children.Add(label);
    return new ViewCell { View = stack };
});
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
EmployeeViewModel employee = new EmployeeViewModel();
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.BindingContext = employee;
comboBox.DataSource = employee.EmployeeCollection;
comboBox.ItemTemplate = itemTemplate;
layout.Children.Add(comboBox);
Content = layout;
```

Refer to [this](#) link to learn more about the customizing options available in the combo box control.

**Note:** Add the required image in drawable folder(Android), Resources folder(iOS) and at project location for UWP.

### DataTemplateSelector

SfComboBox supports DataTemplateSelector, which is used to choose a DataTemplate based on data object.

#### XML

```
<ContentPage.BindingContext>
<local:MobileDetailViewModel/>
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="default">
<ViewCell>
<Grid Padding="5">
<Label Text="{Binding Mobile}" TextColor="Green"/>
</Grid>
</ViewCell>
</DataTemplate>
<DataTemplate x:Key="specific">
<ViewCell>
<Grid Padding="5">
<Label Text="{Binding Mobile}" BackgroundColor="LightGray" TextColor="Red"/>
</Grid>
</ViewCell>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<comboBox:SfComboBox DataSource="{Binding MobileCollection}"
DisplayMemberPath="Mobile">
<comboBox:SfComboBox.ItemTemplate>
<local:DataTemplateSelectorViewModel DefaultTemplate="{StaticResource
default}" SpecificDataTemplate="{StaticResource specific}" />
</comboBox:SfComboBox.ItemTemplate>
</comboBox:SfComboBox>
```

```
</StackLayout>
```

**C#**

```
public partial class MainPage : ContentPage
{
    DataTemplate defaultTemplate;
    DataTemplate specifictempalte;
    public MainPage()
    {
        InitializeComponent();
        MobileDetailViewModel mobileDetailViewModel = new MobileDetailViewModel();
        defaultTemplate = new DataTemplate(() =>
        {
            Grid grid = new Grid();
            grid.Padding = new Thickness(5);
            Label label = new Label();
            label.SetBinding(Label.TextProperty, "Mobile");
            label.TextColor = Color.Green;
            grid.Children.Add(label);
            return new ViewCell { View = grid };
        });
        specifictempalte = new DataTemplate(() =>
        {
            Grid grid = new Grid();
            grid.Padding = new Thickness(5);
            Label label = new Label();
            label.SetBinding(Label.TextProperty, "Mobile");
            label.BackgroundColor = Color.LightGray;
            label.TextColor = Color.Red;
            grid.Children.Add(label);
            return new ViewCell { View = grid };
        });
        StackLayout layout = new StackLayout()
        {
            VerticalOptions = LayoutOptions.Start,
            HorizontalOptions = LayoutOptions.Start,
            Padding = new Thickness(30)
        };
        SfComboBox comboBox = new SfComboBox();
        comboBox.HeightRequest = 40;
        comboBox.DataSource = mobileDetailViewModel.MobileCollection;
        this.BindingContext = mobileDetailViewModel;
        comboBox.DisplayMemberPath = "Mobile";
        comboBox.ItemTemplate = new DataTemplateSelectorViewModel { DefaultTemplate = defaultTemplate, SpecificDataTemplate = specifictempalte };
        layout.Children.Add(comboBox);
        Content = layout;
    }
}
```

*Create and Initialize Business Models*

Define a simple model class MobileDetail with fields IsAvailableInStock, Mobile and populate mobile detail in ViewModel.

**C#**

```
public class MobileDetailViewModel
{
    public ObservableCollection<MobileDetail> MobileCollection { get; set; }
    public MobileDetailViewModel()
    {
        this.MobileCollection = new ObservableCollection<MobileDetail>()
        {
            new MobileDetail () { Mobile="Samasung S8", IsAvailableInStock=false },
            new MobileDetail () { Mobile="Samasung S9", IsAvailableInStock=true },
            new MobileDetail () { Mobile="Samsung S10", IsAvailableInStock=true },
            new MobileDetail () { Mobile="Samsung S10 plus", IsAvailableInStock=true },
            new MobileDetail () { Mobile="iPhone 7", IsAvailableInStock=true },
            new MobileDetail () { Mobile="iPhone 8", IsAvailableInStock=true },
            new MobileDetail () { Mobile="iPhone X", IsAvailableInStock=false },
            new MobileDetail () { Mobile="iPhone XR", IsAvailableInStock=false },
            new MobileDetail () { Mobile="iPhone XS", IsAvailableInStock=true },
        };
    }
}

public class MobileDetail
{
    public string Mobile { get; set; }
    public bool IsAvailableInStock { get; set; }
}
```

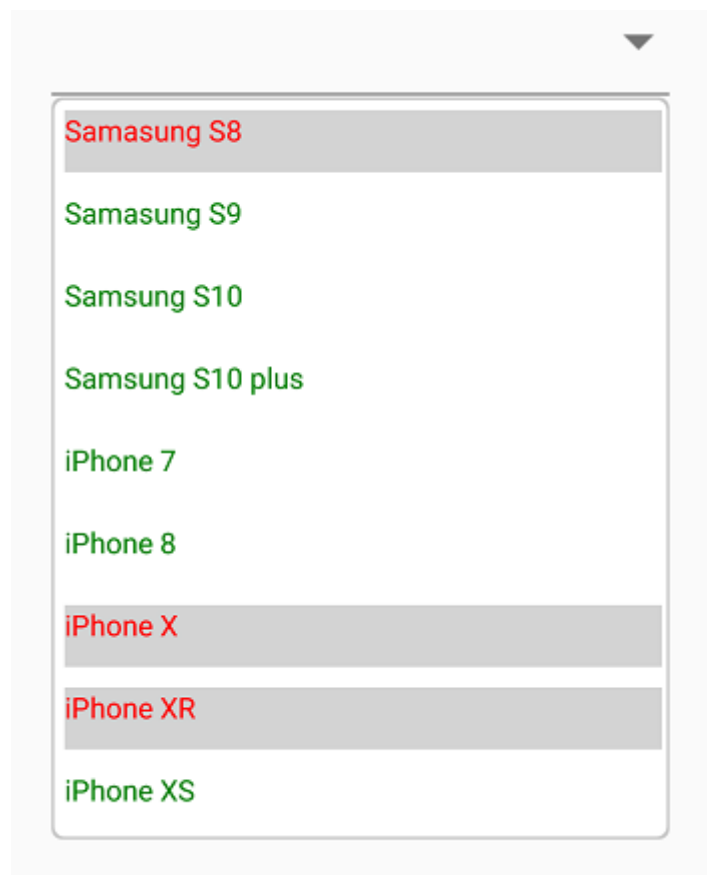

## OnSelectTemplate

The OnSelectTemplate is an overridden method to return a particular DataTemplate. The following code sample demonstrates how to use the OnSelectTemplate method.

**C#**

```
public class DataTemplateSelectorViewModel : DataTemplateSelector
{
    public DataTemplate DefaultTemplate { get; set; }
    public DataTemplate SpecificDataTemplate { get; set; }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject container)
    {
        var message = item as MobileDetail;
        if (message.IsAvailableInStock == null)
            return null;
        return message.IsAvailableInStock == false ? SpecificDataTemplate :
            DefaultTemplate;
    }
}
```

The following screenshot illustrates the output of above code.

We have attached sample for reference. You can download the sample from the following link.

Sample Link: [SfComboBox\\_DataTemplateSelector](#)

### Handling Selected Items

SfComboBox provides a way to handle the selected item using the following properties:

- SelectedIndex
- SelectedIndices
- SelectedItem

#### SelectedIndex

You can get or set the index of the selected item using the [SelectedIndex](#) property. It is applicable only when [MultiSelectMode](#) is set to None.

*Set the index of item to be selected*

The [SelectedIndex](#) property holds the index of selected item in suggestion list.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ComboBox"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
```

```

            {
                HeightRequest = 40,
                SelectedIndex = 1,
                MultiSelectMode=MultiSelectMode.None,
                DataSource = new List<string>()
                {
                    "Antigua and Barbuda",
                    "American Samoa",
                    "Afghanistan",
                    "Antarctica",

```

```

"Argentina",
"Anguilla",
"Albania",
"Algeria",
"Andorra",
"Angola"
}
};
stackLayout.Children.Add(comboBox);
this.Content = stackLayout;
}
}
}

```

#### *Retrieve the index of selected item*

When an item is selected from suggestion list, its index can be retrieved using the [SelectedIndex](#) property.

The following code sample demonstrates how to retrieve [SelectedIndex](#) and display it in an alert.

#### **XML**

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ComboBox"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:comboBox="clr
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"

<x:String>Argentina</x:String>
<x:String>Anguilla</x:String>
<x:String>Albania</x:String>
<x:String>Algeria</x:String>
<x:String>Andorra</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
</ContentPage>

```

#### **C#**

```

using System;
using System.Collections.Generic;

```

```

using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
namespace ComboBox
{
    public partial class MainPage : ContentPage
    {
        SfComboBox comboBox;
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = 30
            };
            comboBox = new SfComboBox()
            {
                HeightRequest = 40, MultiSelectMode=MultiSelectMode.None,
                DataSource = new List<string>()
                {
                    "Antigua and Barbuda",
                    "American Samoa",
                    "Afghanistan",
                    "Antarctica",
                    "Argentina",
                    "Anguilla",
                    "Albania",
                    "Algeria",
                    "Andorra",
                    "Angola"
                }
            };
            comboBox.SelectionChanged += comboBox_SelectionChanged;
            stackLayout.Children.Add(comboBox);
            this.Content = stackLayout;
        }
        private void comboBox_SelectionChanged(object sender,
            Syncfusion.XForms.ComboBox.SelectionChangedEventArgs e)
        {
            DisplayAlert("Selection Changed", "SelectedIndex: " +
                comboBox.SelectedIndex, "OK");
        }
    }
}

```

### SelectedIndices

You can get or set the indices of the selected items using the [SelectedIndices](#) property. It is applicable when [MultiSelectMode](#) is set to either Token or Delimiter.

#### *Set the indices of items*

The [SelectedIndices](#) property holds the indices of the selected items in suggestion list.

### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ComboBox"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:comboBox="clr
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
x:Class="ComboBox.MainPage">
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<comboBox:SfComboBox x:Name="comboBox" HeightRequest="40"
MultiSelectMode="Token" SelectedIndices="{Binding SelectedIndices}">
<comboBox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>Antigua and Barbuda</x:String>
<x:String>American Samoa</x:String>
<x:String>Afghanistan</x:String>
<x:String>Antarctica</x:String>
<x:String>Argentina</x:String>
<x:String>Anguilla</x:String>
<x:String>Albania</x:String>
<x:String>Algeria</x:String>
<x:String>Andorra</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
</ContentPage>
```

## C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
namespace ComboBox
{
    public partial class MainPage : ContentPage
    {
        private object selectedIndices;
        public object SelectedIndices
        {
            get { return selectedIndices; }
            set { selectedIndices = value; }
        }
        public MainPage()
        {
            InitializeComponent();
            SelectedIndices = new List<int>() { 2, 4, 7 };
            this.BindingContext = this;
        }
    }
}
```

*Retrieve the indices of selected item*

When an item is selected from suggestion list, its index can be retrieved using the [SelectedIndices](#) property.

The following code sample demonstrates how to retrieve [SelectedIndices](#) and display them in ListView.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

<x:String>Antarctica</x:String>
<x:String>Argentina</x:String>
<x:String>Anguilla</x:String>
<x:String>Albania</x:String>
<x:String>Algeria</x:String>
<x:String>Andorra</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
<ListView
x:Name="MainListView"
RowHeight="30"
ItemsSource="{Binding Source={x:Reference comboBox},Path=SelectedIndices}">
<ListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<StackLayout Orientation="Horizontal">
<Label Text="SelectedIndex:"/>
<Label Text="{Binding}" />
</StackLayout>
</ViewCell>
</DataTemplate>
</ListView.ItemTemplate>
</ListView>
</StackLayout>
</ContentPage>
```

**C#**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
namespace ComboBox
{
    public partial class MainPage : ContentPage, INotifyPropertyChanged
    {
        public event PropertyChangedEventHandler PropertyChanged;
        protected virtual void NotifyPropertyChanged([CallerMemberName] string
        propertyName = "")
        {
            PropertyChanged?.Invoke(this, new PropertyChangedEventArgs(propertyName));
        }
        private object selectedIndices;
        public object SelectedIndices
        {
            get { return selectedIndices; }
            set
            {
                selectedIndices = value;
                NotifyPropertyChanged("SelectedIndices");
            }
        }
        public MainPage()
        {
            InitializeComponent();
            this.BindingContext = this;
        }
    }
}

```

### SelectedItem

The **SelectedItem** property is used to select a particular item from the suggestion list. You can either get or set the **SelectedItem**.

#### How to set the SelectedItem

The following code sample demonstrates how to set **SelectedItem**.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ComboBox"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:comboBox="clr
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
x:Class="ComboBox.MainPage">
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<comboBox:SfComboBox x:Name="comboBox" HeightRequest="40"
SelectedItem="Angola">
<comboBox:SfComboBox.ComboBoxSource>

```

```

<ListCollection:List x:TypeArguments="x:String">
  <x:String>Antigua and Barbuda</x:String>
  <x:String>American Samoa</x:String>
  <x:String>Afghanistan</x:String>
  <x:String>Antarctica</x:String>
  <x:String>Argentina</x:String>
  <x:String>Anguilla</x:String>
  <x:String>Albania</x:String>
  <x:String>Algeria</x:String>
  <x:String>Andorra</x:String>
  <x:String>Angola</x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
</ContentPage>

```

## C#

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
namespace ComboBox
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = 30
            };
            SfComboBox comboBox = new SfComboBox()
            {
                HeightRequest = 40,
                SelectedItem = "Angola",
                MultiSelectMode = MultiSelectMode.None,
                DataSource = new List<string>()
                {
                    "Antigua and Barbuda",
                    "American Samoa",
                    "Afghanistan",
                    "Antarctica",
                    "Argentina",
                    "Anguilla",
                    "Albania",
                    "Algeria",
                    "Andorra",
                    "Angola"
                }
            };
        }
    }
}

```

```

};
stackLayout.Children.Add(comboBox);
this.Content = stackLayout;
}
}
}

```

### Retrieve the selected item

When an item is selected from suggestion list, it can be retrieved using the [SelectedItem](#) property.

The `SelectedValuePath` API is used to retrieve the value of the selected item in drop-down when the item is selected. The `SelectedValue` property is updated based on the selection. For loading the default values in the control, use only the `SelectedItem`, and the `SelectedValue` is used for retrieving the value of our desired property[ID] based on the selection.

There are scenarios in which `SelectedValue` can have duplicate items when `DisplayMemberPath` is loaded with Countries and `SelectedValue` is bound to Continent; it will be the same for many countries. In such scenarios, you cannot populate based on `SelectedValue`.

The following code sample demonstrates how to retrieve [SelectedItem](#) and display it in an alert.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ComboBox"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:comboBox="clr
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
x:Class="ComboBox.MainPage">
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<comboBox:SfComboBox x:Name="comboBox" HeightRequest="40"
MultiSelectMode="None" SelectionChanged="ComboBox_SelectionChanged">
<comboBox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>Antigua and Barbuda</x:String>
<x:String>American Samoa</x:String>
<x:String>Afghanistan</x:String>
<x:String>Antarctica</x:String>
<x:String>Argentina</x:String>
<x:String>Anguilla</x:String>
<x:String>Albania</x:String>
<x:String>Algeria</x:String>
<x:String>Andorra</x:String>
<x:String>Angola</x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
</ContentPage>

```

### C#

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
namespace ComboBox
{
    public partial class MainPage : ContentPage
    {
        SfComboBox comboBox;
        public MainPage()
        {
            InitializeComponent();
            StackLayout stackLayout = new StackLayout()
            {
                VerticalOptions = LayoutOptions.Start,
                HorizontalOptions = LayoutOptions.Start,
                Padding = 30
            };
            comboBox = new SfComboBox()
            {
                HeightRequest = 40,
                MultiSelectMode = MultiSelectMode.None,
                DataSource = new List<string>()
                {
                    "Antigua and Barbuda",
                    "American Samoa",
                    "Afghanistan",
                    "Antarctica",
                    "Argentina",
                    "Anguilla",
                    "Albania",
                    "Algeria",
                    "Andorra",
                    "Angola"
                }
            };
            comboBox.SelectionChanged += ComboBox_SelectionChanged;
            stackLayout.Children.Add(comboBox);
            this.Content = stackLayout;
        }
        private void ComboBox_SelectionChanged(object sender,
            Syncfusion.XForms.ComboBox.SelectionChangedEventArgs e)
        {
            DisplayAlert("Selection Changed", "SelectedItem: " + comboBox.SelectedItem,
                "OK");
        }
    }
}

```

### Diacritic Sensitivity

The control does not stick with one type of keyboard, so you can populate items from a language with letters containing diacritics, and search for them with English characters from an en-US keyboard. Users can enable or disable the diacritic sensitivity with the [IgnoreDiacritic](#) property. In the below code

example we have illustrate how to enables the diacritic sensitivity so that items in the suggestion list get populated by entering any diacritic character of that alphabet.

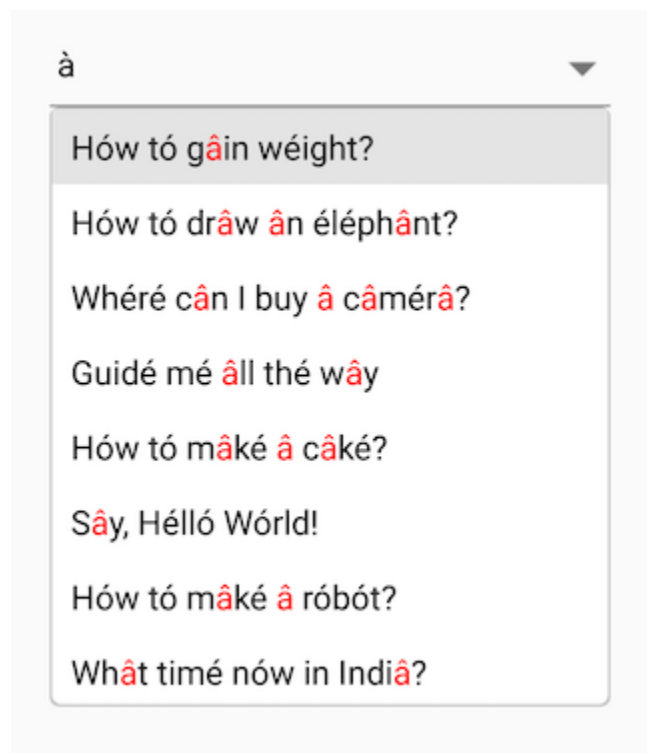

**Note:** Diacritic Sensitivity support has enhanced only on iOS and Android platform.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="True" AllowFiltering="True"
    TextHighlightMode="MultipleOccurrence" SuggestionMode="Contains"
    HighlightedTextColor="Red" IgnoreDiacritic="false">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String>Hów tó gâin wéight?</x:String>
        <x:String>Hów tó drâw ân éléphânt?</x:String>
        <x:String>Whéré cân I buy â câmérâ?</x:String>
        <x:String>Guidé mé âll thé wây</x:String>
        <x:String>Hów tó mâké â câké?</x:String>
        <x:String>Sây, Hélló Wórlđ!</x:String>
        <x:String>Hów tó mâké â róbót?</x:String>
        <x:String>Whât tímé nów in Indiâ?</x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout mainLayout = new StackLayout()
{
    Padding = new Thickness(30)
};
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.TextHighlightMode = OccurrenceMode.MultipleOccurrence;
comboBox.SuggestionMode = SuggestionMode.Contains;
comboBox.HighlightedTextColor = Color.Red;
comboBox.IgnoreDiacritic = false;
List<String> diacritic = new List<String>();
diacritic.Add("Hów tó gâin wéight?");
diacritic.Add("Hów tó drâw ân éléphânt?");
diacritic.Add("Whéré cân I buy â câmérâ?");
diacritic.Add("Guidé mé âll thé wây");
diacritic.Add("Hów tó mâké â câké?");
diacritic.Add("Sây, Hélló Wórlđ!");
diacritic.Add("Hów tó mâké â róbót?");
diacritic.Add("Whât tímé nów in Indiâ?");
comboBox.ComboBoxSource = diacritic;
mainLayout.Children.Add(comboBox);
Content = mainLayout;
```

### Multiple selection

Select multiple items from a suggestion list. There are two ways to perform multi selection in the combo box control.

- Token Representation
- Delimiter

### Token representation

Selected items will be displayed with a customizable token representation. Users can remove each tokenized item with the close button. And `IsSelectedItemsVisibleInDropDown` property is used to restrict the selected items as visible or not in dropDown.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <comboBox:SfComboBox HeightRequest="40" x:Name="comboBox"
    MultiSelectMode="Token" TokensWrapMode="Wrap"
    IsSelectedItemsVisibleInDropDown="false" />
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
SfComboBox comboBox = new SfComboBox();
```

```
comboBox.DropDownItemHeight = 50;
comboBox.MultiSelectMode = MultiSelectMode.Token;
comboBox.TokensWrapMode = TokensWrapMode.Wrap;
comboBox.IsSelectedItemsVisibleInDropDown = false;
layout.Children.Add(comboBox);
Content = layout;
```

### Wrap mode of token

The selected item can be displayed as token inside the SfComboBox in two ways. They are

- **Wrap** - When the **TokensWrapMode** is set to **Wrap** the selected items will be wrapped to the next line of the SfComboBox.
- **None** - When the **TokensWrapMode** is set to **None** the selected item will be wrapped in horizontal orientation.

Define a simple model class Employee with fields ID, Name and populate employee data in ViewModel.

### C#

```
// Create a Employee Class which holds the Name and image.
public class Employee
{
    private string image;
    public string Image
    {
        get { return image; }
        set { image = value; }
    }
    private string name;
    public string Name
    {
        get { return name; }
        set { name = value; }
    }
}

// Create EmployeeViewModel class holds the collection of employee data.
public class EmployeeViewModel : INotifyPropertyChanged
{
    private ObservableCollection<Employee> employeeCollection;
    public ObservableCollection<Employee> EmployeeCollection
    {
        get { return employeeCollection; }
        set { employeeCollection = value; }
    }
    public EmployeeViewModel()
    {
        employeeCollection = new ObservableCollection<Employee>();
        employeeCollection.Add(new Employee() { Image = "John.png", Name = "John" });
        employeeCollection.Add(new Employee() { Image = "Justin.png", Name = "Justin" });
        employeeCollection.Add(new Employee() { Image = "Jerome.png", Name = "Jerome" });
        employeeCollection.Add(new Employee() { Image = "Jessica.png", Name = "Jessica" });
    }
}
```

```

employeeCollection.Add(new Employee() { Image = "Victoria.png", Name =
"Victoria" });
}
public event PropertyChangedEventHandler PropertyChanged;
private void RaisePropertyChanged(String name)
{
if (PropertyChanged != null)
this.PropertyChanged(this, new PropertyChangedEventArgs(name));
}
}

```

Now populate this EmployeeViewModel data in SfComboBox control by binding with [DataSource] property.

### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:combobox="clr-
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"

MultiSelectMode="Token" DataSource="{Binding EmployeeCollection}"/>
</StackLayout>
</ContentPage>

```

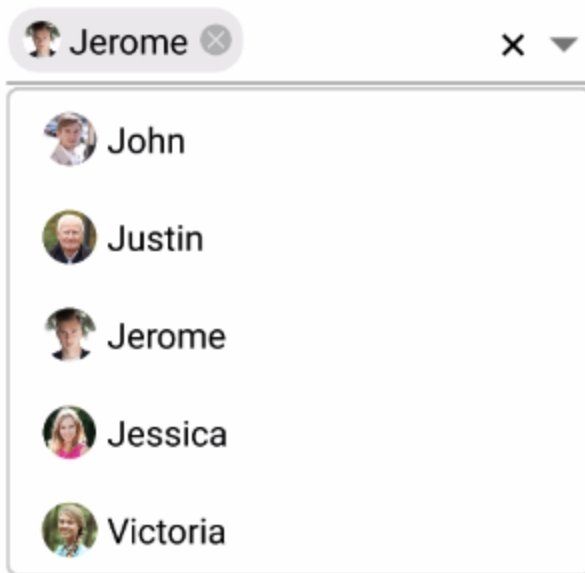

### C#

```

StackLayout layout = new StackLayout()
{
VerticalOptions = LayoutOptions.Start,
HorizontalOptions = LayoutOptions.Start,
Padding = new Thickness(30)
};
SfComboBox comboBox = new SfComboBox();
comboBox.DropDownItemHeight = 50;
comboBox.DisplayMemberPath = "Name";
comboBox.ImageMemberPath = "Image";
comboBox.MultiSelectMode = MultiSelectMode.Token;
this.BindingContext = new EmployeeViewModel();
// Set TokensWrapMode to Wrap
comboBox.TokensWrapMode = TokensWrapMode.Wrap;
comboBox.SetBinding(SfComboBox.DataSourceProperty, "EmployeeCollection",
BindingMode.TwoWay);
layout.Children.Add(comboBox);
Content = layout;

```

#### Token customization

Token can be customized in the following ways:

- **TextColor** - Sets the color of the text inside the token.
- **FontSize** - Sets the size of the font inside the token.
- **FontFamily** - Sets the font family for the text inside the token.
- **BackgroundColor** - Sets the background color for token.
- **SelectedBackgroundColor** - Sets the background color of the token when it is selected.
- **IsCloseButtonVisible** - Enables and disables the close button inside the SfComboBox.
- **DeleteButtonColor** - Sets the color of the close button inside the SfComboBox.
- **CornerRadius** - Sets the corner radius for the token.
- **DeleteButtonPlacement** - sets the placement of delete button. **Left** and **Right** are the placement options. By default, it is set placed at right side of the token.

---

**Note:** CornerRadius support has enhanced only on iOS and Android platform.

---

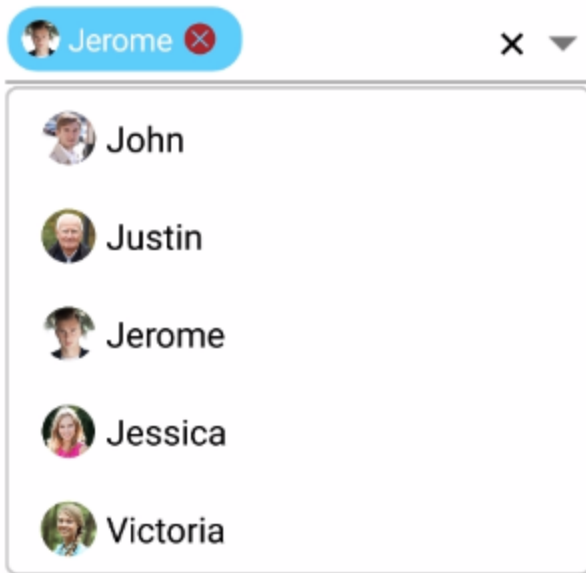

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

#### *Selection indicator*

The combobox enables the user to indicate the selected item from the datasource when selecting multiple items from the dropdown. It can be performed by enabling `EnableSelectionIndicator` property.

#### **XML**

```
<combobox:SfComboBox HeightRequest="40" ShowSuggestionsOnFocus="true"
IsSelectedItemsVisibleInDropDown="true" IndicatorText="A"
IndicatorFontFamily="sample.ttf" IndicatorTextSize="15"
IndicatorTextColor="Red" EnableSelectionIndicator="true"
MultiSelectMode="Token" x:Name="comboBox" DataSource="{Binding
EmployeeCollection}"/>
```

**C#**

```
comboBox.MultiSelectMode=MultiSelectMode.Token;
comboBox.ShowSuggestionsOnFocus=true;
comboBox.IsSelectedItemsVisibleInDropDown=true;
comboBox.IndicatorText= "A";
comboBox.IndicatorFontFamily= "sample.ttf";
comboBox.IndicatorTextSize= "15";
comboBox.IndicatorTextColor = Color.Red;
comboBox.EnableSelectionIndicator= true;
```

*Item padding*

The autocomplete enables the user to provide padding for the items inside dropdown using `ItemPadding` property.

**XML**

```
<combobox:SfComboBox ShowSuggestionsOnFocus="true" ItemPadding="20,10,0,0"
MultiSelectMode="Token" x:Name="comboBox" DataSource="{Binding
EmployeeCollection}"/>
```

**C#**

```
comboBox.MultiSelectMode=MultiSelectMode.Token;
comboBox.ShowSuggestionsOnFocus=true;
comboBox.ItemPadding= new Thickness(20,10,0,0);;
```

*No Results Found*

When the entered item is not in the suggestion list, SfComboBox displays a text that indicates no search results found. You can set the desire text to be displayed for indicating no results found using the [NoResultsFoundText](#) property.

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:ListCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
xmlns:combobox="clr-
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
xmlns:local="clr-namespace:ComboBox_Sample"
x:Class="ComboBox_Sample.MainPage">
<StackLayout Padding="0, 30, 0, 0">
<combobox:SfComboBox AllowFiltering="true"
IsEditableMode="true"
x:Name="comboBox"
HeightRequest="40"
```

```

NoResultsFoundText="Country not in the list"
MultiSelectMode="None">
<combobox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String> Great Britain </x:String>
<x:String> Uganda </x:String>
<x:String> Ukraine </x:String>
<x:String> Canada </x:String>
<x:String> France </x:String>
<x:String> Italy </x:String>
<x:String> United Kingdom </x:String>
<x:String> China </x:String>
<x:String> Japan </x:String>
</ListCollection:List>
</combobox:SfComboBox.ComboBoxSource>
</combobox:SfComboBox>
</StackLayout>
</ContentPage>

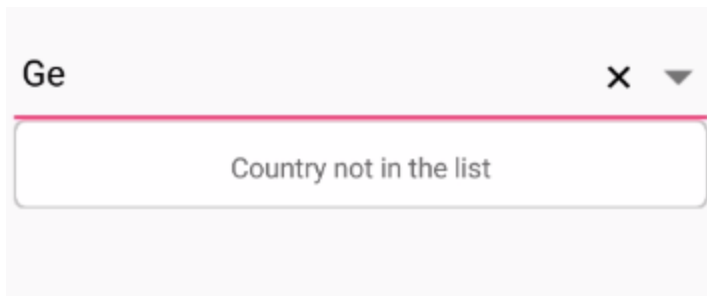

```

**C#**

```

using System;
using System.Collections.Generic;
using Xamarin.Forms;
using Syncfusion.XForms.ComboBox;
namespace ComboBox_Sample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            StackLayout mainLayout = new StackLayout() { Padding=new
            Thickness(0,30,0,0)};
            SfComboBox comboBox = new SfComboBox();
            comboBox.ComboBoxSource = new List<string>() { "Uganda", "Great Britain",
            "Ukraine", "Canada", "France", "Italy", "United Kingdom", "China", "Japan"
            };
            comboBox.IsEditableMode = true;
            comboBox.AllowFiltering = true;
            comboBox.HeightRequest = 40;
            comboBox.NoResultsFoundText = "Country not in the list";
            mainLayout.Children.Add(comboBox);
            this.Content = mainLayout;
        }
    }
}

```

### Customizing NoResultsFoundText

The `NoResultsFoundTextColor`, `NoResultsFoundFontSize`, `NoResultsFoundFontAttributes`, and `NoResultsFoundFontFamily` properties are used to customize the foreground color, font size, font attribute, and font family of `NoResultsFoundText`.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" NoResultsFoundText="Country not in the list"
    NoResultsFoundTextColor="DarkGreen" NoResultsFoundFontSize="20"
    NoResultsFoundFontAttributes="Bold" NoResultsFoundFontFamily="Pacifico.ttf"
  />
</StackLayout>
```

### C#

```
comboBox.NoResultsFoundText="Country not in the list";
comboBox.NoResultsFoundTextColor = Color.Blue;
comboBox.NoResultsFoundFontSize = 20;
comboBox.NoResultsFoundFontAttributes = FontAttributes.Bold;
comboBox.NoResultsFoundFontFamily = "Pacifico.ttf"
comboBox.ComboBoxSource = new List<string>() { "Uganda", "Great Britain",
"Ukraine", "Canada", "France", "Italy", "United Kingdom", "China", "Japan"
};
```

## Highlighting matched text

You can highlight matching characters in a suggestion list to pick an item with more clarity by following two ways:

- First Occurrence
- Multiple Occurrence

Highlighting can be indicated with various customizing styles by enabling the following properties.

- HighlightedTextColor - Sets the color of the highlighted text for differentiating the highlighted characters.
- HighlightTextFontAttributes - Sets the FontAttributes of the highlighted text.

### First occurrence

Highlights the first position of the matching characters in the suggestion list.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" AllowFiltering="true"
    TextHighlightMode="FirstOccurrence" HighlightedTextColor="Red"
    HighlightedTextFontAttributes="Bold" SuggestionMode="StartsWith">
    <combobox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Albania </x:String>
        <x:String> Algeria </x:String>
        <x:String> American Samoa </x:String>
        <x:String> Andorra </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.DataSource>
  </combobox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Albania");
countryNames.Add("Algeria");
countryNames.Add("American Samoa");
countryNames.Add("Andorra");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.SuggestionMode = SuggestionMode.StartsWith;
comboBox.TextHighlightMode = OccurrenceMode.FirstOccurrence;
```

```
comboBox.HighlightedTextColor = Color.Red;
comboBox.HighlightedTextFontAttributes = FontAttributes.Bold;
layout.Children.Add (comboBox);
Content = layout;
```

### Multiple occurrence

Highlights the matching characters that present everywhere in the suggestion list for Contains case in SuggestionMode.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <comboBox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" AllowFiltering="true"
    TextHighlightMode="MultipleOccurrence" HighlightedTextColor="Red"
    HighlightedTextFontAttributes="Bold" SuggestionMode="Contains">
    <comboBox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Albania </x:String>
        <x:String> Algeria </x:String>
        <x:String> American Samoa </x:String>
        <x:String> Andorra </x:String>
      </ListCollection:List>
    </comboBox:SfComboBox.DataSource>
  </comboBox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Albania");
countryNames.Add("Algeria");
countryNames.Add("American Samoa");
```

```
countryNames.Add("Andorra");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.SuggestionMode = SuggestionMode.Contains;
comboBox.TextHighlightMode = OccurrenceMode.MultipleOccurrence;
comboBox.HighlightedTextColor = Color.Red;
comboBox.HighlightedTextFontAttributes = FontAttributes.Bold;
layout.Children.Add(comboBox);
Content = layout;
```

## Header and Footer

You can provide header and footer views in the suggestion list in SfComboBox by enabling the `ShowDropDownHeaderView` and the `ShowDropDownFooterView` properties.

### Header content

You can provide Header content for header at the top of the ComboBox's Suggestion box. The `DropDownHeaderView` property is used to set the content of the header. The height of the header in the SfComboBox can be adjusted using the property `DropDownHeaderViewHeight` property.

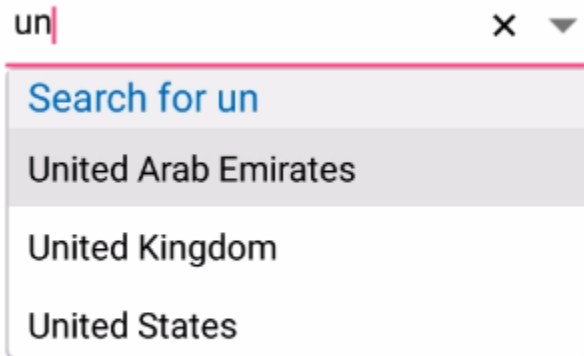

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" AllowFiltering="true">
    <combobox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.DataSource>
    <combobox:SfComboBox.DropDownHeaderView>
      <StackLayout BackgroundColor="#f0f0f0" >
        <Label x:Name="label2" FontSize="20" VerticalTextAlignment="Center"
          HorizontalOptions="Center" VerticalOptions="Center" TextColor="#006bcd" />
      </StackLayout>
    </combobox:SfComboBox.DropDownHeaderView>
  </combobox:SfComboBox>
</StackLayout>
```

```
</StackLayout>
</combobox:SfComboBox.DropDownHeaderView>
</combobox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.ShowDropDownHeaderView = true;
//Set the height of the Header View
comboBox.DropDownHeaderViewHeight = 50;
comboBox.ValueChanged += (object sender,
    Syncfusion.XForms.ComboBox.ValueChangedEventArgs e) =>
{
    label2.Text = "Search for " + e.Value;
}
layout.Children.Add(comboBox);
Content = layout;
```

### Footer Content

You can provide content for footer at the bottom of the ComboBox's Suggestion box. The `DropDownFooterView` property is used to set the content for footer. The height of the Header in the SfComboBox can be adjusted using the `DropDownFooterViewHeight` property.

The following code example shows how to set Footer content in SfComboBox.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
  IsEditableMode="true" AllowFiltering="true">
    <combobox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.DataSource>
    <combobox:SfComboBox.DropDownFooterView>
      <StackLayout BackgroundColor="#f0f0f0" >
        <Label Text="Add New" BackgroundColor="#f0f0f0" TextColor="#006bcd"
        VerticalTextAlignment="Center" VerticalOptions="Center"
        HorizontalTextAlignment="Center" FontSize="20"/>
      </StackLayout>
    </combobox:SfComboBox.DropDownFooterView>
  </combobox:SfComboBox>
</StackLayout>
```

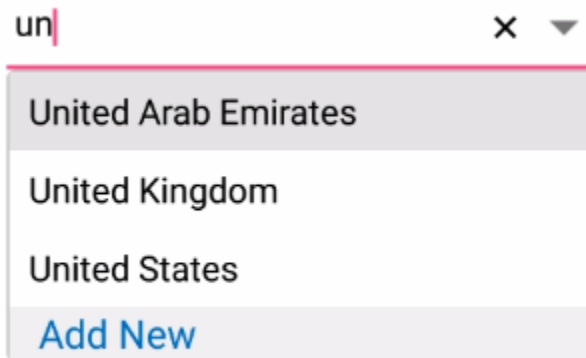

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.ShowDropDownFooterView = true;
StackLayout customFooterView = new StackLayout();
Label label = new Label()
{
    Text = "Add New",
    BackgroundColor = Color.FromHex("#f0f0f0"),
```

```

TextColor = Color.FromHex("#006bcd"),
VerticalOptions = LayoutOptions.Center,
VerticalTextAlignment = TextAlignment.Center,
HorizontalTextAlignment = TextAlignment.Center,
FontSize = 20
};
customFooterView.Children.Add(label);
comboBox.DropDownFooterView = customFooterView;
layout.Children.Add(comboBox);
Content = layout;

```

### ComboBox modes

The combo box control supports both editable and non-editable text box to choose selected items in given data source. Users can select one item from the suggestion list.

**IsEditableMode** property is used to enable the user input in SfComboBox control. The default value is false.

#### Editable combo box

In editable mode, the combo box allows users to edit in the text box that shows the suggestions in drop-down list based on the input.

#### XML

```

<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true">
    <combobox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.DataSource>
  </combobox:SfComboBox>
</StackLayout>

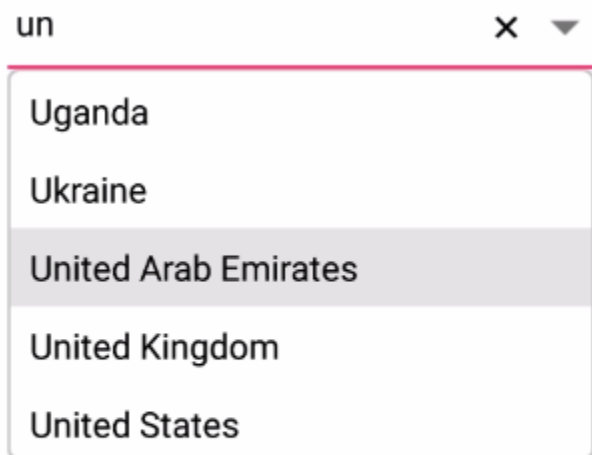

```

**C#**

```

StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
layout.Children.Add(comboBox);
Content = layout;

```

**Non-Editable combo box**

Non-editable mode prevents users from typing and allows them to select from drop-down list.

**XML**

```

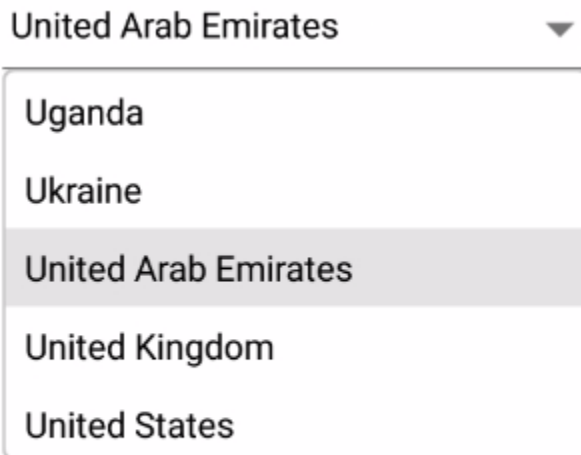

<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="false">
    <combobox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.DataSource>
  </combobox:SfComboBox>
</StackLayout>

```

```
<x:String> United States </x:String>
</ListCollection:List>
</comboBox:SfComboBox.DataSource>
</comboBox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = false;
layout.Children.Add(comboBox);
Content = layout;
```

## Dealing with suggestion box

Suggestion box is a drop-down list box which displays the filtered suggestions inside a popup. This section explains the properties that deals with the drop-down list in SfComboBox control.

### Suggestion box placement mode

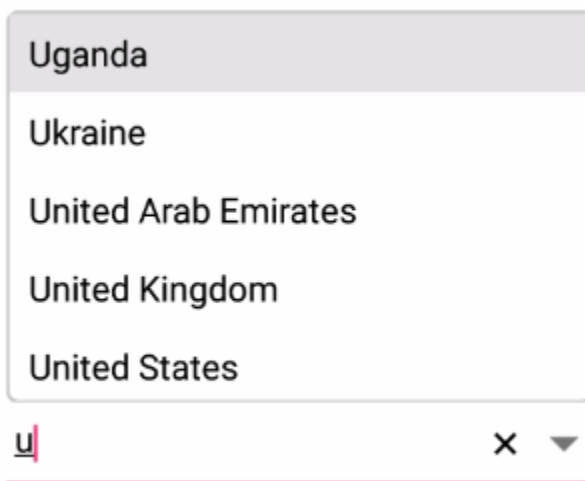

Suggestion Box can be placed either at the top or bottom using the **SuggestionBoxPlacement** property. By default, it is placed at the bottom.

**XML**

```
<StackLayout VerticalOptions="Center" HorizontalOptions="Center"
Padding="30">
<comboBox:SfComboBox HeightRequest="40" SuggestionBoxPlacement="Top"
x:Name="comboBox">
<comboBox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String> Uganda </x:String>
<x:String> Ukraine </x:String>
<x:String> United Arab Emirates </x:String>
<x:String> United Kingdom </x:String>
<x:String> United States </x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
```

**C#**

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.ComboBoxSource = countryNames;
comboBox.SuggestionBoxPlacement = SuggestionBoxPlacement.Top;
layout.Children.Add(comboBox);
Content = layout;
```

### Maximum suggestion box height

The maximum height of the suggestion box in the SfComboBox control can be varied using the `MaximumDropDownHeight` property.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    MaximumDropDownHeight="100">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Great Britain </x:String>
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> Canada </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> France </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> China </x:String>
        <x:String> United States </x:String>
        <x:String> Japan </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Great Britain");
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("Canada");
countryNames.Add("United Arab Emirates");
countryNames.Add("France");
countryNames.Add("United Kingdom");
countryNames.Add("China");
countryNames.Add("United States");
countryNames.Add("Japan");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.ComboBoxSource = countryNames;
comboBox.MaximumDropDownHeight = 100;
layout.Children.Add(comboBox);
Content = layout;
```

### Opening suggestion box on focus

Suggestion Box can be shown whenever control receives focus using the `ShowSuggestionsOnFocus` property. Suggestion list is the complete list of data source.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    ShowSuggestionsOnFocus="true">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Great Britain </x:String>
        <x:String> Canada </x:String>
        <x:String> France </x:String>
        <x:String> China </x:String>
        <x:String> Japan </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Great Britain");
countryNames.Add("Canada");
countryNames.Add("France");
countryNames.Add("China");
countryNames.Add("Japan");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.ComboBoxSource = countryNames;
comboBox.ShowSuggestionsOnFocus = true;
comboBox.IsEditableMode = true;
comboBox.SelectionChanged += (sender, e) =>
{
    DisplayAlert("Selection Changed", "Selected Value: " +
        comboBox.SelectedValue.ToString(), "OK");
};
```

```
layout.Children.Add(comboBox);
Content = layout;
```

#### Delay opening suggestion box

The **PopupDelay** property is used to delay the suggestion box opening process. It gets milliseconds as input in integer data type.

In this example, a time duration of 3 seconds is set to popup delay.

#### XML

```
<StackLayout VerticalOptions="StartAndExpand"
HorizontalOptions="StartAndExpand" Padding="30">
<comboBox:SfComboBox HeightRequest="40" x:Name="comboBox" PopupDelay="3000">
<comboBox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String> Uganda </x:String>
<x:String> Ukraine </x:String>
<x:String> United Arab Emirates </x:String>
<x:String> United Kingdom </x:String>
<x:String> United States </x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
```

```
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.ComboBoxSource = countryNames;
comboBox.PopupDelay = 3000;
layout.Children.Add(comboBox);
Content = layout;
```

### Delay before searching algorithm starts

The **SearchDelay** property is used to delay the searching algorithm process. It gets milliseconds as input in integer data type.

In this example, a time duration of 3 seconds is set to search delay.

### XML

```
<StackLayout VerticalOptions="StartAndExpand"
HorizontalOptions="StartAndExpand" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
SearchDelay="3000">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.ComboBoxSource = countryNames;
comboBox.SearchDelay = 3000;
layout.Children.Add(comboBox);
Content = layout;
```

### Avoid opening suggestion box

APIs are available to avoid pop-ups and retrieve filtered suggestion items that help you arrange lists or items control.

#### XML

```
<StackLayout VerticalOptions="StartAndExpand"
HorizontalOptions="StartAndExpand" Padding="30">
  <comboBox:SfComboBox HeightRequest="40" x:Name="comboBox"
  SuggestionBoxPlacement="None">
    <comboBox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </comboBox:SfComboBox.ComboBoxSource>
  </comboBox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.SuggestionBoxPlacement = SuggestionBoxPlacement.None;
comboBox.ComboBoxSource = countryNames;
layout.Children.Add(comboBox);
Content = layout;
```

### Customizing ComboBox

The combo box control provides user friendly customizing options for both entry part and drop-down part. In this section, customizing the entire ComboBox control is explained.

#### Customizing the entry

The [TextColor](#), [TextSize](#), [FontAttributes](#), [FontFamily](#) and [BorderColor](#) properties are used to customize the foreground color, font size, font attribute, font family and border color of the entry part.

##### Text color

The combo box control provides the user to customize the foreground color of the text inside the entry part.

*Text size*

The combo box control provides the user to customize the text size of the text inside the entry part using [TextSize](#) property.

*Font attributes*

The combo box control provides the user to customize the font attribute of the text inside the entry part using [FontAttributes](#) property.

*Font family*

The combo box control provides the user to customize the font family of the text inside the entry part using [FontFamily](#) property.

*Border color*

The combo box control provides the user to customize the border color of the entry box using [BorderColor](#) property.

**XML**

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <comboBox:SfComboBox HeightRequest="45" x:Name="comboBox" Text="Sample text"
    FontAttributes="Bold" TextColor="#1976d2" TextSize="20"
    BorderColor="#1976d2"/>
</StackLayout>
```

**C#**

```
StackLayout stackLayout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
SfComboBox comboBox = new SfComboBox()
{
    HeightRequest = 45,
    Text = "Sample text",
    TextColor = Color.FromHex("1976d2"),
    TextSize = 20,
    BorderColor = Color.FromHex("1976d2")
    FontAttributes = FontAttributes.Bold
};
stackLayout.Children.Add(comboBox);
this.Content = stackLayout;
```

Sample text

*Changing delete button color*

The [ClearButtonColor](#) property is used to modify the delete button color. The following code example shows changing delete button color.

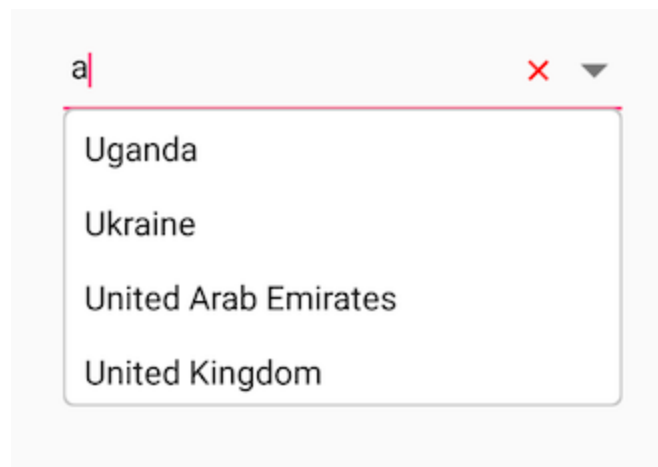

**XML**

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
```

```
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
IsEditableMode="True" ClearButtonColor="Red">
<combobox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>United Kingdom</x:String>
</ListCollection:List>
</combobox:SfComboBox.ComboBoxSource>
</combobox:SfComboBox>
</StackLayout>
```

**C#**

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.ClearButtonColor = Color.Yellow;
comboBox.IsEditableMode = true;
layout.Children.Add(comboBox);
Content = layout;
```

*Changing delete button visibility*

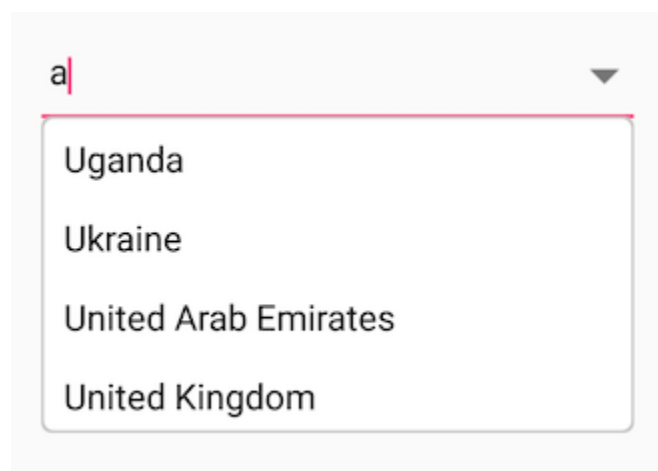

The [ShowClearButton](#) property is used to modify the visibility of delete button. The following code example shows changing delete button visibility.

**XML**

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
IsEditableMode="True" IsEditableMode="True" ShowClearButton="False">
<combobox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>United Kingdom</x:String>
</ListCollection:List>
</combobox:SfComboBox.ComboBoxSource>
</combobox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.ShowClearButton = false;
comboBox.IsEditableMode = true;
layout.Children.Add(comboBox);
Content = layout;
```

### Changing border visibility

The [ShowBorder](#) property is used to modify the visibility of border. The following code example shows changing border visibility.

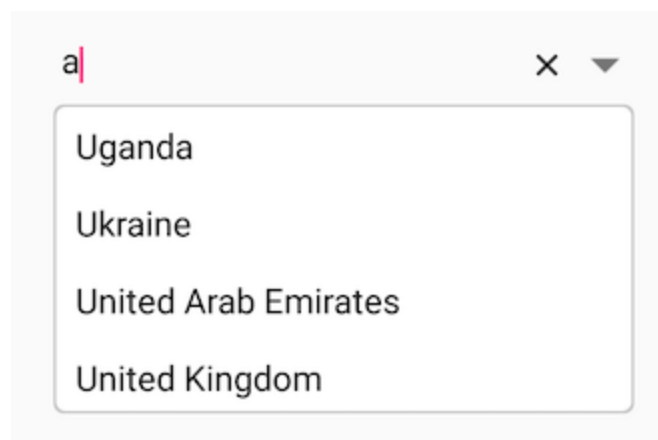

**XML**

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<comboBox:SfComboBox HeightRequest="40" x:Name="comboBox"
IsEditableMode="True" IsEditableMode="True" ShowBorder="False">
<comboBox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>United Kingdom</x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
```

**C#**

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.ShowBorder = false;
comboBox.IsEditableMode = true;
layout.Children.Add(comboBox);
Content = layout;
```

**CustomView for ComboBox**

CustomView property has used to provide the custom view instead of entry in ComboBox. It's default height and width has control height and width.

**XML**

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox">
    <combobox:SfComboBox.CustomView>
      <Label x:Name="customLabel" HeightRequest="40" Text="ComboBox"
        VerticalTextAlignment="Center"/>
    </combobox:SfComboBox.CustomView>
  </combobox:SfComboBox>
</StackLayout>
```

**C#**

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
Label customLabel = new Label();
customLabel.HeightRequest = 40;
customLabel.VerticalTextAlignment = TextAlignment.Center;
customLabel.Text = "ComboBox";
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.SuggestionBoxPlacement = SuggestionBoxPlacement.Top;
comboBox.CustomView = customLabel;
layout.Children.Add(comboBox);
Content = layout;
```

ComboBox

**Custom template for suggestion items**

The **ItemTemplate** property helps to decorate suggestion items with custom templates. The following code explains the steps to add an image to the suggestion list item.

**C#**

```
public class Person
{
    private int age;
    public int Age
    {
        get { return age; }
        set { age = value; }
    }
    private string name;
    public string Name
    {
        get { return name; }
        set { name = value; }
    }
}
```

```

}
public class PersonViewModel
{
    private ObservableCollection<Person> personCollection;
    public ObservableCollection<Person> PersonCollection
    {
        get { return personCollection; }
        set { personCollection = value; }
    }
    public PersonViewModel()
    {
        personCollection = new ObservableCollection<Person>();
        personCollection.Add(new Person() { Age = 21, Name = "Aldan" });
        personCollection.Add(new Person() { Age = 25, Name = "Clara" });
        personCollection.Add(new Person() { Age = 23, Name = "Aldrin" });
        personCollection.Add(new Person() { Age = 25, Name = "Mark" });
        personCollection.Add(new Person() { Age = 25, Name = "Lucas" });
        personCollection.Add(new Person() { Age = 24, Name = "Alan" });
        personCollection.Add(new Person() { Age = 25, Name = "James" });
        personCollection.Add(new Person() { Age = 22, Name = "Aaron" });
    }
}

```

Now populate this PersonViewModel data in SfComboBox control by binding with `[DataSource]` property.

#### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:combobox="clr-
namespace:Syncfusion.XForms.ComboBox;assembly=Syncfusion.SfComboBox.XForms"
xmlns:local="clr-namespace:NamespaceName"
x:Class="NamespaceName.ClassName">
<ContentPage.BindingContext>
<local:PersonViewModel/>
</ContentPage.BindingContext>
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
DisplayMemberPath="Name" DataSource="{Binding PersonCollection}">
<combobox:SfComboBox.ItemTemplate>
<DataTemplate>
<StackLayout Orientation="Horizontal">
<Image Source="User.png" WidthRequest="12"/>
<Label Text="{Binding Name}" />
</StackLayout>
</DataTemplate>
</combobox:SfComboBox.ItemTemplate>
</combobox:SfComboBox>
</StackLayout>
</ContentPage>

```

#### C#

```

DataTemplate itemTemplate = new DataTemplate(() =>
{

```

```

StackLayout stack;
Image image;
Label label;
stack = new StackLayout();
stack.Orientation = StackOrientation.Horizontal;
image = new Image();
image.Source = (FileImageSource)ImageSource.FromFile("User.png");
label = new Label();
label.SetBinding(Label.TextProperty, "Name");
stack.Children.Add(image);
stack.Children.Add(label);
return new ViewCell { View = stack };
});
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
SfComboBox comboBox = new ComboBox();
comboBox.HeightRequest = 40;
comboBox.BindingContext = new PersonViewModel();
Binding binding = new Binding("PersonCollection");
binding.Source = this;
binding.Mode = BindingMode.TwoWay;
comboBox.SetBinding(Label.DataSourceProperty, binding);
comboBox.ItemTemplate = itemTemplate;
layout.Children.Add(comboBox);
Content = layout;

```

### Customizing the suggestion box

#### Changing suggestion item height

The [DropDownItemHeight](#) property is used to modify the height of suggestion items in drop-down list. The following code example shows changing suggestion item height.

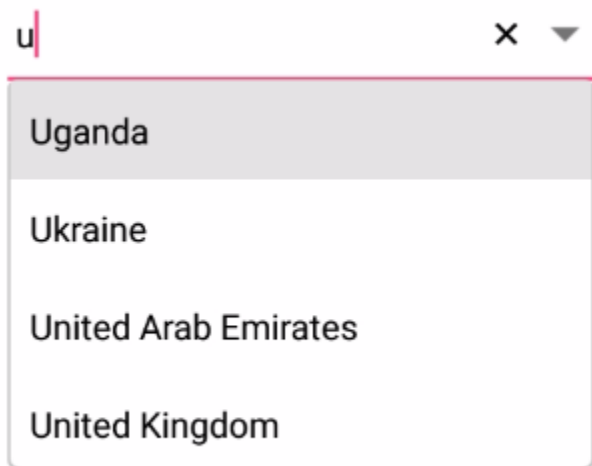

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
```

```
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
DropDownItemHeight="50">
<combobox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String> Uganda </x:String>
<x:String> Ukraine </x:String>
<x:String> United Arab Emirates </x:String>
<x:String> United Kingdom </x:String>
</ListCollection:List>
</combobox:SfComboBox.ComboBoxSource>
</combobox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.DropDownItemHeight = 50;
layout.Children.Add(comboBox);
Content = layout;
```

### *Changing suggestion box width*

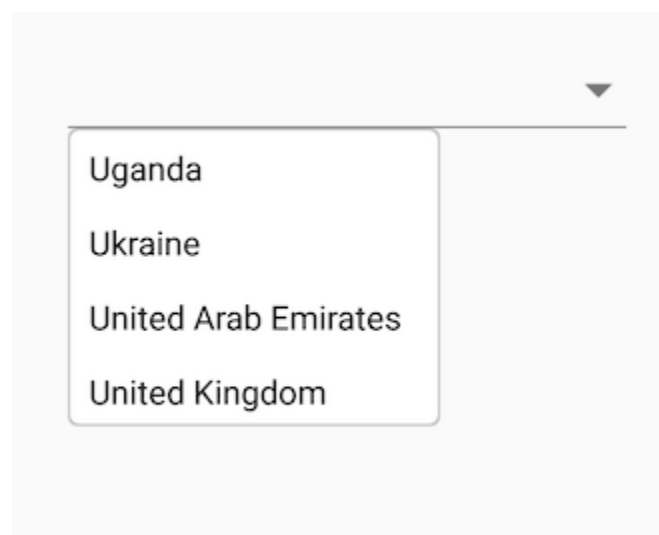

The [DropDownWidth](#) property is used to modify the width of suggestion box. The following code example shows changing suggestion box width.

## XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<comboBox:SfComboBox HeightRequest="40" x:Name="comboBox"
DropDownWidth="300">
<comboBox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String>Uganda</x:String>
<x:String>Ukraine</x:String>
<x:String>United Arab Emirates</x:String>
<x:String>United Kingdom</x:String>
</ListCollection:List>
</comboBox:SfComboBox.ComboBoxSource>
</comboBox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.DropDownWidth = 300;
layout.Children.Add(comboBox);
Content = layout;
```

### Changing suggestion box corner radius

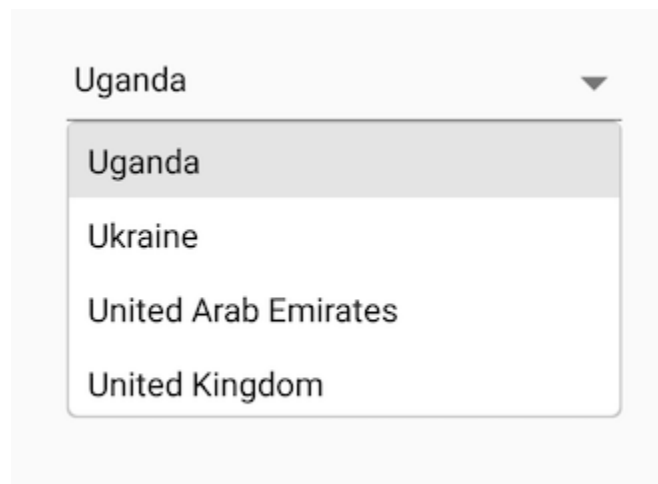

The [DropDownCornerRadius](#) property is used to modify the corner radius of suggestion box. The following code example shows changing suggestion box corner radius.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    DropDownCornerRadius="3">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String>Uganda</x:String>
        <x:String>Ukraine</x:String>
        <x:String>United Arab Emirates</x:String>
        <x:String>United Kingdom</x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.DropDownCornerRadius = 3;
layout.Children.Add(comboBox);
Content = layout;
```

*Changing suggestion box background color*

The [DropDownBackgroundColor](#) property is used to modify the background color of suggestion box. The following code example shows changing suggestion box background color.

**XML**

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    DropDownBackgroundColor="Yellow">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String>Uganda</x:String>
        <x:String>Ukraine</x:String>
        <x:String>United Arab Emirates</x:String>
        <x:String>United Kingdom</x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

**C#**

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.DropDownBackgroundColor = Color.Yellow;
layout.Children.Add(comboBox);
Content = layout;
```

#### *Changing the border color of suggestion box*

The `DropDownBorderColor` property is used to change the border color of suggestion box. The following code example demonstrates how to change the border color of suggestion box.

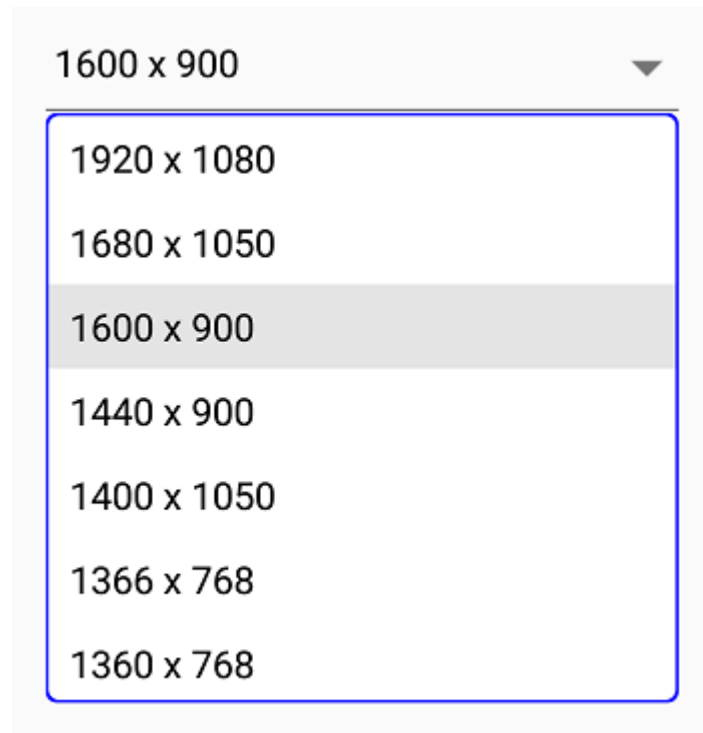

#### **XML**

```
<StackLayout>
  <comboBox:SfComboBox HeightRequest="40" DropDownBorderColor="Blue">
    <comboBox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String>1920 x 1080</x:String>
        <x:String>1680 x 1050</x:String>
        <x:String>1600 x 900</x:String>
        <x:String>1440 x 900</x:String>
        <x:String>1400 x 1050</x:String>
        <x:String>1366 x 768</x:String>
        <x:String>1360 x 768</x:String>
        <x:String>1280 x 1024</x:String>
        <x:String>1280 x 960</x:String>
        <x:String>1280 x 720</x:String>
        <x:String>854 x 480</x:String>
        <x:String>800 x 480</x:String>
        <x:String>480 x 640</x:String>
        <x:String>480 x 320</x:String>
        <x:String>432 x 240</x:String>
        <x:String>360 x 640</x:String>
        <x:String>320 x 240</x:String>
      </ListCollection:List>
    </comboBox:SfComboBox.ComboBoxSource>
  </comboBox:SfComboBox>
</StackLayout>
```

#### **C#**

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
}
```

```
};  
List<String> resolutionList = new List<String>();  
resolutionList.Add("1920 x 1080");  
resolutionList.Add("1680 x 1050");  
resolutionList.Add("1600 x 900");  
resolutionList.Add("1440 x 900");  
resolutionList.Add("1400 x 1050");  
resolutionList.Add("1366 x 768");  
resolutionList.Add("1360 x 768");  
resolutionList.Add("1280 x 1024");  
resolutionList.Add("1280 x 960");  
resolutionList.Add("1280 x 720");  
resolutionList.Add("854 x 480");  
resolutionList.Add("800 x 480");  
resolutionList.Add("480 x 640");  
resolutionList.Add("480 x 320");  
resolutionList.Add("432 x 240");  
resolutionList.Add("360 x 640");  
resolutionList.Add("320 x 240");  
SfComboBox comboBox = new SfComboBox();  
comboBox.HeightRequest = 40;  
comboBox.ComboBoxSource = resolutionList;  
comboBox.DropDownBorderColor = Color.Blue;  
layout.Children.Add(comboBox);  
Content = layout;
```

#### *Customizing suggestion items*

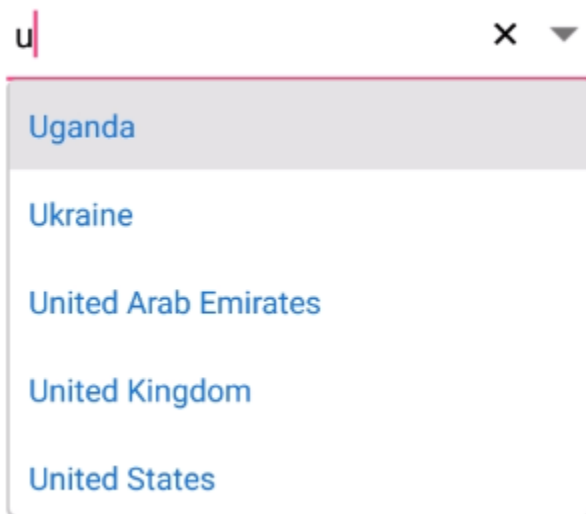

Suggestion box items can be customized using the [DropDownItemFontAttributes](#), [DropDownItemFontFamily](#), [DropDownTextSize](#) and [DropDownTextColor](#) properties.

#### **XML**

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
DropDownTextSize="16" DropDownTextColor="#1976d2">
<combobox:SfComboBox.ComboBoxSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String> Uganda </x:String>
<x:String> Ukraine </x:String>
<x:String> United Arab Emirates </x:String>
<x:String> United Kingdom </x:String>
<x:String> United States </x:String>
</ListCollection:List>
</combobox:SfComboBox.ComboBoxSource>
</combobox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.DropDownTextColor = Color.FromHex("#1976d2");
comboBox.DropDownTextSize = 16;
layout.Children.Add(comboBox);
Content = layout;
```

### Changing selected item color in suggestion box

The [SelectedDropDownItemColor](#) property is used to modify text color of selected item in drop down. The following code example shows changing the selected item text color in drop down.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    SelectedDropDownItemColor="Blue">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String>Uganda</x:String>
        <x:String>Ukraine</x:String>
        <x:String>United Arab Emirates</x:String>
        <x:String>United Kingdom</x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
comboBox.SelectedDropDownItemColor = Color.Blue;
layout.Children.Add(comboBox);
Content = layout;
```

## DropDown button customization

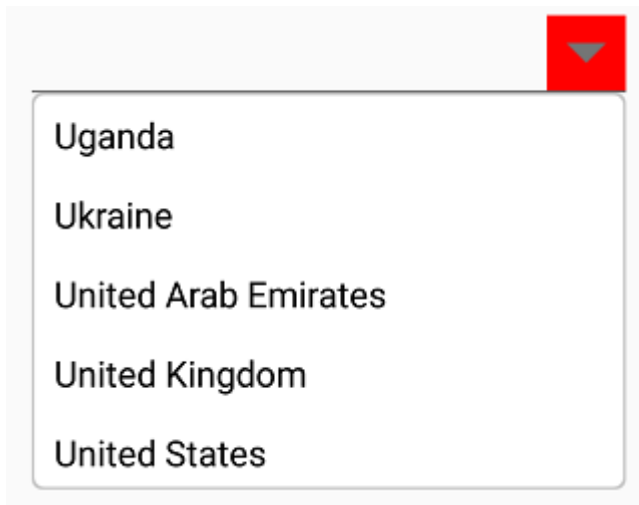

This section explains various DropDown button settings available in SfComboBox control.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox">
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
    <combobox:SfComboBox.DropDownButtonSettings>
      <combobox:DropDownButtonSettings Width="40" Height="40"
        HighlightedBackgroundColor="Green" BackgroundColor="Red"
        HighlightFontColor="Red"/>
    </combobox:SfComboBox.DropDownButtonSettings>
  </combobox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
DropDownButtonSettings dropDownButtonSettings = new
DropDownButtonSettings();
dropDownButtonSettings.Height = 40;
dropDownButtonSettings.Width = 40;
dropDownButtonSettings.HighlightedBackgroundColor = Color.Green;
dropDownButtonSettings.BackgroundColor = Color.Red;
dropDownButtonSettings.HighlightFontColor = Color.Red;
comboBox.DropDownButtonSettings = dropDownButtonSettings;
layout.Children.Add(comboBox);
Content = layout;
```

[View for drop down button](#)

This section explains how to provide view to the drop down button.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <comboBox:SfComboBox HeightRequest="40" x:Name="comboBox">
    <comboBox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String>Uganda</x:String>
        <x:String>Ukraine</x:String>
        <x:String>United Arab Emirates</x:String>
        <x:String>United Kingdom</x:String>
        <x:String>United States</x:String>
      </ListCollection:List>
    </comboBox:SfComboBox.ComboBoxSource>
    <comboBox:SfComboBox.DropDownButtonSettings>
      <comboBox:DropDownButtonSettings Width="40" Height="40">
        <comboBox:DropDownButtonSettings.View>
          <Label WidthRequest="30" Text="Click" HorizontalTextAlignment="Center"
            VerticalTextAlignment="Center"/>
        </comboBox:DropDownButtonSettings.View>
      </comboBox:DropDownButtonSettings>
    </comboBox:SfComboBox.DropDownButtonSettings>
  </comboBox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
```

```
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.DataSource = countryNames;
DropDownButtonSettings dropDownButtonSettings = new
DropDownButtonSettings();
dropDownButtonSettings.Height = 40;
dropDownButtonSettings.Width = 40;
Label label = new Label();
label.Text = "Click";
label.VerticalTextAlignment = TextAlignment.Center;
label.HorizontalTextAlignment = TextAlignment.Center;
label.WidthRequest = 30;
dropDownButtonSettings.View = label;
comboBox.DropDownButtonSettings = dropDownButtonSettings;
layout.Children.Add(comboBox);
Content = layout;
```

### Watermark

Watermark provides a short note about the type of input to enter in the editor control. Watermarks are visible only if the text is empty. It will reappear if the text is cleared. The following example, explains the usability of watermark that hints users to start with the character “U”.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <comboBox:SfComboBox HeightRequest="40" Watermark="Enter 'U' to filter
  suggestions" x:Name="comboBox" />
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
```

```
SfComboBox comboBox = new SfComboBox();
comboBox.Watermark = "Enter 'U' to filter suggestions";
layout.Children.Add(comboBox);
Content = layout;
```

Enter 'U' to filter suggestions ▼

### Changing Watermark Text Color

Text color of watermark can be customized using [WatermarkColor](#) property.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" Watermark="Enter some text"
WatermarkColor="#1976d2" x:Name="comboBox" />
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
SfComboBox comboBox = new SfComboBox();
comboBox.Watermark = "Enter some text";
comboBox.WatermarkColor = Color.FromHex("1976d2");
layout.Children.Add(comboBox);
Content = layout;
```

Enter some text ▼

### Filtering

The combo box enables the filter option for filtering the suggestions in the drop-down.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
<combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
IsEditableMode="true" AllowFiltering="true" MaximumDropDownHeight="150">
<combobox:SfComboBox.DataSource>
<ListCollection:List x:TypeArguments="x:String">
<x:String> Afghanistan </x:String>
<x:String> Albania </x:String>
<x:String> Algeria</x:String>
<x:String> American Samoa </x:String>
<x:String> Andorra </x:String>
<x:String> Angola </x:String>
```

```
<x:String> Anguilla</x:String>
<x:String> Antarctica </x:String>
<x:String> Antigua and Barbuda </x:String>
<x:String> Argentina </x:String>
</ListCollection:List>
</comboBox:SfComboBox.DataSource>
</comboBox:SfComboBox>
</StackLayout>
```

## C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Afghanistan");
countryNames.Add("Albania");
countryNames.Add("Algeria");
countryNames.Add("American Samoa");
countryNames.Add("Andorra");
countryNames.Add("Angola");
countryNames.Add("Anguilla");
countryNames.Add("Antarctica");
countryNames.Add("Antigua and Barbuda");
countryNames.Add("Argentina");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
layout.Children.Add(comboBox);
Content = layout;
```

### Filtering types

The string comparison for filtering suggestions can be changed using the `SuggestionMode` property. The default filtering type is “StartsWith”, and it is case insensitive. The available filtering modes are,

- StartsWith
- StartsWithCaseSensitive
- Contains
- ContainsWithCaseSensitive
- Equals
- EqualsWithCaseSensitive
- EndsWith
- EndsWithCaseSensitive
- Custom

### Filtering words that starts with input text

Displays all the matches that start with the typed characters in control. This strategy is case in-sensitive.

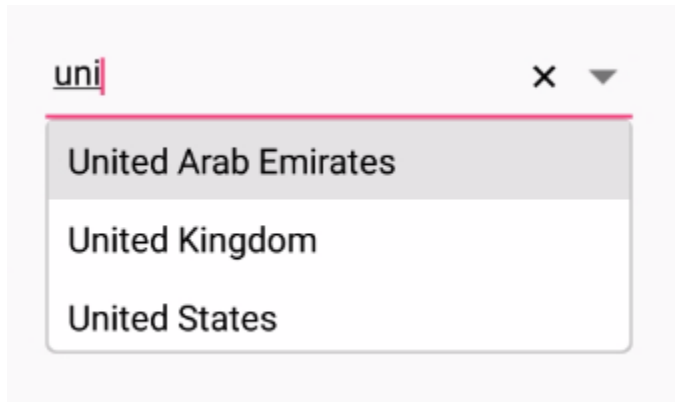

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <comboBox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" AllowFiltering="true" SuggestionMode="StartsWith">
    <comboBox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> UUnited Arab Emirates</x:String>
        <x:String> United Kingdom</x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </comboBox:SfComboBox.DataSource>
  </comboBox:SfComboBox>
</StackLayout>
```

#### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.SuggestionMode = SuggestionMode.StartsWith;
```

```
layout.Children.Add(comboBox);
Content = layout;
```

Filtering words that starts with input text - case sensitive

Displays all the matches that start with the typed characters in control. This strategy is case sensitive.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <comboBox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" AllowFiltering="true"
    SuggestionMode="StartsWithCaseSensitive">
    <comboBox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates</x:String>
        <x:String> United Kingdom</x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </comboBox:SfComboBox.DataSource>
  </comboBox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");

};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.SuggestionMode = SuggestionMode.EndsWithCaseSensitive;
layout.Children.Add(comboBox);
Content = layout;

```

## ComboBox modes

The combo box provides three different ways to display the filtered suggestions. They are

- Suggest - Displays suggestions in drop-down list
- Append - Appends the first suggestion to text
- SuggestAppend - Both suggests and appends.

The `ComboBoxMode` property is used to choose the suggestion display mode in SfComboBox control. The default value is Suggest.

#### Suggesting choices in List

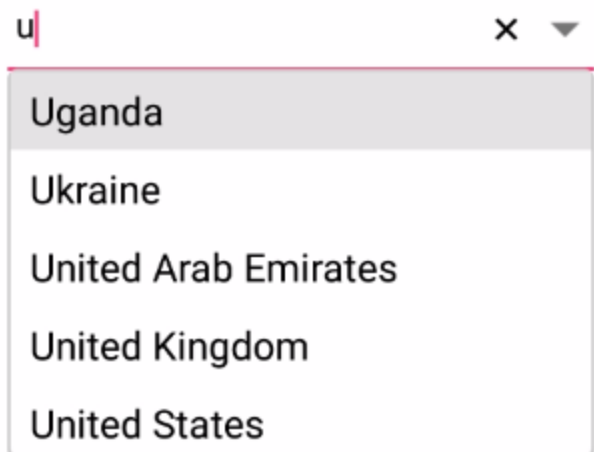

The filtered suggestions are displayed in a drop-down list. User can pick an item from the list.

#### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"

};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.ComboBoxMode = ComboBoxMode.Suggest;
layout.Children.Add(comboBox);
Content = layout;
```

### Appending suggestions to text

The first item in filtered suggestions is appended to SfComboBox text. In this mode, drop down remains closed.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" AllowFiltering="true" ComboBoxMode="Append">
    <combobox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.DataSource>
  </combobox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
```

```
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.ComboBoxMode = ComboBoxMode.Append;
layout.Children.Add(comboBox);
Content = layout;
```

### Suggesting choices and appending suggestions to text

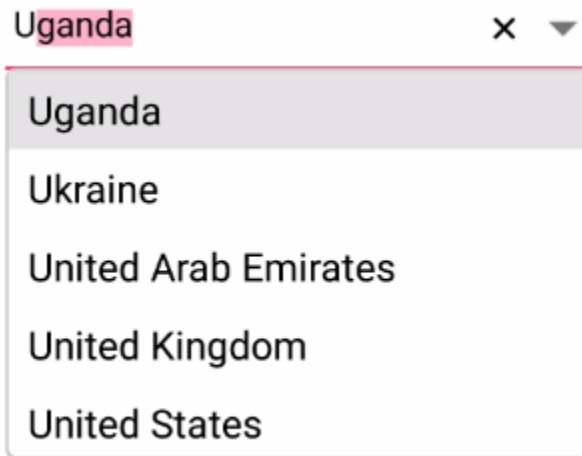

The text is appended to the first matched item in the suggestions collection, and filtered suggestions are displayed in a drop-down list. Users can pick an item from a list directly or use up and down keys for browsing the list.

### XML

```
<StackLayout VerticalOptions="Start" HorizontalOptions="Start" Padding="30">
  <combobox:SfComboBox HeightRequest="40" x:Name="comboBox"
    IsEditableMode="true" AllowFiltering="true" ComboBoxMode="SuggestAppend">
    <combobox:SfComboBox.DataSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Uganda </x:String>
        <x:String> Ukraine </x:String>
        <x:String> United Arab Emirates </x:String>
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.DataSource>
  </combobox:SfComboBox>
</StackLayout>
```

### C#

```
StackLayout layout = new StackLayout()
{
    VerticalOptions = LayoutOptions.Start,
    HorizontalOptions = LayoutOptions.Start,
    Padding = new Thickness(30)
};
List<String> countryNames = new List<String>();
countryNames.Add("Uganda");
countryNames.Add("Ukraine");
countryNames.Add("United Arab Emirates");
countryNames.Add("United Kingdom");
countryNames.Add("United States");
SfComboBox comboBox = new SfComboBox();
comboBox.HeightRequest = 40;
comboBox.DataSource = countryNames;
comboBox.IsEditableMode = true;
comboBox.AllowFiltering = true;
comboBox.ComboBoxMode = ComboBoxMode.SuggestAppend;
layout.Children.Add(comboBox);
Content = layout;
```

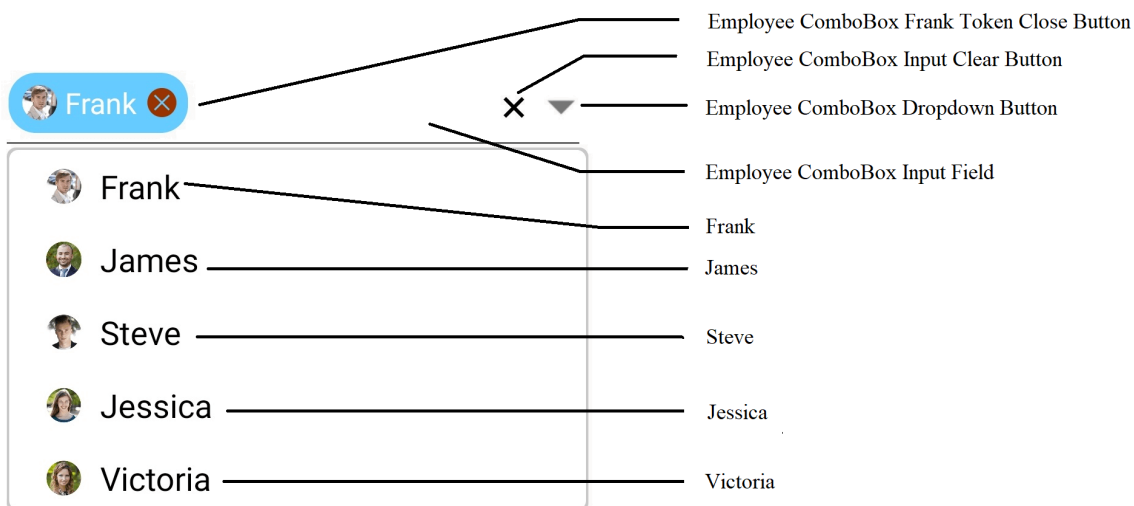

### AutomationId

The SfComboBox control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the SfComboBox control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's **AutomationId**.

For example, If you set SfComboBox's **AutomationId** as "Employee ComboBox", then the automation framework will interact with the drop-down button as "Employee ComboBox Dropdown Button".

The following screenshot illustrates the AutomationIds of inner elements. The automation framework will interact with the dropdown for scrolling the items as "Employee ComboBox Dropdown". You can also interact with the elements inside the HeaderView and FooterView with the element's AutomationId. The Automation framework will not interact with the Input Clear Button when the **MultiSelectMode** is None and Delimiter mode.

## SfDataForm

### SfDataForm

The SfDataForm control helps editing the data fields of any data object. It can be used to develop various forms such as login, reservation, data entry, etc. Key features includes the following:

- Layout and grouping: Supports to linear, grid layout and floating label layout with grouping support. Supports customizing the layout with different heights for each item.
- Caption customization: Supports loading the image as caption for the editor.
- Editors: Built-in support for text, numeric, numeric up-down, picker, date picker, time picker, switch, drop-down, autoComplete and checkbox editors.
- Custom editor: Supports loading the custom editors.
- Validation: Built-in support to validate the data based on the [INotifyDataErrorInfo](#) and data annotations. It also programmatically supports validation handling.

### Getting started

This section explains the quick overview to use the [SfDataForm](#) for Xamarin.Forms in your application.

#### Assembly deployment

After installing Essential Studio for Xamarin, you can find all the required assemblies in the installation folders, {Syncfusion Essential Studio Installed location} \Essential Studio\16.x.x.x\Xamarin\lib

Eg: C:\Program Files (x86) \Syncfusion\Essential Studio\16.1.0.24\Xamarin\lib

---

**Note:** Assemblies can be found in unzipped package location in Mac.

---

#### Adding SfDataForm reference

You can add SfDataForm reference using one of the following methods:

##### Method 1: Adding SfDataForm reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](#). To add SfDataForm to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfDataForm](#), and then install it.

![Adding SfDataForm reference from NuGet](SfDataForm\_images/Adding SfDataForm reference.png)

---

**Note:** Install the same version of SfDataForm NuGet in all the projects.

---

##### Method 2: Adding SfDataForm reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfDataForm control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

##### Method 3: Adding SfDataForm assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfDataForm.XForms.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.SfComboBox.XForms.dll
-----	---

	Syncfusion.SfAutoComplete.XForms.dll Syncfusion.Buttons.XForms.dll Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll System.ComponentModel.Annotations
Android	Syncfusion.SfDataForm.XForms.dll Syncfusion.SfDataForm.XForms.Android.dll Syncfusion.SfNumericTextBox.Android.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.SfNumericTextBox.XForms.Android.dll Syncfusion.SfNumericUpDown.Android.dll Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.SfNumericUpDown.XForms.Android.dll Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.Android.dll Syncfusion.SfAutoComplete.XForms.dll Syncfusion.SfAutoComplete.XForms.Android.dll Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.Android.dll Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.SfMaskedEdit.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfDataForm.XForms.dll Syncfusion.SfDataForm.XForms.iOS.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.SfNumericTextBox.XForms.iOS.dll Syncfusion.SfNumericUpDown.iOS.dll Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.SfNumericUpDown.XForms.iOS.dll Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.iOS.dll Syncfusion.SfAutoComplete.XForms.dll Syncfusion.SfAutoComplete.XForms.iOS.dll Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.iOS.dll Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.SfMaskedEdit.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfDataForm.XForms.dll Syncfusion.SfDataForm.XForms.UWP.dll Syncfusion.SfInput.UWP.dll

	Syncfusion.SfShared.UWP.dll Syncfusion.SfNumericTextBox.XForms.UWP.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.SfNumericUpDown.XForms.UWP.dll Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.UWP.dll Syncfusion.SfAutoComplete.XForms.dll Syncfusion.SfAutoComplete.XForms.UWP.dll Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.UWP.dll Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.SfMaskedEdit.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
--	---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### Launching the data form on each platform

To use the data form inside an application, each platform application must initialize the data form renderer. This initialization step varies from platform to platform and is discussed in the following sections:

##### Android

The Android launches the data form without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

**Note:** If you are adding the references from toolbox, this step is not needed.

##### iOS

To launch the data form in iOS, call the `SfDataFormRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework initialization and before the `LoadApplication` is called, as demonstrated in the following code example:

##### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    SfDataFormRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

### Universal Windows Platform (UWP)

The UWP launches the data form without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

### ReleaseMode issue in UWP platform

The known Framework issue in UWP platform is that the custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the data form assemblies in **App.xaml.cs** file in UWP project as in the following code snippet:

### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add 'using System.Reflection;'
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfDataFormRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfNumericTextBoxRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfNumericUpDownRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfSegmentedControlRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfComboBoxRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfCheckBoxRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfRadioButtonRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfMaskedEditRenderer).GetTypeInfo().Assembly);
    ;
    assembliesToInclude.Add(typeof(SfTextInputLayoutRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfAutoCompleteRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Creating the data form

In this section, you will create Xamarin.Forms application with **SfDataForm**. The control should be configured entirely in C# code.

- Creating the project.
- Adding data form in Xamarin.Forms.
- Creating data object.
- Setting data object.

### Creating the project

Create a new BlankApp (.Net Standard) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding data form in Xamarin.Forms

To add the data form to your application, follow the steps:

1. Add required assemblies as discussed in assembly deployment section.
2. Import the control namespace as `xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"` in XAML Page.
3. Create an instance of data form control and add as a view to the linear layout.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<dataForm:SfDataForm x:Name="dataForm"/>
</ContentPage>
```

### C#

```
using Syncfusion.XForms.DataForm;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        SfDataForm dataForm;
        public MainPage()
        {
            InitializeComponent();
            dataForm = new SfDataForm();
        }
    }
}
```

### Creating data object

The `SfDataForm` is a data edit control so, create a data object to edit the data object.

Here, the data object named **ContactsInfo** created with some properties.

### C#

```
public class ContactsInfo
{
    private string firstName;
    private string middleName;
    private string lastName;
```

```
private string contactNo;
private string email;
private string address;
private DateTime? birthDate;
private string groupName;
public ContactsInfo()
{
}
public string FirstName
{
get { return this.firstName; }
set
{
this.firstName = value;
}
}
public string MiddleName
{
get { return this.middleName; }
set
{
this.middleName = value;
}
}
public string LastName
{
get { return this.lastName; }
set
{
this.lastName = value;
}
}
public string ContactNumber
{
get { return contactNo; }
set
{
this.contactNo = value;
}
}
public string Email
{
get { return email; }
set
{
email = value;
}
}
public string Address
{
get { return address; }
set
{
address = value;
}
}
public DateTime? BirthDate
```

```

{
    get { return birthDate; }
    set
    {
        birthDate = value;
    }
}
public string GroupName
{
    get { return groupName; }
    set
    {
        groupName = value;
    }
}
}

```

**Note:** If you want your data model to respond to property changes, then implement `INotifyPropertyChanged` interface in your model class.

Create a model repository class with `ContactsInfo` property initialized with required data in a new class file as shown in the following code example and save it `ViewModel.cs` file:

### C#

```

public class ViewModel
{
    private ContactsInfo contactsInfo;
    public ContactsInfo ContactsInfo
    {
        get { return this.contactsInfo; }
        set { this.contactsInfo = value; }
    }
    public ViewModel()
    {
        this.contactsInfo = new ContactsInfo();
    }
}

```

### Setting data object

To populate the labels and editors in the data form, set the [DataObject](#) property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
    xmlns:local="clr-namespace:GettingStarted"
    xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
    x:Class="GettingStarted.MainPage">
    <ContentPage.BindingContext>
    <local:ViewModel/>
    </ContentPage.BindingContext>
    <dataForm:SfDataForm x:Name="dataForm"
    DataObject="{Binding ContactsInfo}"/>

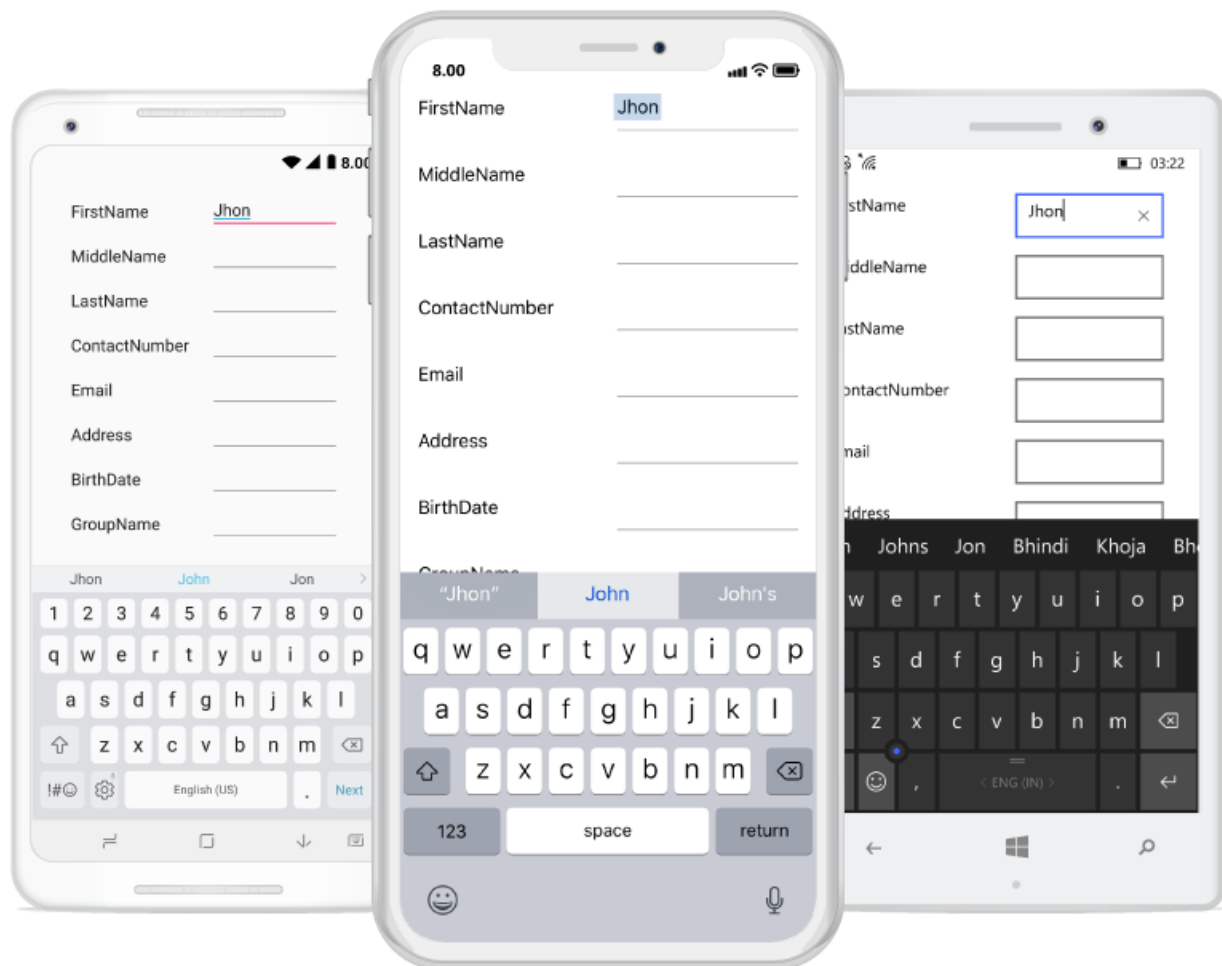

```

```
</ContentPage>
```

### C#

```
dataForm.DataObject = new ContactsInfo();
```

Now, run the application to render the data form to edit the data object as in the following screenshot:

You can download the entire source code of this demo for Xamarin.Forms from here [DataFormGettingStarted](#).

### Defining editors

The data form control automatically generates [DataFormItems](#) (which has UI settings of data field) when the data object set to the `SfDataForm.DataObject` property. The [DataFormItem](#) encapsulates the layout and editor setting for the data field appearing in the data form. When the `DataFormItems` are generated, you can handle the `SfDataForm.AutoGeneratingDataFormItem` event to customize or cancel the `DataFormItem`.

The type of input editor generated for the data field depends on the type and attribute settings of the property. The following table lists the `DataFormItem` and its constraints for generation:

Generated DataFormItem Type	Data Type / Attribute
<a href="#">DataFormTextItem</a>	Default DataFormItem generated for the String type and the properties with [DataType(DataType.Text)], [DataType(DataType.MultilineText)] and [DataType(DataType.Password)] attributes.
<a href="#">DataFormNumericItem</a>	Generated for the Int or Double type property. [DataType(DataType.Currency)]. [DataType("Percent")]
<a href="#">DataFormDateItem</a>	Generated for the DateTime type property. [DataType(DataType.Date)]. [DataType(DataType.DateTime)].
<a href="#">DataFormTimeItem</a>	Generated for the DateTime type property. [DataType(DataType.Time)].
<a href="#">DataFormPickerItem</a>	Generated for the Enum type property. [EnumDataTypeAttribute]
<a href="#">DataFormSegmentItem</a>	Generated for the Enum type property. [EnumDataTypeAttribute]
<a href="#">DataFormCheckBoxItem</a>	Generated for the Bool type property. [BoolDataTypeAttribute]
<a href="#">DataFormMaskedEditTextItem</a>	Generated for the PhoneNumber type property. [DataType(DataType.PhoneNumber)]
<a href="#">DataFormAutoCompleteItem</a>	Generated for the Enum type property. [EnumDataTypeAttribute]
<a href="#">DataFormDropDownItem</a>	Generated for the Enum type property. [EnumDataTypeAttribute]

The following list of editors are supported:

Editor	Data Type/Attribute	Input control loaded
Text	The String type property and any other type apart from the following specified cases.	[Entry](https://docs.microsoft.com/en-us/dotnet/api/xamarin.forms.entry?view=xamarin-forms)
MultilineText	The String type property with multi line text. [DataType(DataType.Multiline)]	<a href="#">Editor</a>
Numeric	Int or Double type property.	<a href="#">SfNumericTextBox</a>
Percent	The Int or Double type Property with percent value. [DataType("Percent")].	{{'SfNumericTextBox'  markdownify }}
Currency	The Int or Double type property with currency value. [DataType(DataType.Currency)].	<a href="#">SfNumericTextBox</a>
Date	The DateTime type property with date value. [DataType(DataType.Date)][DataType(DataType.DateTime)]	<a href="#">DatePicker</a>

Time	Property with [DataType(DataType.Time)] attribute.	<a href="#">TimePicker</a>
NumericUpDown	Int or Double type property.	<a href="#">SfNumericUpDown</a>
Segment	Enum type property.	<a href="#">SfSegmentedControl</a>
Bool	Bool type property.	<a href="#">SfCheckBox</a>
Switch	Bool type property.	<a href="#">Switch</a>
Picker	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">Picker</a>
DropDown	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">SfComboBox</a>
AutoComplete	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">SfAutoComplete</a>
Password	The String type property with [DataType(DataType.Password)] attribute.	{{'Entry'  markdownify }}
RadioGroup	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">SfRadioGroup</a>
MaskedEditText	Property with [DataType(DataType.PhoneNumber)] attribute.	<a href="#">SfMaskedEdit</a>

## Layout options

### Label position

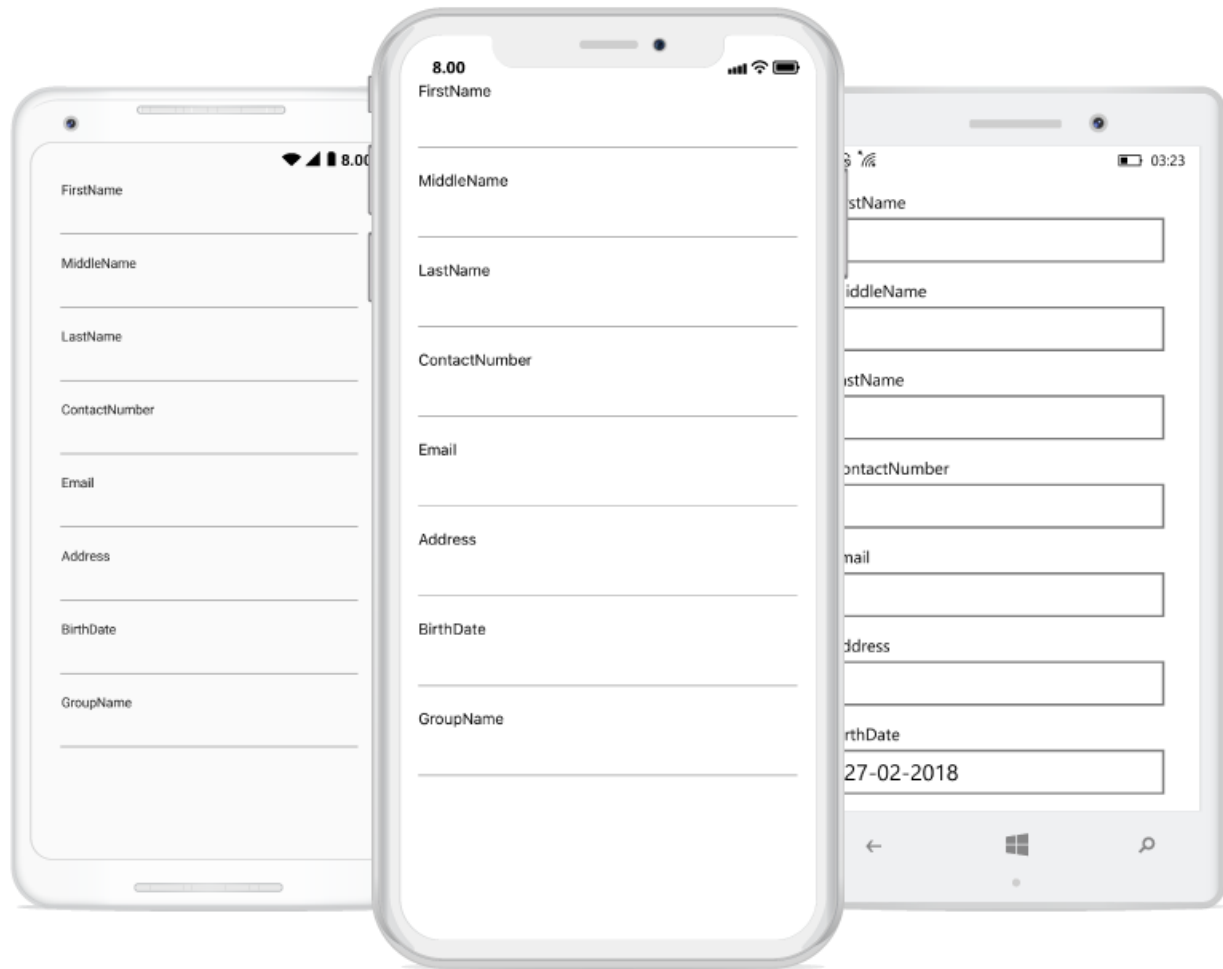

By default, the data form arranges the label at left side and input control at the right side. You can change the label position by setting the [SfDataForm.LabelPosition](#) property. You can position the label from left to top of the input control by setting the `LabelPosition` as `Top`.

### XML

```
<dataForm:SfDataForm LabelPosition="Top"/>
```

### C#

```
dataForm.LabelPosition = LabelPosition.Top;
```

### *Grid layout*

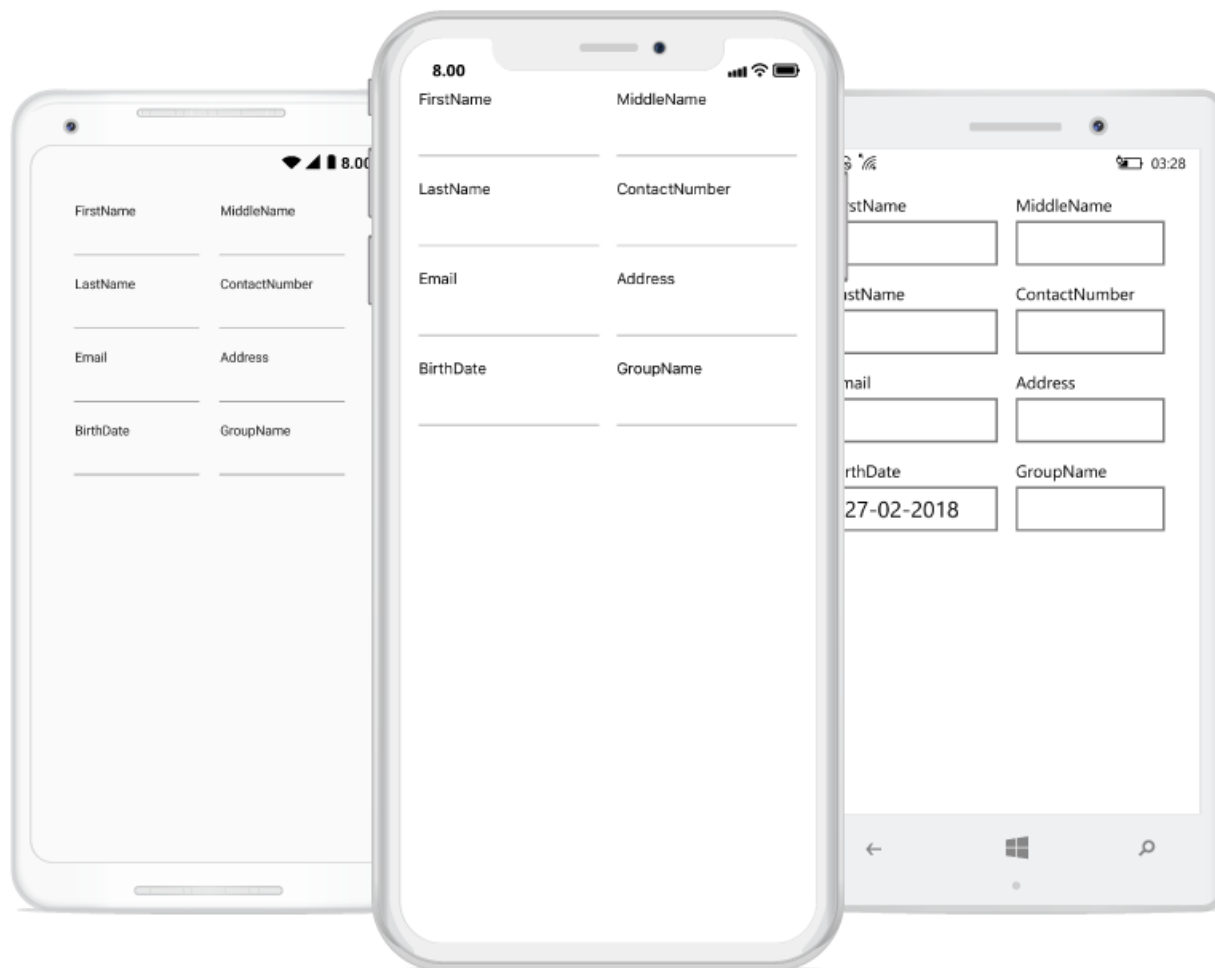

By default, the data form arranges one data field per row. It is possible to have more than one data field per row by setting the [ColumnCount](#) property which provides grid like layout for the data form.

### **XML**

```
<dataForm:SfDataForm ColumnCount="2"/>
```

### **C#**

```
dataForm.ColumnCount = 2;
```

### Loading DataForm inside StackLayout

StackLayout positions the child elements one after another either horizontally or vertically. Space of the [StackLayout](#) depends on the [HorizontalOptions](#) and [VerticalOptions](#) properties. Views in a stack layout can be sized based on space in the layout using layout options.

The DataForm control can be loaded inside any layout such as [Grid](#), [StackLayout](#), etc. When loading DataForm inside a [StackLayout](#), set the [HorizontalOptions](#) and [VerticalOptions](#) properties of DataForm, and set parent(StackLayout) of DataForm to [LayoutOptions.FillAndExpand](#).

Refer to the following code example to load the DataForm control inside a [StackLayout](#). Set the [VerticalOptions](#) and [HorizontalOptions](#) of the [StackLayout](#) and DataForm to [FillAndExpand](#).

#### XML

```
<StackLayout x:Name="stackLayout" VerticalOptions="FillAndExpand"
HorizontalOptions="FillAndExpand">
  <dataForm:SfDataForm x:Name="dataForm" VerticalOptions="FillAndExpand"
HorizontalOptions="FillAndExpand"/>
</StackLayout>
```

#### C#

```
public partial class MainPage : ContentPage
{
    StackLayout StackLayout;
    SfDataForm dataForm;
    public MainPage()
    {
        InitializeComponent();
        stackLayout = new StackLayout();
        stackLayout.VerticalOptions = LayoutOptions.FillAndExpand;
        stackLayout.HorizontalOptions = LayoutOptions.FillAndExpand;
        dataForm = new SfDataForm();
        dataForm.DataObject = new ContactInfo();
        dataForm.VerticalOptions = LayoutOptions.FillAndExpand;
        dataForm.HorizontalOptions = LayoutOptions.FillAndExpand;
        stackLayout.Children.Add(dataform);
        this.Content = stackLayout;
    }
}
```

 100% 12:54 PM

Name	John
Email	
Age	20
Salary	15,000

Loading DataForm with customized height and width

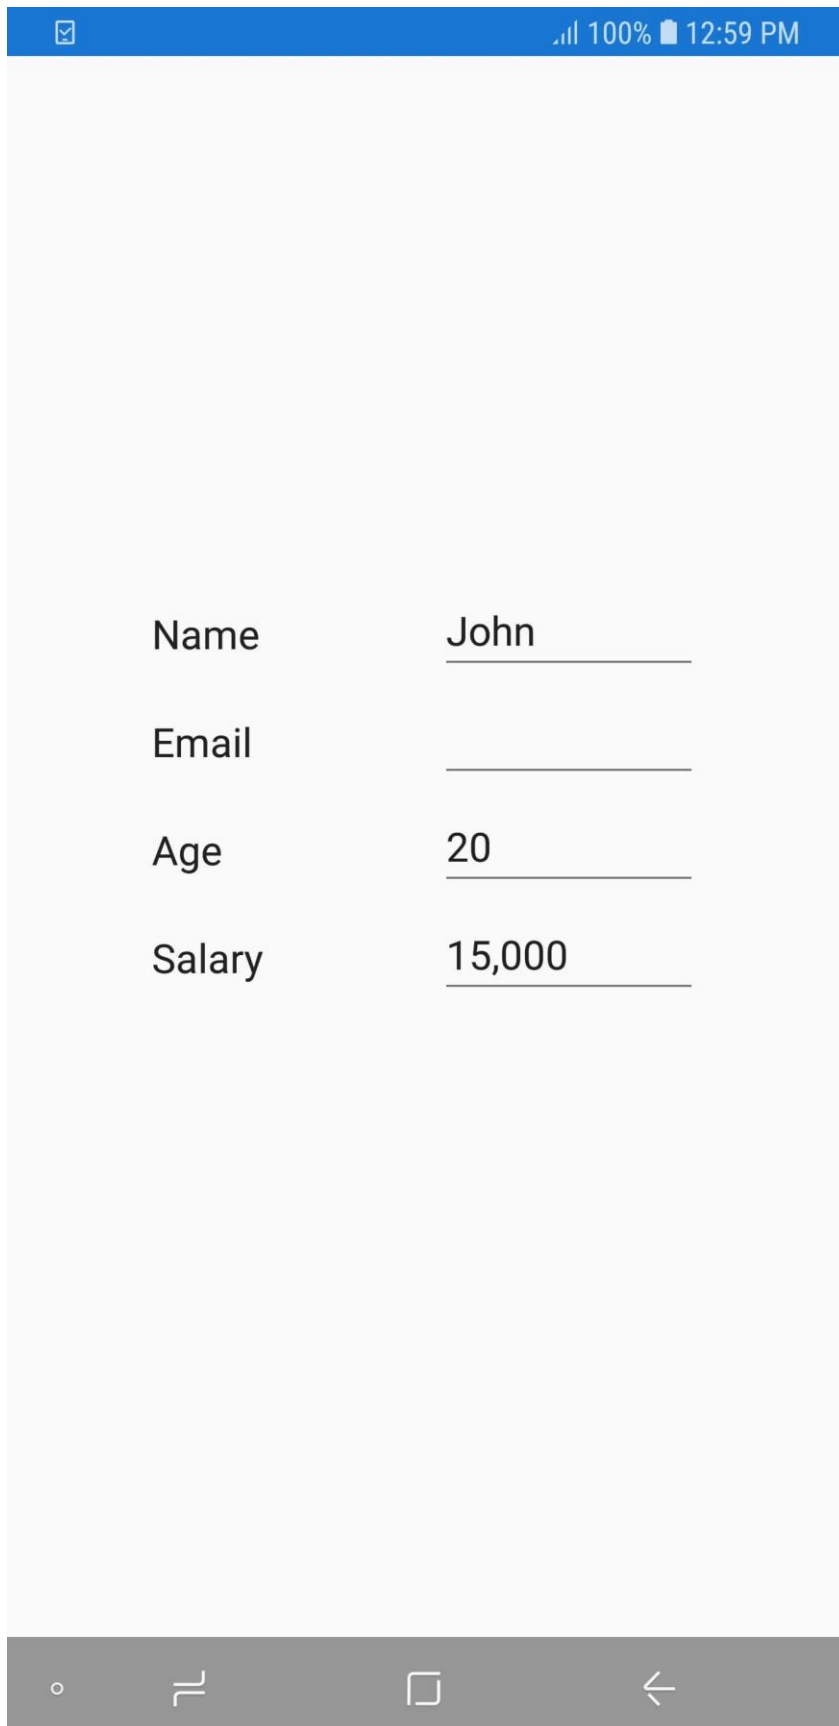

The DataForm can be loaded with specific height and width inside different layouts using the [SfDataForm.HeightRequest](#) and [SfDataForm.WidthRequest](#) properties.

#### **XML**

```
<dataForm:SfDataForm x:Name="dataForm" WidthRequest="300"
HeightRequest="300"
VerticalOptions="CenterAndExpand"
HorizontalOptions="Center"/>
```

#### **C#**

```
dataForm.HeightRequest = 300;
dataForm.WidthRequest = 300;
dataForm.VerticalOptions = LayoutOptions.CenterAndExpand;
dataForm.HorizontalOptions = LayoutOptions.Center;
```

The image shows a mobile application interface with a blue header bar. The header bar contains a checkmark icon on the left and signal strength, 100% battery, and the time 12:59 PM on the right. The main content area is a light gray background with a form. The form has four rows, each with a label on the left and a text input field on the right. The labels are 'Name', 'Email', 'Age', and 'Salary'. The input fields contain the values 'John', an empty field, '20', and '15,000' respectively. At the bottom of the screen is a gray navigation bar with four icons: a circle, a square, a square with a circle inside, and a left arrow.

Name	John
Email	
Age	20
Salary	15,000

## Editing

By default, the data form enables editing of the data field. You can disable editing by setting the [IsReadOnly](#) property of the data form. You can enable or disable editing for a particular data field by setting the [IsReadOnly](#) property of [DataFormItem](#) in the [AutoGeneratingDataFormItem](#) event. The data field editing behavior can also be defined by using [EditableAttribute](#).

## Working with the data form

### Auto-generating DataFormItemS for the data field

By default, the [DataFormItemS](#) will be generated based on the property type. For example, the [DataFormNumericItem](#) will be created for the `int` type property.

The [DataFormItem](#) generation depends on the type and attribute defined for the property.

The following tables lists the several types of [DataFormItem](#) and its constraints for auto generation:

Generated DataFormItem Type	Editor	Data Type / Attribute
<a href="#">DataFormTextItem</a>	Text	Default DataFormItem generated for the String type and the properties with [DataType(DataType.Text)], [DataType(DataType.MultilineText)] and [DataType(DataType.Password)] attributes.
<a href="#">DataFormNumericItem</a>	Numeric	Generated for Int, Double, Float, Decimal, Long types and also its nullable property with [DataType(DataType.Currency)] and [DataType("Percent")] attributes.
<a href="#">DataFormDateItem</a>	Date	Generated for DateTime type and properties with [DataType(DataType.Date)] and [DataType(DataType.DateTime)] attributes.
<a href="#">DataFormTimeItem</a>	Time	Generated for the property with [DataType(DataType.Time)] attribute.
<a href="#">DataFormPickerItem</a>	Picker	Generated for Enum type property and the property with [EnumDataTypeAttribute] attribute.
<a href="#">DataFormDropDownItem</a>	DropDown	Generated for Enum type property and the property with [EnumDataTypeAttribute] attribute.
<a href="#">DataFormAutoCompleteItem</a>	AutoComplete	Generated for Enum type property and the property with [EnumDataTypeAttribute] attribute.
<a href="#">DataFormMaskedEditTextItem</a>	MaskedEditText	Generated for the PhoneNumber type property.[DataType(DataType.PhoneNumber)]
<a href="#">DataFormItem</a>	CheckBox	Bool type

You can customize the property settings or cancel the generation of `DataFormItem` by handling the [AutoGeneratingDataFormItem](#) event.

#### Customize auto generated fields

You can customize or cancel the generated `DataFormItem` by handling the [AutoGeneratingDataFormItem](#) event. This event occurs when the field is auto-generated for public and non-static property of the data object.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem"/>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
}
```

[AutoGeneratingDataFormItemEventArgs](#) provides the information about the auto-generated. [AutoGeneratingDataFormItemEventArgs.DataFormItem](#) property returns the newly created `DataFormItem`.

#### Cancel DataFormItem generation of the data field

You can cancel the specific `DataFormItem` adding to the data form by handling the `AutoGeneratingDataFormItem` event or by defining display attribute to avoid the particular data field being displayed.

#### Using attributes

You can set [AutoGenerateField](#) to `false` for canceling the `DataFormItem` generation.

#### C#

```
private int id;
[Display(AutoGenerateField = false)]
public int ID
{
    get
    {
        return id;
    }
    set
    {
}
```

```
id = value;  
RaisePropertyChanged("ID");  
}  
}
```

### Using event

In the following code, the `DataFormItem` generation for the `MiddleName` property is canceled by setting the `Cancel` property to true.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem.Name == "MiddleName")  
        e.Cancel = true;  
}
```

### Changing editor type

You can change the editor of the `DataFormItem` in the `AutoGeneratingDataFormItem` event.

In the following code, the editor is changed for `IsAvailable` field from `Bool` to `Switch`.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem.Name == "IsAvailable")  
        e.DataFormItem.Editor = "Switch";  
}
```

### Changing property settings

You can change the property of `DataFormItem` in the `AutoGeneratingDataFormItem` event.

Here, `Salary` data field is restricted from being edited in the data form.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null)  
    {  
        if (e.DataFormItem.Name == "Salary")  
            e.DataFormItem.IsReadOnly = true;  
    }  
}
```

### Changing DataFormItem visibility

You can change the `DataFormItem` visibility by using the `IsVisible` property in the `DataFormItem`.

Here, **Salary** data field will be hidden.

### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Salary")
            e.DataFormItem.IsVisible = false;
    }
}
```

### Changing DataFormItem FontSize

Using the [EditorFontSize](#), [LabelFontSize](#), and [ValidationLabelFontSize](#) properties from **DataFormItem**, you can define the font size of the Editor, Label, and ValidationLabel. Changing the font size will be handled in the **AutoGeneratingDataFormItem** event.

You can define the font size as described as follows.

- Set the value to font size directly or use the named font sizes such as **Small**, **Medium**, and **Large**.

### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender, AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        // Setting Fontsize using NamedSize.
        e.DataFormItem.EditorFontSize = Device.GetNamedSize(NamedSize.Small,
            typeof(Label));
        e.DataFormItem.LabelFontSize = Device.GetNamedSize(NamedSize.Large,
            typeof(Label));
        e.DataFormItem.ValidationLabelFontSize =
            Device.GetNamedSize(NamedSize.Micro, typeof(Label));
        // Setting value to FontSize directly.
        e.DataFormItem.EditorFontSize = 8;
        e.DataFormItem.LabelFontSize = 8;
        e.DataFormItem.ValidationLabelFontSize = 8;
    }
}
```

### Setting watermark

You can display the watermark in the editor by defining the display attribute or using the **AutoGeneratingDataFormItem** event.

#### Using attribute

You can show the watermark in the editor by setting the [Prompt](#) in display attribute.

**C#**

```
private string middleName;
[Display(Prompt = "Enter middle name")]
public string MiddleName
{
    get { return this.middleName; }
    set
    {
        this.middleName = value;
    }
}
```

*Using event*

You can show the watermark in the editor by using the [PlaceholderText](#) property in [DataFormItem](#).

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Description")
            e.DataFormItem.PlaceholderText = "Enter description";
    }
}
```

*Changing DataFormItem*

You can change the created [DataFormItem](#) and assign new [DataFormItem](#) in the [AutoGeneratingDataFormItem](#) event.

Here, [DataFormTextItem](#) with number keyboard is loaded for numeric value instead of [DataFormNumericItem](#).

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "ID")
            e.DataFormItem = new DataFormTextItem() { Name = "ID", Editor = "Text",
            KeyBoard = Keyboard.Numeric };
    }
}
```

*Adding or removing the data field displayed in the dataForm at runtime*

If you want to remove or add data fields item at runtime, you can use the [RefreshLayout](#) method which auto-generates the [DataFormItem](#) where you can skip certain item from display. By default, it will

generate the canceled items initially. If you want to regenerate all the items, you should pass argument as `true`.

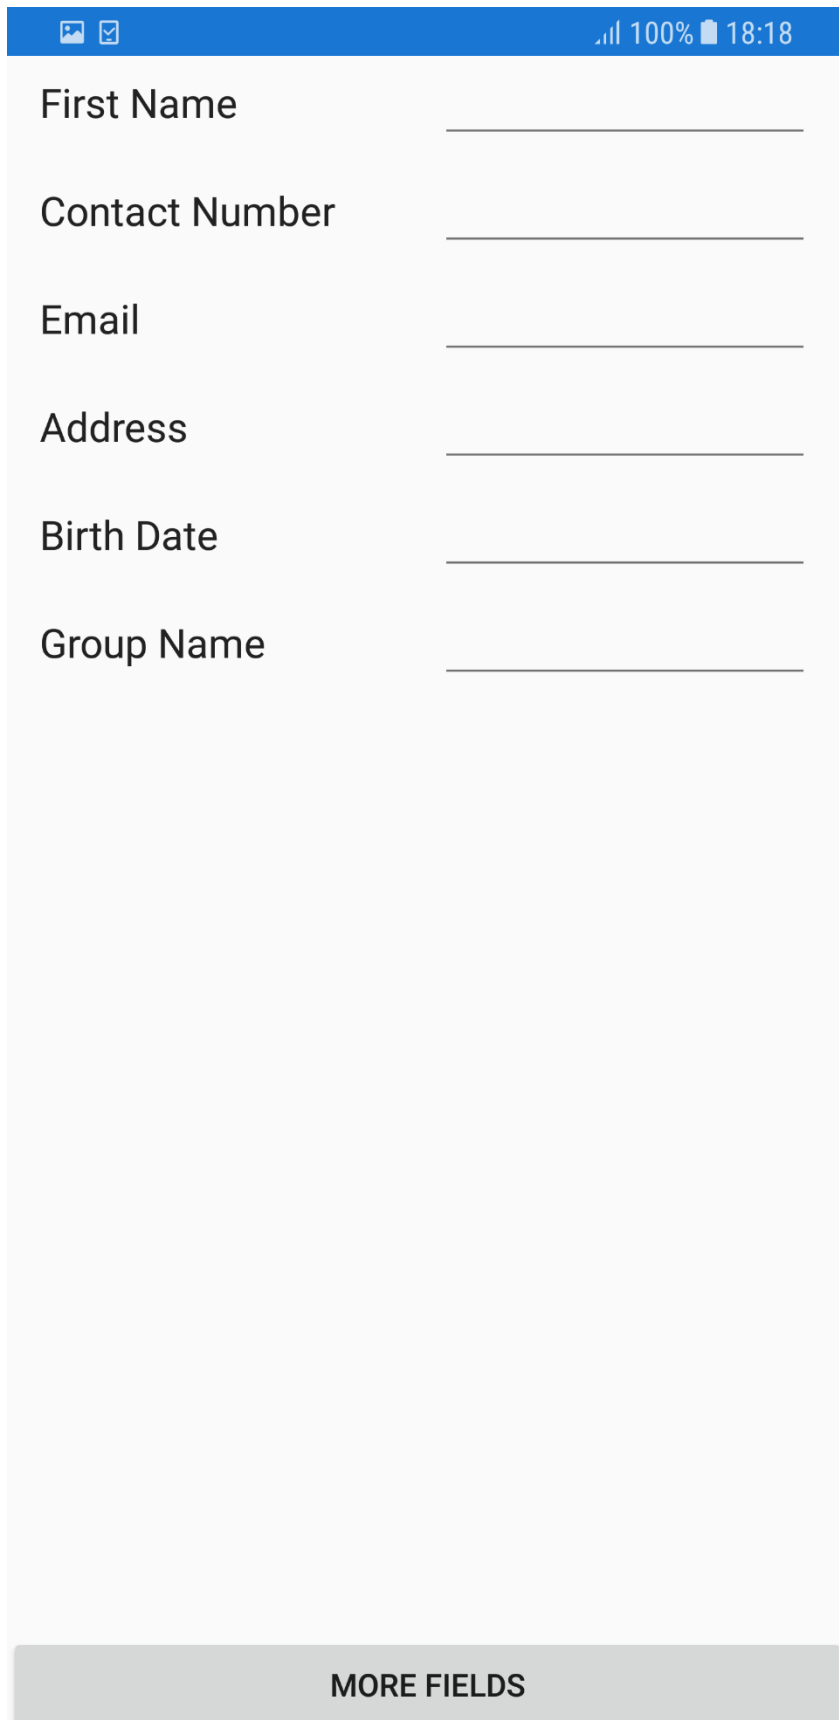

In the following code snippet, items are auto generated based on `refreshLayout` flag where you can change flag at runtime and call `RefreshLayout` method to add or remove items being displayed in the data form at runtime.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="*" />
<RowDefinition Height="Auto" />
</Grid.RowDefinitions>
<dataForm:SfDataForm Grid.Row="0" x:Name="dataForm"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem"/>
<Button x:Name="Commit" Grid.Row="1" WidthRequest="100" HeightRequest="50"
Text="MORE FIELDS" Clicked="Button_Clicked"/>
</Grid>
</ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.DataObject = new ContactsInfo();
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (!refreshLayout)
        {
            if (e.DataFormItem.Name.Equals("MiddleName") ||
e.DataFormItem.Name.Equals("LastName"))
            e.Cancel = true;
        }
        else
        {
            if (e.DataFormItem.Name == "GroupName")
            e.Cancel = true;
        }
    }
}
```

The image shows a mobile application interface with a blue header bar. On the left of the header are two icons: a camera and a checkmark. On the right is the status bar showing signal strength, 100% battery, and the time 18:18. Below the header is a light gray form area containing six text input fields, each with a label to its left: 'First Name', 'Contact Number', 'Email', 'Address', 'Birth Date', and 'Group Name'. At the bottom of the form area is a gray button with the text 'MORE FIELDS'.

First Name

Contact Number

Email

Address

Birth Date

Group Name

MORE FIELDS

If you want to generate the MiddleName and LastName fields at runtime, you should set `refreshLayout` flag to `true` and call the [RefreshLayout](#) method which triggers `AutoGeneratingDataFormItem` event again and generates the items based on `refreshLayout` flag.

#### **C#**

```
private void Button_Click(object sender, System.EventArgs e)
{
    refreshLayout = true;
    dataForm.RefreshLayout();
}
```

Here, the MiddleName and LastName fields are generated at runtime after clicking the more field button.

The image shows a mobile application interface with a blue status bar at the top. The status bar contains icons for signal strength, 100% battery, and the time 18:20. Below the status bar is a light gray form with eight text input fields, each with a label to its left: 'First Name', 'Middle Name', 'Last Name', 'Contact Number', 'Email', 'Address', 'Birth Date', and 'Group Name'. Each label is followed by a horizontal line representing the input field. At the bottom of the form is a gray button with the text 'MORE FIELDS' in bold, uppercase letters.

The `GroupName` field is displayed initially in the data form. If you want to remove it at runtime, you should set `refreshLayout` flag to true and pass the argument as true in [RefreshLayout](#) method. It triggers `AutoGeneratingDataFormItem` event for all the fields where you can cancel 'GroupName' field item generation.

**C#**

```
private void Button_Click(object sender, System.EventArgs e)
{
    refreshLayout = true;
    dataForm.RefreshLayout(true);
}
```

Here, the `GroupName` field is removed at runtime.

A mobile application mockup featuring a data form. The top status bar is blue with icons for camera, gallery, signal strength, 100% battery, and the time 18:19. The form consists of seven text input fields, each with a label to its left: 'First Name', 'Middle Name', 'Last Name', 'Contact Number', 'Email', 'Address', and 'Birth Date'. At the bottom of the form is a grey button labeled 'MORE FIELDS'.

You can download the sample from [here](#).

### DataFormItemManager

The [DataFormItemManager](#) creates [DataFormItems](#) collection and handles value reflection and validation. It also overrides to handle the get and set property values from and to the data object.

### *Manually generate DataFormItems for DataObject*

By default, [DataFormItems](#) will be generated based on DataObject. If you need to generate DataFormItems manually, override the [DataFormItemManager](#) class and set it to [SfDataForm.ItemManager](#).

To create [DataFormItems](#), override the [GenerateDataFormItems](#) method.

### C#

```
// dataform item creating by setting DataObject.
dataForm.DataObject = new ContactsInfo();
dataForm.ItemManager = new DataFormItemManagerExt(dataForm);
public class DataFormItemManagerExt : DataFormItemManager
{
    SfDataForm sfDataForm;
    public DataFormItemManagerExt(SfDataForm dataForm) : base(dataForm)
    {
        sfDataForm = dataForm;
    }
    protected override List<DataFormItemBase>
    GenerateDataFormItems(PropertyInfoCollection itemProperties,
    List<DataFormItemBase> dataFormItems)
    {
        var items = new List<DataFormItemBase>();
        foreach (var propertyInfo in itemProperties)
        {
            DataFormItem dataFormItem;
            if (propertyInfo.Key == "ID")
                dataFormItem = new DataFormNumericItem() { Name = propertyInfo.Key, Editor = "Numeric", MaximumNumberDecimalDigits = 0 };
            else if (propertyInfo.Key == "Name")
                dataFormItem = new DataFormTextItem() { Name = propertyInfo.Key, Editor = "Text" };
            else
                dataFormItem = new DataFormTextItem() { Name = propertyInfo.Key, Editor = "Text" };
            items.Add(dataFormItem);
        }
        return items;
    }
}
```

You can download the source code of this demo from [GenerateDataFormItemsForDataObject](#)

### *Manually generate DataFormItems for data dictionary*

You can load the dataform with custom dictionary by generating DataFormItems manually. To create DataFormItems from dictionary, override the [GenerateDataFormItems](#) method.

### C#

```
// dataform item creating using dictionary.
dataForm.DataObject = new object();
var dictionary = new Dictionary<string, object>();
dictionary.Add("ID", 1);
dictionary.Add("Name", "John");
dataForm.ItemManager = new DataFormItemManagerExt(dataForm, dictionary);
public class DataFormItemManagerExt : DataFormItemManager
{
    Dictionary<string, object> dataFormDictionary;
    public DataFormItemManagerExt(SfDataForm dataForm, Dictionary<string,
    object> dictionary) : base(dataForm)
    {
        dataFormDictionary = dictionary;
    }
    protected override List<DataFormItemBase>
    GenerateDataFormItems(PropertyInfoCollection itemProperties,
    List<DataFormItemBase> dataFormItems)
    {
        var items = new List<DataFormItemBase>();
        foreach (var key in dataFormDictionary.Keys)
        {
            DataFormItem dataFormItem;
            if (key == "ID")
                dataFormItem = new DataFormNumericItem() { Name = key, Editor = "Numeric",
                MaximumNumberDecimalDigits = 0 };
            else if (key == "Name")
                dataFormItem = new DataFormTextItem() { Name = key, Editor = "Text" };
            else
                dataFormItem = new DataFormTextItem() { Name = key, Editor = "Text" };
            items.Add(dataFormItem);
        }
        return items;
    }
}
```

#### Handling reading and writing values to and from the dictionary

By default, the dictionary value will be shown in corresponding editor and value changes in editor will be committed again in dictionary value by using the [GetValue](#) and [SetValue](#) override methods in [DataFormItemManager](#).

Here, the value is read and written from/to dictionary instead of the data object.

#### C#

```
public class DataFormItemManagerExt : DataFormItemManager
{
    Dictionary<string, object> dataFormDictionary;
    public DataFormItemManagerExt(SfDataForm dataForm, Dictionary<string,
    object> dictionary) : base(dataForm)
    {
        dataFormDictionary = dictionary;
    }
    public override object GetValue(DataFormItem dataFormItem)
    {
        var value = dataFormDictionary[dataFormItem.Name];
        return value;
    }
}
```

```

}
public override void SetValue(DataFormItem dataFormItem, object value)
{
    dataFormDictionary[dataFormItem.Name] = value;
}
}

```

Here, the dataform is loaded with field from dictionary.

You can download the source code of this demo from [GenerateDataFormItemsForDictionary](#)

### Binding with dynamic data object

You can also load the dynamic object in SfDataForm **DataObject** and by default text editor will be generated for each dynamic object property. You can change the editor of DataFormItem for dynamic object property data type (default string) by using the AutoGeneratingDataFormItem event. You can find details about this [here](#)

### Limitations

DynamicObject supports only in Xamarin.Forms Android and data form item will be created for each dynamic object property. Currently Dynamic object is not supported in UWP and iOS platform and you can find more details about this for iOS platform under the following links.

<https://forums.xamarin.com/discussion/53941/expandoobject-crashing-ios>

[https://developer.xamarin.com/guides/ios/advanced\\_topics/limitations/](https://developer.xamarin.com/guides/ios/advanced_topics/limitations/)

### C#

```

dataForm.DataObject = new DynamicDataModel().ExpandoObject;
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
    AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "DateOfBirth")
        e.DataFormItem.Editor = "Date";
}
public class DynamicDataModel
{
    public dynamic ExpandoObject;
    public dynamic DynamicObject;
    public DynamicDataModel()
    {
        ExpandoObject = new ExpandoObject();
        ExpandoObject.FirstName = "John";
        ExpandoObject.LastName = "";
        ExpandoObject.DateOfBirth = DateTime.Now.Date;
        ExpandoObject.Email = "";
        DynamicObject = new Data();
        DynamicObject.FirstName = "John";
        DynamicObject.LastName = "";
        DynamicObject.DateOfBirth = DateTime.Now.Date;
        DynamicObject.Email = "";
    }
}
public class Data : DynamicObject, IDictionary<string, object>
{

```

```
Dictionary<string, object> list = new Dictionary<string, object>();
public override bool TrySetMember(SetMemberBinder binder, object value)
{
    list[binder.Name] = value;
    return true;
}
public override bool TryGetMember(GetMemberBinder binder, out object result)
{
    return list.TryGetValue(binder.Name, out result);
}
public override IEnumerable<string> GetDynamicMemberNames()
{
    return list.Keys;
}
public void Add(string key, object value)
{
    this.list.Add(key, value);
}
public bool ContainsKey(string key)
{
    return this.list.ContainsKey(key);
}
public ICollection<string> Keys
{
    get { return this.list.Keys; }
}
public bool Remove(string key)
{
    return this.list.Remove(key);
}
public bool TryGetValue(string key, out object value)
{
    return this.list.TryGetValue(key, out value);
}
public ICollection<object> Values
{
    get { return this.list.Values; }
}
object IDictionary<string, object>.this[string key]
{
    get { return this.list[key]; }
    set { this.list[key] = value; }
}
public void Add(KeyValuePair<string, object> item)
{
    this.list.Add(item.Key, item.Value);
}
public void Clear()
{
    this.list.Clear();
}
public bool Contains(KeyValuePair<string, object> item)
{
    return this.list.Contains(item);
}
public void CopyTo(KeyValuePair<string, object>[] array, int arrayIndex)
{

```

```
}  
public int Count  
{  
    get { return this.list.Count; }  
}  
public bool IsReadOnly  
{  
    get { return false; }  
}  
public bool Remove(KeyValuePair<string, object> item)  
{  
    return this.list.Remove(item.Key);  
}  
public IEnumerator<KeyValuePair<string, object>> GetEnumerator()  
{  
    return this.list.GetEnumerator();  
}  
System.Collections.IEnumerator  
System.Collections.IEnumerable.GetEnumerator()  
{  
    return this.list.GetEnumerator();  
}  
}
```

You can download the sample from [here](#)

#### Adding custom DataFormItems

Support has been provided to generate custom DataFormItems for the defined business model using the [Items](#) property of the `SfDataForm` class. You need to set the [AutoGenerateItems](#) property to false to restrict the auto generation of DataFormItems.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms">
```

```

x:Class="GettingStarted.MainPage">
<ContentPage.BindingContext>
<local:ViewModel x:Name="bindingContext"/>
</ContentPage.BindingContext>
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding Details}"
AutoGenerateItems="false">
<dataForm:SfDataForm.Items>
<dataForm:DataFormTextItem Name="Name" Editor="Text"/>
<dataForm:DataFormTextItem Name="Password" Editor="Password"/>
<dataForm:DataFormMaskedEditTextItem Name="Phone" Editor="MaskedEditText"/>
<dataForm:DataFormTextItem Name="Address" Editor="MultilineText"/>
<dataForm:DataFormAutoCompleteItem Name="Countries" Editor="AutoComplete"
ItemsSource = "{Binding CountryNames}"/>
<dataForm:DataFormDateItem Name="BirthTime" Editor="Date"/>
</dataForm:SfDataForm.Items>
</dataForm:SfDataForm>
</ContentPage.Content>
</ContentPage>

```

## C#

```

ObservableCollection<DataFormItemBase> items = new
ObservableCollection<DataFormItemBase>();
items.Add(new DataFormTextItem() { Name = "Name", Editor = "Text" });
items.Add(new DataFormTextItem() { Name = "Password", Editor = "Password"
});
items.Add(new DataFormMaskedEditTextItem() { Name = "Phone", Editor =
"MaskedEditText" });
items.Add(new DataFormTextItem() { Name = "Address", Editor =
"MultilineText" });
items.Add(new DataFormAutoCompleteItem() { Name = "Countries", Editor =
"AutoComplete", ItemsSource = this.GetItemSource("Countries")});
items.Add(new DataFormTimeItem() { Name = "BirthTime", Editor = "Time" });
dataForm.AutoGenerateItems = false;
dataForm.Items = items;
public class ViewModel
{
private DataFormModel details;
private IList<string> countryNames;
public ViewModel()
{
details = new DataFormModel();
countryNames = new List<string>
{
"United states",
"United Kingdom",
"France",
"Belgium",
"Germany"
};
}
public DataFormModel Details
{
get { return this.details; }
set { this.details = value; }
}
}

```

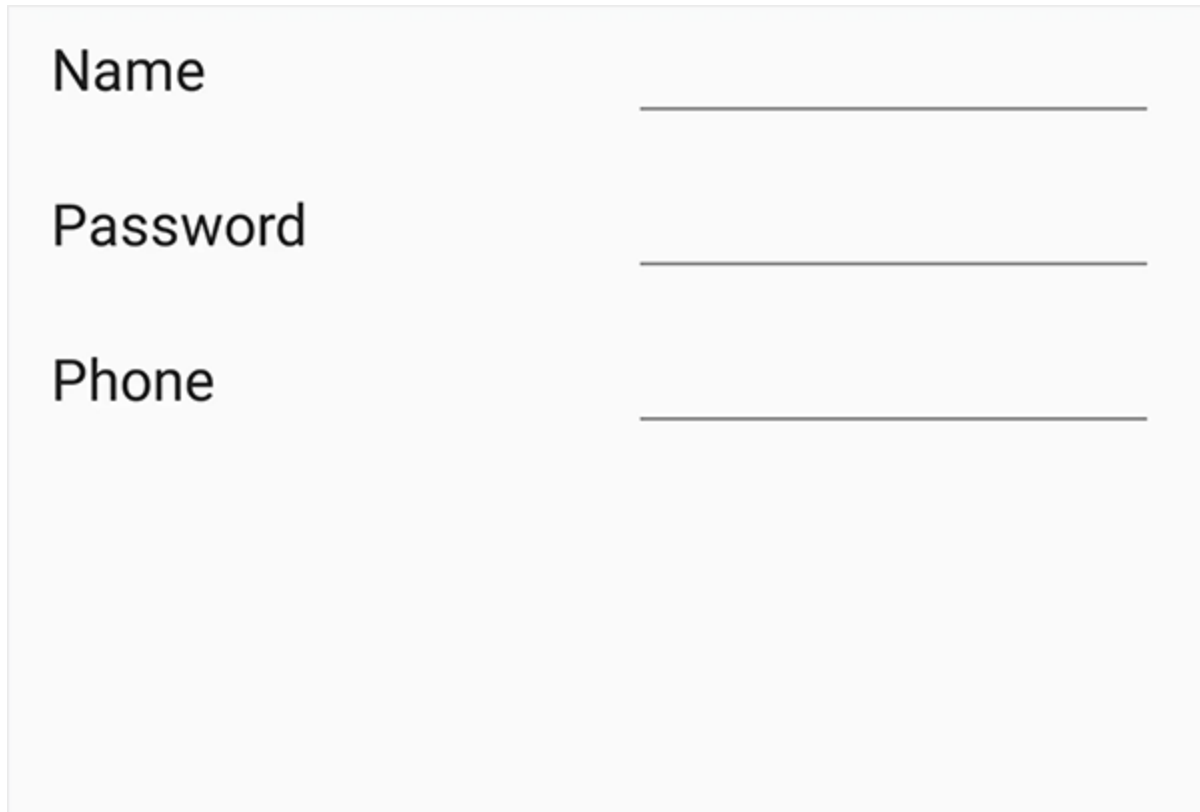

```
}  
public IList<string> CountryNames  
{  
    get { return this.countryNames; }  
    set { this.countryNames = value; }  
}  
private IList GetItemSource(string sourceName)  
{  
    var list = new List<string>();  
    if (sourceName == "Countries")  
    {  
        list.Add("Afghanistan");  
        list.Add("Akrotiri");  
        list.Add("Albania");  
        list.Add("Algeria");  
        list.Add("American Samoa");  
        list.Add("Andorra");  
        list.Add("Angola");  
        list.Add("Anguilla");  
        list.Add("Antarctica");  
        list.Add("Antigua and Barbuda");  
    }  
    return list;  
}
```

#### *Dynamically add custom dataform items*

Support has been provided to dynamically add the dataform items to collections using the [Items](#) property of **SfDataForm**.

#### **C#**

```
dataForm.Items.Add(new DataFormDropDownItem()  
{ Name = "StateName",  
  Editor = "DropDown",  
  ItemsSource = this.GetItemSource("StateName"),  
  PlaceholderText = "Select a State"  
});  
dataForm.Items.Add(new DataFormItem()  
{ Name = "Save",  
  Editor = "Switch"  
});
```

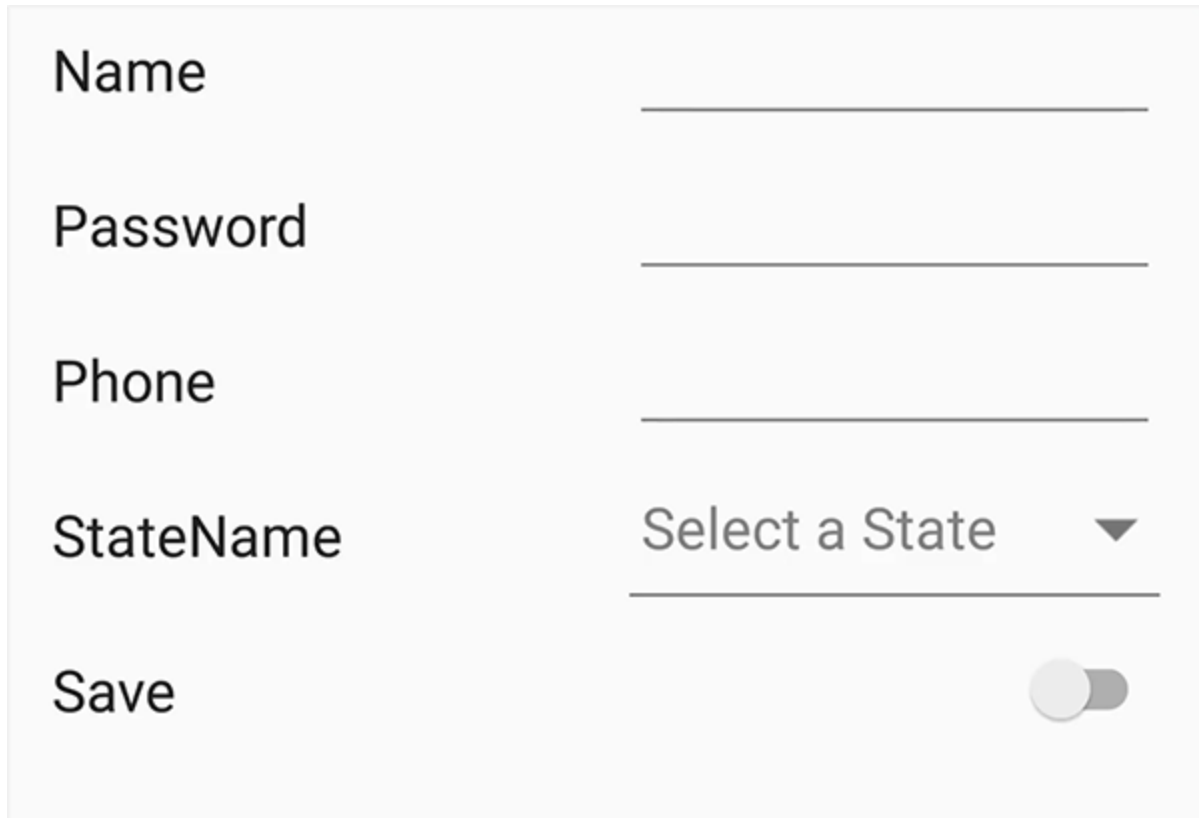

A screenshot of a data form with three input fields. The first field is labeled 'Name' and has a single horizontal line for input. The second field is labeled 'Password' and has a single horizontal line for input. The third field is labeled 'Phone' and has a single horizontal line for input. The form is displayed on a light gray background.

#### *Dynamically remove custom dataform items*

Support has been provided to dynamically remove the dataform items from collections using the [Items](#) property of `SfDataForm`.

#### **C#**

```
dataForm.Items.RemoveAt(2);
```

Name

Password

Phone

StateName

Select a State ▼

Save

#### *Dynamically clear custom dataform items*

Support has been provided to dynamically clear the dataform items using the [Items](#) property of `SfDataForm`.

#### **C#**

```
dataForm.Items.Clear();
```

Name

Password

Phone

*Dynamically reset custom dataform items*

Support has been provided to reset the dataform items using the [Items](#) property of **SfDataForm**.

**C#**

```
var item = dataForm.Items[2];
item = new DataFormNumericUpDownItem() { Name = "Age", Editor =
"NumericUpDown" };
dataForm.Items[2] = item;
```

*Dynamically add custom dataform group items*

Support has been provided to dynamically add custom group items using [Items](#) property of **SfDataForm**.

**C#**

```
DataFormGroupItem dataFormGroupItem = new DataFormGroupItem();
dataFormGroupItem.GroupName = "GroupItem";
dataFormGroupItem.IsExpanded = true;
dataFormGroupItem.DataFormItems = new DataFormItems();
dataFormGroupItem.DataFormItems.Add(new DataFormTextItem() { Name = "First
Name", Editor = "Text", GroupName = "GroupItem" });
dataFormGroupItem.DataFormItems.Add(new DataFormTextItem() { Name = "Middle
Name", Editor = "Text", GroupName = "GroupItem" });
dataFormGroupItem.DataFormItems.Add(new DataFormTextItem() { Name = "Last
Name", Editor = "Text", GroupName = "GroupItem" });
dataForm.Items.Add(dataFormGroupItem);
```

The screenshot shows a SfDataForm control with a single group item named "Name". The group is expanded, showing three text input fields: "First Name", "Middle Name", and "Last Name". Each field has a corresponding text input control.

**Editing**

The data form supports several built-in editors.

*Supported editors and associated DataFormItem*

Editor name	Editor class	Data Type/Attribute	Input control loaded
-------------	--------------	---------------------	----------------------

Text	<a href="#">DataFormTextEditor</a>	The String type property and any other type apart from the following specified cases.	[Entry](https://docs.microsoft.com/en-us/dotnet/api/xamarin.forms.entry?view=xamarin-forms)
Multiline Text	<a href="#">DataFormMultiLineTextEditor</a>	The String type property with multiline text. [DataType(DataType.MultilineText)]	<a href="#">Editor</a>
Numeric	<a href="#">DataFormNumericEditor</a>	The property of Int, Double, Float, Decimal, Long types and also its nullable property.	<a href="#">SfNumericTextBox</a>
Percent	<a href="#">DataFormNumericEditor</a>	The property of Int, Double, Float, Decimal, Long types and also its nullable property with [DataType(DataType.Percent)] attribute.	{{' <a href="#">SfNumericTextBox</a> '   markdownify }}
Currency	{{' <a href="#">DataFormNumericEditor</a> '   markdownify }}	The property of Int, Double, Float, Decimal, Long types and also its nullable property with [DataType(DataType.Currency)] attribute.	[SfNumericTextBox](https://help.syncfusion.com/xamarin/sfnumerictextbox/overview)
Date	<a href="#">DataFormDateTimeEditor</a>	The DateTime type property and the property with [DataType(DataType.Date)] and [DataType(DataType.DateTime)] attributes.	<a href="#">DatePicker</a>
Time	<a href="#">DataFormTimeEditor</a>	The property with [DataType(DataType.Time)] attribute.	<a href="#">TimePicker</a>
Numeric UpDown	<a href="#">DataFormNumericUpDownEditor</a>	Int or Double type property.	<a href="#">SfNumericUpDown</a>
Segment	<a href="#">DataFormSegmentedEditor</a>	Enum type property.	<a href="#">SfSegmentedControl</a>
Bool	<a href="#">DataFormCheckBoxEditor</a>	Bool type property.	<a href="#">SfCheckBox</a>

Switch	<a href="#">DataFormSwitchEditor</a>	Bool type property.	<a href="#">Switch</a>
Picker	<a href="#">DataFormPickerEditor</a>	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">Picker</a>
DropDown	<a href="#">DataFormDropDownEditor</a>	Enum and List type property.[EnumDataTypeAttribute]	<a href="#">SfComboBox</a>
AutoComplete	<a href="#">DataFormAutoCompleteEditor</a>	Enum and List type property.[EnumDataTypeAttribute]	<a href="#">SfAutoComplete</a>
Password	<a href="#">DataFormPasswordEditor</a>	The String type property and property with [DataType(DataType.Password)] attribute.	{{'Entry'   markdownify }}
RadioGroup	<a href="#">DataFormRadioGroupEditor</a>	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">SfRadioGroup</a>
MaskedEditText	<a href="#">DataFormMaskedEditTextEditor</a>	The property with [DataType(DataType.PhoneNumber)] attribute.	<a href="#">SfMaskedEdit</a>

### Changing editor for type

By default, the editors will be loaded based on the previous table. To change the editor for any type, use the [RegisterEditor](#) method and specify the type and editor.

#### C#

```
dataForm.RegisterEditor(typeof(int), "NumericUpDown");
```

Here, the **NumericUpDown** editor will be loaded for the integer type instead of numeric editor.

### Changing editor for property

To change the editor for any property, use the [RegisterEditor](#) method and specify the property name and editor.

#### C#

```
dataForm.RegisterEditor("IsAvailable", "Switch");
```

Here, the Switch editor will be loaded for the `IsAvailable` property (bool type) instead of `CheckBox` editor.

#### Customizing existing editor

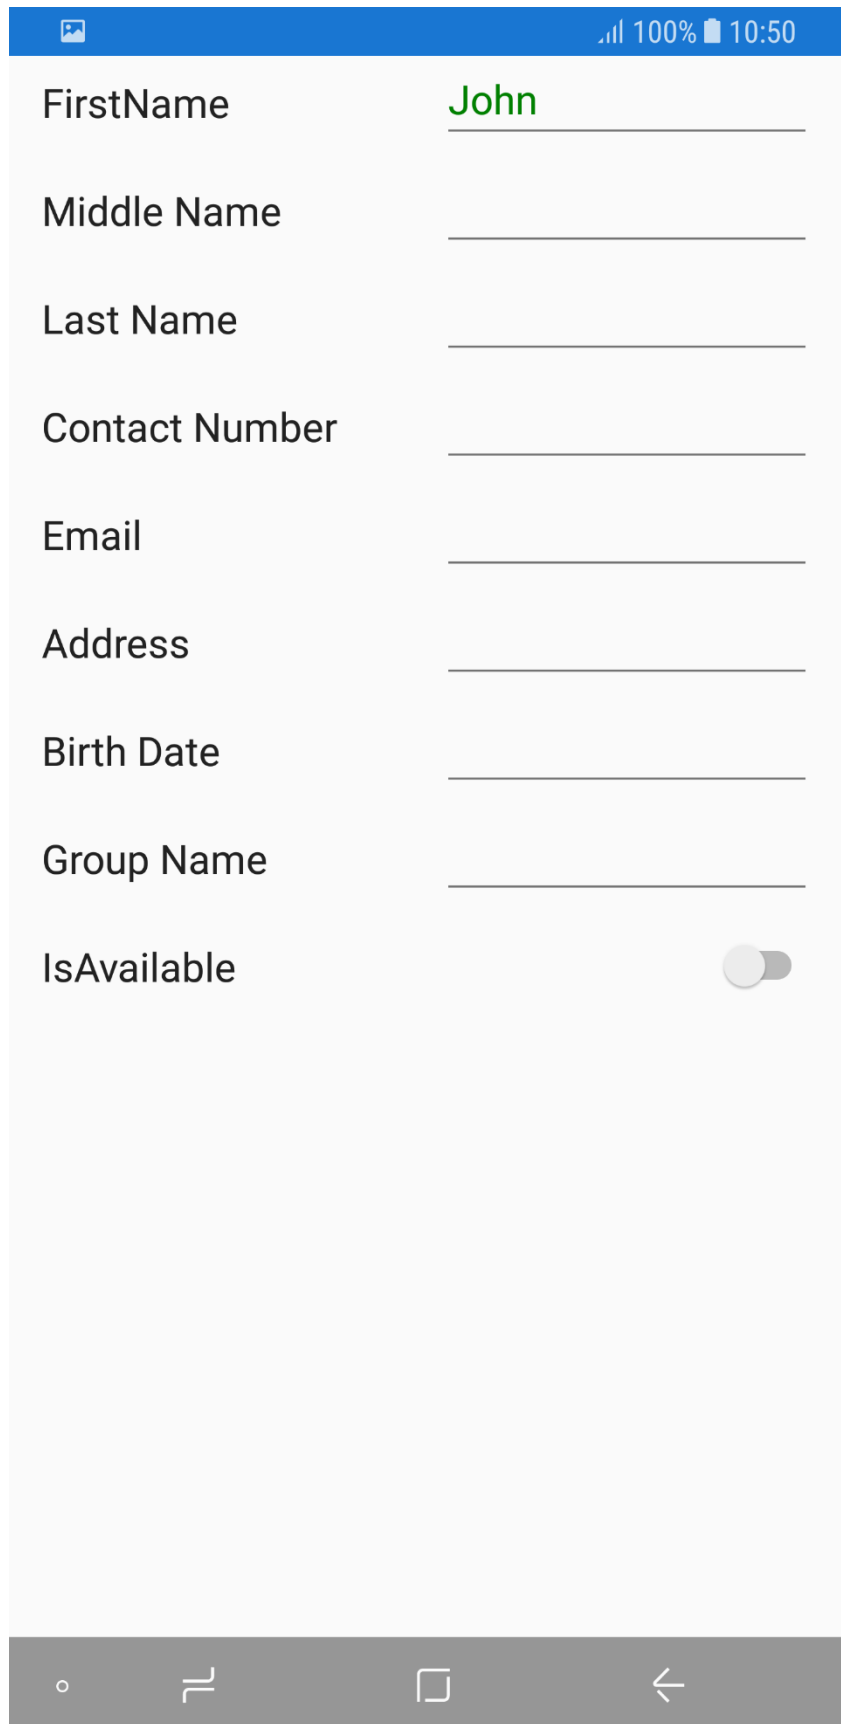

The existing editors defined in the previous table can be customized by overriding the default editors.

Here, the [DataFormTextEditor](#) is customized to set different foreground for the `FirstName` property text editor.

#### C#

```
public class CustomTextEditor : DataFormTextEditor
{
    public CustomTextEditor(SfDataForm dataForm) : base(dataForm)
    {
    }
    protected override void OnInitializeView(DataFormItem dataFormItem, Entry view)
    {
        if (dataFormItem.Name == "FirstName")
            view.TextColor = Color.Green;
        base.OnInitializeView(dataFormItem, view);
    }
}
dataForm.RegisterEditor("Text", new CustomTextEditor(dataForm));
```

First Name **John**

Middle Name

Last Name

Contact Number

Email

Address

Birth Date

Group Name

IsAvailable ☐

### Creating new custom editor

Create the custom editor by overriding the [DataFormEditor](#) class.

Property settings, commit, data validation can be handled by overriding the required methods. Here, the `Entry` is loaded for `Age` editor.

### C#

```
public class CustomTextEditor : DataFormEditor<Entry>
{
    public CustomTextEditor(SfDataForm dataForm) : base(dataForm)
    {
    }
    protected override Entry OnCreateEditorView(DataFormItem dataFormItem)
    {
        return new Entry();
    }
    protected override void OnInitializeView(DataFormItem dataFormItem, Entry view)
    {
        base.OnInitializeView(dataFormItem, view);
        view.Keyboard = Keyboard.Numeric;
        this.OnUpdateValue(dataFormItem, view);
        this.OnUpdateReadOnly(dataFormItem, view);
    }
    protected override void OnWireEvents(Entry view)
    {
        view.TextChanged += OnViewTextChanged;
        view.Focused += OnViewFocused;
        view.Unfocused += OnViewUnfocused;
    }
    private void OnViewPropertyChanged(object sender, PropertyChangedEventArgs e)
    {
        OnValidateValue(sender as Entry);
    }
    private void OnViewFocused(object sender, FocusEventArgs e)
    {
        var view = (sender as Entry);
        view.TextColor = Color.Green;
    }
    protected override bool OnValidateValue(Entry view)
    {
        return this.DataForm.Validate("Age");
    }
    private void OnViewUnfocused(object sender, FocusEventArgs e)
    {
        var view = sender as Entry;
        view.TextColor = Color.Red;
        if (this.DataForm.CommitMode == Syncfusion.XForms.DataForm.CommitMode.LostFocus ||
            this.DataForm.ValidationMode == ValidationMode.LostFocus)
            this.OnValidateValue(view);
        if (this.DataForm.CommitMode != Syncfusion.XForms.DataForm.CommitMode.LostFocus) return;
        this.OnCommitValue(view);
        OnValidateValue(sender as Entry);
    }
}
```

```

}
private void OnViewTextChanged(object sender, TextChangedEventArgs e)
{
    var view = sender as Entry;
    if (DataForm.CommitMode ==
        Syncfusion.XForms.DataForm.CommitMode.PropertyChanged ||
        DataForm.ValidationMode == ValidationMode.PropertyChanged)
    {
        this.OnValidateValue(view);
        if (this.DataForm.CommitMode !=
            Syncfusion.XForms.DataForm.CommitMode.PropertyChanged) return;
        this.OnCommitValue(view);
    }
    protected override void OnCommitValue(Entry view)
    {
        var dataFormItemView = view.Parent as DataFormItemView;
        this.DataForm.ItemManager.SetValue(dataFormItemView.DataFormItem,
            view.Text);
    }
    protected override void OnUpdateValue(DataFormItem dataFormItem, Entry view)
    {
        var cellValue = this.DataForm.ItemManager.GetValue(dataFormItem);
        if (cellValue != null && view.Text == cellValue.ToString())
            return;
        view.Text = cellValue == null ? string.Empty : cellValue.ToString();
    }
    protected override void OnUpdateReadOnly(DataFormItem dataFormItem, Entry
        view)
    {
        base.OnUpdateReadOnly(dataFormItem, view);
    }
    protected override void OnUnWireEvents(Entry view)
    {
        view.TextChanged -= OnViewTextChanged;
        view.Focused -= OnViewFocused;
        view.Unfocused -= OnViewUnfocused;
    }
}
dataForm.RegisterEditor("numeric", new CustomTextEditor(dataForm));
dataForm.RegisterEditor("Age", "numeric");
dataForm.ValidationMode = ValidationMode.LostFocus;

```

You should manually commit the custom DataFormItem editor value by using [OnCommitValue](#) override method of [DataFormEditor](#) class on custom editor [Value](#) or [Focus changed](#) event which is used to update the custom editor value in respective property in [DataObject](#) based on dataform [commit mode](#) set.

Also, you should manually validate the custom editor value in by using [OnValidateValue](#) override method of [DataFormEditor](#) class on custom editor [Value](#) or [Focus changed](#) event which is used to validate the custom editor value based on data form [validation mode](#) set. In the override method for [OnValidateValue](#), you need to return [DataForm.Validate\(string\)](#) method in order to validate the particular data item.

Also, you should manually update the value to the custom editor by using [OnUpdateValue](#) override method of [DataFormEditor](#) class on custom editor while bound the value from the Model class.

 97% 9:21 AM

FirstName	<u>John</u>
LastName	<u>Peter</u>
Email	<u></u>
Age	<u>20</u>

### Support for Email editor

You can load the Email editor by changing **Keyboard** type in the [AutoGeneratingDataFormItem](#) event.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null && e.DataFormItem.Name == "Email")  
        (e.DataFormItem as DataFormTextItem).Keyboard = Keyboard.Email;  
}
```

The screenshot displays a mobile application interface with a blue status bar at the top showing a camera icon, signal strength, 100% battery, and the time 10:59. Below the status bar is a form with the following fields:

- FirstName: John
- Middle Name: (empty)
- Last Name: (empty)
- Contact Number: (empty)
- Email: john@ (with a pink underline)
- Address: (empty)
- Birth Date: (empty)
- Group Name: (empty)
- Salary: 0

At the bottom of the screen is a virtual keyboard with the following layout:

- Top row: gmail, yahoo, hotmail, >
- Row 1: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0
- Row 2: q, w, e, r, t, y, u, i, o, p
- Row 3: a, s, d, f, g, h, j, k, l
- Row 4: ↑, z, x, c, v, b, n, m, ↵
- Row 5: !@#, ⚙️, @, EN(US), ., .com, Next
- Bottom row: ⇐, ⇐, ⇐, ⇐

### Commit mode

The [CommitMode](#) determines when the value should be committed to the data object.

The supported commit modes are as follows:

- `LostFocus`
- `PropertyChanged`
- `Explicit`

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
  <ContentPage.Content>
    <dataForm:SfDataForm x:Name="dataForm" CommitMode="LostFocus"/>
  </ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.CommitMode = CommitMode.LostFocus;
```

#### *LostFocus*

If the commit mode is `LostFocus`, the value is committed when the editor lost its focus.

#### *PropertyChanged*

The value will be committed immediately when it is changed.

#### *Explicit*

The value should be committed manually by calling the [SfDataForm.Commit](#) or [SfDataForm.Commit\(propertyName\)](#) method.

The following code commits the value of all the properties in the data object:

### C#

```
dataForm.Commit();
```

To commit the specific property value, pass the property name as argument.

### C#

```
dataForm.Commit("Name");
```

### Update editor value based on another editor

You can the update the editor value by using the [SfDataForm.UpdateEditor](#) method at runtime.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm"/>
</ContentPage.Content>
</ContentPage>
```

## C#

```
var expenseInfo = new ExpenseInfo();
expenseInfo.PropertyChanged += ExpenseInfo_PropertyChanged;
dataForm.DataObject = expenseInfo;
private void ExpenseInfo_PropertyChanged(object sender,
PropertyChangedEventArgs e)
{
    if (e.PropertyName == "Budget" || e.PropertyName == "Expense")
    {
        var item = sender as ExpenseInfo;
        item.Balance = item.Budget - item.Expense;
        dataForm.UpdateEditor("Balance");
    }
}
```

Here, the Balance property value is updated based on Budget and Expense properties. For updating value in editor, the `UpdateEditor` method is called.

You can download the sample from [here](#).

## Converter

To show the original value in different format or as different value, use the [Converter](#) attribute.

### *Changing original value of the DataForm property value using converter*

Here, the original value is multiplied by 10 and shown in editor. While committing, it is divided by 10 and stored in the data object.

## C#

```
public class ValueConverterExt : IPropertyValueConverter
{
    public object Convert(object value)
    {
        var amount = double.Parse(value.ToString());
        return amount * 10;
    }
    public object ConvertBack(object value)
    {
        var amount = double.Parse(value.ToString());
        return amount / 10;
    }
}
```

```
private double? amount = 1000;
[Converter(typeof(ValueConverterExt))]
public double? Amount
{
    get
    {
        return amount;
    }
    set
    {
        amount = value;
        RaisePropertyChanged("Amount");
    }
}
```

#### *Using date editor for DateTimeOffset DataForm property data type*

In SfDataForm, you cannot use date editor for DateTimeOffset property data type. To overcome this, you need to use Converter attribute to convert DateTimeOffset to DateTime value and vice-versa.

#### **C#**

```
private DateTimeOffset displayDate;
[Converter(typeof(ValueConverterExt))]
public DateTimeOffset DisplayDate
{
    get
    {
        return displayDate;
    }
    set
    {
        displayDate = value;
    }
}

public class ValueConverterExt : IPropertyValueConverter
{
    public object Convert(object value)
    {
        DateTime baseTime = new DateTime(2008, 6, 19, 7, 0, 0);
        DateTime targetTime;
        var dateTimeOffset = (DateTimeOffset)value;
        dateTimeOffset = new DateTimeOffset(baseTime,
            TimeZoneInfo.Local.GetUtcOffset(baseTime));
        targetTime = dateTimeOffset.DateTime;
        return targetTime;
    }
    public object ConvertBack(object value)
    {
        var dateTime = (DateTime)value;
        dateTime = new DateTime(2008, 6, 19, 7, 0, 0);
        dateTime = DateTime.SpecifyKind(dateTime, DateTimeKind.Local);
        DateTimeOffset dateTimeOffset = dateTime;
        return dateTimeOffset;
    }
}
```

You can download the source code of this demo from here [DateTimeOffsetConverter](#)

### Disable editing

You can disable editing by setting the [IsReadOnly](#) property of the data form.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm" IsReadOnly="True"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.IsReadOnly = true;
```

You can also change the editing behavior by setting the [IsReadOnly](#) property of the [DataFormItem](#).

### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Salary")
            e.DataFormItem.IsReadOnly = true;
    }
}
```

You can also change the editing behavior at runtime.

### C#

```
private void Button_Click(object sender, System.EventArgs e)
{
    var dataFormItem = dataForm.ItemManager.DataFormItems["FirstName"];
    dataFormItem.IsReadOnly = true;
}
```

**Note:** [DataFormItem.IsReadOnly](#) takes higher priority than [SfDataForm.IsReadOnly](#).

### Two-way data binding

When the DataForm business object properties are updated with two-way data binding support, the value will sync with underlying DataForm editors.

To enable two-way data binding support, set the value of [NotifyPropertyChanges](#) property to true in DataForm.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm ="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm" NotifyPropertyChanges="True"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.NotifyPropertyChanges = true;
```

You can download the entire source code of this demo from here [Two-wayDataBinding](#)

### Editors

The data form supports several built-in editors as follows:

Editor name	Editor class	Supported Data Type/Attribute	Input control loaded
Text	<a href="#">DataFormTextEditor</a>	The String type property and any other type apart from the below specified cases.	[Entry](https://docs.microsoft.com/en-us/dotnet/api/xamarin.forms.entry?view=xamarin-forms)
Multi lineText	<a href="#">DataFormMultiLineTextEditor</a>	The String type property with multi line text.[DataType(DataType.MultilineText)]	<a href="#">Editor</a>

Num eric	[DataFormNumericEditor](https://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.SfDataForm.XForms~Syncfusion.XForms.DataForm.Editors.DataFormNumericEditor.html)	The property of Int, Double, Float, Decimal, Long types and also its nullable property.	[SfNumericTextBox](https://help.syncfusion.com/xamarin/sfnumerictextbox/overview)
Perc ent	{{' <a href="#">DataFormNumericEditor</a> '   markdownify }}	The property of Int, Double, Float, Decimal, Long types and also its nullable property with [DataType(â€œPercentâ€•)] attribute.	{{' <a href="#">SfNumericTextBox</a> '   markdownify }}
Curr ency	[DataFormNumericEditor](https://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.SfDataForm.XForms~Syncfusion.XForms.DataForm.Editors.DataFormNumericEditor.html)	The property of Int, Double, Float, Decimal, Long types and also its nullable property with [DataType(DataType.Currency)] attribute.	[SfNumericTextBox](https://help.syncfusion.com/xamarin/sfnumerictextbox/overview)
Date	<a href="#">DataFormDateEditor</a>	DateTime type property and the property with [DataType(DataType.Date)] and	<a href="#">DatePicker</a>

		[DataType(DataType.DateTime)] attributes.	
Time	<a href="#">DataFormTimeEditor</a>	The property with [DataType(DataType.Time)] attribute.	<a href="#">TimePicker</a>
NumericUpDown	<a href="#">DataFormNumericUpDownEditor</a>	Int or Double type property.	<a href="#">SfNumericUpDown</a>
Segment	<a href="#">DataFormSegmentedEditor</a>	Enum type property.	<a href="#">SfSegmentedControl</a>
Bool	<a href="#">DataFormCheckBoxEditor</a>	Bool type property.	<a href="#">SfCheckBox</a>
Switch	<a href="#">DataFormSwitchEditor</a>	Bool type property.	<a href="#">Switch</a>
Picker	<a href="#">DataFormPickerEditor</a>	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">Picker</a>
DropDown	<a href="#">DataFormDropDownEditor</a>	Enum and List type property. [EnumDataTypeAttribute]	<a href="#">SfComboBox</a>
Password	<a href="#">DataFormPasswordEditor</a>	The String type property and property with [DataType(DataType.Password)] attribute.	{{'Entry'  markdownify }}

Radi oGro up	<a href="#">DataFormRadioGroupEditor</a>	Enum and List type property.[En umDataType Attribute]	<a href="#">SfRadioGroup</a>
Mask edEd itTex t	<a href="#">DataFormMaskedEditTextEditor</a>	The property with [DataType(D ataType.Pho neNumber)] attribute.	<a href="#">SfMaskedEdit</a>
Auto Com plete	<a href="#">DataFormAutoCompleteEditor</a>	Enum and List type property.[En umDataType Attribute]	<a href="#">SfAutoComplete</a>

#### Text editor

In the text editor, the [Entry](#) is loaded.

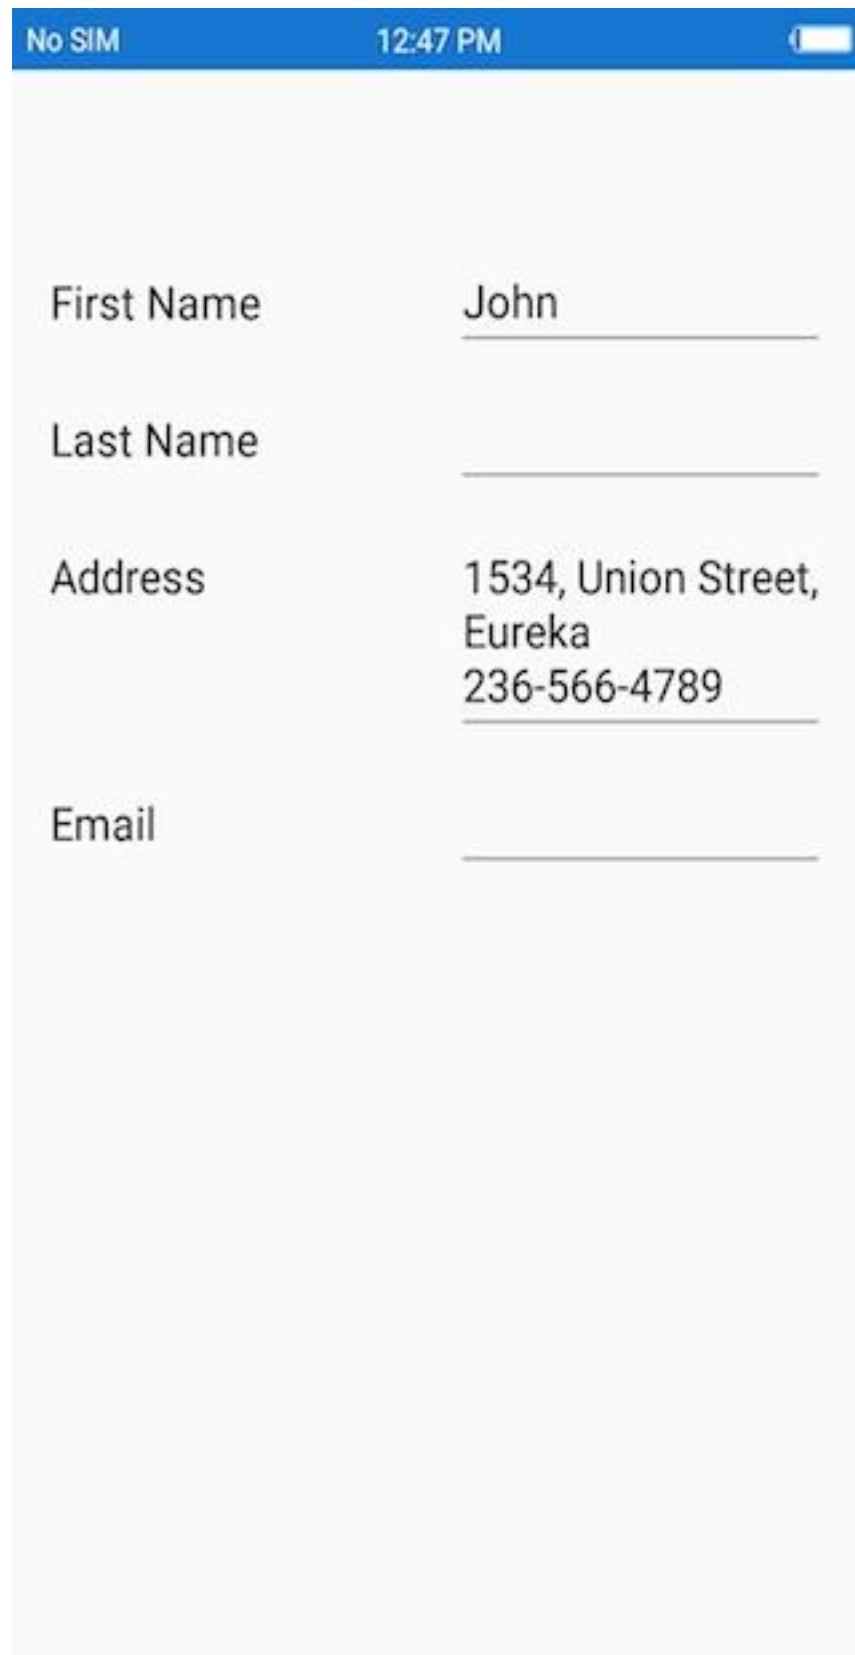

#### Multiline Text editor

In the `MultilineText` editor, the [Editor](#) is loaded.

And `MultilineText` editor height will auto expand/reduce based on the line wraps in editor , which allowing text to be readable without scrolling the editor.

#### C#

```
[DataType(DataType.MultilineText)]
public String Address { get; set; }
```

The image shows a mobile application interface with a blue status bar at the top. The status bar contains the text 'No SIM' on the left, '12:47 PM' in the center, and a battery icon on the right. Below the status bar is a light gray form area. The form contains four labeled text input fields. The first field is labeled 'First Name' and contains the text 'John'. The second field is labeled 'Last Name' and is empty. The third field is labeled 'Address' and contains the text '1534, Union Street, Eureka' followed by '236-566-4789' on the next line. The fourth field is labeled 'Email' and is empty. Each field has a thin gray underline.

First Name	John
Last Name	
Address	1534, Union Street, Eureka 236-566-4789
Email	

## Numeric editor

In the numeric editor, the [SfNumericTextBox](#) is loaded.

### *Change maximum NumberDecimalDigits in the numeric editor*

In the [SfNumericTextBox](#), two decimal digits will be displayed by default. You can change the number of decimal digits being displayed by setting the [MaximumNumberDecimalDigits](#) property in the [DataFormNumericItem](#).

## C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Amount")
    {
        (e.DataFormItem as DataFormNumericItem).MaximumNumberDecimalDigits = 3;
    }
}
```

## Date editor

In the date editor, the [DatePicker](#) will be loaded.

### *Setting null value in date editor*

In [DatePicker](#), the default date value (1/01/0001) is displayed by default. You can also set the null value by adding nullable [DateTime](#) data type for the date picker property in data form, which allows you to set the null value and display the empty value in date editor.

## C#

```
[DataType(DataType.Date)]
[Display(Name = "Birth Date")]
public DateTime? BirthDate { get; set; }
```

The image shows a mobile application interface for a data form. At the top is a blue header bar containing a checkmark icon on the left and status information (signal strength, 100% battery, and 5:44 PM) on the right. Below the header, the form consists of five labeled input fields, each with a horizontal line for text entry: "First Name", "Last Name", "Address", "Birth Date", and "Email". The form is set against a light gray background. At the bottom, there is a light gray navigation bar with four icons: a dot, a home icon, a square, and a back arrow.

*Customizing format in date editor*

In the `DatePicker`, short date will be shown by default. You can change the applied format by setting the `Format` property in `DataFormDateItem`.

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Date")
    {
        (e.DataFormItem as DataFormDateItem).Format = "ddd, MMM d, yyyy";
    }
}
```

100% 17:07

Total Amount	<u>1,000.00</u>
Discount	<u>\$10.00</u>
Date	<u>Wed, Feb 28, 2018</u>
Expense	<u>Enter expense</u>
Balance	<u></u>
Name	<u>Home</u>
ItemName	<u></u>
Time	<u>2/28/2018</u>
IsBillable	<input type="checkbox"/>

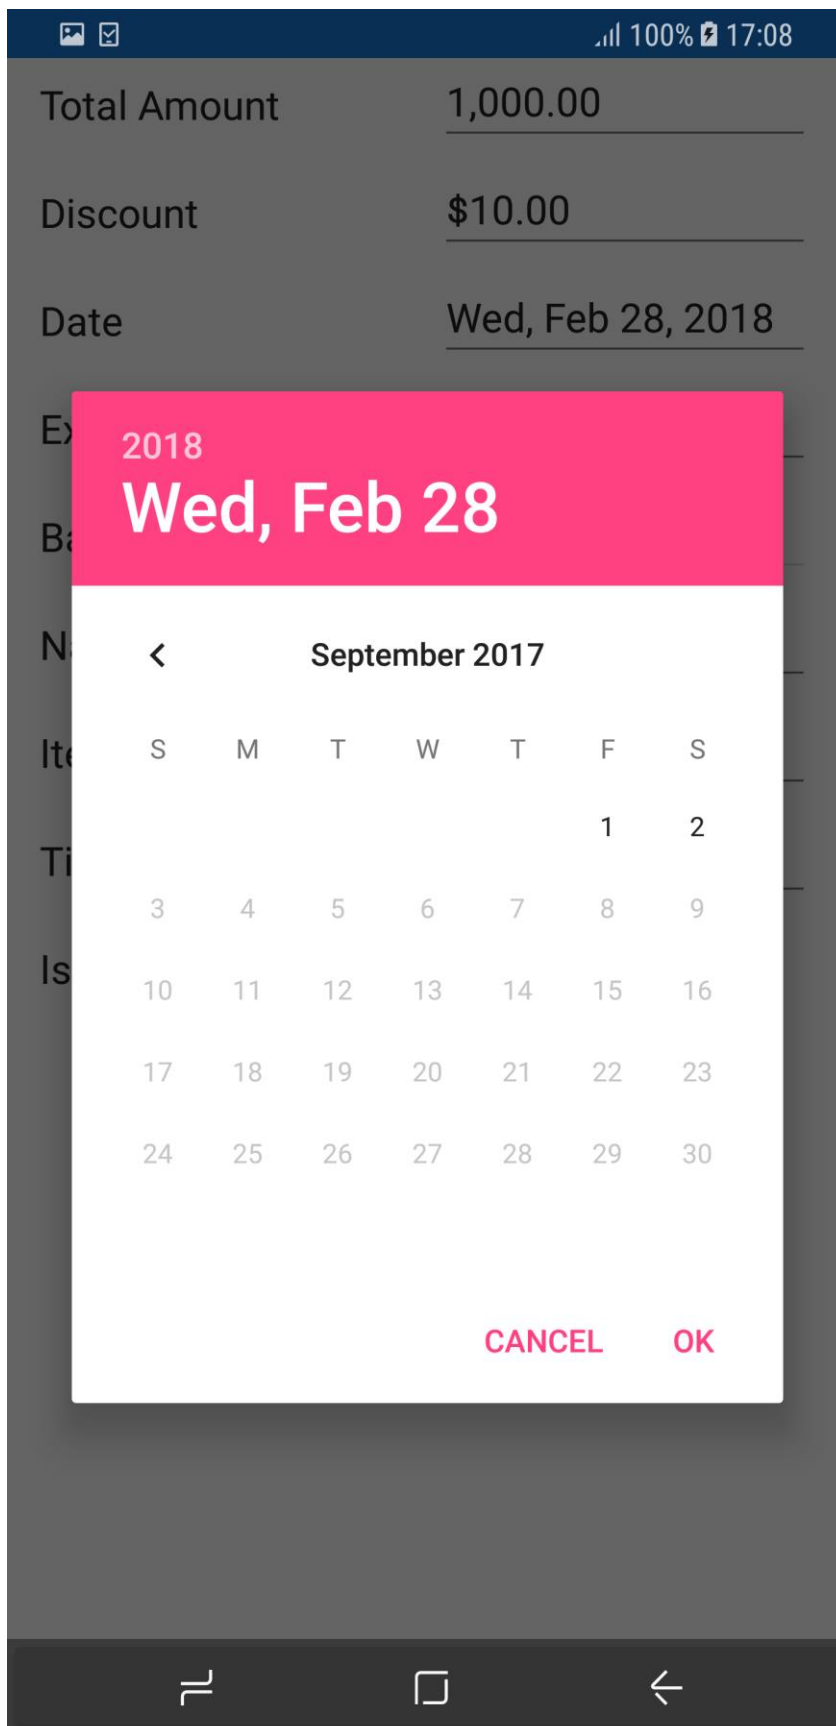

*Setting MaximumDate and MinimumDate in date editor*

You can customize the maximum and minimum allowable dates in the `DatePicker` by setting [MaximumDate](#) and [MinimumDate](#) in the [DataFormDateItem](#) respectively.

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Date")
    {
        (e.DataFormItem as DataFormDateItem).MinimumDate = new DateTime(2017, 5, 5);
        (e.DataFormItem as DataFormDateItem).MaximumDate = new DateTime(2017, 9, 2);
    }
}
```

### Time editor

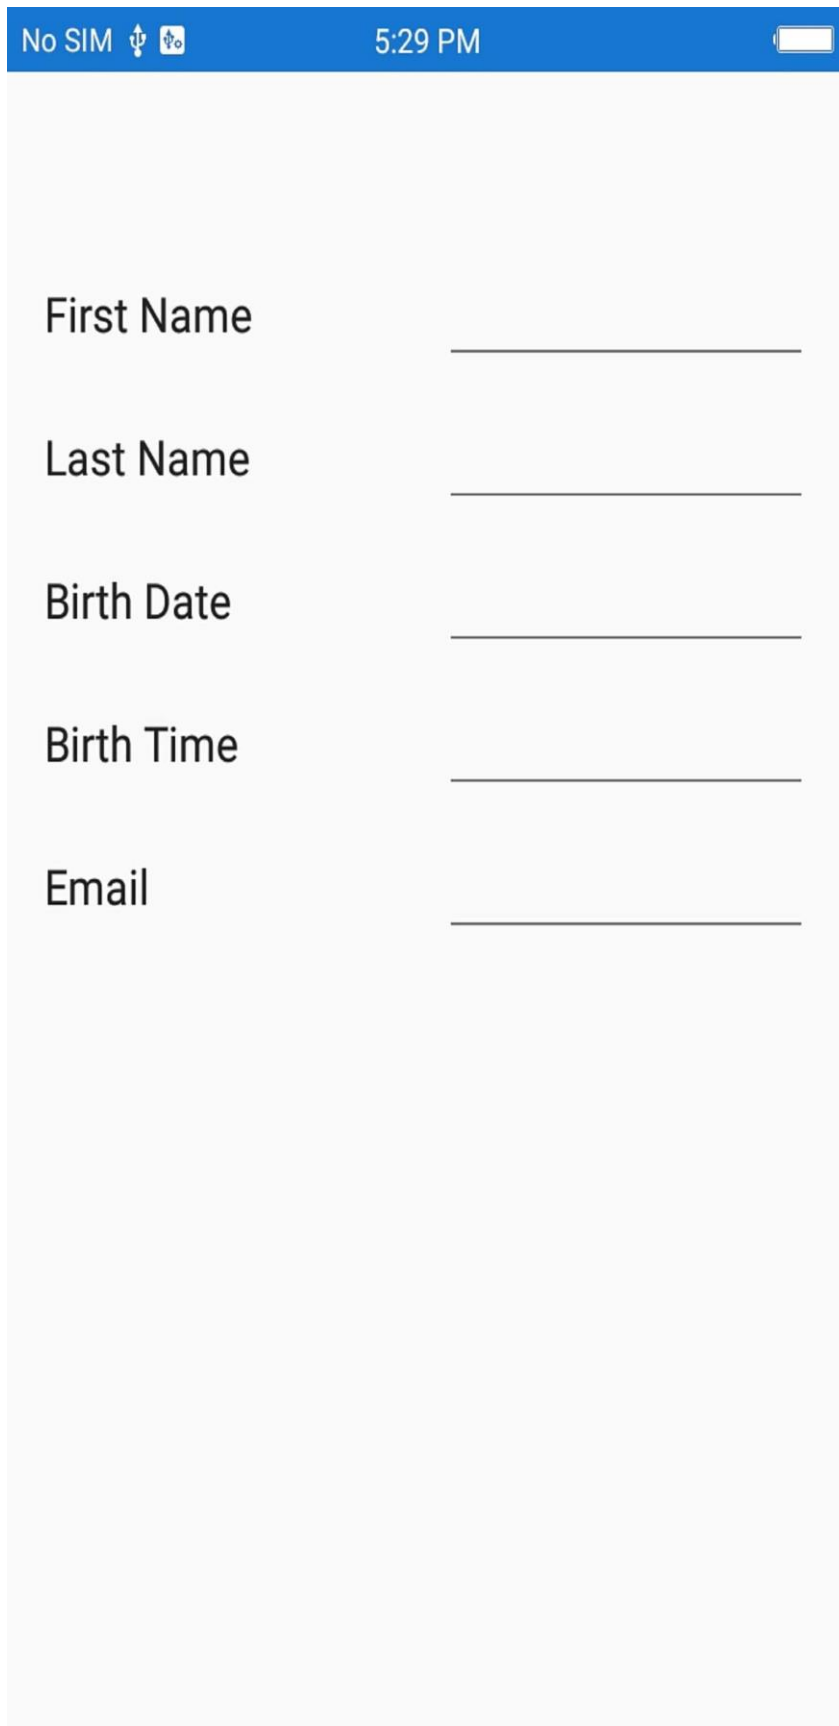

In the time editor, the [TimePicker](#) will be loaded.

#### Setting null value in time editor

In `TimePicker`, the default time value (12:00 AM) is displayed by default. You can also set the null value by adding nullable `DateTime` data type for the time picker property in data form, which allows you to set the null value and display the empty value in time editor.

#### C#

```
[DataType(DataType.Time)]  
[Display(Name = "Birth Time")]  
public DateTime? BirthTime { get; set; }
```

The image shows a mobile application interface with a blue status bar at the top. The status bar contains the text 'No SIM' followed by two small icons (a USB symbol and a SIM card symbol), the time '5:29 PM', and a battery level icon. Below the status bar is a light gray background. On this background, there are five text labels, each followed by a horizontal input line: 'First Name', 'Last Name', 'Birth Date', 'Birth Time', and 'Email'.

No SIM   5:29 PM 

First Name \_\_\_\_\_

Last Name \_\_\_\_\_

Birth Date \_\_\_\_\_

Birth Time \_\_\_\_\_

Email \_\_\_\_\_

### Customizing format in time editor

In the `TimePicker`, short time will be shown by default. You can change the applied format by setting the `Format` property in `DataFormTimeItem`.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null && e.DataFormItem.Name == "BirthTime")  
        (e.DataFormItem as DataFormTimeItem).Format = "HH:mm";  
}
```

### Segment editor

In segment editor, the [SfSegmentedControl](#) is loaded, and DataForm Segment editor supports to enum and List data type properties.

To add Segment editor in DataForm, register the editor as Segment for the required property using the [RegisterEditor](#) method.

### Support for enum data type

By default, the [ItemsSource](#) for [SfSegmentedControl](#) is auto-generated for enum data types, if the property has been registered for Segment editor.

#### C#

```
dataForm.RegisterEditor("SaveTo", "Segment");
private Location saveTo;
[Display(Name = "Save To")]
public Location SaveTo
{
    get { return saveTo; }
    set { this.saveTo = value; }
}
public enum Location
{
    Sim,
    Phone
}
```

### Customizing ItemsSource of SfSegmentedControl

For List data types, you can set the [ItemsSource](#) for [SfSegmentedControl](#) by using the [SourceProvider](#) or using [ItemsSource](#) property of [DataFormSegmentItem](#).

### Using SourceProvider

#### C#

```
private string saveTo;
[Display(Name = "Save To")]
public string SaveTo
{
    get { return saveTo; }
    set { this.saveTo = value; }
}
public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        var list = new List<string>();
        if(sourceName == "SaveTo")
        {
            list.Add("Sim");
            list.Add("Phone");
        }
        return list;
    }
}
```

```
dataForm.RegisterEditor("SaveTo", "Segment");  
dataForm.SourceProvider = new SourceProviderExt();
```

### Using ItemsSource property of DataFormSegmentItem

You can also set `ItemsSource` for segment editor by using the [ItemsSource](#) property in the [DataFormSegmentItem](#).

#### C#

```
dataForm.RegisterEditor("SaveTo", "Segment");  
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null && e.DataFormItem.Name == "SaveTo")  
    {  
        var list = new List<string>();  
        list.Add("Sim");  
        list.Add("Phone");  
        (e.DataFormItem as DataFormSegmentItem).ItemsSource = list;  
    }  
}
```

### CheckBox editor

In **CheckBox** editor, the [SfCheckBox](#) control is loaded. By default, for **bool** data type property, the **CheckBox** editor will be loaded in data form.

#### **C#**

```
[Display(Name = "Is Billable")]  
public bool IsBillable { get; set; } = true;  
[Display(Name = "Registered Member")]  
public bool RegisteredMember { get; set; }
```

The screenshot displays a mobile application interface with a blue status bar at the top. The status bar contains a checkmark icon, signal strength bars, 100% battery, and the time 2:40 PM. The main content area is a light gray form with four fields:

- Amount:** A text input field with a horizontal line below it.
- Is Billable:** A checkbox with a pink checkmark, indicating it is selected.
- Registered Member:** A checkbox with a pink outline, indicating it is not selected.
- Description:** A text input field with a horizontal line below it.

At the bottom of the screen is a white navigation bar with four icons: a dot, a double underline, a square, and a left arrow.

### Visual states of SfCheckBox

SfCheckBox support three visual states.

- Checked
- UnChecked
- Intermediate

### C#

```
[Display(Name = "Is Billable")]  
public bool IsBillable { get; set; } = true;  
[Display(Name = "Registered Member")]  
public bool RegisteredMember { get; set; } = false;  
[Display( Name = "Is Refundable")]  
public bool? IsRefundable { get; set; } = null;
```

Amount

Is Billable ☒

Description

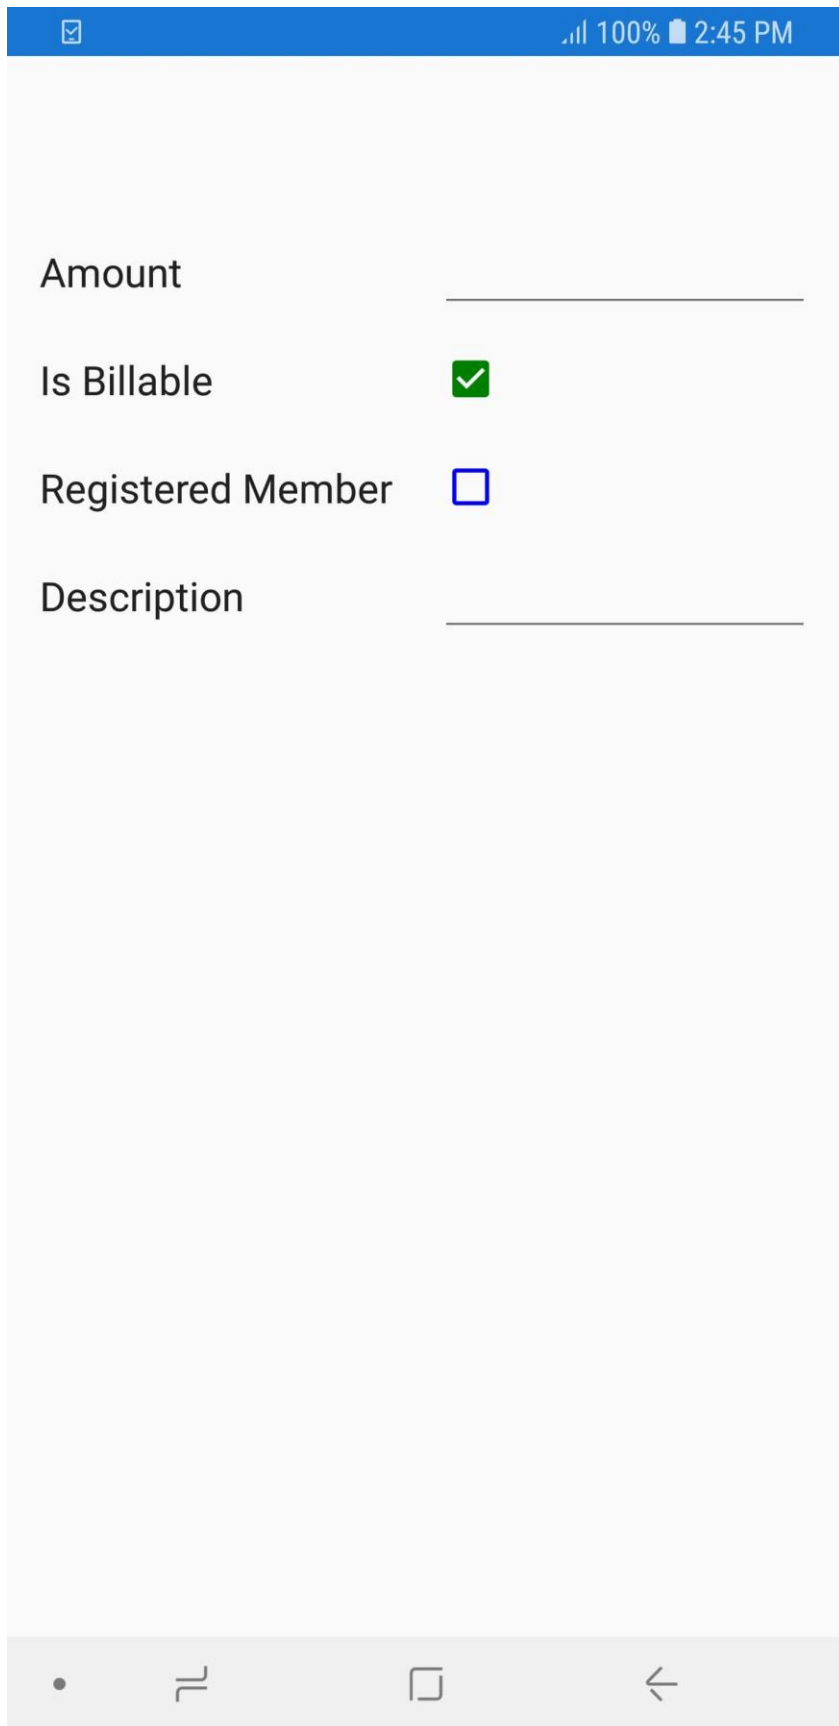

### Customizing the SfCheckBox state color

You can change the color of the checked/indeterminate state of SfCheckBox using the [CheckedColor](#) property and change the color of unchecked state using the [UnCheckedColor](#) property in [DataFormCheckBoxItem](#) in the [AutoGeneratingDataFormItem](#) event of data form.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "IsBillable")
        {
            (e.DataFormItem as DataFormCheckBoxItem).CheckedColor = Color.Green;
        }
        if (e.DataFormItem.Name == "RegisteredMember")
        {
            (e.DataFormItem as DataFormCheckBoxItem).UnCheckedColor = Color.Blue;
        }
    }
}
```

The screenshot displays a mobile application interface with a blue header bar. The header bar contains a checkmark icon on the left and status information '100%' and '2:45 PM' on the right. The main content area is white and contains four form fields. The first field is labeled 'Amount' and has a horizontal line for input. The second field is labeled 'Is Billable' and has a green checkmark icon. The third field is labeled 'Registered Member' and has a blue square checkbox icon. The fourth field is labeled 'Description' and has a horizontal line for input. At the bottom of the screen, there is a grey bar with four icons: a dot, a double line, a square, and a left arrow.

Description

### Setting SfCheckBox caption text

You can customize the appearance of display text in SfCheckBox using the Text property of the DataFormCheckBoxItem.

#### C#

```
[DisplayOptions(ShowLabel = false)]
public bool Agree { get; set; }
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name.Equals("Agree"))
        {
            (e.DataFormItem as DataFormCheckBoxItem).IsThreeState = false;
            (e.DataFormItem as DataFormCheckBoxItem).Text = "I agree to the Terms &
Conditions";
        }
    }
}
```

### Switch Editor

In switch editor, [Switch](#) is loaded, and DataForm **Switch** editor supports bool data type property.

To add **Switch** editor in DataForm, register the editor as **Switch** for the required property using the [RegisterEditor](#) method.

#### C#

```
dataForm.RegisterEditor("CellularData", "Switch");
dataForm.RegisterEditor("AirplaneMode", "Switch");
[Display(Name = "Cellular Data")]
public bool CellularData { get; set; } = true;
[Display(Name = "Airplane Mode")]
public bool AirplaneMode { get; set; }
```

A mockup of a mobile settings screen. At the top is a blue status bar with icons for a warning, a square, cellular signal, 100% battery, and the time 1:00 PM. Below the status bar is a light gray settings area. It contains four items: 'Cellular Data' with a red toggle switch turned on; 'Data limit per use' with a horizontal line below it; 'Airplane Mode' with a gray toggle switch turned off; and 'Language' with 'English' selected and a horizontal line below it.

Cellular Data ☒

Data limit per use \_\_\_\_\_

### Drop down editor

In the drop down editor, the [SfComboBox](#) will be loaded.

#### *Customizing ItemsSource of SfComboBox*

By default, the `ItemsSource` for `SfComboBox` is auto-generated for enum types and collection type properties. For other types, you can set the `ItemsSource` by using the [SourceProvider](#).

#### Using SourceProvider

##### **C#**

```
private string _ItemName;
public string ItemName
{
    get
    {
        return _ItemName;
    }
    set
    {
        _ItemName = value;
    }
}

public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        var list = new List<string>();
        if (sourceName == "ItemName")
        {
            list.Add("Item1");
            list.Add("Item2");
            list.Add("Item3");
        }
        return list;
    }
}

dataForm.SourceProvider = new SourceProviderExt();
dataForm.RegisterEditor("ItemName", "DropDown");
```

#### Using ItemsSource property

You can also set the `ItemsSource` for drop down editor by using the [ItemsSource](#) property in the `DataFormDropDownItem`.

##### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Name")
    {
        var list = new List<string>();
        list.Add("Home");
        list.Add("Food");
        list.Add("Utilities");
        list.Add("Education");
    }
}
```

```
(e.DataFormItem as DataFormDropDownItem).ItemsSource = list;  
}  
}
```

 100% 12:34 AM

Name	<input type="text" value="John"/>
Expense	<input type="text" value="10089"/>
Balance	<input type="text" value="1,492"/>
Item Name	<div><div>▼</div><div><div>Item1</div><div>Item2</div><div>Item3</div></div></div>

*Changing ItemsSource of SfComboBox at run time*

You can also change the **ItemsSource** at runtime.

**C#**

```
private void Button_Click(object sender, EventArgs e)
{
    var dataFormItem = dataForm.ItemManager.DataFormItems["Name"];
    if (dataFormItem.Name == "Name")
    {
        var list = new List<string>();
        list.Add("Home");
        list.Add("Food");
        list.Add("Utilities");
        list.Add("Education");
        (dataFormItem as DataFormDropDownItem).ItemsSource = list;
    }
}
```

*Loading complex type property values in drop down editor*

You can display the complex type property values in drop down editor by using the [GetSource](#) override method of **SourceProvider** class, which is used to get source list as complex property values for drop down editor and set it to **SourceProvider** property of **SfDataForm**. You need to use **AutoGeneratingDataFormItem** event to set [DisplayMemberPath](#) and [SelectedValuePath](#) property value of **DataFormDropDownItem** for complex type property.

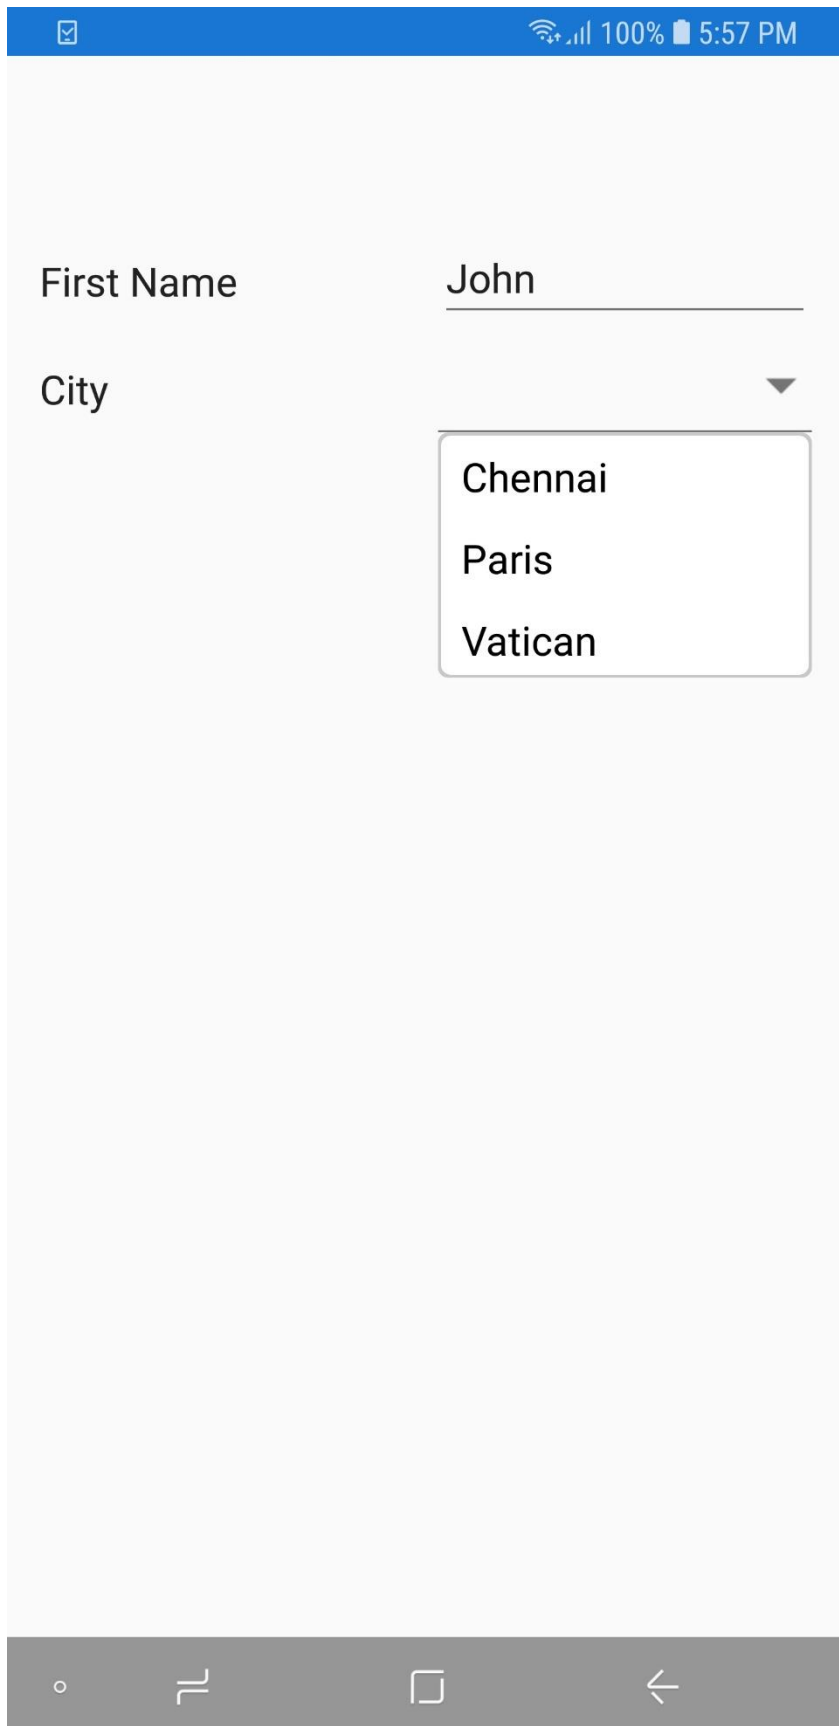

**Note:** Class cannot be directly set as data type for drop down editor in this complex type scenario.

**C#**

```
dataForm.SourceProvider = new SourceProviderExt();
dataForm.DataObject = new ContactInfo();
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
dataForm.RegisterEditor("City", "DropDown");
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "City")
    {
        if (Device.RuntimePlatform != Device.UWP)
        {
            (e.DataFormItem as DataFormDropDownItem).DisplayMemberPath = "City";
            (e.DataFormItem as DataFormDropDownItem).SelectedValuePath = "PostalCode";
        }
    }
}

public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        if (sourceName == "City")
        {
            List<Address> details = new List<Address>();
            details.Add(new Address() { City = "Chennai", PostalCode = 1 });
            details.Add(new Address() { City = "Paris", PostalCode = 2 });
            details.Add(new Address() { City = "Vatican", PostalCode = 3 });
        }
    }
}
```

```
return details;
}
return new List<string>();
}
}
public class ContactInfo
{
    [Display(Name = "First Name")]
    public String FirstName { get; set; }
    public string City { get; set; }
}
public class Address
{
    public int PostalCode { get; set; }
    public string City { get; set; }
}
```

The screenshot displays a mobile application interface with a blue status bar at the top. The status bar contains a checkmark icon, signal strength indicators, 100% battery, and the time 5:57 PM. The main content area is light gray and contains two form fields. The first field is labeled 'First Name' and has the text 'John' entered. The second field is labeled 'City' and has a dropdown menu open, showing three options: 'Chennai', 'Paris', and 'Vatican'. The dropdown menu is a white box with a gray border. At the bottom of the screen is a dark gray navigation bar with four icons: a circle, a square, a square, and a left arrow.

First Name John

City

- Chennai
- Paris
- Vatican

### Picker editor

In the picker editor, the [Picker](#) will be loaded.

#### *Changing title in the Picker*

You can show some text in the **Picker** popup by using the [Title](#) property in the [DataFormPickerItem](#).

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Name")
    {
        (e.DataFormItem as DataFormPickerItem).Title = "Expense Category";
    }
}
```

The screenshot displays an Android application interface for managing expenses. The background form contains the following fields:

- Total Amount: 1,000.00
- Discount: \$10.00
- Date: Wed, Feb 28, 2018
- Expense: Enter expense
- Balance: (empty)

An "Expense Category" modal dialog is overlaid on the form. It features a title bar, a list of categories, and two action buttons at the bottom:

- Home
- Entertainment
- CANCEL
- OK

The bottom of the screen shows the standard Android navigation bar with icons for back, home, and recent apps.

### Customizing ItemsSource of Picker

By default, the `ItemsSource` for picker is auto-generated for enum type and collection type properties. For other types, you can set the `ItemsSource` by using [SourceProvider](#).

#### Using SourceProvider

##### C#

```
private string _ItemName;
public string ItemName
{
    get
    {
        return _ItemName;
    }
    set
    {
        _ItemName = value;
    }
}

public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        var list = new List<string>();
        if (sourceName == "ItemName")
        {
            list.Add("Item1");
            list.Add("Item2");
            list.Add("Item3");
        }
        return list;
    }
}

dataForm.SourceProvider = new SourceProviderExt();
dataForm.RegisterEditor("ItemName", "Picker");
```

#### Using event

You can also set `ItemsSource` for picker editor by using the [ItemsSource](#) property in the [DataFormPickerItem](#).

##### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Name")
    {
        var list = new List<string>();
        list.Add("Home");
        list.Add("Food");
        list.Add("Utilities");
        list.Add("Education");
        (e.DataFormItem as DataFormPickerItem).ItemsSource = list;
    }
}
```

### *Changing ItemsSource of picker at run time*

You can also change the `ItemsSource` at runtime.

#### **C#**

```
private void Button_Click(object sender, EventArgs e)
{
    var dataFormItem = dataForm.ItemManager.DataFormItems["Name"];
    if (dataFormItem.Name == "Name")
    {
        var list = new List<string>();
        list.Add("Home");
        list.Add("Food");
        list.Add("Utilities");
        list.Add("Education");
        (dataFormItem as DataFormPickerItem).ItemsSource = list;
    }
}
```

### *Loading complex type property values in picker*

You can display the complex type property values in picker editor by using the [GetSource](#) override method of `SourceProvider` class, which is used to get source list as complex property values for picker editor and set it to `SourceProvider` property of `SfDataForm`. You need to use

`AutoGeneratingDataFormItem` event to set [DisplayMemberPath](#) and [ValueMemberPath](#) property value `DataFormPickerItem` for complex type property.

---

**Note:** Class cannot be directly set as data type for picker editor in this complex type scenario.

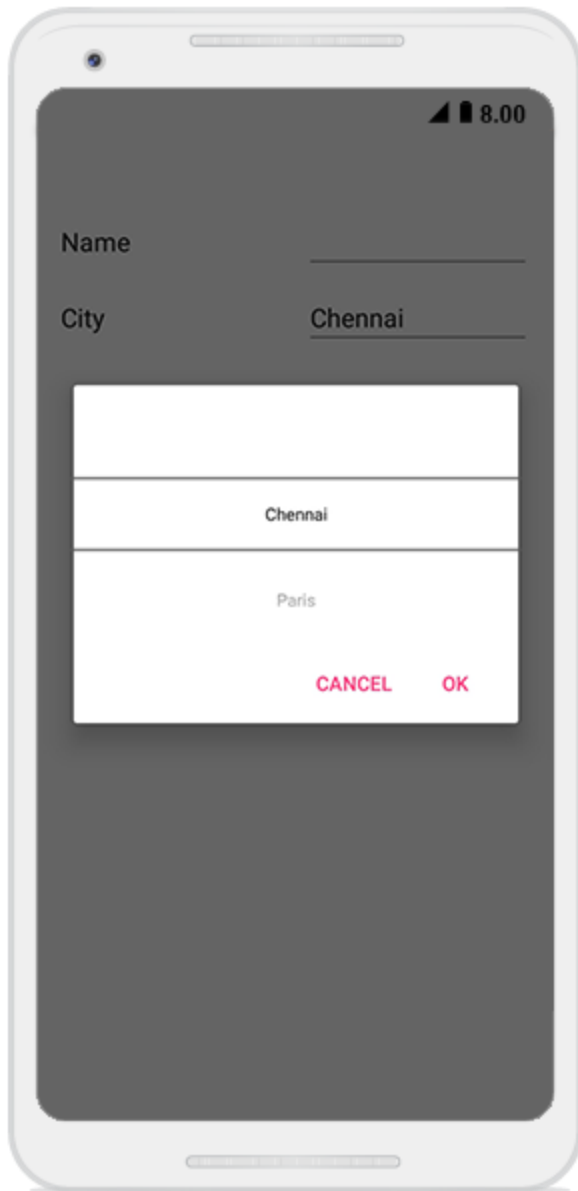

---

#### **C#**

```
dataForm.SourceProvider = new SourceProviderExt();
dataForm.RegisterEditor("City", "Picker");
dataForm.DataObject = new ContactInfo();
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "City")
    {
        if (Device.RuntimePlatform != Device.UWP)
        {
            (e.DataFormItem as DataFormPickerItem).DisplayMemberPath = "City";
            (e.DataFormItem as DataFormPickerItem).ValueMemberPath = "PostalCode";
        }
    }
}
public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        if (sourceName == "City")
        {
            List<Address> details = new List<Address>();
            details.Add(new Address() { City = "Chennai", PostalCode = 1 });
        }
    }
}
```

```
details.Add(new Address() { City = "Paris", PostalCode = 2 });
details.Add(new Address() { City = "Vatican", PostalCode = 3 });
return details;
}
return new List<string>();
}
}
public class ContactInfo
{
    public String FirstName { get; set; }
    public string City { get; set; }
}
public class Address
{
    public int PostalCode { get; set; }
    public string City { get; set; }
}
```

You can download the entire source code of this demo for Xamarin.Forms from here [DataFormPickerEditor](#)

---

**Note:** PickerEditor not supported in Xamarin.Forms.UWP.

---

NumericUpDown editor

In the numeric editor, the [SfNumericUpDown](#) will be loaded.

*Changing SpinButtonAlignment in NumericUpDown*

By default, up down button will be displayed in right side. You can change its alignment by using the [SpinButtonAlignment](#) property in the [DataFormNumericUpDownItem](#).

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
```

```
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Quantity")
        (e.DataFormItem as DataFormNumericUpDownItem).SpinButtonAlignment =
        SpinButtonAlignment.Both;
}
```

100% 17:06

Total Amount	<u>1,000.00</u>
Discount	<u>\$10.00</u>
Date	<u>Wed, Feb 28, 2018</u>
Expense	<u>Enter expense</u>
Balance	<u></u>
Name	<u>Home</u>
ItemName	<u></u>
Time	<u>2/28/2018</u>
IsBillable	<input type="checkbox"/>

### *Changing step value in numeric up down*

You can change the next increment and decrement values by using the [StepValue](#) property in the [DataFormNumericUpDownItem](#). The default value of step value is 1.

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Quantity")
        (e.DataFormItem as DataFormNumericUpDownItem).StepValue = 2;
}
```

---

**Note:** [StepValue](#) property not supported in Xamarin.FormsUWP.

---

### *Setting Maximum and Minimum value in numeric up down*

You can set minimum and maximum values for numeric up down by using [Minimum](#) and [Maximum](#) properties values respectively.

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Quantity")
    {
        (e.DataFormItem as DataFormNumericUpDownItem).Maximum = 100;
        (e.DataFormItem as DataFormNumericUpDownItem).Minimum = 0;
    }
}
```

### *Enabling auto reverse in numeric up down*

In the [SfNumericUpDown](#), once maximum and minimum values reached, the value will be unchanged. You can enable the cyclic behavior by setting the [AutoReverse](#) to [true](#) in the [DataFormNumericUpDownItem](#).

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Quantity")
    {
        (e.DataFormItem as DataFormNumericUpDownItem).AutoReverse = true;
    }
}
```

### *Changing CultureInfo in numeric up down and numeric text box*

You can change the culture in [SfNumericTextBox](#) and [SfNumericUpDown](#) by using the [CultureInfo](#) property in the [DataFormNumericItemBase](#).

SfNumericTextBox

**C#**

```
private double _discount = 10;
[DataType(DataType.Currency)]
public double Discount
{
    get
    {
        return _discount;
    }
    set
    {
        _discount = value;
        RaisePropertyChanged("Discount");
    }
}
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Discount")
    {
        (e.DataFormItem as DataFormNumericUpDownItem).CultureInfo = new
System.Globalization.CultureInfo("fr-FR");
    }
}
```

### RadioGroup editor

In the **RadioGroup** editor, the [SfRadioGroup](#) control is loaded.

The [items](#) for **SfRadioGroup** is generated for **enum** and **List** data type properties. In order to add **RadioGroup** editor in the DataForm, you need to register editor as **RadioGroup** for the required property by using the [RegisterEditor](#) method.

#### Support for enum data type

For **enum** data type property, **SfRadioGroup** [items](#) will be added based on specified property enum values.

#### C#

```
dataForm.RegisterEditor("Phone", "RadioGroup");
private Numbers phone;
public Numbers Phone
{
    get { return phone; }
    set { this.phone = value; }
}
public enum Numbers
{
    Home,
    Work,
    Other
}
```

#### Support for List data type

For **List** data type property, you have to set the **ItemsSource** by using the [SourceProvider](#), based on that **SfRadioGroup** [items](#) will be added.

#### C#

```
dataForm.RegisterEditor("Phone", "RadioGroup");
dataForm.SourceProvider = new SourceProviderExt();
private string phone;
public string Phone
{
    get { return phone; }
    set { this.phone = value; }
}
public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        var list = new List<string>();
        if(sourceName == "Phone")
        {
            list.Add("Home");
            list.Add("Work");
            list.Add("Other");
        }
        return list;
    }
}
```

```
}
```

 100% 9:22 AM

### MaskedEditText editor

In the MaskedEditText editor, the [SfMaskedEdit](#) control is loaded.

#### C#

```
[Display(Name = "Contact Number")]  
[DataType(DataType.PhoneNumber)]  
public string ContactNumber { get; set; }
```

### Setting the masked editor as int and double type

By default, the SfMaskedEdit includes prompt and literals along with your input value. The special characters are not allowed in int and double type, so you need to exclude prompt and literals using the [ValueMaskFormat](#) property in DataFormMaskedEditTextItem.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
...  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null && e.DataFormItem.Name == "ContactNumber")  
    {  
        (e.DataFormItem as DataFormMaskedEditTextItem).ValueMaskFormat =  
        Syncfusion.XForms.MaskedEdit.MaskFormat.ExcludePromptAndLiterals;  
    }  
}
```

### Localizing special characters

The special symbols such as currency, date separator, decimal separator, and other symbols can be localized using the [CultureInfo](#) property of DataFormMaskedEditTextItem.

#### C#

```
(e.DataFormItem as DataFormMaskedEditTextItem).CultureInfo = new  
CultureInfo("fr-FR");
```

### Customizing the clipboard text

By default, when you perform cut or copy operation, the clipboard text will be included with prompt and literals along with your input value. You can modify this and allow the clipboard to hold the value with or without prompt and literals by setting the [CutCopyMaskFormat](#) property of the DataFormMaskedEditTextItem.

#### C#

```
(e.DataFormItem as DataFormMaskedEditTextItem).CutCopyMaskFormat =  
Syncfusion.XForms.MaskedEdit.MaskFormat.ExcludePromptAndLiterals;
```

### Mask and mask types

The mask and mask type of input can be customized using the [Mask](#) and [MaskType](#) properties of DataFormMaskedEditTextItem. Refer to this [link](#) to know more about the mask characters and mask types available in the masked editor.

**C#**

```
(e.DataFormItem as DataFormMaskedEditFormItem).Mask = @"+1\\(\\d{3}\\)\\d{6}";  
(e.DataFormItem as DataFormMaskedEditFormItem).MaskType =  
Syncfusion.XForms.MaskedEdit.MaskType.RegEx;
```

*Customizing prompt character*

The custom prompt character can be set using the [PromptChar](#) property of `DataFormMaskedEditFormItem`.

**C#**

```
(e.DataFormItem as DataFormMaskedEditFormItem).PromptChar = '#';
```

## AutoComplete editor

In the autocomplete editor, the [SfAutoComplete](#) is loaded.

### *Customizing ItemsSource of autocomplete editor*

By default, the [ItemsSource](#) for **AutoComplete** editor is auto-generated for enum types. For other types, you can set [ItemsSource](#) using [SourceProvider](#).

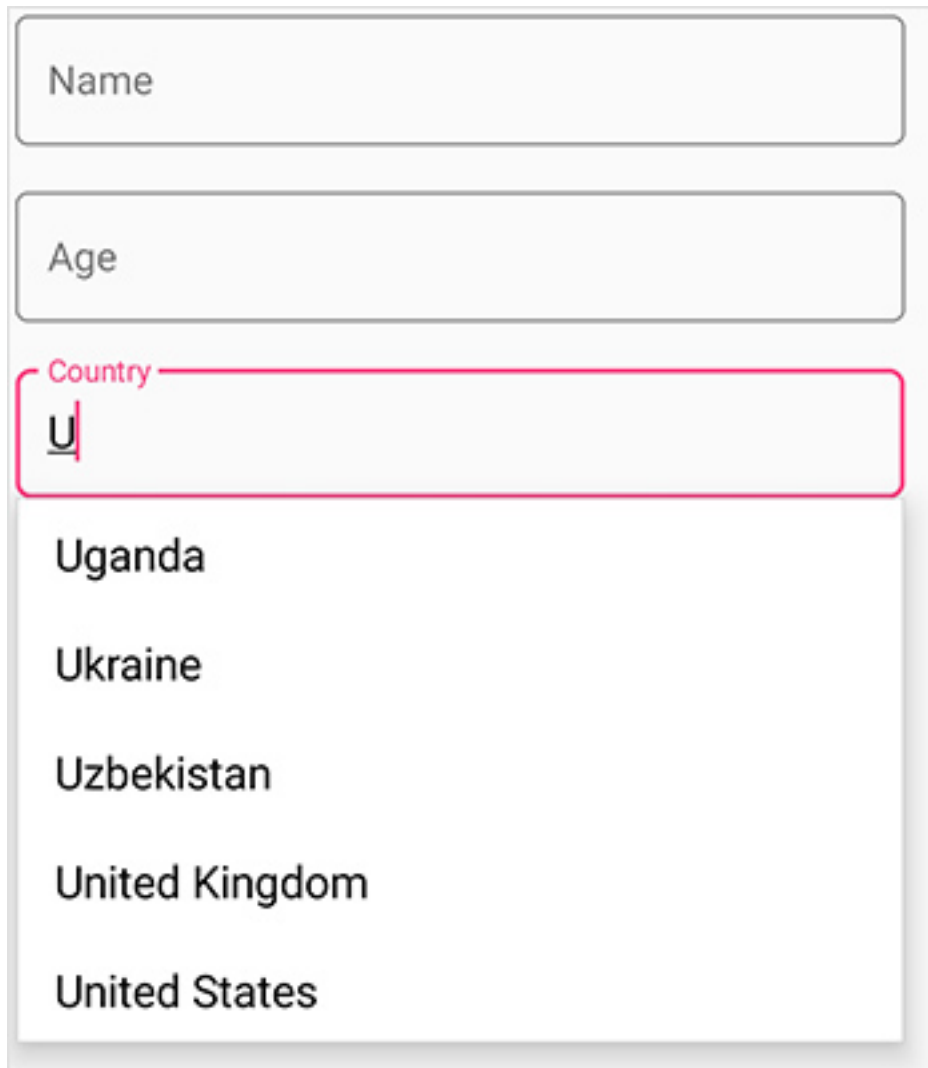

### Using SourceProvider

#### **C#**

```
private string country;
public string Country
{
    get
    {
        return country;
    }
    set
    {
        country = value;
    }
}

public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        var list = new List<string>();
        if (sourceName == "Country")
        {
            list.Add("Indonesia");
            list.Add("Italy");
            list.Add("India");
            list.Add("Iran");
            list.Add("Iraq");
            list.Add("Uganda");
            list.Add("Ukraine");
            list.Add("Canada");
            list.Add("Australia");
            list.Add("Uzbekistan");
            list.Add("France");
            list.Add("United Kingdom");
            list.Add("United States");
        }
        return list;
    }
}

dataForm.SourceProvider = new SourceProviderExt();
dataForm.RegisterEditor("Country", "AutoComplete");
```

The image shows a SfDataForm control with three input fields: 'Name', 'Age', and 'Country'. The 'Country' field is active, showing a dropdown list of suggestions. The suggestions are: Uganda, Ukraine, Uzbekistan, United Kingdom, and United States. The letter 'U' is entered in the 'Country' field, and a red border highlights the dropdown area.

Using [AutoGeneratingItem](#) event

You can also set `ItemsSource` for autocomplete editor by using [ItemsSource](#) property in the [DataFormAutoCompleteItem](#).

### C#

```
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var list = new List<string>();
        list.Add("Indonesia");
        list.Add("Italy");
        list.Add("India");
        list.Add("Iran");
        list.Add("Iraq");
        list.Add("Uganda");
        list.Add("Ukraine");
    }
}
```

```
list.Add("Canada");
list.Add("Australia");
list.Add("Uzbekistan");
list.Add("France");
list.Add("United Kingdom");
list.Add("United States");
(e.DataFormItem as DataFormAutoCompleteItem).ItemsSource = list;
}
```

Dynamically changing the ItemsSource of autocomplete editor

You can also change the [ItemsSource](#) at runtime.

### C#

```
private void Button_Click(object sender, EventArgs e)
{
    var dataFormItem = dataForm.ItemManager.DataFormItems["Country"];
    if (dataFormItem.Name == "Country")
    {
        var list = new List<string>();
        list.Add("Ukraine");
        list.Add("Canada");
        list.Add("Australia");
        list.Add("Uzbekistan");
        list.Add("France");
        list.Add("United Kingdom");
        list.Add("United States");
        (dataFormItem as DataFormAutoCompleteItem).ItemsSource = list;
    }
}
```

Loading complex type property values in autocomplete editor

You can display the complex type property values in autocomplete editor by using [GetSource](#) override method of the SourceProvider class, which is used to get source list as complex property values for autocomplete editor and set it to the SourceProvider property of SfDataForm. Use the [AutoGeneratingDataFormItem](#) event to set [DisplayMemberPath] and [SelectedValuePath] property values of AutoComplete for complex type property.

**Note:** Class cannot be directly set as data type for autocomplete editor in this complex type scenario.

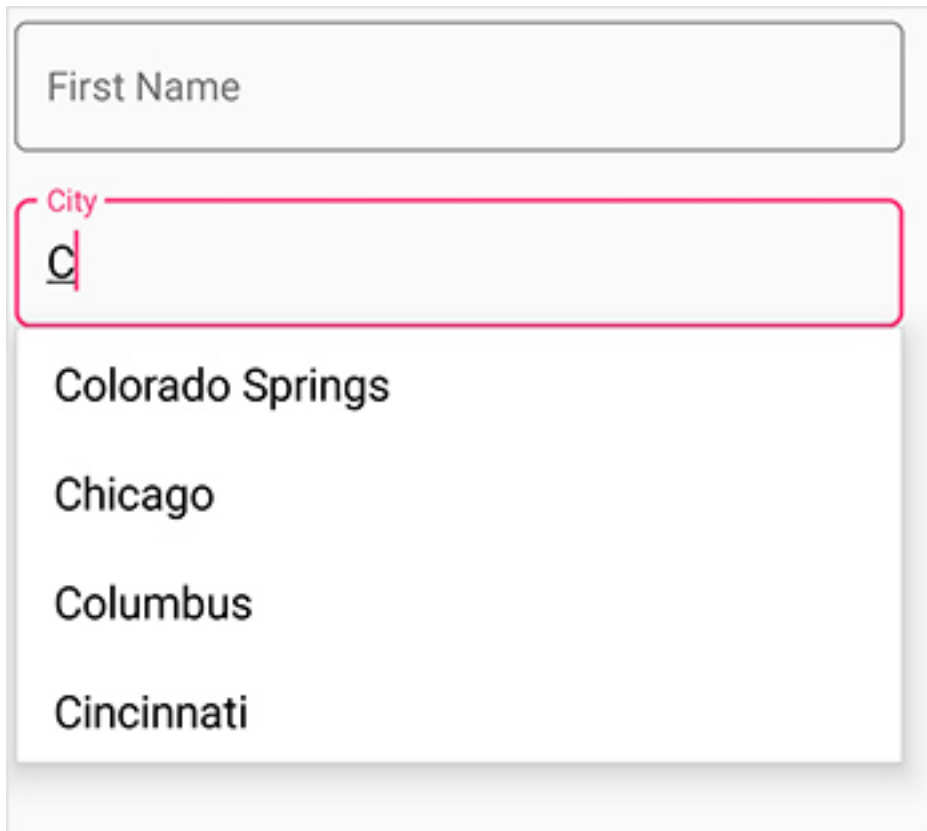

### C#

```
dataForm.SourceProvider = new SourceProviderExt();
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("City", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "City")
    {
        (e.DataFormItem as DataFormAutoCompleteItem).DisplayMemberPath = "City";
        (e.DataFormItem as DataFormAutoCompleteItem).SelectedValuePath =
"PostalCode";
    }
}
```

```
}
}
public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        if (sourceName == "City")
        {
            List<Address> details = new List<Address>();
            details.Add(new Address() { City = "Colorado Springs", PostalCode = 1 });
            details.Add(new Address() { City = "Chicago", PostalCode = 2 });
            details.Add(new Address() { City = "Columbus", PostalCode = 3 });
            details.Add(new Address() { City = "Portland", PostalCode = 4 });
            details.Add(new Address() { City = "Paris", PostalCode = 5 });
            details.Add(new Address() { City = "Las Vegas", PostalCode = 6 });
            details.Add(new Address() { City = "New York", PostalCode = 7 });
            details.Add(new Address() { City = "Cincinnati", PostalCode = 8 });
            details.Add(new Address() { City = "San Diego", PostalCode = 9 });
            return details;
        }
        return new List<string>();
    }
}

public class ContactInfo
{
    [Display(Name = "First Name")]
    public String FirstName { get; set; }
    public string City { get; set; }
}

public class Address
{
    public int PostalCode { get; set; }
    public string City { get; set; }
}
```

#### *Customizing the appearance of autocomplete editor*

##### *AutoComplete editor modes*

The [DataFormAutoCompleteEditor](#) provides the following three different ways to display the filtered suggestions.

- Suggest - Displays suggestions in drop-down list
- Append - Appends the first suggestion to text
- SuggestAppend - Performs both suggest and append.

The [AutoCompleteMode](#) property is used to choose the suggestion display mode in the [DataFormAutoCompleteItem](#) class. The default value is Suggest.

##### *Suggestion choices in list*

The filtered suggestions are displayed in a drop-down list. Users can pick an item from the list.

#### **C#**

```
dataForm.DataObject = new ContactInfo();
dataForm.SourceProvider = new SourceProviderExt();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
```

```
autoCompleteItem.AutoCompleteMode = AutoCompleteMode.Suggest;
}
}
public class SourceProviderExt : SourceProvider
{
    public override IList GetSource(string sourceName)
    {
        var list = new List<string>();
        if (sourceName == "Country")
        {
            list.Add("Indonesia");
            list.Add("Italy");
            list.Add("India");
            list.Add("Iran");
            list.Add("Iraq");
            list.Add("Uganda");
            list.Add("Ukraine");
            list.Add("Canada");
            list.Add("Australia");
            list.Add("Uzbekistan");
            list.Add("France");
            list.Add("United Kingdom");
            list.Add("United States");
        }
        return list;
    }
}
```

The image shows a SfDataForm control with three input fields: 'Name', 'Age', and 'Country'. The 'Country' field is active, showing a dropdown list of suggestions. The suggestions are: Uganda, Ukraine, Uzbekistan, United Kingdom, and United States. The first suggestion, 'Uganda', is highlighted. The dropdown is open, and the text 'U' is visible in the input field.

#### [Appending suggestion to text](#)

The first item in the filtered suggestions is appended to autocomplete editor text. In this mode, the dropdown remains closed.

#### **C#**

```
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.AutoCompleteMode = AutoCompleteMode.Append;
    }
}
```

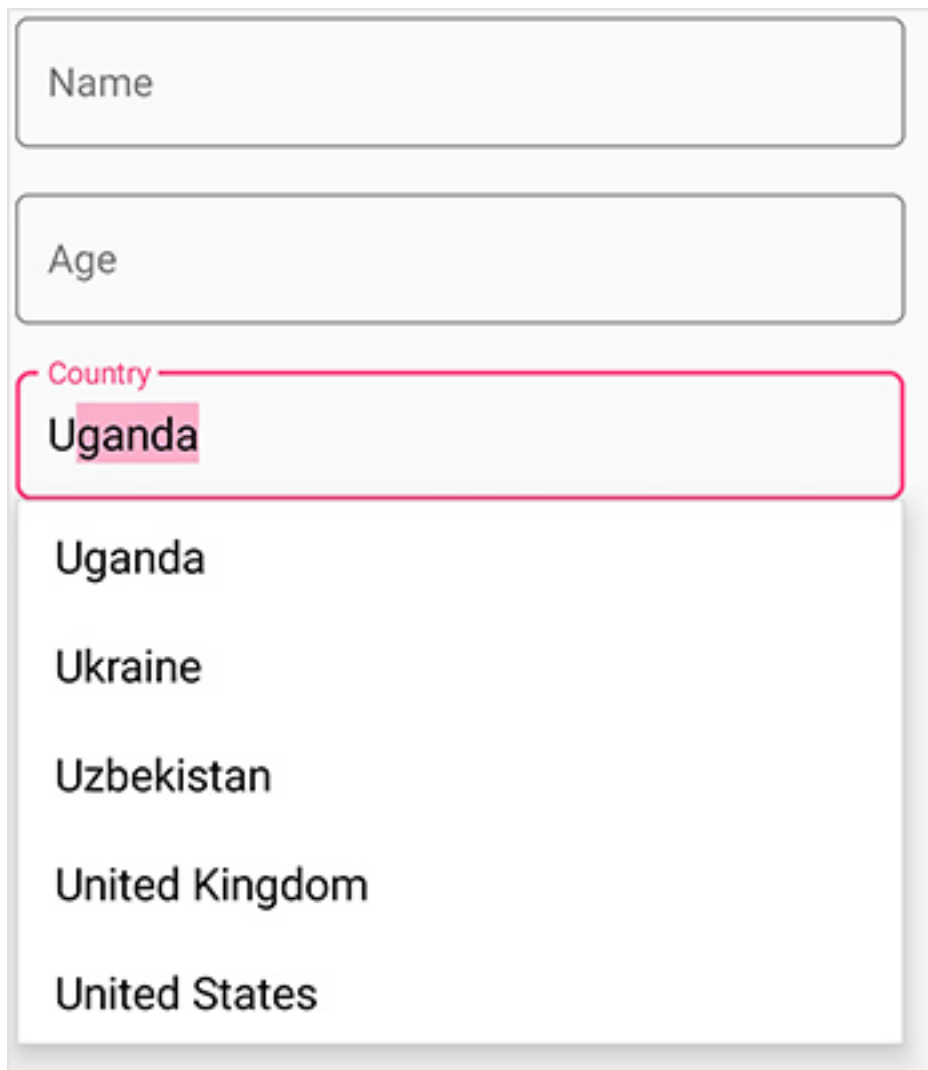

#### [Suggesting choices and appending suggestions to Text](#)

The text is appended to the first matched item in the suggestions collection, and the filtered suggestions are displayed in a drop-down list. The users can pick an item from a list directly or use the up and down keys for browsing the list.

#### **C#**

```
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.AutoCompleteMode = AutoCompleteMode.SuggestAppend;
    }
}
```

The image shows a form with three input fields: 'Name', 'Age', and 'Country'. The 'Country' field is highlighted with a red border and contains the text 'Uganda'. Below the 'Country' field, a dropdown menu is open, displaying a list of suggestions: 'Uganda', 'Ukraine', 'Uzbekistan', 'United Kingdom', and 'United States'. The 'Uganda' suggestion is highlighted with a pink background.

#### [AutoComplete editor suggestion options](#)

The phenomenon of string comparison for filtering suggestions can be changed using the [SuggestionMode](#) property. The default filtering strategy is “StartsWith”, and it is case insensitive. The available filtering modes are,

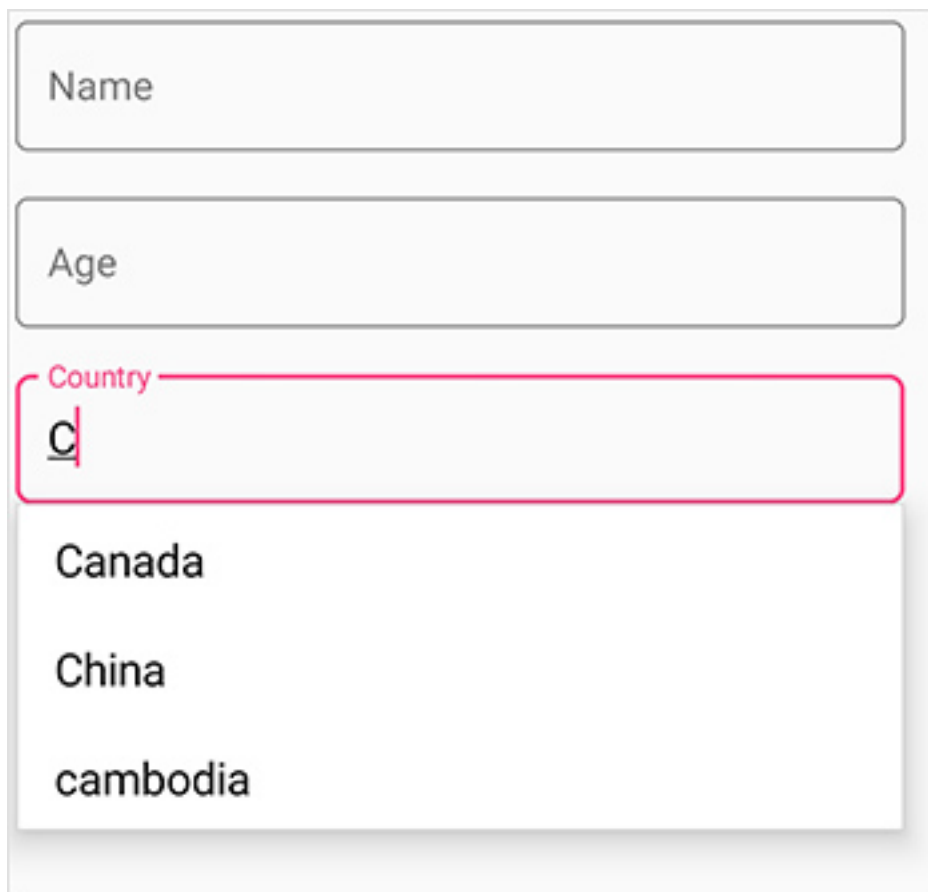

- StartsWith
- StartsWithCaseSensitive
- Contains
- ContainsWithCaseSensitive
- Equals
- EqualsWithCaseSensitive
- EndsWith
- EndsWithCaseSensitive

#### [Filtering words that starts with input text](#)

Displays all the matches that start with the typed characters in items source of autocomplete editor. This strategy is case in sensitive.

**C#**

```
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.SuggestionMode =
        Syncfusion.XForms.DataForm.SuggestionMode.StartsWith;
    }
}
```

The screenshot shows a form with three input fields: 'Name', 'Age', and 'Country'. The 'Country' field is active, showing a red border and a list of suggestions: 'Canada', 'China', and 'cambodia'. The suggestions are filtered based on the input text 'C'.

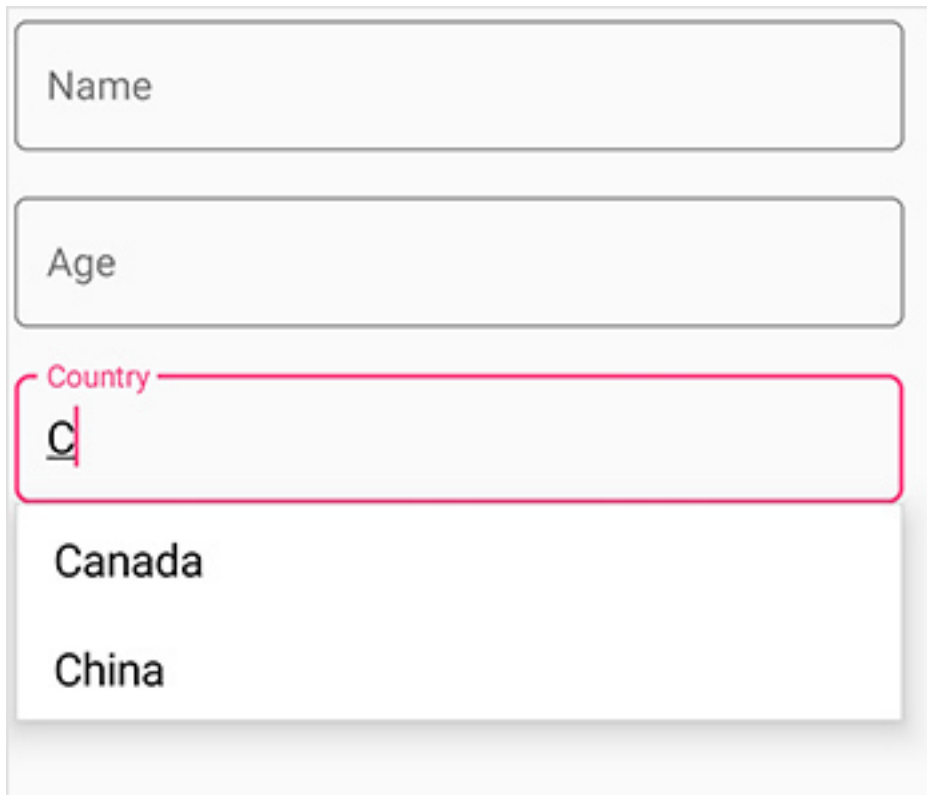

**Filtering words that starts with input text - CaseSensitive**

Displays all the matches that start with the typed characters in items source of autocomplete editor. This strategy is case sensitive.

**C#**

```
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
```

```
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.SuggestionMode =
        Syncfusion.XForms.DataForm.SuggestionMode.StartsWithCaseSensitive;
    }
}
```

The image shows a vertical stack of four text input fields. The first field is labeled 'Name', the second 'Age', and the third 'Country'. The 'Country' field is active, with a red border and a red cursor. Below the 'Country' field, a dropdown menu is open, displaying two suggestions: 'Canada' and 'China'. The first suggestion, 'Canada', is highlighted with a light blue background. The input text in the 'Country' field is 'C'.

#### [Filtering words that contains the input text](#)

Displays all the matches that contain the typed characters in items source of autocomplete editor. This strategy is case in-sensitive.

#### [Filtering words that contains the input text - CaseSensitive](#)

Displays all the matches that contain the typed characters in items source of autocomplete editor. This strategy is case sensitive.

#### [Filtering words that equals the input text](#)

Displays all the words that completely matches with the typed characters in items source of autocomplete editor. This strategy is case in-sensitive.

#### [Filtering words that equal the input text - CaseSensitive](#)

Displays all the words that completely match with the typed characters in items source of autocomplete editor. This strategy is case sensitive.

#### Filtering words that end with the input text

Displays all the matches that end with the typed characters in items source of autocomplete editor. This strategy is case in-sensitive.

#### Filtering words that end with the input text - CaseSensitive

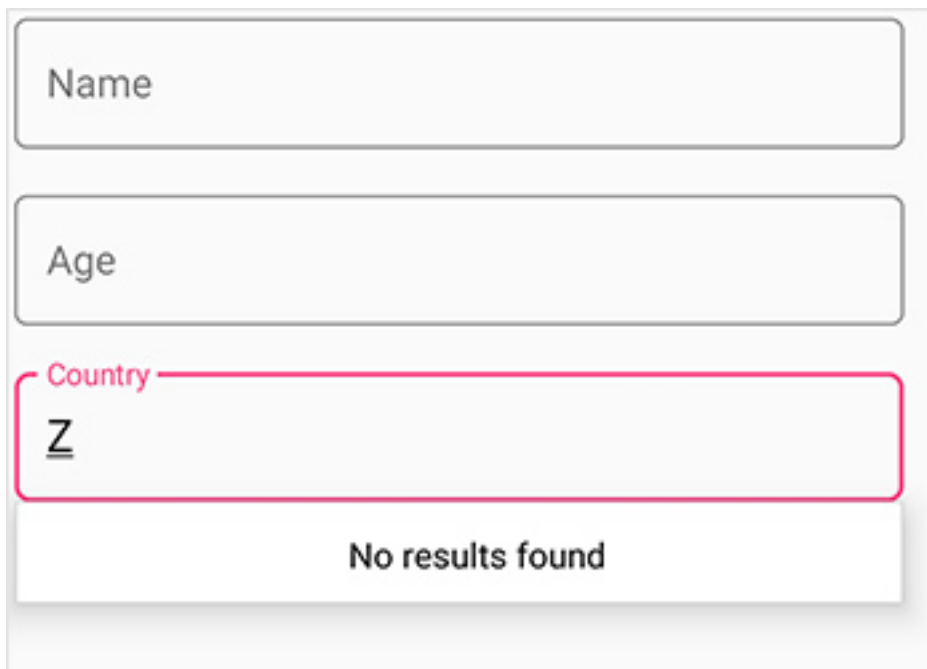

Displays all the matches that end with the typed characters in items source of autocomplete editor. This strategy is case sensitive.

#### No results found text

When the entered item is not in the suggestion list, SfAutoComplete displays a text that indicates there is no search results found. You can set the desire text to be displayed for indicating no results found with the [NoResultsFoundText](#) property.

#### C#

```
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.NoResultsFoundText = "No result found";
    }
}
```

The image shows a user interface with three text input fields stacked vertically. The first field is labeled 'Name', the second 'Age', and the third 'Country'. The 'Country' field is currently active, indicated by a red border, and contains the letter 'Z'. Below the 'Country' field, a white box with a gray border contains the text 'No results found'.

**Note:** The [NoResultsFoundText](#) works by default in the UWP platform without setting any property by showing the text "No result found".

### Highlighting match text

Highlights matching characters in a suggestion list to pick an item with more clarity. The text highlight can be indicated with various customizing colors by enabling the following property.

- [HighlightedTextColor](#) - Sets the color of the highlighted text for differentiating the highlighted characters.

### TextHighlightMode

There are two ways to highlight the matching text:

- First occurrence

### C#

```
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.SuggestionMode = SuggestionMode.StartsWith;
        autoCompleteItem.HighlightedTextColor = Color.Red;
        autoCompleteItem.TextHighlightMode = OccurrenceMode.FirstOccurrence;
        autoCompleteItem.ItemsSource = new List<string>
        {
            "Albania",
            "Algeria",
            "American Samoa",
            "Andorra"
        };
    }
}
```

Name

#### Maximum display item in dropdown column

Restrict the number of suggestions displayed and get the remaining items loaded by selecting LoadMore. You can restrict maximum suggestion to be displayed with the [MaximumSuggestion](#) property. You can set the desired text for displaying the Load more text using the [LoadMoreText](#) property.

#### C#

```
dataForm.DataObject = new ContactInfo();  
dataForm.RegisterEditor("Country", "AutoComplete");  
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")  
    {  
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);  
        autoCompleteItem.MaximumSuggestion = 3;  
        autoCompleteItem.LoadMoreText = "Load more";  
    }  
}
```

```
}
```

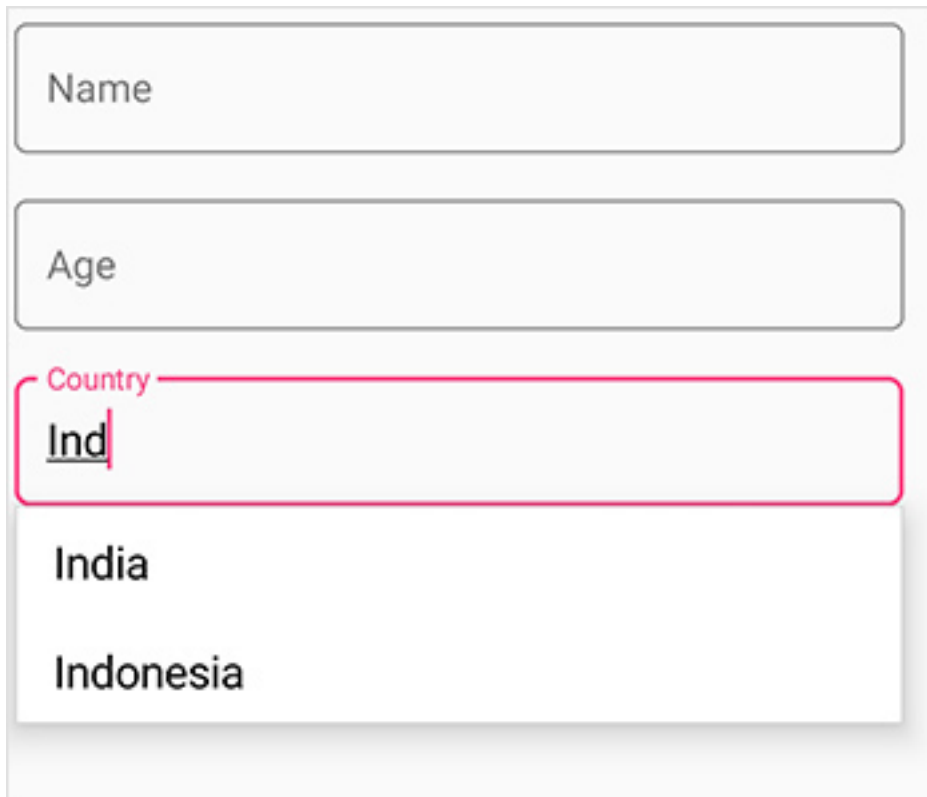

The image shows a user interface for a data form. It has three input fields: 'Name', 'Age', and 'Country'. The 'Country' field is active, showing a red border and a dropdown list of suggestions: 'Uganda', 'Ukraine', and 'Uzbekistan'. The first letter 'U' is entered in the field. Below the list is a 'Load more' button.

#### Minimum prefix character

Instead of displaying suggestion list on every character entry, matches can be filtered and displayed after a few character entries using the [MinimumPrefixCharacters](#) property. The default value is 1.

#### C#

```
dataForm.DataObject = new ContactInfo();
dataForm.RegisterEditor("Country", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Country")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.MinimumPrefixCharacters = 3;
    }
}
```

The image shows a SfDataForm control with three input fields: 'Name', 'Age', and 'Country'. The 'Country' field is active, showing the text 'Ind' with a red border. Below the input field, a suggestion list is displayed with two items: 'India' and 'Indonesia'.

#### Diacritic sensitivity

The control does not stick with one type of keyboard, so you can populate items from a language with letters containing diacritics, and search for them with the English characters from an en-US keyboard. Users can enable or disable the diacritic sensitivity using [IgnoreDiacritic](#) property. The following code example illustrates how to enable the diacritic sensitivity, so that items in the suggestion list can be populated by entering any diacritic character of that alphabet.

#### C#

```
dataForm.DataObject = new Queries();
dataForm.RegisterEditor("RelatedQuestions", "AutoComplete");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "RelatedQuestions")
    {
        var autoCompleteItem = (e.DataFormItem as DataFormAutoCompleteItem);
        autoCompleteItem.IgnoreDiacritic = false;
        autoCompleteItem.ItemsSource = new List<string>
        {
            "Hów tó gâin wéight?",
            "Hów tó drâw ân éléphânt?",
            "Whéré cân I buy â câmérá?",
            "Guidé mé âll thé wây",
        };
    }
}
public class Queries
```

```
{  
    [Display(ShortName = "Product Name")]  
    public string ProductName { get; set; }  
    public string Cost { get; set; }  
    [Display(ShortName = "Related questions asked")]  
    public string RelatedQuestions { get;set; }  
}
```

Product Name

Cost

Related questions asked

a

Hów tó gâin wéight?

Hów tó drâw ân éléphânt?

Whéré cân I buy â câmêrá?

Guidé mé âll thé wây

#### Custom editor

The custom editor can be added to DataForm by overriding the `DataFormEditor` class for business models. You can create custom editor using [Views](#) and [Layouts](#).

To add custom editor in DataForm, register the editor with custom registered type for the required property using `RegisterEditor` method. You can also customize editor settings by using specific override methods available in `DataFormEditor`.

- Creating custom editor using views.
- Creating custom editor using layouts.

*Creating custom editor using views*

Views such as labels, buttons, and sliders can be loaded to custom editor. Here, entry is loaded as custom editor for **ContactName** property.

**C#**

```
public class CustomTextEditor : DataFormEditor<Entry>
{
    public CustomTextEditor(SfDataForm dataForm) : base(dataForm)
    {
    }
    protected override Entry OnCreateEditorView(DataFormItem dataFormItem)
    {
        return new Entry();
    }
}
...
dataForm.RegisterEditor("CustomTextEditor", new CustomTextEditor(dataForm));
dataForm.RegisterEditor("ContactName", "CustomTextEditor");
```

*Creating custom editor using layouts*

Layouts such as Grid, StackLayout, ContentView, and ScrollView can be added as custom editor. Here, the label and image view in Grid are loaded as custom editors for **ContactName** property.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentView xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="DataForm_Forms.TextEditor">
    <ContentPage.Content>
        <Grid>
            <Grid.ColumnDefinitions>
                <ColumnDefinition Width="0.05*" />
                <ColumnDefinition Width="Auto" />
            </Grid.ColumnDefinitions>
            <Image Source="LabelContactName.png" />
            <Editor Grid.Column="1" />
        </Grid>
    </ContentPage.Content>
</ContentView>
```

**C#**

```
public class CustomTextEditor : DataFormEditor<TextEditor>
{
    public CustomTextEditor(SfDataForm dataForm) : base(dataForm)
    {
    }
    protected override TextEditor OnCreateEditorView(DataFormItem dataFormItem)
    {
        return new TextEditor();
    }
}
...
```

```
dataForm.RegisterEditor("CustomTextEditor", new CustomTextEditor(dataForm));  
dataForm.RegisterEditor("ContactName", "CustomTextEditor");
```

You should manually commit and validate the editor value of custom DataFormItem. Refer to this [link](#) to know more about custom editor.

## Validation

The data form validates the data and displays hints in the case of validation is not passed. In case of invalid data, the error message is shown at the bottom of the editor.

### Built in validations

The supported built in validations are as follows:

- INotifyDataErrorInfo
- Data annotation

### Using INotifyDataErrorInfo

You can validate the data by implementing the [INotifyDataErrorInfo](#) interface in the data object class.

### C#

```
public class EmployeeInfo : INotifyDataErrorInfo, INotifyPropertyChanged  
{  
    private int _EmployeeID;  
    private string _Name;  
    private string _Title;  
    public event PropertyChangedEventHandler PropertyChanged;  
    public event EventHandler<DataErrorsChangedEventArgs> ErrorsChanged;  
    public EmployeeInfo()  
    {  
    }  
    public int EmployeeID  
    {  
        get { return this._EmployeeID; }  
        set  
        {  
            this._EmployeeID = value;  
            this.RaisePropertyChanged("EmployeeID");  
        }  
    }  
    public string Name  
    {  
        get { return this._Name; }  
        set  
        {  
            this._Name = value;  
            this.RaisePropertyChanged("Name");  
        }  
    }  
    public string Title  
    {  
        get { return this._Title; }  
        set  
        {  
            this.Title = value;  
        }  
    }  
}
```

```

this.RaisePropertyChanged("Title");
}
}
[Display(AutoGenerateField = false)]
public bool HasErrors
{
    get
    {
        return false;
    }
}
private void RaisePropertyChanged(string propertyName)
{
    if (PropertyChanged != null)
        PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
}
public IEnumerable GetErrors(string propertyName)
{
    var list = new List<string>();
    if (!propertyName.Equals("Title"))
        return list;
    if (this.Title.Contains("Marketing"))
        list.Add("Marketing is not allowed");
    return list;
}
}

```

#### Data annotations

You can validate the data using data annotation attributes.

The numeric type like Int, Double, Decimal properties can be validated using the [Range](#) attribute.

#### C#

```

private int _EmployeeID;
[Range(1000, 1500, ErrorMessage = "EmployeeID should be between 1000 and 1500")]
public int EmployeeID
{
    get { return this._EmployeeID; }
    set
    {
        this._EmployeeID = value;
        this.RaisePropertyChanged("EmployeeID");
    }
}

```

The String type property can be validated using [Required](#) and [StringLength](#) attributes.

#### C#

```

private string _Name;
[Required(AllowEmptyStrings = false, ErrorMessage = "Name should not be empty")]
[StringLength(10, ErrorMessage = "Name should not exceed 10 characters")]
public string Name

```

```
{
get { return this._Name; }
set
{
this._Name = value;
this.RaisePropertyChanged("Name");
}
}
```

#### Date range attribute

You can validate the date time value using date range attribute.

#### C#

```
private DateTime joinDate;
[DateRange(MinYear = 2010, MaxYear = 2017, ErrorMessage = "Join date is
invalid")]
public DateTime JoinDate
{
get
{
return joinDate;
}
set
{
joinDate = value;
}
}
```

The screenshot shows a mobile application interface with a blue header bar. The header bar contains a mail icon on the left and status information (signal strength, 100% battery, and time 15:16) on the right. Below the header, there is a form with five input fields. The first field, labeled 'EmployeeID', contains the value '0'. The second field, labeled 'Name', is empty. The third field, labeled 'CustomerID', is empty. The fourth field, labeled 'Title', is empty. The fifth field, labeled 'JoinDate', contains the value '7/19/0003'. Below the 'JoinDate' field, there is a red error message that reads 'Join date is invalid'. At the bottom of the screen, there is a grey navigation bar with four icons: a circle, a square, a square, and a triangle.

EmployeeID	0
Name	
CustomerID	
Title	
JoinDate	7/19/0003

Join date is invalid

## Validation mode

The [ValidationMode](#) determines when the value should be validated.

The supported validation modes are as follows:

- `LostFocus`
- `PropertyChanged`
- `Explicit`

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
  <ContentPage.Content>
    <dataForm:SfDataForm x:Name="dataForm" ValidationMode="LostFocus"/>
  </ContentPage.Content>
</ContentPage>
```

## C#

```
dataForm.ValidationMode = ValidationMode.LostFocus;
```

### *LostFocus*

If the commit mode is `LostFocus`, the value will be validated when the editor lost its focus.

### *PropertyChanged*

The value will be validated immediately when it is changed.

### *Explicit*

The value should be validated manually by calling the [SfDataForm.Validate](#) or [SfDataForm.Validate \(propertyName\)](#) method.

The following code validates the value of all the properties in the data object:

## C#

```
dataForm.Validate();
```

To validate the specific property value, pass the property name as argument.

## C#

```
dataForm.Validate("Name");
```

You can determine whether the data form or property is valid or not by using the `Validate` method.

## C#

```
bool isValid = dataForm.Validate();
bool isPropertyValid = dataForm.Validate("Property");
```

If the data form or property is valid, `true` will be returned. Or else `false` will be returned.

**Note:** For validating value, the new value should be committed in data object. So, `ValidationMode` takes higher priority than `CommitMode`.

#### Custom validation through events

You can validate the data using the [Validating](#) event of the data form.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm" Validating="DataForm_Validating" />
</Grid>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
dataForm.Validating += DataForm_Validating;
private void DataForm_Validating(object sender, ValidatingEventArgs e)
{
    if (e.PropertyName == "Name")
    {
        if (e.Value != null && e.Value.ToString().Length > 8)
        {
            e.IsValid = false;
            e.ErrorMessage = "Name should not exceed 8 characters";
        }
    }
}
```

You can get the notification after completing validation using the [Validated](#) event of the data form.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm" Validated="DataForm_Validated" />
</Grid>
```

```
</ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.Validated += DataForm_Validated;
private void DataForm_Validated(object sender, ValidatedEventArgs e)
{
    var isValid = e.IsValid;
    var propertyName = e.PropertyName;
}
```

You can get the details of invalid DataFormItems when validating the data form as **Explicit** validation mode using [ValidationCompleted](#) event. This event contains [ValidationCompletedEventArgs](#) argument, which holds a list of DataFormItem as errors.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm"
ValidationCompleted="DataForm_ValidationCompleted" />
</ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.ValidationCompleted += DataForm_ValidationCompleted;
...
private void DataForm_ValidationCompleted(object sender,
ValidationCompletedEventArgs e)
{
    var invalidItems = e.Errors;
}
```

### Valid or positive message

If the value meets the desired criteria, you can show the [valid or positive message](#). As error message, the valid message will also be displayed at the bottom of the editor.

### C#

```
private string _Name;
[DisplayOptions(ValidMessage = "Name length is enough")]
[StringLength(10, ErrorMessage = "Name should not exceed 10 characters")]
public string Name
{
    get { return this._Name; }
    set
```

```
{  
  this._Name = value;  
  this.RaisePropertyChanged("Name");  
}
```

The screenshot displays a mobile application interface with a blue status bar at the top showing icons for signal, Wi-Fi, 100% battery, and the time 15:21. Below the status bar is a form with five input fields. The first field, 'EmployeeID', contains the value '0'. The second field, 'Name', contains the value 'John' and has a green validation message 'Name length is enough' displayed below it. The third field, 'CustomerID', is empty. The fourth field, 'Title', is empty. The fifth field, 'JoinDate', contains the value '1/1/0001'. At the bottom of the screen is a grey navigation bar with four icons: a circle, a square, a square, and a left-pointing arrow.

EmployeeID	0
Name	John Name length is enough
CustomerID	
Title	
JoinDate	1/1/0001

How to validate the property value based on another value

To validate one property value based on another property value, use the [property changed event](#) and [Validate](#) methods.

Here, AccountNumber and AccountNumber1 fields are validated.

### C#

```
dataForm.DataObject = new RecipientInfo();
(dataForm.DataObject as INotifyPropertyChanged).PropertyChanged +=
DataFormGettingStarted_PropertyChanged;
private void DataFormGettingStarted_PropertyChanged(object sender,
PropertyChangedEventArgs e)
{
    if (e.PropertyName.Equals("AccountNumber"))
    {
        var value =
        (string)sender.GetType().GetProperty("AccountNumber1").GetValue(sender);
        if (!string.IsNullOrEmpty(value))
        dataForm.Validate("AccountNumber1");
    }
    else if (e.PropertyName.Equals("AccountNumber1"))
    {
        var value =
        (string)sender.GetType().GetProperty("AccountNumber").GetValue(sender);
        if (!string.IsNullOrEmpty(value))
        dataForm.Validate("AccountNumber");
    }
}
```

Customize validation message using DataTemplate

The default appearance of the validation message can be customized by using the [ValidationTemplate](#) property of the `DataForm`.

### XML

```
<dataForm:SfDataForm
x:Name="dataForm"
ValidationTemplate="{Binding ValidationTemplate}">
<dataForm:SfDataForm.BindingContext>
<local:ValidationDataTemplate/>
</dataForm:SfDataForm.BindingContext>
</dataForm:SfDataForm>
```

*Creating a DataTemplate*

### C#

```
public class ValidationDataTemplate :DataTemplate
{
    public DataTemplate ValidationTemplate { get; set; }
    public ValidationDataTemplate()
    {
        ValidationTemplate = new DataTemplate(() =>
        {
            return new Button

```

```
{
    Text = "Field should not be empty",
    TextColor = Color.White,
    BackgroundColor = Color.LightGreen
};
});
}
```

### Customize validation message using DataTemplateSelector

You can use **DataTemplateSelector** to choose a **DataTemplate** at runtime based on the value of a data-bound to [ValidationTemplate](#) property of DataForm. It lets you choose a different data template for each validation message, customizing the appearance of a particular validation message based on certain conditions.

### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<local:TemplateSelector x:Key="validationDataTemplateSelector" />
</ResourceDictionary>
</ContentPage.Resources>
<dataForm:SfDataForm Grid.Row="1" x:Name="dataForm"
ValidationTemplate="{StaticResource validationDataTemplateSelector}" />
```

### *Creating a DataTemplateSelector*

### C#

```
public class TemplateSelector : DataTemplateSelector
{
    public DataTemplate ValidMessageTemplate { get; set; }
    public DataTemplate InvalidMessageTemplate { get; set; }
    public DataTemplate LastNameTemplate { get; set; }
    public DataTemplate EmailTemplate { get; set; }
    public DataTemplate ContactNumberTemplate { get; set; }
    public TemplateSelector()
    {
        ValidMessageTemplate = new DataTemplate(typeof(ValidMessageTemplate));
        InvalidMessageTemplate = new DataTemplate(typeof(InvalidMessageTemplate));
        LastNameTemplate = new DataTemplate(typeof(LastNameTemplate));
        EmailTemplate = new DataTemplate(typeof(EmailTemplate));
        ContactNumberTemplate = new DataTemplate(typeof(ContactNumberTemplate));
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject container)
    {
        var dataform = (container as SfDataForm);
        if (dataform == null) return null;
        if (dataform != null)
        {
            if ((item as DataFormItem).LabelText == "First Name")
            {
                if (!(item as DataFormItem).IsValid)
                {
                    return InvalidMessageTemplate;
                }
            }
        }
    }
}
```

```

    }
    else
    {
        return ValidMessageTemplate;
    }
}
else if ((item as DataFormItem).LabelText == "Last Name")
{
    if (!(item as DataFormItem).IsValid)
    {
        return LastNameTemplate;
    }
}
else if ((item as DataFormItem).LabelText == "Email")
{
    if (!(item as DataFormItem).IsValid)
    {
        return EmailTemplate;
    }
}
else if ((item as DataFormItem).LabelText == "Contact Number")
{
    if (!(item as DataFormItem).IsValid)
    {
        return ContactNumberTemplate;
    }
}
return null;
}
else
return null;
}
}

```

Used **Button** inside a **Grid** to display the valid and invalid message in the view.

### XML

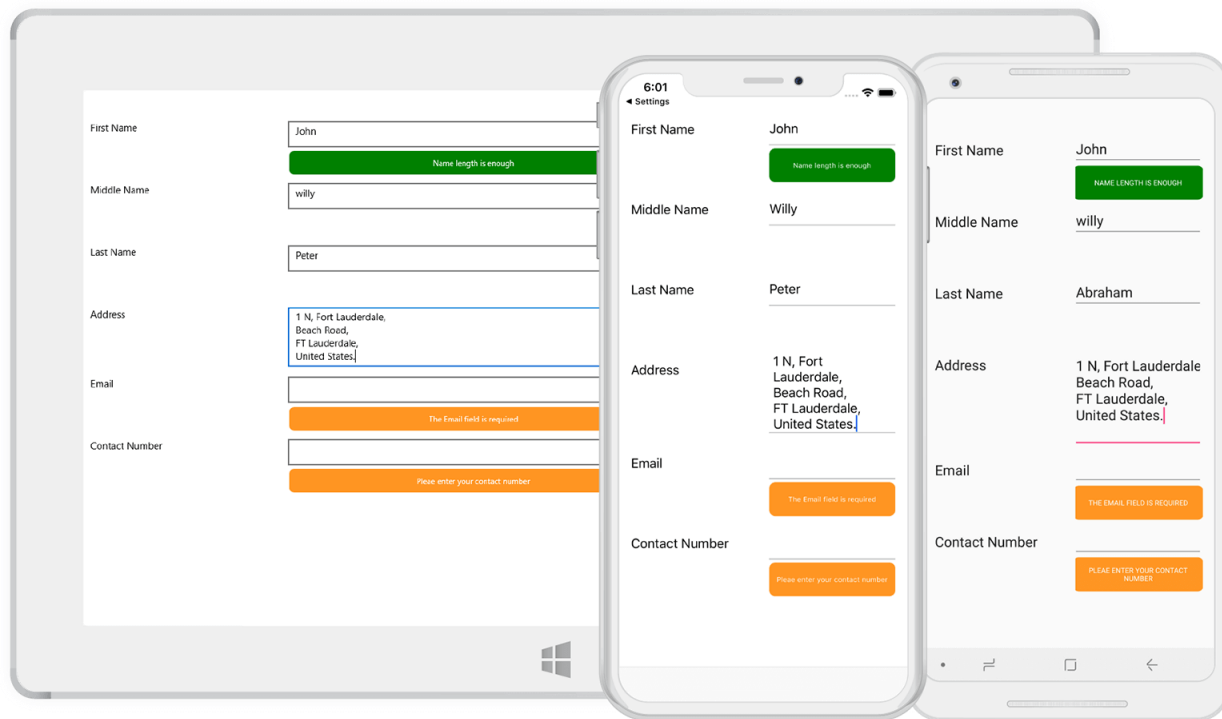

```

<Grid xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="DataForm_Validation.ValidMessageTemplate"
VerticalOptions="FillAndExpand" HorizontalOptions="FillAndExpand">
    <Grid BackgroundColor="Transparent">
        <Button x:Name="maingrid" CornerRadius="8" Text="Name length is enough"
        FontSize="9" TextColor="Green" VerticalOptions="FillAndExpand"
        HorizontalOptions="FillAndExpand"/>
    </Grid>
</Grid>
...
<Grid xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="DataForm_Validation.InvalidMessageTemplate"
VerticalOptions="FillAndExpand" HorizontalOptions="FillAndExpand">
    <Grid BackgroundColor="Transparent">

```

```
<Button x:Name="maingrid" CornerRadius="8" Text="Pleae enter your first  
name" FontSize="9" TextColor="White" VerticalOptions="FillAndExpand"  
HorizontalOptions="FillAndExpand"/>  
</Grid>  
</Grid>
```

## Layout

### Overview

The data form supports linear and grid layouts. The `DataFormLayoutManager` creates the [DataFormItemView](#), [DataFormGroupItemView](#), and manages layout of label, editor, and validation label.

### Linear layout support

By default, the data form arranges the fields one-by-one. It is applicable for both label positions: left and top.

When the label position is Left, the linear layout is shown as follows:

12:11 PM 100%  

First Name

Middle Name

Last Name

Contact Number

Email

Address

When the label position is Top, the linear layout is shown as follows:

12:05 PM  100% 

First Name

Middle Name

Last Name

Contact Number

Email

Address

## Grid layout support

By default, the data form arranges one data field per row. It is possible to have more than one data fields per row by setting the [ColumnCount](#) property which provides grid like layout for the data form.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm" ColumnCount="2"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.ColumnCount = 2;
```

**Note:** Setting the `ColumnCount` property to `SfDataForm` does not arrange the data field in a group according to the column count. To set the column count for data fields in the data form group, refer to [loading different layout for data form group](#)

When the label position is Left, the grid layout is shown as follows:

The image shows a mobile application interface with a blue status bar at the top. The status bar contains icons for a gallery and email on the left, and a mute, Wi-Fi, cellular signal, 100% battery, and 16:17 time on the right. Below the status bar is a light gray data form. The form has six input fields arranged in two columns. The left column contains 'FirstNam', 'LastNam', and 'Email'. The right column contains 'MiddleNa', 'Contact N', and 'BirthDate'. Each field is represented by its label followed by a horizontal line. At the bottom of the screen is a dark gray navigation bar with four white icons: a circle, a stylized 'U' shape, a square, and a left-pointing arrow.

FirstNam	_____	MiddleNa	_____
LastNam	_____	Contact N	_____
Email	_____	BirthDate	_____

When the label position is Top, the grid layout is shown as follows:

The image shows a mobile application interface with a blue status bar at the top. The status bar contains icons for signal strength, Wi-Fi, and battery level (100%), along with the time 16:18. Below the status bar is a light gray data form with six input fields arranged in two columns. The left column contains fields for First Name, Last Name, and Email. The right column contains fields for Middle Name, Contact No, and BirthDate. Each field has a horizontal line indicating the input area. At the bottom of the screen is a dark gray navigation bar with four white icons: a circle, a square, a square with a circle inside, and a left-pointing arrow.

FirstName	MiddleName
_____	_____
LastName	Contact No
_____	_____
Email	BirthDate
_____	_____

### Label visibility

You can hide the label by defining the [DisplayOptions](#) attribute or by handling [AutoGeneratingDataFormItem](#) event. In this case, only the editor will be loaded.

#### Using attributes

##### C#

```
private double? percentage;
[DisplayOptions(ShowLabel = false)]
[Display(Prompt = "Enter percentage")]
public double? Percentage
{
    get
    {
        return percentage;
    }
    set
    {
        percentage = value;
        RaisePropertyChanged("Percentage");
    }
}
```

#### Using event

##### C#

```
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Percentage")
    {
        e.DataFormItem.PlaceholderText = "Enter percentage";
        e.DataFormItem.ShowLabel = false;
    }
}
```

The image shows a mobile application interface with a blue status bar at the top. The status bar contains icons for signal strength, Wi-Fi, and battery level (100%), along with the time 16:21. Below the status bar is a white header area with the text "Enter Name" and a horizontal line. The main content area is white and contains six text input fields, each with a label to its left and a horizontal line to its right. The labels are "MiddleName", "LastName", "Contact No", "Email", and "BirthDate". At the bottom of the screen is a gray navigation bar with four white icons: a circle, a square, a square, and a left arrow.

Enter Name

MiddleName

LastName

Contact No

Email

BirthDate

### Label position

Labels can be positioned either top or left side of the editor. By using the [LabelPosition](#) property, you can layout the label associated with editor.

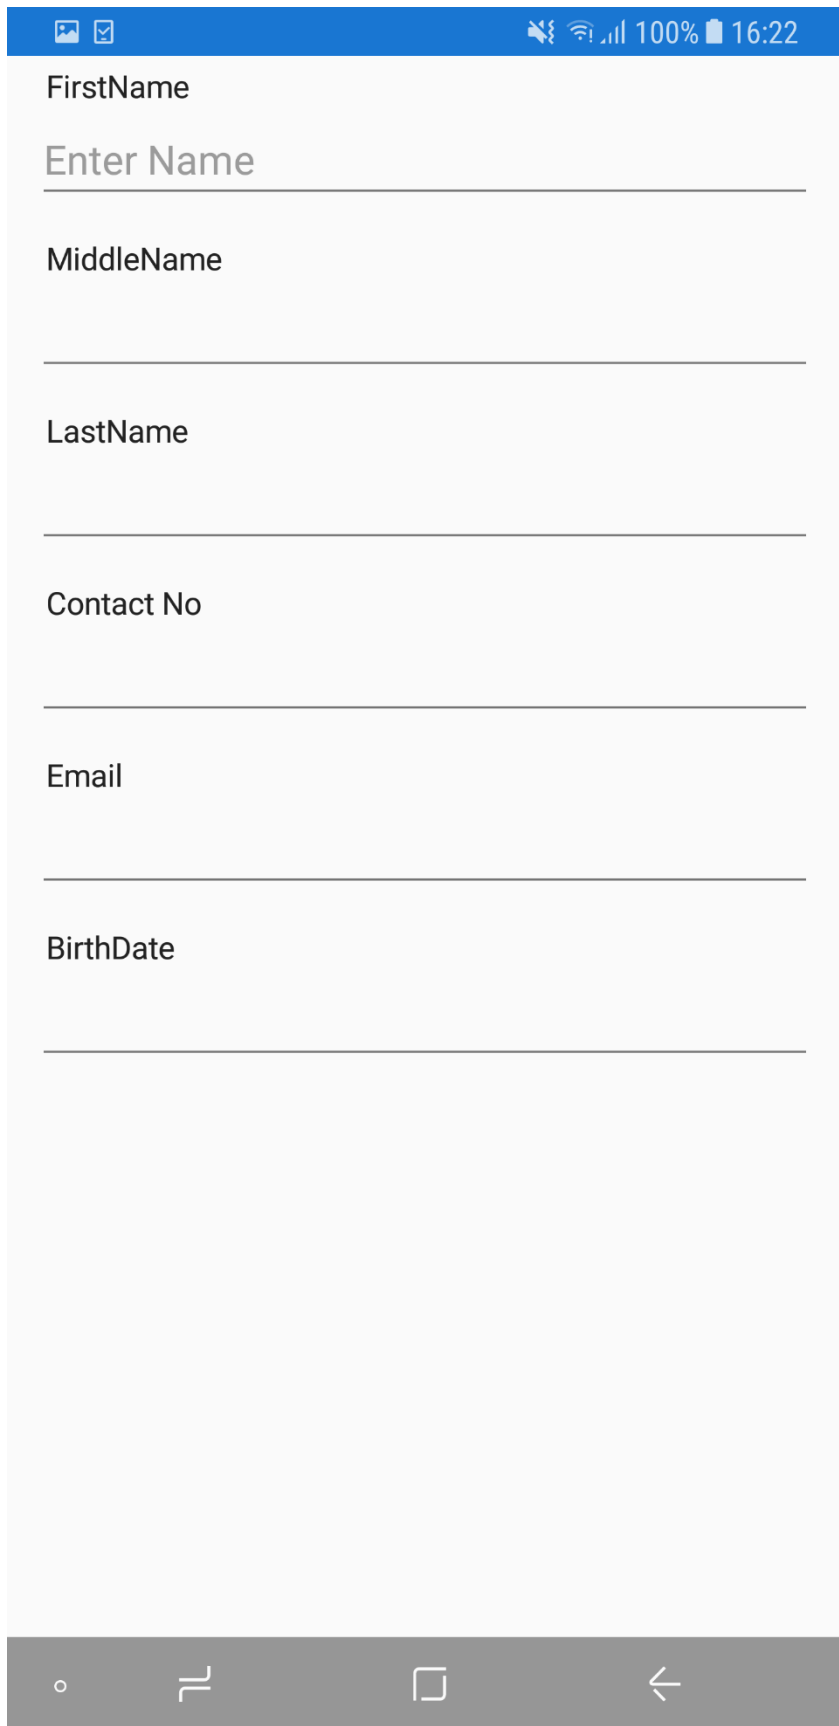

By default, the label will be positioned at left side of the editor.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-
namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<dataForm:SfDataForm x:Name="dataForm" LabelPosition="Top"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
dataForm.LabelPosition = LabelPosition.Top;
```

The image shows a mobile application interface with a blue status bar at the top. The status bar contains icons for a gallery, mail, and a back arrow, along with network and battery status indicators (100% battery, 16:22). Below the status bar is a light gray form with the following fields:

- FirstName**: A text input field with the placeholder text "Enter Name".
- MiddleName**: A text input field.
- LastName**: A text input field.
- Contact No**: A text input field.
- Email**: A text input field.
- BirthDate**: A text input field.

At the bottom of the screen is a dark gray navigation bar with four icons: a circle, a square, a square with a circle inside, and a left-pointing arrow.

### Changing label position of the DataFormItem

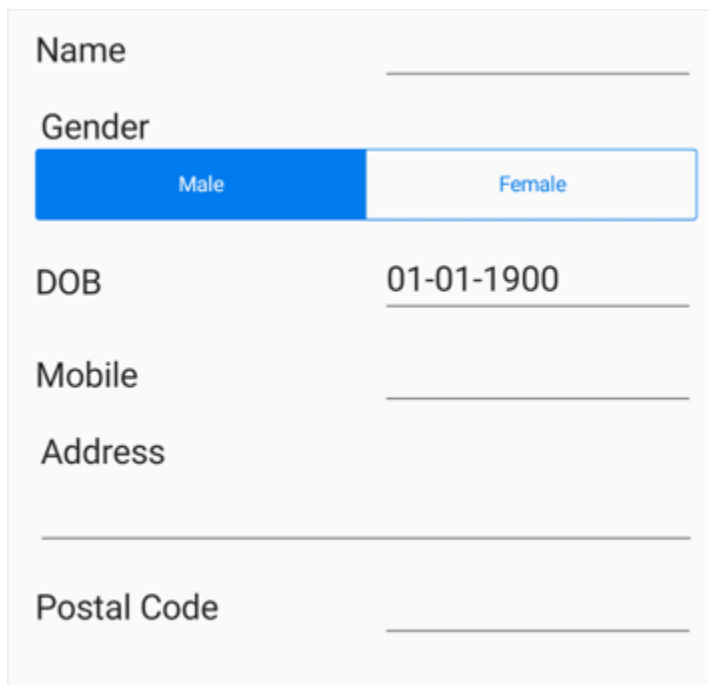

You can change the label position using the [LabelPosition](#) property in `DataFormItem`, and it will be handled in the `AutoGeneratingDataFormItem` event.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

#### C#

```
dataForm.RegisterEditor("Gender", "Segment");
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Gender")
        {
            e.DataFormItem.LabelPosition = LabelPosition.Top;
        }
        if (e.DataFormItem.Name == "Address")
        {
            e.DataFormItem.LabelPosition = LabelPosition.Top;
        }
    }
}
```

### Loading images for label

You can load image instead of label by defining attribute or by handling the `AutoGeneratingDataFormItem` event.

#### Using attributes

To show the image as label, use the `ImageName` property in `DisplayOptions` attribute. Images will be taken from ...\\Resources\\drawable folder in Xamarin.Forms.Android, ...\\Resources folder in Xamarin.Forms.iOS.

#### C#

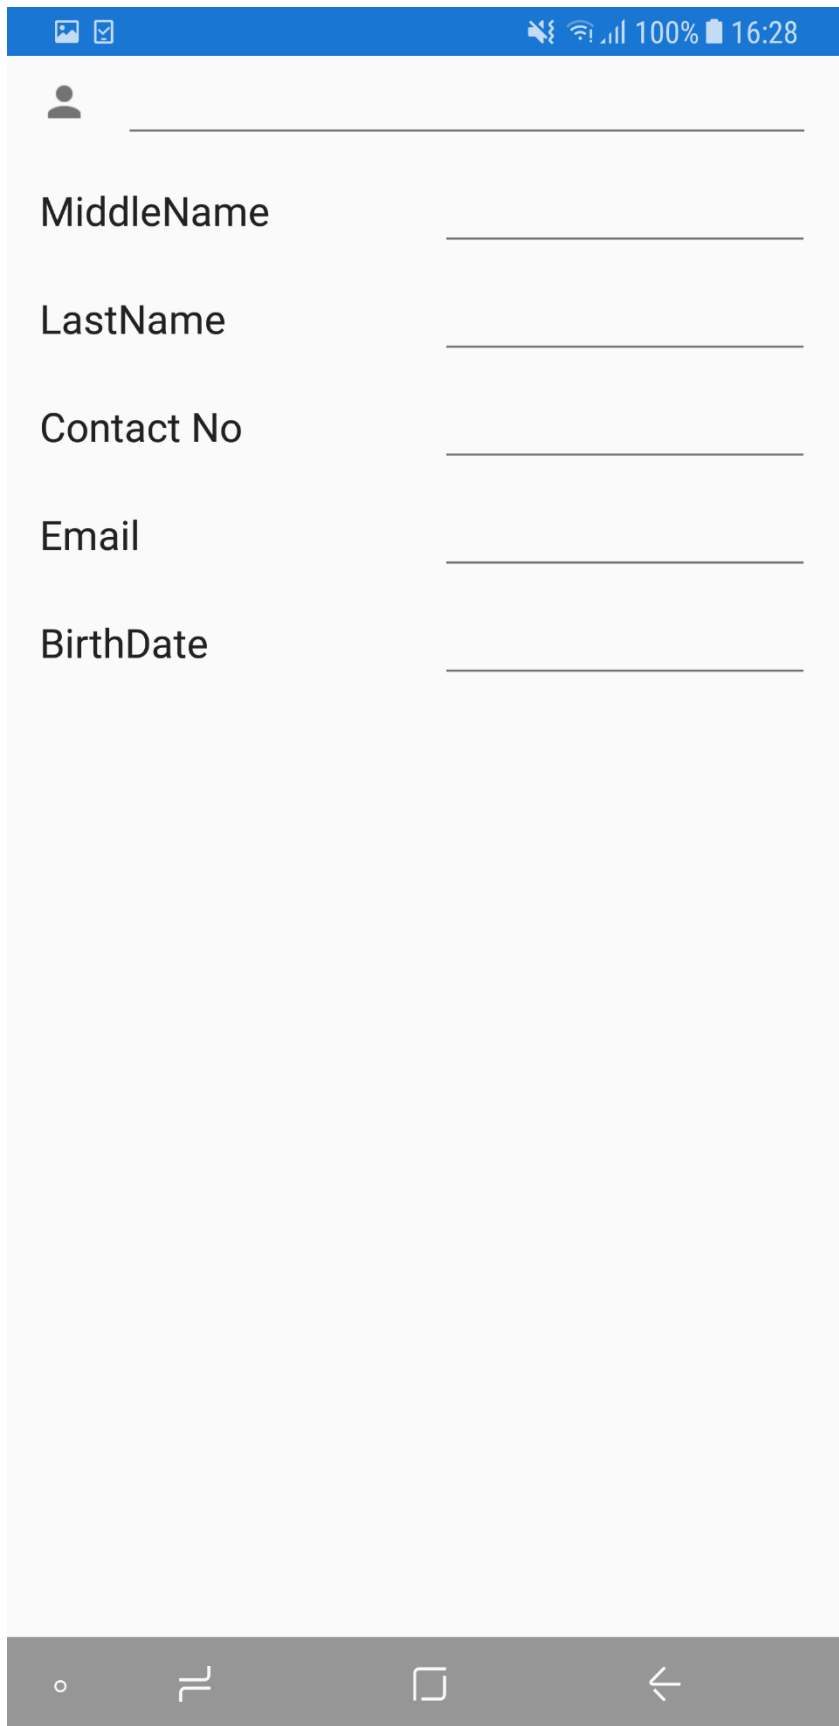

```
private string firstName;
[DisplayOptions(ImageName = "ContactInfo.png")]
public string FirstName
{
    get { return this.firstName; }
    set
    {
        this.firstName = value;
    }
}
```

#### Using event

By using the `ImageSource` property in the `DataFormItem`, you can load the image as label.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "FirstName")
        e.DataFormItem.ImageSource = ImageSource.FromFile("ContactInfo.png");
    }
}
```

The screenshot displays a mobile application interface with a blue header bar. On the left of the header are icons for a gallery and email. On the right are icons for signal strength, Wi-Fi, and battery level (100%), along with the time 16:28. Below the header is a light gray form area. It begins with a profile icon and a horizontal line for a name. This is followed by five labeled input fields: 'MiddleName', 'LastName', 'Contact No', 'Email', and 'BirthDate'. Each label is positioned to the left of a horizontal input line. At the bottom of the screen is a dark gray navigation bar containing four white icons: a circle, a square, a square with a circle, and a left-pointing arrow.

16:28 100% Wi-Fi Signal

BirthDate \_\_\_\_\_

Navigation icons: Circle, Square, Square with Circle, Left Arrow

### Changing order of the DataFormItem

You can change the order of the **DataFormItem** by using attributes or by handling **AutoGeneratingDataFormItem** event.

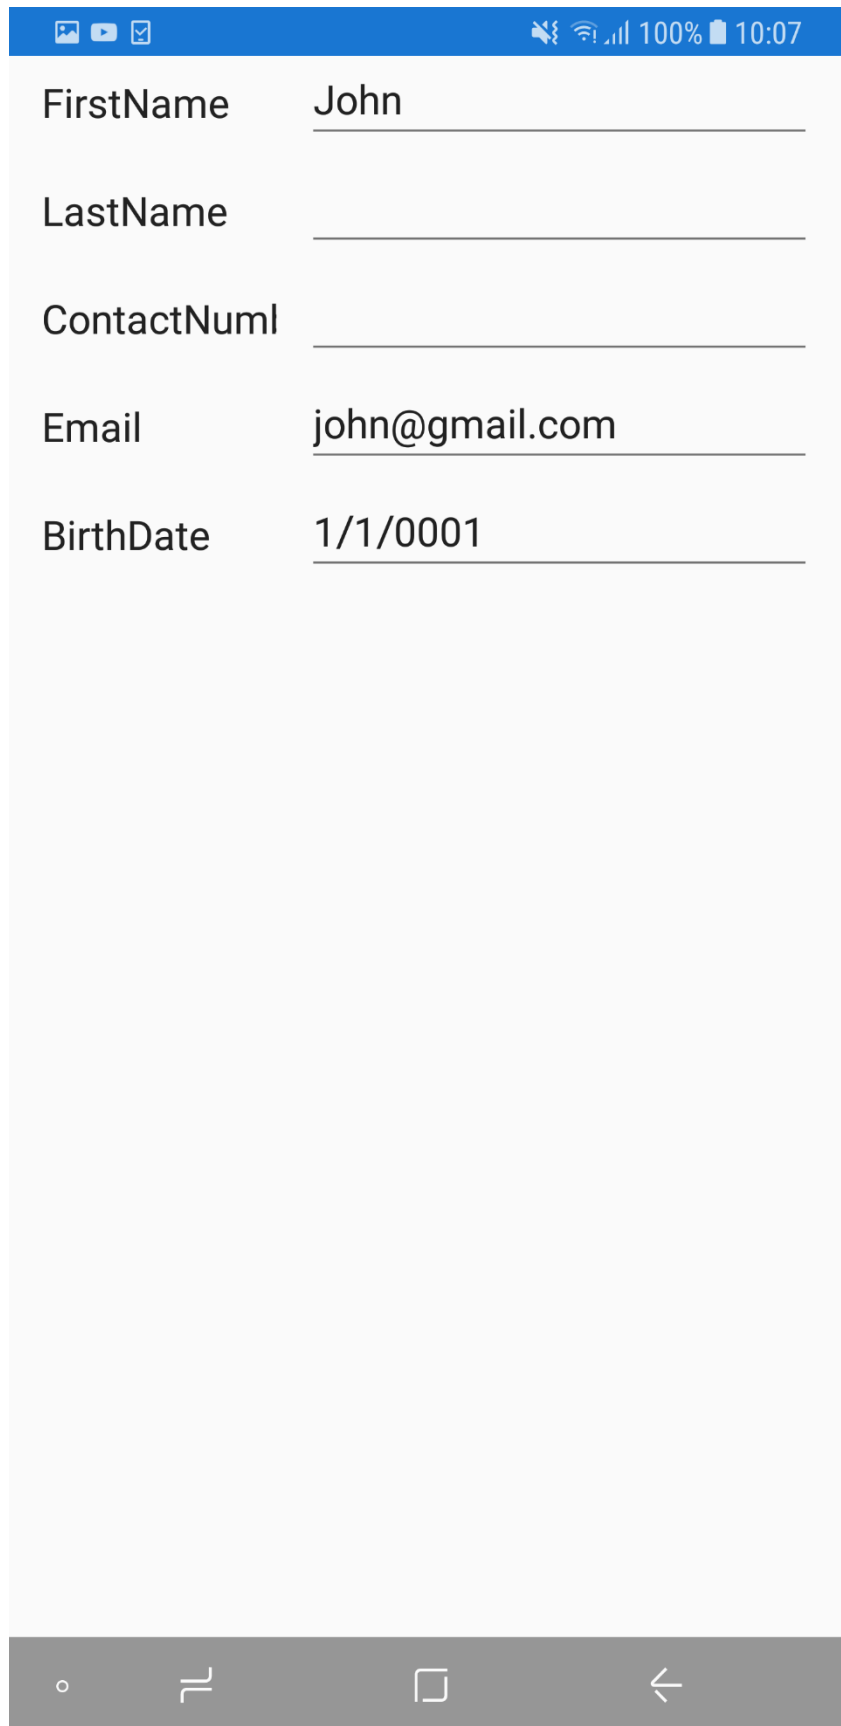

#### *Using attributes*

You can set the order by using the **Order** property in display attribute.

#### **C#**

```
public class ContactsInfo
{
    private string lastName;
    private string contactNo;
    public ContactsInfo()
    {
    }
    [Display(Order = 2)]
    public string ContactNumber
    {
        get { return contactNo; }
        set
        {
            this.contactNo = value;
        }
    }
    private string firstName;
    [Display(Order = 0)]
    public string FirstName
    {
        get { return this.firstName; }
        set
        {
            this.firstName = value;
        }
    }
    [Display(Order = 1)]
    public string LastName
    {
        get { return this.lastName; }
        set
        {
            this.lastName = value;
        }
    }
}
```

The image shows a mobile application interface with a data form. At the top is a blue status bar with icons for gallery, video, mail, and system status (signal, Wi-Fi, 100% battery, 10:07). The form has five rows, each with a label on the left and a text input field on the right. The inputs are: 'John' for 'FirstName', an empty field for 'LastName', an empty field for 'ContactNuml', 'john@gmail.com' for 'Email', and '1/1/0001' for 'BirthDate'. At the bottom is a grey navigation bar with four icons: a circle, a double line, a square, and a left arrow.

FirstName	John
LastName	
ContactNuml	
Email	john@gmail.com
BirthDate	1/1/0001

### Using event

You can change the fields order by using the [Order](#) property in the `DataFormItem`.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "FirstName")
            e.DataFormItem.Order = 0;
    }
}
```

### Grouping data fields

It is possible to group some fields and set group name in the data form. You can expand or collapse the group by tapping the group item.

Grouping can be achieved by defining attributes or by handling the `AutoGeneratingDataFormItem` event.

### Using attributes

#### C#

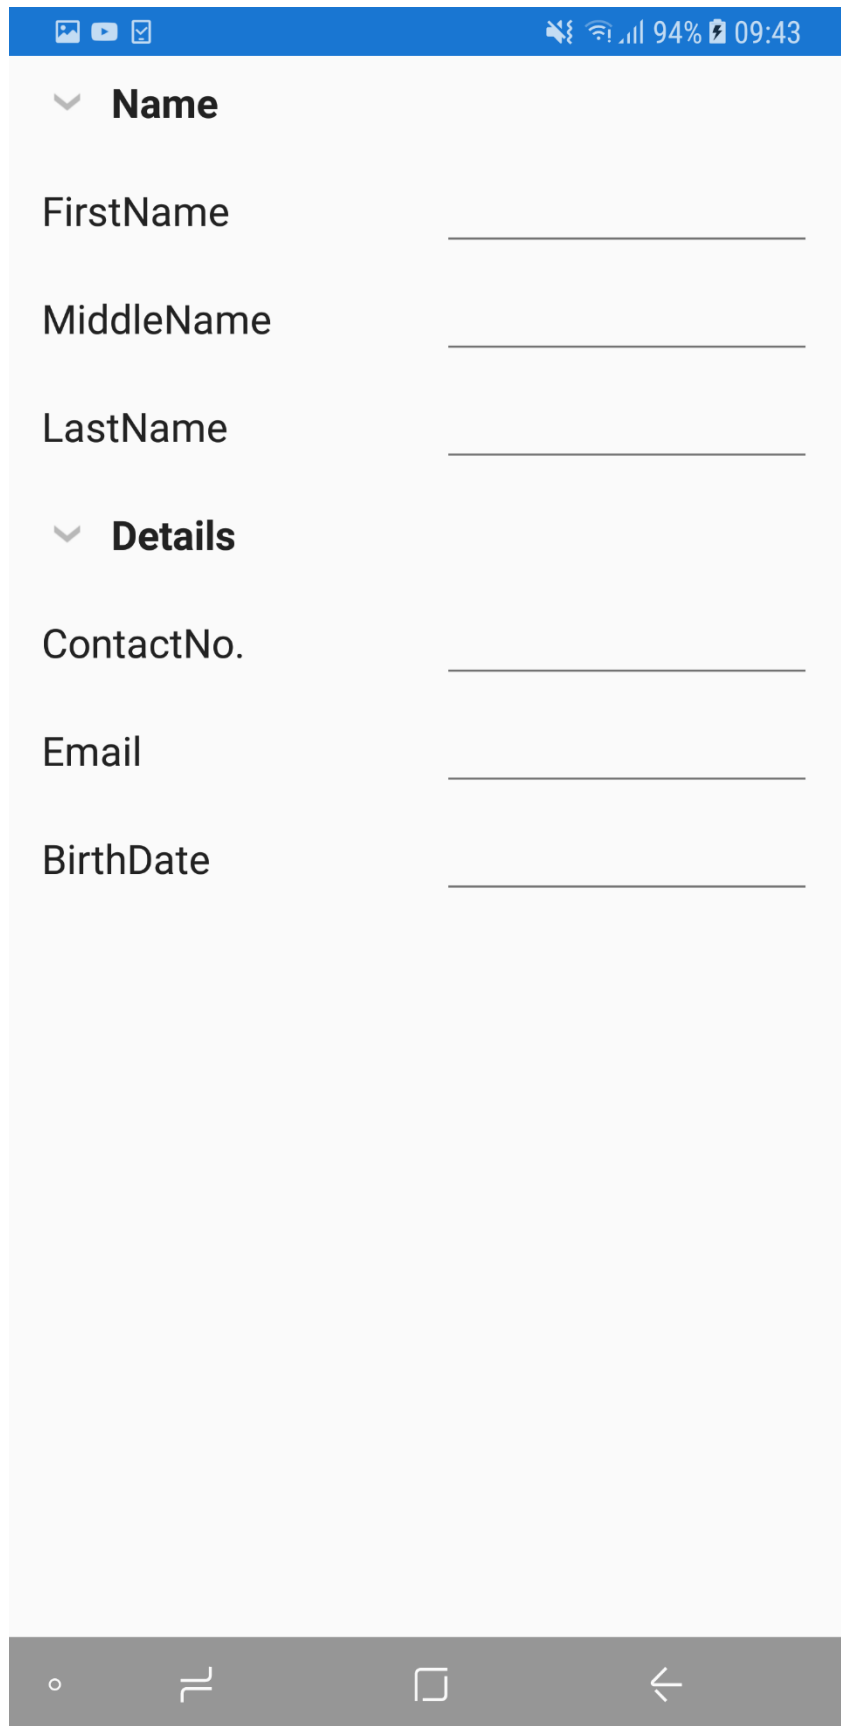

```
public class ContactsInfo
{
    private string lastName;
    private string contactNo;
    private string email;
    private DateTime? birthDate;
    public ContactsInfo()
    {
    }
    private string firstName;
    [Display(GroupName = "Name")]
    public string FirstName
    {
        get { return this.firstName; }
        set
        {
            this.firstName = value;
        }
    }
    private string middleName;
    [Display(GroupName = "Name")]
    public string MiddleName
    {
        get { return this.middleName; }
        set
        {
            this.middleName = value;
        }
    }
    [Display(GroupName = "Name")]
```

```
public string LastName
{
    get { return this.lastName; }
    set
    {
        this.lastName = value;
    }
}
[Display(GroupName = "Details", ShortName = "ContactNo.")]
public string ContactNumber
{
    get { return contactNo; }
    set
    {
        this.contactNo = value;
    }
}
[Display(GroupName = "Details")]
public string Email
{
    get { return email; }
    set
    {
        email = value;
    }
}
[Display(GroupName = "Details")]
public DateTime? BirthDate
{
    get { return birthDate; }
    set
    {
        birthDate = value;
    }
}
}
```

### Using event

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "FirstName" || e.DataFormItem.Name ==
"MiddleName" || e.DataFormItem.Name == "LastName")
            e.DataFormItem.GroupName = "Name";
        else
            e.DataFormItem.GroupName = "Details";
    }
}
```

### *Changing order of the DataFormGroupItem*

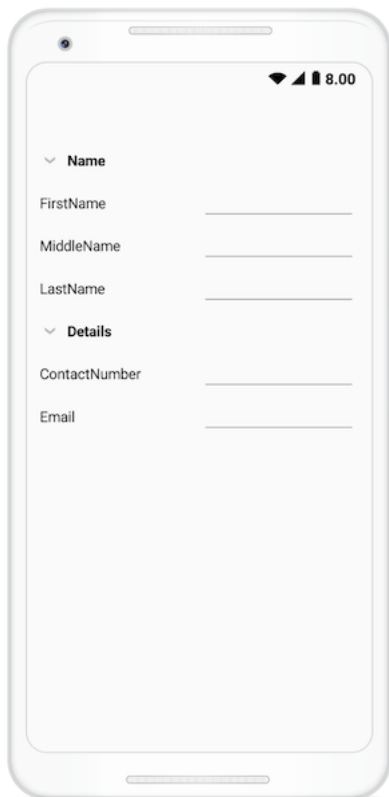

You can change the order of the `DataFormGroupItem` by using attributes. You can set the order of data form items in group by using the `Order` property along with `GroupName` property in display attribute.

#### **C#**

```
public class ContactInfo
{
    private string lastName;
    private string contactNo;
    public ContactInfo()
    {
    }
    private string firstName;
    [Display(Order = 0, GroupName = "Name")]
    public string FirstName
    {
        get { return this.firstName; }
        set
        {
            this.firstName = value;
        }
    }
    [Display(Order = 2, GroupName = "Name")]
    public string LastName
    {
        get { return this.lastName; }
        set
        {
            this.lastName = value;
        }
    }
    private string middleName;
    [Display(Order = 1, GroupName = "Name")]
    public string MiddleName
    {
        get { return this.middleName; }
        set
        {
            this.middleName = value;
        }
    }
    private string email;
    [Display(Order = 1, GroupName = "Details")]
    public string Email
    {
        get { return email; }
        set
        {
            this.email = value;
        }
    }
    [Display(Order = 0, GroupName = "Details")]
    public string ContactNumber
    {

```

```
get { return contactNo; }  
set  
{  
    this.contactNo = value;  
}  
}  
}
```

#### *Changing group name for group*

You can change the `GroupName` for the group in the `AutoGeneratingDataFormItem` event.

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormGroupItem != null && e.DataFormGroupItem.GroupName == "Name")  
        e.DataFormGroupItem.GroupName = "Name Group";  
}
```

#### *Loading different layout for group*

You can load linear or grid layout for the particular group by handling the `AutoGeneratingDataFormItem` event.

By setting the `ColumnCount` property in the data form, non-grouped items only will be arranged in the grid layout. To load the grid layout, set the `ColumnCount` for the `DataFormGroupItem`.

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormGroupItem != null && e.DataFormGroupItem.GroupName == "Name")  
        e.DataFormGroupItem.ColumnCount = 2;  
}
```

The image shows a mobile application interface with a blue header bar containing icons for gallery, video, and mail, and status information (signal, 95% battery, 09:46). Below the header is a form titled "Name" with a dropdown arrow. The form contains five input fields: "FirstNam" and "LastNam" (split into two columns), "ContactNumber", "Email", and "BirthDate". Each field has a corresponding input line. At the bottom is a grey navigation bar with four icons: a circle, a double line, a square, and a left arrow.

▼ **Name**

BirthDate \_\_\_\_\_

Loading linear and grid layout for the group

### C#

```
public class ContactsInfo
{
    private string lastName;
    private string contactNo;
    private string email;
    private DateTime? birthDate;
    public ContactsInfo()
    {
    }
    private string firstName;
    [Display(GroupName = "Name")]
    public string FirstName
    {
        get { return this.firstName; }
        set
        {
            this.firstName = value;
        }
    }
    [Display(GroupName = "Name")]
    public string LastName
    {
        get { return this.lastName; }
        set
        {
            this.lastName = value;
        }
    }
    [Display(GroupName = "Details", ShortName = "ContactNo.")]
    public string ContactNumber
    {
        get { return contactNo; }
        set
        {
            this.contactNo = value;
        }
    }
    [Display(GroupName = "Details")]
    public string Email
    {
        get { return email; }
        set
        {
            email = value;
        }
    }
    [Display(GroupName = "Details")]
    public DateTime? BirthDate
    {
        get { return birthDate; }
        set
        {
            birthDate = value;
        }
    }
}
```

```
}  
}
```

### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormGroupItem != null && e.DataFormGroupItem.GroupName == "Name")  
        e.DataFormGroupItem.ColumnCount = 2;  
}
```

In the following image, for the **Name** group, the grid layout is loaded and for the **Details** group, linear layout is loaded:

The image shows a mobile application interface with a blue header bar containing icons for gallery, video, and mail, along with status icons for signal, Wi-Fi, 95% battery, and the time 09:46. Below the header is a form titled "Name" with a dropdown arrow. The form contains five input fields: "FirstNam" and "LastNam" are side-by-side; "ContactNumber", "Email", and "BirthDate" are stacked vertically. Each field has a horizontal underline. At the bottom is a grey navigation bar with four icons: a circle, a double line, a square, and a left arrow.

▼ **Name**

FirstNam \_\_\_\_\_ LastNam \_\_\_\_\_

BirthDate \_\_\_\_\_

### Setting different column count

You can also set different **ColumnCount** for each group.

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormGroupItem != null)
    {
        if (e.DataFormGroupItem.GroupName == "Name")
            e.DataFormGroupItem.ColumnCount = 2;
        else if (e.DataFormGroupItem.GroupName == "Details")
            e.DataFormGroupItem.ColumnCount = 3;
    }
}
```

▼ **Name**

FirstNam \_\_\_\_\_ LastNam \_\_\_\_\_

▼ **Details**

Contæ \_\_\_\_\_ Email \_\_\_\_\_ Birth[ \_\_\_\_\_

### *Loading group in collapsed state*

By default, the group will be loaded in expanded state. You can collapse the group by setting the [IsExpanded](#) property to false in the [DataFormGroupItem](#).

### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormGroupItem != null && e.DataFormGroupItem.GroupName == "Name")
        e.DataFormGroupItem.IsExpanded = false;
}
```

### *Restricting the group expanding and collapsing*

You can set restrict the group being expanded or collapsed by setting the [AllowExpandCollapse](#) to false in the [DataFormGroupItem](#).

In this case, the group will be shown without expander.

The image displays a mobile application interface for a data form. At the top, a blue status bar contains icons for gallery, video, and mail on the left, and signal, Wi-Fi, 96% battery, and 09:48 on the right. Below the status bar, the form is titled "Name" in bold. It features six input fields, each with a label to its left and a horizontal line for text entry: "FirstName", "LastName", "ContactNumber", "Email", and "BirthDate". The form is set against a light gray background. At the bottom, a dark gray navigation bar contains four white icons: a circle, a stylized "N" shape, a square, and a left-pointing arrow.

**Name**

FirstName \_\_\_\_\_

LastName \_\_\_\_\_

ContactNumber \_\_\_\_\_

Email \_\_\_\_\_

BirthDate \_\_\_\_\_

### *Programmatically expand or collapse group*

You can expand or collapse the group programmatically by using [ExpandGroup](#) and [CollapseGroup](#) methods respectively.

#### **C#**

```
dataForm.ExpandGroup("Group1");  
dataForm.CollapseGroup("Group1");
```

### *Changing DataFormGroupItem visibility*

You can change the [DataFormGroupItem](#) visibility by using the [IsVisible](#) property in the [DataFormGroupItem](#).

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if(e.DataFormGroupItem != null )  
    {  
        if (e.DataFormGroupItem.GroupName == "Details")  
            e.DataFormGroupItem.IsVisible = false;  
    }  
}
```

Here, the **Details** group will be hidden.

### *Customizing DataFormLayoutManager*

To customize the layout, override the [DataFormLayoutManager](#) and assign to the [SfDataForm.LayoutManager](#) property.

#### **C#**

```
public class DataFormLayoutManagerExt : DataFormLayoutManager  
{  
    public DataFormLayoutManagerExt(SfDataForm dataForm) : base(dataForm)  
    {  
    }  
}  
dataForm.LayoutManager = new DataFormLayoutManagerExt(dataForm);
```

### *Changing editor padding*

You can change the editor padding by overriding the [GetLeftPaddingForEditor](#) method.

#### **C#**

```
public class ContactsInfo  
{  
    private string lastName;  
    public ContactsInfo()  
    {  
    }  
    private string firstName;  
    [DisplayOptions(ImageSource = Resource.Drawable.Name)]
```

```
public string FirstName
{
    get { return this.firstName; }
    set
    {
        this.firstName = value;
    }
}
[Display(Prompt = "Enter last name")]
[DisplayOptions(ShowLabel = false)]
public string LastName
{
    get { return this.lastName; }
    set
    {
        this.lastName = value;
    }
}
}
```

### **C#**

```
dataForm.LayoutManager = new DataFormLayoutManagerExt(dataForm);
public class DataFormLayoutManagerExt : DataFormLayoutManager
{
    public DataFormLayoutManagerExt(SfDataForm dataForm) : base(dataForm)
    {
    }
    protected override int GetLeftPaddingForEditor(DataFormItem dataFormItem)
    {
        if (dataFormItem.Name == "LastName")
            return 35;
        return base.GetLeftPaddingForEditor(dataFormItem);
    }
}
```

Here, the LastName padding is customized.

The image displays a mobile application interface. At the top, there is a blue header bar containing three icons: a camera, a video camera, and an envelope. Below the header bar is a status bar showing various system icons (mute, Wi-Fi, cellular signal) and the text '100%' followed by a battery icon and the time '10:04'. The main content area is a light gray rectangle. It features a form with four horizontal input lines. The first line contains the placeholder text 'Enter last name'. The bottom of the screen is occupied by a dark gray navigation bar with four white icons: a circle, a double line, a square, and a left-pointing arrow.

### *Customizing label and editor*

By using `DataFormLayoutManager` class, you can customize the generated label by overriding the `GenerateViewForLabel` method and also you can customize the editor by overriding the `OnEditorCreated` method. Here, `BackgroundColor` and `TextColor` of label and editor is customized.

#### **C#**

```
public class ContactsInfo
{
    public ContactsInfo()
    {
    }
    private string firstName = "Iris";
    public string FirstName
    {
        get { return this.firstName; }
        set
        {
            this.firstName = value;
        }
    }
    private string lastName;
    public string LastName
    {
        get { return this.lastName; }
        set
        {
            this.lastName = value;
        }
    }
}
```

#### **C#**

```
dataForm.LayoutManager = new DataFormLayoutManagerExt(dataForm);
public class DataFormLayoutManagerExt : DataFormLayoutManager
{
    public DataFormLayoutManagerExt(SfDataForm dataForm) : base(dataForm)
    {
    }
    protected override View GenerateViewForLabel(DataFormItem dataFormItem)
    {
        var label = base.GenerateViewForLabel(dataFormItem);
        if (label is Label)
        {
            (label as Label).BackgroundColor = Color.FromHex("#ff9522");
            (label as Label).TextColor = Color.White;
        }
        return label;
    }
    protected override void OnEditorCreated(DataFormItem dataFormItem, View editor)
    {
        if (editor is Entry)
        {
            (editor as Entry).TextColor = Color.White;
            editor.BackgroundColor = Color.FromHex("#0073dc");
        }
    }
}
```

```
}  
}
```

The screenshot displays a mobile application interface with a light gray background. At the top, there is a blue status bar containing the text "100% 16:55". Below the status bar, there is a data form with two rows. The first row has an orange input field labeled "FirstName" and a blue input field labeled "Iris". The second row has an orange input field labeled "LastName" and a blue input field. At the bottom of the screen, there is a gray navigation bar with four icons: a circle, a double line, a square, and a left arrow.

FirstName	Iris
LastName	

### Label width customization

You can set label and editor width proportionally by using [LabelWidth](#) and [EditorWidth](#) properties.

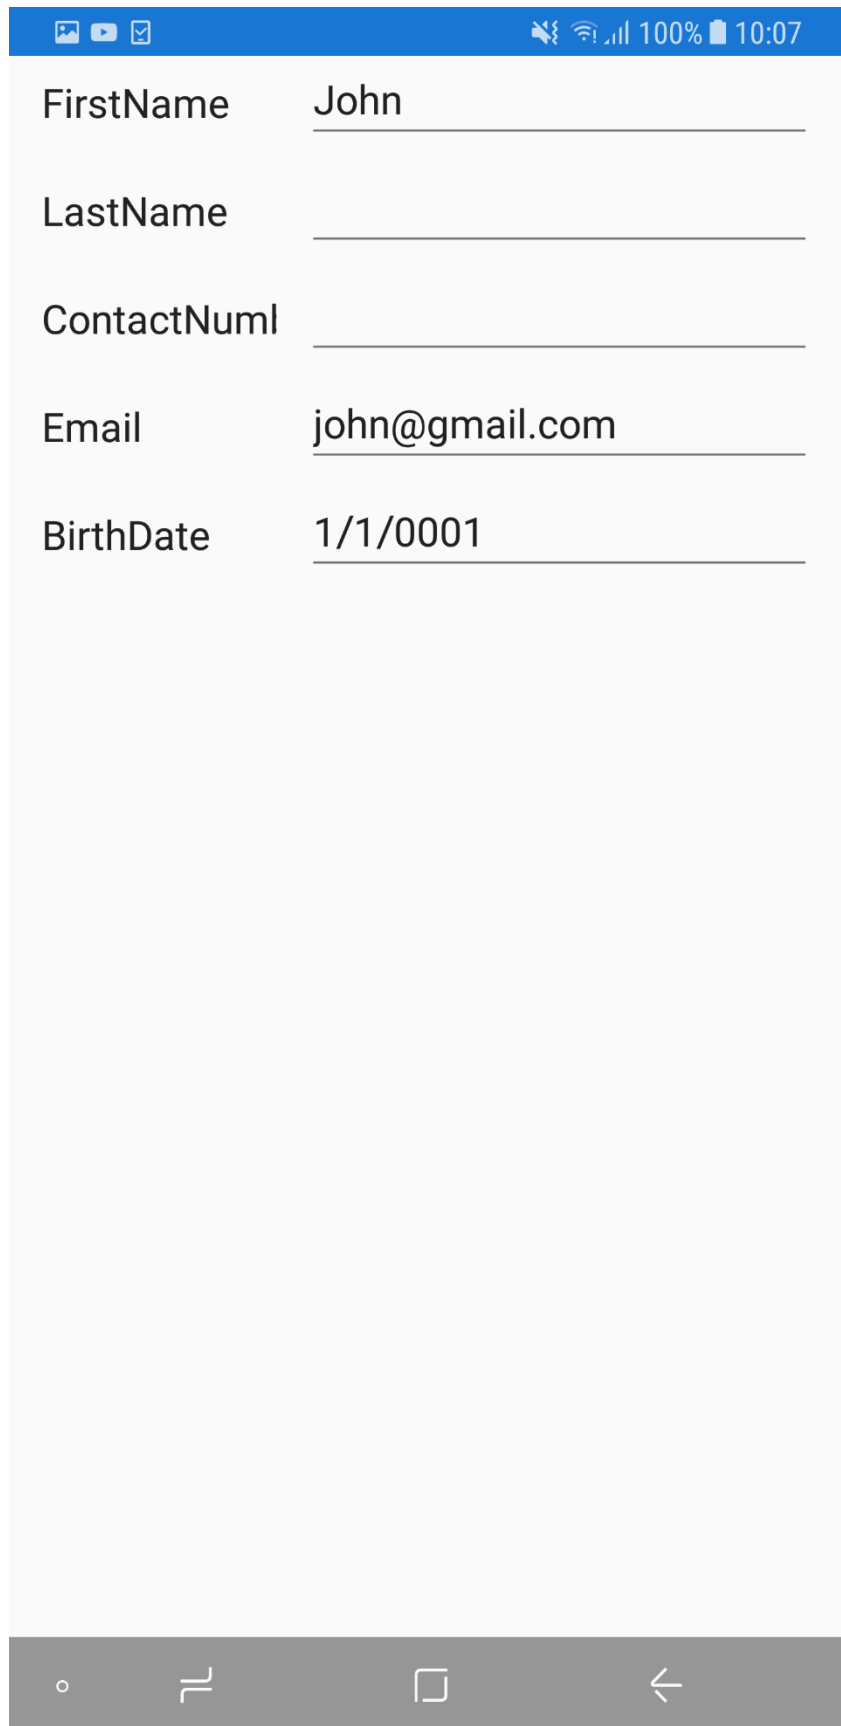

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:dataForm="clr-namespace:Syncfusion.XForms.DataForm;assembly=Syncfusion.SfDataForm.XForms"
x:Class="GettingStarted.MainPage">
  <ContentPage.Content>
    <dataForm:SfDataForm x:Name="dataForm" LabelWidth="1" EditorWidth="2"/>
  </ContentPage.Content>
</ContentPage>
```

#### C#

```
dataForm.LabelWidth = 1;
dataForm.EditorWidth = 2;
```

Here, the available width is divided into proportionally for editor (2) and label (1).

The image shows a mobile application interface with a data form. At the top is a blue status bar with icons for gallery, video, mail, and system status (signal, Wi-Fi, 100% battery, 10:07). The form has five rows, each with a label on the left and a text input field on the right. The inputs are: 'John' for 'FirstName', an empty field for 'LastName', an empty field for 'ContactNuml', 'john@gmail.com' for 'Email', and '1/1/0001' for 'BirthDate'. At the bottom is a grey navigation bar with four icons: a circle, a double line, a square, and a left arrow.

FirstName	John
LastName	
ContactNuml	
Email	john@gmail.com
BirthDate	1/1/0001

---

**Note:** It is applicable only when `LabelPosition` is Left.

---

By default, the available width is divided equally for editor and label.

#### Spanning rows and columns

You can increase row height and column width by defining the `DisplayOptions` attribute.

#### Row span

You can increase the row height by using the `RowSpan` property in the `DisplayOptions` attribute.

#### C#

```
private string firstName;
[DisplayOptions(RowSpan = 2)]
public string FirstName
{
    get { return this.firstName; }
    set
    {
        this.firstName = value;
    }
}
```

Here, `FirstName` field's row height is increased.

A screenshot of a mobile application interface. At the top is a blue status bar with icons for gallery, video, and mail on the left, and mute, Wi-Fi, cellular signal, 100% battery, and 10:08 on the right. Below the status bar is a light gray form area. The form contains five labels on the left, each followed by a horizontal input line on the right: 'FirstName', 'LastName', 'ContactNuml', 'Email', and 'BirthDate'. At the bottom of the screen is a dark gray navigation bar with four white icons: a circle, a horizontal line with a hook, a square, and a left-pointing arrow.

FirstName

LastName

ContactNuml

Email

BirthDate

### *Column span*

When the grid layout is used, you can increase the column width by using the [ColumnSpan](#) property in the `DisplayOptions` attribute.

#### **C#**

```
dataForm.ColumnCount = 2;
```

#### **C#**

```
private string firstName;  
[DisplayOptions(ColumnSpan = 2)]  
public string FirstName  
{  
    get { return this.firstName; }  
    set  
    {  
        this.firstName = value;  
    }  
}
```

The image shows a mobile application interface with a blue status bar at the top. The status bar contains icons for gallery, video, and mail on the left, and icons for silent mode, Wi-Fi, cellular signal, 100% battery, and the time 10:09 on the right. Below the status bar is a light gray data form. The form has five input fields arranged in two rows. The first row has a single field labeled 'FirstName'. The second row has two fields: 'LastName' on the left and 'ContactN' on the right. The third row also has two fields: 'Email' on the left and 'BirthDate' on the right. At the bottom of the screen is a dark gray navigation bar with four white icons: a circle, a home button, a square, and a back arrow.

FirstName \_\_\_\_\_

LastName \_\_\_\_\_ ContactN \_\_\_\_\_

Email \_\_\_\_\_ BirthDate \_\_\_\_\_

### Change DataFormItem visibility at runtime

You can change the field visibility by using the [IsVisible](#) property in the `DataFormItem`.

#### C#

```
var dataFormItem = dataForm.ItemManager.DataFormItems["Name"];  
if (dataFormItem.Name == "Name")  
{  
    dataFormItem.IsVisible = false;  
}
```

Here, the `Name` field will be hidden.

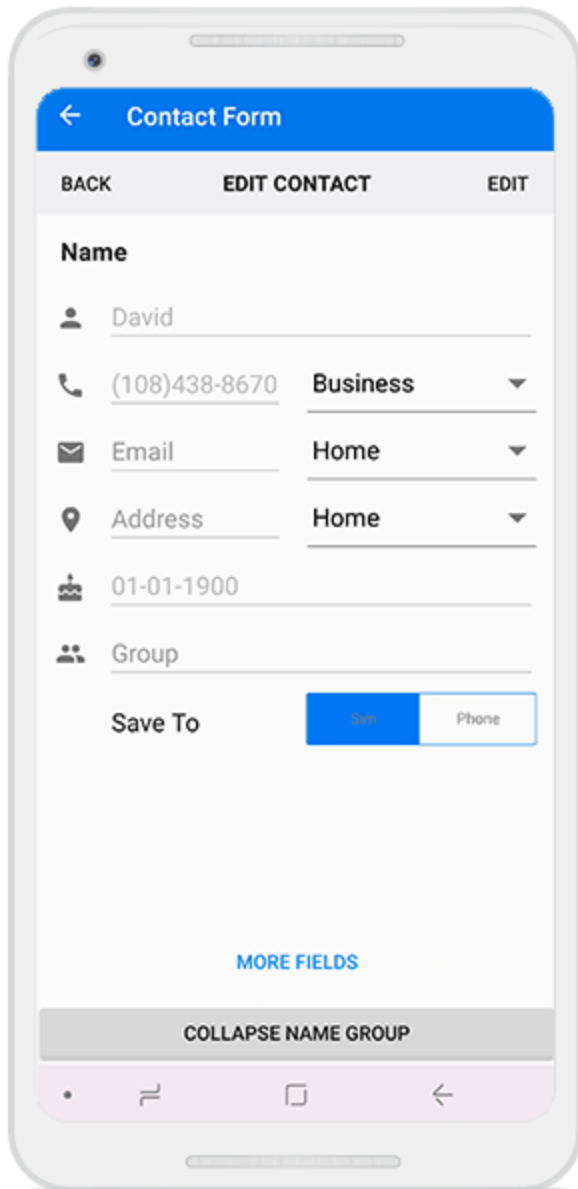

### Change DataFormGroupItem visibility at runtime

You can change the [DataFormGroupItem](#) visibility by using the [IsVisible](#) property in the `DataFormGroupItem`.

#### C#

```
var dataFormGroupItem = dataForm.ItemManager.GetDataFormGroupItem("Name");  
if (dataFormGroupItem.GroupName == "Name")  
{  
    dataFormGroupItem.IsVisible = false;  
}
```

Here, the `Name` group will be hidden.

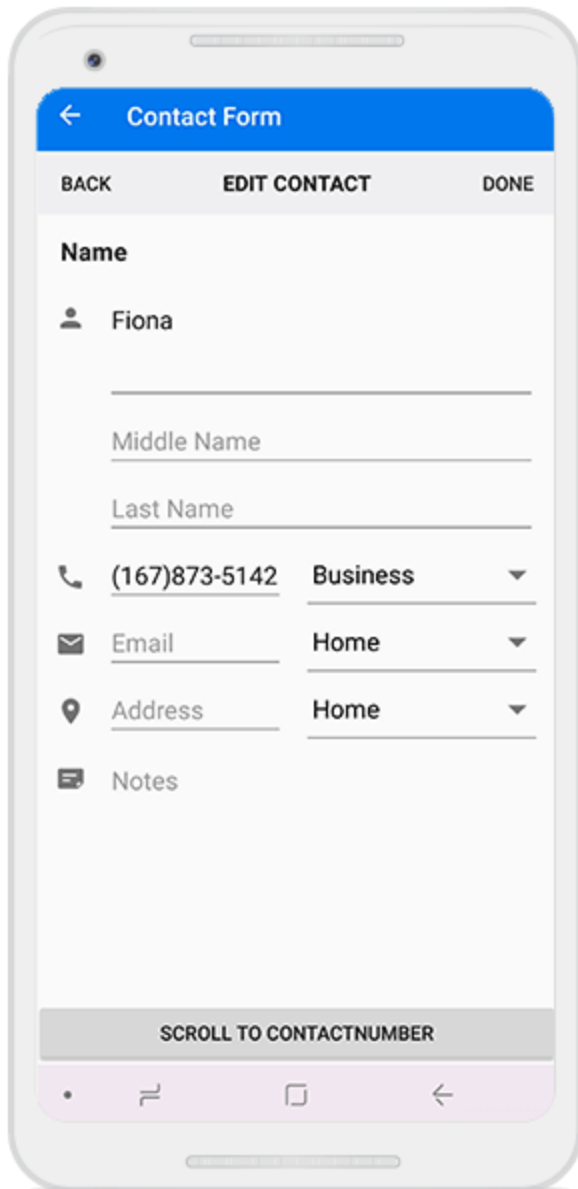

Programmatically scroll to specific editor

You can programmatically scroll to specific editor using the [ScrollTo](#) method by passing the **property name**.

**C#**

```
dataForm.ScrollTo("ContactNumber")
```

### Changing the height of DataFormItem.

You can define the height of each `DataFormItem` using the [Height](#) property, and it will be handled in the `AutoGeneratingDataFormItem` event.

You can define the `Height` as described as follows.

- You can directly set the exact `Height` value; it considers the `GridLength` as `GridUnitType.Absolute`.
- You can use the `GridLength.Auto` to size the height of `DataFormItem`, so that it fits to the label text that it contains.
- You can use the `GridLength.Star` to display the default `DataFormItem` height.

**C#**

```

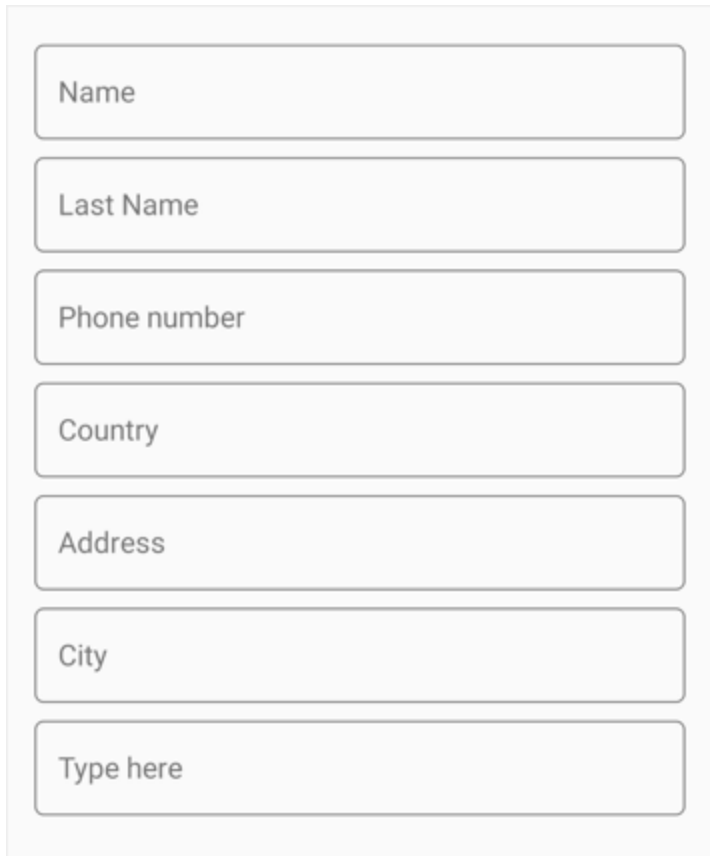

dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object
sender, AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Experience" || e.DataFormItem.Name == "Rating"
|| e.DataFormItem.Name == "Recommend")
        {
            e.DataFormItem.Height = GridLength.Auto;
        }
        if (e.DataFormItem.Name == "Improvement")
        {
            e.DataFormItem.Height = 200;
        }
    }
}

```

**Floating label layout**

The Dataform supports floating label layout with support for assistive labels, leading and trailing icons, and a password toggle icon to show or hide a password. It provides three type of containers such as filled, outlined and none. Floating label layout can be enabled by setting `DataForm.LayoutOptions` to `TextInputLayout`.

### Layout options

By default, the dataform arranges the editors and their labels corresponding to the fields in stack layout. However, to enable the floating label layout set [LayoutOptions](#) property of `DataForm` or [DataFormItem](#) to `TextInputLayout`.

### XML

```
<dataForm:SfDataForm x:Name="dataForm" LayoutOptions="TextInputLayout">
</dataForm:SfDataForm/>
```

### C#

```
dataForm.LayoutOptions = LayoutOptions.TextInputLayout;
```

### Changing layout options of the DataFormItem

You can change layout option by using the [LayoutOptions](#) property in the `DataFormItem` and it will be handled in the `AutoGeneratingDataFormItem` event.

### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null)  
    {  
        if (e.DataFormItem.Name == "Name" || e.DataFormItem.Name == "PhoneNumber" ||  
            (e.DataFormItem.Name == "Address" || e.DataFormItem.Name == "City"))  
        {  
            e.DataFormItem.LayoutOptions = LayoutOptions.TextInputLayout;  
        }  
    }  
}
```

Name

Last Name

Phone number

Country

Address

City

### Supported editors

Dataform supports the floating label layout for the following editors.

- Text editor
- Password editor
- MaskedEditText editor
- Numeric editor
- MultilineText editor
- Date editor
- Time editor
- Picker editor
- DropDown editor
- AutoComplete editor.

### Container types

Containers enhance the perspective of dataform editor views and provide some contrast between editor view and assistive labels. Their border and assistive label color will be changed based on the dataform field validation.

By default, the container type is **Outlined**. By using the [ContainerType](#) property in **DataForm** or in **DataFormItem**, you can modify the container type to **Filled** or **None**.

#### Filled

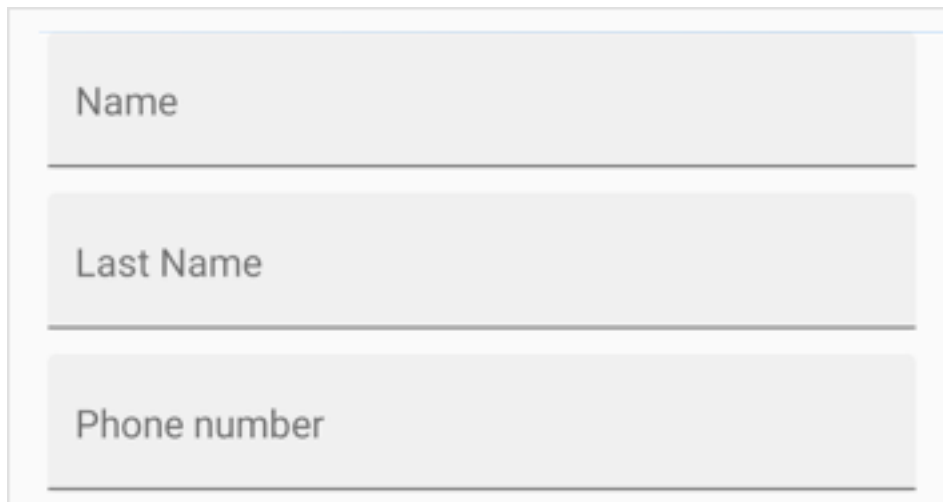

The background color of dataform editor view will be filled with container color and it can be enabled by setting the [ContainerType](#) property to **Filled** in **DataForm** or in **DataFormItem**.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" ContainerType="Filled">
</dataForm:SfDataForm>
```

#### C#

```
dataForm.LayoutOptions = ContainerType.Filled;
```

#### Outlined

To enable the outlined container type, you can set [ContainerType](#) property to **Outlined** in **DataForm** or in **DataFormItem** which covers the editor view with rounded-corner.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" ContainerType="Outlined">
</dataForm:SfDataForm>
```

#### C#

```
dataForm.LayoutOptions = ContainerType.Outlined;
```

### None

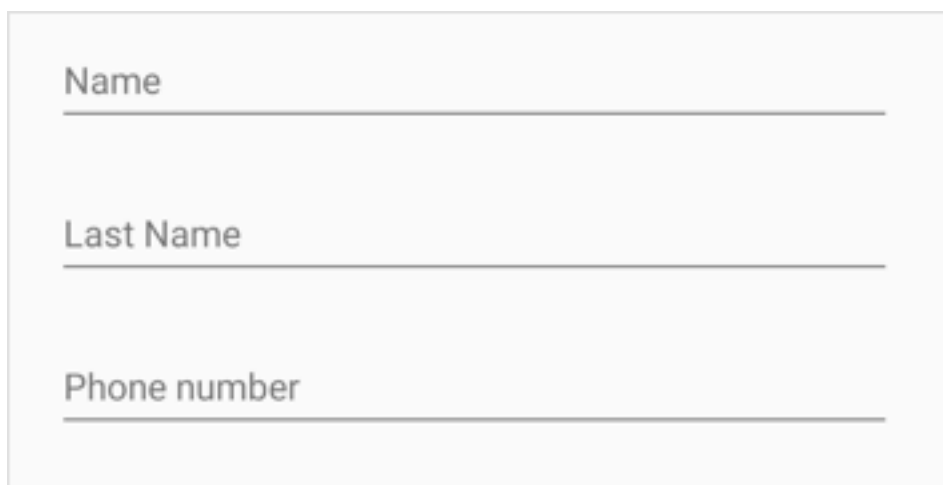

When setting the [ContainerType](#) property to **None** in **DataForm** or in **DataFormItem** container, it will have empty background and enough spacing.

### XML

```
<dataForm:SfDataForm x:Name="dataForm" ContainerType="None">
</dataForm:SfDataForm>
```

### C#

```
dataForm.LayoutOptions = ContainerType.None;
```

### Changing container type of the DataFormItem

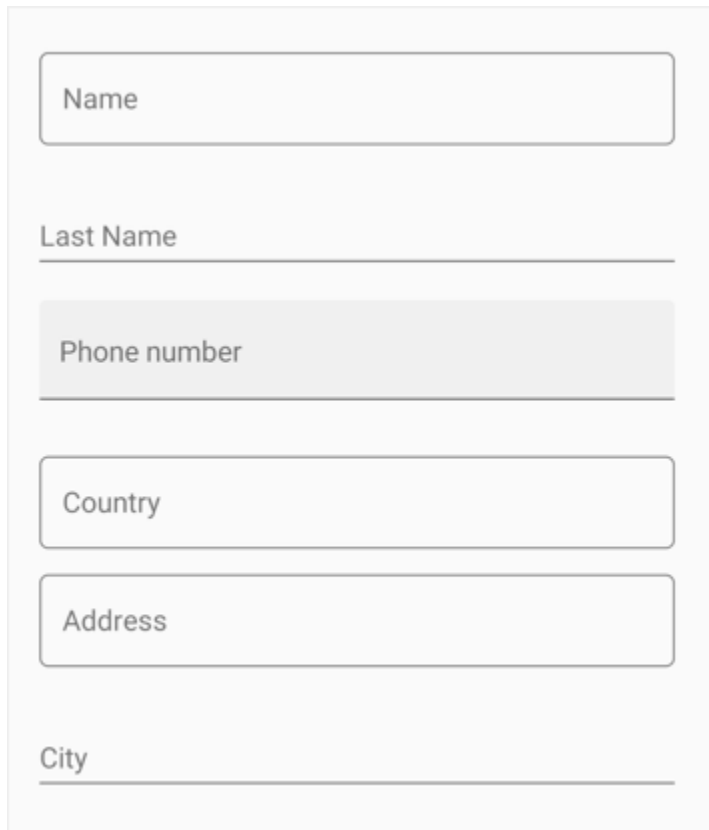

You can change the container type of the [DataFormItem](#) by using the [ContainerType](#) property in the [TextInputLayoutSettings](#) of **DataFormItem** and it will be handled by the **AutoGeneratingDataFormItem** event.

### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

## C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "PhoneNumber")
        {
            e.DataFormItem.ContainerType = ContainerType.Filled;
        }
        if (e.DataFormItem.Name == "LastName")
        {
            e.DataFormItem.ContainerType = ContainerType.None;
        }
    }
}
```

## Leading view

Floating label layout supports leading view, which shows an icon view to the left of editor.

Unicode or font icons for the labels can be displayed as icons. By setting the [LeadingView](#) property in `TextInputLayoutSettings` of `DataFormItem`, a label can be added as a leading icon for editor view. By setting the [LeadingViewPosition](#) property, it can be placed either inside or outside the container. It is positioned outside by default.

**Note:** Refer to the following links to learn more about font icons:

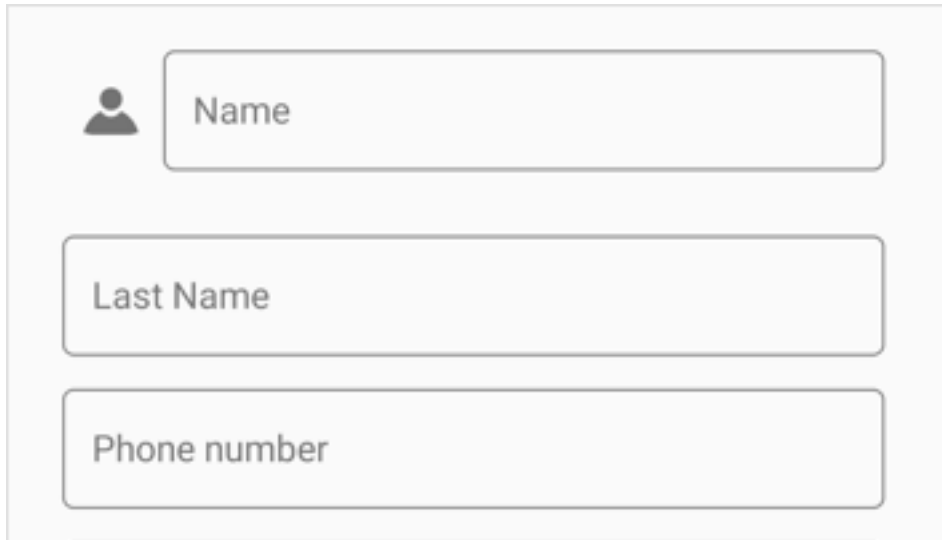

- [How to create font icons using our metro studio and export as ttf?](#)
- [How to set font family for the custom fonts in labels?](#)

### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem1(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Name")
        {
            e.DataFormItem.TextInputLayoutSettings = new
            Syncfusion.SfDataForm.XForms.TextInputLayoutSettings()
            {
                LeadingView = new Label()
                {
                    VerticalTextAlignment = Device.RuntimePlatform == Device.iOS ?
                    TextAlignment.Center : TextAlignment.Start,
                    FontSize = Device.RuntimePlatform == Device.iOS ? 18 : 24,
                    Text = "A",
                    FontFamily = Device.RuntimePlatform == Device.iOS ? "ContactsIcons" :
                    Device.RuntimePlatform == Device.Android ? "ContactsIcons.ttf#ContactsIcons"
                    : "Assets/Fonts/ContactsIcons.ttf#ContactsIcons"
                }
            };
        }
    }
}
```

### Trailing view

Floating label layout supports trailing view, which shows an icon view to the right of editor.

Unicode or font icons for the labels can be displayed as icons. By setting the [TrailingView](#) property in [TextInputLayoutSettings](#) of [DataFormItem](#), a label can be added as a trailing icon for editor view. By setting the [TrailingViewPosition](#) property, it can be placed either inside or outside the container. It is positioned outside by default.

**Note:** Refer to the following links to learn more about font icons:

- [How to create font icons using our metro studio and export as ttf?](#)
- [How to set font family for the custom fonts in labels?](#)

### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem1(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "PhoneNumber")
        {
            e.DataFormItem.TextInputLayoutSettings = new
            Syncfusion.SfDataForm.XForms.TextInputLayoutSettings()
            {
                TrailingView = new Label()
                {
                    VerticalTextAlignment = Device.RuntimePlatform == Device.iOS ?
                    TextAlignment.Center : TextAlignment.Start,
```

```
FontSize = Device.RuntimePlatform == Device.iOS ? 18 : 24,
Text = "I",
FontFamily = Device.RuntimePlatform == Device.iOS ? "ContactsIcons" :
Device.RuntimePlatform == Device.Android ? "ContactsIcons.ttf#ContactsIcons"
: "Assets/Fonts/ContactsIcons.ttf#ContactsIcons"
}
};
}
}
}
```

Enable password visibility toggle for password editor

Password toggle visibility in floating label layout is used to show or hide the visibility of characters in the dataform password editor. You can enable this toggle by setting the [EnablePasswordVisibilityToggle](#) property to true in [DataFormTextItem](#).

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"/>
```

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Password")
    {
        (e.DataFormItem as DataFormTextItem).EnablePasswordVisibilityToggle = true;
    }
}
```

### Assistive label

Assistive labels comprise of floating label or hint label, helper label, counter label and validation label.

### *Reserve space for assistive labels*

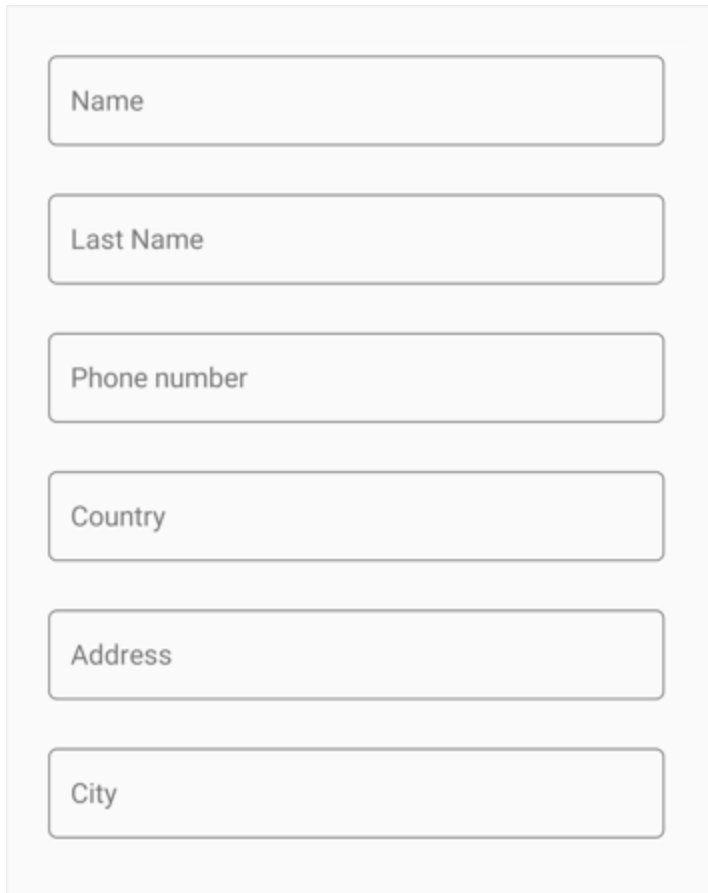

The reserved spaces for assistive labels can be removed by setting the [ReserveSpaceForAssistiveLabels](#) property to false or it can be set to false automatically if there is no prompt value or water mark provider for `DataFormItem` and/or no counter label added.

### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem1(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        e.DataFormItem.TextInputLayoutSettings = new
Syncfusion.SfDataForm.XForms.TextInputLayoutSettings()
        {
            ReserveSpaceForAssistiveLabels= true
        };
    }
}
```

#### *Hint label*

The data field caption will be displayed as floating or hint label for the editor, and it will be enabled by using the `Name` or [LabelText](#) property.

#### *Helper label*

The helper label is used to display the water mark for the editor to provide hint for users and it can be set using [Prompt](#).

The visibility of helper text in DataForm floating label layout can be collapsed by setting [ShowHelperText](#) to false in `DataForm` or [TextInputLayoutSettings](#). In this case, DataForm Prompt text will be displayed as editor view hint text if the hint label visibility is collapsed using the `ShowLabel` property of [DisplayOption](#) or `DataFormItem`.

#### **XML**

```
<dataForm:SfDataForm x:Name="dataForm" LayoutOptions="TextInputLayout"
ShowHelperText="False">
</dataForm:SfDataForm/>
```

#### **C#**

```
dataForm.ShowHelperText = false;
```

### Changing helper text visibility of DataFormItem

You can remove the helper label of [DataFormItem](#) by setting the [ShowHelperText](#) property to false in [TextInputLayoutSettings](#), and it will be handled using the [AutoGeneratingDataFormItem](#) event.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "PhoneNumber")
        {
            e.DataFormItem.TextInputLayoutSettings = new
            Syncfusion.SfDataForm.XForms.TextInputLayoutSettings()
            {
                ShowHelperText = false
            };
        }
    }
}
```

### Validation label

The validation label used to display the dataform validation messages such as valid or invalid data. Refer [validation](#) to learn more about dataform validation.

*Counter label*

The counter label is can be used to notify the character count limitation in given validation. It can be enabled by setting the [ShowCharCount](#) property to `true`. Character limit can be set using the `StringLength` attribute.

**XML**

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null && e.DataFormItem.Name == "Password")
    {
        e.DataFormItem.ShowCharCount = true;
    }
}
private string _Password;
[Required(AllowEmptyStrings = false, ErrorMessage = "Password should not be
empty")]
[StringLength(10, ErrorMessage = "Password should not exceed 10
characters")]
public string Password
{
    get { return this._Password; }
    set
    {
        this._Password = value;
        this.RaisePropertyChanged("Password");
    }
}
```

### Appearance customization

The assistive labels and border color can be customized based on the editor view states and data validation.

#### Changing outline corner radius

When setting the [OutlineCornerRadius](#) property to double value, the corner radius of the container will be changed.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem1(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        e.DataFormItem.TextInputLayoutSettings = new
Syncfusion.SfDataForm.XForms.TextInputLayoutSettings()
        {
            OutlineCornerRadius = 30
        };
    }
}
```

#### Focused color

When the given editor view is focused, the [FocusedColor](#) property value will be applied to the label text and border.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem1(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Name")
        {
            e.DataFormItem.FocusedColor = Color.Violet;
        }
    }
}
```

*Unfocused color*

When the given editor view is unfocused, the [UnfocusedColor](#) property value will be applied to the label text and border.

**XML**

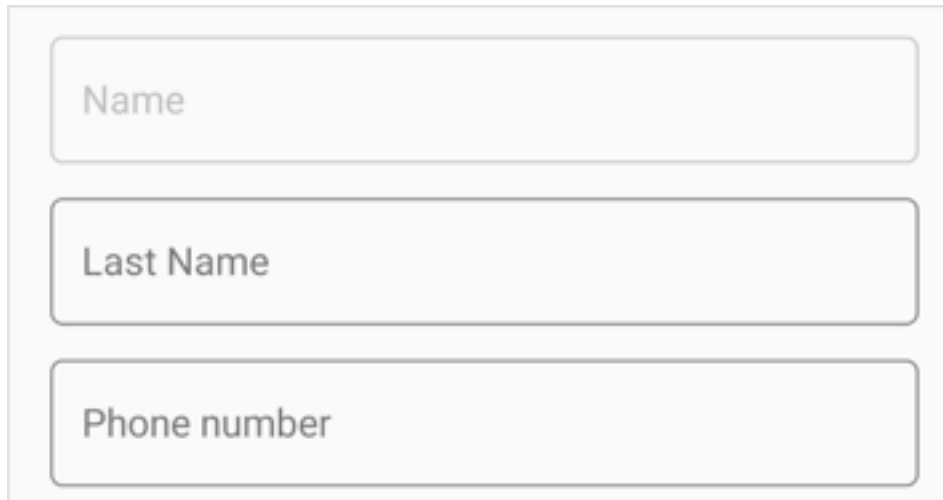

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

**C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem1(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Name")
        {

```

```
{  
    e.DataFormItem.UnfocusedColor = Color.Silver;  
}  
}
```

#### *Error message color*

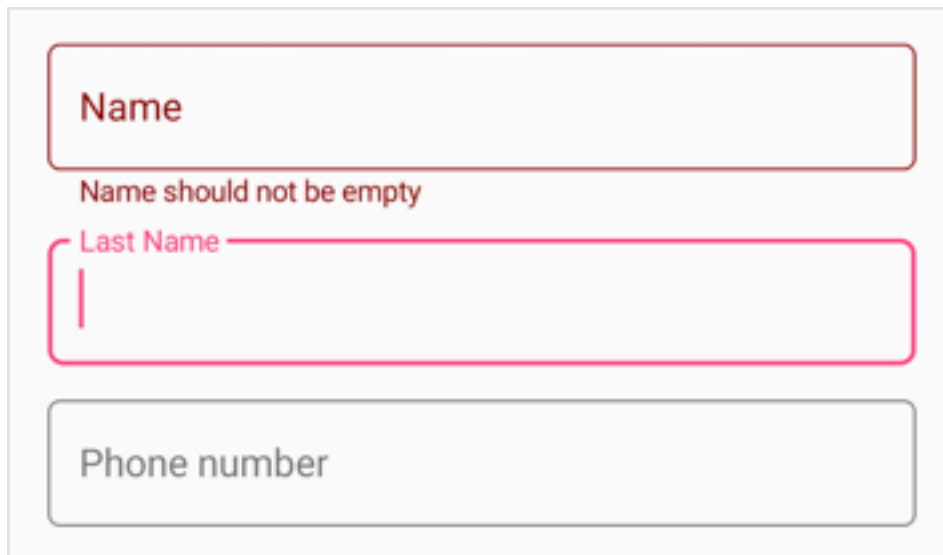

In case of invalid data, the [ErrorMessageColor](#) will be applied to the error label, hint label and border.

#### **XML**

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"  
    AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">  
</dataForm:SfDataForm>
```

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem1(object sender,  
    AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null)  
    {  
        if (e.DataFormItem.Name == "Name")  
        {  
            e.DataFormItem.ErrorMessageColor = Color.DarkRed;  
        }  
    }  
}
```

#### *Valid message color*

In case of valid data, the [ValidMessageColor](#) will be applied to the valid message label, hint label and border.

#### **XML**

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

#### **C#**

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem1(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "Name")
        {
            e.DataFormItem.ValidMessageColor = Color.BlueViolet;
        }
    }
}
```

Customize the background color of editor view

The floating label layout editor view background color can be customized by setting the [ContainerBackgroundColor](#) property of `DataForm` or [TextInputLayoutSettings](#). It is applicable when the [ContainerType](#) is set to `Filled` or `Outlined`.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" LayoutOptions="TextInputLayout"
ContainerBackgroundColor="Silver">
</dataForm:SfDataForm/>
```

#### C#

```
dataForm.ContainerBackgroundColor = Color.Silver;
```

*Customize the editor view background color of DataFormItem*

You can change the editor view background color of [DataFormItem](#) using the [ContainerBackgroundColor](#) property in [TextInputLayoutSettings](#), and it will be handled using the `AutoGeneratingDataFormItem` event.

#### XML

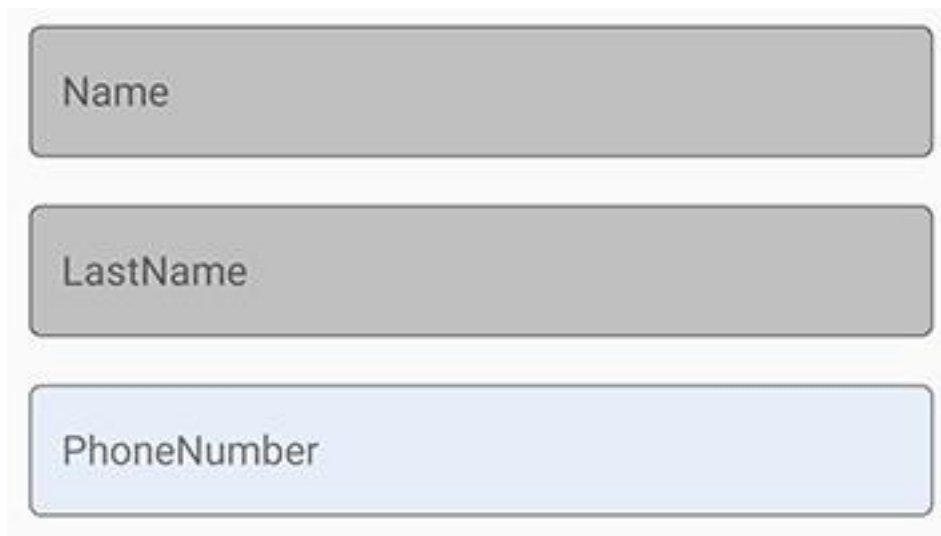

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"
AutoGeneratingDataFormItem="DataForm_AutoGeneratingDataFormItem">
</dataForm:SfDataForm>
```

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.Name == "PhoneNumber")
        {

```

```
e.DataFormItem.TextInputLayoutSettings = new  
Syncfusion.SfDataForm.XForms.TextInputLayoutSettings()  
{  
    ContainerBackgroundColor = Color.FromHex("#E6EEF9")  
};  
}  
}
```

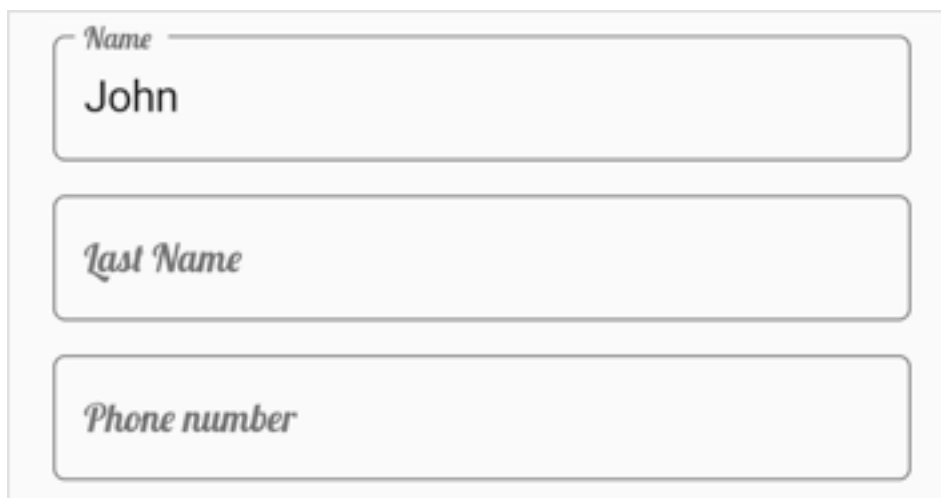

The image shows three text input fields stacked vertically. Each field has a light gray background and rounded corners. The first field is labeled 'Name', the second 'LastName', and the third 'PhoneNumber'. The labels are positioned at the top left of each field, partially overlapping the input area.

#### Font customization

You can customize the font of assistive labels by setting the `FontFamily`, `FontSize`, and `FontAttributes` properties of the `LabelStyle` property.

#### Hint label style

You can customize the text of hint label by setting the `FontFamily`, `FontSize`, and `FontAttributes` properties of [HintLabelStyle](#) in `DataFormItem`.

The image shows three text input fields stacked vertically. Each field has a light gray background and rounded corners. The first field is labeled 'Name' with the text 'John' entered. The second field is labeled 'Last Name' and is empty. The third field is labeled 'Phone number' and is empty. The labels are positioned at the top left of each field, partially overlapping the input area.

#### Helper label style

You can customize the text of helper label by setting the `FontFamily`, `FontSize`, and `FontAttributes` properties of [HelperLabelStyle](#) in `DataFormItem`.

#### Validation label style

You can customize the text of validation label by setting the `FontFamily`, `FontSize`, and `FontAttributes` properties of [ValidationLabelStyle](#) in `DataFormItem`.

#### XML

```
<dataForm:SfDataForm x:Name="dataForm" DataObject="{Binding ContactsInfo}"/>
```

#### C#

```
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;  
private void DataForm_AutoGeneratingDataFormItem(object sender,  
AutoGeneratingDataFormItemEventArgs e)  
{  
    if (e.DataFormItem != null && e.DataFormItem.Name == "Name")  
    {  
        e.DataFormItem.HintLabelStyle = new LabelStyle() { FontFamily =  
            Device.OnPlatform("Lobster-Regular", "Lobster-Regular.ttf#Lobster-Regular",  
                "Assets/Fonts/Lobster-Regular.ttf#Lobster"), FontSize = 16};  
    }  
}
```

### Limitations

- It is recommended not to provide background color for editor view while customizing existing editor inside floating label layout.
- It is recommended not to use non-editable custom editor views inside floating label layout such as range slider, etc.
- It is recommended not to use the [LayoutOptions](#) attribute for setting default layout for data fields.
- It is recommended not to use null values in [Date Editor](#) and [Time Editor](#) with text input layout in initial loading time and runtime in iOS platform.

### Unsupported editors

Floating label layout do not support for the following non-editable editors.

- RadioGroup editor
- Segment editor
- CheckBox editor
- Switch editor

---

**Note:** While using unsupported editors with `DataForm` layout option as `TextInputLayout` we can set layout options for unsupported editors' data fields using this [link](#)

---

You can download the [DataForm with floating labels](#) sample in GitHub.

### Data Annotations

The data form supports the following attribute, and these attributes can be accessible using `System.ComponentModel.DataAnnotations` assembly.

#### Display attribute

Property	Details
----------	---------

<a href="#">Name</a>	Specifies the label text.
<a href="#">GroupName</a>	Specifies the group name which groups the fields in the data form. Refer to <a href="#">here</a> for more details.
<a href="#">ShortName</a>	Specifies the label text. It takes higher priority than Name.
<a href="#">AutoGenerateField</a>	Specifies whether the field should be auto generated or not. Refer to <a href="#">here</a> for more details.
<a href="#">Prompt</a>	Specifies watermark text for the editor. Refer to <a href="#">here</a> for more details.
<a href="#">Order</a>	Specifies the order of field in the data form. Refer to <a href="#">here</a> for more details.

#### Validation attributes

Property	Details
MinLength	Specifies the required minimum length. Refer to <a href="#">[here](https://help.syncfusion.com/xamarin/sfdataform/validation#data-annotations)</a> for more details.
MaxLength	Specifies the required maximum length. Refer to <a href="#">{{'here'  markdownify }}</a> for more details.
Required	Specifies the required data field value. Refer to <a href="#">[here](https://help.syncfusion.com/xamarin/sfdataform/validation#data-annotations)</a> for more details.
Range	Specifies the maximum and minimum values. Refer to <a href="#">{{'here'  markdownify }}</a> for more details.

#### Bindable attribute

It specifies whether the field should be auto generated or not. Refer to [here](#) for more details.

#### Editable attribute

It specifies whether the data field is editable or not.

#### ReadOnly attribute

It specifies whether the data field is read only or not. Refer to [here](#) for more details.

#### EnumDataType attribute

It specifies enum type for the data field.

#### DataType attribute

It specifies data type for the field.

Supported data types are Text, MultilineText, Date, DateTime, Time, and Currency.

Refer to [here](#) for more details.

### DisplayFormat attribute

It specifies how data fields are displayed and formatted.

Supported data types are currency, percentage, date, time.

Property	Details
DataFormatString	Specifies the display format of the field value.

Editor	FormatString
Currency	{0:C}
Percentage	{0:P}
Date	{0:D}
Time	{0:T}

### C#

```

dataForm.DataObject = new ContactInfo();
public class ContactInfo
{
    private int markPercentage;
    [DisplayFormat(DataFormatString = "{0:P}")]
    public String MarkPercentage
    {
        get
        {
            return markPercentage;
        }
        set
        {
            markPercentage = value;
        }
    }
}

```

### CustomDataType attribute

The Percent data type is supported. Refer to [here](#) for more details.

### Custom attribute

The data form supports the following custom attribute, and these attributes can be accessible using `Syncfusion.SfDataForm.XForms`.

### DisplayOptions attribute

Property	Details
<a href="#">RowSpan</a>	Specifies the row span for the data form item. Refer to <a href="#">here</a> for more details.

<a href="#">ColumnSpan</a>	Specifies the column span for the data form item. Refer to <a href="#">here</a> for more details.
<a href="#">ValidMessage</a>	Specifies positive message to be shown when validation is passed. Refer to <a href="#">here</a> for more details.
<a href="#">ImageSource</a>	Specifies the image source for loading image instead of label. Refer to <a href="#">here</a> for more details.
<a href="#">ShowLabel</a>	Specifies whether the label should be visible or not. Refer to <a href="#">here</a> for more details.

*Converter attribute*

Property	Details
<a href="#">ConverterType</a>	Specifies the Converter type which converts the original value in different format or as different value. Refer to <a href="#">here</a> for more details.

*DateRange attribute*

Property	Details
<a href="#">MinYear</a>	Specifies the required minimum year.
<a href="#">MinMonth</a>	Specifies the required minimum month.
<a href="#">MinDay</a>	Specifies the required minimum day.
<a href="#">MaxYear</a>	Specifies the required maximum year.
<a href="#">MaxMonth</a>	Specifies the required maximum month.
<a href="#">MaxDay</a>	Specifies the required maximum day.

Refer to [here](#) for more details.

*Localization*

You can localize the DataFormItem [Display](#) attribute values and validation ([Required](#), [StringLength](#)) attributes values by using `ResourceType` display attribute or using the `AutoGeneratingDataFormItem` event.

Please refer the [Localization](#) document to localize the application.

Based on the culture specifies the corresponding culture string value of display attribute in Resource (.Resx) file as mentioned in document.

*Localizing data form item display values*

Here, the display attributes or data form item display values get localized based on culture from Localization Resource File (.Resx).

### Using attribute

**ResourceType** [Display](#) attribute specifies the Resources File (.Resx) which is used to localize the Display attribute of **Name**, **ShortName**, **GroupName** and **Prompt** values.

### C#

```
[Display(Name = "FirstName", Prompt = "EnterFirstName", GroupName = "Name",
ResourceType = typeof(Localization))]
public String FirstName { get; set; }
```

### Using event

You can also localize the DataFormItem **LabelText**, **PlaceholderText**, **GroupName** in the **AutoGeneratingDataFormItem** event of SfDataForm by using the Resources (.Resx) file.

Here, string member of .resx file will be accessed through the class (in resxFilename.Designer.cs) which was auto-generated when .resx file created and static string members get localized using [ResourceManager](#) based on culture.

### C#

```
[Display(GroupName = "Name")]
public String FirstName { get; set; }
dataForm.AutoGeneratingDataFormItem += DataForm_AutoGeneratingDataFormItem;
private void DataForm_AutoGeneratingDataFormItem(object sender,
AutoGeneratingDataFormItemEventArgs e)
{
    if (e.DataFormItem != null)
    {
        if (e.DataFormItem.LabelText == "FirstName")
        {
            e.DataFormItem.LabelText = Localization.FirstName;
            e.DataFormItem.PlaceholderText = Localization.EnterFirstName;
        }
        if (e.DataFormItem.GroupName == "Name")
        {
            e.DataFormItem.GroupName = Localization.Name;
        }
    }
}
```

### Localizing validation error messages

Here, the validation (**Required**, **StringLength**) attributes or data form error messages get localized based on culture from Localization Resource File (.Resx).

### Using attribute

The **Required** and **StringLength** attributes error message can be localized using [ErrorMessageResourceType](#) and [ErrorMessageResourceName](#) properties which are used to get a localized error messages from Localization Resource File (.Resx) based on culture.

### C#

```
[Required(AllowEmptyStrings = false, ErrorMessageResourceType =
typeof(Localization), ErrorMessageResourceName = "FirstNameEmpty")]
```

```
[StringLength(25,MinimumLength =5,ErrorMessageResourceType =  
typeof(Localization), ErrorMessageResourceName = "FirstNameLength")]  
public String FirstName { get; set; }
```

### Using event

You can also localize the data form error message in the **Validating** event of SfDataForm by using the Resources (.Resx) file.

Here, string member of .resx file will be accessed through the class (in resxFilename.Designer.cs) which was auto-generated when .resx file created and static string members get localized using [ResourceManager](#) based on culture.

### C#

```
dataForm.Validating += DataForm_Validating;  
private void DataForm_Validating(object sender, ValidatingEventArgs e)  
{  
    if (e.PropertyName == "FirstName")  
    {  
        if (e.Value.ToString().Length == 0)  
        {  
            e.IsValid = false;  
            e.ErrorMessage = Localization.FirstNameEmpty;  
        }  
        else if (e.Value != null && e.Value.ToString().Length > 0 &&  
            !(e.Value.ToString().Length >= 5))  
        {  
            e.IsValid = false;  
            e.ErrorMessage = Localization.FirstNameLength;  
        }  
    }  
}
```

You can download the entire source code of this demo for Xamarin.Forms using attributes from here [LocalizationThroughAttribute](#) and using event from here [LocalizationThroughEvent](#).

### Right to left (RTL)

SfDataForm supports to change the layout direction of the control in the right-to-left direction by setting the [FlowDirection](#) to `RightToLeft` or by changing the device language.

#### XML

```
<dataForm:SfDataForm FlowDirection="RightToLeft">  
</dataForm:SfDataForm>
```

#### C#

```
dataForm.FlowDirection = FlowDirection.RightToLeft;
```

**Note**

For implementing the `FlowDirection` in the control, Xamarin.Forms package version must be 3.0 and above. Please refer [RightToLeft](#) to get more details about `RightToLeft` flow direction in Xamarin.Forms.

*Android*

For Android, add `android:supportsRtl="true"` in your application tag of `AndroidManifest.xml` file, and make sure your `MinSDKVersion` is 17+. By changing the device language / enabling the device's `Force RTL layout` can achieve the `RightToLeft` layout direction in DataForm.

**XML**

```
<manifest ... >
<uses-sdk android:minSdkVersion="17" ... />
<application ... android:supportsRtl="true">
</application>
</manifest>
```

*iOS*

For iOS, add the `RightToLeft` language in the `CFBundleLocalizations` section of your `Info.plist` file, and make sure you're targeting iOS 9+.

**XML**

```
<resources>
<key>CFBundleDevelopmentRegion</key>
<string>en</string>
<key>CFBundleLocalizations</key>
<array>
<string>en</string>
<string>ar</string>
</array>
</resources>
```

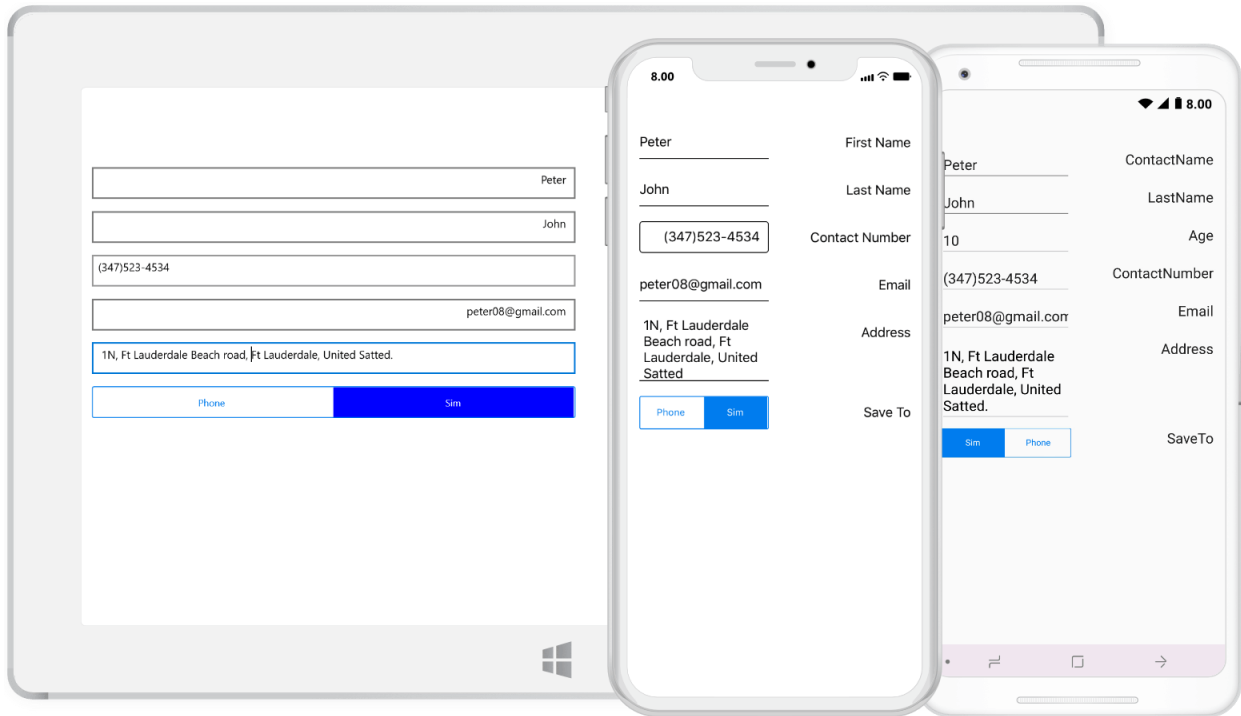

Localization native development region	String en
▼ Localizations	Array (2 items)
	String en
	String ar

*UWP*

For UWP, you need to set `FlowDirection` to `RightToLeft` in the `MainPage.cs` file of the `UWP` project.

**C#**

```
public MainPage ()
{
    ...
    this.FlowDirection = FlowDirection.RightToLeft;
    LoadApplication (new App ());
    ...
}
```

### AutomationId

The **SfDataForm** control has built-in **AutomationId** support for inner elements. Please find the following table of Automation IDs for inner elements.

Editor	AutomationId Format	Example
Text editor	"Focus" + LabelText	FocusFirstName
Multiline text editor	"Focus" + LabelText	FocusAddress
Password Editor	"Focus" + LabelText	FocusPassword
Switch Editor	"Focus" + LabelText	FocusRegistered
Picker	"Focus" + LabelText	FocusName
Date Editor	"Focus" + LabelText	FocusBirth Date
Time editor	"Focus" + LabelText	FocusBirth Time
Dropdown Editor	"Focus" + LabelText	FocusTeam
AutoComplete Editor	"Focus" + LabelText	FocusCountry
Numeric Editor	"Focus" + LabelText	FocusNumeric
NumericUpDown Editor	"Focus" + LabelText	FocusValue
Checkbox Editor	"Focus" + LabelText	FocusCheckBox
Masked Editor	"Focus" + LabelText	FocusContact

To keep unique `AutomationId`, these inner elements' `AutomationIds` are updated based on the control's `AutomationId`. For example, if you set `SfDataForm AutomationId` as `SfDataForm.AutomationId = ContactsInfo`, then the Automation framework will interact with the text editor as `ContactsInfoFocus FirstName`. The following screenshots denote the `AutomationIds` for inner elements.

FirstName	<input type="text"/>	ContactsInfoFocusFirstName
Birth Date	12/6/1994	ContactsInfoFocusBirthDate
Birth Time	08:30 AM	ContactsInfoFocusBirthTime
Address	<input type="text"/>	ContactsInfoFocusAddress
Country	United States of...	ContactsInfoFocusCountry
Registered	<input type="radio"/>	ContactsInfoFocusRegistered
TrackHours	<input type="checkbox"/>	ContactsInfoFocusTrackHours
Team	<input type="text"/>	ContactsInfoFocusTeam

Name	Raju	ContactsInfoFocusName
Contact	<input type="text"/>	ContactsInfoFocusContact
Password	<input type="text"/>	ContactsInfoFocusPassword
Amount	10 - +	ContactsInfoFocusAmount
Value	0.000	ContactsInfoFocusValue

## SfDataGrid

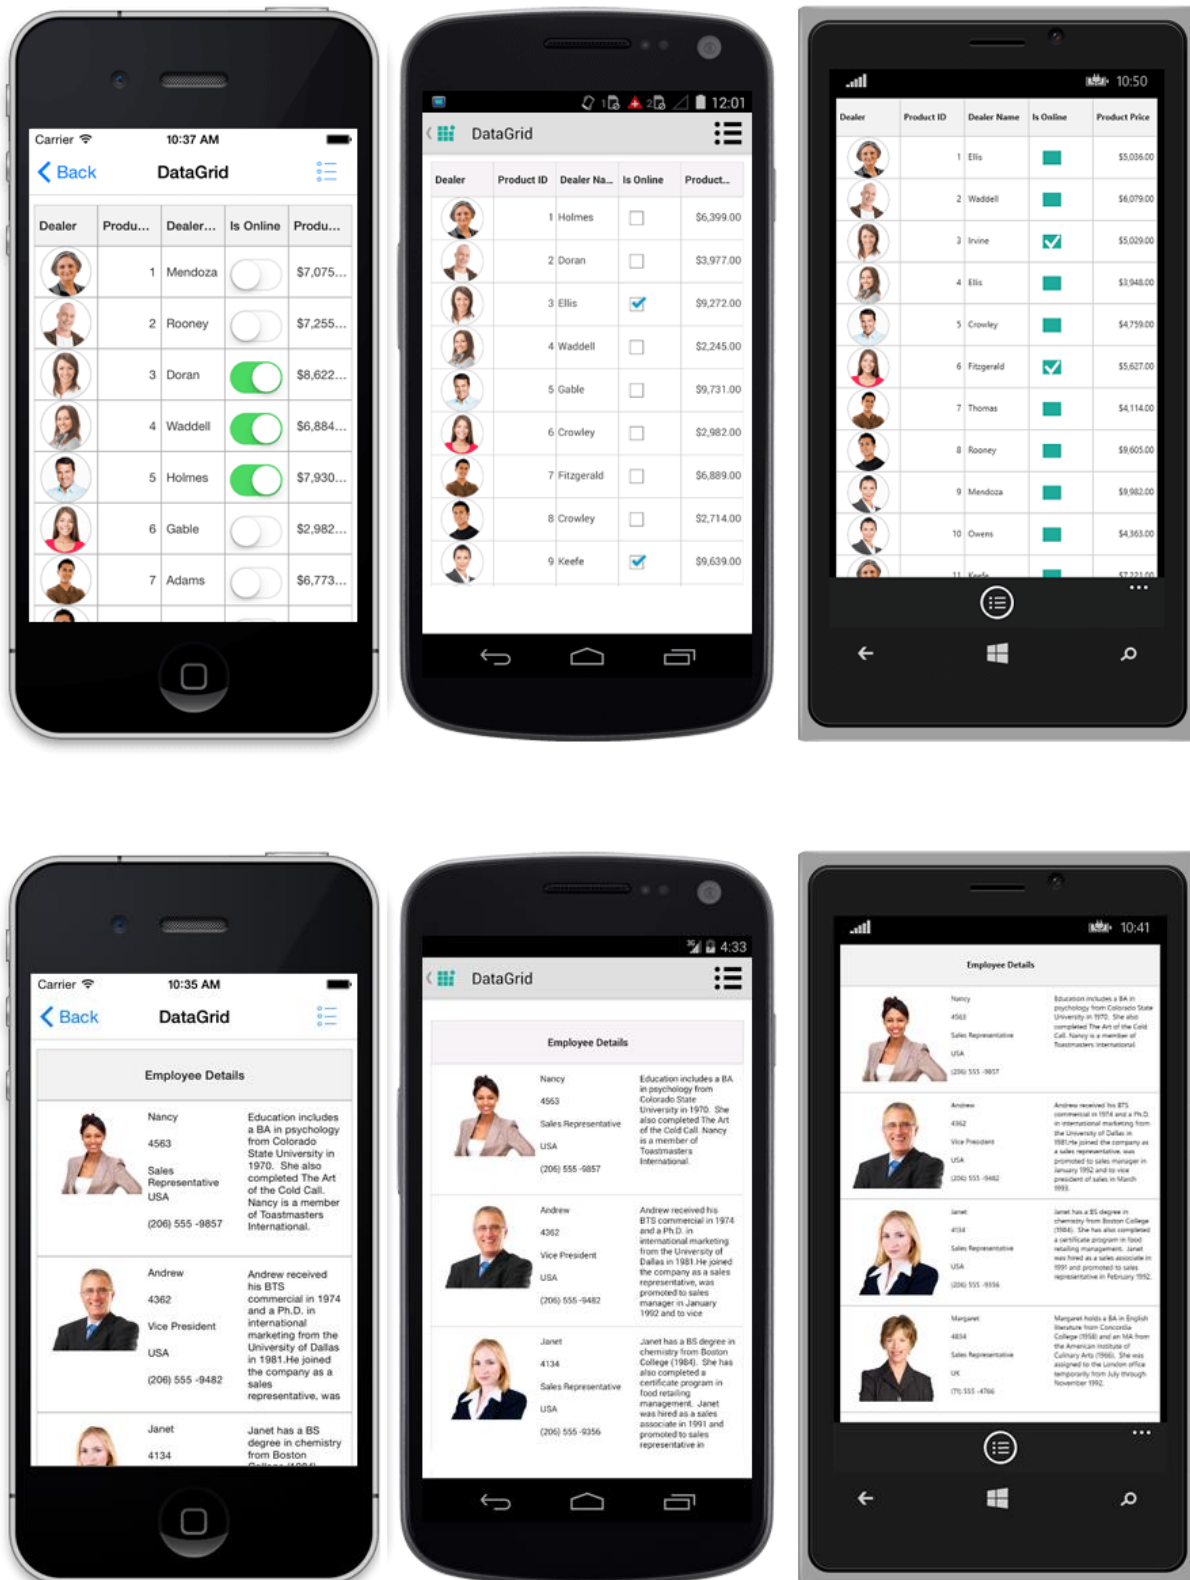

### SfDataGrid

The `DataGrid` control is available in `Xamarin.Forms`, `Xamarin.Android`, and `Xamarin.iOS`. This helps to create entirely customizable features and is used to display and manipulate large amounts of data in a tabular view. It is built from the ground up to achieve the best possible performance even when loading

large data sets. The following table lists the key features of this control in Xamarin.Forms, Xamarin.Android, and Xamarin.iOS.

**Information:** Xamarin.Forms is unique and offers a single language(C#) and runtime that works across the platforms like Android, iOS, UWP and MacOS platform as well.

Features	Xamarin.Forms (Android, iOS ,UWP and MacOS)	Xamarin.Android	Xamarin.iOS
Diagonal scrolling			
Sorting			
Custom sorting			
Grouping			
Custom grouping			
Summaries			
Filtering			
Editing			
Resizing columns			
Selection			
Load more			
Pull to refresh			
Swiping			
Column drag and drop			
Row drag and drop			
Template column			
Custom cell			
Styles			
Conditional styles			
Exporting			
Row Freezing			
Column freezing			
Row height customization			

## Getting Started

This section provides a quick overview for working with the SfDataGrid for Xamarin.Forms. Walk through the entire process of creating a real world of this control.

**Note:** Watch the video: [Xamarin.Forms DataGrid - Getting Started \(YouTube\)](#)

### Assembly deployment

After installing Essential Studio for Xamarin, find all the required assemblies in the installation folders {Syncfusion Essential Studio Installed location}\Essential Studio\{{ site.releaseversion }}\Xamarin\lib.

Eg: C:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Xamarin\lib.

**Note:** Assemblies can be found in an unzipped package location in Mac.

### NuGet configuration

To install the required NuGet for the SfDataGrid control in the application, configure the NuGet packages of the Syncfusion components.

Refer to the following KB to configure the NuGet packages of the Syncfusion components:

[How to configure package source and install Syncfusion NuGet packages in an existing project?](#)

The following NuGet package should be installed to use the SfDataGrid control in the application.

Project	Required package
Xamarin.Forms	Syncfusion.Xamarin.SfDataGrid

### Adding SfDataGrid reference

You can add SfDataGrid reference using one of the following methods:

#### Method 1: Adding SfDataGrid reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](#). To add SfDataGrid to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfDataGrid](#), and then install it.

![Adding SfDataGrid reference from NuGet](Getting-started\_images/Adding SfDataGrid reference.png)

**Note:** Install the same version of SfDataGrid NuGet in all the projects.

#### Method 2: Adding SfDataGrid reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfDataGrid control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfDataGrid assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.Data.Portable.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfDataGrid.XForms.dll
-----	--

	Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Licensing.dll Syncfusion.SfComboBox.XForms.dll
Android	Syncfusion.Data.Portable.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfDataGrid.XForms.dll Syncfusion.SfDataGrid.XForms.Android.dll Syncfusion.SfNumericTextBox.Android.dll Syncfusion.SfNumericTextBox.XForms.Android.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.Android.dll
iOS	Syncfusion.Data.Portable.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfDataGrid.XForms.dll Syncfusion.SfDataGrid.XForms.iOS.dll Syncfusion.SfNumericTextBox.iOS.dll Syncfusion.SfNumericTextBox.XForms.iOS.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.iOS.dll
UWP	Syncfusion.Data.Portable.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfDataGrid.XForms.dll Syncfusion.SfDataGrid.XForms.UWP.dll Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfNumericTextBox.XForms.UWP.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll Syncfusion.SfComboBox.XForms.dll Syncfusion.SfComboBox.XForms.UWP.dll
macOS	Syncfusion.Data.Portable.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfDataGrid.XForms.dll Syncfusion.SfDataGrid.XForms.macOS.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.macOS.dll Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the SfDataGrid on each platform

To use the SfDataGrid inside an application, each platform application must initialize the SfDataGrid renderer. This initialization step varies from platform to platform and is discussed in the following sections:

#### Android

The Android launches the SfDataGrid without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the SfDataGrid in iOS, call the `SfDataGridRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework initialization and before the `LoadApplication` is called as demonstrated in the following code example:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.SfDataGrid.XForms.iOS.SfDataGridRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

#### Universal Windows Platform (UWP)

To launch the SfDataGrid in UWP, call the `SfDataGridRenderer.Init()` in the `MainPage` constructor before the `LoadApplication` is called as demonstrated in the following code example.

#### C#

```
public MainPage ()
{
    ...
    Syncfusion.SfDataGrid.XForms.UWP.SfDataGridRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

### Release mode issue in UWP platform

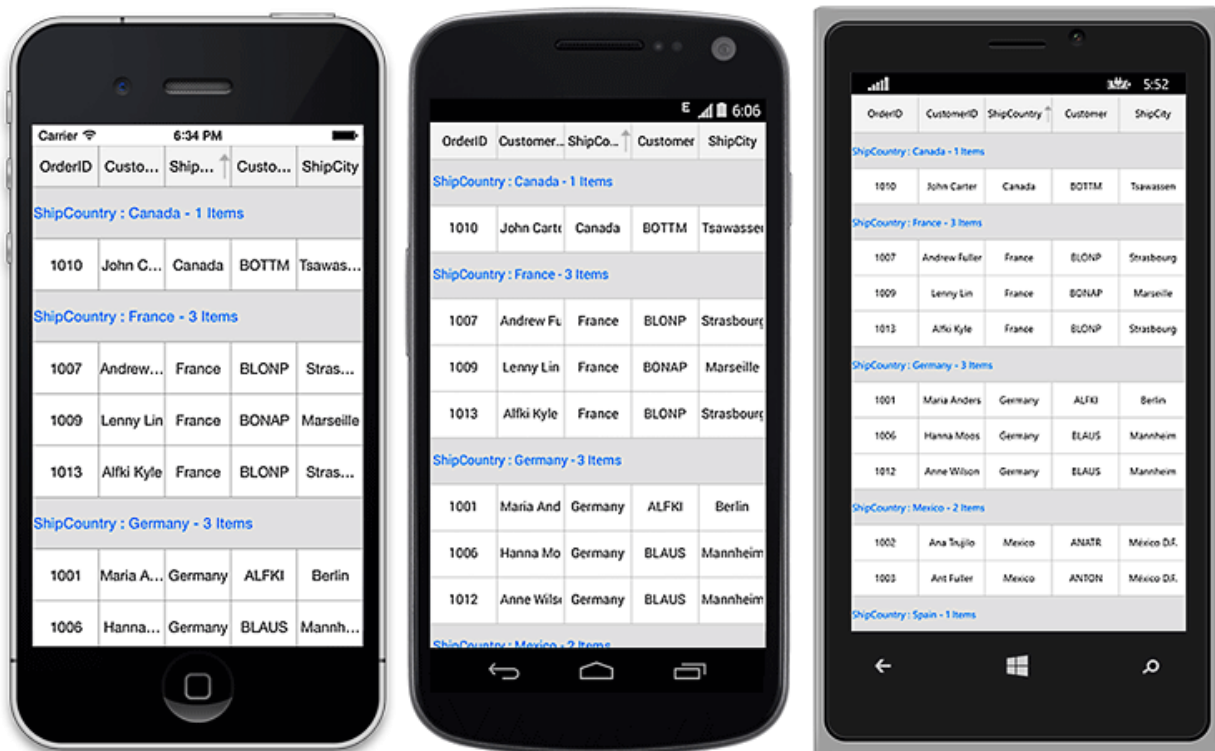

The known Framework issue in UWP platform is the custom controls will not render when deployed the application in **Release Mode**. It can be resolved by initializing the SfDataGrid assemblies in **App.xaml.cs** in UWP project as in the following code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you should add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfDataGrid.XForms.UWP.SfDataGridRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(Syncfusion.SfNumericTextBox.XForms.UWP.SfNumericTextBoxRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a simple SfDataGrid

This section explains how to create a SfDataGrid and configure it. The SfDataGrid control can be configured entirely in C# code or using XAML markup. This is how the final output will look like on iOS, Android, and Windows Phone devices.

---

**Note:** You can download the complete project of this demo from [GitHub](#).

---

In this walk through, a new application can be created that contains the SfDataGrid which includes the following topics:

- [Creating the project](#)
- [Adding SfDataGrid in Xamarin.Forms](#)
- [Create data model](#)
- [Binding data](#)
- [Defining columns](#)
- [Sorting](#)
- [Grouping](#)
- [Selection](#)

### Creating the project

Create a new BlankApp (Xamarin.Forms.Portable) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding SfDataGrid in Xamarin.Forms

1. Add the required assembly references to the pcl and renderer projects as discussed in the [Assembly deployment](#) section.
2. Import the SfDataGrid control namespace as `xmlns:syncfusion="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"` in XAML Page.
3. Set the SfDataGrid control as content to the ContentPage.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
xmlns:syncfusion="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
x:Class="GettingStarted.Sample">
  <ContentPage.Content>
    <syncfusion:SfDataGrid x:Name="dataGrid" />
  </ContentPage.Content>
</ContentPage>
```

### C#

```
using Syncfusion.SfDataGrid.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfDataGrid dataGrid;
        public App ()
```

```
{
    dataGrid = new SfDataGrid();
    MainPage = new ContentPage { Content = dataGrid };
}
}
```

### Create DataModel for the SfDataGrid

The SfDataGrid is a data-bound control. Hence, a data model should be created to bind it to the control.

Create a simple data source as shown in the following code example in a new class file. Save it as OrderInfo.cs file:

#### C#

```
public class OrderInfo
{
    private int orderID;
    private string customerID;
    private string customer;
    private string shipCity;
    private string shipCountry;
    public int OrderID {
        get { return orderID; }
        set { this.orderID = value; }
    }
    public string CustomerID {
        get { return customerID; }
        set { this.customerID = value; }
    }
    public string ShipCountry {
        get { return shipCountry; }
        set { this.shipCountry = value; }
    }
    public string Customer {
        get { return this.customer; }
        set { this.customer = value; }
    }
    public string ShipCity {
        get { return shipCity; }
        set { this.shipCity = value; }
    }
    public OrderInfo (int orderId, string customerId, string country, string customer, string shipCity)
    {
        this.OrderID = orderId;
        this.CustomerID = customerId;
        this.Customer = customer;
        this.ShipCountry = country;
        this.ShipCity = shipCity;
    }
}
```

**Note:** If you want your data model to respond to property changes, implement `INotifyPropertyChanged` interface in your model class.

Create a model repository class with OrderInfo collection property initialized with required number of data objects in a new class file as shown in the following code example and save it as OrderInfoRepository.cs file:

### C#

```
public class OrderInfoRepository
{
    private ObservableCollection<OrderInfo> orderInfo;
    public ObservableCollection<OrderInfo> OrderInfoCollection {
        get { return orderInfo; }
        set { this.orderInfo = value; }
    }
    public OrderInfoRepository ()
    {
        orderInfo = new ObservableCollection<OrderInfo> ();
        this.GenerateOrders ();
    }
    private void GenerateOrders ()
    {
        orderInfo.Add (new OrderInfo (1001, "Maria Anders", "Germany", "ALFKI", "Berlin"));
        orderInfo.Add (new OrderInfo (1002, "Ana Trujillo", "Mexico", "ANATR", "Mexico D.F.));
        orderInfo.Add (new OrderInfo (1003, "Ant Fuller", "Mexico", "ANTON", "Mexico D.F.));
        orderInfo.Add (new OrderInfo (1004, "Thomas Hardy", "UK", "AROUT", "London"));
        orderInfo.Add (new OrderInfo (1005, "Tim Adams", "Sweden", "BERGS", "London"));
        orderInfo.Add (new OrderInfo (1006, "Hanna Moos", "Germany", "BLAUS", "Mannheim"));
        orderInfo.Add (new OrderInfo (1007, "Andrew Fuller", "France", "BLONP", "Strasbourg"));
        orderInfo.Add (new OrderInfo (1008, "Martin King", "Spain", "BOLID", "Madrid"));
        orderInfo.Add (new OrderInfo (1009, "Lenny Lin", "France", "BONAP", "Marsielle));
        orderInfo.Add (new OrderInfo (1010, "John Carter", "Canada", "BOTTM", "Lenny Lin"));
        orderInfo.Add (new OrderInfo (1011, "Laura King", "UK", "AROUT", "London"));
        orderInfo.Add (new OrderInfo (1012, "Anne Wilson", "Germany", "BLAUS", "Mannheim"));
        orderInfo.Add (new OrderInfo (1013, "Martin King", "France", "BLONP", "Strasbourg"));
        orderInfo.Add (new OrderInfo (1014, "Gina Irene", "UK", "AROUT", "London"));
    }
}
```

### Binding data to the SfDataGrid

To bind the data source to the SfDataGrid, set the [SfDataGrid.ItemsSource](#) property as follows. You can bind the data source of the SfDataGrid either from XAML or in code.

The following code example binds the collection created in previous step to `SfDataGrid.ItemsSource` property.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
xmlns:syncfusion="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
x:Class="GettingStarted.Sample">
<ContentPage.BindingContext>
<local:OrderInfoRepository x:Name="viewModel" />
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrderInfoCollection}">
</syncfusion:SfDataGrid>
</ContentPage.Content>
</ContentPage>
```

**C#**

```
OrderInfoRepository viewModel = new OrderInfoRepository ();
dataGrid.ItemsSource = viewModel.OrderInfoCollection;
```

Run the application to render the following output.

## Defining columns

By default, the SfDataGrid automatically creates columns for all the properties in the data source. The type of the column generated depends on the type of data in the column. When the columns are auto-generated, handle the [SfDataGrid.AutoGeneratingColumn](#) event to customize or cancel the columns before they are added to the columns collection in the SfDataGrid.

The columns can be manually defined by setting the [SfDataGrid.AutoGenerateColumns](#) property to false and by adding the [GridColumn](#) objects to the [SfDataGrid.Columns](#) collection. It can be done from both XAML and code. The following code example illustrates this:

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    ColumnSizer="Star"
    AutoGenerateColumns="False"
    ItemsSource="{Binding OrderInfoCollection}">
    <syncfusion:SfDataGrid.Columns x:TypeArguments="syncfusion:Columns">
    <syncfusion:GridTextColumn HeaderText="Order ID"
    MappingName="OrderID" />
    <syncfusion:GridTextColumn HeaderText="Customer ID"
    MappingName="CustomerID" />
    <syncfusion:GridTextColumn MappingName="Customer" />
    <syncfusion:GridTextColumn HeaderText="Ship Country"
    MappingName="ShipCountry" />
    </syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

### C#

```
dataGrid.AutoGenerateColumns = false;
GridColumn orderIdColumn = new GridTextColumn ();
orderIdColumn.MappingName = "OrderID";
orderIdColumn.HeaderText = "Order ID";
GridColumn customerIdColumn = new GridTextColumn ();
customerIdColumn.MappingName = "CustomerID";
customerIdColumn.HeaderText = "Customer ID";
GridColumn customerColumn = new GridTextColumn ();
customerColumn.MappingName = "Customer";
customerColumn.HeaderText = "Customer";
GridColumn countryColumn = new GridTextColumn ();
countryColumn.MappingName = "ShipCountry";
countryColumn.HeaderText = "Ship Country";
dataGrid.Columns.Add (orderIdColumn);
dataGrid.Columns.Add (customerIdColumn);
dataGrid.Columns.Add (customerColumn);
dataGrid.Columns.Add (countryColumn);
```

## Sorting

The SfDataGrid allows sorting on its data by setting the [SfDataGrid.AllowSorting](#) property to true.

### XML

```
<syncfusion:SfDataGrid AllowSorting="True" />
```

**C#**

```
dataGrid.AllowSorting = true;
```

Run the application and touch the header cell to sort the data and the following output will be displayed.

Sorting can also be configured by adding the column to the [SfDataGrid.SortColumnDescriptions](#) collection as follows.

**XML**

```
<syncfusion:SfDataGrid.SortColumnDescriptions>
<syncfusion:SortColumnDescription ColumnName="CustomerID" />
</syncfusion:SfDataGrid.SortColumnDescriptions>
```

**C#**

```
dataGrid.SortColumnDescriptions.Add (new SortColumnDescription ()
{ ColumnName = "CustomerID" });
```

**Grouping**

The SfDataGrid allows grouping a column by adding the column to the [SfDataGrid.GroupColumnDescriptions](#) collection as follows.

**XML**

```
<syncfusion:SfDataGrid.GroupColumnDescriptions>
<syncfusion:GroupColumnDescription ColumnName="ShipCountry" />
```

```
</syncfusion:SfDataGrid.GroupColumnDescriptions>
```

## C#

```
dataGrid.GroupColumnDescriptions.Add (new GroupColumnDescription ()
{ ColumnName = "ShipCountry" });
```

Run the application to render the following output.

## Selection

The SfDataGrid allows selecting the row or rows by setting the [SfDataGrid.SelectionMode](#) property. You can set the [SfDataGrid.SelectionMode](#) property to single, multiple, single deselect, or none. Information about the row or rows selected can be tracked using the [SfDataGrid.SelectedItem](#) and [SfDataGrid.SelectedItems](#) properties.

The selection operations can be handled with the help of the [SelectionChanging](#) and [SelectionChanged](#) events of the SfDataGrid.

## Launching the SfDataGrid inside a StackLayout

The StackLayout positions the child element one after the other. They are adding either horizontally or vertically. Space of the [StackLayout](#) depends on the HorizontalOptions and VerticalOptions properties are set. But by default, the [StackLayout](#) will try to use the entire screen.

The SfDataGrid control can be loaded inside any layout such as [Grid](#), [StackLayout](#), etc., When loading SfDataGrid inside a [StackLayout](#), set the Horizontal and/or VerticalOptions of the SfDataGrid and its parent to "LayoutOptions.FillAndExpand" based on the orientation of the container in which the SfDataGrid is loaded.

Refer to the following code example to load the SfDataGrid control inside a `StackLayout`. The `VerticalOptions` of the `StackLayout` and the SfDataGrid alone is set as “FillAndExpand” as the default orientation of the `StackLayout` is vertical.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GridInForms"
xmlns:sfgrid="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
x:Class="GridInForms.MainPage">
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<ContentPage.Content>
<StackLayout VerticalOptions="FillAndExpand">
<SearchBar Placeholder="UserName" TextChanged="searchBar_TextChanged" />
<sfgrid:SfDataGrid x:Name="dataGrid"
ColumnSizer="Star"
ItemsSource="{Binding OrderInfoCollection}"
VerticalOptions="FillAndExpand" />
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

### C#

```
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        private StackLayout stackLayout;
        private SfDataGrid dataGrid;
        private ViewModel viewModel;
        private SearchBar searchBar;
        public MainPage()
        {
            InitializeComponent();
            stackLayout = new StackLayout();
            dataGrid = new SfDataGrid();
            viewModel = new ViewModel();
            searchBar = new SearchBar();
            searchBar.Placeholder = "UserName";
            dataGrid.ItemsSource = viewModel.OrdersInfo;
            dataGrid.ColumnSizer = ColumnSizer.Star;
            stackLayout.VerticalOptions = LayoutOptions.FillAndExpand;
            stackLayout.HorizontalOptions = LayoutOptions.FillAndExpand;
            stackLayout.Children.Add(searchBar);
            stackLayout.Children.Add(dataGrid);
            this.Content = stackLayout;
        }
    }
}
```

Refer to the following screenshot for the outcome.

**Note:** In case, if the orientation of the `StackLayout` is horizontal, set the `HorizontalOptions` instead. In some cases, set both the “`VerticalOptions`” and “`HorizontalOptions`” of the `SfDataGrid` based on its parent.

Loading the `SfDataGrid` with customized height and width

The `SfDataGrid` can be load with specific height and width inside different layouts using the [SfDataGrid.HeightRequest](#) and [SfDataGrid.WidthRequest](#) properties.

The following code example illustrates how this can be done.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
```

```
xmlns:local="clr-namespace:GridInForms"
x:Class="GridInForms.MainPage"
xmlns:sfgrid="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
" >
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
HeightRequest="290"
WidthRequest="200"
VerticalOptions="CenterAndExpand"
HorizontalOptions="Center"/>
</ContentPage>
```

## C#

```
public MainPage()
{
    InitializeComponent();
    viewModel = new ViewModel();
    dataGrid = new SfDataGrid();
    dataGrid.ItemsSource = viewModel.OrdersInfo;
    dataGrid.HeightRequest = 290;
    dataGrid.WidthRequest = 200;
    dataGrid.VerticalOptions = LayoutOptions.CenterAndExpand;
    dataGrid.HorizontalOptions = LayoutOptions.Center;
    this.Content = dataGrid;
}
```

The following screenshot shows how the SfDataGrid is loaded with specific height and width with VerticalOptions and HorizontalOptions.

![DataGrid with customized height and width](SfDataGridimages>Loadingwith specificheightand\_width.png)

---

**Note:** Set the [HorizontalOptions](#) and [VerticalOptions](#) for the grid accordingly.

---

### [Linker issue in Xamarin.Forms.iOS](#)

There are some known Framework issues in Xamarin.Forms.iOS platform.

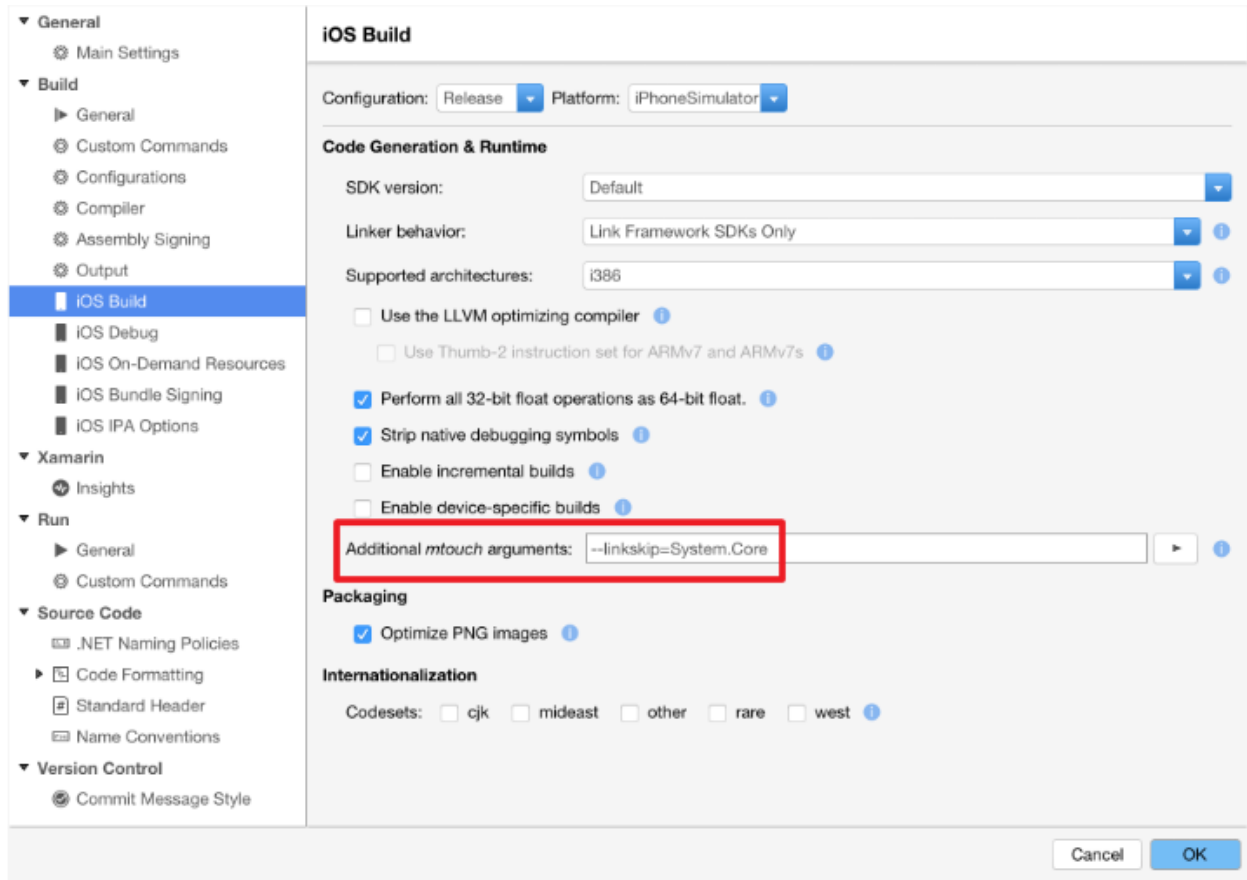

When creating the SfDataGrid in `Xamarin.Forms` with `Linker behavior` in `iOS` renderer project as “Link Framework SDKs only”, sometimes `System.MethodMissingException` or `No method Count exists on type System.Linq.Queryable` exception will be thrown.

The above exceptions can be resolved by using the following workaround:

#### **Workaround:**

The above exceptions can be resolved in two ways.

1. By setting `LinkerBehavior` as “Do not Link”. 2. By setting custom linker argument in `iOS` renderer project as in the following screenshot.

## Data Binding

The SfDataGrid is bound to an external data source to display the data. It supports data sources such as [List](#), [ObservableCollection](#), and so on. The [SfDataGrid.ItemsSource](#) property helps to bind this control with collection of objects.

In order to bind data source of the SfDataGrid, set the [SfDataGrid.ItemsSource](#) property as follows. Such that each row in the SfDataGrid would bind to an object in data source. Each column would bind to a property in the data model object.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:DataGridDemo;assembly=DataGridDemo"
xmlns:syncfusion="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
x:Class="DataGridDemo.Sample">
<ContentPage.BindingContext>
<local:OrderInfoRepository x:Name="viewModel" />
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrderInfoCollection}">
</syncfusion:SfDataGrid>
```

```
</ContentPage.Content>
</ContentPage>
```

**C#**

```
OrderInfoRepository viewModel = new OrderInfoRepository ();
dataGrid.ItemsSource = viewModel.OrderInfoCollection;
```

If the data source implements `ICollectionChanged` interface, then the SfDataGrid will automatically refresh the view when an item is added, removed, or cleared. When you add or remove an item in `ObservableCollection`, it automatically refreshes the view as the `ObservableCollection`. That implements the [INotifyCollectionChanged](#). But when you do the same in `List`, it will not refresh the view automatically.

If the data model implements the [INotifyPropertyChanged](#) interface, then the SfDataGrid responds to the property change at runtime to update the view.

---

**Note:** The SfDataGrid does not supports `DataTable` binding in `Xamarin.Forms` since `System.Data` is inaccessible in `Portable Class Library`.

---

**Binding with IEnumerable**

The SfDataGrid control supports to bind any collection that implements the [IEnumerable](#) interface. All the data operations such as sorting, grouping, and filtering are supported when binding collection derived from `IEnumerable`.

**Binding with DataTable**

SfDataGrid control supports to bind the [DataTable](#). SfDataGrid control automatically refresh the UI when binding `DataTable` as `ItemsSource` when rows are added, removed or cleared.

**XML**

```
<sfGrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding Table}">
</sfGrid:SfDataGrid>
```

**C#**

```
DataTable Table = this.GetDataTable();
this.sfDataGrid1.ItemsSource = Table;
```

Below are the limitations when binding `DataTable` as `ItemsSource` to SfDataGrid.

- Custom sorting is not supported.
- `SfDataGrid.View.Filter` is not supported.
- Advanced Filtering does not support Case Sensitive filtering.
- [GridUnboundColumn.Expression](#) is not supported. This can be achieved by using the [DataColumn](#) of `DataTable` by setting [DataColumn.Expression](#) property.
- [SfDataGrid.LiveDataUpdateMode](#) is not supported.

### Binding complex properties

The SfDataGrid control supports to bind complex property to its columns. To bind complex property to the [GridColumn](#), set the complex property path to the [MappingName](#).

### XML

```
<sfGrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfGrid:GridTextColumn MappingName="OrderID.Order" />
<sfGrid:GridTextColumn MappingName="CustomerID" />
<sfGrid:GridTextColumn MappingName="Freight" />
<sfGrid:GridTextColumn MappingName="Country" />
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

### C#

```
this.dataGrid.Columns.Add(new GridTextColumn() { MappingName =
"OrderID.Order" });
```

### View

The DataGrid has the [View](#) property of type [ICollectionViewAdv](#) interface that implements [ICollectionView](#) interface. [View](#) is responsible for maintaining and manipulating data and other advanced operations, like [Sorting](#), [Grouping](#), and etc.,

When you bind collection to the [ItemsSource](#) property of the SfDataGrid, then [View](#) will be created and maintains the operations on [Data](#) such as [Grouping](#), [Sorting](#), [Insert](#), [Delete](#), and [Modification](#).

**Note:** The DataGrid creates different types of view derived from [ICollectionViewAdv](#) interface based on the [ItemsSource](#).

**Information:** [View](#) related properties can be used only after creating [SfDataGrid](#) view. Hence changes related to view can be done in [SfDataGrid.GridViewCreated](#) or [SfDataGrid.GridLoaded](#) event or in runtime only.

The following property is associated with [View](#)

#### LiveDataUpdateMode

The SfDataGrid supports to update the view during data manipulation operations and property changes using the [LiveDataUpdateMode](#). It allows to update the view based on the [SfDataGrid.View.LiveDataUpdateMode](#) property.

LiveDataUpdateMode	Description
Default	Data operations are not updated.
AllowSummaryUpdate	Summaries are updated during data manipulation change.
AllowDataShaping	Data operations like sorting, grouping, and filtering are updated during data manipulation change.

**C#**

```
dataGrid.GridViewCreated += DataGrid_GridViewCreated;  
private void DataGrid_GridViewCreated(object sender,  
GridViewCreatedEventArgs e)  
{  
    dataGrid.View.LiveDataUpdateMode = LiveDataUpdateMode.Default;  
}
```

The following events are associated with **View**.

*RecordPropertyChanged*

The [RecordPropertyChanged](#) event is raised when **DataModel** property value is changed, if **DataModel** implements the [INotifyPropertyChanged](#) interface. The event receives with two arguments namely sender that handles the **DataModel** and the [PropertyChangedEventArgs](#) as argument.

**PropertyChangedEventArgs** has the following property:

[PropertyName](#): It denotes the **PropertyName** of the changed value.

*CollectionChanged*

The [CollectionChanged](#) event is raised when changes in **Records/DisplayElements** collection. The event receives two arguments namely sender that handles **View** object and the [NotifyCollectionChangedEventArgs](#) as argument.

**NotifyCollectionChangedEventArgs** has the following properties:

[Action](#): It contains the current action. (i.e.) **Add**, **Remove**, **Move**, **Replace**, **Reset**.

[NewItems](#): It contains the list of new items involved in the change.

[OldItems](#): It contains the list of old items affected by the **Action**.

[NewStartingIndex](#): It contains the index at which the change occurred.

[OldStartingIndex](#): It contains the index at which the **Action** occurred.

*SourceCollectionChanged*

The [SourceCollectionChanged](#) event is raised when making changes in **SourceCollection**. For example, adding or removing the collection. The event receives two arguments namely sender that handles **GridQueryableCollectionViewWrapper** object and the [NotifyCollectionChangedEventArgs](#) as argument.

**NotifyCollectionChangedEventArgs** has the following properties:

[Action](#): It contains the current action. (i.e.) **Add**, **Remove**, **Move**, **Replace**, **Reset**.

[NewItems](#): It contains the list of new items involved in the change.

[OldItems](#): It contains the list of old items affected by the **Action**.

[NewStartingIndex](#): It contains the index at which the change occurred.

[OldStartingIndex](#): It contains the index at which the **Action** occurred.

The following methods are associated with **View** which can be used to defer refresh the view:

Method Name	Description
DeferRefresh	Enter the defer cycle so that you can perform all data operations in view and update once.
BeginInit & EndInit	When BeginInit method is called it suspends all the updates until EndInit method is called. You can suspend and resume all the operations in these methods and update the view at once.

### Data Virtualization

Data grid provides support to handle the large amount of data through built-in virtualization feature. With Data virtualization, the record entries will be created in the runtime only upon scrolling to the vertical end which increases the performance of grid loading time.

To set SfDataGrid.EnableDataVirtualization property to true, follow the code example:

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
ItemsSource="{Binding EmployeeDetails}"
EnableDataVirtualization="True">
```

### C#

```
datagrid.EnableDataVirtualization = true;
```

### NotificationSubscriptionMode

Data grid exposed [SfDataGrid.NotificationSubscriptionMode](#) property that allows you to set whether the underlying source collection items can listen to the INotifyCollectionChanged or INotifyPropertyChanging events. You can handle the property change or collection change by setting the NotificationSubscriptionMode property.

NotificationSubscriptionMode	Description
CollectionChange	Denotes a view that listens System.Collections.Specialized.INotifyCollectionChanged.CollectionChanged event of the SourceCollection.
None	Denotes System.ComponentModel.INotifyPropertyChanging.PropertyChanging, System.ComponentModel.INotifyPropertyChanged.PropertyChanged, and System.Collections.Specialized.INotifyCollectionChanged.CollectionChanged events will not be listened.
PropertyChange	Denotes a view that listens the System.ComponentModel.INotifyPropertyChanging.PropertyChanging and System.ComponentModel.INotifyPropertyChanged.PropertyChanged events of the data object.

To set the NotificationSubscriptionMode property, follow the code example.

#### **XML**

```
<syncfusion:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
ItemsSource="{Binding EmployeeDetails}"
NotificationSubscriptionMode="CollectionChange">
```

#### **C#**

```
dataGrid.NotificationSubscriptionMode =
NotificationSubscriptionMode.CollectionChange;
```

#### *Binding SfDataGrid.SelectedIndex property*

You can bind any int value to the bindable property [SfDataGrid.SelectedIndex](#) which gets or sets the lastly selected row's index in the SfDataGrid.

Refer the below code to bind the [SfDataGrid.SelectedIndex](#) from the ViewModel.

#### **XML**

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrderInfoCollection}"
SelectionMode="Multiple"
SelectedIndex="{Binding SelectedIndex}">
</sfgrid:SfDataGrid>
```

#### **C#**

```
//ViewModel.cs code
private int _selectedIndex;
public int SelectedIndex
{
    get { return _selectedIndex; }
    set { this._selectedIndex = value;RaisePropertyChanged("SelectedIndex"); }
}
public ViewModel()
{
    this.SelectedIndex = 5;
}
```

#### *Binding SfDataGrid.SelectedItem property*

You can bind any object value to the bindable property [SfDataGrid.SelectedItem](#) which gets or sets the selected item in the SfDataGrid.

Refer the below code to bind the [SfDataGrid.SelectedItem](#) from the ViewModel.

#### **XML**

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrderInfoCollection}"
```

```
SelectionMode="Multiple"
SelectedItem="{Binding SelectedItem}">
</sfgrid:SfDataGrid>
```

**C#**

```
//ViewModel.cs code
private object _selectedItem;
public object SelectedItem
{
    get { return _selectedItem; }
    set { this._selectedItem = value; RaisePropertyChanged("SelectedItem"); }
}
public ViewModel()
{
    this.SelectedItem = this.OrderInfoCollection[8];
}
```

*Binding SfDataGrid.SelectedItems property*

You can bind any object type collection to the bindable property SfDataGrid [SfDataGrid.SelectedItems](#) which gets or sets the collection of [SelectedItem](#) collection in the SfDataGrid.

Refer the below code to bind the [SfDataGrid.SelectedItems](#) from the ViewModel.

**XML**

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrderInfoCollection}"
SelectionMode="Multiple"
SelectedItem="{Binding SelectedItems}">
</sfgrid:SfDataGrid>
```

**C#**

```
//ViewModel.cs code
private ObservableCollection<object> _selectedItems;
public ObservableCollection<object> SelectedItems
{
    get { return _selectedItems; }
    set { this._selectedItems = value; RaisePropertyChanged("SelectedItems"); }
}
public ViewModel()
{
    this.SelectedItems.Add(OrderInfoCollection[1]);
    this.SelectedItems.Add(OrderInfoCollection[5]);
    this.SelectedItems.Add(OrderInfoCollection[8]);
}
```

*Binding GridColumn properties*

You can also assign value via binding to the properties of the [GridColumn](#) such as [HeaderCellTextSize](#), [CellTextSize](#), [FontAttribute](#), [RecordFont](#), [HeaderFont](#) etc.

Refer the below code to bind the GridColumn properties from the ViewModel.

## XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrderInfoCollection}">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn MappingName="Customer" CellTextSize="{Binding
CellTextSize,Source={x:Reference viewModel}}"/>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
```

## C#

```
//ViewModel.cs code
private double _cellTextSize;
public double CellTextSize
{
    get { return _cellTextSize; }
    set { this._cellTextSize = value; RaisePropertyChanged("CellTextSize"); }
}
public ViewModel()
{
    this.CellTextSize = 20;
}
```

### *Binding GridPickerColumn ItemsSource from ViewModel*

You can assign any object typed collection to the [GridPickerColumn.ItemsSource](#) to display a list of items in the [GridPickerColumn](#) when entering edit mode.

Refer the below code to bind the ItemsSource of GridPickerColumn from the ViewModel.

## XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrderInfoCollection}">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridPickerColumn BindingContext="{x:Reference viewModel}"
MappingName="ShipCity"
ItemsSource="{Binding CustomerNames}" HeaderText="PickerColumn"/>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
```

## C#

```
//ViewModel.cs code
private ObservableCollection<string> _customerNames;
public ObservableCollection<string> CustomerNames
{
    get { return _customerNames; }
    set { this._customerNames = value; RaisePropertyChanged("CustomerNames"); }
}
public ViewModel()
{
    this.CustomerNames = customerNames.ToObservableCollection();
}
```

```
}
string[] customerNames = { "Thomas", "John", "Hanna", "Laura", "Gina" };
```

#### *Binding the ItemsSource in ViewModel to the Picker loaded inside template*

The `ItemsSource` of a picker which is loaded inside the `GridTemplateColumn` can also be assigned any value via binding by passing the binding context as the `Source` to the `ItemsSource` property.

Refer the below code to bind the `ItemsSource` of Picker loaded inside the `GridTemplateColumn` from the `ViewModel`.

#### **XML**

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrderInfoCollection}">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTemplateColumn MappingName="Customer" HeaderText="Picker">
<sfgrid:GridTemplateColumn.CellTemplate>
<DataTemplate>
<Picker ItemsSource="{Binding SelectedModels,Source={x:Reference
viewModel}}" SelectedIndex="0"/>
</DataTemplate>
</sfgrid:GridTemplateColumn.CellTemplate>
</sfgrid:GridTemplateColumn>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
```

#### **C#**

```
//ViewModel.cs code
private List<String> _vehicleModel;
public List<String> SelectedModels
{
get { return _vehicleModel; }
set { this._vehicleModel = value;RaisePropertyChanged("SelectedCars"); }
}
public ViewModel()
{
this.SelectedModels = selectedModels.ToList();
}
string [] selectedModels = { "Select Car", "Audi", "Bentley", "Mercedes
Benz", "Porsche" };
```

#### *Binding the button command in template column to ViewModel*

You can also assign any value to the `Command` property of the `Button` loaded inside the `GridTemplateColumn` via binding.

Refer the below code to bind the `command` property of `Button` loaded inside the `GridTemplateColumn` from the `ViewModel`.

#### **XML**

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrderInfoCollection}">
```

```

<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTemplateColumn MappingName="Customer">
<sfgrid:GridTemplateColumn.CellTemplate>
<DataTemplate>
<Button Text="Template" Command="{Binding ButtonCommand, Source={x:Reference
viewModel}}"/>
</DataTemplate>
</sfgrid:GridTemplateColumn.CellTemplate>
</sfgrid:GridTemplateColumn>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>

```

## C#

```

//ViewModel.cs code
private Command _buttonCommand;
public Command ButtonCommand
{
    get { return _buttonCommand; }
    set { this._buttonCommand = value;RaisePropertyChanged("ButtonCommand"); }
}
public ViewModel()
{
    this.ButtonCommand = new Command(CustomMethod);
}
public void CustomMethod()
{
    // Customize your code here
}

```

You can download the source code of binding the SfDataGrid properties sample [here](#)

## Columns

The SfDatagrid allows to create and add columns in the following two ways:

- Automatic columns generation based on the underlying collection.
- Manually defining columns in XAML or C#.

### Automatic columns generation

The SfDataGrid creates columns automatically based on the bindable property [SfDataGrid.AutoGenerateColumns](#). Columns are generated based on type of individual properties in the underlying collection which is set as ItemsSource. For example, [GridNumericColumn](#) is added for int type property. Below table shows the column type created for the respective data type. For remaining types, [GridTextColumn](#) will be created.

Data Tye	Column
string, object	GridTextColumn
int, float, double, decimal and it's respective nullable types	GridNumericColumn
DateTime	GridDateTimeColumn

bool	GridSwitchColumn
enum	GridPickerColumn
ImageSource	GridImageColumn

You can refer the sample from [here](#) to get to know the codes for defining properties in the Model class and populating data for generating different types of column automatically.

#### *AutoGenerateColumns with different modes*

The auto generation of the columns in SfDataGrid is based on the [SfDataGrid.AutoGenerateColumnsMode](#) property.

[SfDataGrid.AutoGenerateColumnsMode](#) decides a way to create columns when [SfDataGrid.AutoGenerateColumns](#) is set to `true`. It also decides to retain grouping and sorting when the [ItemsSource](#) changed.

The [SfDataGrid.AutoGenerateColumnsMode](#) is of [AutoGenerateColumnsMode](#) type which has the following five options:

Modes	Description
<a href="#">None</a>	Stores only the columns that are defined in SfDataGrid.Columns collection. When changing the ItemsSource, the grouping and sorting for explicitly defined SfDataGrid.Columns alone will be retained.
<a href="#">Reset</a>	Retains the columns defined explicitly in the application level and creates columns newly for all the other properties in a data source. When changing the ItemsSource, the grouping and sorting for explicitly defined SfDataGrid.Columns alone will be retained.
<a href="#">ResetAll</a>	When changing the ItemsSource, the columns for the previous data source are cleared and the columns will be created newly for the new data source. Even when columns are explicitly defined it does not consider the defined columns and creates the column based on the underlying collection. Further when changing the ItemsSource, the grouping and sorting for all the columns will be cleared.
<a href="#">RetainOld</a>	When changing the ItemsSource, creates columns for all fields in a data source when the Grid does not have any explicit definition for columns. When columns are defined explicitly, then the defined columns alone are retained and new columns are not created.

	Similarly when changing the ItemsSource and when the Grid have any explicit definition for columns, the grouping and sorting are retained as it is.
<a href="#">SmartReset</a>	Retains the columns defined explicitly in application level and the columns with MappingName identical to the properties in the new data source. Creates columns newly for all the other properties in the data source. Similarly it retains the grouping and sorting of the columns that are defined explicitly in application level and the columns with MappingName identical to the properties in new data source.

The default value of `SfDataGrid.AutoGenerateColumns` property is `true` and `SfDataGrid.AutoGenerateColumnsMode` is `Reset`. By default, SfDataGrid creates columns automatically for every non-explicitly defined public property in the underlying collection bound to its `ItemsSource` property.

**Note:** When you change items source for the SfDataGrid during run time, then the columns are generated on the basis of option set for `SfDataGrid.AutoGenerateColumnsMode`.

#### *Auto generate columns for custom type*

By default columns are also auto generated for custom type properties and for parent properties of complex properties in the data object. To prevent such columns from being auto generated set the `SfDataGrid.AutoGenerateColumnsForCustomType` property as `False`.

In case of complex properties, use the `SfDataGrid.AutoGenerateColumnsModeForCustomType` to auto generate columns for either parent property, inner properties of the parent or both parent and inner properties.

#### **XML**

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo,Mode=TwoWay}"
AutoGenerateColumnsForCustomType="True"
AutoGenerateColumnsModeForCustomType="Both"
AllowEditing="True"
AllowSorting="True"
NavigationMode="Cell"
SelectionMode="Single">
</syncfusion:SfDataGrid>
```

#### **C#**

```
this.dataGrid.AutoGenerateColumnsForCustomType = true;
this.dataGrid.AutoGenerateColumnsModeForCustomType =
AutoGenerateColumnsModeForCustomType.Both;
```

### *Customize automatically generated columns*

When `SfDataGrid.AutoGenerateColumns` is `true`, the `SfDataGrid.AutoGeneratingColumn` event is raised for each `GridColumn`. This event receives two arguments namely sender which is the `SfDataGrid` and the `AutoGeneratingColumnEventArgs`.

The `AutoGeneratingColumnEventArgs` object contains the following properties:

- `Column`: This property returns the created column which can be customized.
- `Cancel`: This property cancels the column creation.
- `PropertyType`: This property provides the type of underlying model property for which the column is created.

You can skip generating a column by handling the `SfDataGrid.AutoGeneratingColumn` event as shown as follows:

#### **C#**

```
dataGrid.AutoGeneratingColumn += GridAutoGeneratingColumns;
void GridAutoGeneratingColumns(object sender,
AutoGeneratingColumnEventArgs e)
{
    if (e.Column.MappingName == "EmployeeID")
        e.Cancel = true;
}
```

Formatting for auto generated columns can be applied as follows:

#### **C#**

```
void GridAutoGeneratingColumns(object sender, AutoGeneratingColumnEventArgs
e)
{
    if (e.Column.MappingName == "Freight") {
        e.Column.Format = "C";
        e.Column.CultureInfo = new CultureInfo ("en-US");
    } else if (e.Column.MappingName == "ShippingDate")
        e.Column.Format = "dd/MM/yyyy";
}
```

You can perform any desired operation based on the property type of the underlying model object as follows.

#### **C#**

```
void GridAutoGeneratingColumns(object sender, AutoGeneratingColumnEventArgs
e)
{
    if(e.PropertyType == typeof(string))
    {
        // Here we have hidden the columns if the underlying property type is
        string.
        e.Column.IsHidden = true;
    }
}
```

You can also customize header text, sorting, alignment, padding, etc., of a column by handling the `SfDataGrid.AutoGeneratingEvent`.

### Manually generate columns

The `SfDataGrid` also allows to define the columns manually by adding the `GridColumn` objects to the [SfDataGrid.Columns](#) collection. If you want only the manually defined columns to be in view, you can achieve it by setting the [SfDataGrid.AutoGenerateColumns](#) property to `false`. There are different types of columns available. Any column can be created based on the requirements from both XAML and code.

The following code example illustrates about creating columns manually:

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    ColumnSizer="Star"
    AutoGenerateColumns="False"
    ItemsSource="{Binding OrderInfoCollection}">
    <syncfusion:SfDataGrid.Columns x:TypeArguments="syncfusion:Columns">
        <syncfusion:GridTextColumn HeaderText="Order ID"
            MappingName="OrderID" />
        <syncfusion:GridTextColumn HeaderText="Customer ID"
            MappingName="CustomerID" />
        <syncfusion:GridTextColumn MappingName="Customer" />
        <syncfusion:GridTextColumn HeaderText="Ship Country"
            MappingName="ShipCountry" />
    </syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

#### C#

```
dataGrid.AutoGenerateColumns = false;
GridColumn orderIdColumn = new GridTextColumn ();
orderIdColumn.MappingName = "OrderID";
orderIdColumn.HeaderText = "Order ID";
GridColumn customerIdColumn = new GridTextColumn ();
customerIdColumn.MappingName = "CustomerID";
customerIdColumn.HeaderText = "Customer ID";
GridColumn customerColumn = new GridTextColumn ();
customerColumn.MappingName = "Customer";
GridColumn countryColumn = new GridTextColumn ();
countryColumn.MappingName = "ShipCountry";
countryColumn.HeaderText = "Ship Country";
dataGrid.Columns.Add (orderIdColumn);
dataGrid.Columns.Add (customerIdColumn);
dataGrid.Columns.Add (customerColumn);
dataGrid.Columns.Add (countryColumn);
```

### Resizing columns

The `SfDataGrid` allows to resize the columns by tapping and dragging the right border of the column headers. Resizing can be enabled or disabled by setting the [SfDataGrid.AllowResizingColumn](#) property. A resizing indicator is displayed while resizing a column.

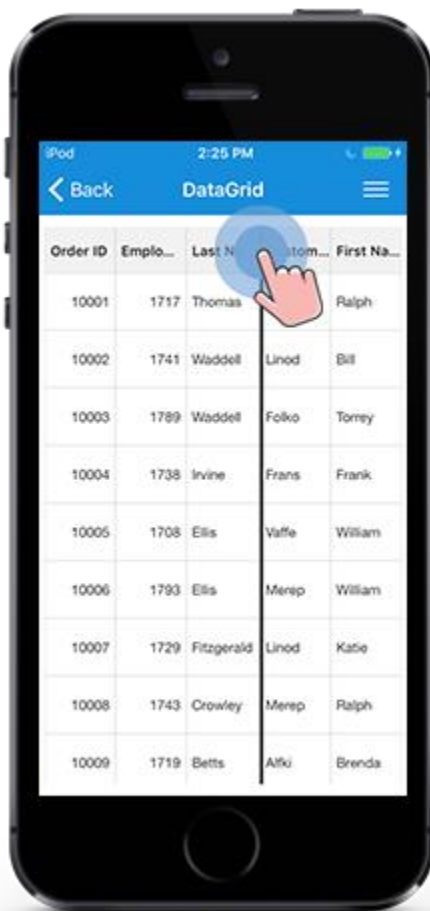

**Note:** Resizing considers [GridColumn.MinimumWidth](#) and [GridColumn.MaximumWidth](#) of the column and will not resize the minimum and maximum width constraints.

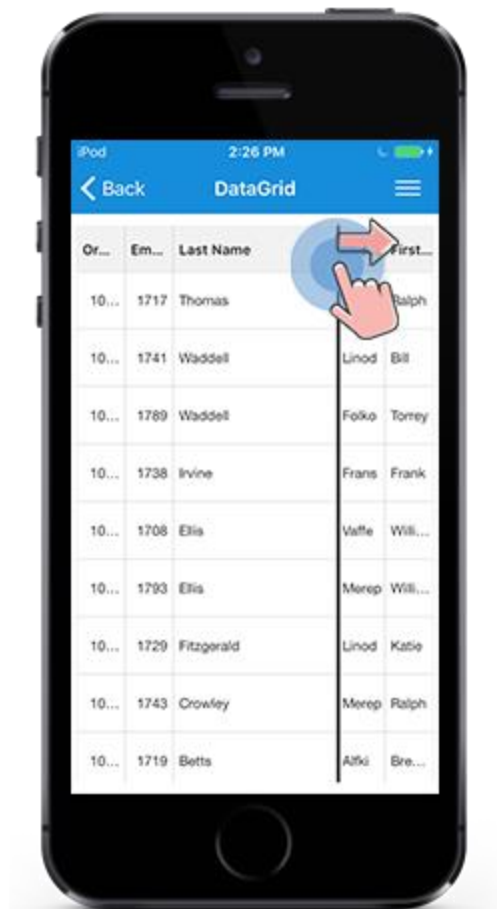

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AllowResizingColumn="True"
    AutoGenerateColumns="True"
    ItemsSource="{Binding Orders}" />
```

### C#

```
dataGrid.AllowResizingColumn = true;
```

The column width can be changed by tapping and dragging the resizing indicator.

---

**Note:** The resizing indicator appears while tapping the right corner of the column header.

---

To interactively hide a column, set the `GridColumn.MinimumWidth` property to zero. Resize the column to a width less than 0.

#### *Resizing modes*

The SfDataGrid allows two modes of resizing by setting the [SfDataGrid.ResizingMode](#) property. The resizing modes are as follows:

- **OnMoved:** The resizing indicator is moved based on the touch point. The width of the column is updated as the resizing indicator moves.
- **OnTouchUp:** The resizing indicator is moved based on the touch point. However the width of the column is updated only on a touch up operation.

---

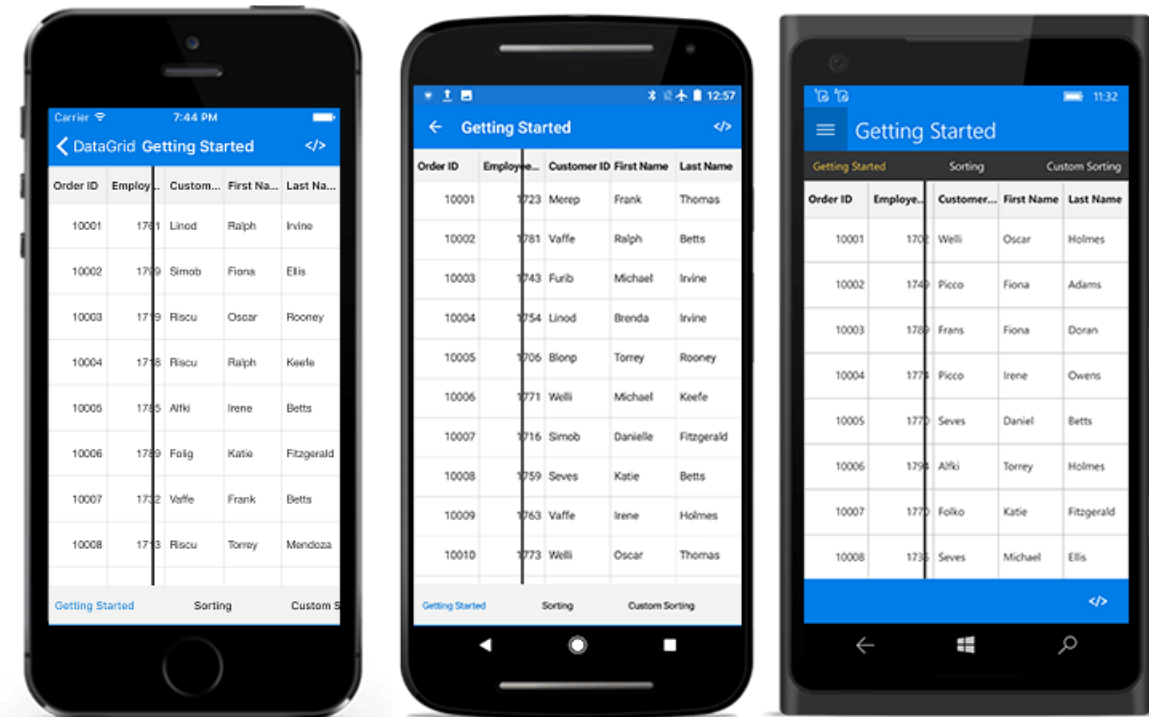

**Note:** The default resizing mode is OnMoved.

---

The following image shows resizing mode OnMoved:

The following image shows resizing mode OnTouchUp:

### Resizing events

Based on the requirement resizing operation can be handled using the [SfDataGrid.ColumnResizing](#) event. The `SfDataGrid.ColumnResizing` event is fired while resizing a column. It will be continuously fired till the resizing operation ends.

By handling the `SfDataGrid.ColumnResizing` event, the resizing of a particular column can be canceled.

The `SfDataGrid.ColumnResizing` event provides the following properties through [GridResizingEventArgs](#).

- [Index](#) - Returns the index of the column currently being resized.
- [NewValue](#) - Returns the current width of the column being resized.
- [ResizingState](#) - Returns the current state of the user-interaction through a value from the `ProgressStates` enum.
- [Cancel](#) - A Boolean property to cancel the event and the resizing operation.

### Cancel resizing for a column

To cancel resizing a particular column, use the `SfDataGrid.ColumnResizing` event. Based on the different arguments provided in the `GridResizingEventArgs`, the resizing operation of a column can be canceled.

To cancel resizing a column using the `SfDataGrid.ColumnResizing` event using the `Index` value, follow the code example:

#### C#

```
this.dataGrid.ResizingColumns += dataGrid_ResizingColumns;
private void DataGrid_ColumnResizing(object sender, GridResizingEventArgs e)
{
    //Code to end resizing if ColumnIndex is 2
    if (e.Index == 2)
        e.Cancel = true;
}
```

To cancel resizing a column using the `SfDataGrid.ColumnResizing` event using the `NewValue` value, follow the code example:

#### C#

```
this.dataGrid.ResizingColumns += dataGrid_ResizingColumns;
private void DataGrid_ColumnResizing(object sender, GridResizingEventArgs e)
{
    //Code to end resizing if Column's Width is >= 100
    if (e.NewValue >= 100 ||)
        e.Cancel = true;
}
```

To cancel resizing a column using the `SfDataGrid.ColumnResizing` event using the `ProgressStates` value, follow the code example:

#### C#

```
this.dataGrid.ResizingColumns += dataGrid_ResizingColumns;
```

```
private void DataGrid_ColumnResizing(object sender, GridResizingEventArgs e)
{
    //Code to end resizing if interaction state is Progressing
    if (e.ResizingState == ProgressStates.Progressing)
    {
        e.Cancel = true;
    }
}
```

## Column Types

The SfDataGrid contains different types of columns. The functionalities of the column can be implied by its name. Based on the requirements any column can be used.

The following table describes the types of columns and its usage:

Column Type	Renderer	Description
<a href="#">GridTextColumn</a>	<a href="#">GridCellTextViewRenderer</a>	To display string or numbers in each row.
<a href="#">GridSwitchColumn</a>	<a href="#">GridCellSwitchRenderer</a>	To display switch in each row.
<a href="#">GridImageColumn</a>	<a href="#">GridImageCellRenderer</a>	To display an image in each row.
<a href="#">GridTemplateColumn</a>	<a href="#">GridCellTemplateRenderer</a>	To customize the column based on the requirements.
<a href="#">GridNumericColumn</a>	<a href="#">GridCellNumericRenderer</a>	To display a numeric data.
<a href="#">GridPickerColumn</a>	<a href="#">GridCellPickerRenderer</a>	To display the IEnumerable data using Picker.
<a href="#">GridComboBoxColumn</a>	<a href="#">GridCellComboBoxRenderer</a>	To display the IEnumerable data using Picker.
<a href="#">GridDateTimeColumn</a>	<a href="#">GridDateTimeColumn</a>	To display the date and time value.
<a href="#">GridUnboundColumn</a>	<a href="#">GridUnboundCellTextBoxRenderer</a>	To add additional columns that are not bound with data object from the underlying data source.

## GridColumn

The [GridColumn](#) is the base column types of all columns. Hence its properties are used by all the columns. The following sub-sections explain the properties and customizations of GridColumn:

### Binding options

Display content of the GridColumn is determined from the [GridColumn.DisplayBinding](#) property. It gets or sets display binding that associates the GridColumn with a property in the data source.

The actual bound value of the GridColumn is determined from [GridColumn.ValueBinding](#) property. It gets or sets value binding that associates the GridColumn with a property in the data source.

### Mapping column to particular property

The [GridColumn.MappingName](#) associates the GridColumn with a property available in the underlying data source. While setting MappingName alone to the SfDataGrid, the `GridColumn.DisplayBinding` will be automatically generated based on the MappingName. Data manipulation operations like sorting, filtering, and grouping will be done based on the MappingName property.

To format cell content, use the converter of the `GridColumn.DisplayBinding` to customize the cell content. The following code example appends the text "Customer" along with the Customer ID:

### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<local:DisplayBindingConverter x:Key="displayBindingConverter" />
</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridTextColumn MappingName="CustomerID"
DisplayBinding="{Binding CustomerID,
Converter={StaticResource displayBindingConverter}}" />
</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

### C#

```
public class DisplayBindingConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        if (value != null)
            return "Customer:" + value.ToString();
        return null;
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        return value.ToString().Substring(9);
    }
}
```

### Header customizations

#### HeaderCellTextSize

The FontSize can be customized using the [GridColumn.HeaderCellTextSize](#) property. The default font size is 14.

#### HeaderFont

The FontFamily can be customized using the [GridColumn.HeaderFont](#) property. The default font value is HelveticaNeue LT 55 Roman.

### HeaderFontAttribute

The FontAttribute can be customized using the [GridColumn.HeaderFontAttribute](#) property. The default value of this property is **None**. It can be customized as **Bold** or **Italic**.

### HeaderText

To customize the display content of the header cell, use the [GridColumn.HeaderText](#) property. It specifies the text displayed in the column header. If header text is not defined, then **GridColumn.MappingName** will be assigned to the header text and will be displayed as column header.

### HeaderTextAlignment

To get or set the TextAlignment of the header cell, use the [GridColumn.HeaderTextAlignment](#) property. The default alignment is **Center**. It can be customized as **Start** or **End**.

### HeaderTemplate

Based on the requirement, the header cell can be customized using the [GridColumn.HeaderTemplate](#) property. To customize header cell by loading a template in the header cell, follow the code example:

#### XML

```
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridTextColumn MappingName="OrderID">
<syncfusion:GridTextColumn.HeaderTemplate>
<DataTemplate>
<Label x:Name="OrderID" Text="OrderID" TextColor="Black"
Background="Yellow" YAlign="Center" />
</DataTemplate>
</syncfusion:GridTextColumn.HeaderTemplate>
</syncfusion:GridTextColumn>
</syncfusion:SfDataGrid.Columns>
```

### Setting manual column width

SfDataGrid allows you to customize the width of each GridColumn in the [SfDataGrid.Columns](#) collection. To customize column width, use the [GridColumn.Width](#) property. By default, this property will not be assigned any value. The GridColumn renders in view based on the value of the [DefaultColumnWidth](#) property.

**Note:** Set the IsHidden property to True instead of setting column width as 0 to hide a column.

Customize the width for auto generated columns in both XAML and code as follows:

#### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="false"
<sfgrid:SfDataGrid.Columns x:TypeArguments="sfgrid:Columns">
<sfgrid:GridTextColumn MappingName="OrderID"
Width="100"/>
</sfgrid:SfDataGrid.Columns >
</sfgrid:SfDataGrid>
```

#### C#

```
// AutoGenerated Column
dataGrid.AutoGeneratingColumn += DataGrid_AutoGeneratingColumn;
```

```
void dataGrid_AutoGeneratingColumn(object sender, AutoGeneratingColumnArgs e) {
    if (e.Column.MappingName == "OrderID") {
        e.Column.Width = 100;
    }
}
// Manually generated column
dataGrid.Columns.Add(new GridTextColumn() { MappingName = "OrderID", Width = 100 });
```

### Hiding a column

To hide a particular column, use the [GridColumn.IsHidden](#) property. The default value of the `IsHidden` property is `False`.

**Note:** Set the `IsHidden` property to `True` instead of setting column width as `0` to hide a column.

To hide column using the `IsHidden` property, follow the code example:

### XML

```
<syncfusion:GridTextColumn MappingName="OrderID" IsHidden = "True"/>
```

### C#

```
// AutoGenerate Column
dataGrid.AutoGeneratingColumn += DataGrid_AutoGeneratingColumn;
void dataGrid_AutoGeneratingColumn(object sender, AutoGeneratingColumnArgs e) {
    if (e.Column.MappingName == "OrderID") {
        e.Column.IsHidden = true;
    }
}
// Manually generated column
dataGrid.Columns.Add(new GridTextColumn() { MappingName = "OrderID", IsHidden = true });
```

### LoadUIView

The [GridColumn.LoadUIView](#) property indicates whether to load `UIElement` inside the `GridCell` or to draw cell value directly in the `canvas` of the `GridCell` in Android platform.

- When `LoadUIView` is set to `false`, cell value of the column is directly drawn in the `canvas` of the grid cells to improve performance.
- While setting the `LoadUIView` to `true`, a `UIElement` ([SfLabel](#)) is loaded in the `GridCells`.

The default value of the `LoadUIView` is `false` for `Xamarin.Forms.Android`, and `true` for other platforms in `Xamarin.Forms`.

### C#

```
GridTextColumn customerID = new GridTextColumn();
customerID.MappingName = "Description";
customerID.LoadUIView = true;
```

### Padding

SfDataGrid allows the user to set padding for the cells by using the property [GridColumn.Padding](#).

### XML

```
<syncfusion:GridTextColumn MappingName="OrderID" TextAlignment="Start"
    Padding="10,0,0,0"/>
```

### C#

```
GridTextColumn orderID = new GridTextColumn();
orderID.MappingName = "OrderID";
orderID.TextAlignment = TextAlignment.Start;
orderID.Padding = new Thickness(10, 0, 0, 0);
```

**Note:** `GridTemplateColumn` ignores the `GridTemplateColumn.Padding` values set in the sample since it takes default padding values based on the [DataGridStyle.GetGridLinesVisibility](#), so that the borders are visible. Hence to set custom padding values, set margin for the base view of your `DataTemplate`.

### GridTextColumn

`GridTextColumn` inherits all the properties of `GridColumn`. It is used to host the textual content in the record cells. Each of the record cell displays text based on the `MappingName` that associates the column with a property in the data source.

The following code example creates `GridTextColumn`:

### XML

```
<syncfusion:GridTextColumn MappingName="OrderID" />
```

### C#

```
dataGrid.Columns.Add(new GridTextColumn() { MappingName = "OrderID" });
```

The following topics explain the customizations done in the `GridTextColumn`:

### Formatting

To format values displayed in the `GridColumn`, use the [GridColumn.Format](#) property.

#### Format column using StringFormat

Assign the format of string to the `GridColumn.Format` property based on the bound data type of the property, the `GridColumn` is associated to format the value. You can use different [StringFormats](#) to customize values displayed in the record cells.

To apply formatting for a `GridTextColumn`, follow the code example:

### XML

```
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridTextColumn MappingName="Freight" Format="C" />
<syncfusion:GridTextColumn MappingName="ShippingDate" Format="dd/MM/yyyy" />
</syncfusion:SfDataGrid.Columns>
```

### C#

```
dataGrid.Columns.Add (new GridTextColumn () {  
    MappingName = "Freight",  
    Format = "C"  
});  
dataGrid.Columns.Add (new GridTextColumn () {  
    MappingName = "ShippingDate",  
    Format = "dd/MM/yyyy"  
});
```

#### Format column using converter

Using converter, set the format of the column.

To set the format using converter, follow the code example:

### XML

```
<sfgrid:SfDataGrid.Columns>  
<sfgrid:GridTextColumn MappingName="Salary" DisplayBinding="{Binding Salary,  
Converter={StaticResource SummaryConverter}}" />  
</sfgrid:SfDataGrid.Columns>
```

### C#

```
public object Convert(object value, Type targetType, object parameter,  
    CultureInfo culture)  
{  
    var formattedString = string.Format("$ {0}", value);  
    return formattedString;  
}
```

**Note:** For AutoGenerated columns formatting can be applied by handling the [SfDataGrid.AutoGeneratingColumn](#) event.

#### Formatting GridTextColumn with different culture

To apply different [CultureInfo](#) for GridColumns, use the [GridColumn.CultureInfo](#) property. Assign format of the string to this property. Based on the type of the property the column is associated to format the value. You can use different [StringFormat](#)s to customize values displayed in the record cells.

To apply different cultures for the GridColumns, follow the code example:

### C#

```
dataGrid.Columns.Add (new GridTextColumn () {  
    MappingName = "Freight",  
    Format = "C",  
    CultureInfo = new CultureInfo("en-US")  
});  
dataGrid.Columns.Add (new GridTextColumn () {  
    MappingName = "OrderID",  
    Format = "C",  
    CultureInfo = new CultureInfo("en-GB")  
});
```

For auto generated columns, this is achievable by handling the [SfDataGrid.AutoGeneratingColumn](#) event. To apply different cultures for auto generated GridColumns, follow the code example:

### C#

```
void GridAutoGeneratingColumns(object sender, AutoGeneratingColumnArgs e)
{
    if (e.Column.MappingName == "Freight") {
        e.Column.Format = "C";
        e.Column.CultureInfo = new CultureInfo ("en-US");
    } else if (e.Column.MappingName == "OrderID") {
        e.Column.Format = "C";
        e.Column.CultureInfo = new CultureInfo ("en-GB");
    }
}
```

### Font and alignment options

#### CellTextSize

The FontSize for the content of record cells can be customized using the [GridColumn.CellTextSize](#) property. The default font size of the record cells is 14.

#### RecordFont

The FontFamily for the content of record cell can be customized using the [GridColumn.RecordFont](#) property. The default font value is **Helvetica Neue**.

#### FontAttribute

The FontAttribute for the content of record cells can be customized using the [\[GridColumn.FontAttribute\]](#). The record cells text can be customized as **Bold**, or **Italic**, or **None**. The default value of this property is **None**.

To set font attribute for a column, follow the code example:

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid" ItemsSource="{Binding OrdersInfo}">
  <sfgrid:SfDataGrid.Columns>
    <sfgrid:GridTextColumn MappingName="Freight" FontAttribute="Bold" />
  </sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
```

### C#

```
dataGrid.Columns.Add (new GridTextColumn ()
{
    MappingName = "Freight",
    FontAttribute = FontAttribute.Bold,
});
```

Run the application to render the following output:

### TextAlignment

To get or set `TextAlignment` of the header cell, use the [GridColumn.TextAlignment](#) property. The default alignment of the record cell is `Center`. It can be customized as `Start` or `End`.

### LineBreakMode

When the text for the record cells exceeds the content area, wrap the record cell by setting the [GridColumn.LineBreakMode](#) as `LineBreakMode.WordWrap`.

To use `LineBreakMode`, follow the code example:

#### C#

```
dataGrid.Columns[0].LineBreakMode=LineBreakMode.WordWrap;
```

### GridSwitchColumn

`GridSwitchColumn` inherits all the properties of `GridColumn`. It loads a switch as the content of record cells in the column and responds to value changes in it. The underlying data source can be changed that it toggles the values shown in the switch. The `SfDataGrid` automatically generates `GridSwitchColumn` if the property in the underlying collection of type set to `bool`.

To use `GridSwitchColumn`, follow the code example:

#### XML

```
<ContentPage.BindingContext>
<local:ViewModel />
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid">
```

```
AutoGenerateColumns="True"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfGrid:GridSwitchColumn MappingName="IsClosed" />
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

## C#

```
// Model class
public class Model
{
    private bool _isClosed;
    public bool IsClosed
    {
        get { return _isClosed; }
        set
        {
            this._isClosed = value;
        }
    }
}

// ViewModel class
public class ViewModel
{
    public ViewModel()
    {
        GetOrderDetails(50);
    }
    #region ItemsSource
    private ObservableCollection<OrderInfo> ordersInfo;
    public ObservableCollection<OrderInfo> OrdersInfo
    {
        get { return ordersInfo; }
        set { this.ordersInfo = value; }
    }
    #endregion
    #region ItemSource Generator
    public void GetOrderDetails(int count)
    {
        var orderDetails = new ObservableCollection<OrderInfo>();
        for (int i = 1; i <= count; i++)
        {
            var order = new OrderInfo()
            {
                IsClosed = (i % 2) == 0 ? true : false
            };
            orderDetails.Add(order);
        }
        ordersInfo = orderDetails;
    }
    #endregion
}
```

### Editing for switch column

To edit the switch column, set the [AllowEditing](#) property to `true`. By default, `AllowEditing` is `true`. If `AllowEditing` is set to `false`, you cannot check or uncheck the Switch column.

To set the `AllowEditing` property, follow the code example:

#### XML

```
<sfgrid:GridSwitchColumn MappingName="IsClosed" AllowEditing="true"/>
```

#### C#

```
GridSwitchColumn column = new GridSwitchColumn();  
column.MappingName = "IsClosed";  
column.AllowEditing = true;
```

{% endtabs%}

### GridImageColumn

`GridImageColumn` is derived from `GridColumn`. Hence, it inherits all the properties of `GridColumn`. It displays image as cell content of a column. To create `GridImageColumn`, the property corresponding to the column in the underlying collection must be `ImageSource` type.

In `GridImageColumn`, it is possible to load images in any of the following four ways:

- **FromFile:** Required to specify the path of the file.
- **FromResource:** Required to set image as embedded resource.
- **FromStream:** Required to load image from `byte[]` array.
- **FromURI:** Required to set image from a web service or website.

To load image (embedded resource) in `GridImageColumn`, follow the code example:

#### XML

```
<ContentPage.BindingContext>  
<local:ViewModel />  
</ContentPage.BindingContext>  
<sfGrid:SfDataGrid x:Name="dataGrid"  
AutoGenerateColumns="True"  
ItemsSource="{Binding OrdersInfo}">  
<sfGrid:SfDataGrid.Columns>  
<sfGrid:GridImageColumn MappingName="DealerImage" />  
</sfGrid:SfDataGrid.Columns>  
</sfGrid:SfDataGrid>
```

#### C#

```
// Model class  
public class Model  
{  
    private ImageSource _dealer;  
    public ImageSource DealerImage  
    {  
        get { return _dealer; }  
    }  
}
```

```
set
{
    this._dealer = value;
}
}
}
// ViewModel class
public class ViewModel
{
    public ViewModel()
    {
        GetOrderDetails(50);
    }
    #region ItemsSource
    private ObservableCollection<OrderInfo> ordersInfo;
    public ObservableCollection<OrderInfo> OrdersInfo
    {
        get { return ordersInfo; }
        set { this.ordersInfo = value; }
    }
    #endregion
    #region ItemSource Generator
    public void GetOrderDetails(int count)
    {
        var orderDetails = new ObservableCollection<OrderInfo>();
        for (int i = 1; i <= count; i++)
        {
            var order = new OrderInfo()
            {
                DealerImage = ImageSource.FromResource("DataGridDemo.Buchanan.png") // Need
                to give the image path properly. Here, DataGridDemo denotes the project name
                and Buchanan denotes the image name.
            };
            orderDetails.Add(order);
        }
        ordersInfo = orderDetails;
    }
    #endregion
}
```

### Aspect

SfDataGrid allows you to set the **Aspect** to size the loaded images within the bounds of the grid cell (whether to stretch, crop or letterbox) using the [GridImageColumn.Aspect](#) property. The supported aspects are described below, the default value is AspectFit.

**AspectFill:** Clips the image so that it fills the display area while preserving the aspect (no distortion).

**AspectFit:** Letterboxes the image (if required) so that the entire image fits into the display area, with blank space added to the top/bottom or sides depending on whether the image is wide or tall.

**Fill:** Stretches the image to completely and exactly fill the display area. This may result in the image being distorted.

To set **Aspect** to images loaded inside **GridImageColumn**, refer the below code snippet.

### XML

```
<ContentPage.BindingContext>
<local:ViewModel />
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfGrid:GridImageColumn MappingName="DealerImage" Aspect="AspectFit"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

### GridTemplateColumn

The GridTemplateColumn is derived from GridColumn. Hence, it inherits all the properties of GridColumn. It allows you to extend the functionality of GridColumn with own view by creating the **CellTemplate** or **CellTemplateSelector**.

The following table provides the list of properties in GridTemplateColumn:

Property	Type	Description	Default Value
CellTemplate	DataTemplate	Gets or sets the template that is used to display the contents of the record cells.	Null
CellTemplateSelector	DataTemplateSelector	Gets or sets the template selector that is used to display the contents of the record cells.	Null

### CellTemplate

Underlying records will be the BindingContext for the **CellTemplate**. The following code example shows templating of GridTemplateColumn:

#### XML

```
<syncfusion:GridTemplateColumn MappingName="CustomerID">
  <syncfusion:GridTemplateColumn.CellTemplate>
    <DataTemplate>
      <Label Text="{Binding CustomerID}" TextColor="Blue"
        XAlign="Center" YAlign="Center" />
    </DataTemplate>
  </syncfusion:GridTemplateColumn.CellTemplate>
</syncfusion:GridTemplateColumn>
```

#### C#

```
GridTemplateColumn templateColumn = new GridTemplateColumn()
{
    MappingName = "CustomerID",
    Width = 50,
};
var dataTemplate = new DataTemplate(() =>
{
    var label = new Label()
    {
        TextColor = Color.Blue,
        VerticalOptions = LayoutOptions.Center,
        HorizontalOptions = LayoutOptions.Center
    };
    label.SetBinding(Label.TextProperty, "CustomerID");
    return label;
});
templateColumn.CellTemplate = dataTemplate;
```

The following code example illustrates how template column can be used to load a stock cell inside it:

**XML**

```

<ContentPage.Resources>
<ResourceDictionary>
<local:ImageConverter x:Key="imageConverter" />
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.ContentView>
<syncfusion:SfDataGrid x:Name="dataGrid"
ColumnSizer="Star">
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridTemplateColumn HeaderText="Stock Change"
MappingName="StockChange">
<syncfusion:GridTemplateColumn.CellTemplate>
<DataTemplate>
<Grid>
<Grid.ColumnDefinitions>
<ColumnDefinition Width="Auto" />
<ColumnDefinition Width="*" />
</Grid.ColumnDefinitions>
<Image Grid.Column="0"
Source="{Binding StockChange,
Converter={StaticResource imageConverter}}" />
<Label x:Name="changeValue" Grid.Column="1"
Text="{Binding StockChange}" TextColor="Black"
XAlign="Center" YAlign="Center">
</Label>
</Grid>
</DataTemplate>
</syncfusion:GridTemplateColumn.CellTemplate>
</syncfusion:GridTemplateColumn>
</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
</ContentPage.ContentView>

```

In order to get the above code example working, write a converter to load images inside the [GridCell](#) based on the CellValue. The images that have to be loaded in the [GridCell](#) must be added as EmbeddedResource.

The converter code for loading images in a template column is shown in the following code:

**C#**

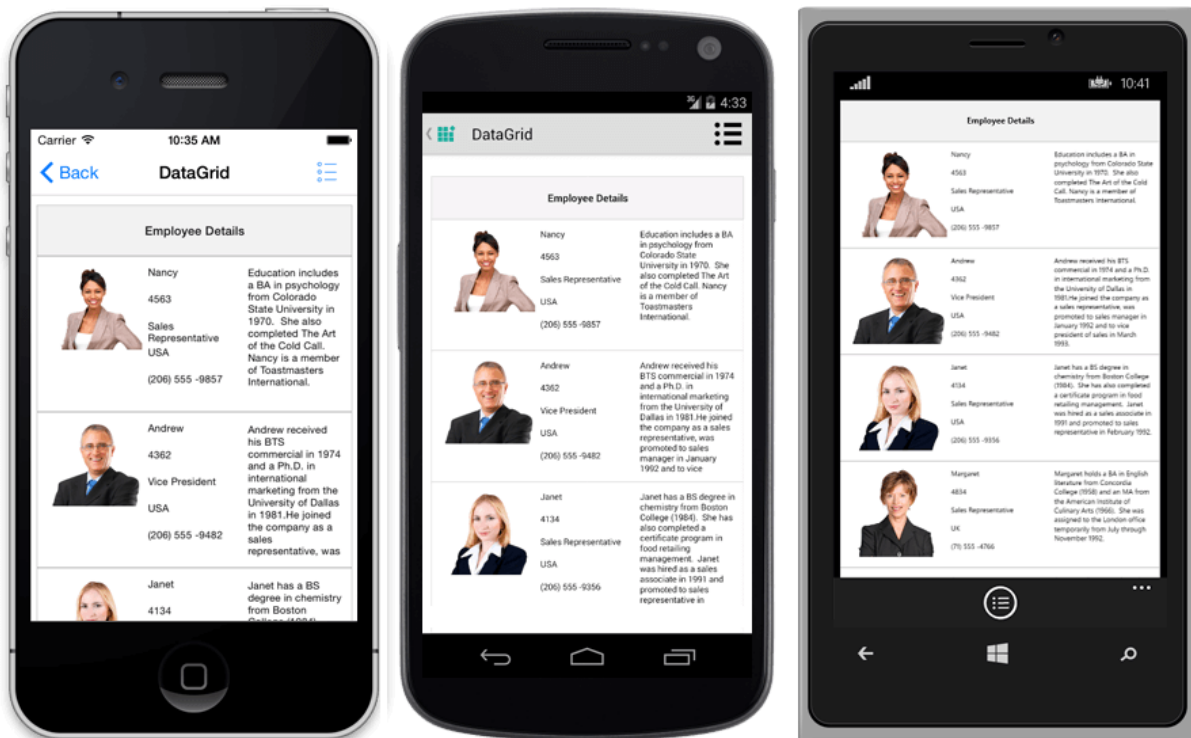

```

public class ImageConverter: IValueConverter
{
public object Convert (object value, Type targetType, object parameter, CultureInfo culture)
{
var data = value as double?;
if (data != null && data > 0)
return ImageSource.FromResource ("DataGridSample.Icons.Green.png");
else
return ImageSource.FromResource ("DataGridSample.Icons.Red.png");
}
public object ConvertBack (object value, Type targetType, object parameter, CultureInfo culture)

```

```
{
    throw new NotImplementedException ();
}
```

The following screenshot shows the different types of columns in the SfDataGrid:

### CellTemplateSelector

Underlying records will be the BindingContext for the CellTemplateSelector. The following code example shows templating of the GridTemplateColumn using the CellTemplateSelector property:

### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="low" >
<Label Text="{Binding Freight}"
TextColor="White"
BackgroundColor="Red"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center" />
</DataTemplate>
<DataTemplate x:Key="average" >
<Label Text="{Binding Freight}"
TextColor="Black"
BackgroundColor="Yellow"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center" />
</DataTemplate>
```

```
</DataTemplate>
<DataTemplate x:Key="high" >
<Label Text="{Binding Freight}"
TextColor="White"
BackgroundColor="Green"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center" />
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:GridTemplateColumn MappingName="Freight" >
<sfgrid:GridTemplateColumn.CellTemplateSelector>
<local:FreightTemplateSelector High="{StaticResource high}"
Average="{StaticResource average}"
Low="{StaticResource low}" />
</sfgrid:GridTemplateColumn.CellTemplateSelector>
</sfgrid:GridTemplateColumn>
```

## C#

```
// FreightTemplateSelector implementation
public class FreightTemplateSelector : DataTemplateSelector
{
    public DataTemplate Low { get; set; }
    public DataTemplate Average { get; set; }
    public DataTemplate High { get; set; }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject
container)
    {
        var value = double.Parse((item as OrderInfo).Freight);
        if (value > 750)
            return High;
        else if (value > 500)
            return Average;
        else
            return Low;
    }
}
```

### Getting row index of a row in GridTemplateColumn

The SfDataGrid provides various resolving methods to resolve the row index of grid rows based on certain criteria. The actual row index of a row can be resolved by using the `ResolveToRowIndex(recordRowIndex)` method.

The row index of a grid row can be obtained in GridTemplateColumn by retrieving the record index of the row using the bound data from its `BindingContext` and by resolving the `recordRowIndex` using the `SfDataGrid.ResolveToRowIndex(recordRowIndex)` method.

### XML

```
// MainPage.Xaml
<sfgrid:GridTemplateColumn HeaderText="ShipCity" MappingName="ShipCity">
  <sfgrid:GridTemplateColumn.CellTemplate>
    <DataTemplate>
      <Button Clicked="button_Clicked" WidthRequest="120" Text="{Binding ShipCity}"/>
    </DataTemplate>
  </sfgrid:GridTemplateColumn.CellTemplate>
</sfgrid:GridTemplateColumn>
```

### C#

```
// MainPage.cs
public partial class MainPage : ContentPage
{
  public MainPage ()
  {
  }
```

```
InitializeComponent();
}
private void button_Clicked(object sender, EventArgs e)
{
    var button = sender as Button;
    var record = button.BindingContext as OrderInfo;
    var recordRowIndex = viewModel.OrderInfoCollection.IndexOf(record);
    var rowIndex = sfGrid.ResolveToRowIndex(recordRowIndex);
}
}
```

**Note:** The row index of the row can also be retrieved by using the [GridTapped](#), [GridDoubleTapped](#), and [GridLongPressed events](#). When using complex layout in a [DataTemplate](#), set the [InputTransparent](#) property of the views loaded in the [DataTemplate](#) of the [GridTemplateColumn](#) to [True](#).

#### *Loading DatePicker and TimePicker together*

Currently Xamarin.Forms does not provide a view that combines both the [DatePicker](#) and the [TimePicker](#) as one control. However, the two controls are available individually.

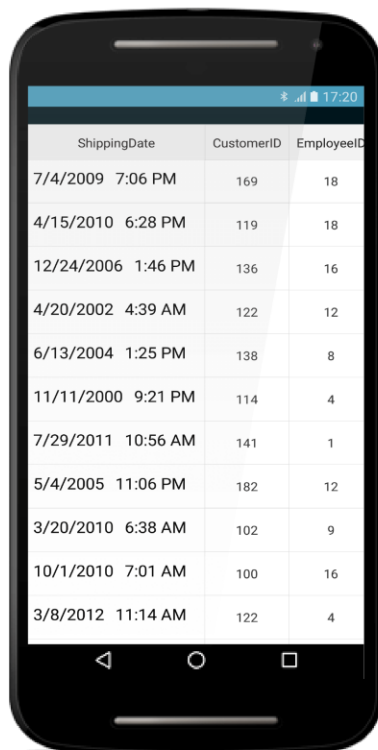

The SfDataGrid supports [DatePicker](#) and [TimePicker](#) in the same column. It can be achieved by loading the [DatePicker](#) and [TimePicker](#) in [StackLayout](#) in the [GridTemplateColumn](#).

To load [DatePicker](#) and [TimePicker](#) together, follow the code example:

#### **XML**

```
<sfgrid:GridTemplateColumn MappingName="ShippingDate">
  <sfgrid:GridTemplateColumn.CellTemplate>
    <DataTemplate>
      <StackLayout Orientation="Horizontal">
        <DatePicker Date="{Binding ShippingDate}" TextColor="Black"/>
        <TimePicker Time="{Binding ShippingTime}" TextColor="Black"/>
      </StackLayout>
    </DataTemplate>
  </sfgrid:GridTemplateColumn.CellTemplate>
</sfgrid:GridTemplateColumn>
```

The following screenshot shows that how [DatePicker](#) and [TimePicker](#) are viewed together:

### GridDateTimeColumn

The [SfDataGrid.GridDateTimeColumn](#) inherits all the properties of the [SfDataGrid.GridColumn](#). It displays the date information as the content of a column. To create the [SfDataGrid.GridDateTimeColumn](#), the property corresponding to the column in the underlying collection must be of type `DateTime`. To enable or disable editing for the particular column, set the [GridColumn.AllowEditing](#) property to true or false. In the editing mode it displays a customized `DatePicker` element which is derived from the [Xamarin.Forms.DatePicker](#). The [SfDatePicker](#) enables to scroll through a list of dates between the [GridDateTimeColumn.MinimumDate](#) and [GridDateTimeColumn.MaximumDate](#) and selects one from it.

### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfgrid:GridDateTimeColumn Format="d"
HeaderText="Shipped Date"
MappingName="ShippedDate" />
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

### C#

```
dataGrid = new SfDataGrid();
GridDateTimeColumn dateColumn = new GridDateTimeColumn()
{
```

```
MappingName = "ShippedDate",
HeaderText = "Shipped Date",
Format = "d"
};
dataGrid.Columns.Add(dateColumn);
```

## C#

```
// Model class
public class Model
{
    private DateTime shippedDate;
    public DateTime ShippedDate
    {
        get { return shippedDate; }
        set
        {
            shippedDate = value;
            RaisePropertyChanged("ShippedDate");
        }
    }
}

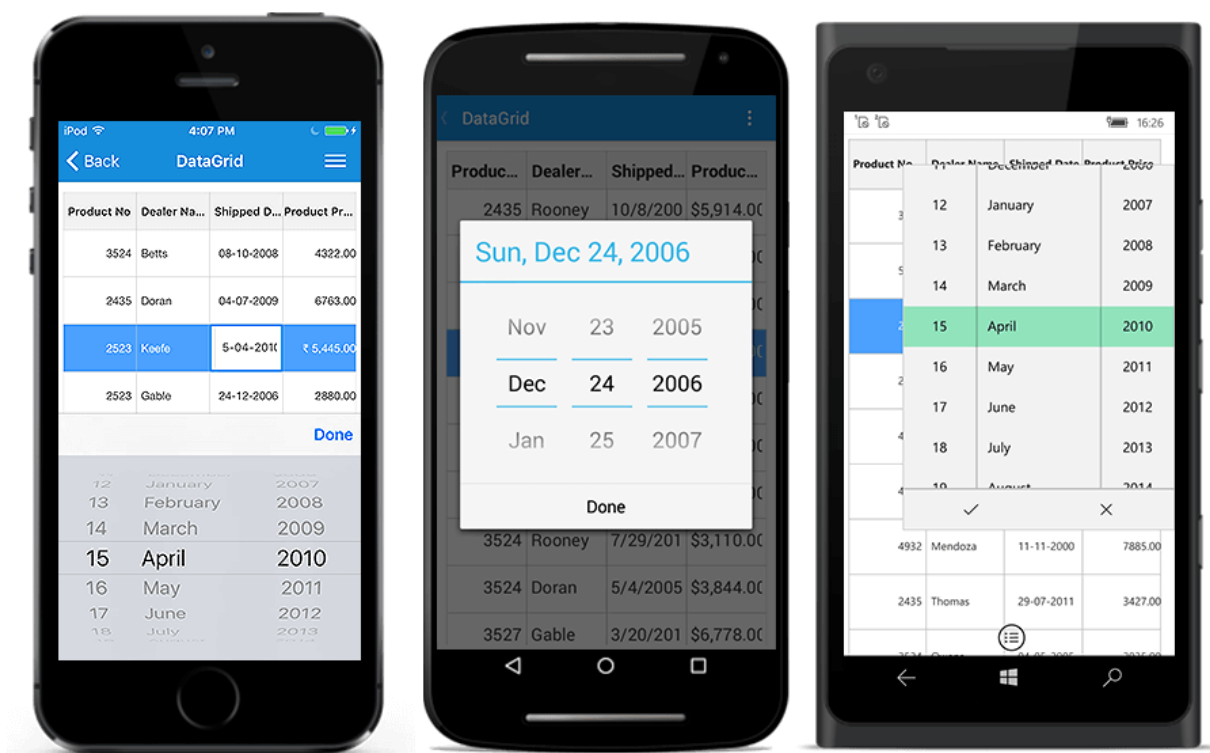

// ViewModel class
public class ViewModel
{
    private List<DateTime> OrderedDates;
    public ViewModel()
    {
        GetOrderDetails(50);
    }
    #region ItemsSource
    private ObservableCollection<OrderInfo> ordersInfo;
    public ObservableCollection<OrderInfo> OrdersInfo
    {
        get { return ordersInfo; }
        set { this.ordersInfo = value; }
    }
    #endregion
    #region ItemSource Generator
    private List<DateTime> GetDateBetween(int startYear, int endYear, int count)
    {
        List<DateTime> date = new List<DateTime>();
        Random d = new Random(1);
        Random m = new Random(2);
        Random y = new Random(startYear);
        for (int i = 0; i < count; i++)
        {
            int year = y.Next(startYear, endYear);
            int month = m.Next(3, 13);
            int day = d.Next(1, 31);
            date.Add(new DateTime(year, month, day));
        }
        return date;
    }
    public void GetOrderDetails(int count)
    {

```

```

var orderDetails= new ObservableCollection<OrderInfo>();
this.OrderedDates = GetDateBetween(2000, 2014, count);
for (int i = 1; i <= count; i++)
{
    var order = new OrderInfo()
    {
        ShippedDate = this.OrderedDates[i - 1],
    };
    orderDetails.Add(order);
}
ordersInfo = orderDetails;
}
#endregion
}

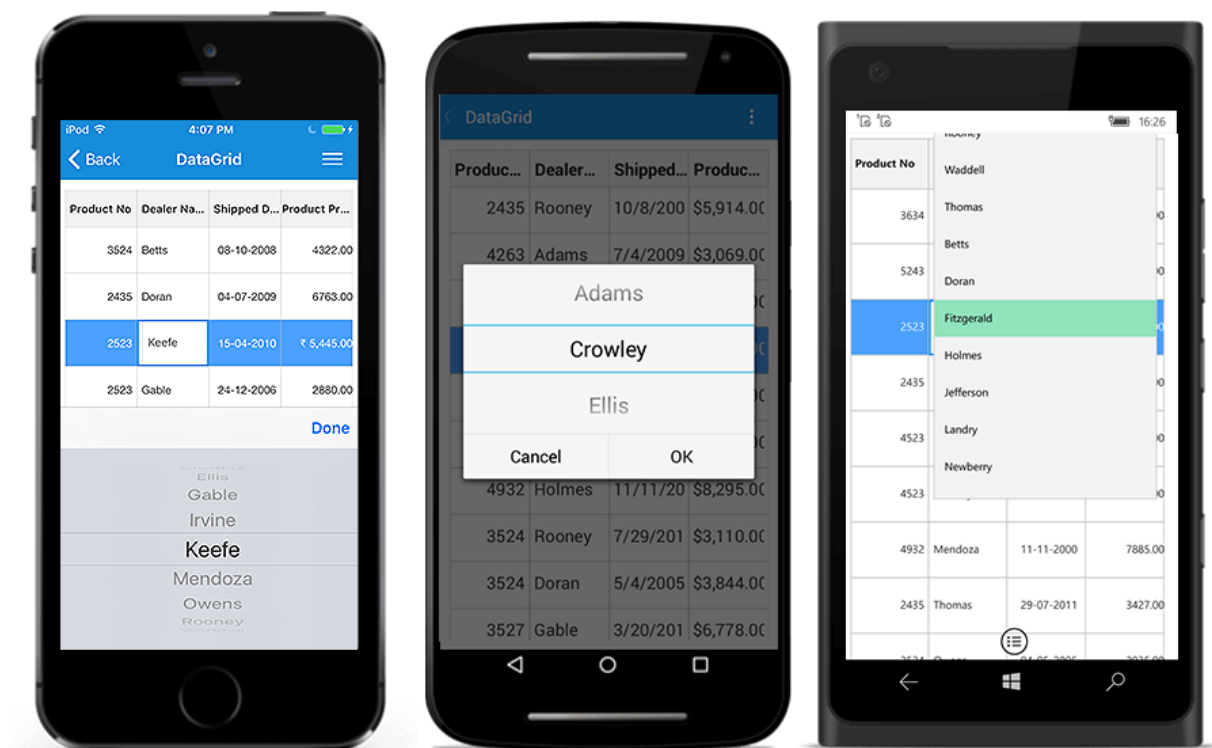

```

### GridPickerColumn

The [GridPickerColumn](#) inherits all the properties of the [SfDataGrid.GridColumn](#). It displays a list of items in the form of a picker as the content of a column. To enable or disable editing for the particular column, set the [GridColumn.AllowEditing](#) property to true or false. In the editing mode it displays a customized [Picker](#) element which is derived from the [Xamarin.Forms.Picker](#). The data source to [Picker](#) can be set by using the [GridPickerColumn.ItemsSource](#) property. The picker column can be populated with data by the following ways:

- Collection of primitive types
- Collection of user-defined types (Custom objects)

### Collection of primitive types

To display the collection of items in the picker drop down, create a `GridPickerColumn` and set its `ItemsSource` property to a simple collection.

To load the `GridPickerColumn` with a simple string collection, follow the code example:

### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfGrid:GridPickerColumn BindingContext="{x:Reference viewModel}"
HeaderText="Dealer Name"
ItemsSource="{Binding CustomerNames}"
MappingName="DealerName"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

### C#

```
dataGrid = new SfDataGrid();
GridPickerColumn pickerColumn = new GridPickerColumn()
{
    BindingContext = viewModel,
    MappingName = "DealerName",
```

```
ItemsSource = viewModel.CustomerNames,
HeaderText = "Dealer Name"
};
dataGrid.Columns.Add(pickerColumn);
```

**C#**

```
// ViewModel class
public class ViewModel
{
    public ObservableCollection<string> CustomerNames { get; set; }
    public ViewModel()
    {
        this.CustomerNames = Customers.ToObservableCollection();
    }
    internal string[] Customers = new string[]
    { "Adams", "Crowley", "Ellis", "Gable", "Irvine", "Keefe", "Mendoza", "Owens", "Rooney", "Wadded", };
}
```

*Collection of user-defined types*

To display a list of user-defined items in the picker drop down, create a `SfDataGrid.GridPickerColumn` and set its `ItemsSource` property to a user-defined collection. Initially, the picker column will be displayed with the values from the `GridColumn.MappingName` property of the column if the `DisplayMemberPath` and `ValueMemberPath` are not set.

*DisplayMemberPath*

Displays a value by comparing values of the properties set as `GridColumn.MappingName` and `ValueMemberPath` in their respective underlying collections. If the values of `ValueMemberPath` property contains the current value of `MappingName` property, its corresponding value of `DisplayMemberPath` property is displayed in the `GridCell`. Or else the `GridCell` appears blank. However, in edit mode the values of the `DisplayMemberPath` property are displayed as picker items.

*ValueMemberPath*

Once editing completed, the column having the `MappingName` equal to the `ValueMemberPath` has its data changed to the corresponding `ValueMemberPath` value for the selected `DisplayMemberPath` value in the picker.

*Customization of picker dropdown values*

To customize the picker data using `DisplayMemberPath` and `ValueMemberPath`, follow the code example:

**XML**

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn HeaderText="Order ID"
MappingName="OrderID"/>
<sfgrid:GridPickerColumn BindingContext="{x:Reference viewModel}"
```

```

HeaderText="Picker Column"
DisplayMemberPath="EmployeeID"
ValueMemberPath="OrderID"
ItemsSource="{Binding PickerInfo}"
MappingName="OrderID"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>

```

**C#**

```

sfGrid = new SfDataGrid();
viewModel = new ViewModel();
sfGrid.ItemsSource = viewModel.OrdersInfo;
GridTextColumn orderIDColumn = new GridTextColumn();
orderIDColumn.MappingName = "OrderID";
orderIDColumn.HeaderText = "Order ID";
GridPickerColumn pickerColumn = new GridPickerColumn();
pickerColumn.MappingName = "OrderID";
pickerColumn.HeaderText = "Picker Column";
pickerColumn.DisplayMemberPath = "EmployeeID";
pickerColumn.ValueMemberPath = "OrderID";
pickerColumn.ItemsSource = viewModel.PickerInfo;
sfGrid.Columns.Add(orderIDColumn);
sfGrid.Columns.Add(pickerColumn);
// ViewModel class
public class ViewModel
{
    public class ViewModel : INotifyPropertyChanged
    {
        public ViewModel ()
        {
            SetRowsToGenerate (100);
            this.PickerInfo = OrdersInfo.ToList();
        }
        #region ItemsSource
        private OrderInfoRepository order;
        private ObservableCollection<OrderInfo> ordersInfo;
        public ObservableCollection<OrderInfo> OrdersInfo
        {
            get { return ordersInfo; }
            set { this.ordersInfo = value; RaisePropertyChanged("OrdersInfo"); }
        }
        public List<OrderInfo> PickerInfo
        {
            get;
            set;
        }
        #endregion
        #region ItemSource Generator
        public void SetRowsToGenerate (int count)
        {
            order = new OrderInfoRepository ();
            ordersInfo = order.GetOrderDetails (count);
        }
        #endregion
        public ObservableCollection<OrderInfo> GetOrderDetails(int count)
    }
}

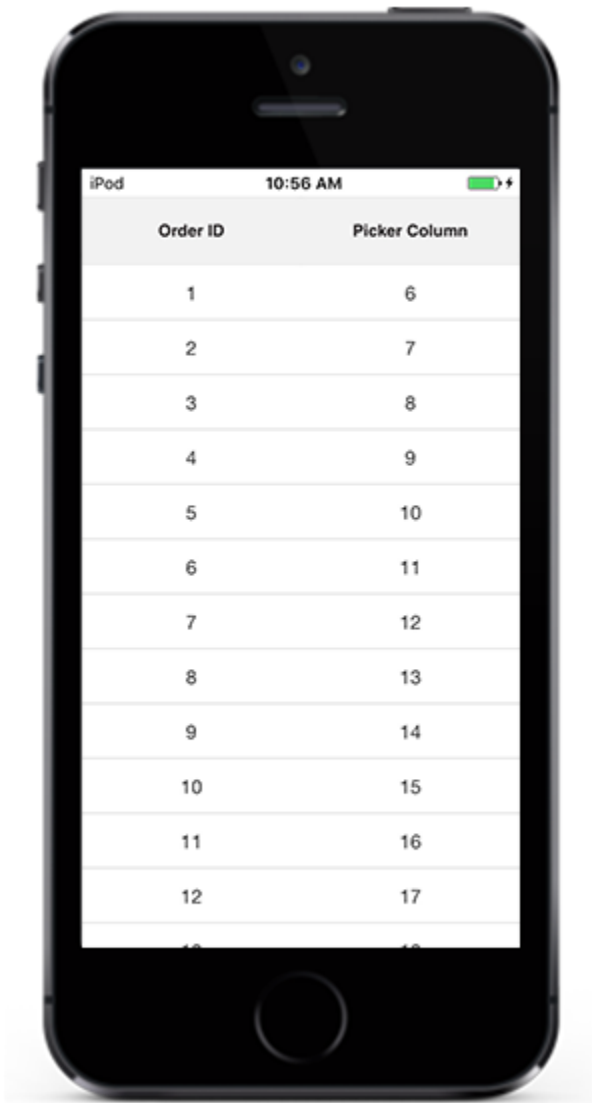

```

```
{
ObservableCollection<OrderInfo> orderDetails = new
ObservableCollection<OrderInfo> ();
for (int i = 1; i <= count; i++)
{
var order = new OrderInfo ()
{
OrderID = i,
EmployeeID = i+5,
};
orderDetails.Add (order);
}
return orderDetails;
}
#region INotifyPropertyChanged implementation
public event PropertyChangedEventHandler PropertyChanged;
private void RaisePropertyChanged(String name)
{
if (PropertyChanged != null)
this.PropertyChanged(this, new PropertyChangedEventArgs (name));
}
#endregion
}
```

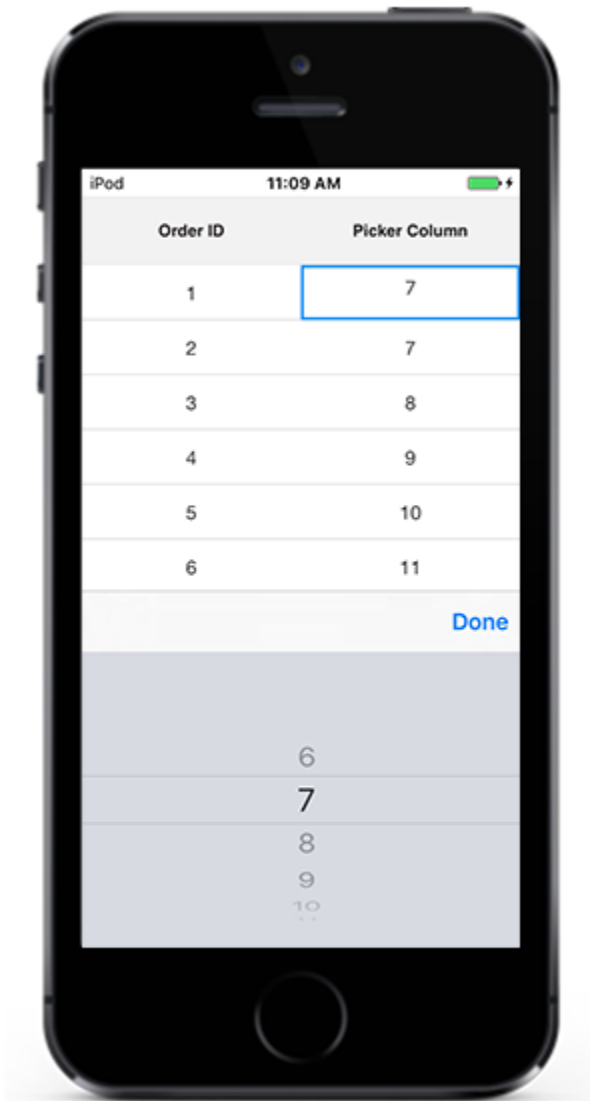

The following screenshots explain the above code and show the working of the **PickerColumn** with **ValueMemberPath** and **DisplayMemberPath** properties set:

In the above code example underlying collection has two properties (OrderID,EmployeeID). A **GridPickerColumn** has been created with MappingName = OrderID, DisplayMemberPath = EmployeeID, ValueMemberPath = OrderID. EmployeeID has the values 6,7,8,9,10.... and OrderID has the values 1,2,3,4,5.... . Initially, the GridCells of the **PickerColumn** will be displayed with the values 6,7,8,9,10.... in row wise order based on the **DisplayMemberPath**.

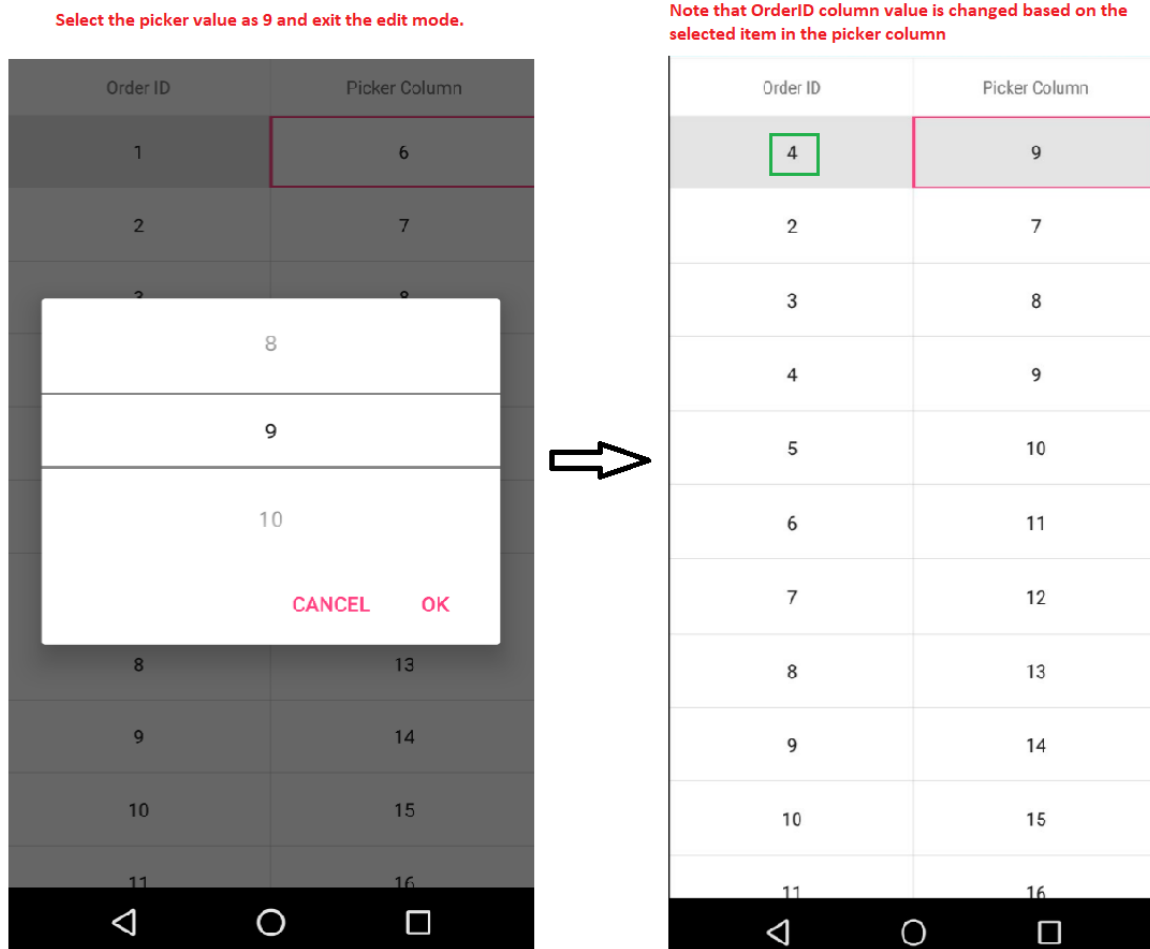

Upon entering the edit mode at `RowColumnIndex(1,1)`, the Picker pop up opens with the picker items as 6,7,8,9,10.... again based on the `DisplayMemberPath`.

When edit mode is exited by selecting a value(9) from the Picker pop up, the `GridCell` at RowColumn index(0,1) displays the corresponding OrderID value for the selected EmployeeID value which is 4.

#### Loading Different ItemSource for each row of GridPickerColumn

You can load the different ItemsSource to each row of GridPickerColumn by setting [GridPickerColumn.ItemsSourceSelector](#) property.

#### Implementing ItemsSourceSelector

[GridPickerColumn.ItemsSourceSelector](#) needs to implement `ItemsSourceSelector` interface which requires you to implement `GetItemsSource` method which receives the below parameters,

- Record – data object associated with row.
- Data Context – Binding context of data grid.

In the below code, ItemsSource for ShipCity column returned based on ShipCountry column value using the record and Binding context of data grid passed to `GetItemsSource` method.

#### XML

```
<ContentPage.Resources>
  <ResourceDictionary>
    <local:ItemSourceSelector x:Key="converter"/>
  </ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid"
```

```
ItemsSource="{Binding DealerInformation}"
AllowEditing="True"
AutoGenerateColumns="false"
NavigationMode="Cell"
EditTapAction="OnDoubleTap"
SelectionMode="Single">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridPickerColumn BindingContext="{x:Reference viewModel}"
ItemsSource="{Binding CountryList}"
MappingName="ShipCountry"
LoadUIView="True">
</sfgrid:GridPickerColumn>
<sfgrid:GridPickerColumn ItemsSourceSelector="{StaticResource converter}"
MappingName="ShipCity"
LoadUIView="True">
</sfgrid:GridPickerColumn>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
```

## C#

```
public class ItemSourceSelector : IItemsSourceSelector
{
    public IEnumerable GetItemsSource(object record, object dataContext)
    {
        if (record == null)
        {
            return null;
        }
        var orderinfo = record as DealerInfo;
        var countryName = orderinfo.ShipCountry;
        var viewModel = dataContext as EditingViewModel;
        // Returns ShipCity collection based on ShipCountry.
        if (viewModel.ShipCities.ContainsKey(countryName))
        {
            string[] shipcities = null;
            viewModel.ShipCities.TryGetValue(countryName, out shipcities);
            return shipcities.ToList();
        }
        return null;
    }
}
```

### GridComboBoxColumn

The [GridComboBoxColumn](#) inherits all the properties of the [SfDataGrid.GridColumn](#). It displays a list of items in the form of a [SfComboBox](#) as the content of a column. To enable or disable editing for the particular column, set the [GridColumn.AllowEditing](#) property to true or false. In the editing mode it displays a [SfComboBox](#) element. The data source to SfComboBox can be set by using the [GridColumn.AllowEditing](#) property to true or false. In the editing mode it displays a [SfComboBox](#) element. The data source to SfComboBox can be set by using the [GridComboBoxColumn.ItemsSource](#) property. The combobox column can be populated with data by the following ways:

- Collection of primitive types
- Collection of user-defined types (Custom objects)

### Collection of primitive types

To display the collection of items in the comboBox drop down, create a [GridComboBoxColumn](#) and set its [GridComboBoxColumn.ItemsSource](#) property to a simple collection.

To load the [GridComboBoxColumn](#) with a simple string collection, follow the code example:

### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
```

```
<sfgrid:GridComboBoxColumn BindingContext="{x:Reference viewModel}"
HeaderText="Dealer Name"
ItemsSource="{Binding CustomerNames}"
MappingName="DealerName"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

**C#**

```
dataGrid = new SfDataGrid();
GridComboBoxColumn comboBoxColumn = new GridComboBoxColumn()
{
    BindingContext = viewModel,
    MappingName = "DealerName",
    ItemsSource = viewModel.CustomerNames,
    HeaderText = "Dealer Name"
};
dataGrid.Columns.Add(comboBoxColumn);
```

**C#**

```
// ViewModel class
public class ViewModel
{
    public ObservableCollection<string> CustomerNames { get; set; }
    public ViewModel()
    {
        this.CustomerNames = Customers.ToObservableCollection();
    }
    internal string[] Customers = new string[]
    { "Adams", "Crowley", "Ellis", "Gable", "Irvine", "Keefe", "Mendoza", "Owens", "Roone
y", "Wadded", };
}
```

*Collection of user-defined types*

To display a list of user-defined items in the combo-box drop down, create a [GridComboBoxColumn](#) and set its [GridComboBoxColumn.ItemsSource](#) property to a user-defined collection. Initially, the combo-box column will be displayed with the values from the [GridColumn.MappingName](#) property of the column if the [DisplayMemberPath](#) and [ValueMemberPath](#) are not set.

For more details about the DisplayMemberPath and ValueMemberPath, Please refer [here](#).

*Customizing GridComboBoxColumn*

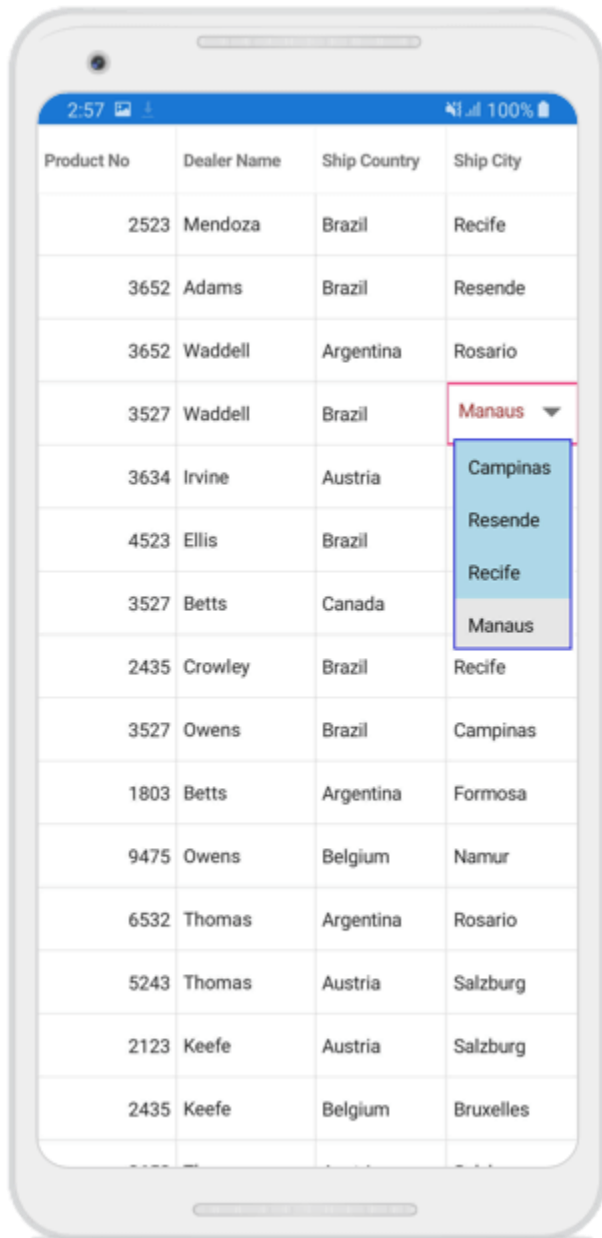

Editable element of the [GridComboBoxColumn](#) can be Customizing by using the custom [GridCellComboBoxRenderer](#).

Replace the default renderer with custom renderer in the SfDataGrid.CellRenderers collection.

**C#**

```
this.dataGrid.CellRenderers.Remove("ComboBox");
this.dataGrid.CellRenderers.Add("ComboBox", new CustomComboBoxRenderer());
public class CustomComboBoxRenderer : GridCellComboBoxRenderer
{
}
```

```
public override void OnInitializeEditView(DataColumnBase dataColumn,
GridComboBox view)
{
    base.OnInitializeEditView(dataColumn, view);
    view.DropDownBackgroundColor = Color.LightBlue;
    view.DropDownBorderColor = Color.Blue;
    view.TextColor = Color.Brown;
}
}
```

*Loading Different ItemSource for each row of GridComboBoxColumn*

You can load the different ItemsSource to each row of GridComboBoxColumn by setting [GridComboBoxColumn.ItemsSourceSelector](#) property.

*Implementing IItemsSourceSelector*

[GridComboBoxColumn.ItemsSourceSelector](#) needs to implement IItemsSourceSelector interface which requires you to implement GetItemsSource method which receives the below parameters,

- Record – data object associated with row.
- Data Context – Binding context of data grid.

In the below code, ItemsSource for ShipCity column returned based on ShipCountry column value using the record and Binding context of data grid passed to GetItemsSource method.

**XML**

```
<ContentPage.Resources>
<ResourceDictionary>
<local:ItemSourceSelector x:Key="converter"/>
</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding DealerInformation}"
AllowEditing="True"
AutoGenerateColumns="false"
NavigationMode="Cell"
EditTapAction="OnDoubleTap"
SelectionMode="Single">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridComboBoxColumn BindingContext="{x:Reference viewModel}"
ItemsSource="{Binding CountryList}"
MappingName="ShipCountry"
LoadUIView="True">
</sfgrid:GridComboBoxColumn>
<sfgrid:GridComboBoxColumn ItemsSourceSelector="{StaticResource converter}"
MappingName="ShipCity"
LoadUIView="True">
</sfgrid:GridComboBoxColumn>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
```

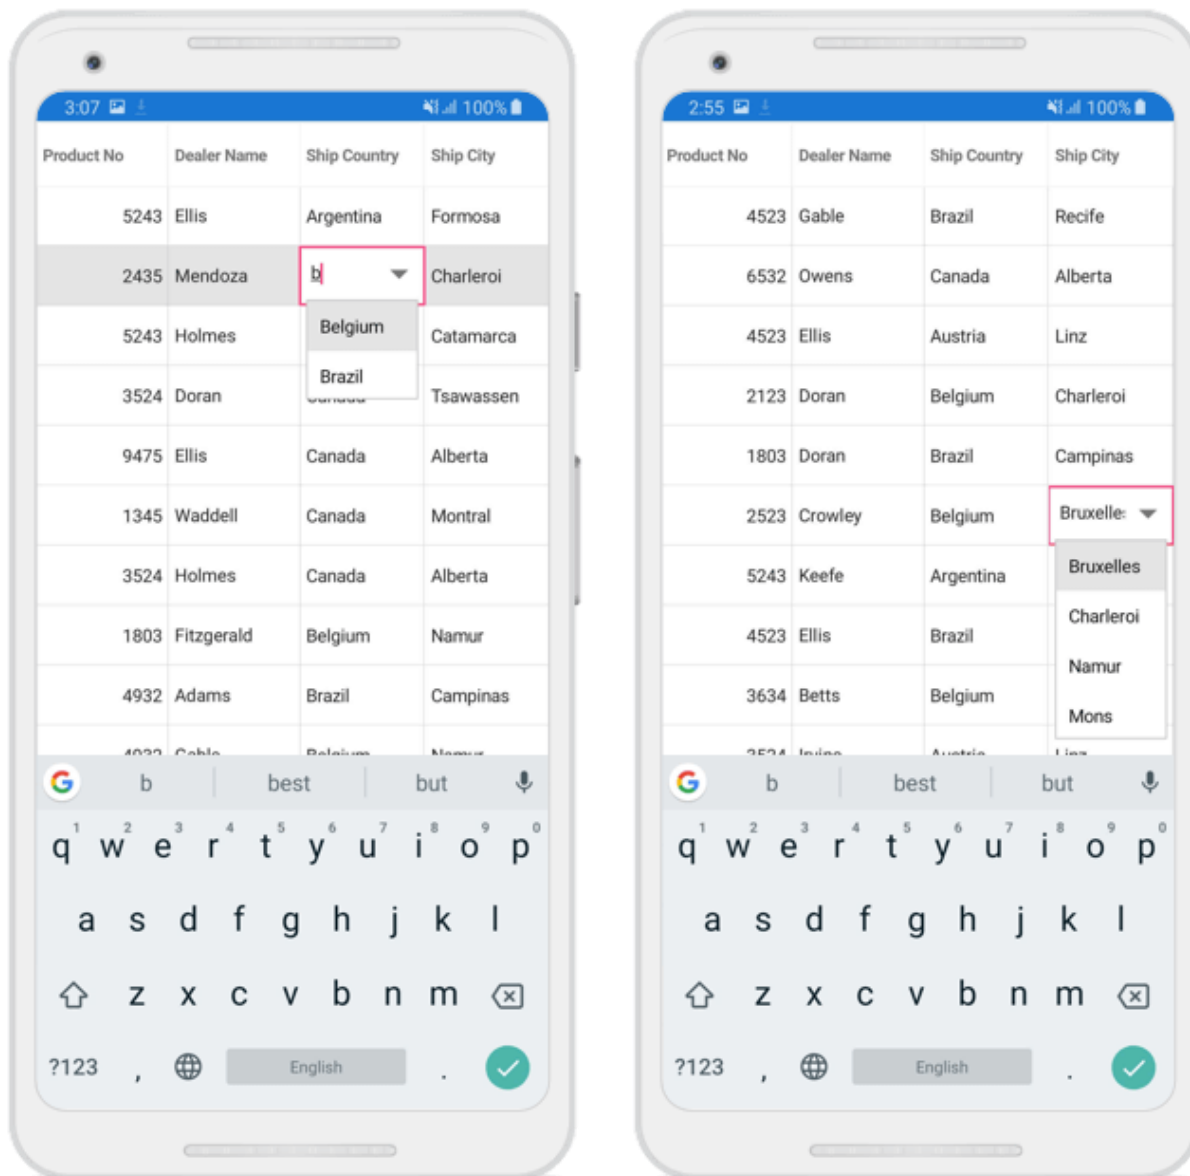

**C#**

```
public class ItemSourceSelector : IItemsSourceSelector
{
    public IEnumerable GetItemsSource(object record, object dataContext)
    {
        if (record == null)
        {
            return null;
        }
        var orderinfo = record as DealerInfo;
        var countryName = orderinfo.ShipCountry;
        var viewModel = dataContext as EditingViewModel;
        // Returns ShipCity collection based on ShipCountry.
```

```

if (viewModel.ShipCities.ContainsKey(countryName))
{
    string[] shipcities = null;
    viewModel.ShipCities.TryGetValue(countryName, out shipcities);
    return shipcities.ToList();
}
return null;
}
}

```

#### Editing the combo box

The [GridComboBoxColumn](#) supports both editable and non-editable text box to choose selected items in given data source. Users can select one item from the suggestion list.

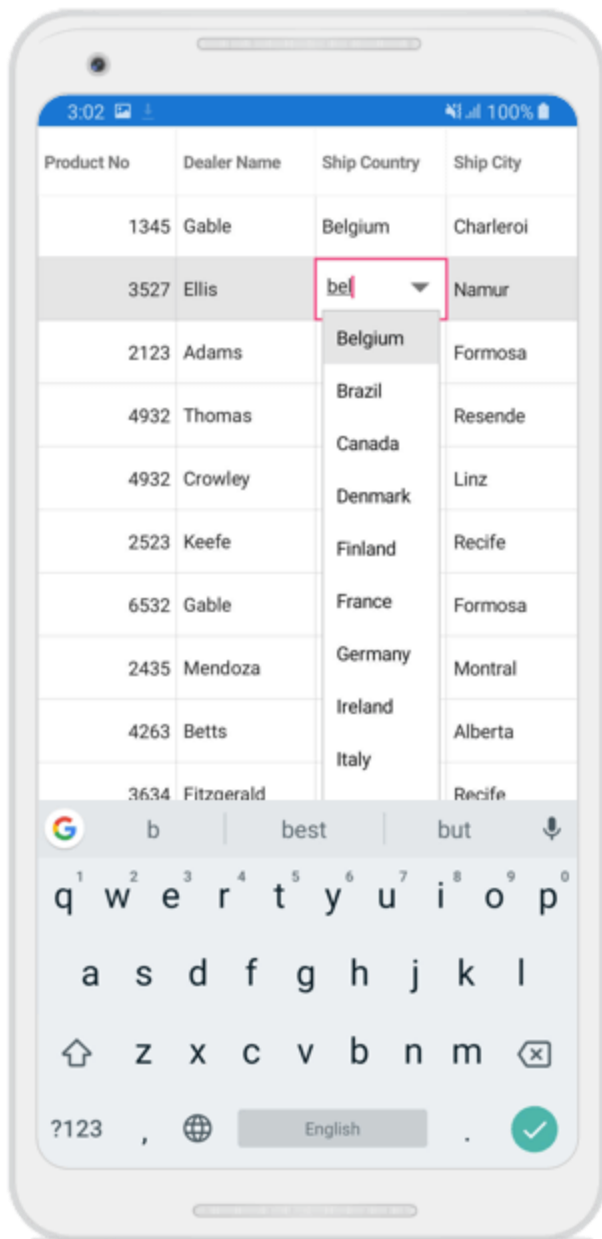

[IsEditableMode](#) property is used to enable the user input in [GridComboBoxColumn](#). The default value is false.

#### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfgrid:GridComboBoxColumn BindingContext="{x:Reference viewModel}"
HeaderText="Dealer Name"
IsEditableMode="True"
ItemsSource="{Binding CustomerNames}"
MappingName="DealerName"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

#### C#

```
dataGrid = new SfDataGrid();
GridComboBoxColumn comboBoxColumn = new GridComboBoxColumn()
{
    BindingContext = viewModel,
    MappingName = "DealerName",
    ItemsSource = viewModel.CustomerNames,
    IsEditableMode = True,
    HeaderText = "Dealer Name"
};
dataGrid.Columns.Add(comboBoxColumn);
```

#### Auto completing on edit mode

The auto completion on the edit mode can be enabled by using the [GridComboBoxColumn.AutoCompleteMode](#) property. Default value is Suggest. Following types of auto complete modes are available,

- Append
- Suggest
- SuggestAppend

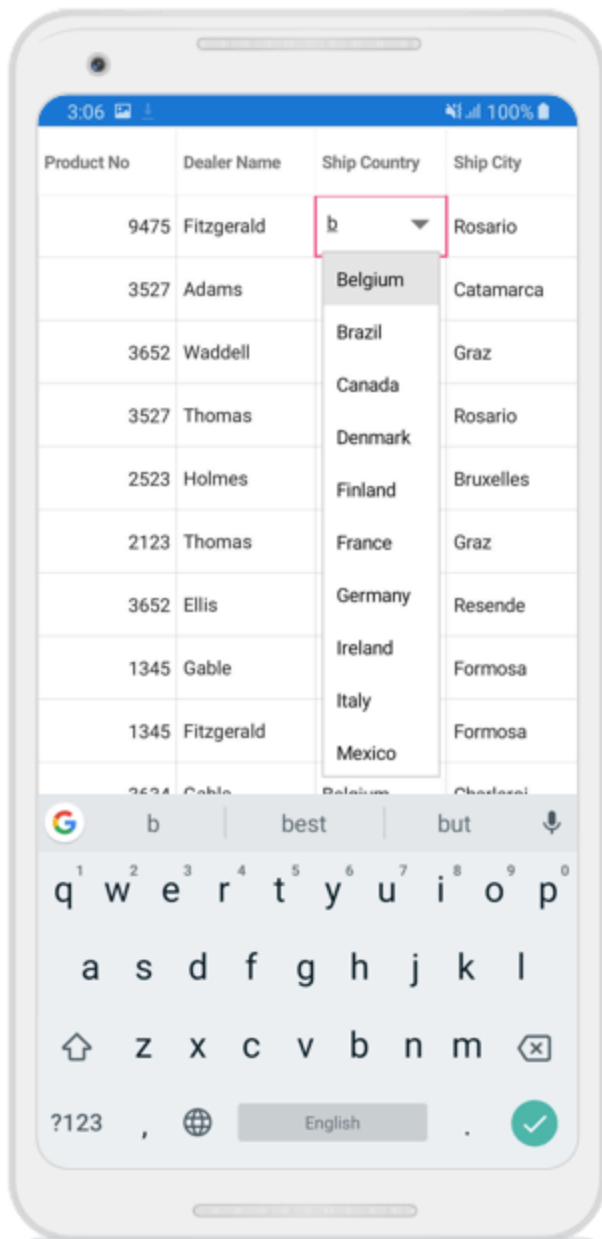

#### XML

```
<ContentPage.BindingContext>
```

```
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfgrid:GridComboBoxColumn BindingContext="{x:Reference viewModel}"
HeaderText="Dealer Name"
IsEditableMode="True"
AutoCompleteMode="Suggest"
ItemsSource="{Binding CustomerNames}"
MappingName="DealerName"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

### C#

```
dataGrid = new SfDataGrid();
GridComboBoxColumn comboBoxColumn = new GridComboBoxColumn()
{
    BindingContext = viewModel,
    MappingName = "DealerName",
    ItemsSource = viewModel.CustomerNames,
    IsEditableMode = True,
    AutoCompleteMode = ComboBoxMode.Suggest,
    HeaderText = "Dealer Name"
};
dataGrid.Columns.Add(comboBoxColumn);
```

### Auto suggesting on edit mode

By default, auto suggestion in the dropdown will display the value based on the [StartsWith](#) filter condition. This can be changed to retrieve the matches with the Contains condition by using the [SuggestionMode](#) property.

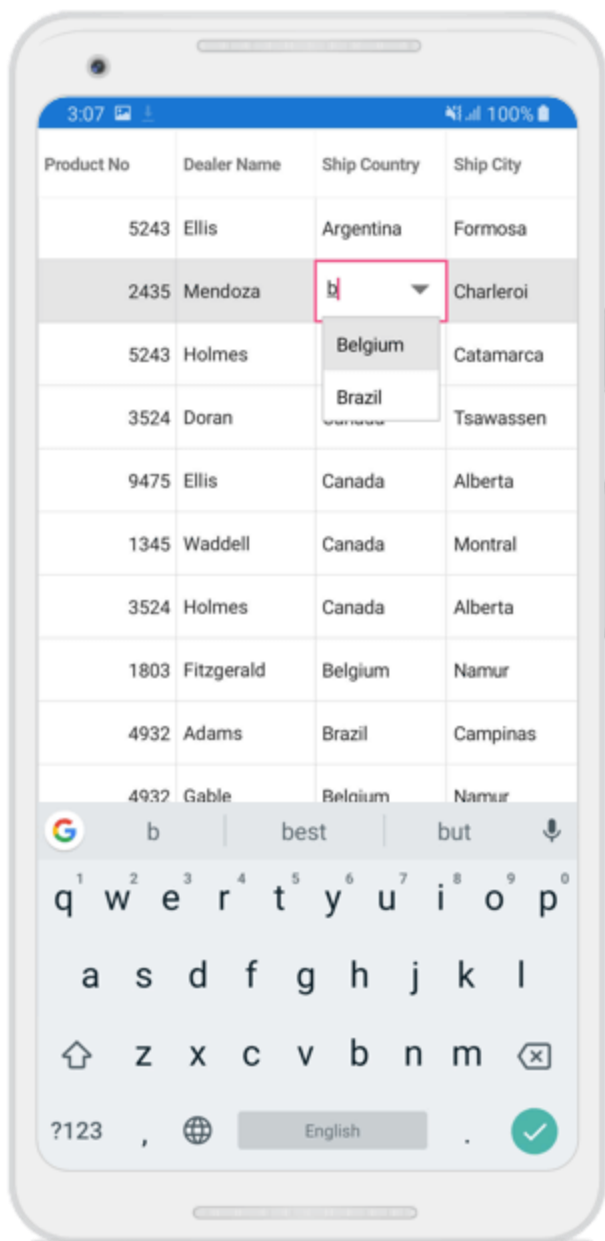

### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfgrid:GridComboBoxColumn BindingContext="{x:Reference viewModel}"
```

```
HeaderText="Dealer Name"
IsEditableMode="True"
CanFilterSuggestions="True"
AutoCompleteMode="Suggest"
SuggestionMode="Contains"
ItemsSource="{Binding CustomerNames}"
MappingName="DealerName"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

## C#

```
dataGrid = new SfDataGrid();
GridComboBoxColumn comboBoxColumn = new GridComboBoxColumn()
{
    BindingContext = viewModel,
    MappingName = "DealerName",
    ItemsSource = viewModel.CustomerNames,
    IsEditableMode = True,
    CanFilterSuggestions = true;
    AutoCompleteMode = ComboBoxMode.Suggest,
    SuggestionMode = SuggestionMode.Contains,
    HeaderText = "Dealer Name"
};
dataGrid.Columns.Add(comboBoxColumn);
```

### GridNumericColumn

The [GridNumericColumn](#) inherits all the properties of [GridColumn](#). It is used to display numeric data. To create [GridNumericColumn](#), the property corresponding to the column in the underlying collection must be a numeric type(int, double, float, etc.). To enable or disable editing a particular column, set the [GridColumn.AllowEditing](#) property to true or false. In the editing mode it displays the [SfNumericTextBox](#) element from the [View](#). To create a [GridNumericColumn](#), follow the code example:

### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<sfGrid:SfDataGrid x:Name="dataGrid"
```

```
ItemsSource="{Binding OrdersInfo}">
<sfGrid:SfDataGrid.Columns>
<sfgrid:GridNumericColumn NumberDecimalDigits="0"
HeaderText="Product No"
MappingName="ProductNo"/>
</sfGrid:SfDataGrid.Columns>
</sfGrid:SfDataGrid>
```

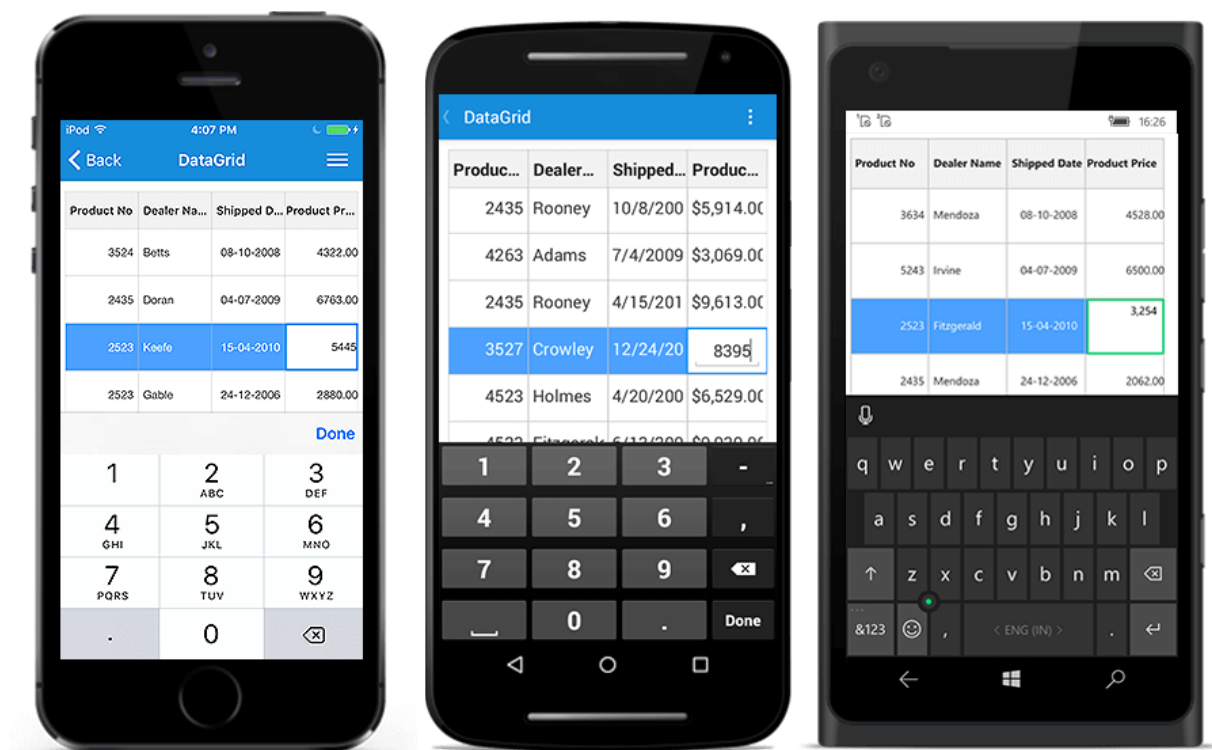

## C#

```
dataGrid = new SfDataGrid();
GridNumericColumn numericColumn = new GridNumericColumn()
{
    MappingName = "ProductNo",
    HeaderText = "Product No",
    NumberDecimalDigits = 0
};
dataGrid.Columns.Add(numericColumn);
```

### Number formatting

The `GridNumericColumn` allows formatting the numeric data with culture-specific information.

- [NumberDecimalDigits](#): To change the number of decimal digits to be displayed after the decimal point, use the `GridNumericColumn.NumberDecimalDigits` property.
- [NumberDecimalSeparator](#): By default, the dot(.) operator separates the decimal part of numeric value. Any operator can be used as decimal separator using the `GridNumericColumn.NumberDecimalSeparator` property.
- [NumberGroupSeparator](#): By default, the comma(,) separates group of digits before the decimal point. Any operator can be used as group separator using the `GridNumericColumn.NumberGroupSeparator` property.
- [NumberGroupSizes](#): To change the number of digits in each group before the decimal point on numeric values, use the `GridNumericColumn.NumberGroupSizes` property.
- [NumberNegativePattern](#): To format the pattern of negative numeric values, use `GridNumericColumn.NumberNegativePattern`.
- [MinValue](#): To set the minimum value for the numeric column, use the `GridNumericColumn.MinValue` property.
- [MaxValue](#): To set the maximum value for the numeric column, use the `GridNumericColumn.MaxValue` property.

### Row header

Row header is a special column placed as first cell of each row, and it will be always frozen. To enable the row header, set the [SfDataGrid.ShowRowHeader](#) to true.

Further, the SfDataGrid allows customizing the row header width using the [SfDataGrid.RowHeaderWidthProperty](#). The default value of `SfDataGrid.RowHeaderWidth` is 20.

To enable and customize the row header, follow the code example:

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
    ColumnSizer="Star"
    ShowRowHeader="True"
    RowHeaderWidth="50"
    ItemsSource="{Binding OrdersInfo}">
</sfgrid:SfDataGrid>
```

### C#

```
dataGrid.ShowRowHeader = true;
dataGrid.RowHeaderWidth = 50;
```

### Bind a view model property inside header template?

The SfDataGrid allows binding the view model property to the [HeaderTemplate](#) by setting the BindingContext of the the [GridColumn](#) as ViewModel.

To bind a view model property inside `HeaderTemplate`, follow the code example:

#### **XML**

```
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
AutoGenerateColumns="False"
ColumnSizer="Star"
SelectionMode="Single">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn MappingName="OrderID">
<sfgrid:GridColumn.HeaderTemplate>
<DataTemplate>
<Label BindingContext="{StaticResource viewModel}"
VerticalTextAlignment="Center"
HorizontalTextAlignment="Center"
Text="{Binding HeaderText}" TextColor="Blue" IsVisible="{Binding
_Visibility}"/>
</DataTemplate>
</sfgrid:GridColumn.HeaderTemplate>
</sfgrid:GridTextColumn>
<sfgrid:GridTextColumn MappingName="EmployeeID"/>
<sfgrid:GridTextColumn MappingName="FirstName"/>
<sfgrid:GridTextColumn MappingName="ShipCity"/>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
```

## ColumnSizer

The SfDataGrid allows to apply **ColumnSizer** for the [GridColumn](#) by setting the [SfDataGrid.ColumnSizer](#) property.

To apply **ColumnSizer** in the SfDataGrid, follow the code example:

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    ColumnSizer="None">
```

### C#

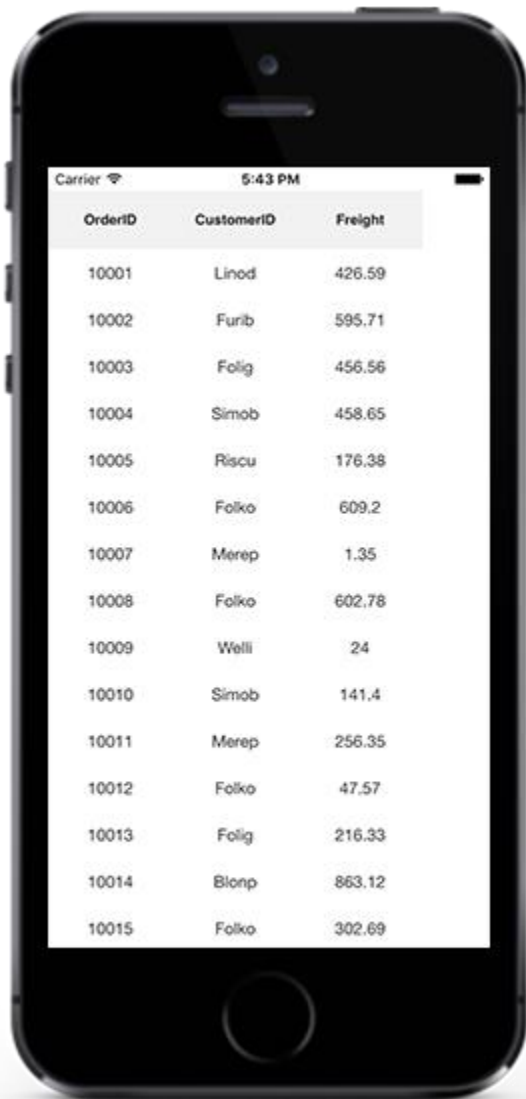

```
dataGrid.ColumnSizer = ColumnSizer.None;
```

The SfDataGrid applies width for all the `GridColumn`s in the [SfDataGrid.Columns](#) collection based on the `SfDataGrid.ColumnSizer` property. Following lists of options are available to set width of the column:

- None
- LastColumnFill
- Star
- Auto

#### `ColumnSizer.None`

No column sizing is applied when the [SfDataGrid.ColumnSizer](#) set to [None](#). Columns are arranged in view based on the [SfDataGrid.DefaultColumnWidth](#) property. This is the default value of the `SfDataGrid.ColumnSizer` property.

OrderID	CustomerID	Freight
10001	Linod	426.59
10002	Furib	595.71
10003	Folig	456.56
10004	Simob	458.65
10005	Riscu	176.38
10006	Folko	609.2
10007	Merep	1.35
10008	Folko	602.78
10009	Welli	24
10010	Simob	141.4
10011	Merep	256.35
10012	Folko	47.57
10013	Folig	216.33
10014	Blonp	863.12
10015	Folko	302.69

### ColumnSizer.LastColumnFill

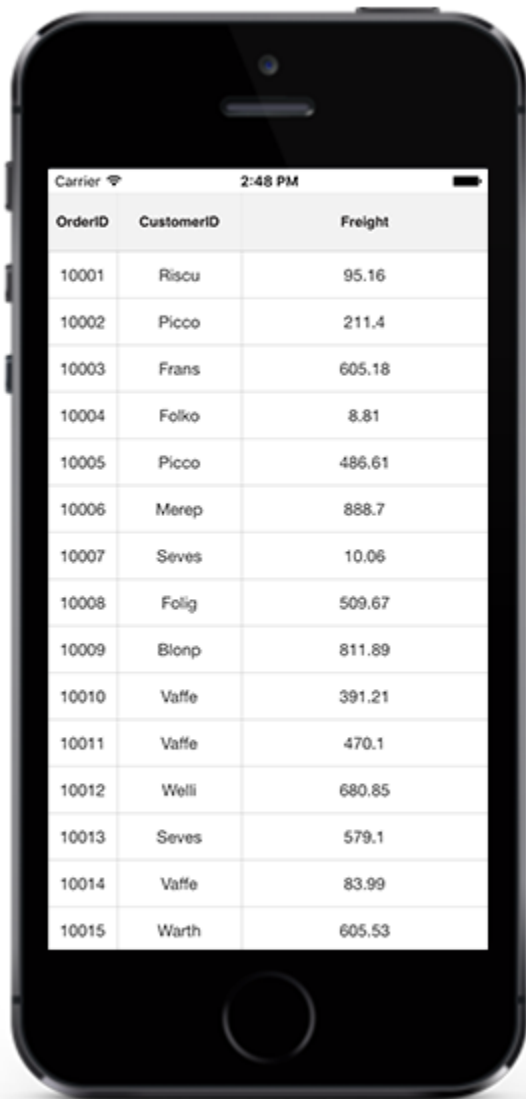

When the [SfDataGrid.ColumnSizer](#) is [LastColumnFill](#), the column width of the [GridColumns](#) are adjusted with respect to [SfDataGrid.DefaultColumnWidth](#) property. In case the columns does not fill the entire view space, width of the last column fills the unoccupied space in the view.

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
ColumnSizer="LastColumnFill">
```

### C#

```
dataGrid.ColumnSizer = ColumnSizer.LastColumnFill;
```

OrderID	CustomerID	Freight
10001	Riscu	95.16
10002	Picco	211.4
10003	Frans	605.18
10004	Folko	8.81
10005	Picco	486.61
10006	Merep	888.7
10007	Seves	10.06
10008	Folig	509.67
10009	Blonp	811.89
10010	Vaffe	391.21
10011	Vaffe	470.1
10012	Welli	680.85
10013	Seves	579.1
10014	Vaffe	83.99
10015	Warth	605.53

### ColumnSizer.Star

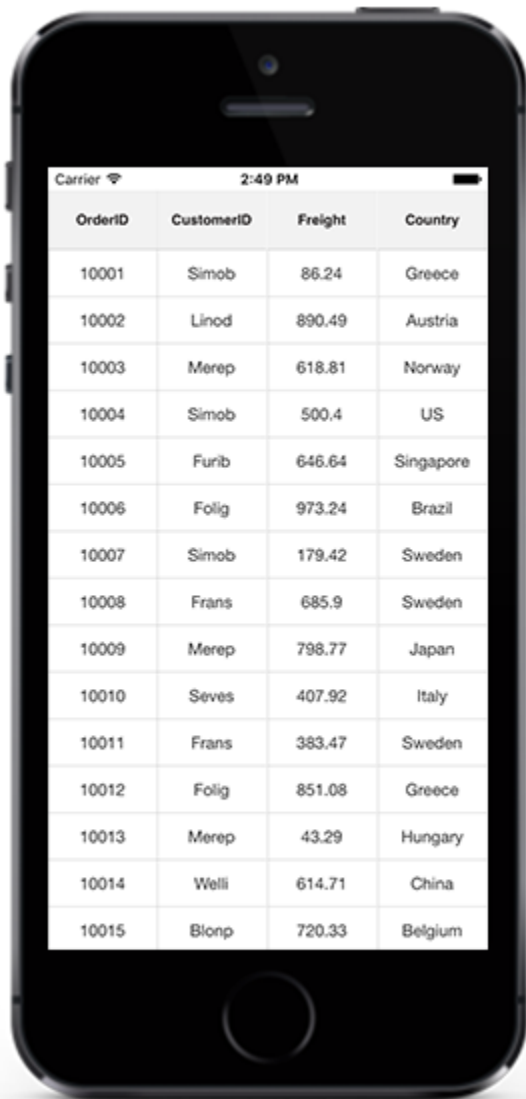

When the [SfDataGrid.ColumnSizer](#) is [Star](#), all the [GridColumn](#)s are adjusted to an equal column width to fit within the view. Setting [ColumnSizer](#) to [Star](#) will disable the [HorizontalScrolling](#) in the [SfDataGrid](#).

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    ColumnSizer="Star">
```

### C#

```
dataGrid.ColumnSizer = ColumnSizer.Star;
```

OrderID	CustomerID	Freight	Country
10001	Simob	86.24	Greece
10002	Linod	890.49	Austria
10003	Merep	618.81	Norway
10004	Simob	500.4	US
10005	Furib	646.64	Singapore
10006	Folig	973.24	Brazil
10007	Simob	179.42	Sweden
10008	Frans	685.9	Sweden
10009	Merep	798.77	Japan
10010	Seves	407.92	Italy
10011	Frans	383.47	Sweden
10012	Folig	851.08	Greece
10013	Merep	43.29	Hungary
10014	Welli	614.71	China
10015	Blonp	720.33	Belgium

### ColumnSizer.Auto

When the [SfDataGrid.ColumnSizer](#) is [Auto](#), the width of the `GridColumn`s are adjusted based on the header text or cell contents.

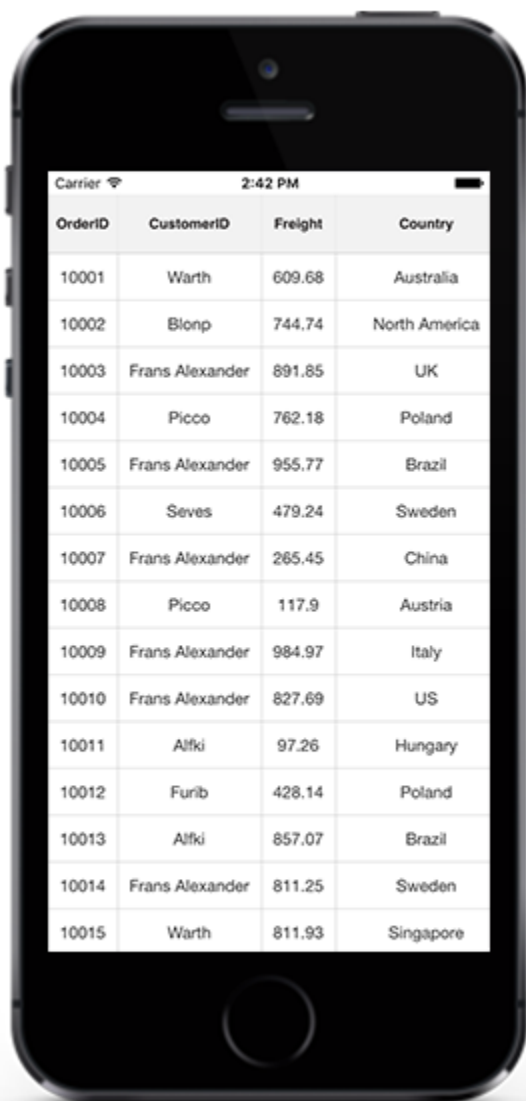

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    ColumnSizer="Auto">
```

### C#

```
dataGrid.ColumnSizer = ColumnSizer.Auto;
```

OrderID	CustomerID	Freight	Country
10001	Warth	609.68	Australia
10002	Blonp	744.74	North America
10003	Frans Alexander	891.85	UK
10004	Picco	762.18	Poland
10005	Frans Alexander	955.77	Brazil
10006	Seves	479.24	Sweden
10007	Frans Alexander	265.45	China
10008	Picco	117.9	Austria
10009	Frans Alexander	984.97	Italy
10010	Frans Alexander	827.69	US
10011	Alfki	97.26	Hungary
10012	Furib	428.14	Poland
10013	Alfki	857.07	Brazil
10014	Frans Alexander	811.25	Sweden
10015	Warth	811.93	Singapore

---

**Note:** If any column explicitly specified a width using the [GridColumn.Width](#) property, that column is not considered ColumnSizing width and skipped while applying the ColumnSizer for the grid columns.

---

How to

*Apply ColumnSizer for a particular column*

To apply column sizing to individual column, use the [GridColumn.ColumnSizer](#) property. The `GridColumn.ColumnSizer` property is also a type of the [ColumnSizer](#). If the `GridColumn.ColumnSizer` is not explicitly set to a value, then it takes the value of the [SfDataGrid.ColumnSizer](#) and applies width to the columns accordingly.

To apply `ColumnSizer` for a particular column, follow the code example:

**XML**

```
<sfgrid:SfDataGrid x:Name="dataGrid"
```

```

AutoGenerateColumns="True"
ColumnSizer="None">
<syncfusion:GridTextColumn MappingName="OrderID"
ColumnSizer = "Auto" />

```

**C#**

```

GridTextColumn textColumn = new GridTextColumn();
textColumn.MappingName = "CustomerID";
textColumn.HeaderText = "Full Name";
textColumn.ColumnSizer = ColumnSizer.Auto;

```

*Fill remaining width for any column*

The **SfDataGrid** allows to fill the remaining width in view for any column using [GridColumn.ColumnSizer](#) property.

The **GridColumn.ColumnSizer** has higher priority than the [SfDataGrid.ColumnSizer](#) property. Hence, individual columns having the **GridColumn.ColumnSizer** property set will not be included in the column size calculations of the **SfDataGrid**. To fill the column with remaining width in view, set the **GridColumn.ColumnSizer** property as [ColumnSizer.LastColumnFill](#). Refer to the following code example to achieve the same:

In the below code snippet, the **SfDataGrid** is applied with **ColumnSizer.Star** and the second column is applied with **ColumnSizer.LastColumnFill**. Hence the second column will take up the remaining space after other columns are rendered with star size.

**XML**

```

<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrdersInfo}">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn MappingName="OrderID"/>
<sfgrid:GridTextColumn MappingName="CustomerID"
ColumnSizer="LastColumnFill"/>
<sfgrid:GridTextColumn MappingName="Salary"/>
<sfgrid:GridTextColumn MappingName="Country"/>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>

```

**C#**

```

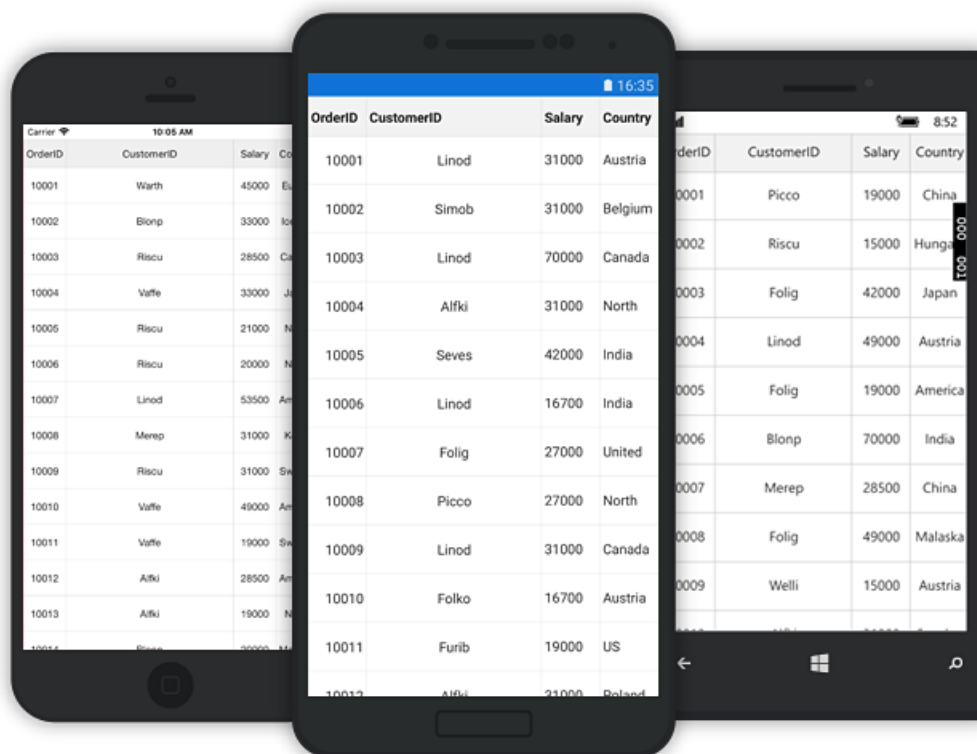

SfDataGrid dataGrid;
ViewModel viewModel;
public MainPage()
{
InitializeComponent();
dataGrid = new SfDataGrid();
viewModel = new ViewModel();
dataGrid.AutoGenerateColumns = false;
dataGrid.ItemsSource = viewModel.OrdersInfo;
GridTextColumn orderIDColumn = new GridTextColumn();
orderIDColumn.MappingName = "OrderID";
GridTextColumn customerIDColumn = new GridTextColumn();

```

```

customerIDColumn.MappingName = "CustomerID";
customerIDColumn.ColumnSizer = ColumnSizer.LastColumnFill;
GridTextColumn salaryColumn = new GridTextColumn();
salaryColumn.MappingName = "Salary";
GridTextColumn countryColumn = new GridTextColumn();
countryColumn.MappingName = "Country";
dataGrid.Columns.Add(orderIDColumn);
dataGrid.Columns.Add(customerIDColumn);
dataGrid.Columns.Add(salaryColumn);
dataGrid.Columns.Add(countryColumn);
}

```

### Refreshing ColumnSizer at runtime

To refresh the column sizing for `SfDataGrid.Columns` at runtime, use the [SfDataGrid.GridColumnSizer.Refresh\(\)](#) method.

Consider that `ColumnSizer.Auto` is applied to the `SfDataGrid`. If the underlying values are changed at run time, refresh the column sizer as follows:

### XML

```

<StackLayout HorizontalOptions="Center"
Orientation="Vertical">
<Button x:Name="button"
Text="Refresh ColumnSizer"
HeightRequest="100"
HorizontalOptions="Center"
Clicked="ColumnSizerChanged"/>
<sfgrid:SfDataGrid x:Name="dataGrid"

```

```

AutoGenerateColumns="True"
AllowEditing="True"
ColumnSizer="Auto"
ItemsSource="{Binding OrdersInfo}">
</sfgrid:SfDataGrid>
</StackLayout>

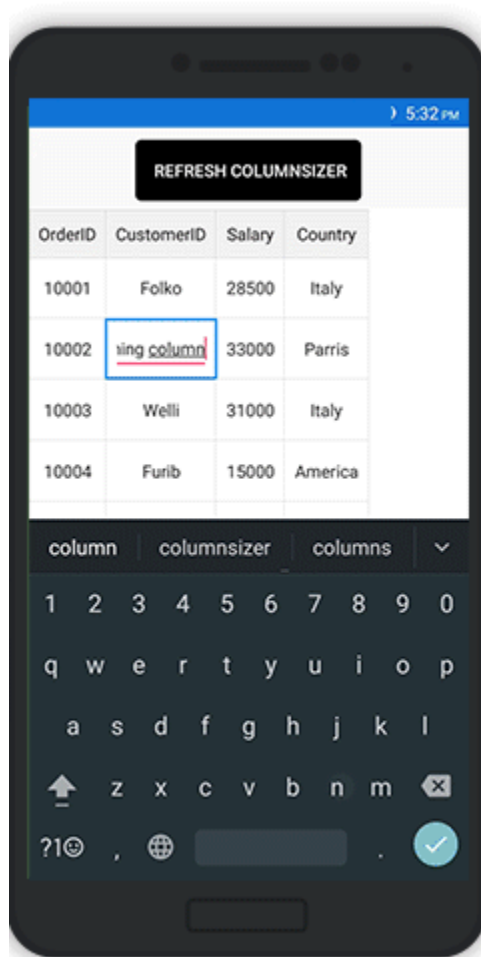

```

## C#

```

private void ColumnSizerChanged(object sender, EventArgs e)
{
    //Refreshes the column sizer of the SfDataGrid
    dataGrid.GridColumnSizer.Refresh(true);
}

```

### Resetting column width to apply ColumnSizer

By default, columns having the [GridColumn.Width](#) property set will not be included for column sizer calculations of the SfDataGrid. To include the width columns and reset the column sizer at runtime, set the [GridColumn.Width](#) property to double.NaN before calling the [SfDataGrid.GridColumnSizer.Refresh\(\)](#) method. Refer to the following code example to achieve the same:

## XML

```
<StackLayout
Orientation="Vertical">
<Button x:Name="button"
Text=" Reset ColumnWidth"
TextColor="White"
HeightRequest="50"
BackgroundColor="Black"
HorizontalOptions="Center"
Clicked="ColumnSizerChanged"/>
<sfgrid:SfDataGrid x:Name="dataGrid"
AllowEditing="True"
AutoGenerateColumns="False"
ItemsSource="{Binding OrdersInfo}">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn MappingName="OrderID" Width="20"/>
<sfgrid:GridTextColumn MappingName="CustomerID"/>
<sfgrid:GridTextColumn MappingName="Salary"/>
<sfgrid:GridTextColumn MappingName="Country"/>
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
</StackLayout>
```

## C#

```
private void ColumnSizerChanged(object sender, EventArgs e)
{
    //Resets the widths for the columns having GridColumn.Width property set
    ResetColumnsWidth();
    dataGrid.GridColumnSizer.Refresh(true);
}

private void ResetColumnsWidth()
{
    foreach (var column in dataGrid.Columns)
    {
        // Setting NaN values to columns for which width is applied
        if (!double.IsNaN(column.Width))
        {
            column.Width = double.NaN;
        }
    }
}
```

RESET COLUMNWIDTH

OrderID	CustomerID	Salary	Country
10001	Alfki	70000	Korea
10002	Folig	19000	Nepal
10003	Blonp	24500	Belgium
10004	Merep	15000	Canada
10005	Seves	49000	India
10006	Folig	28500	Hungary
10007	Folig	24500	Brazil
10008	Riscu	24500	Belgium
10009	Folko	37500	Japan
10010	Frans	37500	Austria

After resetting  
column width and  
refreshing the  
columnSizer

RESET COLUMNWIDTH

OrderID	CustomerID	Salary	Country
10001	Alfki	70000	Korea
10002	Folig	19000	Nepal
10003	Blonp	24500	Belgium
10004	Merep	15000	Canada
10005	Seves	49000	India
10006	Folig	28500	Hungary
10007	Folig	24500	Brazil
10008	Riscu	24500	Belgium
10009	Folko	37500	Japan
10010	Frans	37500	Austria

#### Customize auto width calculation for a column

For cases, where a column might require more width than the applied auto width or if you want to apply your own custom logic to calculate the auto width of a column, return a desired width in the [GetColumnAutoSizeWidth\(\)](#) override of the custom written column-sizer class derived from [GridColumnSizer](#) and assign it to the [SfDataGrid.GridColumnSizer](#) property.

If in case you want to modify the auto calculations of a column's header cell alone, return a desired width in the [GetHeaderCellWidth\(\)](#) override of your custom column-sizer class.

#### C#

```
public class CustomColumnSizer : GridColumnSizer
{
    protected override double GetColumnAutoSizeWidth(GridColumn column)
    {
        if (column.MappingName == "OrderID")
        {
            // return width based on your logic
        }
        else
        {
            return base.GetColumnAutoSizeWidth(column);
        }
    }
    protected override double GetHeaderCellWidth(GridColumn column)
```

```

{
    if (column.MappingName == "CustomerID")
    {
        // return width based on your logic
    }
    else
    {
        return base.GetHeaderCellWidth(column);
    }
}
}

```

## XML

```

<ContentPage.Resources>
<local:CustomColumnSizer x:Key="CustomColumnSizer"/>
</ContentPage.Resources>
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo,Mode=TwoWay}"
ColumnSizer="Auto"
GridColumnSizer="{x:StaticResource CustomColumnSizer}">
</syncfusion:SfDataGrid>

```

## C#

```
dataGrid.GridColumnSizer = new CustomColumnSizer();
```

## Star column sizer ratio support

To customize the `ColumnSizer.Star` width calculation, write a custom `GridColumnSizer` class derived from [GridColumnSizer](#) and assign it to the `SfDataGrid.ColumnSizer` property. To implement your own logic to divide column width in different ratios, override the [SetStarWidthForColumns](#) method in your custom `GridColumnSizer` class.

To set star sizer ratio for individual column, follow the code example:

## C#

```

<sfgrid:SfDataGrid.Columns >
<sfgrid:GridTextColumn HeaderText="OrderID" MappingName="OrderID"
local:StarSizerRatioHelpers.ColumnRatio="2"/>
<sfgrid:GridTextColumn HeaderText="CustomerID" MappingName="CustomerID"
local:StarSizerRatioHelpers.ColumnRatio="3"/>
<sfgrid:GridTextColumn HeaderText="Salary" MappingName="Salary"/>
<sfgrid:GridTextColumn HeaderText="Country" MappingName="Country"/>
</sfgrid:SfDataGrid.Columns>

```

The following code example demonstrates how the width is calculated for column using the `SetStarWidthForColumns` method based on the `ColumnRatio` property of the `StarSizerRatioHelpers` class:

## C#

```

// Assign custom GridColumnSizer to datagrid GridColumnSizer
dataGrid.GridColumnSizer = new CustomColumnSizer(this.dataGrid);

```

```

public class CustomColumnSizer : GridColumnSizer
{
    public CustomColumnSizer(SfDataGrid grid) : base(grid)
    {
    }
    protected override void SetStarWidthForColumns(double columnsWidth,
    IEnumerable<GridColumn> columns)
    {
        var removedColumn = new List<GridColumn>();
        var column = columns.ToList();
        var totalRemainingStarValue = columnsWidth;
        double removedWidth = 0;
        bool isRemoved;
        while (column.Count > 0)
        {
            isRemoved = false;
            removedWidth = 0;
            var columnsCount = 0;
            foreach (var data in column)
            {
                columnsCount += StarSizerRatioHelpers.GetColumnRatio(data);
            }
            double starWidth = Math.Floor((totalRemainingStarValue / columnsCount));
            var getColumn = column.First();
            //Calculate the ColumnSizer ratio for every column
            starWidth *= StarSizerRatioHelpers.GetColumnRatio(getColumn);
            var columnSizer = DataGrid.GridColumnSizer;
            var method = columnSizer.GetType().GetRuntimeMethods().FirstOrDefault(x =>
            x.Name == "SetColumnWidth");
            var width = method.Invoke(columnSizer, new object[] { getColumn, starWidth
            });
            double computeWidth = (double)width;
            if (starWidth != computeWidth && starWidth > 0)
            {
                isRemoved = true;
                column.Remove(getColumn);
                foreach (var remColumn in removedColumn)
                {
                    if (!column.Contains(remColumn))
                    {
                        removedWidth += remColumn.ActualWidth;
                        column.Add(remColumn);
                    }
                }
                removedColumn.Clear();
                totalRemainingStarValue += removedWidth;
            }
            totalRemainingStarValue = totalRemainingStarValue - computeWidth;
            if (!isRemoved)
            {
                column.Remove(getColumn);
                if (!removedColumn.Contains(getColumn))
                removedColumn.Add(getColumn);
            }
        }
    }
}

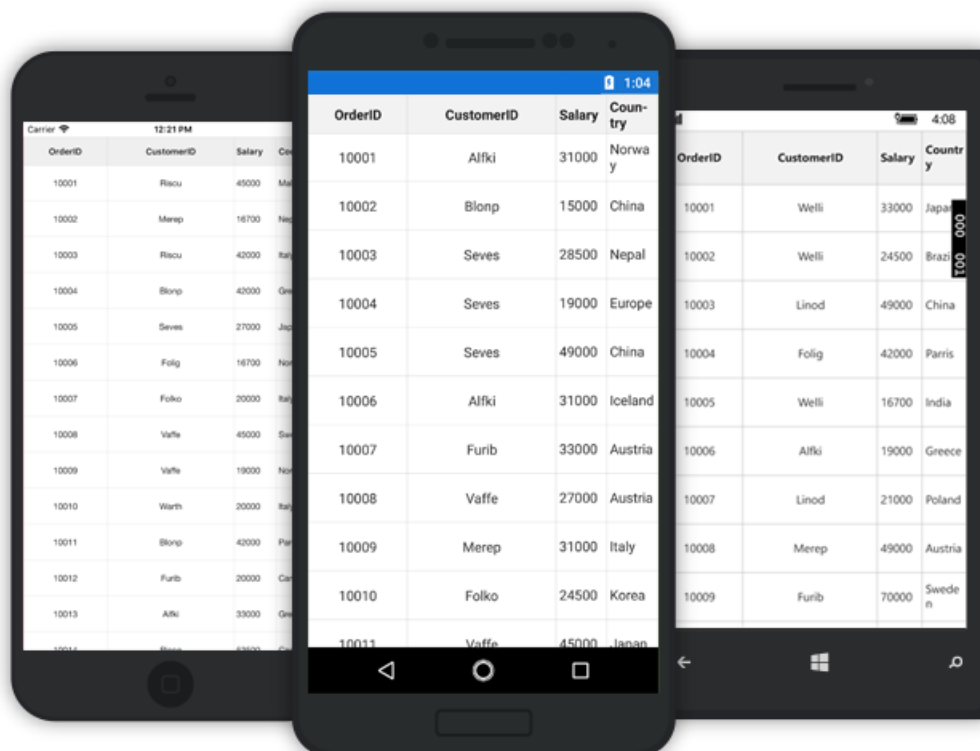

```

The following code example explains the `StarSizerRatioHelpers` class:

**C#**

```
public static class StarSizerRatioHelpers
{
    public static int GetColumnRatio(BindableObject obj)
    {
        return (int)obj.GetValue(ColumnRatioProperty);
    }
    public static void SetColumnRatio(BindableObject obj, int value)
    {
        obj.SetValue(ColumnRatioProperty, value);
    }
    public static readonly BindableProperty ColumnRatioProperty =
        BindableProperty.Create("ColumnRatio", typeof(int),
            typeof(StarSizerRatioHelpers), 1, BindingMode.TwoWay);
    public static void OnColumnSizerChanged(BindableObject bindable, object
        oldValue, object newValue)
    {
    }
}
```

## Freeze Panes

The SfDataGrid allows to freeze the rows and columns when scrolling the grid.

### Freeze rows

The SfDataGrid provides extensive support to freeze the rows at the top of the view below the header row by setting the [SfDataGrid.FrozenRowCount](#) property.

The following code example illustrates freezing two rows:

#### C#

```
//Setting number of rows to freeze in SfDataGrid  
dataGrid.FrozenRowCount = 2;
```

#### Limitation

- **FrozenRowCount** should be lesser than the number of rows displayed in view. For example, If you have 10 rows in view, then you set **FrozenRowCount** to a maximum value of 9.

---

**Note:** Header row is frozen by default and works regardless of the **FrozenRowCount** property.

---

### Freeze columns

The SfDataGrid also supports to freeze the columns at the left of the view by setting the [SfDataGrid.FrozenColumnsCount](#) property.

The following code example illustrates freezing two columns:

#### C#

```
//Setting number of columns to freeze in SfDataGrid  
dataGrid.FrozenColumnsCount = 2;
```

#### Limitation

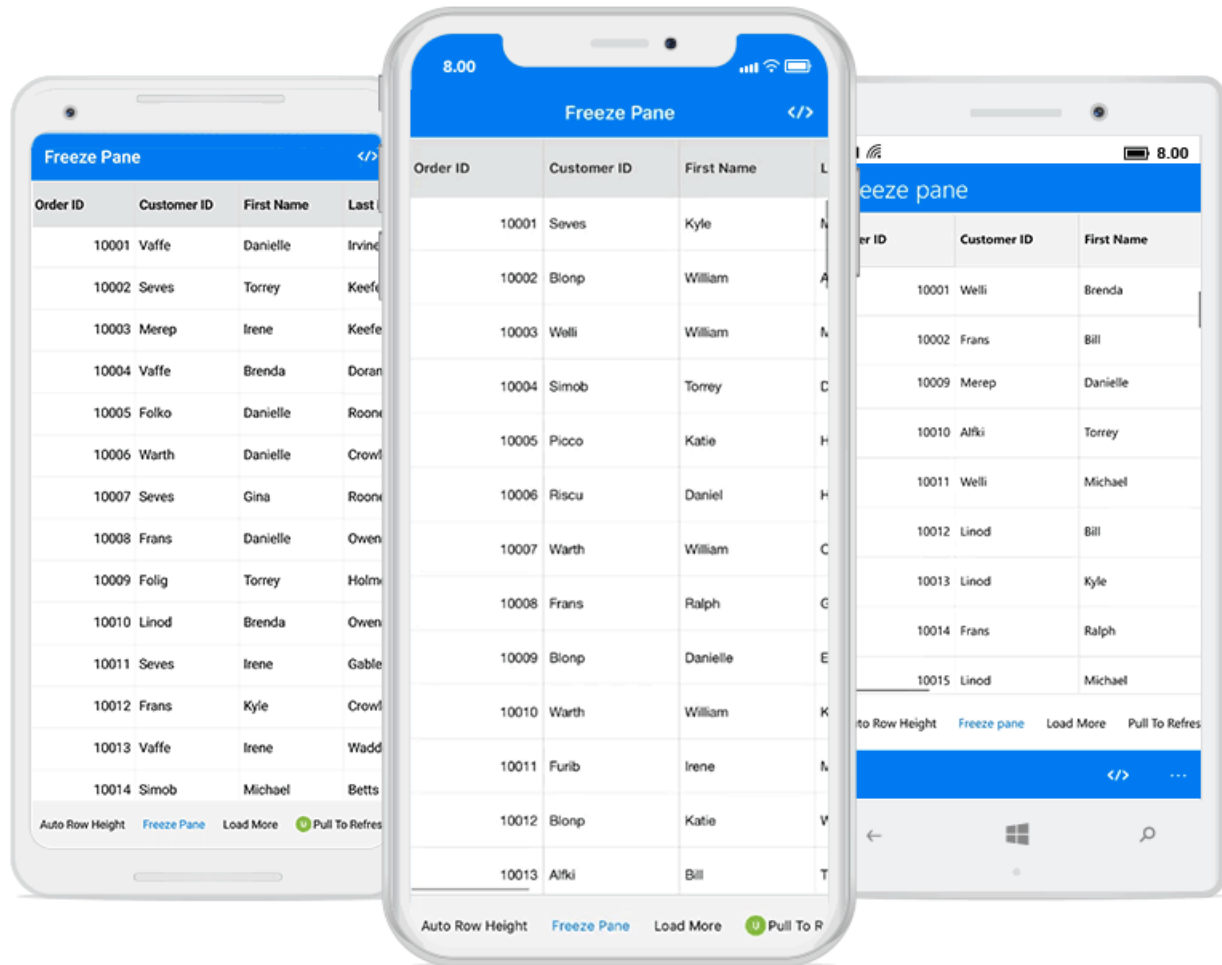

- **FrozenColumnsCount** should be lesser than number of columns displayed in view. For example, If you have 5 columns in view, then you can set **FrozenColumnsCount** to a maximum value of 4.

---

**Note:** RowHeader is frozen by default and works regardless of the **FrozenColumnsCount** property.

---

The following GIF illustrates FrozenRows and FrozenColumns.

## Grid Events

### GridTapped event

This event will be triggered while tapping the SfDataGrid with [GridTappedEventArgs](#) properties as follows:

- [RowIndex](#): Gets row index of the tapped row.
- [ColumnIndex](#): Gets column index of the tapped column.
- [RowData](#): Gets row data of the tapped row.

To hook the `GridTapped` event, and to get the tapped row and column details, follow the code example:

#### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    GridTapped="DataGrid_GridTapped"
    ItemsSource="{Binding OrdersInfo}" />
```

#### C#

```
private void DataGrid_GridTapped(object sender, GridTappedEventArgs e)
{
    var rowIndex = e.RowColumnIndex.RowIndex;
    var rowData = e.RowData;
    var columnIndex = e.RowColumnIndex.ColumnIndex;
}
```

### GridDoubleTapped event

This event will be triggered while double tapping the SfDataGrid with [GridDoubleTappedEventArgs](#) properties as follows:

- [RowIndex](#): Gets row index of the double tapped row.
- [ColumnIndex](#): Gets column index of the double tapped column.
- [RowData](#): Gets row data of the double tapped row.

To hook the `GridDoubleTapped` event, and to get the double tapped row and column details, follow the code example:

#### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    GridDoubleTapped="DataGrid_GridDoubleTapped"
    ItemsSource="{Binding OrdersInfo}" />
```

#### C#

```
private void DataGrid_GridDoubleTapped(object sender,
    GridDoubleTappedEventArgs e)
{
    var rowIndex = e.RowColumnIndex.RowIndex;
    var rowData = e.RowData;
    var columnIndex = e.RowColumnIndex.ColumnIndex;
}
```

### GridLongPressed event

This event will be triggered while long pressing the SfDataGrid with [GridLongPressedEventArgs](#) properties as follows:

- [RowIndex](#): Gets row index of the long pressed row.
- [ColumnIndex](#): Gets column index of the long pressed column.
- [RowData](#): Gets row data of the long pressed row.

To hook the `GridLongPressed` event, and to get the long pressed row and column details, follow the code example:

#### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    GridLongPressed="DataGrid_GridLongPressed"
    ItemsSource="{Binding OrdersInfo}" />
```

### C#

```
private void DataGrid_GridLongPressed(object sender,
GridLongPressedEventArgs e)
{
    var rowIndex = e.RowColumnIndex.RowIndex;
    var rowData = e.RowData;
    var columnIndex = e.RowColumnIndex.ColumnIndex;
}
```

### GridViewCreated event

This event will be triggered once the [SfDataGrid.View](#) is created. This event gives any operation only after the creation of [SfDataGrid.View](#) by handling the [GridViewCreatedEventArgs](#).

To hook the [GridViewCreated](#) event, and to set alternate row colors, follow the code example:

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
GridViewCreated="DataGrid_GridViewCreated"
ItemsSource="{Binding OrdersInfo}" />
```

### C#

```
private void DataGrid_GridViewCreated(object sender,
GridViewCreatedEventArgs e)
{
    (sender as SfDataGrid).GridStyle = new CustomGridStyle();
}
internal class CustomGridStyle : DataGridStyle
{
    public override Color GetAlternatingRowBackgroundColor()
    {
        return Color.Aqua;
    }
}
```

### GridLoaded event

This event will be triggered once components in the [SfDataGrid](#) initialized and rendered. This event gives any operation only after loading the grid by handling the [GridLoadedEventArgs](#).

To hook the [GridLoaded](#) event, and to show the [ActivityIndicator](#) until the grid comes to view, follow the code example:

### XML

```
<Grid x:Name="grid"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
    <sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
GridLoaded="DataGrid_GridLoaded"/>
```

```
HorizontalOptions="FillAndExpand"  
ItemsSource="{Binding OrdersInfo}"  
VerticalOptions="FillAndExpand" />
```

### C#

```
private void DataGrid_GridLoaded(object sender, GridLoadedEventArgs e)  
{  
    ActivityIndicator indicator = new ActivityIndicator();  
    indicator.IsRunning = true;  
    indicator.IsVisible = true;  
    indicator.BackgroundColor = Color.Gray;  
    grid.Children.Add(indicator);  
    await Task.Delay(2000);  
    indicator.IsRunning = false;  
    indicator.IsVisible = false;  
}
```

### ValueChanged event

The [SfDataGrid.ValueChanged](#) event will be triggered whenever the current cell's value has been changed in the GridTextBoxColumn, GridNumericColumn or GridSwitchColumn. This event handler contains the parameter of type [ValueChangedEventArgs](#) that contains the following properties.

- [Column](#) : Gets the current [GridColumn](#) that contains the grid cell for which value is edited or changed.
- [NewValue](#) : The newly edited value to be committed.
- [RowColumnIndex](#) : The current [RowColumnIndex](#) of the grid cell undergoing the value change.
- [RowData](#) : The [RowData](#) of the row that contains the grid cell undergoing the value change.
- [CellValue](#) : The initial value when current cell entered edit mode.

### C#

```
dataGrid.ValueChanged += DataGrid_ValueChanged;  
private void DataGrid_ValueChanged(object sender, ValueChangedEventArgs e)  
{  
    var column = e.Column;  
    var newValue = e.NewValue;  
    var rowColIndex = e.RowColIndex;  
    var rowData = e.RowData;  
}
```

### ItemsSource changed event

The [SfDataGrid.ItemsSourceChanged](#) event will be triggered whenever the [SfDataGrid.ItemsSource](#) property is changed in the grid during both the runtime changes and initial loading of the DataGrid. This event handler contains the parameter of type [GridItemsSourceChangedEventArgs](#) that contains the following properties:

- [OldItemSource](#): Gets the previous ItemsSource collection as object. Always null when the grid is initially loaded.
- [NewItemSource](#): Gets the current ItemsSource collection as object.

- **OldView**: Gets the old [SfDataGrid.View](#) associated with the **OldItemSource**. Always null when the grid is initially loaded.
- **NewView**: Gets the new [SfDataGrid.View](#) associated with the **NewItemSource**.

The following code example shows how to hook the **SfDataGrid.ItemsSourceChanged** event and get the **ItemsSource** collection details.

#### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
ItemsSource="{Binding OrdersInfo}"
ItemsSourceChanged="DataGrid_ItemsSourceChanged"/>
```

#### C#

```
private void DataGrid_ItemsSourceChanged(object sender,
GridItemsSourceChangedEventArgs e)
{
    var newItemSource = e.NewItemSource;
    var oldItemSource = e.OldItemSource;
    var newView = e.NewView;
    var oldView = e.OldView;
}
```

#### Create custom context menu using grid events

The SfDataGrid allows you to display any custom view, like context menu. This menu acts similar to pop-up by using the **GridLongPressed** and **GridTapped** events.

To create custom context menu using grid events, follow the code example:

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ContextMenuSupport"
x:Class="ContextMenuSupport.MainPage"
xmlns:sfgrid="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
">
<ContentPage.BindingContext>
<local:ViewModel />
</ContentPage.BindingContext>
<RelativeLayout x:Name="relativeLayout">
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding Collection}"
ColumnSizer="Star"
RelativeLayout.WidthConstraint="{ConstraintExpression
Type=RelativeToParent,Property=Width,Factor=1,Constant=0}"
RelativeLayout.HeightConstraint="{ConstraintExpression
Type=RelativeToParent,Property=Height,Factor=1,Constant=0}"
GridLongPressed="DataGrid_GridLongPressed"
/>
</RelativeLayout>
</ContentPage>
```

**C#**

```
public partial class MainPage : ContentPage
{
    StackLayout contextMenu;
    Button sortButton;
    Button clearSortButton;
    private bool isContextMenuDisplayed = false;
    private string currentColumnName;
    public MainPage()
    {
        InitializeComponent();
        // Creates the view for the ContextMenu
        CreateContextMenu();
        dataGrid.AllowSorting = true;
        dataGrid.GridTapped += DataGrid_GridTapped;
    }
    private void DataGrid_GridTapped(object sender, GridTappedEventArgs e)
    {
        // Hides the context menu when SfDataGrid is tapped anywhere outside the context menu view
        relativeLayout.Children.Remove(contextMenu);
        isContextMenuDisplayed = false;
    }
    public void CreateContextMenu()
    {
        contextMenu = new StackLayout();
        sortButton = new Button();
        sortButton.Text = "Sort";
        sortButton.BackgroundColor = Color.Black;
        sortButton.TextColor = Color.White;
        sortButton.Clicked += SortButton_Clicked;
        clearSortButton = new Button();
        clearSortButton.Text = "Clear sort";
        clearSortButton.BackgroundColor = Color.Black;
        clearSortButton.TextColor = Color.White;
        clearSortButton.Clicked += ClearSortButton_Clicked;
        // A custom view hosting two buttons are now created
        contextMenu.Children.Add(sortButton);
        contextMenu.Children.Add(clearSortButton);
    }
    // Removes the sorting applied to the SfDataGrid
    private void ClearSortButton_Clicked(object sender, EventArgs e)
    {
        relativeLayout.Children.Remove(contextMenu);
        isContextMenuDisplayed = false;
        dataGrid.SortColumnDescriptions.Clear();
    }
    // Sorts the SfDataGrid data based on the column selected in the context menu
    private void SortButton_Clicked(object sender, EventArgs e)
    {
        relativeLayout.Children.Remove(contextMenu);
        isContextMenuDisplayed = false;
        dataGrid.SortColumnDescriptions.Clear();
    }
}
```

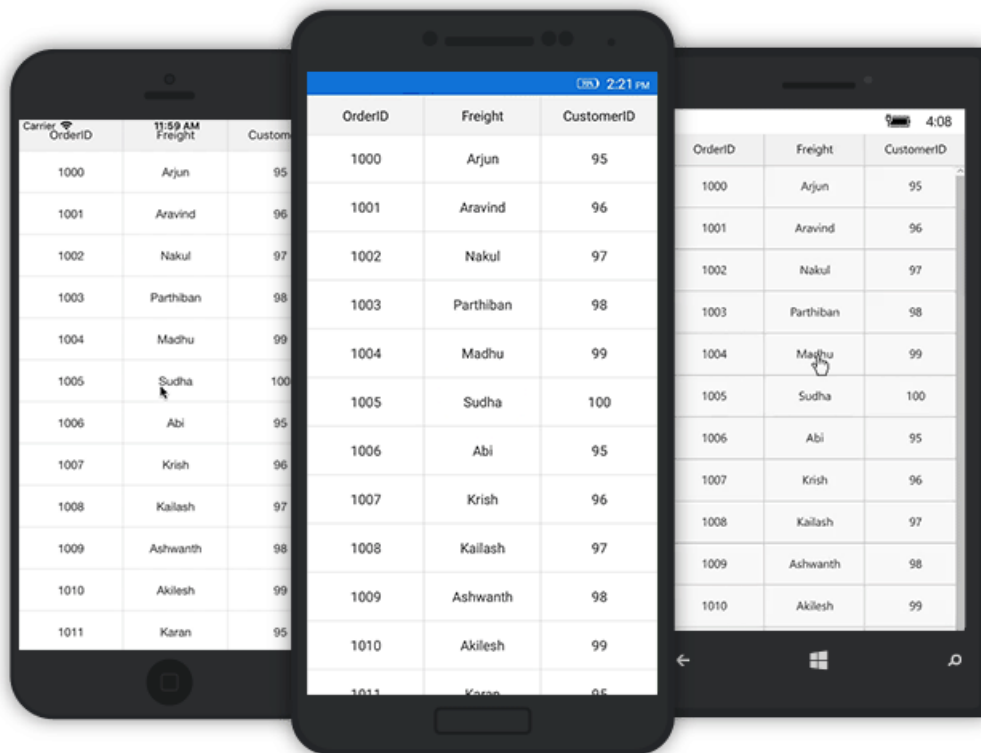

```

dataGrid.SortColumnDescriptions.Add(new SortColumnDescription()
{
    ColumnName = currentColumnName
});
}
public void DataGrid_GridLongPressed(object sender,
GridLongPressedEventArgs e)
{
    if (!isContextMenuDisplayed)
    {
        currentColumnName =
dataGrid.Columns[e.RowColumnIndex.ColumnIndex].MappingName;
var point = dataGrid.RowColumnIndexToPoint(e.RowColumnIndex);
// Display the ContextMenu when the SfDataGrid is long pressed
relativeLayout.Children.Add(contextMenu, Constraint.Constant(point.X),
Constraint.Constant(point.Y));
isContextMenuDisplayed = true;
    }
    else
    {
        // Hides the context menu when SfDataGrid is long pressed when the context
menu is already visible in screen
relativeLayout.Children.Remove(contextMenu);
isContextMenuDisplayed = false;
    }
}
}

```

Refer to the following GIF for final rendering on execution of above code example:

## Commands

### *GridTapped command*

The [SfDataGrid.GridTappedCommand](#) will be executed when tapping the SfDataGrid. You can directly assign any [ICommand](#) type property to the [SfDataGrid.GridTappedCommand](#) or write a class derived from ICommand interface, and assign your CustomClass type property to the [SfDataGrid.GridTappedCommand](#) property. By configuring this, the data grid comes handy if you have your own logics determining whether to execute the command or not.

### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
GridTappedCommand="{Binding TappedCommandAction}"/>
```

### C#

```
// viewModel.cs
public ViewModel ()
{
    // assigning command action to ICommand type property
    TappedCommandAction = new Command(add);
    // assigning command action to your custom command type property
    TappedCommandAction1 = new DerivedTappedCommand();
}
// ICommand type property for binding with DataGrid.TappedCommandAction
public ICommand TappedCommandAction
{
    get;
    set;
}
// Custom command type property for binding with
DataGrid.TappedCommandAction
public DerivedTappedCommand TappedCommandAction1
{
    get;
    set;
}
public void add()
{
    //your logics here
}
// below codes for writing custom command derived from ICommand.
public class DerivedTappedCommand : ICommand
{
    public event EventHandler CanExecuteChanged;
    public DerivedTappedCommand( )
    {
    }
    public bool CanExecute(object parameter)
    {
        return true;
    }
}
```

```
public void Execute(object parameter)
{
    // your logics here.
}
}
```

You can download the sample demo [here](#).

#### *GridDoubleTapped command*

The [SfDataGrid.GridDoubleTappedCommand](#) will be executed when double tapping the SfDataGrid. You can directly assign any [ICommand](#) type property to the [SfDataGrid.GridTappedCommand](#) or write a class derived from [ICommand](#) interface, and assign your CustomClass type property to the [SfDataGrid.GridTappedCommand](#) property. By configuring this, the data grid comes handy if you have your own logics determining whether to execute the command or not.

#### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
GridDoubleTappedCommand="{Binding DoubleTappedCommandAction}" />
```

#### C#

```
// viewModel.cs
public ViewModel()
{
    // assigning command action to ICommand type property
    DoubleTappedCommandAction = new Command(add);
    // assigning command action to your custom command type property
    DoubleTappedCommandAction1 = new DerivedDoubleTappedCommand();
}
// ICommand type property for binding with DataGrid.DoubleTappedCommand
public ICommand DoubleTappedCommandAction
{
    get;
    set;
}
// Custom command type property for binding with
DataGrid.DoubleTappedCommand
public DerivedDoubleTappedCommand DoubleTappedCommandAction1
{
    get;
    set;
}
public void add()
{
    //your logics here
}
// below codes for writing custom command derived from ICommand.
public class DerivedDoubleTappedCommand : ICommand
{
    public event EventHandler CanExecuteChanged;
```

```

public DerivedDoubleTappedCommand( )
{
}
public bool CanExecute(object parameter)
{
    return true;
}
public void Execute(object parameter)
{
    // your logics here.
}
}

```

You can download the sample demo [here](#).

#### *GridLongPressed command*

The `SfDataGrid.GridLongPressedCommand` will be executed when long pressing the SfDataGrid. You can directly assign any `ICommand` type property to the `SfDataGrid.GridTappedCommand` or write a class derived from `ICommand` interface, and assign your CustomClass type property to the `SfDataGrid.GridTappedCommand` property. By configuring this, the data grid comes handy if you have your own logics determining whether to execute the command or not.

#### **XML**

```

<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
GridLongPressedCommand="{Binding LongPressedCommandAction}">

```

#### **C#**

```

// viewModel.cs
public ViewModel()
{
    // assigning command action to ICommand type property
    LongPressedCommandAction = new Command(add);
    // assigning command action to your custom command type property
    LongPressedCommandAction1 = new DerivedLongPressedCommand();
}
// ICommand type property for binding with DataGrid.GridLongPressedCommand
public ICommand LongPressedCommandAction
{
    get;
    set;
}
// Custom command type property for binding with
DataGrid.GridLongPressedCommand
public DerivedLongPressedCommand LongPressedCommandAction1
{
    get;
    set;
}
public void add()

```

```

{
    // your logics here
}
// below codes for writing custom command derived from ICommand.
public class DerivedLongPressedCommand : ICommand
{
    public event EventHandler CanExecuteChanged;
    public DerivedLongPressedCommand( )
    {
    }
    public bool CanExecute(object parameter)
    {
        return true;
    }
    public void Execute(object parameter)
    {
        // your logics here.
    }
}

```

### XML

```

<sfgrid:SfDataGrid x:Name="dataGrid"
    ItemsSource="{Binding OrdersInfo}"
    GridLongPressedCommand="{Binding LongPressedCommandAction}">

```

You can download the sample demo [here](#).

### Sorting

The data grid sorts the data by setting the `SfDataGrid.AllowSorting` property to `true`. It allows sorting the data against one or more columns. When sorting is applied, the control automatically rearranges the data to match with the current sort criteria. When `SfDataGrid.AllowSorting` is `true`, you can sort the data simply by tapping the column header. Once sorting is applied, the control shows a sort icon in the respective column header indicating the direction of sorting.

**Note:** To update sorting for the newly added row or column, set the `SfDataGrid.View.LiveDataUpdateMode` to `LiveDataUpdateMode.AllowDataShaping`.

#### Programmatic sorting

The data grid also sorts from the code. This requires to manually define the `SortColumnDescription` objects, and add it in the `SfDataGrid.SortColumnDescriptions` collection. The control sorts the data based on the `SortColumnDescription` objects added to this collection.

The `SortColumnDescription` object holds the following two properties:

- **ColumnName:** Name of the sorted column.
- **SortDirection:** An object of type `ListSortDirection` defines the sorting direction.

The following code example illustrates this:

### XML

```

<syncfusion:SfDataGrid x:Name="dataGrid"

```

```
ItemsSource="{Binding OrdersInfo}">
<syncfusion:SfDataGrid.SortColumnDescriptions>
<syncfusion:SortColumnDescription ColumnName="OrderID"
SortDirection="Descending" />
</syncfusion:SfDataGrid.SortColumnDescriptions>
</syncfusion:SfDataGrid>
```

**C#**

```
dataGrid.AllowSorting = true;
dataGrid.SortColumnDescriptions.Add (new SortColumnDescription () {
ColumnName = "OrderID",
SortDirection = ListSortDirection.Descending
});
```

The following screenshot shows the sorting functionality in the data grid:

**Tri-State sorting**

In addition to sort the data in ascending/descending order, the SfDataGrid unsort the data in the original order by clicking the header again after sorting to descending order by setting the [SfDataGrid.AllowTriStateSorting](#) property to true. When this property is set, sorting in each column iterates through three sort states: ascending, descending, and unsort.

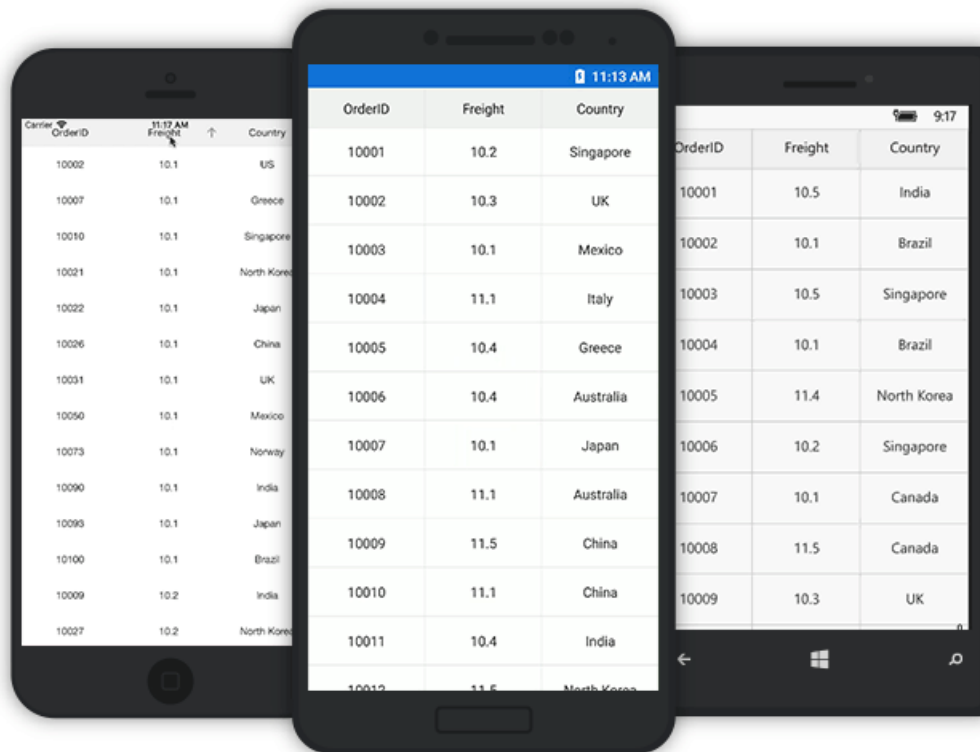

To enable tri-State sorting in the SfDataGrid, follow the code example:

**XML**

```
<syncfusion:SfDataGrid AllowTriStateSorting="True" />
```

**C#**

```
dataGrid.AllowTriStateSorting = true;
```

**Multi-column sorting**

The data grid sorts the data against more than one columns by setting the [SfDataGrid.AllowMultiSorting](#) property to `true`. The number of columns by which the data can be sorted is unlimited. To apply sorting for multiple columns, tap the desired column headers after setting the [SfDataGrid.AllowMultiSorting](#) property.

To enable multi-sorting, follow the code example:

**XML**

```
<syncfusion:SfDataGrid AllowMultiSorting="True" />
```

**C#**

```
dataGrid.AllowMultiSorting = true;
```

### Sort column in double click

By default, column gets sorted when column header clicked. This behavior can be changed to sort the column in double click action by setting [SfDataGrid.SortTapAction](#) property to `DoubleTap`.

To set `SortTapAction` as `DoubleTap`, follow the code example:

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    SortTapAction="DoubleTap"
    ItemsSource="{Binding OrdersInfo}">
</syncfusion:SfDataGrid>
```

#### C#

```
dataGrid.SortTapAction=SortTapAction.DoubleTap;
```

### Sorting events

The data grid provides the following events for the sorting functionality:

- [SortColumnsChanging](#): This event is raised while sorting the column at execution time before the column gets sorted. It helps to cancel the sorting action by setting the `Cancel` property of [DataGridSortColumnsChangingEventArgs](#).
- [SortColumnsChanged](#): This event is raised after the column is sorted.

These two events are triggered with `DataGridSortColumnsChangingEventArgs` and `DataGridSortColumnsChangedEventArgs` that contains the following properties:

- `AddedItems`: Gets the collection of `SortColumnDescription` objects that are added to `SortColumnDescriptions` collection for sorting.
- `RemovedItems`: Gets the collection of `SortColumnDescription` objects that are removed from `SortColumnDescriptions` collection.

To hook the `SortColumnsChanging` event, and cancel the sorting of a column, follow the code example:

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AllowSorting="True"
    SortColumnsChanging="DataGrid_SortColumnsChanging"
    ItemsSource="{Binding OrdersInfo}">
</syncfusion:SfDataGrid>
```

#### C#

```
dataGrid.SortColumnsChanging += DataGrid_SortColumnsChanging;
```

#### C#

```
void DataGrid_SortColumnsChanging (object sender, DataGridSortColumnsChangingEventArgs e)
{
    if (e.AddedItems[0].ColumnName == "OrderID")
    {
        e.Cancel = true;
    }
}
```

#### Custom sorting

The data grid sort columns based on custom logic, when the standard sorting techniques do not meet the requirements. For each column, you can apply different sorting criteria by adding `SortComparer` objects to `SfDataGrid.SortComparers` collection.

A `SortComparer` object has the following properties:

- `PropertyName`: [MappingName](#) of the column that applies custom sorting.
- `Comparer`: Gets or sets the custom comparer that implements the `IComparer` and `ISortDirection` interfaces.

To perform custom sorting for the `FirstName` column based on the string length of the names, follow the code example:

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
```

```

xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:data="clr-namespace:Syncfusion.Data;assembly=Syncfusion.Data.Portable"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
"
xmlns:local ="clr-namespace:DataGridSample;assembly=DataGridSample"
x:Class="DataGridSample.Sample">
<ContentPage.Resources>
<ResourceDictionary>
<local:CustomComparer x:Key="Comparer" />
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<syncfusion:SfDataGrid x:Name="dataGrid"
AllowSorting="True"
ItemsSource="{Binding OrdersInfo}">
<syncfusion:SfDataGrid.SortComparers>
<data:SortComparer Comparer="{StaticResource Comparer}"
PropertyName="FirstName" />
</syncfusion:SfDataGrid.SortComparers>
<syncfusion:SfDataGrid.SortColumnDescriptions>
<syncfusion:SortColumnDescription ColumnName="FirstName"
SortDirection="Descending" />
</syncfusion:SfDataGrid.SortColumnDescriptions>
</syncfusion:SfDataGrid>
</ContentPage>

```

**C#**

```

dataGrid.SortComparers.Add (new SortComparer () {
PropertyName = "FirstName",
Comparer = new CustomComparer()
});
dataGrid.SortColumnDescriptions.Add (new SortColumnDescription () {
ColumnName = "FirstName",
SortDirection = ListSortDirection.Descending
});

```

To write custom comparer, follow the code example:

**C#**

```

public class CustomComparer : IComparer<Object>, ISortDirection
{
public int Compare(object x, object y)
{
int nameX;
int nameY;
//For OrderInfo type data
if (x.GetType () == typeof(OrderInfo)) {
//Calculating the length of FirstName in OrderInfo objects
nameX = ((OrderInfo)x).FirstName.Length;
nameY = ((OrderInfo)y).FirstName.Length;
}
}

```

```

//For Group type data
else if (x.GetType () == typeof(Group)) {
    //Calculating the group key length
    nameX = ((Group)x).Key.ToString ().Length;
    nameY = ((Group)y).Key.ToString ().Length;
} else {
    nameX = x.ToString ().Length;
    nameY = y.ToString ().Length;
}
// Objects are compared and return the SortDirection
if (nameX.CompareTo (nameY) > 0)
return SortDirection == ListSortDirection.Ascending ? 1 : -1;
else if (nameX.CompareTo (nameY) == -1)
return SortDirection == ListSortDirection.Ascending ? -1 : 1;
else
return 0;
}
//Gets or sets the SortDirection value
public ListSortDirection SortDirection { get; set; }
}

```

### Animating sorting icon

The data grid loads two different icons for denoting the **Ascending** and **Descending** sort direction states. However, rotate the [DataGridStyle.GetHeaderSortIndicatorUp](#) icon animatedly for denoting the descending state by overriding the [DataGridStyle.GetHeaderSortIndicatorDown](#) method, and returning null.

To animate the sorting icon, follow the code example:

### XML

```

<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
AllowSorting ="true"
GridStyle="{local:CustomStyle}">
</sfgrid:SfDataGrid>

```

### C#

```

dataGrid.AllowSorting = true;
dataGrid.GridStyle = new CustomStyle();

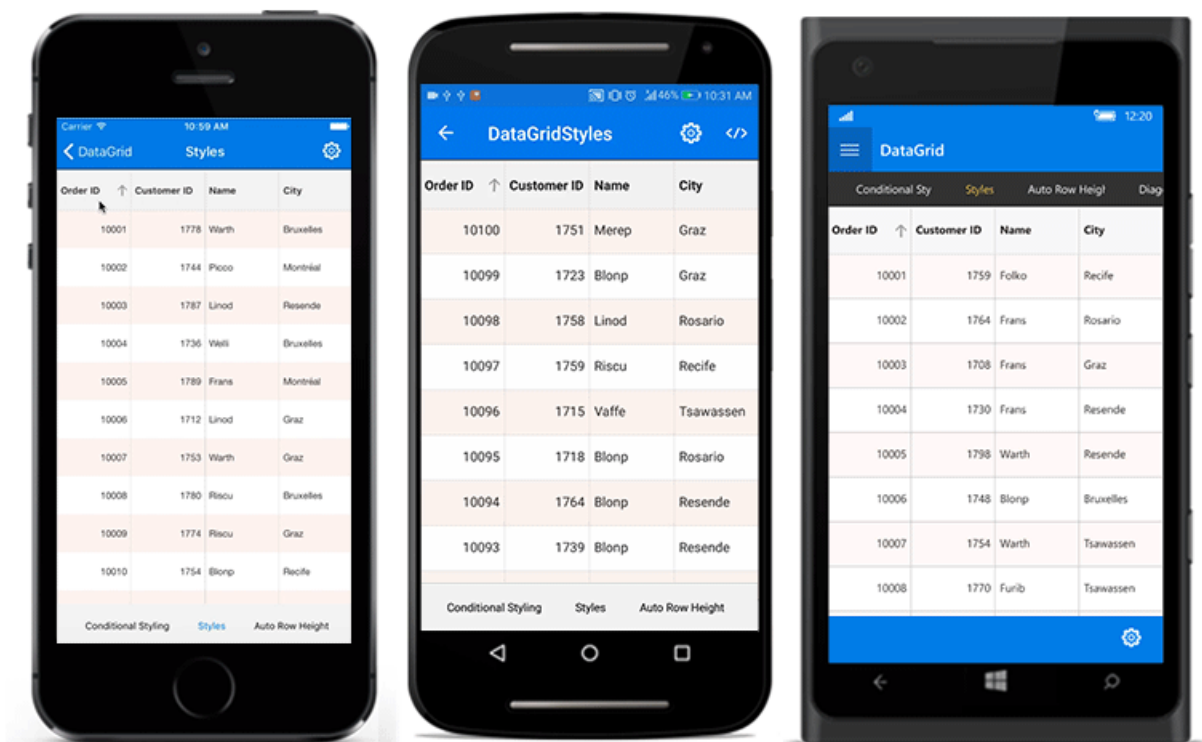

```

### C#

```

//Custom style class
public class CustomStyle :DataGridStyle
{
    public CustomStyle()
    {
    }
    public override ImageSource GetHeaderSortIndicatorDown()
    {
        return null;
    }
}

```

## How to disable sorting

### for an individual column

The data grid disables sorting for an individual column using the [GridColumn.AllowSorting](#) property. The default value of this property is true. So all the columns in the [SfDataGrid.Columns](#) collection can be sorted when [SfDataGrid.AllowSorting](#) is set to true.

To disable sorting for an individual column, follow the code example:

### for auto generated column

#### C#

```
public MainPage()
{
    InitializeComponent();
    viewModel = new ViewModel();
    dataGrid = new SfDataGrid();
    dataGrid.ItemsSource = viewModel.OrdersInfo;
    dataGrid.AllowSorting = true;
    dataGrid.AutoGeneratingColumn += DataGrid_AutoGeneratingColumn;
    this.Content = dataGrid;
}

private void DataGrid_AutoGeneratingColumn(object sender,
AutoGeneratingColumnEventArgs e)
{
    // Sorting will not be done for the Freight column
    if (e.Column.MappingName == "Freight")
        e.Column.AllowSorting = false;
}
```

for manually defined column

### C#

```
public MainPage()
{
    InitializeComponent();
    viewModel = new ViewModel();
    dataGrid = new SfDataGrid();
    dataGrid.ItemsSource = viewModel.OrdersInfo;
    dataGrid.AutoGenerateColumns = false;
    dataGrid.AllowSorting = true;
    dataGrid.Columns.Add(new GridTextColumn() { MappingName = "OrderID" });
    // Sorting will not be done for the Freight column
    dataGrid.Columns.Add(new GridTextColumn() { MappingName = "Freight",
    AllowSorting = false });
    dataGrid.Columns.Add(new GridTextColumn() { MappingName = "Country" });
    this.Content = dataGrid;
}
```

## Grouping

A group represents a collection of records that belongs to a particular category. When grouping, the data is organized into hierarchical structure based on matching field values. The records having identical values in the grouped column are combined to form a group. Each group is identified by its [CaptionSummaryRow](#) to get the underlying records in view.

**Note:** To update grouping for the newly added row or column, set the `SfDataGrid.View.LiveDataUpdateMode` to `LiveDataUpdateMode.AllowDataShaping`.

**Note:** When `BeginInit` method is called, it suspends all the updates until `EndInit` method is called.

### Programmatic grouping

The `SfDataGrid` also allows to perform grouping from the code by defining the [GroupColumnDescription](#) object and adding it in the `SfDataGrid.GroupColumnDescriptions` collection. It groups the data based on the `GroupColumnDescription` object added to this collection.

`GroupColumnDescription` object holds following two properties:

- `ColumnName`: Name of the grouped column.
- `Converter`: Get the `IValueConverter` as input that helps to apply the custom grouping.

To apply column grouping, follow the code example:

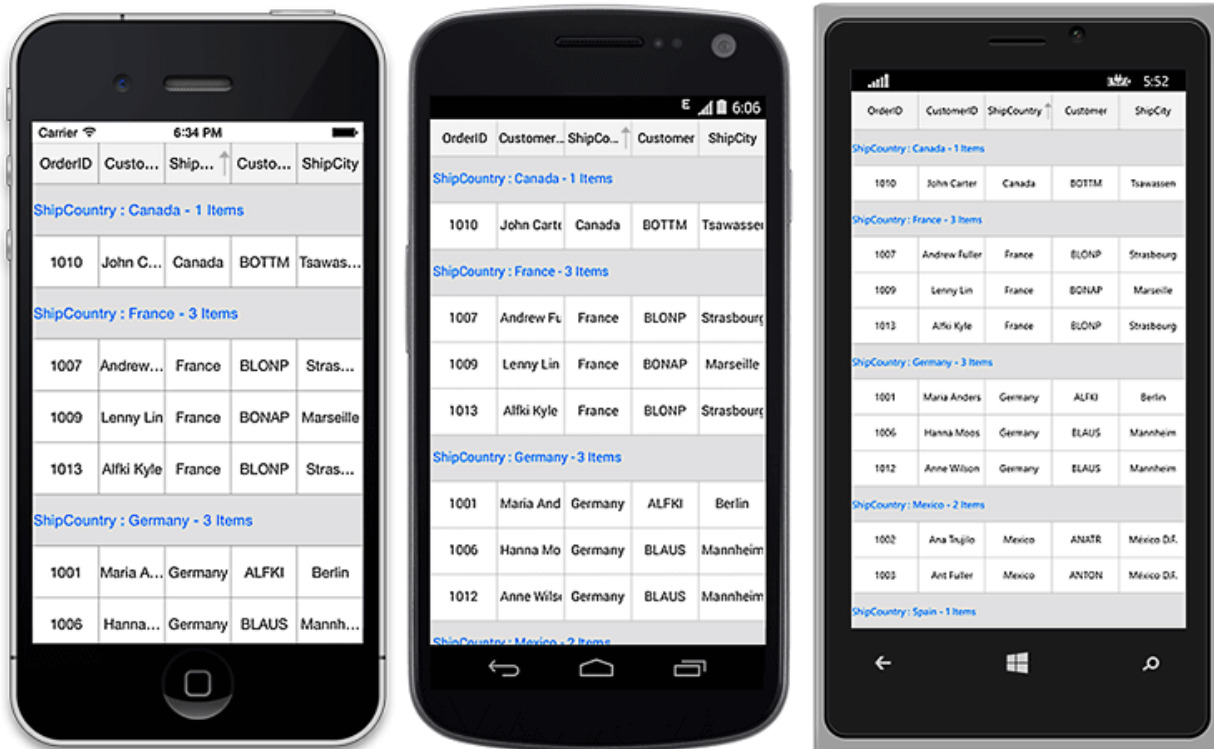

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    ItemsSource="{Binding OrdersInfo}">
    <syncfusion:SfDataGrid.GroupColumnDescriptions>
    <syncfusion:GroupColumnDescription ColumnName="CustomerID" />
    </syncfusion:SfDataGrid.GroupColumnDescriptions>
</syncfusion:SfDataGrid>
```

### C#

```
dataGrid.GroupColumnDescriptions.Add (new GroupColumnDescription () {
    ColumnName = "CustomerID",
});
```

The following screenshot shows the output rendered when grouping is applied:

### MultiGrouping

The SfDataGrid also allows to group the data against one or more columns using the [SfDataGrid.GroupingMode](#) property. When `GroupingMode` is set as `GroupingMode.Multiple`, the data is organized into hierarchical tree structure based on identical values of that column. MultiGrouping feature works similarly as MultiSorting feature. Initially the data is grouped according to the first column added in the `GroupColumnDescriptions` collection. When more columns are added to the `GroupColumnDescriptions`, the newly added column will be grouped in consideration to the previous group(s). This results in a tree like hierarchy. Refer to the following code snippet to enable MultiGrouping:

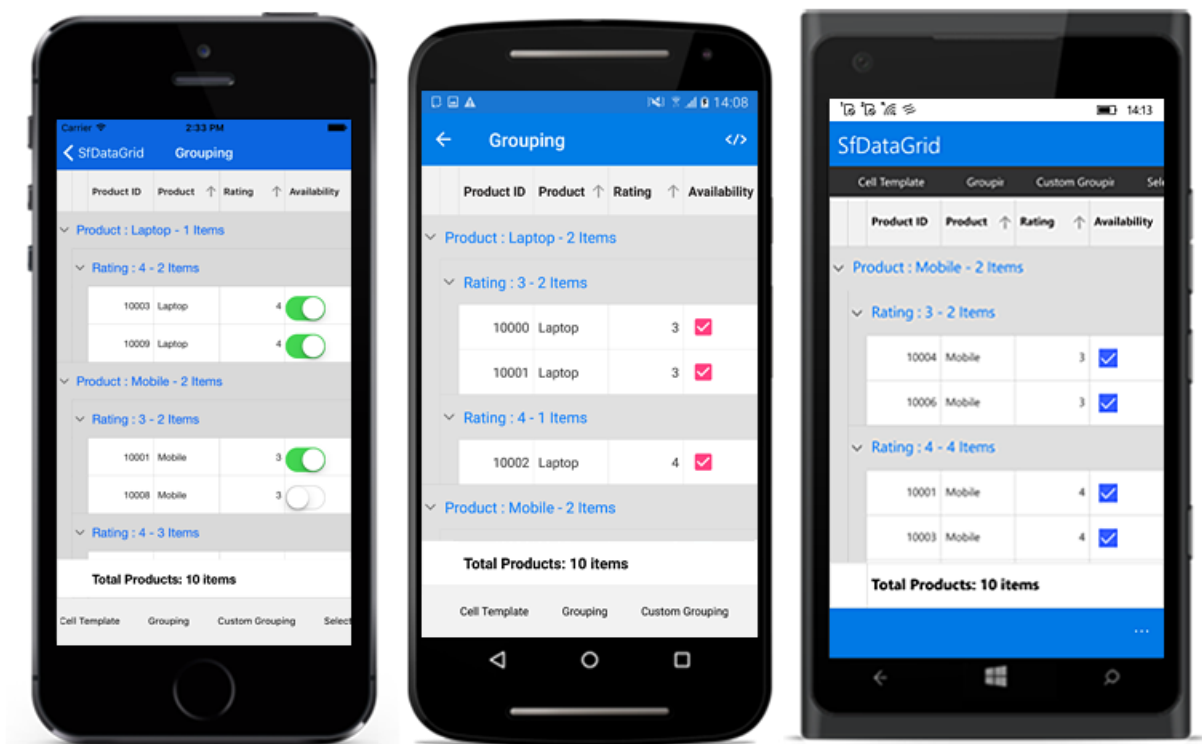

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    ItemsSource="{Binding Orders}"
    GroupingMode = "Multiple"/>
```

#### C#

```
this.dataGrid.GroupingMode = GroupingMode.Multiple;
```

The following screenshot shows the output rendered when above code is executed:

### Indent column customizations

Indent columns are the columns present to the left of the `CaptionSummaryRows` when `GroupingMode` is set as multiple. The number of indent cells in each `CaptionSummaryRow` will be determined by the level of that `Group`. For example, the first group will have only one indent cell and the next immediate group will have an extra indent cell. It keeps on adding by one for each lower level groups to maintain the tree structure. Each data row will have indent cells count equal to the level of the last sub group in view. The following customizations can be done for indent cells:

#### Customize indent column width

By default, the width of the indent column is 20. To customize the width of indent column, use the `IndentColumnWidth` property as follows:

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    ItemsSource="{Binding Orders}"
    IndentColumnWidth="60"/>
```

#### C#

```
this.dataGrid.IndentColumnWidth = 60;
```

#### Customize indent column background color

Set background colors to indent cells based on the row where indent cells present. To set the desired background color, use the `GetIndentBackgroundColor()` override in the custom `DataGridStyle` class.

Refer to this [link](#) to know how to apply custom style to the SfDataGrid. Refer to the following code snippet to apply background color to indent cells based on the row type:

**C#**

```
this.dataGrid.GridStyle = new CustomStyle();  
public class CustomStyle : DataGridStyle  
{  
    public override Color GetIndentBackgroundColor(RowType rowType)  
    {  
        if (rowType == RowType.DefaultRow)  
            return Color.DarkOrange;  
        if (rowType == RowType.CaptionCoveredRow)  
            return Color.Navy;  
        else return Color.FromRgb(224, 224, 224);  
    }  
}
```

IsClosed	OrderID ↑	ShippingDate	EmployeeID
OrderID : 1 - 1 Items			
EmployeeID : 15 - 1 Items			
<input type="checkbox"/>	1	11/20/2017 6:56:40 PM	15
OrderID : 2 - 1 Items			
EmployeeID : 4 - 1 Items			
<input checked="" type="checkbox"/>	2	11/20/2017 6:56:40 PM	4
OrderID : 3 - 1 Items			
EmployeeID : 1 - 1 Items			
<input type="checkbox"/>	3	11/20/2017 6:56:40 PM	1
OrderID : 4 - 1 Items			
EmployeeID : 18 - 1 Items			
<input checked="" type="checkbox"/>	4	11/20/2017 6:56:40 PM	18

-  **CaptionCoveredRow**
-  **DefaultRow**
-  **Header Row**

### Custom grouping

The SfDataGrid allows to group a column based on custom logic when the standard grouping techniques do not meet the requirements. To achieve this, write a converter that implements `IValueConverter` with custom grouping logic. Assign that converter to the `GroupColumnDescription.Converter` property.

To set custom grouping converter for the group description that is added to group the freight column, follow the code example:

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
```

```

xmlns:syncfusion="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
"
xmlns:local ="clr-namespace:DataGridSample;assembly=DataGridSample"
x:Class="DataGridSample.Sample">
<ContentPage.Resources>
<ResourceDictionary>
<local:GroupConverter x:Key="groupConverter" />
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<syncfusion:SfDataGrid.GroupColumnDescriptions>
<syncfusion:GroupColumnDescription ColumnName="Freight"
Converter="{StaticResource groupConverter}" />
</syncfusion:SfDataGrid.GroupColumnDescriptions>
</syncfusion:SfDataGrid>
</ContentPage>

```

**C#**

```

dataGrid.GroupColumnDescriptions.Add (new GroupColumnDescription () {
ColumnName = "Freight",
Converter = new GroupConverter()
});

```

The following code example illustrates the converter used for applying custom grouping logic.

**C#**

```

public class GroupConverter : IValueConverter
{
    public GroupConverter()
    {
    }
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        var orderInfo = value as OrderInfo;
        if (orderInfo.Freight > 0 && orderInfo.Freight <= 250)
            return "<=250";
        else if (orderInfo.Freight > 250 && orderInfo.Freight <= 500)
            return ">250 & <=500";
        else if (orderInfo.Freight > 500 && orderInfo.Freight <= 750)
            return ">500 & <=750";
        else
            return ">1000";
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        return null;
    }
}

```

```
}
```

### Expand groups while grouping

To expand all groups while grouping, set the [SfDataGrid.AutoExpandGroups](#) to `true`. While grouping any column, all groups will be in expanded state.

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AutoExpandGroups="True"
    AllowGroupExpandCollapse="True"
    ItemsSource="{Binding Orders}"/>
```

#### C#

```
this.dataGrid.AutoExpandGroups = true;
this.dataGrid.AllowGroupExpandCollapse = true;
```

### Expand or collapse the groups

By default, the groups will be in expanded state. However expand or collapse a group in runtime by setting the [SfDataGrid.AllowGroupExpandCollapse](#) to `true`.

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AllowGroupExpandCollapse="True"
    ItemsSource="{Binding Orders}"/>
```

#### C#

```
this.dataGrid.AllowGroupExpandCollapse = true;
```

### Expand or collapse all the groups

Programmatically expand or collapse all the groups at runtime using the [SfDataGrid.ExpandAllGroup](#) and [SfDataGrid.CollapseAllGroup](#) methods.

#### C#

```
this.dataGrid.ExpandAllGroup();
this.dataGrid.CollapseAllGroup();
```

### Expand or collapse a specific group

Expand or collapse specific group by using the [SfDataGrid.ExpandGroup](#) and [SfDataGrid.CollapseGroup](#) methods.

#### C#

```
var group = (dataGrid.View.Groups[0] as Group);
this.dataGrid.ExpandGroup(group);
this.dataGrid.CollapseGroup(group);
```

ID	Name	Remarks	Date
Name : Arun - 41 Items			
Name : Bala - 32 Items			
7	Bala	9	13/06/2016 C
8	Bala	10	13/06/2016 C
10	Bala	12	13/06/2016 C
22	Bala	24	13/06/2016 C
23	Bala	25	13/06/2016 C
24	Bala	26	13/06/2016 C
31	Bala	33	13/06/2016 C
37	Bala	39	13/06/2016 C
38	Bala	41	13/06/2016 C

### Display based grouping using GroupMode property

By default, column grouping occurs based on the value in the underlying collection thereby creating a new group for each new value of that column. However, a column can also be grouped based on the Display value by setting the [GridColumn.GroupMode](#) property as **Display**. In the following code example, set the [GridColumn.Format](#) property as "#" which displays only the rounded off value in the [GridCell](#):

#### XML

```
<syncfusion:GridColumn HeaderText="Shipment Weight"
MappingName="ShipmentWeight"
GroupMode="Display"
Format="#" />
```

#### C#

```
GridNumericColumn cargoWeight = new GridTextColumn();
cargoWeight.MappingName = "ShipmentWeight";
cargoWeight.GroupMode = Syncfusion.Data.DataReflectionMode.Display;
cargoWeight.Format = "#";
```

Following screenshot shows the comparison between two Group modes. GroupMode.Value on the left and GroupMode.Display on the right:

GroupMode.Value

GroupMode.Display

### Clearing or removing a group

To clear applied grouping, remove the items from the `SfDataGrid.GroupColumnDescriptions` collection or clear the collection.

Refer to the following code snippets to remove grouping:

#### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GridInForms"
x:Class="GridInForms.MainPage"
xmlns:sfgrid="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
" >
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<StackLayout VerticalOptions="FillAndExpand">
<Button Text="Remove Grouping"
TextColor="Black"
BackgroundColor="White"
Clicked="ClearGroupingButton_Click"/>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
>
<syncfusion:SfDataGrid.GroupColumnDescriptions>
<syncfusion:GroupColumnDescription ColumnName="Freight" />
</syncfusion:SfDataGrid.GroupColumnDescriptions>
<syncfusion:SfDataGrid.GroupColumnDescriptions>
<syncfusion:GroupColumnDescription ColumnName="CustomerID" />
</syncfusion:SfDataGrid.GroupColumnDescriptions>
</sfgrid:SfDataGrid>
</StackLayout>
</ContentPage>

```

**C#**

```

public partial class MainPage : ContentPage
{
    StackLayout stackLayout;
    SfDataGrid dataGrid;
    ViewModel viewModel;
    Button clearGroupingButton;
    public MainPage()
    {
        InitializeComponent();
        viewModel = new ViewModel();
        dataGrid = new SfDataGrid();
        clearGroupingButton = new Button();
        stackLayout = new StackLayout();
        dataGrid.ItemsSource = viewModel.OrdersInfo;
        dataGrid.GroupingMode = GroupingMode.Multiple;
        dataGrid.GroupColumnDescriptions.Add(new GroupColumnDescription()
        {
            ColumnName = "Freight",
        });
        dataGrid.GroupColumnDescriptions.Add(new GroupColumnDescription()
        {
            ColumnName = "CustomerID",
        });
        clearGroupingButton.Text = "Remove Grouping";
        clearGroupingButton.TextColor = Color.Black;
        clearGroupingButton.BackgroundColor = Color.White;
    }
}

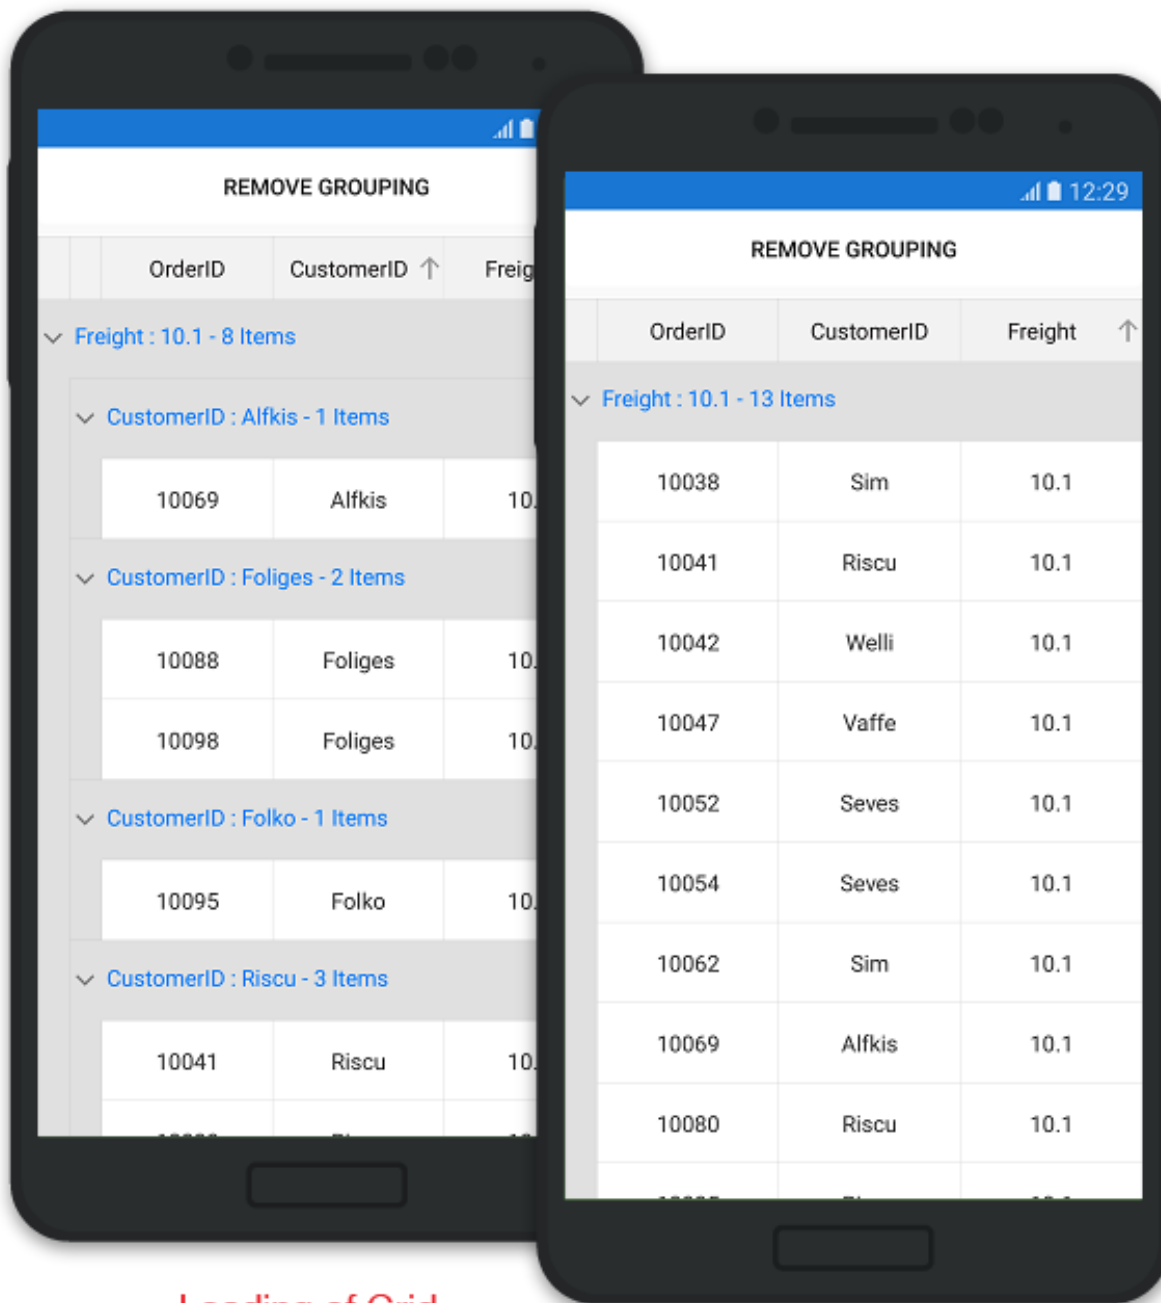

```

```
clearGroupingButton.Clicked += ClearGroupingButton_Click;
stackLayout.Children.Add(clearGroupingButton);
stackLayout.Children.Add(dataGrid);
this.Content = stackLayout;
}
```

### C#

```
private void ClearGroupingButton_Click(object sender, System.EventArgs e)
{
    //Clearing the Group
    dataGrid.GroupColumnDescriptions.Clear();
    //Removing the Group based on group item
    //var groupColumn = dataGrid.GroupColumnDescriptions[0];
    //dataGrid.GroupColumnDescriptions.Remove(groupColumn);
    //Removing the Group based on group index
    //dataGrid.GroupColumnDescriptions.RemoveAt(0);
}
```

Run the application to render the following output:

Loading of Grid

After clicking the remove grouping button

**Note:** Clear or remove grouping on [GridTapped event](#), [GridDoubleTapped event](#), or [GridLongPressed event](#).

#### Events

##### *GroupExpanding event*

The [SfDataGrid.GroupExpanding](#) event occurs when group is being expanded.

The [GroupChangingEventArgs](#) of the **GroupExpanding** event provides the information about the expanding group and it has the following members:

**Syncfusion.Data.Group**: Gets expanded group.

**Cancel**: Decides to cancel group expansion.

Cancel group expansion by setting [GroupChangingEventArgs.Cancel](#) to **true**.

#### C#

```
this.dataGrid.GroupExpanding += dataGrid_GroupExpanding;
void dataGrid_GroupExpanding(object sender,
Syncfusion.SfDataGrid.XForms.GroupChangingEventArgs e)
{
    if (e.Group.Key.Equals(1001))
        e.Cancel = true;
}
```

#### *GroupExpanded event*

The [SfDataGrid.GroupExpanded](#) event occurs after group is expanded.

The [GroupChangedEventArgs](#) of the **GroupExpanded** event provides the information about the expanded group and it has the following member:

**Syncfusion.Data.Group**: Gets the expanded group.

#### *GroupCollapsing event*

The [SfDataGrid.GroupCollapsing](#) event occurs when group is being collapsed.

The [GroupChangingEventArgs](#) of the **GroupCollapsing** event provides the information about the collapsing group and it contains the following member:

**Syncfusion.Data.Group**: Gets collapsed group.

**Cancel**: Decides to cancel the group collapsing.

Cancel the group is being collapsed by using the [GroupChangingEventArgs.Cancel](#) of **GroupCollapsing** event.

#### C#

```
this.dataGrid.GroupCollapsing += dataGrid_GroupCollapsing;
void dataGrid_GroupCollapsing(object sender,
Syncfusion.SfDataGrid.XForms.GroupChangingEventArgs e)
{
    if (e.Group.Key.Equals(1001))
        e.Cancel = true;
}
```

#### *GroupCollapsed event*

The [SfDataGrid.GroupCollapsed](#) event occurs after group collapsed.

The [GroupChangedEventArgs](#) of the **GroupCollapsed** event provides the information about collapsed group and it contains the following member:

**Syncfusion.Data.Group**: Gets the collapsed group.

### Animate group expand/collapse icon

The SfDataGrid loads two different icons for denoting the group expanded and collapsed state. However rotate the expander icon animatedly for denoting the collapsed status by overriding the `DataGridStyle.GetGroupCollapseIcon` method and returning `null`.

To enable group expand/collapse icons animation by writing a custom style, follow the code example:

#### C#

```
//Apply custom style to SfDataGrid from code
dataGrid.GridStyle = new CustomStyle ();
//Custom Style class
public class CustomStyle : DataGridStyle
{
    public CustomStyle ()
    {
    }
    public override ImageSource GetGroupCollapseIcon ()
    {
        return null;
    }
}
```

### How to hide the grouped column in SfDataGrid

To hide/show a particular column gets grouped, set the [SfDataGrid.ShowColumnWhenGrouped](#) property to `false/true`. Any column(s) added in the `GroupColumnDescriptions` collection will be shown or hidden based on the value of the [SfDataGrid.ShowColumnWhenGrouped](#) property. Refer to the following code snippet:

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AutoGenerateColumns="True"
    ItemsSource="{Binding Orders}"
    ShowColumnWhenGrouped="False"/>
```

#### C#

```
this.dataGrid.ShowColumnWhenGrouped = false;
```

### Summary

The data grid supports to display the concise information about the bound data objects using summaries. The control provides the following summary types:

- **Caption Summary** - Used to display the summary information in the caption of the group.
- **Group Summary** - Used to display summary information of data objects in each group.
- **Table Summary** - Used to display the summary information at top and/or bottom in SfDataGrid.

Summary rows are represented by using the [GridSummaryRow](#) that hold summary information of columns in the [SummaryColumns](#) property. The [SummaryColumns](#) contains the collection of [GridSummaryColumn](#) which carries name, format, and summary aggregate type of the column.

Derive additional information from the data like sum, average, maximum, minimum, and count using summaries in the data grid. These summary values can be computed for groups or for the entire control using [GridSummaryRow](#) and [GridSummaryColumn](#) that implements [ISummaryRow](#) and [ISummaryColumn](#) interfaces.

**Note:** The Summary does not refresh with data. To update the summary for the newly added row, or for the modified summary column, set the [SfDataGrid.View.LiveDataUpdateMode](#) to [LiveDataUpdateMode.AllowDataShaping](#) or [LiveDataUpdateMode.AllowSummaryUpdate](#).

### Caption summaries

The data grid provides built-in support for caption summaries. The caption summary value calculated based on the records in a group. The summary information will be displayed in the caption of group.

The following screenshot shows the built-in caption summary of a group:

![DataGrid with caption summary](SfDataGrid\_images/Caption summaries.png)

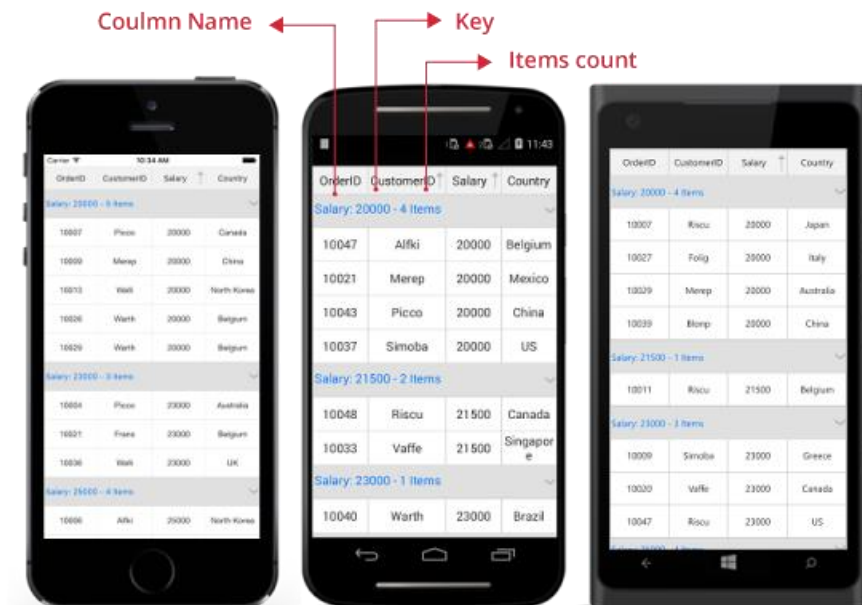

### Formatting built-in caption summary

By default, caption summary rows are displayed with the [SfDataGrid.GroupCaptionTextFormat](#) property.

Default group caption format is `{ColumnName}: {Key} - {ItemsCount} Items`.

- **ColumnName:** Displays the name of the currently grouped column.

- **Key:** Displays the key value of the group.
- **ItemCount:** Displays the number of items in a group.

The group caption text format can be customized by setting the `SfDataGrid.GroupCaptionTextFormat` property. The following code example illustrates how to customize group caption text in the data grid:

#### XML

```
<sfGrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="True"
ColumnSizer="Star"
GroupCaptionTextFormat="{0}{ColumnName}: {Key}">
```

#### C#

```
//Customized group caption text
dataGrid.GroupCaptionTextFormat = "{0}{ColumnName} : {Key}";
```

The following screenshot shows the outcome of the previous code:

### Displaying summary for a row

Display summary information in a row by setting the [GridGroupSummaryRow.ShowSummaryInRow](#) property to `true` and define summary columns. You have to define the [GridGroupSummaryRow.Title](#) based on the [GridSummaryColumn.Name](#) property to format summary columns value in a row.

### XML

```
<sfGrid:SfDataGrid.CaptionSummaryRow>
  <sfGrid:GridGroupSummaryRow Title="Total Salary :{TotalSalary} for
  {ProductCount} members"
  ShowSummaryInRow="True">
    <sfGrid:GridGroupSummaryRow.SummaryColumns>
      <sfGrid:GridSummaryColumn Name="TotalSalary"
      Format="{ }{Sum:c}"
      MappingName="Salary"
      Format="{ }{Count}"
      MappingName="Salary"
      SummaryType="CountAggregate" />
    </sfGrid:GridGroupSummaryRow.SummaryColumns>
  </sfGrid:GridGroupSummaryRow>
</sfGrid:SfDataGrid.CaptionSummaryRow>
```

### C#

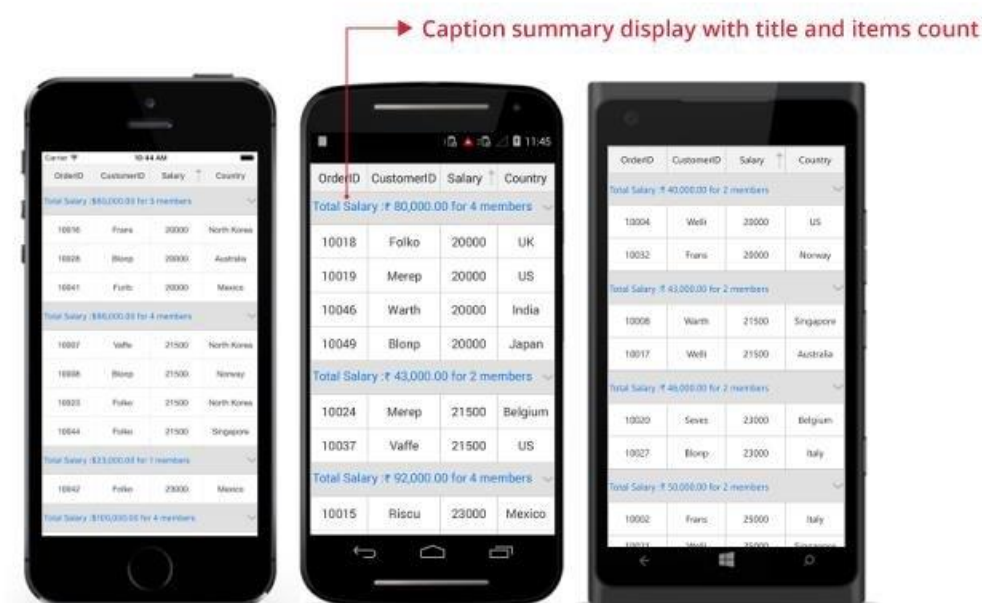

```
GridGroupSummaryRow summaryRow = new GridGroupSummaryRow();
summaryRow.Title = "Total Salary:{TotalSalary} for {ProductCount} members";
summaryRow.ShowSummaryInRow = true;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TotalSalary",
    MappingName = "Salary",
```

```

Format = "{Sum:c}",
SummaryType = SummaryType.DoubleAggregate
});
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "ProductCount",
    MappingName = "Salary",
    Format = "{Count}",
    SummaryType = SummaryType.CountAggregate
});
sfGrid.CaptionSummaryRow= summaryRow;

```

The following screenshot shows the outcome for both values of `ShowSummaryInRow` to `true`:

### Displaying summary for column

Display summary information in the column by setting the `GridSummaryRow.ShowSummaryInRow` to `false` and define summary columns. `SfDataGrid.GridSummaryColumn` is the object of [GridSummaryRow.SummaryColumns](#) collection that contains the following important properties:

- **Name:** Defines name of the `GridSummaryColumn` to denote the `GridSummaryColumn` in `GridSummaryRow` with title.
- **MappingName:** Defines the corresponding column name used for the summary calculation.
- **SummaryType:** Defines the `SummaryType` (enum) property to define the aggregate type for the summary calculation.

The `DataGrid` control provides the following predefined aggregates:

- `CountAggregate`

- Int32Aggregate
- DoubleAggregate

[CustomAggregate](#) defines the `CustomAggregate` class object when the summary type is set as `Custom` that calculates the custom summaries.

The [Format](#) defines the `string` property that formats the summary value and displays it. The `Format` property may contains two parts separated by a colon (:). First part denotes the aggregate function name, and second part denotes display format of the summary value.

Refer to the [Formatting Summary](#) section to know more about how to format summary, and [Aggregate Types](#) section to know about different summary types.

In the following code snippet, summary is defined for `Salary` column:

#### XML

```
<sfGrid:SfDataGrid.CaptionSummaryRow>
<sfGrid:GridSummaryRow Name="CaptionSummary" ShowSummaryInRow="False">
<sfGrid:GridSummaryRow.SummaryColumns>
<sfGrid:GridSummaryColumn Name="CaptionSummary"
Format="{Sum}"
MappingName="Salary"
SummaryType="DoubleAggregate" />
</sfGrid:GridSummaryRow.SummaryColumns>
</sfGrid:GridSummaryRow>
</sfGrid:SfDataGrid.CaptionSummaryRow>
```

#### C#

```
GridSummaryRow summaryRow = new GridSummaryRow();
summaryRow.ShowSummaryInRow = false;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "CaptionSummary",
    MappingName = "Salary",
    Format = "{Sum:c}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.CaptionSummaryRow= summaryRow;
```

**Note:** The CaptionSummaryColumn text will be aligned based on the `GridColumn.TextAlignment`.

#### *Caption summary template*

The data grid hosts any view(s) inside a caption summary for the entire row or for individual columns by loading a template.

#### *Displaying template for a row*

The template for a caption summary row can be set by using [SfDataGrid.CaptionSummaryTemplate](#) to customize it based on requirement.

Refer the below code example in which a label is loaded in the caption summary template of caption summary row.

#### **XML**

```
<ContentPage.Resources>
<ResourceDictionary>
<local:DisplayBindingConverter x:Key="SummaryConverter" />
</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfgrid:SfDataGrid.CaptionSummaryTemplate>
<DataTemplate>
<StackLayout Orientation="Horizontal" BackgroundColor="Gray">
<Image Source="{local:ImageResource UG_Sample.SalaryIcon.Png}"
Margin="0,5,0,5"
HorizontalOptions="Start"
VerticalOptions="Center"/>
<Label Text="{Binding Converter={StaticResource SummaryConverter},
ConverterParameter = {x:Reference dataGrid} }"
TextColor="White"
```

```

FontSize="Large"
VerticalTextAlignment="Center"
HorizontalTextAlignment="Start"
LineBreakMode="NoWrap"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
<Label.Style>
<Style TargetType="Label">
<Setter Property="FontAttributes" Value="Bold, Italic" />
</Style>
</Label.Style>
</Label>
</StackLayout>
</DataTemplate>
</sfgrid:SfDataGrid.CaptionSummaryTemplate>
<sfgrid:SfDataGrid.CaptionSummaryRow>
<sfgrid:GridSummaryRow Name="CaptionSummary" ShowSummaryInRow="True"
Title="Salary: {CaptionSummary}">
<sfgrid:GridSummaryRow.SummaryColumns>
<sfgrid:GridSummaryColumn Name="CaptionSummary"
Format="{ }{Sum}"
MappingName="Salary"
SummaryType="DoubleAggregate" />
</sfgrid:GridSummaryRow.SummaryColumns>
</sfgrid:GridSummaryRow>
</sfgrid:SfDataGrid.CaptionSummaryRow>
</sfgrid:SfDataGrid>

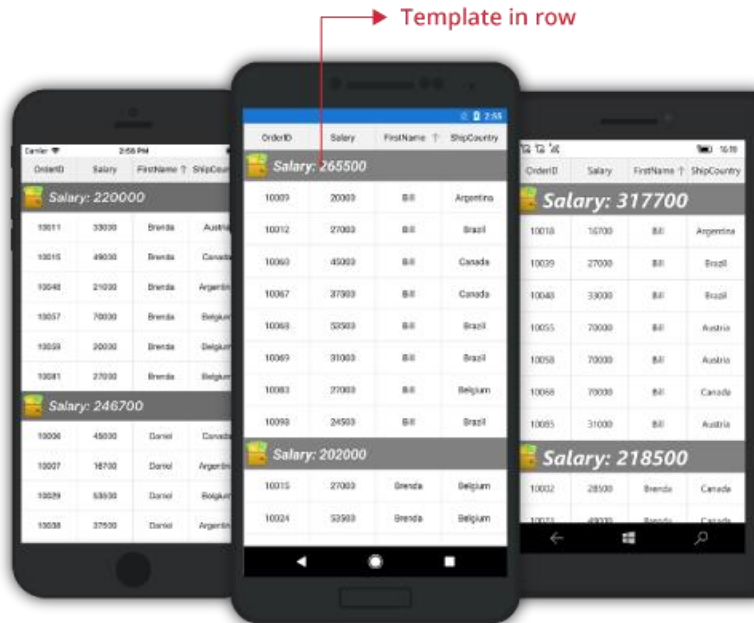

```

## C#

```

// To write a converter, follow the code example:
public class GroupCaptionConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        {
            var data = value != null ? value as Group : null;
            if (data != null)
            {
                SfDataGrid dataGrid = (SfDataGrid)parameter;
                var summaryText = SummaryCreator.GetSummaryDisplayTextForRow((value as
                    Group).SummaryDetails, dataGrid.View);
                return summaryText;
            }
            return null;
        }
        public object ConvertBack(object value, Type targetType, object parameter,
            CultureInfo culture)
        {
            return null;
        }
    }
}

```

**Note:** The `DataTemplateSelector` can also be directly assigned to the `CaptionSummaryTemplate`.

#### Displaying template for a column

The template for a Caption summary column can be set by using `GridSummaryColumn.Template` to customize it based on requirement.

Refer the below code example in which a label is loaded in the template of caption summary column.

#### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<local:GroupCaptionConverter x:Key="SummaryConverter" />
</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid" AllowResizingColumn="True"
AutoGenerateColumns="False" ColumnSizer="Star">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn MappingName="OrderID" />
<sfgrid:GridTextColumn MappingName="Salary" />
<sfgrid:GridTextColumn MappingName="CustomerID" />
</sfgrid:SfDataGrid.Columns>
<sfgrid:SfDataGrid.CaptionSummaryRow>
<sfgrid:GridSummaryRow Name="CaptionSummary" ShowSummaryInRow="False"
Title="Salary: {CaptionSummary}">
<sfgrid:GridSummaryRow.SummaryColumns>
<sfgrid:GridSummaryColumn Name="CaptionSummary" Format="{{Sum}}"
MappingName="Salary"
SummaryType="DoubleAggregate" >
<sfgrid:GridSummaryColumn.Template>
<DataTemplate>
<StackLayout Orientation="Horizontal" BackgroundColor="DarkCyan">
```

```

<Image PropertyChanged="Image_PropertyChanged" Margin="0,5,0,5"
HorizontalOptions="Start"
VerticalOptions="Center"/>
<Label Text="{Binding Converter={StaticResource SummaryConverter},
ConverterParameter = {x:Reference dataGrid} }"
TextColor="White" FontSize="Small"
VerticalTextAlignment="Center"
HorizontalTextAlignment="Start"
LineBreakMode="NoWrap"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
<Label.Style>
<Style TargetType="Label">
<Setter Property="FontAttributes" Value="Bold, Italic" />
</Style>
</Label.Style>
</Label>
</StackLayout>
</DataTemplate>
</sfgrid:GridSummaryColumn.Template>
</sfgrid:GridSummaryColumn>
</sfgrid:GridSummaryRow.SummaryColumns>
</sfgrid:GridSummaryRow>
</sfgrid:SfDataGrid.CaptionSummaryRow>
</sfgrid:SfDataGrid>

```

## C#

```

// To write a converter, follow the code example:
public class GroupCaptionConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        var data = value != null ? value as Group : null;
        if (data != null)
        {
            SfDataGrid dataGrid = (SfDataGrid)parameter;
            var summaryText = SummaryCreator.GetSummaryDisplayTextForRow((value as
                Group).SummaryDetails, dataGrid.View);
            return summaryText;
        }
        return null;
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        return null;
    }
}

```

### Group summary

Group summary values are calculated based on records in the group. The summary information will be displayed at the bottom of each group. You can view the group summary row by expanding the corresponding group header. The data grid adds any number of group summary row.

Add group summary rows in the data grid by adding the [GridGroupSummaryRow](#) to [SfDataGrid.GroupSummaryRows](#) collection.

### Displaying summary in the row

The summary information can be displayed in the row by setting the [GridGroupSummaryRow.ShowSummaryInRow](#) to true and by defining summary columns. You have to define the [GridGroupSummaryRow.Title](#) based on the [GridGroupSummaryRow.Name](#) property to format summary columns value in a row.

Refer to [Formatting Summary](#) section to know more about how to format summary.

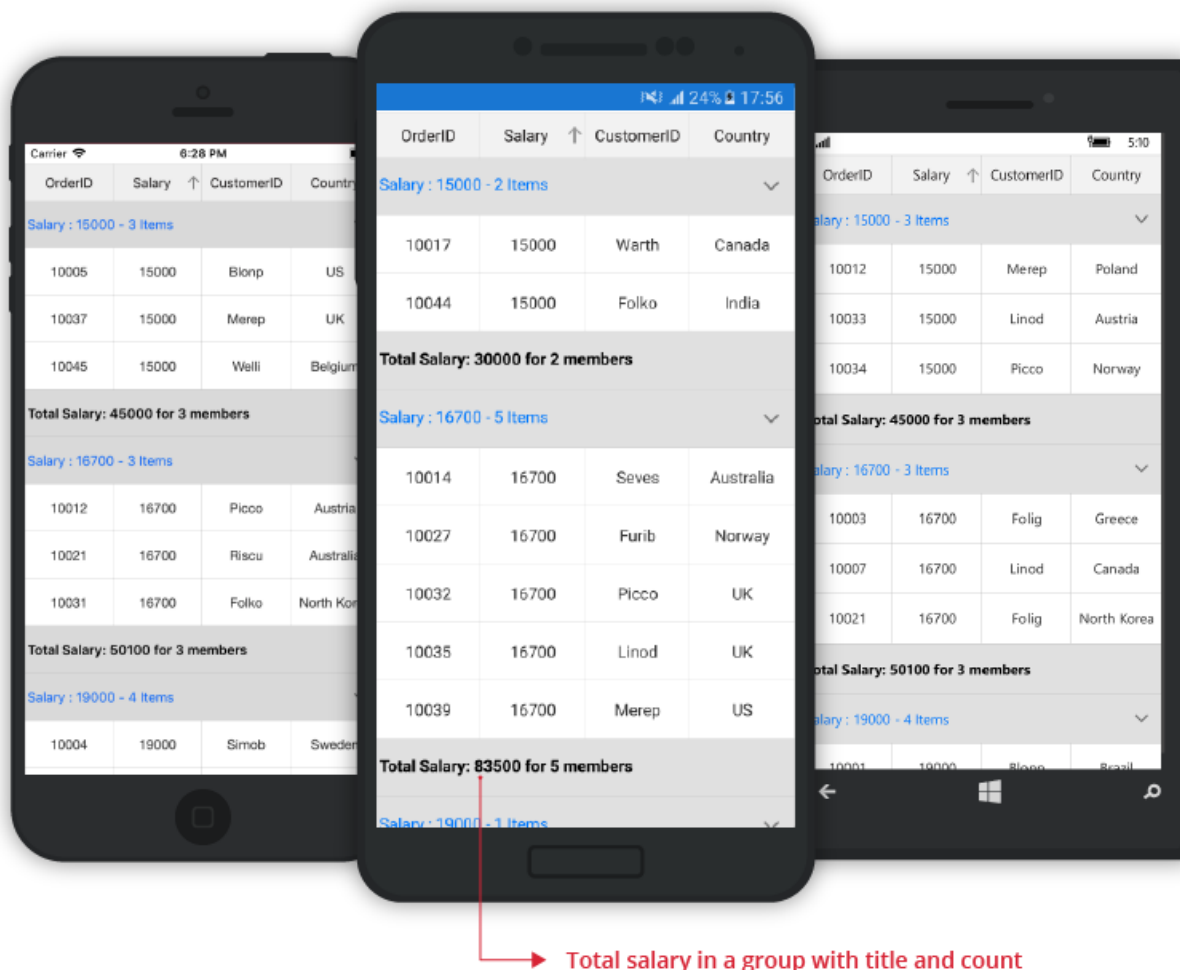

### XML

```
<ContentPage x:Class="SummaryDemo.Summary"
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:SummaryDemo"
xmlns:sfgrid="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
">
<sfgrid:SfDataGrid x:Name="dataGrid" AllowResizingColumn="True"
AllowGroupExpandCollapse="True"
AutoGenerateColumns="True"
ColumnSizer="Star">
<sfgrid:SfDataGrid.GroupColumnDescriptions>
<sfgrid:GroupColumnDescription ColumnName="Salary" />
</sfgrid:SfDataGrid.GroupColumnDescriptions>
```

```
<sfgrid:SfDataGrid.GroupSummaryRows>
<sfgrid:GridGroupSummaryRow ShowSummaryInRow="True" Title="Total Salary:
{Salary} for {customerID} members">
<sfgrid:GridGroupSummaryRow.SummaryColumns>
<sfgrid:GridSummaryColumn Name="Salary"
MappingName="Salary"
Format="{0}{Sum}"
SummaryType="DoubleAggregate">
</sfgrid:GridSummaryColumn>
<sfgrid:GridSummaryColumn Name="customerID"
MappingName="CustomerID"
Format="{0}{Count}"
SummaryType="CountAggregate">
</sfgrid:GridSummaryColumn>
</sfgrid:GridGroupSummaryRow.SummaryColumns>
</sfgrid:GridGroupSummaryRow>
</sfgrid:SfDataGrid.GroupSummaryRows>
</sfgrid:SfDataGrid>
</ContentPage>
```

## C#

```
this.dataGrid.GroupSummaryRows.Add(new GridGroupSummaryRow()
{
    ShowSummaryInRow = true,
    Title = "Total Salary: {Salary} for {customerID} members",
    SummaryColumns = new ObservableCollection<ISummaryColumn>()
    {
        new GridSummaryColumn()
        {
            Name="Salary",
            MappingName="Salary",
            SummaryType=SummaryType.DoubleAggregate,
            Format="{0}{Sum}"
        },
        new GridSummaryColumn()
        {
            Name="customerID",
            MappingName="customerID",
            Format="{0}{Count}",
            SummaryType=SummaryType.CountAggregate
        }
    }
});
```

### Displaying summary in the column

The summary information can be displayed in the column by setting the [GridGroupSummaryRow.ShowSummaryInRow](#) to false and by defining summary columns. To calculate summary based on the column, specify the following properties:

1. [GridSummaryColumn.MappingName](#): Provides MappingName of the column (Property name of data object) that you want to calculate summary.
2. [GridSummaryColumn.SummaryType](#): Provides different built-in summary calculation functions for various types.
3. [GridSummaryColumn.Format](#): Provides format string for the summary based on support function name in the specified SummaryType.

Refer to [Formatting Summary](#) section to know more about how to format summary and [Aggregate Types](#) section to know about different Summary Types.

In the following code snippet, summary is defined for `Salary` and `CustomerID` columns:

### XML

```
<ContentPage x:Class="SummaryDemo.Summary"
```

```

xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:SummaryDemo"
xmlns:sfgrid="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
">
<sfgrid:SfDataGrid x:Name="dataGrid" AllowResizingColumn="True"
AutoGenerateColumns="True"
ColumnSizer="Star">
<sfgrid:SfDataGrid.GroupSummaryRows>
<sfgrid:GridGroupSummaryRow ShowSummaryInRow="False" >
<sfgrid:GridGroupSummaryRow.SummaryColumns>
<sfgrid:GridSummaryColumn Name="Salary"
MappingName="Salary"
Format="{Sum}"
SummaryType="DoubleAggregate">
</sfgrid:GridSummaryColumn>
<sfgrid:GridSummaryColumn Name="customerID"
MappingName="CustomerID"
Format="Total members - {Count}"
SummaryType="CountAggregate">
</sfgrid:GridSummaryColumn>
</sfgrid:GridGroupSummaryRow.SummaryColumns>
</sfgrid:GridGroupSummaryRow>
</sfgrid:SfDataGrid.GroupSummaryRows>
</sfgrid:SfDataGrid>
</ContentPage>

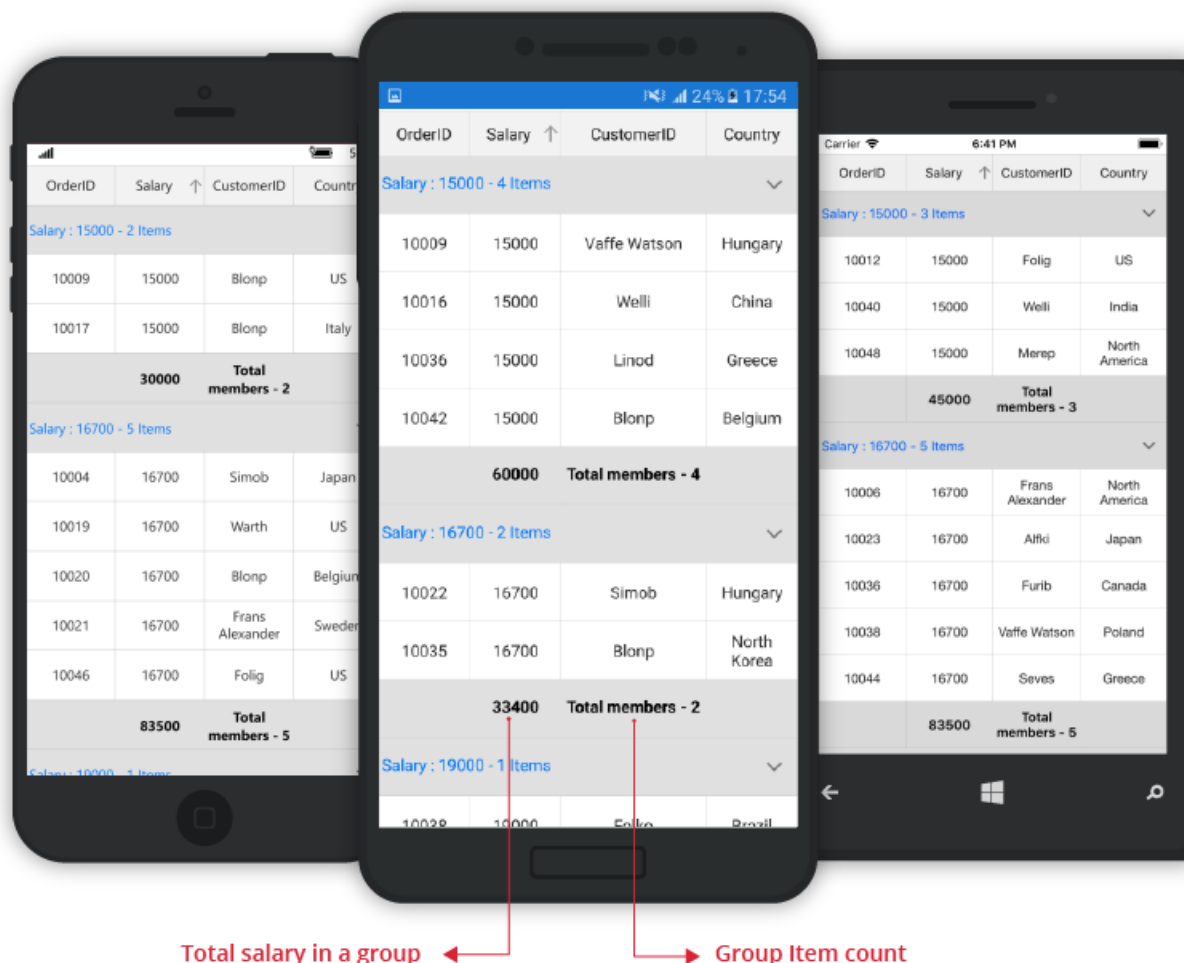

```

## C#

```

this.dataGrid.GroupSummaryRows.Add(new GridGroupSummaryRow()
{
    ShowSummaryInRow = false,
    SummaryColumns = new ObservableCollection<ISummaryColumn>()
    {
        new GridSummaryColumn()
        {
            Name="Salary",
            MappingName="Salary",
            SummaryType=SummaryType.DoubleAggregate,
            Format="{Sum}"
        },
        new GridSummaryColumn()
        {
            Name="customerID",
            MappingName="CustomerID",
            Format="Total members - {Count:d}",
            SummaryType=SummaryType.CountAggregate
        }
    }
});

```

### Group summary template

The data grid hosts any view(s) inside a group summary for the entire row or for individual columns by loading a template.

### Displaying template for a row

The template for a group summary row can be set by using `SfDataGrid.GroupSummaryTemplate` to customize it based on requirement.

Refer the below code example in which a label is loaded in the group summary template of group summary row.

### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<local:GroupSummaryConverter x:Key="SummaryConverter" />
</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<sfgrid:SfDataGrid.GroupSummaryTemplate>
<DataTemplate>
```

```

<StackLayout Orientation="Horizontal" BackgroundColor="Gray">
<Label Text="{Binding Converter={StaticResource SummaryConverter},
ConverterParameter = {x:Reference dataGrid} }"
TextColor="White"
FontSize="Large"
VerticalTextAlignment="Center"
HorizontalTextAlignment="Start"
LineBreakMode="NoWrap"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
<Label.Style>
<Style TargetType="Label">
<Setter Property="FontAttributes" Value="Bold, Italic" />
</Style>
</Label.Style>
</Label>
</StackLayout>
</DataTemplate>
</sfgrid:SfDataGrid.GroupSummaryTemplate>
<sfgrid:SfDataGrid.GroupSummaryRows>
<sfgrid:GridGroupSummaryRow ShowSummaryInRow="True">
<sfgrid:GridGroupSummaryRow.SummaryColumns>
<sfgrid:GridSummaryColumn Name="Salary"
MappingName="Salary"
Format="{ }{Sum}"
SummaryType="DoubleAggregate">
</sfgrid:GridSummaryColumn>
<sfgrid:GridSummaryColumn Name="customerID"
MappingName="CustomerID"
Format="{ }{Count}"
SummaryType="CountAggregate">
</sfgrid:GridSummaryColumn>
</sfgrid:GridGroupSummaryRow.SummaryColumns>
</sfgrid:GridGroupSummaryRow>
</sfgrid:SfDataGrid.GroupSummaryRows>
</sfgrid:SfDataGrid>

```

## C#

```

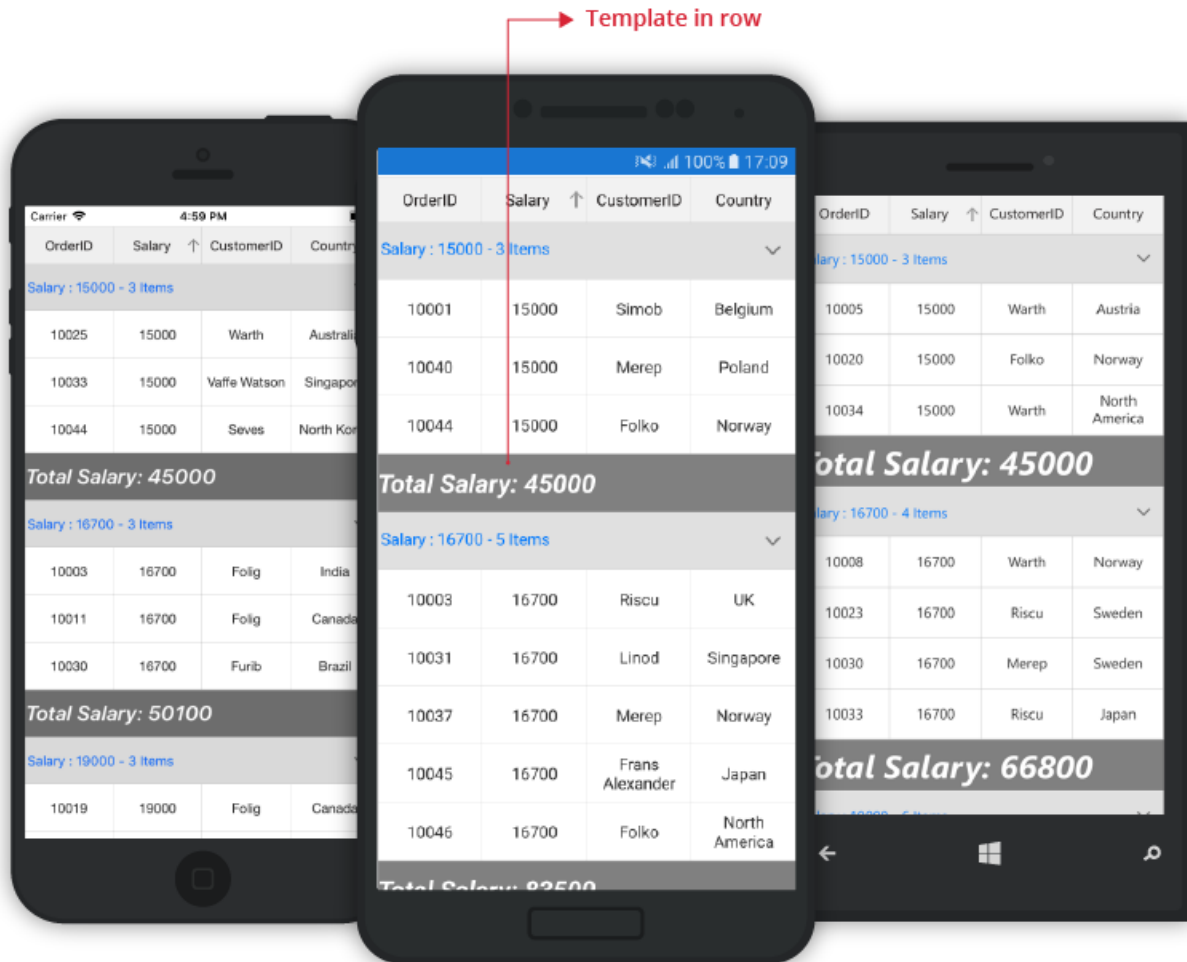

// To write a converter, follow the code example:
public class GroupSummaryConverter : IValueConverter
{
public object Convert(object value, Type targetType, object parameter,
CultureInfo culture)
{
var data = value != null ? value as SummaryRecordEntry : null;
if (data != null)
{
SfDataGrid dataGrid = (SfDataGrid)parameter;
var summaryText =
SummaryCreator.GetSummaryDisplayText(data, "Salary", dataGrid.View);
return "Total Salary:" + " " + summaryText.ToString();
}
return null;
}
}

```

```

public object ConvertBack(object value, Type targetType, object parameter,
CultureInfo culture)
{
    return null;
}
}

```

**Note:** The `DataTemplateSelector` can also be directly assigned to the `SfDataGrid.GroupSummaryTemplate`.

#### Displaying template for a column

The template for a group summary column can be set by using `GridSummaryColumn.Template` to customize it based on requirement.

Refer the below code example in which a label is loaded in the template of group summary column.

#### XML

```

<ContentPage.Resources>
<ResourceDictionary>
<local:GroupSummaryConverter x:Key="SummaryConverter" />

```

```

</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid" AllowResizingColumn="True"

</sfgrid:GridSummaryColumn>
</sfgrid:GridGroupSummaryRow.SummaryColumns>
</sfgrid:GridGroupSummaryRow>
</sfgrid:SfDataGrid.GroupSummaryRows>
</sfgrid:SfDataGrid>

```

## C#

```

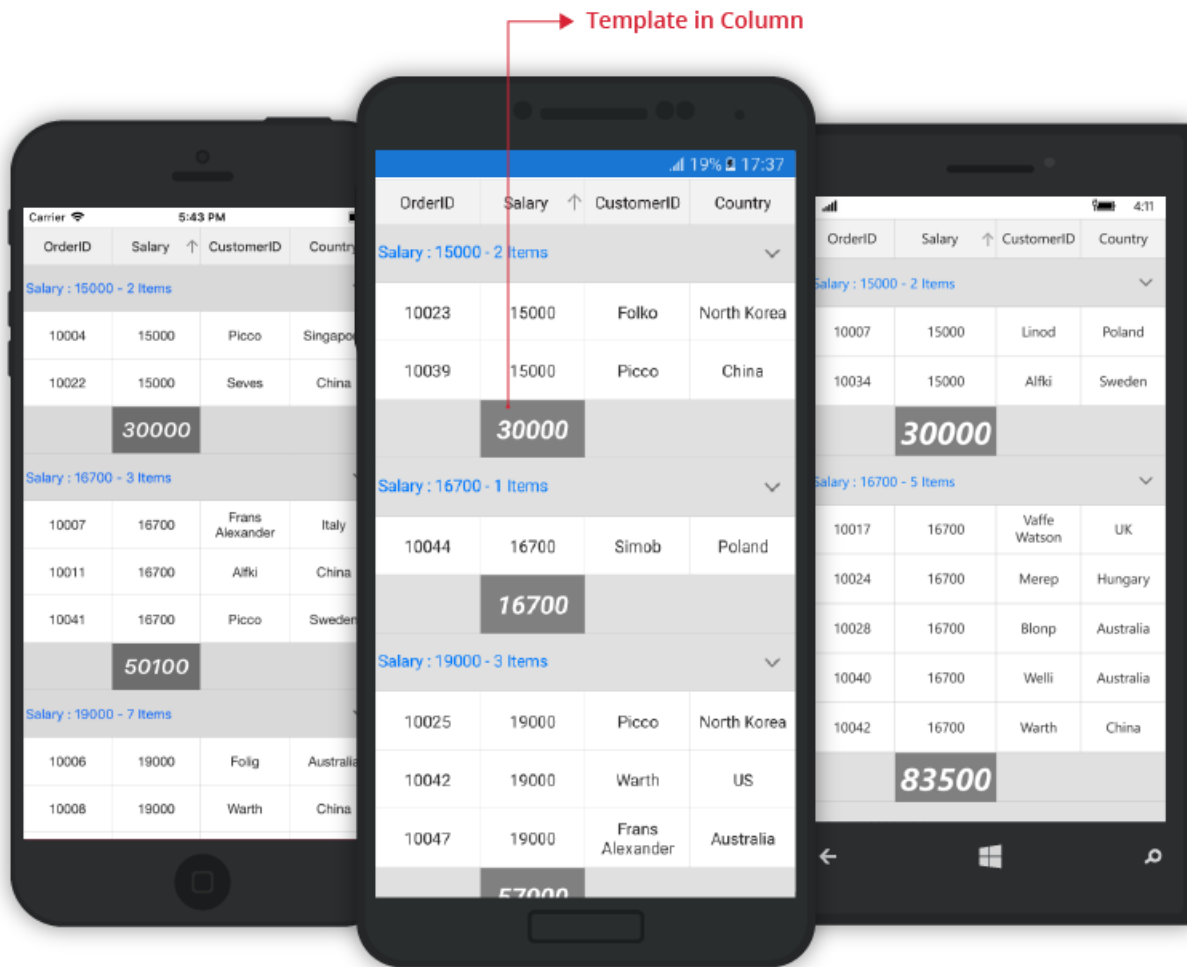

// To write a converter, follow the code example:
public class GroupSummaryConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        var data = value != null ? value as SummaryRecordEntry : null;
        if (data != null)
        {
            SfDataGrid dataGrid = (SfDataGrid)parameter;

```

```

var summaryText =
SummaryCreator.GetSummaryDisplayText(data, "Salary", dataGrid.View);
return summaryText.ToString();
}
return null;
}
public object ConvertBack(object value, Type targetType, object parameter,
CultureInfo culture)
{
return null;
}
}

```

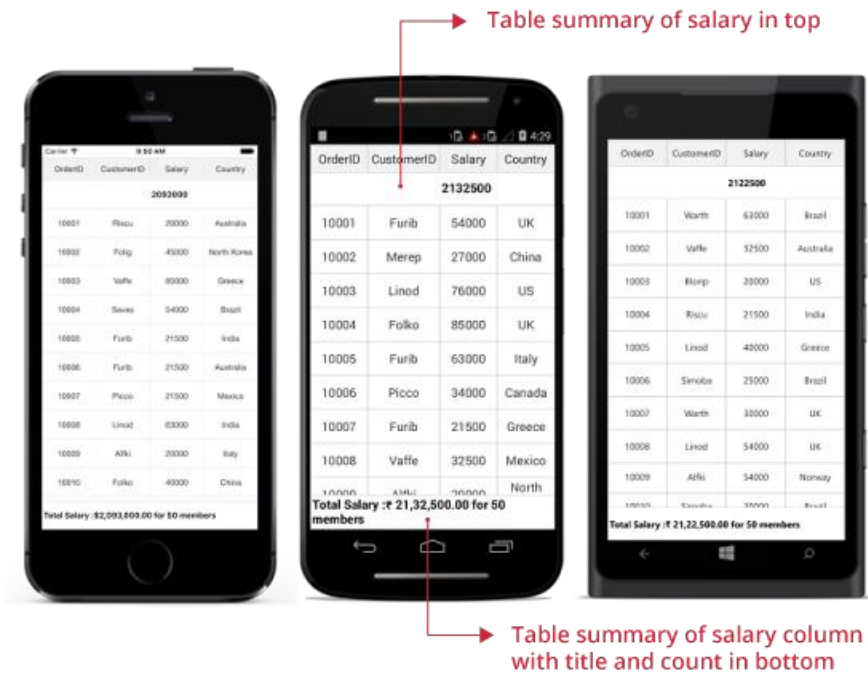

### Table summaries

The data grid provides built-in support for table summaries. The table summary value is calculated based on all records in the control.

You can add table summary row in the data grid by adding the [GridTableSummaryRow](#) to the [SfDataGrid.TableSummaryRows](#) collection.

The following screenshot illustrates table summary rows in the data grid:

### XML

```
<sfGrid:SfDataGrid.TableSummaryRows>
  <sfGrid:GridTableSummaryRow Title="Total Salary :{TotalSalary} for
  {ProductCount} members"
  Position="Top"
  ShowSummaryInRow="True">
    <sfGrid:GridTableSummaryRow.SummaryColumns>
      <sfGrid:GridSummaryColumn Name="TotalSalary"
      Format="{ }{Sum:c}"
      MappingName="Salary"
      SummaryType="DoubleAggregate" />
      <sfGrid:GridSummaryColumn Name="ProductCount"
      Format="{ }{Count}"
      MappingName="Salary"
      SummaryType="CountAggregate" />
    </sfGrid:GridTableSummaryRow.SummaryColumns>
  </sfGrid:GridTableSummaryRow>
  <sfGrid:GridTableSummaryRow Position="Top" ShowSummaryInRow="True">
    <sfGrid:GridTableSummaryRow.SummaryColumns>
      <sfGrid:GridSummaryColumn Name="TotalSalary"
      Format="{ }{Sum}"
      MappingName="Salary"
      SummaryType="DoubleAggregate" />
    </sfGrid:GridTableSummaryRow.SummaryColumns>
  </sfGrid:GridTableSummaryRow>
</sfGrid:SfDataGrid.TableSummaryRows>
```

### C#

```
GridTableSummaryRow summaryRow1 = new GridTableSummaryRow();
summaryRow1.Title = "Total Salary:{TotalSalary} for {ProductCount} members";
```

```

summaryRow1.ShowSummaryInRow = true;
summaryRow1.Position = Position.Top;
summaryRow1.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TotalSalary",
    MappingName = "Salary",
    Format = "{Sum:c}",
    SummaryType = SummaryType.DoubleAggregate
});
summaryRow1.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "ProductCount",
    MappingName = "Salary",
    Format = "{Count}",
    SummaryType = SummaryType.CountAggregate
});
sfGrid.TableSummaryRows.Add(summaryRow1);
GridTableSummaryRow summaryRow2 = new GridTableSummaryRow();
summaryRow2.ShowSummaryInRow = false;
summaryRow2.Position = Position.Top;
summaryRow2.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TotalSalary",
    MappingName = "Salary",
    Format = "{Sum}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.TableSummaryRows.Add(summaryRow2);

```

Table summary of salary column  
with title and count in top

Table summary of  
salary in top

### Displaying summary in a row

Display summary information in a row by setting the [GridTableSummaryRow.ShowSummaryInRow](#) to `true` and define summary columns. You have to define the [GridTableSummaryRow.Title](#) based on the [GridSummaryColumn.Name](#) property to format summary columns values in a row.

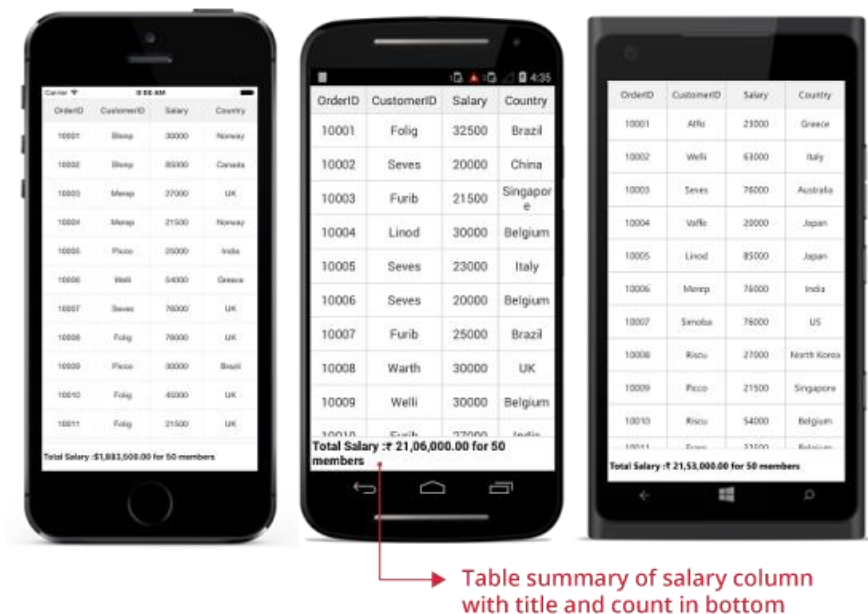

### XML

```
<sfGrid:SfDataGrid.TableSummaryRows>
  <sfGrid:GridTableSummaryRow Title="Total Salary :{TotalSalary} for
    {ProductCount} members"
    ShowSummaryInRow="True">
    <sfGrid:GridTableSummaryRow.SummaryColumns>
      <sfGrid:GridSummaryColumn Name="TotalSalary"
        Format="{Sum:c}"
        MappingName="Salary"
        SummaryType="DoubleAggregate" />
      <sfGrid:GridSummaryColumn Name="ProductCount"
        Format="{Count}"
        MappingName="Salary"
        SummaryType="CountAggregate" />
    </sfGrid:GridTableSummaryRow.SummaryColumns>
  </sfGrid:GridTableSummaryRow>
</sfGrid:SfDataGrid.TableSummaryRows>
```

### C#

```
GridTableSummaryRow summaryRow = new GridTableSummaryRow();
summaryRow.Title = "Total Salary:{TotalSalary} for {ProductCount} members";
summaryRow.ShowSummaryInRow = true;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TotalSalary",
    MappingName = "Salary",
    Format = "{Sum:c}",
    SummaryType = SummaryType.DoubleAggregate
});
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "ProductCount",
    MappingName = "Salary",
    Format = "{Count}",
    SummaryType = SummaryType.CountAggregate
});
sfGrid.TableSummaryRows.Add(summaryRow);
```

The following screenshot shows the table summary row if `ShowSummaryInRow` is `true`:

### Displaying summary in a column

Display summary information in a column by setting `GridTableSummaryRow.ShowSummaryInRow` to false and defining summary columns. `GridSummaryColumn` is the object of [GridTableSummaryRow.SummaryColumns](#) collection that contains the following important properties:

- **Name:** Defines name of the `GridSummaryColumn` to denote the `GridSummaryColumn` in `GridTableSummaryRow` with title.
- **MappingName:** Defines the corresponding column name for the summary calculation.
- **SummaryType:** Defines the `SummaryType` (enum) property to define the aggregate type for the summary calculation.

The data grid control provides the following predefined aggregates:

- `CountAggregate`
- `Int32Aggregate`
- `DoubleAggregate`

[CustomAggregate](#) defines the `CustomAggregate` class object when the summary type is set as `Custom` that calculates custom summaries.

The **Format** defines the string property that formats the summary value and displays it. The `Format` property may contains two parts that are separated by a colon (:). First part denotes the aggregate function name, and second part denotes display format of the summary value.

Refer to the [Formatting Summary](#) section to know more about how to format summary and [Aggregate Types](#) section to know about different summary types.

In the following code snippet, summary is defined for `Salary` column:

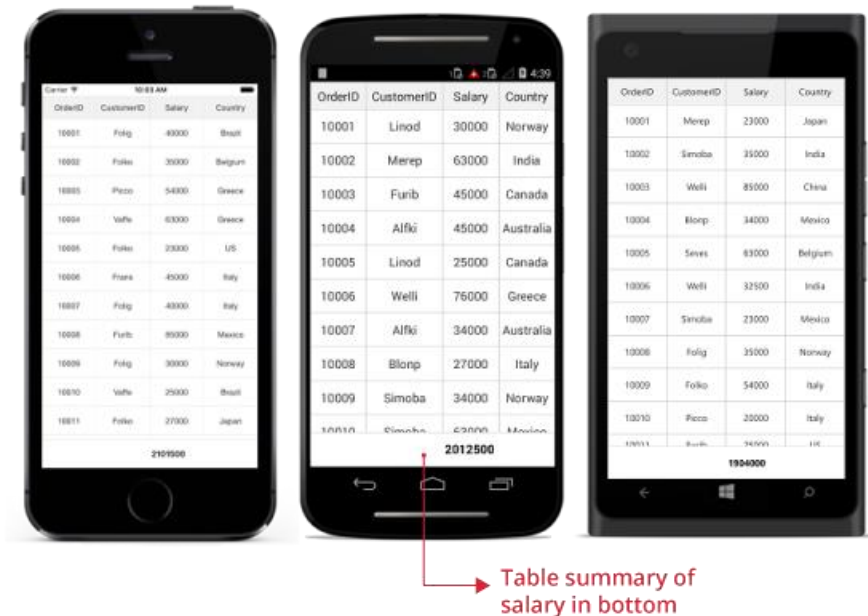

**XML**

```
<sfGrid:SfDataGrid.TableSummaryRows>
<sfGrid:GridTableSummaryRow Name="TableSummary" ShowSummaryInRow="False">
<sfGrid:GridTableSummaryRow.SummaryColumns>
<sfGrid:GridSummaryColumn Name="TableSummary"
Format="{ }{Sum}"
MappingName="Salary"
SummaryType="DoubleAggregate" />
</sfGrid:GridTableSummaryRow.SummaryColumns>
</sfGrid:GridTableSummaryRow>
</sfGrid:SfDataGrid.TableSummaryRows>
```

**C#**

```
GridTableSummaryRow summaryRow = new GridTableSummaryRow();
summaryRow.ShowSummaryInRow = false;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TableSummary",
    MappingName = "Salary",
    Format = "{Sum}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.TableSummaryRows.Add(summaryRow);
```

The following screenshot shows the table summary row if `ShowSummaryInRow` is `false`.

*Positioning TableSummaryRows*

The data grid add table summary rows either at top or bottom positions using the [GridTableSummaryRow.Position](#) property.

**XML**

```

<sfGrid:SfDataGrid.TableSummaryRows>
  <sfGrid:GridTableSummaryRow Position="Top"
    ShowSummaryInRow="False">
    <sfGrid:GridTableSummaryRow.SummaryColumns>
      <sfGrid:GridSummaryColumn Name="TotalSalary"
        Format="{Sum}"
        MappingName="Salary"
        SummaryType="DoubleAggregate" />
    </sfGrid:GridTableSummaryRow.SummaryColumns>
  </sfGrid:GridTableSummaryRow>
  <sfGrid:GridTableSummaryRow Position="Bottom"
    ShowSummaryInRow="True"
    Title="Total Salary :{TotalSalary} for {ProductCount} members">
    <sfGrid:GridTableSummaryRow.SummaryColumns>
      <sfGrid:GridSummaryColumn Name="TotalSalary"
        Format="{Sum:c}"
        MappingName="Salary"
        SummaryType="DoubleAggregate" />
      <sfGrid:GridSummaryColumn Name="ProductCount"
        Format="{Count}"
        MappingName="Salary"
        SummaryType="CountAggregate" />
    </sfGrid:GridTableSummaryRow.SummaryColumns>
  </sfGrid:GridTableSummaryRow>
</sfGrid:SfDataGrid.TableSummaryRows>

```

**C#**

```

GridTableSummaryRow topSummaryRow = new GridTableSummaryRow();
topSummaryRow.Position = Position.Top;
topSummaryRow.ShowSummaryInRow = false;
topSummaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TotalSalary",
    MappingName = "Salary",
    Format = "{Sum}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.TableSummaryRows.Add(topSummaryRow);
GridTableSummaryRow bottomSummaryRow = new GridTableSummaryRow();
bottomSummaryRow.Position = Position.Bottom;
bottomSummaryRow.Title = "Total Salary:{TotalSalary} for {ProductCount}
members";
bottomSummaryRow.ShowSummaryInRow = true;
bottomSummaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TotalSalary",
    MappingName = "Salary",
    Format = "{Sum:c}",
    SummaryType = SummaryType.DoubleAggregate
});
bottomSummaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "ProductCount",

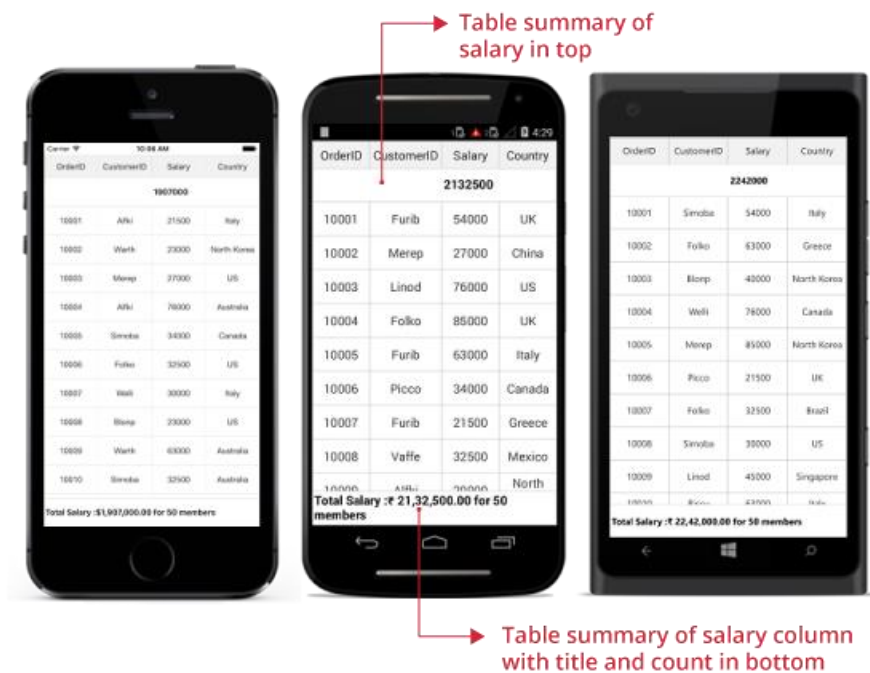

```

```

MappingName = "Salary",
Format = "{Count}",
SummaryType = SummaryType.CountAggregate
});
sfGrid.TableSummaryRows.Add(bottomSummaryRow);

```

The below screenshot illustrates the positioning of table summary rows in SfDataGrid.

### Table summary template

The data grid hosts any view(s) inside a table summary for the entire row or for individual columns by loading a template.

#### Displaying template for a row

The template for a table summary row can be set by using [SfDataGrid.TableSummaryTemplate](#) and it can be customized based on the requirement.

Refer the below code example in which a label is loaded in the table summary template of table summary row.

### XML

```

VerticalOptions="FillAndExpand">
<Label.Style>
<Style TargetType="Label">
<Setter Property="FontAttributes" Value="Italic" />
</Style>
</Label.Style>
</Label>
</StackLayout>
</DataTemplate>
</sfgrid:GridSummaryColumn.Template>
</sfgrid:GridSummaryColumn>
</sfgrid:GridTableSummaryRow.SummaryColumns>
</sfgrid:GridTableSummaryRow>
```

```
</sfgrid:SfDataGrid.TableSummaryRows>  
</sfgrid:SfDataGrid>  
</StackLayout>
```

## C#

```
// To write a converter, follow the code example:  
public class TableSummaryConverter : IValueConverter  
{  
    public object Convert(object value, Type targetType, object parameter,  
        CultureInfo culture)  
    {  
        var data = value != null ? value as SummaryRecordEntry : null;  
        if (data != null)  
        {  
            SfDataGrid dataGrid = (SfDataGrid)parameter;  
            var summaryText = SummaryCreator.GetSummaryDisplayText(data, "OrderID",  
                dataGrid.View);  
            return summaryText.ToString();  
        }  
        return null;  
    }  
    public object ConvertBack(object value, Type targetType, object parameter,  
        CultureInfo culture)  
    {  
        return null;  
    }  
}
```

OrderID	EmployeeID	FirstName
10001.00	1703	Oscar
10002.00	1704	Michael
10003.00	1702	Danielle
10004.00	1700	Torrey
10005.00	1716	Irene
10006.00	1706	Danielle
10007.00	1719	Torrey
10008.00	1712	Bill
10009.00	1715	Kyle
10010.00	1709	Daniel
10011.00	1702	Brenda
10012.00	1716	Torrey
₹ 5,01,275.00		

**Note:** The `DataTemplateSelector` can also be directly assigned to the `SfDataGrid.TableSummaryTemplate`.

### Formatting summary

In the following sections, the formatting is explained using the `CaptionSummary`. However, the formatting can also be applied for `TableSummaries`.

#### Defining summary function

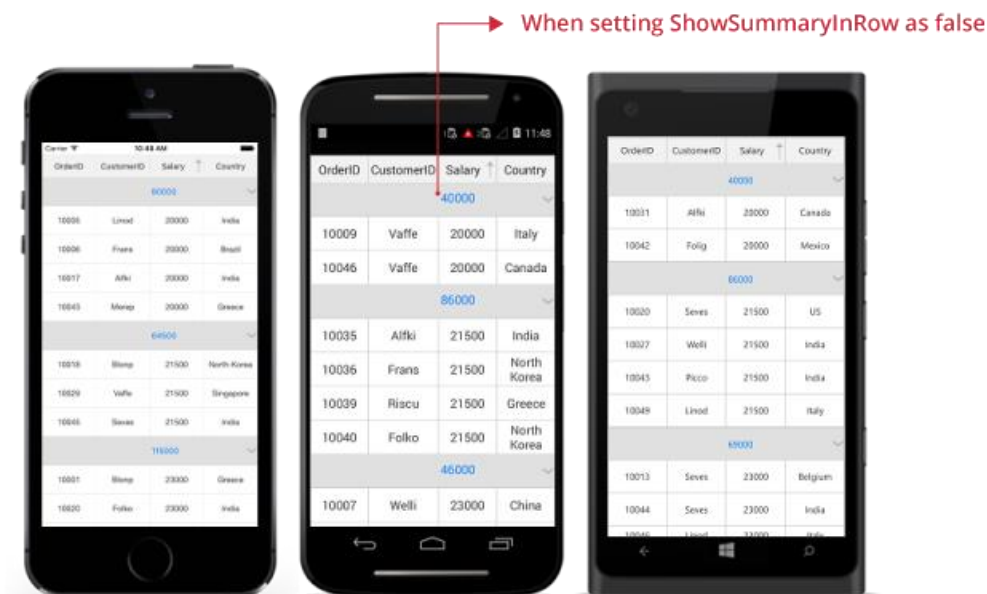

In the following code snippet, the `Format` property is defined to display sum of `Salary` by specifying the function name inside curly braces:

#### XML

```
<sfGrid:SfDataGrid.CaptionSummaryRow>
<sfGrid:GridSummaryRow ShowSummaryInRow="False">
<sfGrid:GridSummaryRow.SummaryColumns>
<sfGrid:GridSummaryColumn Name="CaptionSummary"
Format="{Sum}"
MappingName="Salary"
SummaryType="DoubleAggregate" />
</sfGrid:GridSummaryRow.SummaryColumns>
</sfGrid:GridSummaryRow>
</sfGrid:SfDataGrid.CaptionSummaryRow>
```

#### C#

```
GridSummaryRow summaryRow = new GridSummaryRow();
summaryRow.ShowSummaryInRow = false;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "CaptionSummary",
    MappingName = "Salary",
    Format = "{Sum}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.CaptionSummaryRow= summaryRow;
```

### Formatting summary value

Format the summary value by setting the appropriate format after the aggregate function followed by a colon(:) in the `GridSummaryColumn.Format` property.

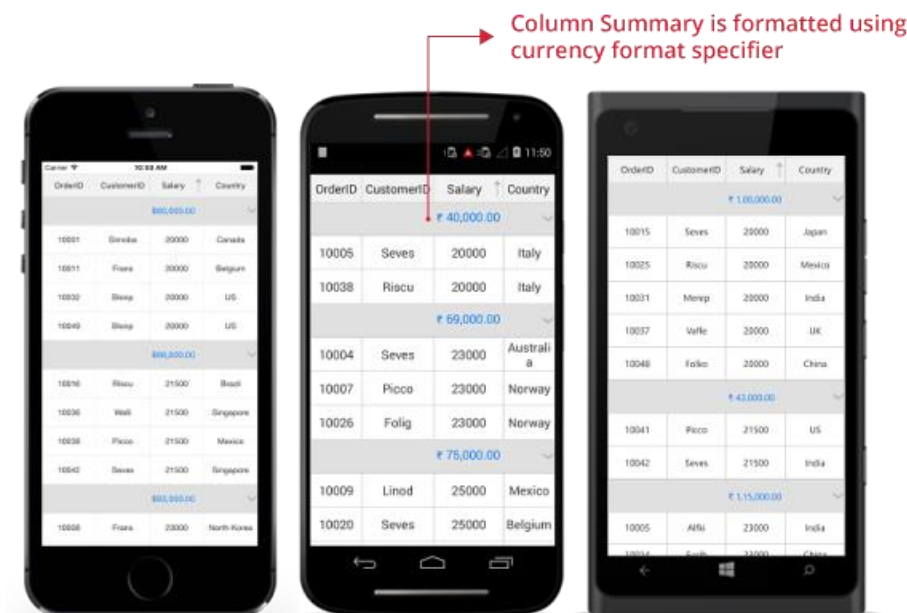

In the following code snippet Salary column summary is formatted using `c` format specifier. Refer to [here](#) to know about how to set different formats.

### XML

```
<sfGrid:SfDataGrid.CaptionSummaryRow>
  <sfGrid:GridSummaryRow ShowSummaryInRow="False">
    <sfGrid:GridSummaryRow.SummaryColumns>
      <sfGrid:GridSummaryColumn Name="CaptionSummary"
        Format="{Sum:c}"
        MappingName="Salary"
        SummaryType="DoubleAggregate" />
    </sfGrid:GridSummaryRow.SummaryColumns>
  </sfGrid:GridSummaryRow>
</sfGrid:SfDataGrid.CaptionSummaryRow>
```

### C#

```
GridSummaryRow summaryRow = new GridSummaryRow();
summaryRow.ShowSummaryInRow = false;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "CaptionSummary",
    MappingName = "Salary",
    Format = "{Sum:c}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.CaptionSummaryRow= summaryRow;
```

### Displaying additional content in summary

Append additional content with summary value using the `GridSummaryColumn.Format` property.

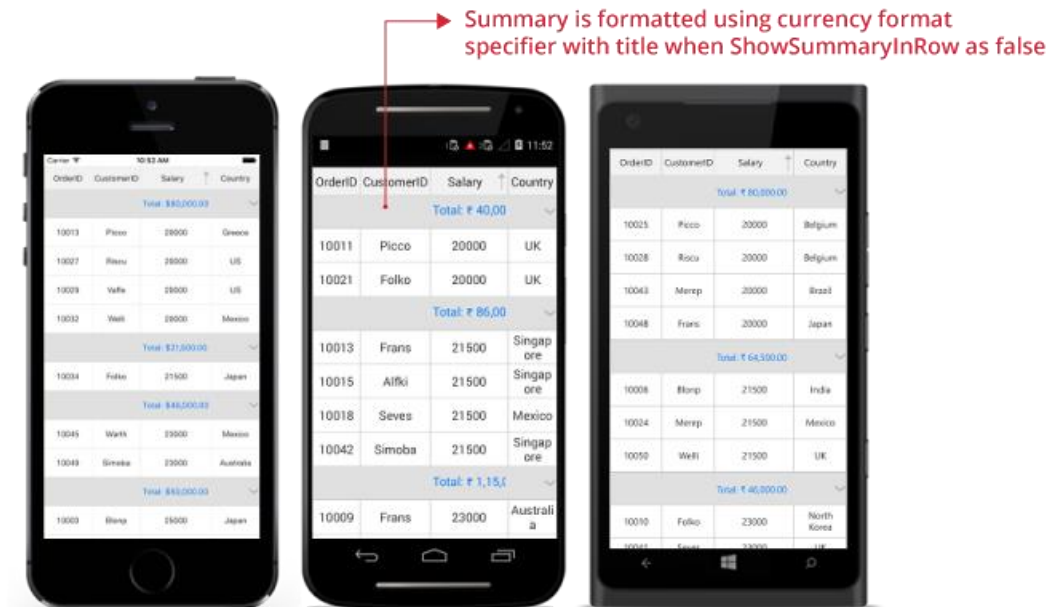

In the following code snippet `Total:` text is appended before summary value:

#### XML

```
<sfGrid:SfDataGrid.CaptionSummaryRow>
<sfGrid:GridSummaryRow ShowSummaryInRow="False">
<sfGrid:GridSummaryRow.SummaryColumns>
<sfGrid:GridSummaryColumn Name="CaptionSummary"
Format="Total: {Sum:c}"
MappingName="Salary"
SummaryType="DoubleAggregate" />
</sfGrid:GridSummaryRow.SummaryColumns>
</sfGrid:GridSummaryRow>
</sfGrid:SfDataGrid.CaptionSummaryRow>
```

#### C#

```
GridSummaryRow summaryRow = new GridSummaryRow();
summaryRow.ShowSummaryInRow = false;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "CaptionSummary",
    MappingName = "Salary",
    Format = "Total:{Sum:c}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.CaptionSummaryRow= summaryRow;
```

### Formatting summary for a row using Title property

Format the summary value for a row using the [GridSummaryRow.Title](#) when `ShowSummaryInRow` set to `true`.

#### XML

```
<sfGrid:SfDataGrid.CaptionSummaryRow>
<sfGrid:GridSummaryRow Title="Total Salary:{TotalSalary} for {ProductCount}
members" ShowSummaryInRow="True">
<sfGrid:GridSummaryRow.SummaryColumns>
<sfGrid:GridSummaryColumn Name="TotalSalary"
Format="{0} {Sum:c}"
MappingName="Salary"
SummaryType="DoubleAggregate" />
<sfGrid:GridSummaryColumn Name="ProductCount"
Format="{0} {Count}"
MappingName="Salary"
SummaryType="CountAggregate" />
</sfGrid:GridSummaryRow.SummaryColumns>
</sfGrid:GridSummaryRow>
</sfGrid:SfDataGrid.CaptionSummaryRow>
```

#### C#

```
GridSummaryRow summaryRow = new GridSummaryRow();
summaryRow.Title = "Total Salary:{TotalSalary} for {ProductCount} members";
summaryRow.ShowSummaryInRow = true;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "TotalSalary",
```

```

MappingName = "Salary",
Format = "{{Sum:c}}",
SummaryType = SummaryType.DoubleAggregate
});
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "ProductCount",
    MappingName = "Salary",
    Format = "{Count}",
    SummaryType = SummaryType.DoubleAggregate
});
sfGrid.CaptionSummaryRow= summaryRow;

```

Summary is formatted using currency format specifier with title when ShowSummaryInRow as true

**Note:** Setting the `SummaryColumn.Format` property to `{Sum:c}` throws an exception since the compiler treats it like how we set binding to a string, since the syntax is the same. But here we are trying to set the culture format for the string. Hence set the format as `Format = "{{Sum:c}}"` when setting the format in XAML.

### Aggregate types

Specify different summary aggregate types by using the [GridSummaryColumn.SummaryType](#) property, and use the built-in function in [GridSummaryColumn.Format](#).

List of predefined aggregate types and its built-in functions are as follows:

Aggregate Type	Built-in function
CountAggregate	Count
Int32Aggregate	Count, max, min, average, and sum.

DoubleAggregate	Count, max, min, average, and sum.
Custom	Used for custom summaries

**Note:** The above aggregate types can be applied for both [CaptionSummaries](#) and [TableSummaries](#).

#### Custom summaries

The data grid implements your own aggregate functions when the built-in aggregate functions do not meet your requirement.

Summary values can be calculated based on custom logic using the [GridSummaryColumn.CustomAggregate](#) property.

#### Implementing custom aggregate

1. Create a custom aggregate class by deriving from [ISummaryAggregate](#) interface.
2. In the `CalculateAggregateFunc()` method, you have to calculate the summary and assign it to the property.

In the following code snippet, **Standard Deviation** is calculated for quantity of products:

#### C#

```
public class CustomAggregate : ISummaryAggregate
{
    public CustomAggregate()
    {
    }
    public double StdDev { get; set; }
    public Action<System.Collections.IEnumerable, string,
    System.ComponentModel.PropertyDescriptor> CalculateAggregateFunc()
    {
        return (items, property, pd) =>
        {
            var enumerableItems = items as IEnumerable<OrderInfo>;
            if (pd.Name == "StdDev")
            {
                this.StdDev = enumerableItems.StdDev<OrderInfo>(q => q.OrderID);
            }
        };
    }
}

public static class LinqExtensions
{
    public static double StdDev<T>(this IEnumerable<T> values, Func<T, double?>
    selector)
    {
        double value = 0;
        var count = values.Count();
        if (count > 0)
        {
            double? avg = values.Average(selector);
            double sum = values.Select(selector).Sum(d =>
            {
```

```

if (d.HasValue)
{
    return Math.Pow(d.Value - avg.Value, 2);
}
return 0.0;
});
value = Math.Sqrt((sum) / (count - 1));
}
return value;
}
}

```

Assign the custom aggregate to `GridSummaryColumn.CustomAggregate` property and set the `SummaryType` as `Custom`. `GridSummaryColumn.Format` property is defined based on property name in custom aggregate `StdDev`.

### XML

```

<sfGrid:SfDataGrid.CaptionSummaryRow>
<sfGrid:GridSummaryRow Title="Standard Deviation:{CaptionSummary}"
ShowSummaryInRow = "True">
<sfGrid:GridSummaryRow.SummaryColumns>
<sfGrid:GridSummaryColumn Name="CaptionSummary"
CustomAggregate="{StaticResource customAggregate}"
Format="{}{StdDev}"
MappingName="OrderID"
SummaryType="Custom" />
</sfGrid:GridSummaryRow.SummaryColumns>
</sfGrid:GridSummaryRow>
</sfGrid:SfDataGrid.CaptionSummaryRow>

```

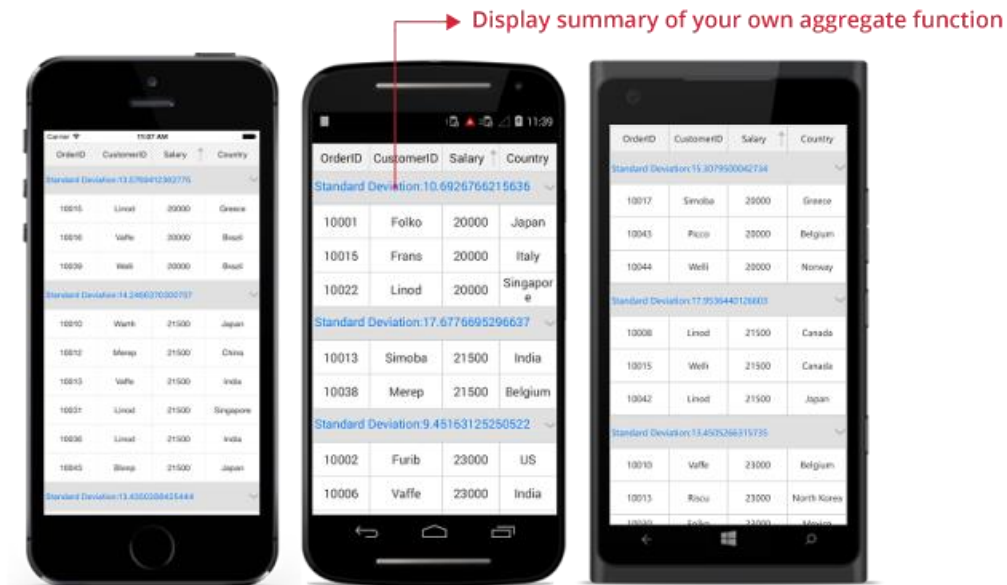

### C#

```

GridSummaryRow summaryRow = new GridSummaryRow();
summaryRow.Title = "Standard Deviation:{CaptionSummary}";
summaryRow.ShowSummaryInRow = true;
summaryRow.SummaryColumns.Add(new GridSummaryColumn
{
    Name = "CaptionSummary",
    CustomAggregate = new CustomAggregate(),
    MappingName = "OrderID",
    Format = "{StdDev}",
    SummaryType = Syncfusion.Data.SummaryType.Custom
});
dataGrid.CaptionSummaryRow = summaryRow;

```

**Note:** The above custom summaries section is explained using `CaptionSummary` but the custom summaries can be also applied for `TableSummaries`.

### Overriding summary renderer

Each summary cell in the data grid is associated with its own cell renderer. The data grid allows to extend this renderer to customize the grid cells based on your requirement. Customization can be applied by overriding the available virtual methods in the each cell renderer.

Each summary has a specific key using which the custom summary renderer can be registered to the [SfDataGrid.CellRenderers](#) collection. Remove the key from collection and add a new entry with the same key along with the instance of custom renderer to register.

Types of summary	Renderer	Key
Table summary	<a href="#">GridTableSummaryCellRenderer</a>	TableSummary
Caption summary	<a href="#">GridCaptionSummaryCellRenderer</a>	CaptionSummary
Group summary	<a href="#">GridSummaryCellRenderer</a>	GroupSummary

### Customizing table summary

The data grid allows customizing the table summary by extending the [GridTableSummaryCellRenderer](#) class.

**Note:** By default, `LoadUIView` property of `GridColumn` is `false` for android. Hence, `OnInitializeDisplayView()` will not be called.

To customize the table summary, follow the code example:

**C#**

```
// To remove default summary and Add custom summary.
public class Summary : ContentPage
{
    public Summary()
    {
        InitializeComponent();
        dataGrid.CellRenderers.Remove("TableSummary");
        dataGrid.CellRenderers.Add("TableSummary", new
        GridTableSummaryCellRendererExt());
    }
}

public class GridTableSummaryCellRendererExt : GridTableSummaryCellRenderer
{
    public GridTableSummaryCellRendererExt()
    {
    }

    public override void OnInitializeDisplayView(DataColumnBase dataColumn,
    SfLabel view)
    {
        base.OnInitializeDisplayView(dataColumn, view);
        view.HorizontalTextAlignment = TextAlignment.Center;
        view.BackgroundColor = Color.DarkCyan;
        view.FontSize = 16;
        view.TextColor = Color.White;
    }
}
```

The following screenshot shows the final outcome upon execution of the above code.

#### Customizing caption summary

The data grid customizes the caption summary by overriding the [GridCaptionSummaryCellRenderer](#).

---

**Note:** By default, `LoadUIView` property of `GridColumn` is `false` for android. Hence, `OnInitializeDisplayView()` will not be called.

---

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AllowResizingColumn="True"
AutoGenerateColumns="False"
ColumnSizer="Star">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridColumn MappingName="OrderID" LoadUIView="True" />
<sfgrid:GridColumn MappingName="Salary" />
<sfgrid:GridColumn MappingName="CustomerID" />
<sfgrid:GridColumn MappingName="Freight" />
<sfgrid:GridColumn MappingName="Country" />
</sfgrid:SfDataGrid.Columns>
<sfgrid:SfDataGrid.GroupColumnDescriptions>
<sfgrid:GroupColumnDescription ColumnName="CustomerID" />
</sfgrid:SfDataGrid.GroupColumnDescriptions>
</sfgrid:SfDataGrid>
```

### C#

```
// To remove default summary and Add custom summary.
public class Summary : ContentPage
{
    public Summary()
    {
        InitializeComponent();
        dataGrid.CellRenderers.Remove("CaptionSummary");
        dataGrid.CellRenderers.Add("CaptionSummary", new
        GridCaptionSummaryCellRendererExt());
        dataGrid.GroupCaptionTextFormat = "{ColumnName} is Grouped by {Key} with
        Count- {ItemsCount}";
    }
}

public class GridCaptionSummaryCellRendererExt :
GridCaptionSummaryCellRenderer
{
    public GridCaptionSummaryCellRendererExt()
    {
    }

    public override void OnInitializeDisplayView(DataColumnBase dataColumn,
    SfLabel view)
    {
        base.OnInitializeDisplayView(dataColumn, view);
        view.HorizontalTextAlignment = TextAlignment.Center;
        view.BackgroundColor = Color.DarkCyan;
        view.FontAttributes = FontAttributes.Bold;
        view.FontSize = 16;
        view.TextColor = Color.White;
    }
}
```

### Customizing group summary

The data grid customizes the group summary by overriding the [GridGroupSummaryCellRenderer](#).

**Note:** By default, `LoadUIView` property of `GridColumn` is `false` for android. Hence, `OnInitializeDisplayView()` will not be called.

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
AutoGenerateColumns="False"
ItemsSource="{Binding OrdersInfo}">
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn MappingName="OrderID" LoadUIView="True" Width="85" />
<sfgrid:GridTextColumn MappingName="Salary" LoadUIView="True" Width="90"/>
<sfgrid:GridTextColumn MappingName="CustomerID" LoadUIView="True"
Width="150"/>
<sfgrid:GridTextColumn MappingName="Country" LoadUIView="True" Width="90"/>
</sfgrid:SfDataGrid.Columns>
<sfgrid:SfDataGrid.GroupColumnDescriptions>
<sfgrid:GroupColumnDescription ColumnName="Salary" />
</sfgrid:SfDataGrid.GroupColumnDescriptions>
</sfgrid:SfDataGrid>
```

### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        // To remove default summary and Add custom summary.
        dataGrid.CellRenderers.Remove("GroupSummary");
    }
}
```

```
dataGrid.CellRenderers.Add("GroupSummary", new
GridGroupSummaryCellRendererExt());
dataGrid.GroupSummaryRows.Add(new GridGroupSummaryRow()
{
    ShowSummaryInRow = true,
    Title = "Total Salary: {Salary} for {customerID} members",
    SummaryColumns = new ObservableCollection<ISummaryColumn>()
    {
        new GridSummaryColumn()
        {
            Name="Salary",
            MappingName="Salary",
            SummaryType=SummaryType.DoubleAggregate,
            Format="{Sum}"
        },
        new GridSummaryColumn()
        {
            Name="customerID",
            MappingName="customerID",
            Format="{Count}",
            SummaryType=SummaryType.CountAggregate
        }
    }
});
// Custom CellRenderer
public class GridGroupSummaryCellRendererExt : GridGroupSummaryCellRenderer
{
    public GridGroupSummaryCellRendererExt()
    {
    }
    public override void OnInitializeDisplayView(DataColumnBase dataColumn,
    SfLabel view)
    {
        base.OnInitializeDisplayView(dataColumn, view);
        base.OnInitializeDisplayView(dataColumn, view);
        view.HorizontalTextAlignment = TextAlignment.Center;
        view.BackgroundColor = Color.Gray;
        view.FontAttributes = FontAttributes.Italic;
        view.FontSize = 20;
        view.TextColor = Color.White;
    }
}
```

OrderID   Salary   ↑   CustomerID   Country			
<b>Salary : 10000 - 9 Items</b>			
10010	10000	Folko	China
10013	10000	Alfkis	Belgium
10017	10000	Folko	Norway
10021	10000	Foliges	Brazil
10030	10000	Vaffe	Netherland
10032	10000	Furib	Italy
10056	10000	Picco	US
10071	10000	Foliges	Singapore
10092	10000	Sim	Japan
<i>Total Salary: 90000 for 9 members</i>			
<b>Salary : 12000 - 8 Items</b>			
10018	12000	Seves	China
10040	12000	Riscu	Mexico
10060	12000	Alfkis	Greece
10067	12000	Furib	Brazil

You can download the sample demo [here](#) .

## Filtering

The SfDataGrid supports to view filtering.

### View Filtering

The SfDataGrid supports to filter the records in view by setting `SfDataGrid.View.Filter` property where `Filter` is a predicate.

In order to filter the records, assign the filtered strings to the `ViewModel.FilterText` property which will be later applied in `FilterPredicate` that is assigned to `SfDataGrid.View.Filter` in `OnFilterChanged()` method.

---

**Note:** To update filtering for newly added row or column, set the `SfDataGrid.View.LiveDataUpdateMode` to `LiveDataUpdateMode.AllowDataShaping`.

---

The following code example illustrates the delegate, properties, and methods used in the `ViewModel` class in order to perform filtering operation:

### C#

```
// ViewModel.cs
#region Filtering
#region Fields
private string filterText = "";
private string selectedColumn = "All Columns";
private string selectedCondition = "Equals";
internal delegate void FilterChanged();
internal FilterChanged filterTextChanged;
#endregion
#region Property
public string FilterText
{
    get { return filterText; }
    set
    {
        filterText = value;
        OnFilterTextChanged();
        RaisePropertyChanged("FilterText");
    }
}
public string SelectedCondition
{
    get { return selectedCondition; }
    set { selectedCondition = value; }
}
public string SelectedColumn
{
    get { return selectedColumn; }
    set { selectedColumn = value; }
}
#endregion
#region Private Methods
private void OnFilterTextChanged()
{
    filterTextChanged();
}
private bool MakeStringFilter(OrderInfo o, string option, string condition)
```

```
{
var value = o.GetType().GetProperty(option);
var exactValue = value.GetValue(o, null);
exactValue = exactValue.ToString().ToLower();
string text = FilterText.ToLower();
var methods = typeof(string).GetMethods();
if (methods.Count() != 0)
{
if (condition == "Contains")
{
var methodInfo = methods.FirstOrDefault(method => method.Name == condition);
bool result1 = (bool)methodInfo.Invoke(exactValue, new object[] { text });
return result1;
}
else if (exactValue.ToString() == text.ToString())
{
bool result1 = String.Equals(exactValue.ToString(), text.ToString());
if (condition == "Equals")
return result1;
else if (condition == "NotEquals")
return false;
}
else if (condition == "NotEquals")
{
return true;
}
return false;
}
else
return false;
}

private bool MakeNumericFilter(OrderInfo o, string option, string condition)
{
var value = o.GetType().GetProperty(option);
var exactValue = value.GetValue(o, null);
double res;
bool checkNumeric = double.TryParse(exactValue.ToString(), out res);
if (checkNumeric)
{
switch (condition)
{
case "Equals":
try
{
if (exactValue.ToString() == FilterText)
{
if (Convert.ToDouble(exactValue) == (Convert.ToDouble(FilterText)))
return true;
}
}
catch (Exception e)
{
Console.WriteLine(e);
}
break;
case "NotEquals":
try
```

```
{
    if (Convert.ToDouble(FilterText) != Convert.ToDouble(exactValue))
        return true;
    }
    catch (Exception e)
    {
        Console.WriteLine(e);
        return true;
    }
    break;
}
return false;
}
#endregion
#region Public Methods
public bool FilterRecords(object o)
{
    double res;
    bool checkNumeric = double.TryParse(FilterText, out res);
    var item = o as OrderInfo;
    if (item != null && FilterText.Equals(""))
    {
        return true;
    }
    else
    {
        if (item != null)
        {
            if (checkNumeric && !SelectedColumn.Equals("All Columns"))
            {
                bool result = MakeNumericFilter(item, SelectedColumn, SelectedCondition);
                return result;
            }
            else if (SelectedColumn.Equals("All Columns"))
            {
                if (item.CustomerID.ToLower().Contains(FilterText.ToLower()) ||
                    item.Country.ToLower().Contains(FilterText.ToLower()) ||
                    item.Freight.ToString().ToLower().Contains(FilterText.ToLower()) ||
                    item.OrderID.ToString().ToLower().Contains(FilterText.ToLower()))
                {
                    return true;
                }
                return false;
            }
            else
            {
                bool result = MakeStringFilter(item, SelectedColumn, SelectedCondition);
                return result;
            }
        }
        return false;
    }
}
#endregion
#endregion
```

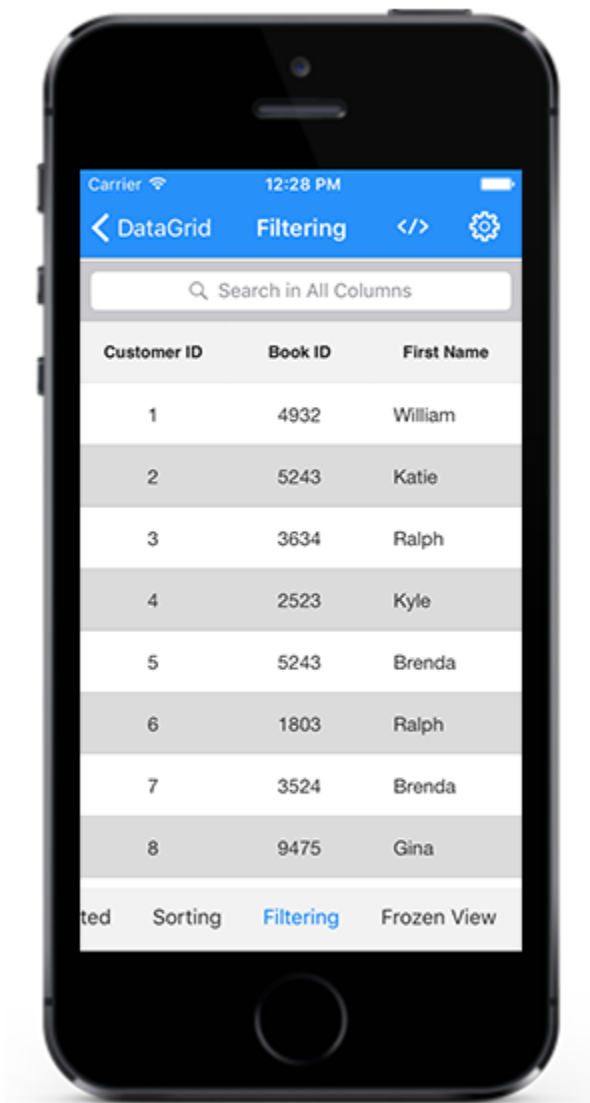

To create a `SearchBar` and apply the filtered records to `ViewModel.FilterText` property in `SearchBar.TextChanged` event, follow the code example:

#### XML

```
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<SearchBar x:Name="filterText"
Grid.Row="0"
Grid.Column="0"
IsVisible="true"
Placeholder="Search here to Filter"
TextChanged="OnFilterTextChanged" />
```

#### C#

```
private void OnFilterTextChanged(object sender, TextChangedEventArgs e)
{
    if (e.NewTextValue == null)
        viewModel.FilterText = "";
    else
        viewModel.FilterText = e.NewTextValue;
}
```

Once you create a `SearchBar` and a view model, filtering can be performed by setting `SfDataGrid.View.Filter` property. Call the `SfDataGrid.View.RefreshFilter()` method after setting the filtered records to the `SfDataGrid.View.Filter` property as in the following code example:

#### C#

```
// Code-Behind
viewModel.filterTextChanged = OnFilterChanged; //where 'filterTextChanged'
is a delegate declared in ViewModel class.
private void OnFilterChanged()
{
    if (dataGrid.View != null)
    {
        this.dataGrid.View.Filter = viewModel.FilerRecords;
        this.dataGrid.View.RefreshFilter();
    }
}
```

```
}

```

### DataTable filtering

To filter the rows in SfDataGrid using [DataView.RowFilter](#) expression, set the value of [SfDataGrid.CanUseViewFilter](#) property to **true**. The default filter which created in DataView can be applied or canceled through this property.

### Filter individual columns

To filter records in all the columns or in a particular column, use codes in OnColumnSelected() method.

For example, the records can be filtered in **OrderID** or any other particular column alone. The following code example illustrates how to create a **Picker** for columns and how the records will be filtered based on the column selected:

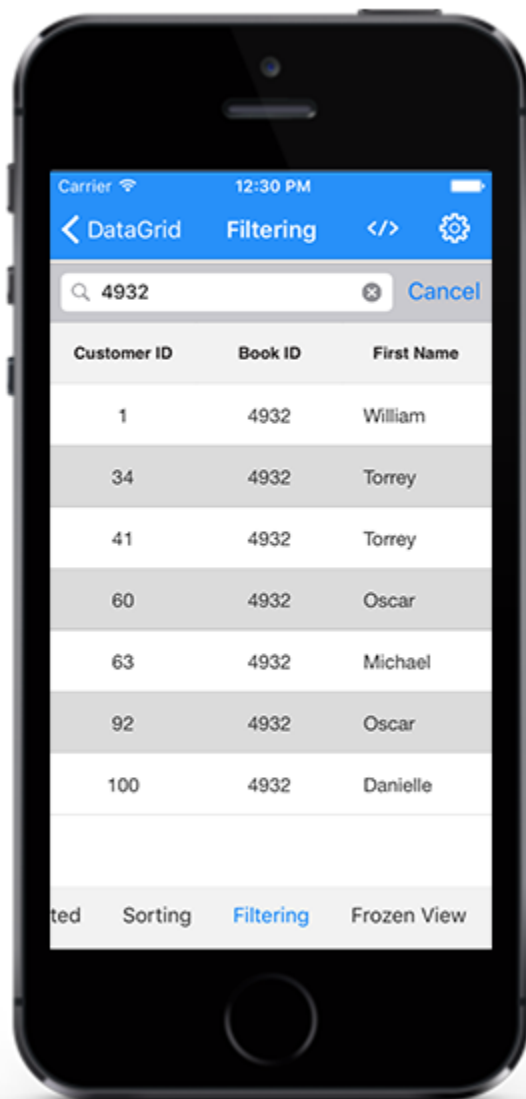

### XML

```
<Picker x:Name="ColumnsList"
HorizontalOptions="Start"
SelectedIndexChanged="OnColumnsSelectionChanged"
WidthRequest="200">
  <Picker.Items>
    <x:String>All Columns</x:String>
    <x:String>CustomerID</x:String>
    <x:String>BookID</x:String>
    <x:String>FirstName</x:String>
    <x:String>LastName</x:String>
    <x:String>BookName</x:String>
  </Picker.Items>
</Picker>
```

### C#

```
private void OnColumnsSelectionChanged(object sender, EventArgs e)
{
    Picker newPicker = (Picker)sender;
    viewModel.SelectedColumn = newPicker.Items[newPicker.SelectedIndex];
    if (viewModel.SelectedColumn == "All Columns")
    {
        viewModel.SelectedCondition = "Contains";
        OptionsList.IsVisible = false;
        this.OnFilterChanged();
    }
    else
    {
        OptionsList.IsVisible = true;
        foreach (var prop in typeof(OrderInfo).GetProperties())
        {
            // Records will be filtered based on selected column
            if (prop.Name == viewModel.SelectedColumn)
            {
                if (prop.PropertyType == typeof(string))
                {
                    OptionsList.Items.Clear();
                    OptionsList.Items.Add("Contains");
                    OptionsList.Items.Add("Equals");
                }
            }
        }
    }
}
```

```
OptionsList.Items.Add("NotEquals");
if (this.viewModel.SelectedCondition == "Equals")
OptionsList.SelectedIndex = 1;
else if (this.viewModel.SelectedCondition == "NotEquals")
OptionsList.SelectedIndex = 2;
else
OptionsList.SelectedIndex = 0;
}
else
{
OptionsList.Items.Clear();
OptionsList.Items.Add("Equals");
OptionsList.Items.Add("NotEquals");
if (this.viewModel.SelectedCondition == "Equals")
OptionsList.SelectedIndex = 0;
else
OptionsList.SelectedIndex = 1;
}
}
}
}
```

### Filter based on conditions

In addition to column based filtering, the records can be filtered based on some conditions. For example, the records can be filtered based on the given input or the records can be filtered contrast to the input. The condition based filtering can be achieved for all the columns or any particular column.

The records can be filtered in view based on any of the following conditions:

- Equals
- NotEquals
- Contains

The above conditions are the mostly used conditions. However any other conditions can be added based on the requirement and alter the following code example based on the condition.

**C#**

```
// ViewModel.cs
public bool FilterRecords(object o)
{
    double res;
    bool checkNumeric = double.TryParse(FilterText, out res);
    var item = o as OrderInfo;
    if (item != null && FilterText.Equals(""))
    {
        return true;
    }
    else
    {
        if (item != null)
        {
            if (checkNumeric && !SelectedColumn.Equals("All Columns"))
            {
                bool result = MakeNumericFilter(item, SelectedColumn, SelectedCondition);
                return result;
            }
            else if (SelectedColumn.Equals("All Columns"))
            {
                if (item.CustomerID.ToLower().Contains(FilterText.ToLower()) ||
                    item.Country.ToLower().Contains(FilterText.ToLower()) ||
                    item.Freight.ToString().ToLower().Contains(FilterText.ToLower()) ||
                    item.OrderID.ToString().ToLower().Contains(FilterText.ToLower()))
                {
                    return true;
                }
                return false;
            }
            else
            {
                bool result = MakeStringFilter(item, SelectedColumn, SelectedCondition);
                return result;
            }
        }
        return false;
    }
}

private bool MakeStringFilter(OrderInfo o, string option, string condition)
{
    var value = o.GetType().GetProperty(option);
    var exactValue = value.GetValue(o, null);
    exactValue = exactValue.ToString().ToLower();
    string text = FilterText.ToLower();
    var methods = typeof(string).GetMethods();
    if (methods.Count() != 0)
    {
        if (condition == "Contains")
        {
            var methodInfo = methods.FirstOrDefault(method => method.Name == condition);
            bool result1 = (bool)methodInfo.Invoke(exactValue, new object[] { text });
            return result1;
        }
        else if (exactValue.ToString() == text.ToString())
        {
            bool result1 = String.Equals(exactValue.ToString(), text.ToString());
            return result1;
        }
    }
}
```

```
if (condition == "Equals")
return result1;
else if (condition == "NotEquals")
return false;
}
else if (condition == "NotEquals")
{
return true;
}
return false;
}
else
return false;
}
private bool MakeNumericFilter(OrderInfo o, string option, string condition)
{
var value = o.GetType().GetProperty(option);
var exactValue = value.GetValue(o, null);
double res;
bool checkNumeric = double.TryParse(exactValue.ToString(), out res);
if (checkNumeric)
{
switch (condition)
{
case "Equals":
try
{
if (exactValue.ToString() == FilterText)
{
if (Convert.ToDouble(exactValue) == (Convert.ToDouble(FilterText)))
return true;
}
}
catch (Exception e)
{
Console.WriteLine(e);
}
break;
case "NotEquals":
try
{
if (Convert.ToDouble(FilterText) != Convert.ToDouble(exactValue))
return true;
}
catch (Exception e)
{
Console.WriteLine(e);
return true;
}
break;
}
}
return false;
}
```

The following code example illustrates how to create a **Picker** for conditions and add appropriate strings to that **Picker** and how the records will be filtered based on selected conditions:

#### XML

```
<Picker x:Name="OptionsList"
HorizontalOptions="Start"
IsVisible="False"
SelectedIndexChanged="OnFilterOptionsChanged"
WidthRequest="200">
  <Picker.Items>
    <x:String>Equals</x:String>
    <x:String>NotEquals</x:String>
    <x:String>Contains</x:String>
  </Picker.Items>
</Picker>
```

#### C#

```
private void OnFilterOptionsChanged(object sender, EventArgs e)
{
    Picker newPicker = (Picker)sender;
    if (newPicker.SelectedIndex >= 0)
    {
        viewModel.SelectedCondition = newPicker.Items[newPicker.SelectedIndex];
        if (filterText.Text != null)
            this.OnFilterChanged();
    }
}
```

Screenshot//

The following code example illustrates the complete **FilteringUI** and its operations:

#### XML

```
<StackLayout HorizontalOptions="FillAndExpand"
Orientation="Vertical"
VerticalOptions="FillAndExpand">
  <Grid HorizontalOptions="FillAndExpand" VerticalOptions="FillAndExpand">
    <Grid.RowDefinitions>
      <RowDefinition Height="Auto" />
      <RowDefinition Height="*" />
    </Grid.RowDefinitions>
    <Grid.ColumnDefinitions>
      <ColumnDefinition Width="*" />
    </Grid.ColumnDefinitions>
    <SearchBar x:Name="filterText"
Grid.Row="0"

<x:String>Contains</x:String>
</Picker.Items>

```

```
</Picker>
</Grid>
</StackLayout>
```

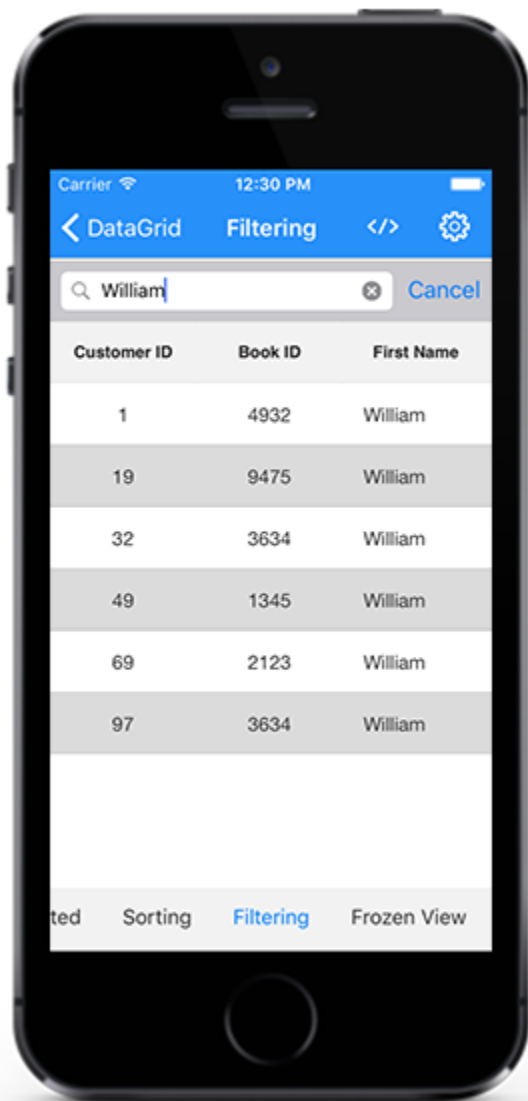

## C#

```
this.dataGrid.ItemsSource = viewModel.OrdersInfo;
viewModel.filterTextChanged = OnFilterChanged;
ColumnsList.SelectedIndex = 0;
private void OnColumnsSelectionChanged(object sender, EventArgs e)
{
    Picker newPicker = (Picker)sender;
    viewModel.SelectedColumn = newPicker.Items[newPicker.SelectedIndex];
    if (viewModel.SelectedColumn == "All Columns")
    {
        viewModel.SelectedCondition = "Contains";
        OptionsList.IsVisible = false;
        this.OnFilterChanged();
    }
    else
    {
        OptionsList.IsVisible = true;
        foreach (var prop in typeof(OrderInfo).GetProperties())
        {
            if (prop.Name == viewModel.SelectedColumn)
            {
                if (prop.PropertyType == typeof(string))
                {
                    OptionsList.Items.Clear();
                    OptionsList.Items.Add("Contains");
                    OptionsList.Items.Add("Equals");
                    OptionsList.Items.Add("NotEquals");
                    if (this.viewModel.SelectedCondition == "Equals")
                        OptionsList.SelectedIndex = 1;
                    else if (this.viewModel.SelectedCondition == "NotEquals")
                        OptionsList.SelectedIndex = 2;
                    else
                        OptionsList.SelectedIndex = 0;
                }
                else
                {
                    OptionsList.Items.Clear();
                    OptionsList.Items.Add("Equals");
                    OptionsList.Items.Add("NotEquals");
                    if (this.viewModel.SelectedCondition == "Equals")
                        OptionsList.SelectedIndex = 0;
                    else
                        OptionsList.SelectedIndex = 1;
                }
            }
        }
    }
}
private void OnFilterOptionsChanged(object sender, EventArgs e)
{
    Picker newPicker = (Picker)sender;
```

```
if (newPicker.SelectedIndex >= 0)
{
    viewModel.SelectedCondition = newPicker.Items[newPicker.SelectedIndex];
    if (filterText.Text != null)
    this.OnFilterChanged();
}
}

private void OnFilterTextChanged(object sender, TextChangedEventArgs e)
{
    if (e.NewTextValue == null)
        viewModel.FilterText = "";
    else
        viewModel.FilterText = e.NewTextValue;
}

private void OnFilterChanged()
{
    if (dataGrid.View != null)
    {
        this.dataGrid.View.Filter = viewModel.FilerRecords;
        this.dataGrid.View.RefreshFilter();
    }
}
```

### Clear filtering

The SfDataGrid allows to clear the applied filtering by setting the `SfDataGrid.View.Filter` property to `null`.

To clear the applied filtering, follow the code example:

#### C#

```
// Code-Behind
private void OnFilterChanged()
{
    if (dataGrid.View != null)
    {
        this.dataGrid.View.Filter = null;
        this.dataGrid.View.RefreshFilter();
    }
}
```

```
}
```

You can download the filtering demo [here](#).

## Editing

The SfDataGrid supports for editing the cell values by setting the [SfDataGrid.AllowEditing](#) property, [SfDataGrid.NavigationMode](#) as Cell and setting the [SfDataGrid.SelectionMode](#) as any other than None.

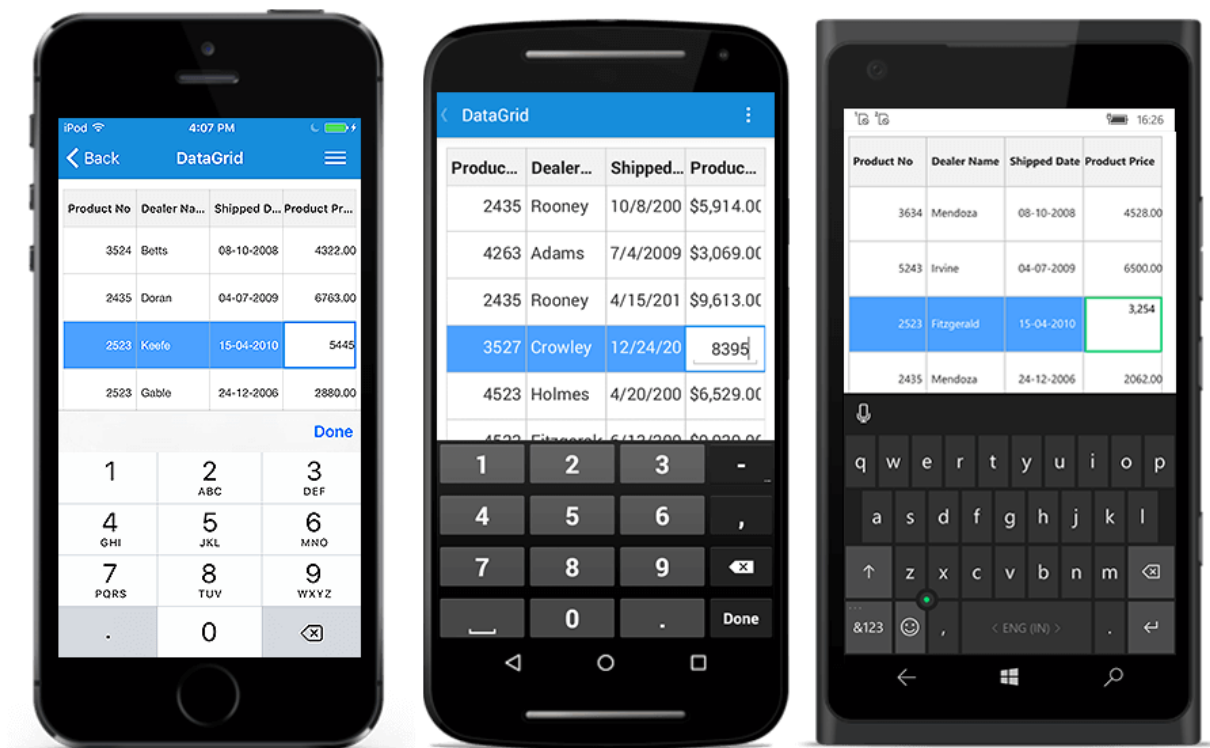

To enable editing, follow the code example:

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
    AllowEditing="True"
    SelectionMode="Multiple"
    NavigationMode="Cell"
    AutoGenerateColumns="True"
    ItemsSource="{Binding Orders}" />
```

### C#

```
dataGrid.AllowEditing = true;
dataGrid.SelectionMode = SelectionMode.Multiple;
dataGrid.NavigationMode = NavigationMode.Cell;
```

## Column editing

To enable or disable editing for a particular column, set the [GridColumn.AllowEditing](#) property.

## XML

```
<syncfusion:GridTextColumn AllowEditing="True" MappingName="OrderID" />
```

## C#

```
GridTextColumn column = new GridTextColumn();  
column.MappingName="OrderID";  
column.AllowEditing = false;
```

**Note:** The `GridColumn.AllowEditing` takes higher priority than the `SfDataGrid.AllowEditing`.

### Entering into edit mode

To enter into edit mode by just tapping or double tapping the grid cells, set the [SfDataGrid.EditTapAction](#) property.

## XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"  
AllowEditing="True"  
AutoGenerateColumns="True"  
EditTapAction="OnTap">
```

## C#

```
//Enter edit mode in single tap  
this.dataGrid.EditTapAction = TapAction.OnTap;  
//Enter edit mode in double tap  
this.dataGrid.EditTapAction = TapAction.OnDoubleTap;
```

**Note:** The keyboard will be collapsed when editing grid cell gets unfocused.

### Cursor behavior

When the cell enters into edit mode, cursor is placed based on the [SfDataGrid.EditorSelectionBehavior](#) property.

- **SelectAll:** Selects the text of edit element loaded inside cell.
- **MoveLast:** Places the cursor to the end of edit element loaded inside cell.

## XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"  
AllowEditing="True"  
AutoGenerateColumns="True"  
EditTapAction="OnTap"  
EditorSelectionBehavior="SelectAll">
```

## C#

```
//Selects all the text in the edit mode  
this.dataGrid.EditorSelectionBehavior = EditorSelectionBehavior.SelectAll;  
//Places the cursor at the last  
this.dataGrid.EditorSelectionBehavior = EditorSelectionBehavior.MoveLast;
```

---

**Note:** Editing supports for GridTemplateColumn and GridUnboundColumn are not provided yet.

### Support for IEditableObject

The SfDataGrid supports to commit and roll back the changes in row level when underlying data object implements the [IEditableObject](#) interface.

The editing changes in a row will be committed only when tapping on next row.

The [IEditableObject](#) has the following methods to capture editing:

- [BeginEdit](#): Gets called to begin edit on underlying data object when cells in a row enters into edit mode.
- [CancelEdit](#): Gets called when you cancel editing to discard the changes in a row since last BeginEdit call.
- [EndEdit](#): Gets called when you move to the next row by tapping to commit changes in underlying data object since last BeginEdit call.

The following code snippet explains the simple implementation of [IEditableObject](#):

### C#

```
public class OrderInfo : INotifyPropertyChanged, IEditableObject
{
    public OrderInfo()
    {
    }
    #region private variables
    private int _orderID;
    private int _employeeID;
    private int _customerID;
    private bool _isClosed;
    private string _firstName;
    private string _lastName;
    private string _gender;
    private string _shipCity;
    private string _shipCountry;
    private string _freight;
    private DateTime _shippingDate;
    #endregion
    #region Public Properties
    public int OrderID
    {
        get { return _orderID; }
        set
        {
            this._orderID = value;
            RaisePropertyChanged("OrderID");
        }
    }
    public int EmployeeID
    {
        get { return _employeeID; }
        set
        {

```

```
this._employeeID = value;
RaisePropertyChanged("EmployeeID");
}
}
public int CustomerID
{
    get { return _customerID; }
    set
    {
        this._customerID = value;
        RaisePropertyChanged("CustomerID");
    }
}
public bool IsClosed
{
    get { return _isClosed; }
    set
    {
        this._isClosed = value;
        RaisePropertyChanged("IsClosed");
    }
}
public string FirstName
{
    get { return _firstName; }
    set
    {
        this._firstName = value;
        RaisePropertyChanged("FirstName");
    }
}
public string LastName
{
    get { return _lastName; }
    set
    {
        this._lastName = value;
        RaisePropertyChanged("LastName");
    }
}
public string Gender
{
    get { return _gender; }
    set
    {
        this._gender = value;
        RaisePropertyChanged("Gender");
    }
}
public string ShipCity
{
    get { return _shipCity; }
    set
    {
        this._shipCity = value;
        RaisePropertyChanged("ShipCity");
    }
}
```

```

}
public string ShipCountry
{
    get { return _shipCountry; }
    set
    {
        this._shipCountry = value;
        RaisePropertyChanged("ShipCountry");
    }
}
public string Freight
{
    get { return _freight; }
    set
    {
        this._freight = value;
        RaisePropertyChanged("Freight");
    }
}
public DateTime ShippingDate
{
    get { return _shippingDate; }
    set
    {
        this._shippingDate = value;
        RaisePropertyChanged("ShippingDate");
    }
}
#endregion
#region INotifyPropertyChanged implementation
public event PropertyChangedEventHandler PropertyChanged;
private void RaisePropertyChanged (String Name)
{
    if (PropertyChanged != null)
        this.PropertyChanged (this, new PropertyChangedEventArgs (Name));
}
private Dictionary<string, object> storedValues;
public void BeginEdit()
{
    this.storedValues = this.BackUp();
}
public void CancelEdit()
{
    if (this.storedValues == null)
        return;
    foreach (var item in this.storedValues)
    {
        var itemProperties = this.GetType().GetTypeInfo().DeclaredProperties;
        var pDesc = itemProperties.FirstOrDefault(p => p.Name == item.Key);
        if (pDesc != null)
            pDesc.SetValue(this, item.Value);
    }
}
public void EndEdit()
{
    if (this.storedValues != null)
    {

```

```

this.storedValues.Clear();
this.storedValues = null;
}
Debug.WriteLine("End Edit Called");
}
protected Dictionary<string, object> BackUp()
{
var dictionary = new Dictionary<string, object>();
var itemProperties = this.GetType().GetTypeInfo().DeclaredProperties;
foreach (var pDescriptor in itemProperties)
{
if (pDescriptor.CanWrite)
dictionary.Add(pDescriptor.Name, pDescriptor.GetValue(this));
}
return dictionary;
}
#endregion
}

```

### Editing events

The SfDataGrid triggers the following events while editing:

#### *CurrentCellBeginEdit*

The [SfDataGrid.CurrentCellBeginEdit](#) event occurs when the CurrentCell enters into edit mode. The [GridCurrentCellBeginEditEventArgs](#) has the following members which provides information for SfDataGrid.CurrentCellBeginEdit event:

- [Cancel](#): When this member set to 'true', the event is canceled and the CurrentCell does not enter into the edit mode.
- [RowColumnIndex](#): Gets the current row and column index of the DataGrid.
- [Column](#): Gets the Grid Column of the SfDataGrid.

To hook the [SfDataGrid.CurrentCellBeginEdit](#) event, follow the code example:

#### **C#**

```

this.dataGrid.CurrentCellBeginEdit += DataGrid_CurrentCellBeginEdit;
private void DataGrid_CurrentCellBeginEdit(object sender,
GridCurrentCellBeginEditEventArgs args)
{
// Editing prevented for the cell at RowColumnIndex(2,2).
if (args.RowColumnIndex == new
Syncfusion.GridCommon.ScrollAxis.RowColumnIndex(2, 2))
args.Cancel = true;
}

```

#### *CurrentCellEndEdit*

The [CurrentCellEndEdit](#) event occurs when the CurrentCell exits the edit mode. The [GridCurrentCellEndEditEventArgs](#) has following members which provides information for SfDataGrid.CurrentCellEndEdit event:

- [RowColumnIndex](#): Gets the current row and column index of the DataGrid.

- [Cancel](#): When this member set to 'true', the event is canceled and the edited value is not committed in the underlying collection.

To hook the `SfDataGrid.CurrentCellEndEdit` event, follow the code example:

#### C#

```
this.dataGrid.CurrentCellEndEdit += DataGrid_CurrentCellEndEdit;
private void DataGrid_CurrentCellEndEdit(object sender,
GridCurrentCellEndEditEventArgs args)
{
    // Editing prevented for the cell at RowColumnIndex(1,3).
    if (args.RowColumnIndex == new
Syncfusion.GridCommon.ScrollAxis.RowColumnIndex(1, 3))
    args.Cancel = true;
}
```

Programmatically edit a cell

#### Begin editing

The SfDataGrid allows to edit the cell programmatically by calling the [SfDataGrid.BeginEdit](#) method. By calling this method, the particular cell enters into edit mode. It edits the data manually or programmatically. To edit a cell programmatically, follow the code example:

#### C#

```
this.dataGrid.Loaded += dataGrid_Loaded;
void dataGrid_Loaded(object sender, RoutedEventArgs e)
{
    //Edit the cell at 2nd row,2nd column programmatically
    this.dataGrid.BeginEdit(2, 2);
}
```

#### End editing

The [SfDataGrid.EndEdit](#) method can be called to programmatically end editing. A cell that is currently in edit mode commits the edited value to the underlying collection and exits the edit mode when this method is called. To end the editing programmatically, follow the code example:

#### C#

```
this.dataGrid.EndEdit();
```

#### Cancel editing

The [SfDataGrid.CancelEdit](#) method can be called to programmatically cancel editing. A cell that is currently in edit mode exits the edit mode without committing the edited value in the underlying collection when this method is called. To cancel the editing programmatically, follow the code example:

#### C#

```
this.dataGrid.CancelEdit();
```

How to

### Cancel editing

The [SfDataGrid.CurrentCellBeginEdit](#) event can be used to cancel the editing operation for the corresponding cell. To cancel the editing operation using the [SfDataGrid.CurrentCellBeginEdit](#) event, follow the code example:

#### C#

```
this.dataGrid.CurrentCellBeginEdit += DataGrid_CurrentCellBeginEdit;
private void DataGrid_CurrentCellBeginEdit(object sender,
GridCurrentCellBeginEditEventArgs args)
{
    if (args.Column.MappingName == "OrderID" || args.RowColumnIndex.RowIndex == 2)
        args.Cancel = true;
}
```

### Cancel edited value from getting committed

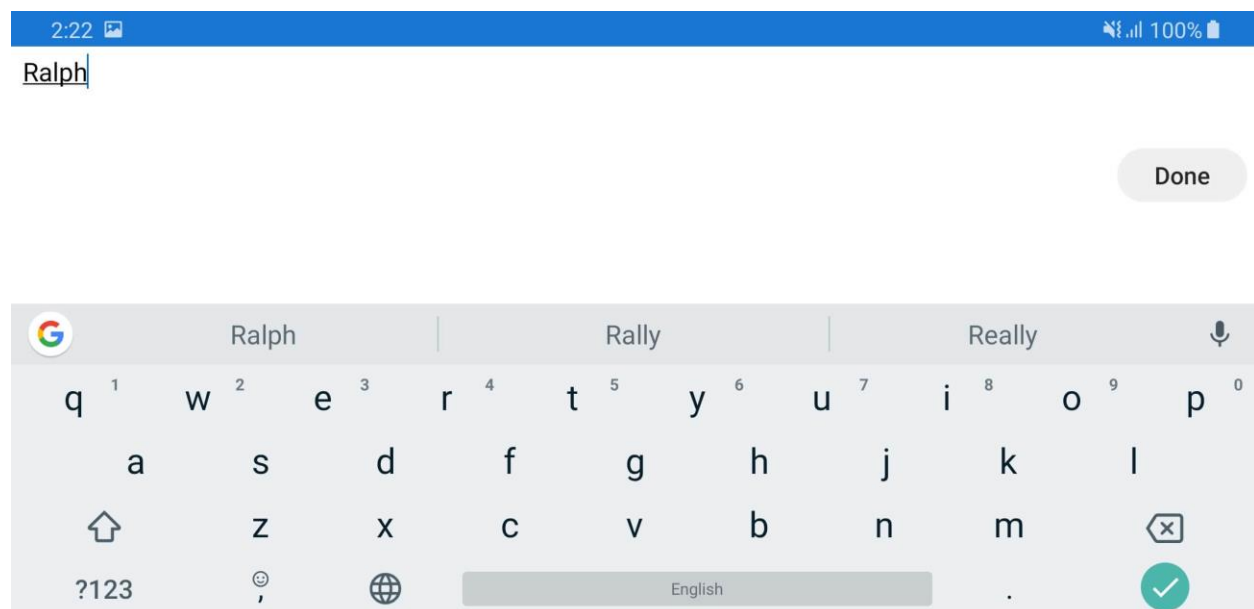

To prevent the edited value from getting committed, use the [CurrentCellEndEdit](#) event. To prevent the edited values from getting committed in the underlying collection, follow the code example:

#### C#

```
this.dataGrid.CurrentCellEndEdit += DataGrid_CurrentCellEndEdit;
private void DataGrid_CurrentCellEndEdit(object sender,
GridCurrentCellEndEditEventArgs args)
{
    if (args.RowColumnIndex.RowIndex == 2)
        args.Cancel == true;
}
```

### Customize editor UI in landscape mode

By default in Android platform, when entering edit mode for a text column in landscape orientation, the editor view loads in full width and height of the screen like below.

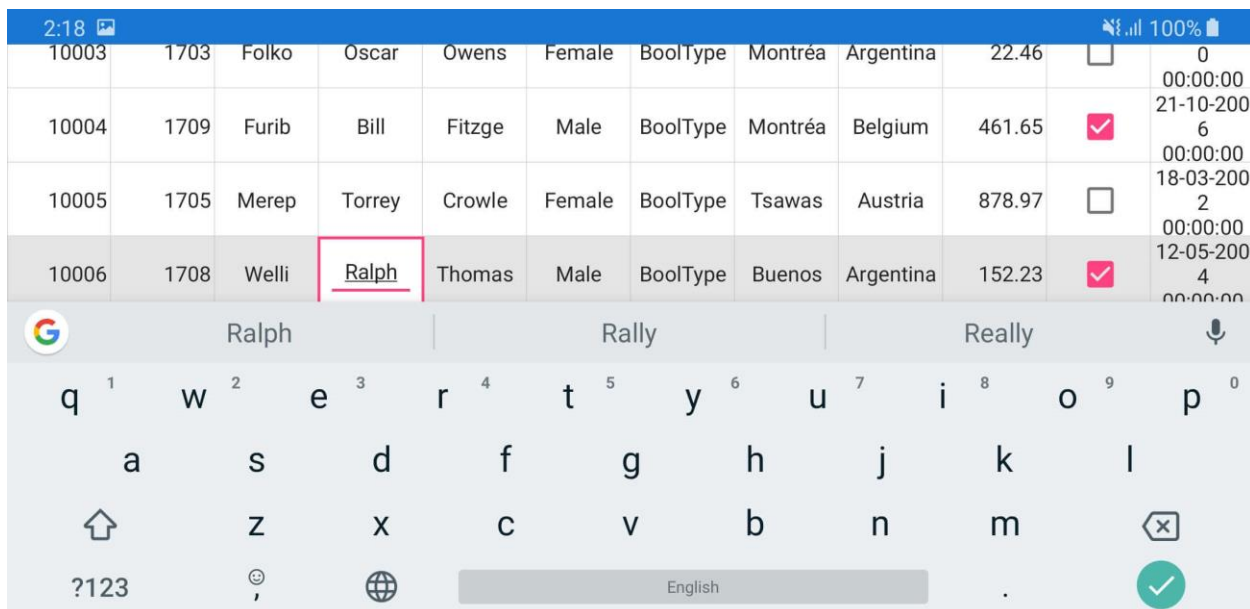

If in case when entering edit mode you want to load the editor just like in portrait orientation, where the editor is loaded within the cells and the grid rows are visible in the background, set the [SfDataGrid.ImeOptions](#) property as [GridImeOptions.NoExtractUi](#). The default value of [SfDataGrid.ImeOptions](#) is [GridImeOptions.Done](#).

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo,Mode=TwoWay}"
AllowEditing="True"
NavigationMode="Cell"
SelectionMode="Single"
ImeOptions="NoExtractUi">
</syncfusion:SfDataGrid>
```

### C#

```
this.dataGrid.ImeOptions = GridImeOptions.NoExtractUi;
```

### Selection

This section explains how to enable selection in the data grid; modes, properties, and events involved in selection; and customizations available for selection.

The data grid allows you to select a specific row or group of rows either programmatically or by touch interactions. To enable selection, set the [SfDataGrid.SelectionMode](#) property to a value other than [None](#). This control has different selection modes to perform the selection operation as follows:

#### Selection modes

Modes	Description
<a href="#">None</a>	Disables selection, and no rows can be selected. This is the default value.

<a href="#">Single</a>	Allows selection of a single row only. Upon selecting the next row, the selection in the previous row is cleared.
<a href="#">Multiple</a>	Allows selection of more than one row. Selection is not cleared when selecting more than one record. When you click on a selected row for the second time, the selection is cleared.
<a href="#">SingleDeselect</a>	Allows selection of only a single row. However, upon tapping the row again, the selection is cleared. Similar to single mode, upon selecting the next row, the selection in the previous row is cleared.

To set the selection mode, follow the code example:

#### **XML**

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ColumnSizer="Star"
AutoGenerateColumns="True"
SelectionMode="Multiple"
ItemsSource="{Binding OrdersInfo}"/>
```

#### **C#**

```
dataGrid.SelectionMode = SelectionMode.Multiple;
```

OrderID	Genders	EmployeeID	CustomerID
10001	Male	10501	Linod
10002	Female	10502	Furib
10003	Male	10503	Folig
10004	Female	10504	Frans
10005	Male	10505	Picco
10006	Male	10506	Warth
10007	Female	10507	Riscu
10008	Female	10508	Seves
10009	Male	10509	Linod
10010	Male	10510	Folko
10011	Female	10511	Vaffe
10012	Male	10512	Welli
10013	Female	10513	Vaffe
10014	Female	10514	Alfki

#### Getting selected rows

The SfDataGrid provides `SelectedIndex`, `SelectedItem`, and `CurrentItem` properties to get details of the selected rows when the selection mode is `Single`, `Multiple`, and `SingleDeselect`.

- [SfDataGrid.SelectedItem](#): Provides the underlying data object of the selected row. Denotes the first selected row in multiple selection.
- [SfDataGrid.SelectedIndex](#): Provides the index of [SfDataGrid.SelectedItem](#).
- [SfDataGrid.CurrentItem](#): Provides the underlying data object of the currently selected row in the data grid. Denotes the first selected row in multiple selection.

#### Row selection

When multiple rows are selected, the [SelectedItems](#) and [SelectionController.SelectedRows](#) properties provide information of all the selected rows.

- [SfDataGrid.SelectedItems](#): Provides all the selected records of the selected items when multiple selection is enabled.
- [SfDataGrid.SelectionController.SelectedRows](#): Provides collection of the underlying model object(row data) of all the selected items.

#### CurrentItem vs SelectedItem

Both the [SelectedItem](#) and [CurrentItem](#) returns the same data object when the selection mode is single. When multiple selection is enabled, the initially selected row will be maintained in the [SelectedItem](#) and the currently selected row will be maintained in the [CurrentItem](#).

#### Programmatic selection

When [SfDataGrid.SelectionMode](#) is set a value other than [None](#), select row/rows from the code by setting the [SfDataGrid.SelectedIndex](#), [SfDataGrid.SelectedItem](#), or [SfDataGrid.SelectedItems](#) property based on the selection mode. To enable selection from code, follow the code example:

When the selection mode is [Single](#), programmatically select a row in two ways either by setting the row index to the [SfDataGrid.SelectedIndex](#) property, or by setting the underlying object to be selected to the [SfDataGrid.SelectedItem](#) property.

To programmatically select a row from the code, follow the code example:

#### C#

```
//Perform selection using selected index
dataGrid.SelectedIndex = 3;
//Perform selection using selected item
dataGrid.SelectedItem = viewModel.OrdersInfo [5];
```

When the selection mode is multiple, programmatically select more than one row by adding the underlying object to be selected to the [SfDataGrid.SelectedItems](#) property.

To programmatically select more than one row from the code, follow the code example:

#### C#

```
//Perform multiple selection using selected item
dataGrid.SelectedItems.Add (viewModel.OrdersInfo [4]);
dataGrid.SelectedItems.Add (viewModel.OrdersInfo [6]);
dataGrid.SelectedItems.Add (viewModel.OrdersInfo [9]);
dataGrid.SelectedItems.Add (viewModel.OrdersInfo [11]);
```

The following screenshot shows the selection functionality in the data grid:

OrderID	Genders	EmployeeID	CustomerID
10001	Male	10501	Linod
10002	Female	10502	Furib
10003	Male	10503	Folig
10004	Female	10504	Frans
10005	Male	10505	Picco
10006	Male	10506	Warth
10007	Female	10507	Riscu
10008	Female	10508	Seves
10009	Male	10509	Linod
10010	Male	10510	Folko
10011	Female	10511	Vaffe
10012	Male	10512	Welli
10013	Female	10513	Vaffe
10014	Female	10514	Alfki

### Keyboard behavior

**SfDataGrid** supports selection via keyboard interaction for the Xamarin.Forms.macOS and Xamarin.Forms.UWP platforms. Keyboard interaction will not have any effect when the **SfDataGrid.SelectionMode** is set as **SelectionMode.None**.

Key or key combinations	Description
DownArrow	Moves selection to the next row directly below the currently selected row when the SelectionMode is Single. Upon reaching the bottom of screen, pressing down arrow scrolls and applies selection to the next row if grid has scrollable content. If the selected row is the last row of grid, pressing down arrow does nothing. In <b>Multiple</b> and <b>SingleDeselect</b> selection modes, if the next row has already been selected, pressing down arrow key will deselect the row.
UpArrow	Moves selection to the previous row directly above the currently selected row when the SelectionMode is Single. Upon reaching the top of screen, pressing up arrow scrolls and applies selection to the previous row if grid has scrollable content. If the selected row is the first row of grid, pressing up arrow does nothing. In <b>Multiple</b> and <b>SingleDeselect</b> selection modes, if the previous row has already been selected, pressing up arrow key will deselect the row.
PageDown	SfDataGrid will be scrolled to the next set of rows that are not displayed in view including the partially displayed row. If selection is applied to any row, pressing PageDown arrow will move selection to the last row of the next set of rows when the SelectionMode is Single.
PageUp	SfDataGrid will be scrolled to the previous set of rows that are not displayed in view including the partially displayed row. If the selection is applied to any row, pressing PageUp will move selection to the first row of the next set of rows when the SelectionMode is Single.
