Tab	Moves selection to the next row directly below the currently selected row when the SelectionMode is Single. Upon reaching the bottom of screen, pressing Tab key scrolls and applies selection to the next row if grid has scrollable content. If the selected row is the last row of grid, pressing Tab key does nothing. In <b>Multiple</b> and <b>SingleDeselect</b> selection modes, if the next row has already been selected, pressing Tab key will deselect the row.
Ctrl + Home or Ctrl + UpArrow or Home	Scrolls grid to the first row of the collection.
Ctrl + End or Ctrl + DownArrow or End	Scrolls grid to the last row of the collection.

Enter or Ctrl + Enter	If the active current cell is in edit mode, changes will be committed and selection will be moved to the row below the active current cell. If the active current cell is in last row, commits changes and only editing is ended.
Esc	If the current cell is in edit mode, reverts the changes done in the current cell. If the underlying source implements the <a href="#">IEditableObject</a> , pressing Esc key for the second time will cancel the edit mode for the entire row.
Delete	Deletes all the rows that are currently in selection. To prevent rows from being deleted set the <a href="#">SfDataGrid.AllowDeleting</a> as <code>False</code> .

### Shift key combinations

Key combinations	Description
Shift + DownArrow	If the Selection Mode is multiple, the next multiple rows will be continuously selected below the currently selected row. If the Selection Mode is Single or SingleDeselect, selection will be moved to the next row.
Shift + UpArrow	If the Selection Mode is multiple, the previous multiple rows will be continuously selected above the currently selected row. If the Selection Mode is Single or SingleDeselect, selection will be moved to the previous row.
Shift + Tab	Moves selection to the previous row from the currently selected row when the SelectionMode is Single or SingleDeselect. If the selected row is in first row, pressing Shift +Tab does nothing.

### Customize key functionalities

To perform custom actions apart from the functionalities mentioned in the above tables for key press actions of the keyboard, implement your custom actions in the [ProcessKeyDown\(\)](#) override of the custom written selection controller class derived from [GridSelectionController](#) and assign it to the [SfDataGrid.GridSelectionController](#) property.

### XML

```
<ContentPage.Resources>
<local:CustomSelectionController x:Key="CustomSelectionController" />
</ContentPage.Resources>
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo,Mode=TwoWay}"
AllowEditing="True"
NavigationMode="Cell"
SelectionMode="Single"
SelectionController="{x:StaticResource CustomSelectionController}">
</syncfusion:SfDataGrid>
```

### C#

```
dataGrid.SelectionController = new CustomSelectionController();
```

### C#

```
public class CustomSelectionController : GridSelectionController
{
    public CustomSelectionController()
    {
        this.SelectedRows = new GridSelectedRowsCollection();
    }
    protected override void ProcessKeyDown(string keyCode, bool
isCtrlKeyPressed, bool isShiftKeyPressed)
    {
        if(keyCode == "Down")
        {
            // your logics here
        }
        else
        {
            // default key action
            base.ProcessKeyDown(keyCode, isCtrlKeyPressed, isShiftKeyPressed);
        }
    }
}
```

#### Scroll to selected item

You can scroll programmatically to the selected item by passing the `SelectedIndex` to the [SfDataGrid.ScrollToRowIndex](#) method.

### C#

```
dataGrid.ScrollToRowIndex((int) dataGrid.SelectedIndex);
```

#### Clear selection

Data grid allows you to clear the selection applied in the grid rows either by setting the `SfDataGrid.SelectionMode` to `None` or by calling the [SfDataGrid.SelectionController.ClearSelection \(\)](#) method.

### C#

```
//Clear selection using selection mode
dataGrid.SelectionMode = SelectionMode.None;
//Clear selection using selection controller
dataGrid.SelectionController.ClearSelection ();
```

**Note:** Selected items and selections will be cleared whenever the `ItemsSource` is changed at runtime.

#### Row header selection

Data grid allows you to select the grid row(s) upon tapping them over the grid cells. It also allows you to select the grid rows when you tap the row header cells. To enable selection in the data grid, set the [SfDataGrid.SelectionMode](#) property to a value other than `None`.

*Select records in the data grid when tapping only on the row header cells*

The data grid allows you to select a specific row or group of rows by touching the grid cells. However, to select the record only when tapping the row header cells, use the `SfDataGrid.SelectionChanging` event.

**C#**

```
dataGrid.SelectionMode = SelectionMode.Single;
private void DataGrid_SelectionChanging(object sender,
GridSelectionChangingEventArgs e)
{
    e.Cancel = true;
}
private void DataGrid_GridTapped(object sender, GridTappedEventArgs e)
{
    if(e.RowColumnIndex.ColumnIndex == 0)
    {
        dataGrid.SelectedIndex = e.RowColumnIndex.RowIndex;
    }
}
```

**Note:** To enable the row header in the data grid, set the `SfDataGrid.ShowRowHeader` to true.

*Selection animation*

The data grid supports selecting one or more rows programmatically or by touch interactions. In addition, the control also provides extensibility to animate the selected rows.

It can be done by extending the [GridSelectionController](#).

Refer to the following example in which a CustomSelectionController is derived from `GridSelectionController` and an instance of it is assigned to the `SfDataGrid.SelectionController` property to perform selection animation.

**XML**

```
<ContentPage.Resources>
<ResourceDictionary>
<local:CustomSelectionController x:Key="CustomSelectionController"
DataGrid="{x:Reference dataGrid}">
</local:CustomSelectionController>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<sfgrid:SfDataGrid x:Name="dataGrid"
ColumnSizer="Star"
SelectedIndex="1"
SelectionMode="Multiple"
VerticalOverScrollMode="None"
SelectionController="{StaticResource CustomSelectionController}" />
</ContentPage.Content>
```

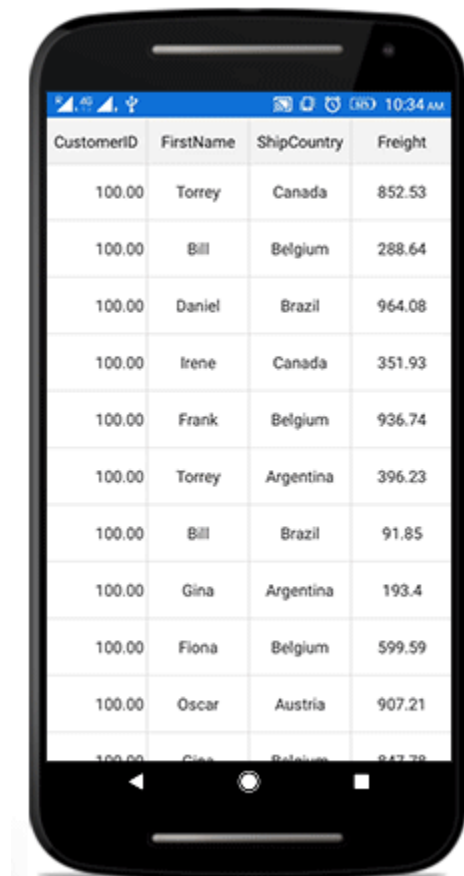

**C#**

```
this.dataGrid.ItemsSource = viewModel.OrdersInfo;
this.dataGrid.SelectionController = new CustomSelectionController();
```

```
this.dataGrid.SelectionMode = SelectionMode.Multiple;  
SelectionPicker.SelectedIndex = 1;
```

## C#

```
public class CustomSelectionController : GridSelectionController  
{  
    public CustomSelectionController()  
    {  
        this.SelectedRows = new GridSelectedRowsCollection();  
    }  
    protected override async void SetSelectionAnimation(VirtualizingCellsControl  
rowElement)  
    {  
        rowElement.Opacity = 0.50;  
        await rowElement.FadeTo(1, 400, Easing.CubicInOut);  
    }  
}
```

## Events in selection

The data grid provides the following events for selection:

- [SelectionChanging](#): This event is raised while selecting a row at the execution time before the row is selected. So it allows canceling the selection action by setting the Cancel property of `GridSelectionChangingEventArgs`.
- [SelectionChanged](#): This event is raised after the column is selected.

These two events are triggered with `GridSelectionChangingEventArgs` and [GridSelectionChangedEventArgs](#) that contain the following properties:

- `AddedItems`: Gets collection of the underlying data objects added for selection.
- `RemovedItems`: Gets collection of the underlying data objects removed from selection.

To hook the `SelectionChanging` event and cancel the selection of a column, follow the code example:

#### C#

```
dataGrid.SelectionChanging += DataGrid_SelectionChanging;
void DataGrid_SelectionChanging (object sender, GridSelectionChangingEventArgs e)
{
    e.Cancel = true;
}
```

To get the selected item in code-behind using the `SelectionChanged` event, follow the code example:

#### C#

```
dataGrid.SelectionChanged += DataGrid_SelectionChanged;
private void DataGrid_SelectionChanged (object sender,
GridSelectionChangedEventArgs e)
{
    // Gets the selected item
    var selectedItem = e.AddedItems[0];
}
```

#### CurrentItem

The [SfDataGrid.CurrentItem](#) property holds the underlying data of the last selected row in data grid.

Get the current item in the `SfDataGrid.SelectionChanged` event by setting the `SfDataGrid.SelectionMode` as `Multiple` or `SingleDeselect`. If the `SelectionMode` is `Single`, the current item and selected item are same.

#### C#

```
dataGrid.SelectionMode = SelectionMode.Multiple;
dataGrid.SelectionChanged += DataGrid_SelectionChanged;
void DataGrid_SelectionChanged (object sender, GridSelectionChangedEventArgs e)
{
    var currentItem = dataGrid.CurrentItem;
    //your codes
}
```

## Customizing Selection Appearance

### *Adding multiple selection color*

The data grid supports selecting one or more rows either programmatically or by touch interactions. By default, the control applies a common background color for the selected rows based on the current theme. However, it also provides extensibility to have multiple selection colors when touching the rows by writing a custom SelectionController derived from [GridSelectionController](#), and assigning it to the [SfDataGrid.SelectionController](#) property. Override the GetSelectionColor() method to apply different colors for selection at runtime.

To set different colors for the selected rows in the data grid, follow the code example:

#### **C#**

```
sfGrid.SelectionController = new CustomSelectionController(sfGrid);  
sfGrid.SelectionMode = SelectionMode.Multiple;
```

#### **C#**

```
public class CustomSelectionController : GridSelectionController  
{  
    public Color[] SelectionColors { get; set; }  
    public CustomSelectionController(SfDataGrid datagrid) : base(datagrid)  
    {  
        this.DataGrid = datagrid;  
        SelectionColors = new Color[11]  
        {  
            Color.DarkSalmon,  
            Color.DarkSlateGray,  
            Color.Red,  
            Color.Blue,  
            Color.DarkOliveGreen,  
            Color.Black,  
            Color.Gray,  
            Color.MediumPurple,  
            Color.BurlyWood,  
            Color.DarkCyan,  
            Color.DarkGoldenrod  
        };  
    }  
    //Code to set multiple selection colors  
    public override Color GetSelectionColor(int rowIndex, object rowData)  
    {  
        if (SelectionColors != null)  
            return SelectionColors[rowIndex % 11];  
        else  
            return Color.Blue;  
    }  
}
```

The following screenshot shows the final outcome upon execution of the above code:

OrderID	Genders	EmployeeID	CustomerID
10001	Male	10501	Frans
10002	Female	10502	Warth
10003	Female	10503	Warth
10004	Female	10504	Warth
10005	Male	10505	Welli
10006	Male	10506	Riscu
10007	Male	10507	Vaffe
10008	Male	10508	Blonp
10009	Male	10509	Vaffe
10010	Male	10510	Folig
10011	Male	10511	Seves
10012	Female	10512	Warth
10013	Male	10513	Linod
10014	Female	10514	Folko
10015	Male	10515	Warth

### *Changing selection background and foreground color*

The SfDataGrid allows you to change the selection background and foreground colors by returning the required color in the `GetSelectionBackgroundColor` and `GetSelectionForegroundColor` properties overrides in the custom style class overriding from [DataGridStyle](#) and assign it to the [SfDataGrid.GridStyle](#) property.

#### **XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:sfgrid="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
"
xmlns:local="clr-namespace:SummaryDemo"
x:Class="SummaryDemo.Summary">
<ContentPage.Resources>
<ResourceDictionary>
<local:SelectionStyle x:Key="selectionStyle"/>
</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid"
GridStyle="{StaticResource selectionStyle}"
ItemsSource="{Binding OrdersInfo}" />
</ContentPage>
```

#### **C#**

```
//Apply selection background and foreground color to SfDataGrid from code.
SfDataGrid dataGrid = new SfDataGrid();
dataGrid.GridStyle = new SelectionStyle();
```

#### **C#**

```
//Custom style class
public class SelectionStyle : DataGridStyle
{
    public SelectionStyle()
    {
    }
    public override Color GetSelectionBackgroundColor()
    {
        return Color.Blue;
    }
    public override Color GetSelectionForegroundColor()
    {
        return Color.White;
    }
}
```

OrderID	Genders	EmployeeID	CustomerID
10001	Female	10501	Simob
10002	Female	10502	Folko
10003	Female	10503	Furib
10004	Female	10504	Simob
10005	Male	10505	Riscu
10006	Male	10506	Riscu
10007	Female	10507	Riscu
10008	Female	10508	Seves
10009	Male	10509	Blonp
10010	Female	10510	Warth
10011	Male	10511	Riscu
10012	Male	10512	Furib
10013	Male	10513	Welli

#### *Changing current cell border color*

The SfDataGrid allows you to change the current cell border color applied to the grid cells when entering the edit mode by returning the required color in the `GetCurrentCellBorderColor` override of your custom style class derived from [DataGridStyle](#) and assign it to the [SfDataGrid.GridStyle](#) property.

#### **XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms">
```

```
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:sfgrid="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
"
xmlns:local="clr-namespace:SummaryDemo"
x:Class="SummaryDemo.Summary">
<ContentPage.Resources>
<ResourceDictionary>
<local:SelectionStyle x:Key="selectionStyle"/>
</ResourceDictionary>
</ContentPage.Resources>
<sfgrid:SfDataGrid x:Name="dataGrid"
GridStyle="{StaticResource selectionStyle}"
ItemsSource="{Binding OrdersInfo}" />
</ContentPage>
```

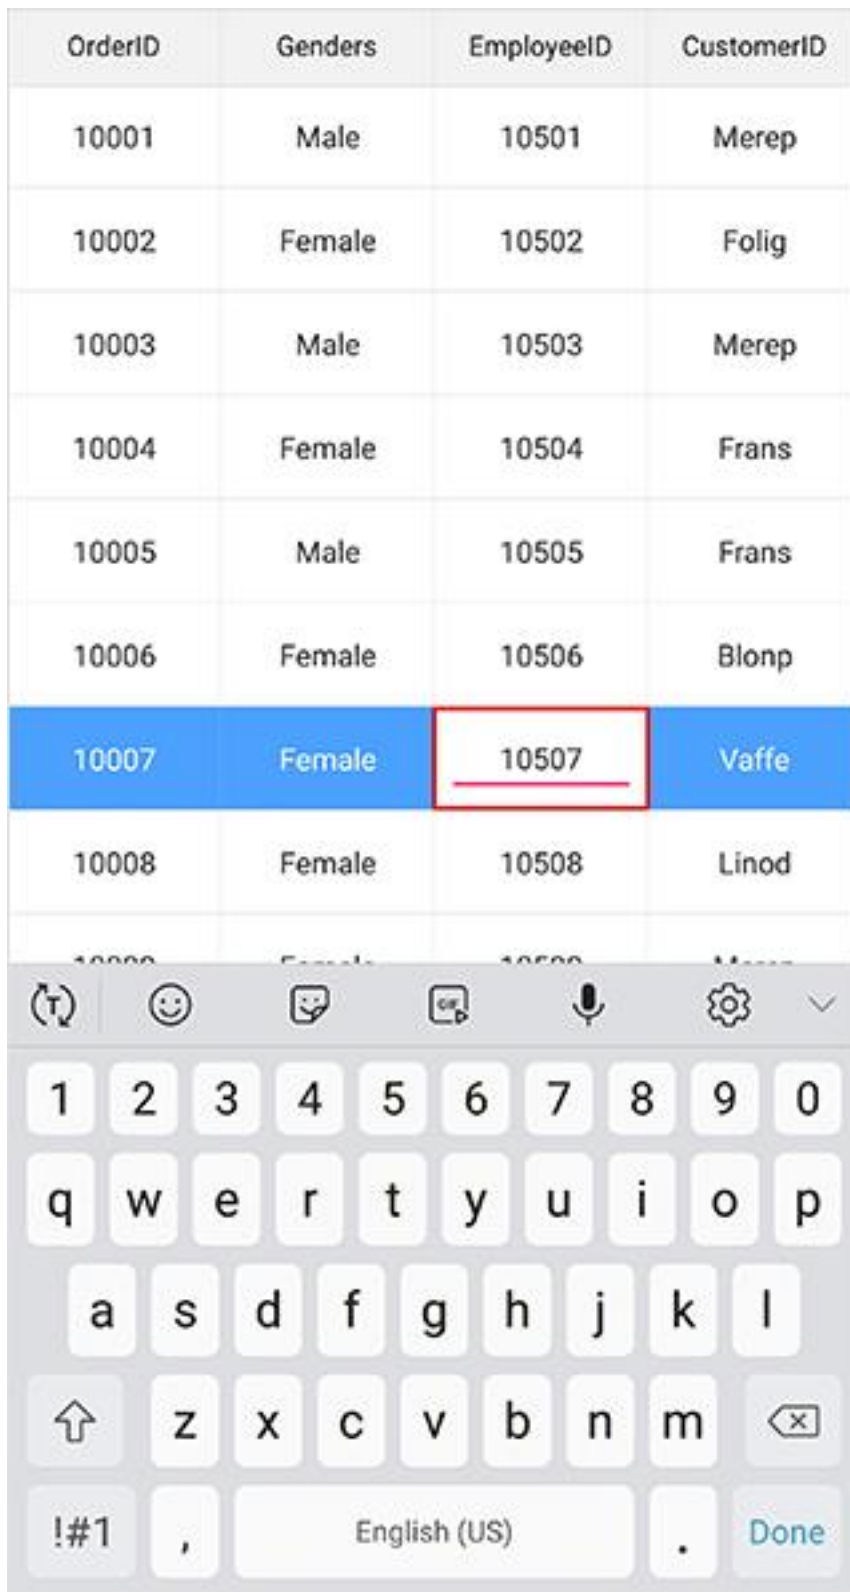

### C#

```
//Apply selection background and foreground color to SfDataGrid from code.
SfDataGrid dataGrid = new SfDataGrid();
dataGrid.GridStyle = new SelectionStyle();
```

### C#

```
//Custom style class
public class SelectionStyle : DataGridStyle
{
    public SelectionStyle()
    {
    }
    public override Color GetCurrentCellBorderColor()
    {
        return Color.Pink;
    }
}
```

OrderID	Genders	EmployeeID	CustomerID
10001	Male	10501	Merep
10002	Female	10502	Folig
10003	Male	10503	Merep
10004	Female	10504	Frans
10005	Male	10505	Frans
10006	Female	10506	Blonp
10007	Female	10507	Vaffe
10008	Female	10508	Linod
10009	Female	10509	Merep

#### Binding selection properties

The SfDataGrid allows you to bind the selection properties such as [SelectedIndex](#) and [SelectedItem](#) to the properties in the ViewModel directly.

## XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:sfgrid="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
"
xmlns:local="clr-namespace:SummaryDemo"
x:Class="SummaryDemo.Summary">
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<sfgrid:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}"
SelectionMode="Multiple"
SelectedIndex="{Binding DataGridSelectedIndex,Mode=TwoWay}"
SelectedItem="{Binding DataGridSelectedItem,Mode=TwoWay}"/>
```

## C#

```
// In ViewModel.cs
private int dataGridSelectedIndex;
private object dataGridSelectedItem;
public int DataGridSelectedIndex
{
    get
    {
        return dataGridSelectedIndex;
    }
    set
    {
        this.dataGridSelectedIndex = value;
        RaisePropertyChanged("DataGridSelectedIndex");
    }
}
public object DataGridSelectedItem
{
    get
    {
        return dataGridSelectedItem;
    }
    set
    {
        this.dataGridSelectedItem = value;
        RaisePropertyChanged("DataGridSelectedItem");
    }
}
public ViewModel()
{
    DataGridSelectedIndex = 2;
    DataGridSelectedItem = OrdersInfo[5];
}
```

## Stacked Headers

The SfDataGrid supports displaying additional unbound, multiple/multilevel header rows known as **StackedHeaderRows** that spans across the DataGrid columns. You can group one or more columns under each stacked header.

Each **StackedHeaderRow** contains **StackedColumns**, which contains a number of child columns. The **StackedColumn.ChildColumns** property contains the columns grouped under the stacked header row. The **StackedColumn.MappingName** is a unique name used for mapping a specific child column grouped under the same stacked header row, whereas the **StackedColumn.Text** contains the text displayed in the stacked header row.

### Adding stacked header

The stacked headers can be added using the following steps:

1. Create an object of **StackedHeaderRow** for adding stacked columns.
2. Add the columns using the **ChildColumns** property of **StackedColumn**.
3. Add the **StackedColumn** to **StackedColumns** collection.
4. Finally, add the **StackedHeaderRow** to **StackedHeaderRows** collection of the SfDataGrid.

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding Orders}">
  <syncfusion:SfDataGrid.StackedHeaderRows>
    <syncfusion:StackedHeaderRow>
      <syncfusion:StackedHeaderRow.StackedColumns>
        <syncfusion:StackedColumn
ChildColumns="OrderID, OrderDate, CustomerID, ContactName"
Text="Order Shipment Details"
MappingName="SalesDetails"
FontAttribute="Bold"
TextAlignment="Center"
/>
      </syncfusion:StackedHeaderRow.StackedColumns>
    </syncfusion:StackedHeaderRow>
    <syncfusion:StackedHeaderRow>
      <syncfusion:StackedHeaderRow.StackedColumns>
        <syncfusion:StackedColumn
ChildColumns="OrderID, OrderDate"
Text="Order Details"
MappingName="OrderDetails"
FontAttribute="Bold"
TextAlignment="Center"
/>
        <syncfusion:StackedColumn
ChildColumns="CustomerID, ContactName"
Text="Customer Details"
MappingName="CustomerDetails"
FontAttribute="Bold"
TextAlignment="Center"
/>
      </syncfusion:StackedHeaderRow.StackedColumns>
    </syncfusion:StackedHeaderRow>
  </syncfusion:SfDataGrid.StackedHeaderRows>
</syncfusion:SfDataGrid>
```

```
</syncfusion:SfDataGrid.StackedHeaderRows>  
</syncfusion:SfDataGrid>
```

## C#

```
var stackedHeaderRow = new StackedHeaderRow();  
stackedHeaderRow.StackedColumns.Add(new StackedColumn()  
{  
    ChildColumns = "OrderID" + "," + "OrderDate" + "," + "CustomerID" + "," +  
    "ContactName",  
    Text = "Order Shipment Details",  
    MappingName = "SalesDetails",  
    FontAttribute = FontAttributes.Bold,  
    TextAlignment = TextAlignment.Center,  
});  
dataGrid.StackedHeaderRows.Add(stackedHeaderRow);  
var stackedHeaderRow1 = new StackedHeaderRow();  
stackedHeaderRow1.StackedColumns.Add(new StackedColumn()  
{  
    ChildColumns = "OrderID" + "," + "OrderDate",  
    Text = "Order Details",  
    MappingName = "OrderDetails",  
    FontAttribute = FontAttributes.Bold,  
    TextAlignment = TextAlignment.Center  
});  
stackedHeaderRow1.StackedColumns.Add(new StackedColumn()  
{  
    ChildColumns = "CustomerID" + "," + "ContactName",  
    Text = "Customer Details",  
    MappingName = "CustomerDetails",  
    FontAttribute = FontAttributes.Bold,  
    TextAlignment = TextAlignment.Center  
});  
this.dataGrid.StackedHeaderRows.Add(stackedHeaderRow1);
```

5:21 100%

Order Shipment Details			
Order Details		Customer Details	
Order ID	Order Date	Customer ID	Contact Name
10001	08-10-2008	1761	Ralph
10002	04-07-2009	1790	Torrey
10003	15-04-2010	1795	Bill
10004	24-12-2006	1740	Oscar
10005	20-04-2002	1773	Oscar
10006	13-06-2004	1701	William
10007	11-11-2000	1781	Katie
10008	29-07-2011	1720	Michael
10009	04-05-2005	1791	Michael
10010	20-03-2010	1779	Oscar
10011	01-10-2010	1736	Bill
10012	08-03-2012	1714	Michael
10013	10-03-2007	1749	Oscar
10014	30-08-2013	1729	Torrey
10015	21-06-2012	1708	William
10016	20-05-2001	1712	Brenda
10017	09-10-2008	1711	William

### Adding child columns

You can add the child columns to a particular stacked header row directly.

#### C#

```
var childColumn =  
dataGrid.StackedHeaderRows[0].StackedColumns[0].ChildColumns;  
dataGrid.StackedHeaderRows[0].StackedColumns[0].ChildColumns = childColumn +  
", " + "OrderDate";
```

### Removing child columns

Similarly, you can remove the child columns from a particular stacked header row directly.

#### C#

```
var removingColumns =  
this.dataGrid.StackedHeaderRows[0].StackedColumns[0].ChildColumns.Split(',')  
.ToList<string>();  
string childColumns = string.Empty;  
foreach(var stackedColumnName in removingColumns.ToList())  
{  
    if (stackedColumnName.Equals("OrderID"))  
    {  
        removingColumns.Remove(stackedColumnName);  
    }  
    else  
    {  
        childColumns = childColumns + stackedColumnName + ", ";  
    }  
}  
dataGrid.StackedHeaderRows[0].StackedColumns[0].ChildColumns = childColumns;
```

### Changing stacked header row height

You can change the height of StackedHeaderRows using the `SfDataGrid.HeaderRowHeight` property.

#### C#

```
dataGrid.HeaderRowHeight = 50;
```

You can also change the height of stacked header rows using the `SfDataGrid.QueryRowHeight` event.

#### C#

```
dataGrid.QueryRowHeight += dataGrid_QueryRowHeight;  
void dataGrid_QueryRowHeight(object sender, QueryRowHeightEventArgs e)  
{  
    if(e.RowIndex < this.dataGrid.GetHeaderIndex())  
    {  
        // Using the following code, you can set a desired height based on the row  
        // index.  
        e.Height = 50;  
        // Uncomment the below line of code to apply auto fit height based on the  
        // contents of the stacked header row.  
        //e.Height = dataGrid.GetRowHeight(e.RowIndex);  
        e.Handled = true;  
    }  
}
```

```
}
}
```

## Appearance

### Font customization

Customize the font's size, family and attribute of the text displayed in stacked header column using the `StackedColumn.TextSize`, `StackedColumn.Font`, and `StackedColumn.FontAttribute` properties, respectively. The default font size and font attribute are 14 and normal, respectively.

### XML

```
<syncfusion:StackedHeaderRow>
  <syncfusion:StackedHeaderRow.StackedColumns>
    <syncfusion:StackedColumn
      ChildColumns="OrderID,OrderDate,CustomerID,ContactName"
      Text="Order Shipment Details"
      MappingName="SalesDetails"
      TextSize = 16
      Font="Helvetica Neue"
      FontAttribute="Bold"
    />
  </syncfusion:StackedHeaderRow.StackedColumns>
</syncfusion:StackedHeaderRow>
```

### C#

```
var stackedHeaderRow = new StackedHeaderRow();
stackedHeaderRow.StackedColumns.Add(new StackedColumn()
{
    ChildColumns = "OrderID" + "," + "OrderDate" + "," + "CustomerID" + "," +
    "ContactName",
    Text = "Order Shipment Details",
    MappingName = "SalesDetails",
    TextSize = 14,
    Font = "Helvetica Neue",
    FontAttribute = FontAttributes.Bold
});
dataGrid.StackedHeaderRows.Add(stackedHeaderRow);
```

### Foreground and background customization

The appearance of stacked header row can be customized by returning a desired color in the `GetStackedHeaderBackgroundColor()` and `GetStackedHeaderForegroundColor()` overrides of the custom written style class derived from `DataGridStyle` and assigning it to the `SfDataGrid.GridStyle` property.

### XML

```

    public Dark ()
    {
    }
    public override Color GetStackedHeaderBackgroundColor(int rowIndex)
    {
        return Color.DarkGoldenrod;
    }
    public override Color GetStackedHeaderForegroundColor(int rowIndex)
    {
        return Color.FromRgb(255, 255, 255);
    }
}
```

Order Shipment Details			
Order Details		Customer Details	
Order ID	Order Date	Customer ID	Contact Name
10001	08-10-2008	1764	Fiona
10002	04-07-2009	1738	Fiona
10003	15-04-2010	1778	Oscar
10004	24-12-2006	1725	Frank
10005	20-04-2002	1725	Oscar
10006	13-06-2004	1706	Torrey
10007	11-11-2000	1721	Katie
10008	29-07-2011	1763	Michael
10009	04-05-2005	1768	Ralph
10010	20-03-2010	1772	Brenda
10011	01-10-2010	1736	Danielle
10012	08-03-2012	1756	Kyle
10013	10-03-2007	1794	Bill
10014	30-08-2013	1780	Danielle
10015	21-06-2012	1791	Michael
10016	20-05-2001	1764	Michael
10017	09-10-2008	1724	Danielle

### Conditional styling

The SfDataGrid also allows to customize the appearance of stacked header rows conditionally based on its row index.

### C#

```
//Custom style class
public class Dark : DataGridStyle
{
    public Dark ()
    {
    }
    public override Color GetStackedHeaderBackgroundColor(int rowIndex)
    {
        if (rowIndex == 0)
```

```
{
    return Color.Black;
}
else if (rowIndex == 1)
{
    return Color.DarkOliveGreen;
}
}
public override Color GetStackedHeaderForegroundColor(int rowIndex)
{
    if (rowIndex == 0 || rowIndex == 1)
    {
        return Color.FromRgb(255, 255, 255);
    }
    else
    {
        return Color.FromRgb(43, 43, 43);
    }
}
}
```

10017	09-10-2008	1762	Danielle

Loading template in stacked column

The SfDataGrid allows you to load any desired view inside a `StackedColumn` using the `StackedColumn.Template` property.

#### XML

```
<syncfusion:SfDataGrid.StackedHeaderRows>
<syncfusion:StackedHeaderRow>
<syncfusion:StackedHeaderRow.StackedColumns>
<syncfusion:StackedColumn
ChildColumns="OrderID,OrderDate"
Text="Order Details"
MappingName="OrderDetails"
FontAttribute="Bold"
TextAlignment="Center"
```

```

/>
<syncfusion:StackedColumn
ChildColumns="CustomerID,ContactName"
MappingName="CustomerDetails"
>
<syncfusion:StackedColumn.Template>
<DataTemplate>
<Grid BackgroundColor="MediumPurple">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="*" />
<ColumnDefinition Width="50" />
</Grid.ColumnDefinitions>
<Label Text="Customer Details" TextColor="White"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center"
Grid.Column="0" />
<Image Source="customer_details.png" VerticalOptions="Center"
HorizontalOptions="Start" Aspect="AspectFit" Grid.Column="1" />
</Grid>
</DataTemplate>
</syncfusion:StackedColumn.Template>
</syncfusion:StackedColumn>
</syncfusion:StackedHeaderRow.StackedColumns>
</syncfusion:StackedHeaderRow>
</syncfusion:SfDataGrid.StackedHeaderRows>

```

**C#**

```

var stackedHeaderRow1 = new StackedHeaderRow();
stackedHeaderRow1.StackedColumns.Add(new StackedColumn()
{
    ChildColumns = "OrderID" + "," + "OrderDate",
    Text = "Order Details",
    MappingName = "OrderDetails",
    FontAttribute = FontAttributes.Bold,
    TextAlignment = TextAlignment.Center
});
stackedHeaderRow1.StackedColumns.Add(new StackedColumn()
{
    ChildColumns = "CustomerID" + "," + "ContactName",
    MappingName = "CustomerDetails",
    Template = new DataTemplate(() =>
    {
        var gridView = new Grid()
        {
            BackgroundColor = Color.MediumPurple,
            ColumnDefinitions = new ColumnDefinitionCollection()
            {
                new ColumnDefinition{Width = new GridLength(1, GridUnitType.Star) },
                new ColumnDefinition{ Width = 50}
            }
        };
        var imageView = new Image()
        {
            Source = ImageSource.FromFile("customer_details.png"),
            Aspect = Aspect.AspectFit,
            VerticalOptions = LayoutOptions.Center,

```

```
HorizontalOptions = LayoutOptions.Start
};
var label = new Label()
{
    Text = "Customer Details",
    TextColor = Color.White,
    VerticalTextAlignment = TextAlignment.Center,
    HorizontalTextAlignment = TextAlignment.Center
};
gridView.Children.Add(label, 0, 0);
gridView.Children.Add(imageView, 1, 0);
return gridView;
})
});
this.dataGrid.StackedHeaderRows.Add(stackedHeaderRow1);
```

## Load More

The data grid enables **LoadMore** option when the [SfDataGrid.AllowLoadMore](#) property is set to **true**, and also by setting the [SfDataGrid.LoadMoreCommand](#) property. When **LoadMore** is enabled, the control loads a subset of data to its data source at runtime using [LoadMoreView](#).

When the grid reaches maximum offset while scrolling down, an interactive load more view is displayed. Tapping the load more view triggers a command to add more data to the data source of the grid at runtime.

## Load more command

The data grid load records to its data source at runtime by triggering an **ICommand** bound to the [SfDataGrid.LoadMoreCommand](#) property. When the load more view is tapped, the **CanExecute** of the **ICommand** returns **true**, and this command is triggered to load the records at runtime.

Set the [SfDataGrid.IsBusy](#) property to `true` before loading items to notify the grid that more items are to be loaded. Set the property to `false` after loading items to the grid. When loading items, alter the time for the [LoadMore](#) animation from the sample by setting a delay based on the requirement.

To enable and load items at runtime, follow the code example:

### C#

```
//Enable load more in SfDataGrid
dataGrid.AllowLoadMore = true;
dataGrid.LoadMoreCommand = new Command(ExecuteLoadMoreCommand);
private async void ExecuteLoadMoreCommand()
{
    this.dataGrid.IsBusy = true;
    await Task.Delay(new TimeSpan(0, 0, 5));
    viewModel.LoadMoreItems ();
    this.dataGrid.IsBusy = false;
}
//ViewModel.cs
private OrderInfoRepository order;
public ViewModel()
{
    SetRowsToGenerate(50);
}
//ItemsSource
private ObservableCollection<OrderInfo> ordersInfo;
public ObservableCollection<OrderInfo> OrdersInfo
{
    get { return ordersInfo; }
    set { this.ordersInfo = value; }
}
//ItemsSource Generator
public void SetRowsToGenerate(int count)
{
    order = new OrderInfoRepository();
    ordersInfo = order.GetOrderDetails(count);
}
public void LoadMoreItems()
{
    for (int i = 0; i < 20; i++)
    {
        this.OrdersInfo.Add(order.GenerateOrder(OrdersInfo.Count + 1));
    }
}
//OrderInfoRepository.cs
public ObservableCollection<OrderInfo> GetOrderDetails (int count)
{
    ObservableCollection<OrderInfo> orderDetails = new
    ObservableCollection<OrderInfo> ();
    for (int i = 10001; i <= count + 10000; i++) {
        var order = new OrderInfo () {
            OrderID = i,
            CustomerID = CustomerID [random.Next (7)],
            EmployeeID = random.Next (1700, 1800).ToString (),
            FirstName = FirstNames [random.Next (7)],
            LastName = LastNames [random.Next (7)]
        };
        orderDetails.Add (order);
    }
}
```

```

return orderDetails;
}
public OrderInfo GenerateOrder(int id)
{
var order = new OrderInfo(){
OrderID = (id + 10000),
CustomerID = CustomerID [random.Next (15)],
EmployeeID = random.Next (1700, 1800).ToString (),
FirstName = FirstNames [random.Next (15)],
LastName = LastNames [random.Next (15)],
};
return order;
}
//Main DataSources
string[] FirstNames = new string[] {
"Kyle",
"Gina",
"Irene",
"Katie",
"Michael",
"Oscar",
"Ralph"
};
string[] LastNames = new string[] {
"Adams",
"Crowley",
"Ellis",
"Gable",
"Irvine",
"Keefe",
"Mendoza"
};
string[] CustomerID = new string[] {
"Adams",
"Frans",
"Katie",
"Laura",
"Wilson",
"Andrew",
"Lenny"
};
};

```

### Customize load more display text

Customize the text displayed in the `LoadMoreView` by setting the [SfDataGrid.LoadMoreText](#) property as follows:

#### C#

```

//setting load more text in SfDataGrid
dataGrid.LoadMoreText = "Load More Items";

```

### Customize load more view position

Customize the displayed `LoadMoreView` to either `top` or `bottom` based on the requirement.

#### C#

```
//Enable load more in SfDataGrid  
dataGrid.LoadMorePosition = LoadMoreViewPosition.Bottom;
```

### Customize LoadMoreView

The data grid also customizes **LoadMoreView** based on the requirements. To do this, write custom **LoadMoreView** class inheriting from **LoadMoreView**, and perform the **LoadMoreOperation**.

To customize **LoadMoreView**, follow the code example:

#### C#

```
public class CustomLoadMoreView : LoadMoreView  
{  
    private Button loadMoreView;  
    public CustomLoadMoreView()  
    {  
        this.BackgroundColor = Color.Red;  
        loadMoreView = new Button ();  
        loadMoreView.Text = "LoadItems";  
        this.Children.Add(loadMoreView);  
        loadMoreView.Clicked += loadMoreView_Tapped;  
    }  
    void loadMoreView_Tapped (object sender, EventArgs e)  
    {  
        if (this.LoadMoreCommand != null)  
        {  
            this.LoadMoreCommand.Execute(null);  
        }  
    }  
    protected override void LayoutChildren(double x, double y, double width, double height)  
    {  
        loadMoreView.Layout(new Rectangle(x, y, width, height));  
    }  
}
```

Running application renders the following output:

You can download a readily runnable sample that illustrates enabling and using the load more functionality, [here](#).

### Pull To Refresh

The data grid enables the `PullToRefresh` option by setting the `SfDataGrid.AllowPullToRefresh` property to `true` and by setting the `SfDataGrid.PullToRefreshCommand` property. When the `PullToRefresh` is enabled, the control supports for refreshing the data source at runtime while doing the pull to refresh action.

### Pull to refresh command

The data grid refreshes the data in view at runtime by triggering an `ICommand` bound to the `SfDataGrid.PullToRefreshCommand` property. While you perform pull to refresh action, if the progress bar meets 100 %, then this command is triggered to refresh the records in view.

Set the `SfDataGrid.IsBusy` property to `true` before refreshing the records to notify the grid that pull to refresh action is being performed and set the property to `false` after the view is refreshed. You can also alter the pull to refresh animation time from the sample by setting a delay.

To enable and perform pull to refresh operation, follow the code example:

### C#

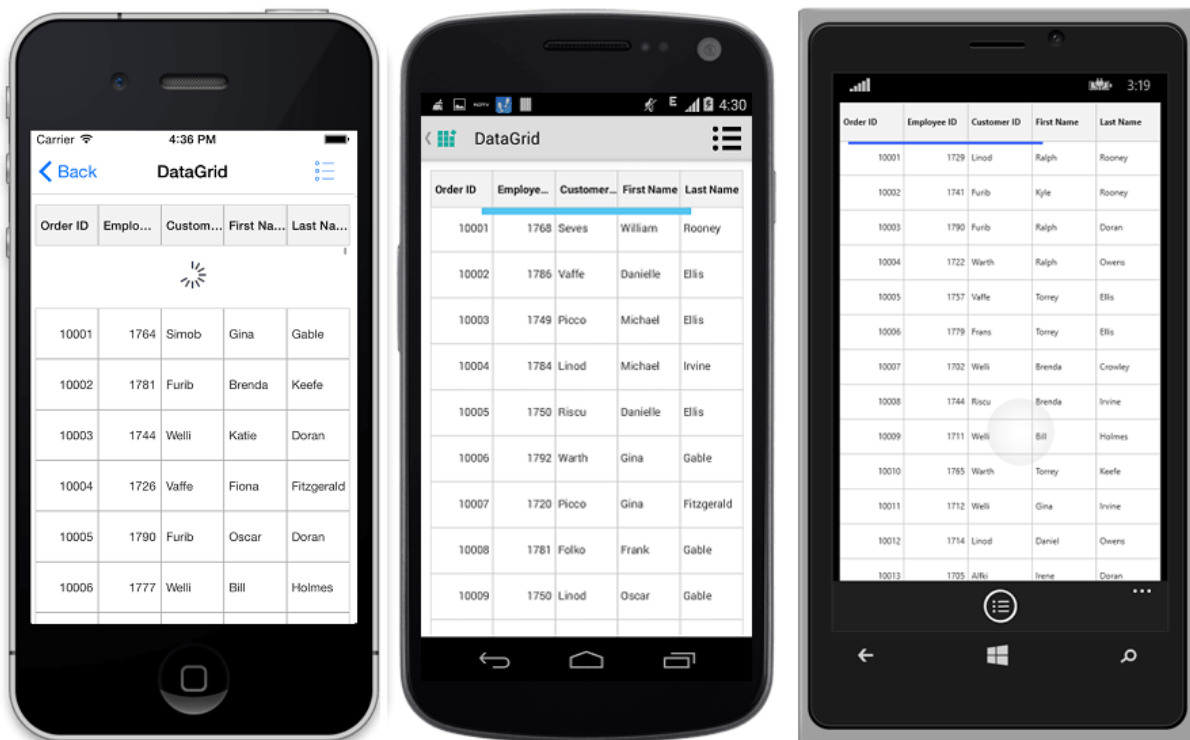

```
//Enable PullToRefresh in SfDataGrid
dataGrid.AllowPullToRefresh = true;
dataGrid.PullToRefreshCommand = new Command(ExecutePullToRefreshCommand);
private async void ExecutePullToRefreshCommand()
{
    this.dataGrid.IsBusy = true;
```

```
await Task.Delay(new TimeSpan(0, 0, 5));
viewModel.ItemsSourceRefresh ();
this.dataGrid.IsBusy = false;
}
//ViewModel.cs
private OrderInfoRepository order;
public ViewModel()
{
    SetRowsToGenerate(50);
}
//ItemsSource
private ObservableCollection<OrderInfo> ordersInfo;
public ObservableCollection<OrderInfo> OrdersInfo
{
    get { return ordersInfo; }
    set { this.ordersInfo = value; }
}
//ItemsSource Generator
public void SetRowsToGenerate(int count)
{
    order = new OrderInfoRepository();
    ordersInfo = order.GetOrderDetails(count);
}
public void ItemsSourceRefresh()
{
    int count = random.Next (1, 6);
    for (int i = 11000; i < 11000 + count; i++)
    {
        int value = i + random.Next (100, 150);
        this.OrdersInfo.Insert (0, order.RefreshItemsSource (value));
    }
}
//OrderInfoRepository.cs
public ObservableCollection<OrderInfo> GetOrderDetails (int count)
{
    ObservableCollection<OrderInfo> orderDetails = new
    ObservableCollection<OrderInfo> ();
    for (int i = 10001; i <= count + 10000; i++) {
        var order = new OrderInfo () {
            OrderID = i,
            CustomerID = CustomerID [random.Next (7)],
            EmployeeID = random.Next (1700, 1800).ToString (),
            FirstName = FirstNames [random.Next (7)],
            LastName = LastNames [random.Next (7)]
        };
        orderDetails.Add (order);
    }
    return orderDetails;
}
public OrderInfo RefreshItemsource(int i)
{
    var order = new OrderInfo(){
        OrderID = i,
        CustomerID = CustomerID[random.Next(7)],
        EmployeeID = random.Next(1700, 1800).ToString(),
        FirstName = FirstNames[random.Next(7)],
        LastName = LastNames[random.Next(7)]
    }
```

```
};  
return order;  
}  
//Main DataSources  
string[] FirstNames = new string[] {  
    "Kyle",  
    "Gina",  
    "Irene",  
    "Katie",  
    "Michael",  
    "Oscar",  
    "Ralph"  
};  
string[] LastNames = new string[] {  
    "Adams",  
    "Crowley",  
    "Ellis",  
    "Gable",  
    "Irvine",  
    "Keefe",  
    "Mendoza"  
};  
string[] CustomerID = new string[] {  
    "Hanna",  
    "Frans",  
    "Maria",  
    "John",  
    "Andrew",  
    "Fuller",  
    "Carter"  
};
```

Running application renders the following output:

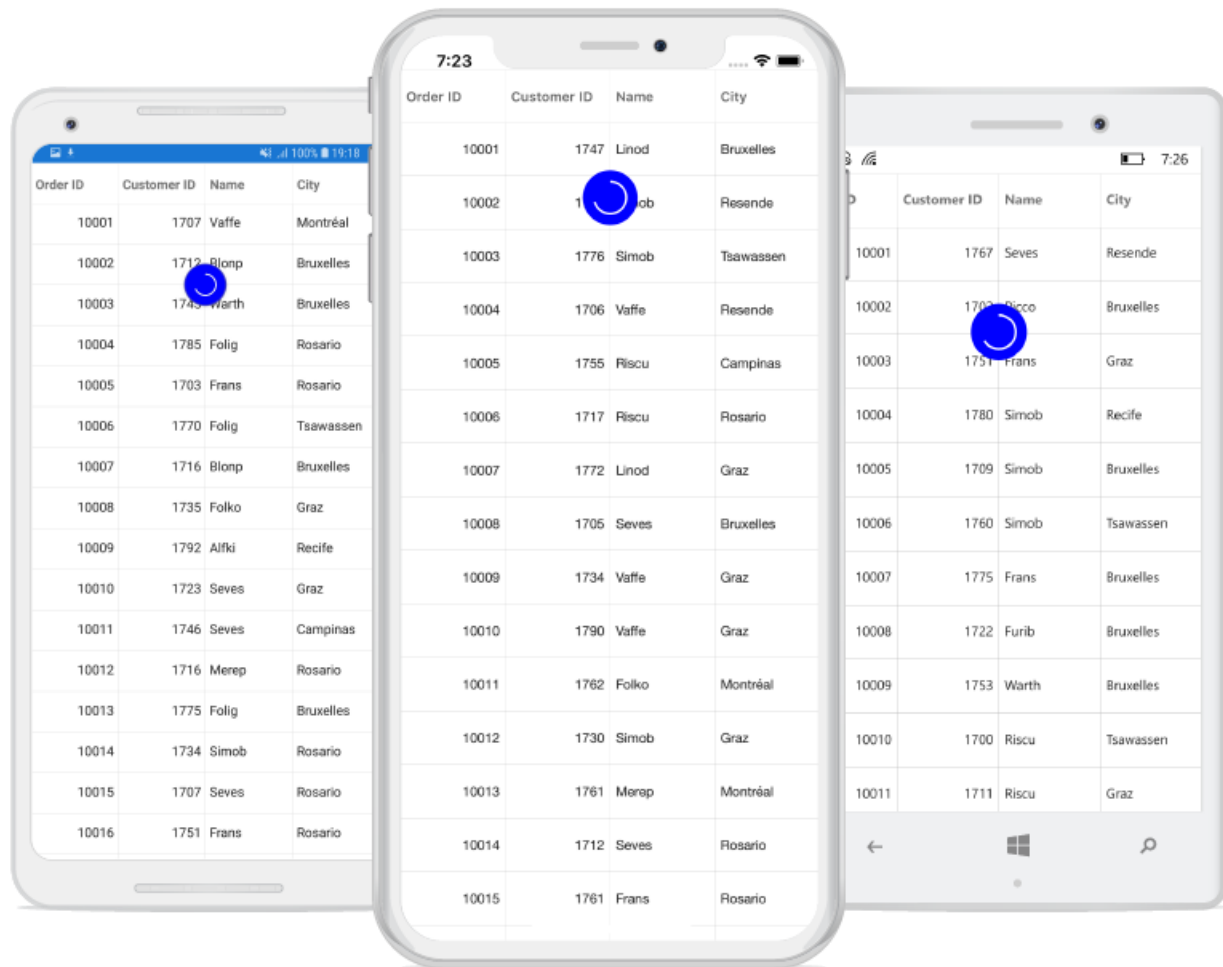

### Host the data grid inside pull-to-refresh

The pull-to-refresh is a refreshing control allows you to interact and refresh the view loaded in it. When the control is hosted inside the pull-to-refresh, it is used to refresh the item while performing the pull to refresh action.

For more details and code example for hosting the SfDataGrid inside SfPullToRefresh, refer [here](#).

The output will look like on iOS, Android, and Windows Phone devices as follows:

## Column Drag And Drop

The SfDataGrid allows dragging and dropping a column header by setting the [SfDataGrid.AllowDraggingColumn](#) property to `true`. The Drag view is displayed while dragging a column header. Based on the requirements, drag and drop operations can be handled by using the [SfDataGrid.QueryColumnDragging](#) event.

To enable column drag and drop, follow the code example:

### XML

```
<syncfusion:SfDataGrid AllowDraggingColumn="True" />
```

### C#

```
dataGrid.AllowDraggingColumn = true;
```

OrderID	Gender	EmployeeID	CustomerID
10001	Male	10501	Frans
10002	Male	10502	Alfki
10003	Female	10503	Frans
10004	Female	10504	Simob
10005	Male	10505	Linod
10006	Female	10506	Alfki
10007	Male	10507	Furib
10008	Female	10508	Simob
10009	Male	10509	Vaffe
10010	Female	10510	Blonp

### Column drag and drop events

The `QueryColumnDragging` event is fired while dragging a column. It will be continuously fired till the dragging ends. By handling the `SfDataGrid.QueryColumnDragging` event, dragging of a particular column header can be canceled.

`QueryColumnDragging` event provides the following properties in the [QueryColumnDraggingEventArgs](#):

- [From](#): Returns index of the currently dragging column.
- [To](#): Returns dragging index where you try to drop the column.
- [Reason](#): Returns the column dragging details as the [QueryColumnDraggingReason](#).
- [DraggingPosition](#): Returns positions of the drag view during column drag and drop operations.
- [CanAutoScroll](#): Returns whether auto-scrolling should happen when column drag view reaches the left or right ends of the `SfDataGrid`.
- [Cancel](#): Returns the boolean property to cancel the event.

### Cancel dragging of a particular column

Dragging of a particular column can be canceled using `QueryColumnDraggingReason` argument of the `QueryColumnDragging` event handler.

### C#

```
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;
private void SfGrid_QueryColumnDragging(object sender,
QueryColumnDraggingEventArgs e)
```

```
{  
    //e.From returns the index of the dragged column.  
    //e.Reason returns the dragging status of the column.  
    if (e.From == 1 && e.Reason == QueryColumnDraggingReason.DragStarted)  
        e.Cancel = true;  
}
```

Cancel dropping when dragging for a particular column

Dropping when dragging a particular column can be canceled using `QueryColumnDraggingReason` argument of the `QueryColumnDragging` event handler.

**C#**

```
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;  
private void SfGrid_QueryColumnDragging(object sender,  
    QueryColumnDraggingEventArgs e)  
{  
    //e.To returns the index of the current column.  
    //e.Reason returns the dragging status of the column.  
    if ((e.To > 5 || e.To < 10) &&  
        (e.Reason == QueryColumnDraggingReason.DragEnded || e.Reason ==  
        QueryColumnDraggingReason.Dragging))  
        e.Cancel = true;  
}
```

Cancel dropping for a particular column

Dropping of a particular column can be canceled using `QueryColumnDraggingReason` argument of the `QueryColumnDragging` event handler.

**C#**

```
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;  
private void SfGrid_QueryColumnDragging(object sender,  
    QueryColumnDraggingEventArgs e)  
{  
    //e.From returns the index of the dragged column.  
    //e.Reason returns the dragging status of the column.  
    if (e.From == 1 && e.Reason == QueryColumnDraggingReason.DragEnded)  
        e.Cancel = true;  
}
```

Cancel dropping at a particular position

Dropping at a particular position can be canceled using `QueryColumnDraggingReason` argument of the `QueryColumnDragging` event handler.

**C#**

```
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;  
private void SfGrid_QueryColumnDragging(object sender,  
    QueryColumnDraggingEventArgs e)  
{  
    //e.To returns the index of the current column.  
    //e.Reason returns the dragging status of the column.
```

```
if ((e.To == 5 || e.To == 7) && e.Reason ==  
QueryColumnDraggingReason.DragEnded)  
e.Cancel = true;  
}
```

Cancel dropping of a particular column in a position

Dropping of a particular column in a position can be canceled using `QueryColumnDraggingReason` and `Position` arguments of the `QueryColumnDragging` event handler.

#### C#

```
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;  
private void SfGrid_QueryColumnDragging(object sender,  
QueryColumnDraggingEventArgs e)  
{  
    //e.To returns the index of the current column.  
    //e.DraggingPosition returns the x and y position of the current column  
    if (e.DraggingPosition == new Point(100,100) && e.Reason ==  
QueryColumnDraggingReason.DragEnded)  
e.Cancel = true;  
}
```

Cancel drag and drop between frozen and non-frozen columns

*Cancel dragging between frozen and non-frozen columns*

Dragging between frozen and non-frozen columns can be canceled using `QueryColumnDraggingReason` and `From` arguments of the `QueryColumnDragging` event handler by checking whether the value of `From` argument is a frozen column index.

#### C#

```
SfGrid.FrozenColumnsCount = 2;  
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;  
private void SfGrid_QueryColumnDragging(object sender,  
QueryColumnDraggingEventArgs e)  
{  
    //e.From returns the index of the dragged column.  
    //e.To returns the index of the current column.  
    if (e.From < 2 && e.Reason == QueryColumnDraggingReason.DragStarted)  
e.Cancel = true;  
}
```

*Cancel dropping between frozen and non-frozen columns*

Dropping between frozen and non-frozen columns can be canceled using `QueryColumnDraggingReason` and `From` argument of the `QueryColumnDragging` event handler by checking whether the `e.From` value is a frozen column index.

#### C#

```
SfGrid.FrozenColumnsCount = 2;  
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;  
private void SfGrid_QueryColumnDragging(object sender,  
QueryColumnDraggingEventArgs e)  
{
```

```
//e.From returns the index of the dragged column.  
//e.To returns the index of the current column.  
if (e.From < 2 && e.Reason == QueryColumnDraggingReason.DragEnded)  
    e.Cancel = true;  
}
```

### Customize column drag and drop indicators

The SfDataGrid allows customizing the column drag and drop indicators by writing the custom grid style, deriving from the [DataGridStyle](#) and assigning it to the [SfDataGrid.GridStyle](#) property.

#### C#

```
dataGrid.GridStyle = new CustomGridStyle();
```

#### C#

```
// Custom style class  
public class CustomGridStyle : DataGridStyle  
{  
    public CustomGridStyle()  
    {  
    }  
    public override ImageSource GetColumnDragUpIndicator()  
    {  
        return ImageSource.FromResource("DataGridDemo.icons.GreenUp.png");  
    }  
    public override ImageSource GetColumnDragDownIndicator()  
    {  
        return ImageSource.FromResource("DataGridDemo.icons.GreenDown.png");  
    }  
}
```

OrderID	 Gender	Country	CustomerID
10001	Female	America	Riscu
10002	Male	India	Picco
10003	Male	Poland	Vaffe
10004	Male	Italy	Vaffe
10005	Male	India	Blonp
10006	Female	US	Linod
10007	Female	Belgium	Vaffe
10008	Male	US	Merep
10009	Female	Australia	Welli
10010	Male	China	Folig
10011	Male	India	Simob

### Cancel auto scrolling

Horizontal auto-scrolling of the **SfDataGrid** during column drag and drop can be canceled using **CanAutoScroll** argument of the **QueryColumnDragging** event handler.

### C#

```
this.SfGrid.QueryColumnDragging += SfGrid_QueryColumnDragging;
private void SfGrid_QueryColumnDragging(object sender,
QueryColumnDraggingEventArgs e)
{
    // Disable scroll while dragging the columns.
    e.CanAutoScroll = false;
}
```

## Row Drag and Drop

The data grid allows you to drag and drop a row by setting the [SfDataGrid.AllowDraggingRow](#) property to `true`. A customizable row drag-and-drop template is displayed while dragging a row. Drag-and-drop operations can be handled using the [SfDataGrid.QueryRowDragging](#) event.

To enable row drag and drop, follow the code example:

### XML

```
<syncfusion:SfDataGrid AllowDraggingRow="True" />
```

### C#

```
dataGrid.AllowDraggingRow = true;
```

OrderID	Gender	EmployeeID	CustomerID
10001	Female	10501	Alfki
10002	Male	10502	Folig
10003	Male	10503	Folko
10004	Male	10504	Warth
10005	Male	10505	Linod
10006	Female	10506	Folig
10007	Male	10507	Folig
10008	Male	10508	Welli
10009	Male	10509	Alfki
10010	Female	10510	Merep

## Dragging scenarios

The data grid performs drag-and-drop operations with both data rows and groups as in the following scenarios:

- Records can be reordered to any position with auto scrolling.
- Group position can be reordered using drag and drop. But no groups can be added inside other groups.
- Data rows can be reordered within the same group or into other groups, as well.

**Note:** Reordering changes are made only in the [SfDataGrid.View](#), and not in the underlying data. Thus, the changes will be reverted when performing sorting, grouping, or any other operation refreshing the view. Reordering changes in the underlying data can be achieved by handling a `QueryRowDragging` event in the sample side as explained below in [Reordering underlying data](# Reordering underlying data ).

**Note:** Now you can drag and drop the grid rows using your mouse in the UWP (Desktop) platform.

#### Row drag-and-drop template

The data grid allows you to load desired content when performing row drag-and-drop operations using the [SfDataGrid.RowDragDropTemplate](#). The template can be defined either in code or XAML.

#### Default template

The default template will be loaded if another template is not explicitly assigned for row drag-and-drop operations.

OrderID	Gender	EmployeeID	CustomerID
10001	Female	10501	Furib
10002	Female	10502	Alfki
10003	Male	10503	Picco
10005	Female	10505	Alfki
10004	Female	10504	Folko
10006	Male	10506	Linod
10007	Male	10507	Simob
Drop below			
10008	Female	10508	Furib
10009	Male	10509	Simob
10010	Female	10510	Picco
10011	Male	10511	Welli

## Customizing row drag-and-drop template

Any type of custom view can be loaded inside the [SfDataGrid.RowDragDropTemplate](#).

Refer to the following code example that shows how to load a view in a template:

**XML**

```
<sfgrid:SfDataGrid.RowDragDropTemplate>
  <DataTemplate>
    <sfgrid:BorderView BackgroundColor="White" BorderColor="Black">
      <sfgrid:BorderView.Content>
        <local:RowTemplate />
      </sfgrid:BorderView.Content>
    </sfgrid:BorderView>
  </DataTemplate>
</sfgrid:SfDataGrid.RowDragDropTemplate>
```

**C#**

```
//Row template with a custom view representing rows.
public class RowTemplate : Grid
{
    #region Constructor
    public RowTemplate()
    {
        this.BackgroundColor = Color.White;
        this.Children.Add(CreateLabel("OrderID"));
        this.Children.Add(new BoxView() { Color = Color.Gray, WidthRequest = 1 });
        this.Children.Add(CreateLabel("EmployeeID"));
        this.Children.Add(new BoxView() { Color = Color.Gray, WidthRequest = 1 });
        this.Children.Add(CreateLabel("CustomerID"));
        this.Children.Add(new BoxView() { Color = Color.Gray, WidthRequest = 1 });
        this.Children.Add(CreateLabel("FirstName"));
        this.Children.Add(new BoxView() { Color = Color.Gray, WidthRequest = 1 });
        this.Children.Add(CreateLabel("LastName"));
    }
    #endregion
    #region Private Method
    private ContentView CreateLabel(string Property)
    {
        var label = new Label();
        label.TextColor = Color.Black;
        label.LineBreakMode = LineBreakMode.NoWrap;
        label.FontSize = 12;
        label.HorizontalTextAlignment = TextAlignment.Center;
        label.VerticalTextAlignment = TextAlignment.Center;
        label.SetBinding(Label.TextProperty, Property);
        return new ContentView() { Content = label };
    }
    #endregion
    #region Override Method
    protected override void LayoutChildren(double x, double y, double width,
        double height)
    {
        foreach (var child in Children)
        {
            if (Device.OS == TargetPlatform.Android || Device.OS == TargetPlatform.iOS)

```

```
{
    if (child is ContentView)
        child.Layout(new Rectangle(x, y, (width / ((Children.Count + 1) / 2)) - 0.5,
            height));
    else
        child.Layout(new Rectangle(x, y, 0.5, height));
    }
    else
    {
        if (child is ContentView)
            child.Layout(new Rectangle(x, y, (width / ((Children.Count + 1) / 2)) - 1,
                height));
        else
            child.Layout(new Rectangle(x, y, 1, height));
        }
        x += child.Width;
    }
}
#endregion
}
```

OrderID	Gender	EmployeeID	CustomerID
10001	Male	10501	Simob
10002	Male	10502	Welli
10003	Female	10503	Simob
10004	Male	10504	Simob
10005	Female	10505	Welli
10006	Male	10506	Welli
10007	Female	10507	Welli
10008	Male	10508	Alfki
10009	Male	10509	Merep
10010	Female	10510	Merep
10011	Male	10511	Simob

**Note:** Currently, the row drag-and-drop features cannot be used if different rows sets with different heights using the [QueryRowHeight](#) event.

You can download the customizing row drag-and-drop template sample [here](#).

#### Events in row drag-and-drop

The `QueryRowDragging` event is fired upon starting to drag a row and will be continuously fired until the dragging ends. By handling the [SfDataGrid.QueryRowDragging](#) event, you can also cancel the dragging of a particular row.

The `QueryRowDragging` event provides the following properties in [QueryRowDraggingEventArgs](#):

- [From](#): Returns index of the currently being dragged row.
- [To](#): Returns the dragging index where you try to drop the row.
- [Position](#): Returns current x and y coordinates of the RowDragView.

- [Reason](#): Returns row dragging details as [QueryRowDraggingReason](#).
- [RowData](#): Returns the underlying data associated with the dragged row.
- [CurrentRowData](#): Returns the corresponding row data over which the row drag view is currently placed.
- [CanAutoScroll](#): Returns whether auto-scrolling should happen when row drag view reaches the top or bottom of the [SfDataGrid](#).
- [Cancel](#): Returns the Boolean property to cancel the event.

#### Cancel dragging of a particular row

Dragging of a particular row can be canceled using [QueryRowDraggingReason](#) argument of the [QueryRowDragging](#) event handler.

#### C#

```
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;
private void SfGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
    //e.From returns the index of the dragged row.
    //e.Reason returns the dragging status of the row.
    if (e.From == 1 && e.Reason == QueryRowDraggingReason.DragStarted)
        e.Cancel = true;
}
```

#### Cancel dropping when dragging over particular rows

Dropping when dragging over particular rows can be canceled using [QueryRowDraggingReason](#) argument of the [QueryRowDragging](#) event handler.

#### C#

```
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;
private void SfGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
    //e.To returns the index of the current row.
    //e.Reason returns the dragging status of the row.
    if ((e.To > 5 || e.To < 10) &&
        (e.Reason == QueryRowDraggingReason.DragEnded || e.Reason ==
        QueryRowDraggingReason.Dragging))
        e.Cancel = true;
}
```

#### Cancel dropping of a particular row

Dropping of a particular row can be canceled using [QueryRowDraggingReason](#) argument of the [QueryRowDragging](#) event handler.

#### C#

```
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;
private void SfGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
    //e.From returns the index of the dragged row.
}
```

```
//e.Reason returns the dragging status of the row.  
if (e.From == 1 && e.Reason == QueryRowDraggingReason.DragEnded)  
e.Cancel = true;  
}
```

Cancel dropping at a particular position

Dropping at a particular position can be canceled using `QueryRowDraggingReason` argument of the `QueryRowDragging` event handler.

**C#**

```
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;  
private void SfGrid_QueryRowDragging(object sender,  
QueryRowDraggingEventArgs e)  
{  
//e.To returns the index of the current row.  
//e.Reason returns the dragging status of the row.  
if ((e.To == 5 || e.To == 7) && e.Reason ==  
QueryRowDraggingReason.DragEnded)  
e.Cancel = true;  
}
```

Cancel dropping of a particular row in a position

Dropping of a particular row in a position can be canceled using `QueryRowDraggingReason` and `Position` arguments of the `QueryRowDragging` event handler.

**C#**

```
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;  
private void SfGrid_QueryRowDragging(object sender,  
QueryRowDraggingEventArgs e)  
{  
//e.To returns the index of the current row.  
//e.Position returns the x and y position of the current row  
if ((e.To == 3) && e.Position == new Point(927,1167) && e.Reason ==  
QueryRowDraggingReason.DragEnded)  
e.Cancel = true;  
}
```

Cancel drag and drop between frozen and non-frozen rows

*Cancel dragging between frozen and non-frozen rows*

Dragging between frozen and non-frozen rows can be canceled using `QueryRowDraggingReason` and `From` arguments of the `QueryRowDragging` event handler by checking whether the value of `From` argument is a frozen row index.

**C#**

```
SfGrid.FrozenRowsCount = 4;  
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;  
private void SfGrid_QueryRowDragging(object sender,  
QueryRowDraggingEventArgs e)  
{  
//e.From returns the index of the dragged frozen row.
```

```
//e.To returns the index of the current row.
if (e.From > sfGrid.GetHeaderIndex() && e.From <= sfGrid.FrozenRowCount
&& e.Reason == QueryRowDraggingReason.DragStarted)
e.Cancel = true;
}
```

#### Cancel dropping between frozen and non-frozen rows

Dropping between frozen and non-frozen rows can be canceled using `QueryRowDraggingReason` and `From` arguments of the `QueryRowDragging` event handler by checking whether the value of `From` argument is a frozen row index.

#### C#

```
SfGrid.FrozenRowCount = 4;
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;
private void SfGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
//e.From returns the index of the dragged frozen row.
//e.To returns the index of the current row.
if (e.From > sfGrid.GetHeaderIndex() && e.From <= sfGrid.FrozenRowCount &&
e.Reason == QueryRowDraggingReason.DragEnded)
e.Cancel = true;
}
```

---

**Note:** `FrozenRowCount` must be less than rows in view.

---

#### Reorder the underlying data

Reordering changes directly on the underlying data can be done using `QueryRowDraggingReason` argument of the `QueryRowDragging` event handler. Refer to the following code sample to make permanent reordering changes:

#### C#

```
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;
private void SfGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
//e.To returns the index of the current row.
//e.From returns the index of the dragged row.
if (e.Reason == QueryRowDraggingReason.DragEnded)
{
var collection = (sender as SfDataGrid).ItemsSource as IList;
collection.RemoveAt(e.From - 1);
collection.Insert(e.To - 1, e.RowData);
//To skip default collection change inside the SfDataGrid source for a
successful drag and drop operation.
e.Cancel = true;
}
}
```

### Drop a grid row in the last position

The **To** property of the **QueryRowDraggingEventArgs** denotes the current drop index of the dragged row when dragging over the grid rows. It returns the same index when dragging a row over the rows in last position or last but one. In order to programmatically track whether the dragged row is dropped at the last position or last but one, the data grid provides the **Position** property in **QueryRowDraggingEventArgs**, which denotes the position of the RowDragView.

Refer to the following code example in which the **Position** property is used to determine whether the row is dropped in the last position or not:

#### C#

```
this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;
private void SfGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
    var totalHeight = dataGrid.RowColumnIndexToPoint(new
RowColumnIndex(viewModel.OrdersInfo.Count, 0)).Y + this.dataGrid.RowHeight;
    if (e.Reason == QueryRowDraggingReason.DragEnded)
    {
        if (Math.Ceiling(e.Position.Y + (dataGrid.RowHeight / 2)) > totalHeight &&
e.To == viewModel.OrdersInfo.Count)
        {
            //Will hit if the row is dropped at the last position
            DisplayAlert("RowDragAndDrop info", "The row is dropped at the last
position", "OK");
        }
    }
}
```

### Customizing row drag-and-drop indicators

Data grid allows you to customize the row drag-and-drop indicators by writing a custom grid style, deriving from the [DataGridStyle](#) and assigning it to the [SfDataGrid.GridStyle](#) property.

#### C#

```
dataGrid.GridStyle = new CustomGridStyle();
```

#### C#

```
// Custom style class
public class CustomGridStyle : DataGridStyle
{
    public CustomGridStyle()
    {
    }
    public override ImageSource GetRowDragUpIndicator()
    {
        return ImageSource.FromResource("DataGridDemo.icons.RedUp.png");
    }
    public override ImageSource GetRowDragDownIndicator()
    {
        return ImageSource.FromResource("DataGridDemo.icons.RedDown.png");
    }
}
```

OrderID	Gender	CustomerID	Country
10001	Female	Furib	Austria
10002	Female	Merep	India
10003	Female	Blonp	America
10004	Male	Warth	Belgium
10005	Male	Warth	Korea
10006	Female	Alfki	China
10007	Female	Picco	Singapore
10008	Female	Furib	Australia
10009	Male	Alfki	Korea
10010	Male	Merep	China
10011	Male	Folko	US

#### Updating summaries when dragging and dropping a row between groups

Grouping and summarization of items in the data grid are manipulated based on group key. When dragging an item from one group to another group, the group key of the dragged item will differ from the group key of the items in the dropped group. Thus, by default, the summaries will not be updated. This is the actual behavior of this control.

Hence, in order to update the summaries when a row is dragged and dropped between groups, call the `UpdateCaptionSummaries` and the `Refresh` methods in the `QueryRowDragging` event.

#### C#

```
public partial class MainPage : ContentPage
{
    private SfDataGrid dataGrid;
```

```

private ViewModel viewModel;
public MainPage()
{
    InitializeComponent();
    dataGrid = new SfDataGrid();
    viewModel = new ViewModel();
    dataGrid.ItemsSource = viewModel.OrdersInfo;
    dataGrid.QueryRowDragging += DataGrid_QueryRowDragging;
    this.Content = dataGrid;
}
private async void DataGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
    if (e.Reason == QueryRowDraggingReason.DragEnded)
    {
        // Delay is given for refreshing the view.
        await Task.Delay(100);
        this.dataGrid.View.TopLevelGroup.UpdateCaptionSummaries();
        this.dataGrid.View.Refresh();
    }
}
}

```

The following screenshot shows the output rendered when executing the above code example.

### Before DragAndDrop

OrderID	Gender	EmployeeID	CustomerID ↑
Total Salary:2'			
10010	Male	10510	Alfki
10013	Female	10513	Alfki
Total Salary:1'			
10019	Male	10519	Folko
Total Salary:4'			
10003	Female	10503	Frans
10011	Female	10511	Frans
10017	Male	10517	Frans
10018	Male	10518	Frans
Total Salary:4'			
10002	Male	10502	Furib
10007	Male	10507	Furib
10014	Female	10514	Furib

Drag and Drop  
to reorder the  
values

### After DragAndDrop

OrderID	Gender	EmployeeID	CustomerID ↑
Total Salary:1'			
10010	Male	10510	Alfki
Total Salary:2'			
10013	Female	10513	Alfki
10019	Male	10519	Folko
Total Salary:4'			
10003	Female	10503	Frans
10011	Female	10511	Frans
10017	Male	10517	Frans
10018	Male	10518	Frans
Total Salary:4'			
10002	Male	10502	Furib
10007	Male	10507	Furib
10014	Female	10514	Furib

### Cancel auto scrolling

Vertical auto-scrolling of the `SfDataGrid` during row drag and drop can be canceled using `CanAutoScroll` argument of the `QueryRowDragging` event handler.

**C#**

```

this.SfGrid.QueryRowDragging += SfGrid_QueryRowDragging;
private void SfGrid_QueryRowDragging(object sender,
QueryRowDraggingEventArgs e)
{
    // Disable scroll while dragging the Rows.
    e.CanAutoScroll = false;
}

```

**Swiping**

The

[SfDataGrid](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid.html# "") allows enabling the swiping option by setting the [SfDataGrid.AllowSwiping](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~AllowSwiping.html# "") property to true. Swipe views are displayed when swiping from 'left to right' or 'right to left' on a data row. The control provides customizable swipe templates for swiping on the left and right side. The swipe gesture can be restricted to a certain point on the row by setting the [SfDataGrid.MaxSwipeOffset](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~MaxSwipeOffset.html# "") property.

**Swipe template**

The data grid enables loading a desired content using the

[SfDataGrid.LeftSwipeTemplate](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~LeftSwipeTemplate.html# "") when swiping towards right. The template can be defined either in code or XAML. The content inside the swipe template is arranged based on the offset values when swiping a data row.

**XAML**

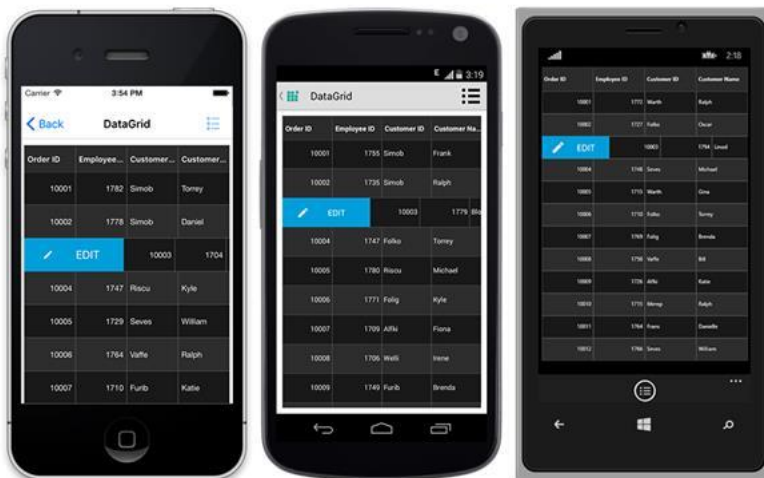

```

//Defining left swipe template
<sfgrid:SfDataGrid.LeftSwipeTemplate>
<DataTemplate>
<Grid BackgroundColor="#009EDA" Padding="9">
<Grid.ColumnDefinitions>
<ColumnDefinition/>
<ColumnDefinition/>
</Grid.ColumnDefinitions>
<Image Grid.Column="0"
BackgroundColor="Transparent"
HorizontalOptions="CenterAndExpand"
Source="EditIcon.png"
BindingContextChanged="rightImage_BindingContextChanged" />
<Label Grid.Column="1"
Text ="EDIT"
HorizontalTextAlignment="Start"
VerticalTextAlignment="Center"
LineBreakMode ="NoWrap"
BackgroundColor="Transparent"
TextColor ="White" />
</Grid>
</DataTemplate>
</sfgrid:SfDataGrid.LeftSwipeTemplate>

```

**C#**

```
//Defining left swipe template
dataGrid.LeftSwipeTemplate = new DataTemplate(() =>
{
    Grid myGrid = new Grid();
    myGrid.HorizontalOptions = LayoutOptions.FillAndExpand;
    myGrid.BackgroundColor = Color.FromHex("#009EDA");
    myGrid.Padding = 9;
    myGrid.ColumnDefinitions = new ColumnDefinitionCollection
    {
        new ColumnDefinition {},
        new ColumnDefinition {}
    };
    var image = new Image();
    image.BackgroundColor = Color.Transparent;
    image.BindingContextChanged += MainPage_BindingContextChanged;
    image.HorizontalOptions = LayoutOptions.FillAndExpand;
    image.Source = "EditIcon.png";
    var label = new Label();
    label.Text = "EDIT";
    label.HorizontalTextAlignment = TextAlignment.Start;
    label.VerticalTextAlignment = TextAlignment.Center;
    label.LineBreakMode = LineBreakMode.NoWrap;
    label.BackgroundColor = Color.Transparent;
    label.TextColor = Color.White;
    myGrid.Children.Add(image, 0, 0);
    myGrid.Children.Add(label, 1, 0);
    return myGrid;
});
```

**Note:** Similarly, desired content can be loaded using the [SfDataGrid.RightSwipeTemplate](http://help.syncfusion.com/cr/cref\_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~RightSwipeTemplate.html# "") when swiping towards left.

---

**Note:** The `DataTemplateSelector` can also be directly assigned to the `SfDataGrid.RightSwipeTemplate` and `SfDataGrid.LeftSwipeTemplate`. You can load the desired template using the `RowData` and the row element passed in the arguments.

---

### Swipe events

`[SwipeStarted]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~SwipeStartedEV.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~SwipeStartedEV.html#)): Fired when the swipe offset changes from its initial value. The swipe action can be canceled by setting the

`[Cancel]`([https://msdn.microsoft.com/query/dev10.query?appId=Dev10IDEF1&l=EN-US&k=k\(System.ComponentModel.CancelEventArgs.Cancel\)&rd=true#""](https://msdn.microsoft.com/query/dev10.query?appId=Dev10IDEF1&l=EN-US&k=k(System.ComponentModel.CancelEventArgs.Cancel)&rd=true#)) property of the `[SwipeStartedEventArgs]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipeStartedEventArgs.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipeStartedEventArgs.html#)) to `true`.

`[SwipeEnded]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~SwipeEndedEV.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~SwipeEndedEV.html#)): Fired when the swipe offset value reaches the `SfDataGrid.MaxSwipeOffset` indicating that the swipe action is completed. This event is triggered with

`[SwipeEndedEventArgs]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipeEndedEventArgs.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipeEndedEventArgs.html#)).

`[Swiping]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~SwipingEV.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~SwipingEV.html#)): Raised while swiping a row is in progress. This event is triggered with

`[SwipingEventArgs]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs.html#)).

The swipe events provides the following properties in their arguments:

- `[RowIndex]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~RowIndex.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~RowIndex.html#)): Defines the swiping row index.
- `[RowData]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~RowData.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~RowData.html#)): Defines the underlying data associated with the swiped row as its arguments.
- `[SwipeDirection]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~SwipeDirection.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~SwipeDirection.html#)): Defines the swipe direction of the swiped row.
- `[SwipeOffset]`([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~SwipeOffset.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SwipingEventArgs~SwipeOffset.html#)): Defines the current swipe offset of the row being swiped.

By handling the swipe events, you can use these properties value from the arguments to perform any desired action such as deleting the row, editing the data, etc.

### Loading multiple views as swipe template

The swipe templates can be customized by loading any view in the templates, and assigning custom actions to them such as deleting a row, adding a row, editing the underlying data associated, etc. Multiple views can also be displayed in a template like in the following example, where two views are loaded for editing the cell values in the row and deleting the row respectively.

**Swiping.xaml****XML**

```
//Defining left swipe template
<sfgrid:SfDataGrid.LeftSwipeTemplate>
<DataTemplate>
<Grid BackgroundColor="#009EDA">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="50"/>
<ColumnDefinition Width="100"/>
<ColumnDefinition Width="130"/>
</Grid.ColumnDefinitions>
<Image Grid.Column="0"
BackgroundColor="Transparent"
BindingContextChanged="leftImage_BindingContextChanged"
HorizontalOptions="CenterAndExpand"
Source="EditIcon.png" />
<Label Grid.Column="1"
BackgroundColor="Transparent"
LineBreakMode="NoWrap"
Text="EDIT"
TextColor="White"
HorizontalTextAlignment ="Start"
VerticalTextAlignment="Center" />
<Grid Grid.Column="2" BackgroundColor="#DC595F">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="50" />
<ColumnDefinition Width="80" />
</Grid.ColumnDefinitions>
<Image Grid.Column="0"
BackgroundColor="Transparent"
BindingContextChanged="rightImage_BindingContextChanged"
HorizontalOptions="CenterAndExpand"
Source="TrashImage.png" Margin="9"/>
<Label Grid.Column="1"
BackgroundColor="Transparent"
LineBreakMode="NoWrap"
Text="DELETE"
TextColor="White"
HorizontalTextAlignment ="Start"
VerticalTextAlignment ="Center" />
</Grid>
</Grid>
</DataTemplate>
</sfgrid:SfDataGrid.LeftSwipeTemplate>
```

**Swiping.xaml.cs****C#**

```
public partial class Swiping : SamplePage
{
private Image leftImage;
private Image rightImage;
private int swipedRowIndex;
private FormsView formView;
```

```
public Swiping()
{
    InitializeComponent();
    this.PropertyChanged += Swiping_PropertyChanged;
    formView = new FormsView(dataGrid);
    customLayout.Children.Add(formView);
}

private void Swiping_PropertyChanged(object sender, PropertyChangedEventArgs e)
{
    if (e.PropertyName == "Width" && this.formView != null)
    {
        formView.IsVisible = false;
        dataGrid.Opacity = 1.0;
    }
}

private void dataGrid_GridTapped(object sender, GridTappedEventArgs e)
{
    this.formView.IsVisible = false;
    dataGrid.Opacity = 1.0;
    dataGrid.IsEnabled = true;
}

//Gesture listener to perform edit
private void leftImage_BindingContextChanged(object sender, EventArgs e)
{
    if (leftImage == null)
    {
        leftImage = sender as Image;
        (leftImage.Parent as View).GestureRecognizers.Add(new TapGestureRecognizer()
        { Command = new Command(Edit)});
        leftImage.Source =
        ImageSource.FromResource("SfDataGridSample.EditIcon.png");
    }
}

//Code to edit row
private void Edit()
{
    if (Device.RuntimePlatform != Device.UWP || Device.Idiom ==
    TargetIdiom.Phone)
    formView.LayoutTo(new Rectangle(10, (this.Height / 2) - (350 / 2),
    this.dataGrid.Width - 20, 370), 250, null);
    else
    formView.LayoutTo(new Rectangle(10, (this.dataGrid.Height / 2) - (350 / 2),
    this.dataGrid.Width - 20, 350), 450, null);
    formView.IsVisible = true;
}

//Code to delete row
private void Delete()
{
    this.viewModel.OrdersInfo.RemoveAt(swipedRowIndex - 1);
}

//Gesture listener to perform delete
private void rightImage_BindingContextChanged(object sender, EventArgs e)
{
    if (rightImage == null)
    {
        rightImage = sender as Image;
```

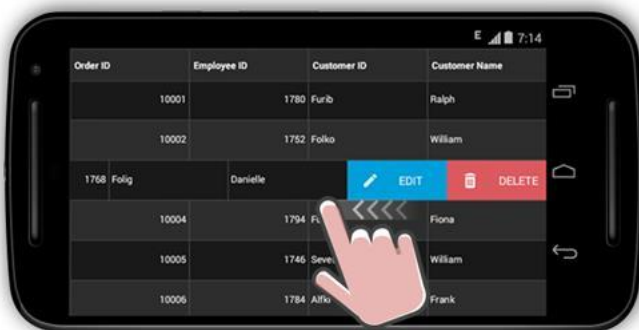

```

(rightImage.Parent as View).GestureRecognizers.Add(new
TapGestureRecognizer() { Command = new Command(Delete) });
rightImage.Source =
ImageSource.FromResource("SfDataGridSample.TrashImage.png");
}
}
private void dataGrid_SwipeEnded(object sender, SwipeEndedEventArgs e)
{
formView.BindingContext = e.RowData;
swipedRowIndex = e.RowIndex;
}
}

```

**Note:** Similarly, you can load two views using the `SfDataGrid.RightSwipeTemplate` when swiping towards left will result in the following outcome:

### Customized swipe delete functionality

Operations such as deleting a row when swiping a data row from one extent to other in the view can be performed.

### Swiping.Xaml

**XML**

```
//Creating view for left swipe
<sfgrid:SfDataGrid.LeftSwipeTemplate>
<DataTemplate>
<ContentView BindingContextChanged="leftTemplate_BindingContextChanged"
BackgroundColor="#1AAA87">
<Label FontSize="15"
Text ="Deleted"
TextColor ="White"
HorizontalTextAlignment ="Start"
VerticalTextAlignment ="Center"
LineBreakMode ="NoWrap" />
</ContentView>
</DataTemplate>
</sfgrid:SfDataGrid.LeftSwipeTemplate>
//Creating view for right swipe
<sfgrid:SfDataGrid.RightSwipeTemplate>
<DataTemplate>
<ContentView BindingContextChanged="rightTemplate_BindingContextChanged"
BackgroundColor="#1AAA87">
<Label FontSize="15"
HorizontalTextAlignment ="Center"
Text ="Deleted"
TextColor ="White"
VerticalTextAlignment ="Center"
LineBreakMode ="NoWrap" />
</ContentView>
</DataTemplate>
</sfgrid:SfDataGrid.RightSwipeTemplate>
```

Swiping.Xaml.cs

**C#**

```
//Call to delete() when swipe is ended
private void dataGrid_SwipeEnded(object sender, SwipeEndedEventArgs e)
{
    swipedRowIndex = e.RowIndex;
    if (Math.Abs(e.SwipeOffset) >= dataGrid.Width)
    {
        if (e.SwipeOffset > 0)
            leftTemplateView.Content.IsVisible = true;
        else
            rightTemplateView.Content.IsVisible = true;
        doDeleting();
    }
}
//Code to delete row
private async void doDeleting()
{
    await Task.Delay(2000);
    if (leftTemplateView.Content.IsVisible)
        leftTemplateView.Content.IsVisible = false;
    else if (rightTemplateView.Content.IsVisible)
        rightTemplateView.Content.IsVisible = false;
    if (!IsUndoClicked)
```

```
viewModel.OrdersInfo.RemoveAt (swipedRowIndex - 1);
else
{
    var removedData = viewModel.OrdersInfo[swipedRowIndex - 1];
    var isSelected = dataGrid.SelectedItems.Contains(removedData);
    viewModel.OrdersInfo.Remove(removedData);
    viewModel.OrdersInfo.Insert(swipedRowIndex - 1, removedData);
    if (isSelected)
    {
        dataGrid.SelectedItems.Add(removedData);
        IsUndoClicked = false;
    }
}
```

### Loading complex template for swiping

When a complex layout is loaded in the `GridTemplateColumn`, swiping may not occur or may not be smooth at times, since the touches will be intercepted by the views loaded in the template. As a result, the data grid may not recognize the touches that might restrict the swiping operation. To resolve this issue, set the `InputTransparent` property of the views loaded in the `DataTemplate` of the `GridTemplateColumn` to `True`.

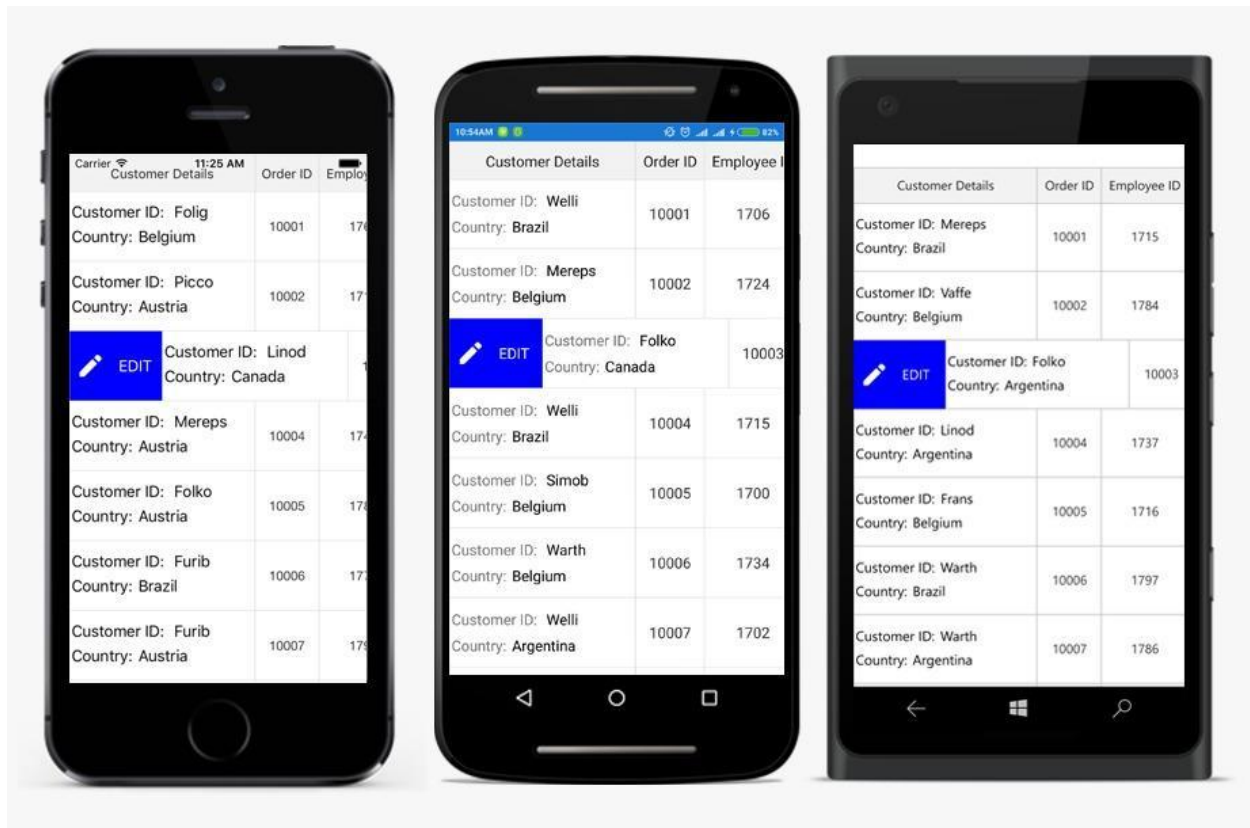

### XML

```
<sfgrid:GridTemplateColumn MappingName="CustomerID" HeaderText="Customer
Details" Width="200">
<sfgrid:GridTemplateColumn.CellTemplate>
<DataTemplate>
<Grid InputTransparent="True"
ColumnSpacing="0"
RowSpacing="0"
HorizontalOptions="FillAndExpand"
Margin="0" >
<Grid.ColumnDefinitions>
<ColumnDefinition />
<ColumnDefinition />
<ColumnDefinition />
</Grid.ColumnDefinitions>
<Grid.RowDefinitions>
<RowDefinition Height="10" />
```

```

<RowDefinition Height="*" />
<RowDefinition Height="10" />
</Grid.RowDefinitions>
<StackLayout InputTransparent="True"
Margin="2"
BackgroundColor="White"
Orientation="Vertical"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand"
Grid.Column="0"
Grid.ColumnSpan="3"
Grid.Row="1">
<StackLayout Orientation="Horizontal" HorizontalOptions="FillAndExpand" >
<Label Text="Customer ID: " HorizontalTextAlignment="Start"/>
<Label Text="{Binding CustomerID}" TextColor="Black"
HorizontalTextAlignment="Start"/>
</StackLayout>
<StackLayout Orientation="Horizontal" HorizontalOptions="FillAndExpand">
<Label Text="Country:" HorizontalTextAlignment="Start"/>
<Label Text="{Binding ShipCountry}" TextColor="Black"
HorizontalTextAlignment="Start"/>
</StackLayout>
</StackLayout>
</Grid>
</DataTemplate>
</sfgrid:GridTemplateColumn.CellTemplate>
</sfgrid:GridTemplateColumn>

```

How to cancel the swipe programmatically

The data grid allows canceling the swipe programmatically by calling the [SfDataGrid.ResetSwipeOffset](#) method in [SfDataGrid.SwipeEnded](#) event.

#### XML

```
<syncfusion:SfDataGrid x:Name="datagrid"
    ColumnSizer="Star"
    AutoGenerateColumns="True"
    AllowSwiping="True"
    ItemsSource="{Binding OrdersInfo}"
    SwipeEnded="Datagrid_SwipeEnded">
    <syncfusion:SfDataGrid.LeftSwipeTemplate>
    <DataTemplate>
    <Grid BackgroundColor="Blue" Padding="9">
    <Label Text ="EDIT"
        HorizontalTextAlignment="Start"
        VerticalTextAlignment="Center"
        LineBreakMode ="NoWrap"
        BackgroundColor="Transparent"
        TextColor ="White" />
    </Grid>
    </DataTemplate>
    </syncfusion:SfDataGrid.LeftSwipeTemplate>
    <syncfusion:SfDataGrid.RightSwipeTemplate>
    <DataTemplate>
    <Grid BackgroundColor="Red" Padding="9">
    <Label FontSize="15"
        HorizontalTextAlignment ="Center"
        Text ="Deleted"
        TextColor ="White"
        VerticalTextAlignment ="Center"
        LineBreakMode ="NoWrap" />
    </Grid>
    </DataTemplate>
    </syncfusion:SfDataGrid.RightSwipeTemplate>
</syncfusion:SfDataGrid>
```

#### C#

```
private void Datagrid_SwipeEnded(object sender, SwipeEndedEventArgs e)
{
    datagrid.ResetSwipeOffset();
}
```

You can download the source code of swiping sample [here](#).

#### Limitations

When data grid is loaded in MasterDetailPage with `AllowSwiping` as true, it behaves as follows:

- In iOS platform, when swiping a data row, touch and hold the row for some fraction of seconds (0.25 - 0.5 seconds) and then swipe.

## Styles

The data grid applies style for all of its elements by writing a Style class overriding from [DataGridStyle](#), and assigning it to the [SfDataGrid.GridStyle](#) property.

To apply custom style, follow the code example:

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms
"
xmlns:local ="clr-namespace:DataGridSample;assembly=DataGridSample"
x:Class="DataGridSample.Sample">
<ContentPage.Resources>
<ResourceDictionary>
<local:Dark x:Key="dark" />
</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfDataGrid x:Name="dataGrid"
GridStyle="{StaticResource dark}"
ItemsSource="{Binding OrdersInfo}" />
</ContentPage>
```

### C#

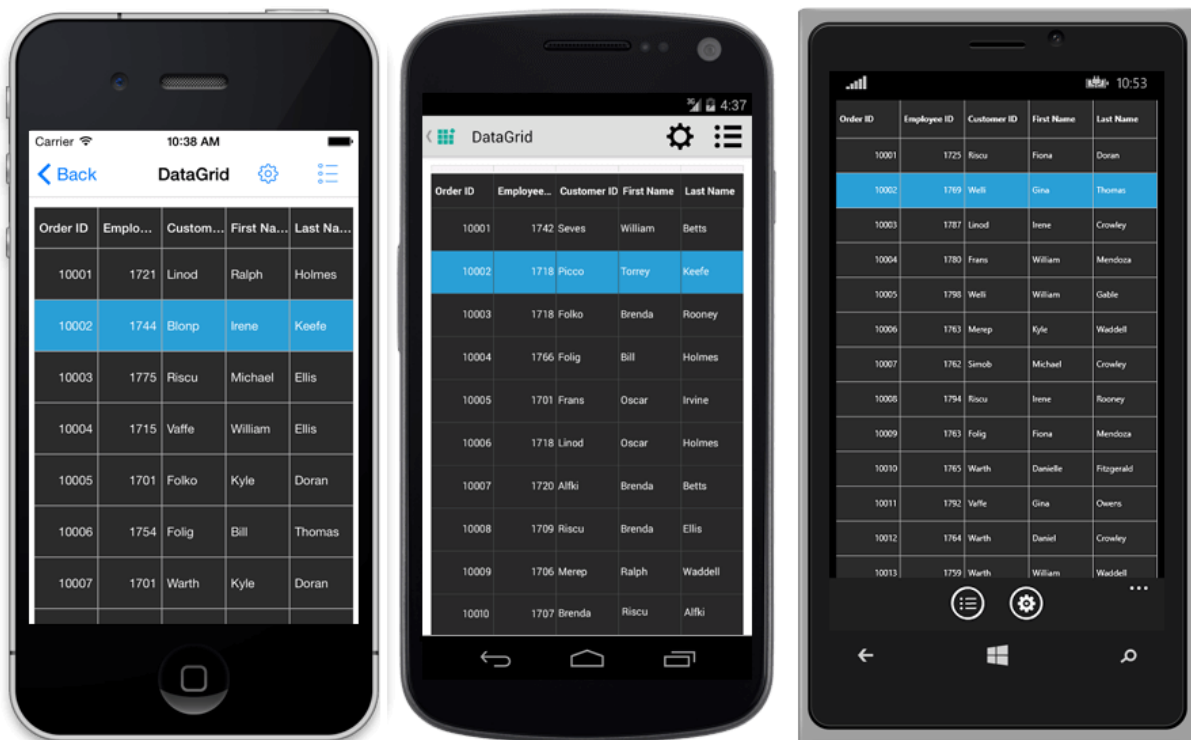

```
//Apply custom style to SfDataGrid from code
SfDataGrid dataGrid = new SfDataGrid();
dataGrid.GridStyle = new Dark ();
```

### C#

```
//Custom style class
public class Dark : DataGridStyle
{
    public Dark ()
    {
    }
    public override Color GetHeaderBackgroundColor()
    {
        return Color.FromRgb (15, 15, 15);
    }
    public override Color GetHeaderForegroundColor()
    {
        return Color.FromRgb (255, 255, 255);
    }
    public override Color GetRecordBackgroundColor ()
    {
        return Color.FromRgb (43, 43, 43);
    }
    public override Color GetRecordForegroundColor ()
    {
        return Color.FromRgb (255, 255, 255);
    }
    public override Color GetSelectionBackgroundColor ()
```

```
{  
    return Color.FromRgb (42, 159, 214);  
}  
public override Color GetSelectionForegroundColor ()  
{  
    return Color.FromRgb (255, 255, 255);  
}  
public override Color GetCaptionSummaryRowBackgroundColor ()  
{  
    return Color.FromRgb (02, 02, 02);  
}  
public override Color GetCaptionSummaryRowForegroundColor ()  
{  
    return Color.FromRgb (255, 255, 255);  
}  
public override Color GetBorderColor ()  
{  
    return Color.FromRgb (81, 83, 82);  
}  
public override Color GetLoadMoreViewBackgroundColor ()  
{  
    return Color.FromRgb(242, 242, 242);  
}  
public override Color GetLoadMoreViewForegroundColor ()  
{  
    return Color.FromRgb(34, 31, 31);  
}  
public override Color GetAlternatingRowBackgroundColor()  
{  
    return Color.Yellow;  
}  
}
```

The following picture shows the grid loaded in a different style:

**Note:** Xamarin.Forms.Style which has specified target type, that will not be applied to the internal components used in the SfDataGrid.

### Applying alternate row style

The SfDataGrid applies the alternative row style by writing a Style class deriving from `DataGridStyle`, and assigning it to the `SfDataGrid.GridStyle` property.

To apply alternate row style, follow the code example:

### C#

```
//Apply alternative row style
dataGrid.GridStyle = new CustomStyle ();
// Custom style class
public class CustomGridStyle : DataGridStyle
{
    public CustomGridStyle()
    {
    }
    public override Color GetAlternatingRowBackgroundColor()
    {
        return Color.Gray;
    }
}
```

OrderID	CustomerID	FirstName	ShipCountry	Freight
10001	10001	Brenda	Austria	748.59
10002	10002	Bill	Austria	655.22
10003	10003	Daniel	Austria	902.32
10004	10004	Daniel	Brazil	721.38
10005	10005	Daniel	Brazil	288.68
10006	10006	Bill	Canada	10.55
10007	10007	Frank	Belgium	343.44
10008	10008	William	Argentina	363.83
10009	10009	Ralph	Argentina	208.89
10010	10010	Gina	Austria	545.95

### Customizing the alternation count

The data grid customizes the alternate row count for applying the alternate row style using the [SfDataGrid.AlternationCount](#) property.

To set the alternate row count, follow the code example:

#### **C#**

```
//Apply alternative row count  
dataGrid.AlternationCount = 3;
```

OrderID	CustomerID	FirstName	ShipCountry	Freight
10001	10001	Irene	Argentina	169.86
10002	10002	Oscar	Belgium	492.24
10003	10003	Katie	Austria	630.33
10004	10004	Oscar	Austria	100.17
10005	10005	Michael	Belgium	263.67
10006	10006	Gina	Brazil	622.94
10007	10007	Daniel	Austria	501.2
10008	10008	Ralph	Argentina	89.81
10009	10009	Fiona	Argentina	690.84
10010	10010	Danielle	Austria	578.58

### Border customization

The data grid customizes the grid borders to vertical, horizontal, both, or none. Override the [DataGridStyle.GetGridLinesVisibility](#) method to customize borders in the data grid.

#### C#

```
//Apply custom style to SfDataGrid from code  
dataGrid.GridStyle = new CustomStyle ();
```

#### C#

```
//Custom Style class  
public class CustomStyle : DataGridStyle  
{  
    public CustomStyle ()  
    {  
    }  
    public override GridLinesVisibility GetGridLinesVisibility()  
    {  
        return base.GetGridLinesVisibility();  
    }  
}
```

Following are the list of options available to customize the grid borders:

- Both
- Horizontal
- Vertical
- None

#### *Both*

The [GridLinesVisibility.Both](#) displays the data grid with both horizontal and vertical borders.

#### **C#**

```
public override GridLinesVisibility GetGridLinesVisibility()  
{  
    return GridLinesVisibility.Both;  
}
```

The following screenshot shows the outcome upon execution of the above code:

#### *Horizontal*

The [GridLinesVisibility.Horizontal](#) allows displays the data grid with horizontal border only.

#### **C#**

```
public override GridLinesVisibility GetGridLinesVisibility()  
{  
    return GridLinesVisibility.Horizontal;  
}
```

The following screenshot shows the outcome upon execution of the above code:

### Vertical

The [GridLinesVisibility.Vertical](#) displays the data grid with vertical border only.

### C#

```
public override GridLinesVisibility GetGridLinesVisibility()
{
    return GridLinesVisibility.Vertical;
}
```

The following screenshot shows the outcome upon execution of the above code:

*None*

[GridLinesVisibility.None](#) allows you to display the data grid without borders.

**C#**

```
public override GridLinesVisibility GetGridLinesVisibility()
{
    return GridLinesVisibility.None;
}
```

The following screenshot shows the outcome upon execution of the above code:

### Header border color customization

The data grid customizes the header border color for different `DataGridStyle.GridLinesVisibility` by writing a custom style class deriving from `DataGridStyle`, and assigning it to the `SfDataGrid.GridStyle` property. Override the `GetHeaderBorderColor` method in the custom style to customize color of the column header and row header.

To customize the header border color by writing a custom style, follow the code example:

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
xmlns:local="clr-namespace:DataGridSample;assembly=DataGridSample"
x:Class="DataGridSample.Sample">
<ContentPage.Resources>
<ResourceDictionary>
<local:CustomStyle x:Key="customStyle" />
</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfDataGrid x:Name="dataGrid"
GridStyle="{StaticResource customStyle}"
ItemsSource="{Binding OrdersInfo}" />
</ContentPage>
```

**C#**

```
//Applying custom style to SfDataGrid from code to customize header border color
SfDataGrid dataGrid = new SfDataGrid();
dataGrid.GridStyle = new customStyle ();
```

**C#**

```
//Custom style class
public class CustomStyle : DataGridStyle
{
    Public CustomStyle()
    {
    }
    Public override color GetHeaderBorderColor()
    {
        return Color.Red;
    }
}
```

The following screenshot shows the final outcome upon execution of the above code:

Order ID	Customer ID	Name	City
10001	1779	Alfki	Montréal
10002	1780	Picco	Bruxelles
10003	1769	Alfki	Tsawassen
10004	1775	Frans	Graz
10005	1766	Frans	Bruxelles
10006	1778	Folko	Campinas
10007	1768	Seves	Campinas
10008	1756	Furib	Bruxelles
10009	1754	Vaffe	Rosario
10010	1709	Vaffe	Graz

## Customizing sort icons in the header

Any desired image can be loaded as the sort indicator using the [GetHeaderSortIndicatorDown](#) and [GetHeaderSortIndicatorUp](#) overriding from the [DataGridStyle](#) class. To change the sort indicators, follow the code example:

**C#**

```
//Apply custom style to SfDataGrid from code
dataGrid.GridStyle = new Custom();
```

```

public class Custom : DataGridStyle
{
    public override ImageSource GetHeaderSortIndicatorDown()
    {
        return ImageSource.FromResource("SfDataGrid_Sample.SortDown.png");
    }
    public override ImageSource GetHeaderSortIndicatorUp()
    {
        return ImageSource.FromResource("SfDataGrid_Sample.SortUp.png");
    }
}

```

The following screenshots shows the final outcome of the above code:

Ascending Sort (SortUp)		Descending Sort (SortDown)	
Order ID	 Employee ID 	Order ID	 Employee ID 
1	6	99	104
10	15	98	103
100	105	97	102
11	16	96	101
12	17	95	100
13	18	94	99

**Note:** The BuildAction image must be set to EmbeddedResource in order to access the image as resource as shown in above code.

### Customizing resizing indicator

The color of the resizing indicator can be changed using the [GetResizingIndicatorColor](#) overriding from the [DataGridStyle](#) class. To change the color of the resizing indicator, follow the code example:

#### C#

```
//Apply custom style to SfDataGrid from code
dataGrid.GridStyle = new Custom();
public class Custom : DataGridStyle
{
    public override Color GetResizingIndicatorColor()
    {
        return Color.Blue;
    }
}
```

### Border width customization

SfDataGrid allows you to customize the border width of the grid cells and the header cells.

The default border width of the grid cell and the header cell for Forms.iOS and Forms.UWP is 0.5f and 1f for Forms.Android.

Refer the below code snippet to customize the width of the grid cells and header cells.

#### C#

```
//Apply custom style to SfDataGrid from code
dataGrid.GridStyle = new CustomStyle();
public class CustomStyle : DataGridStyle
{
    public CustomStyle()
    {
    }
    // Customize border width for grid cells
    public override float GetBorderWidth()
    {
        return 5;
    }
    // Customize border width for header cells
    public override float GetHeaderBorderWidth()
    {
        return 5;
    }
}
```

### Conditional Styles

The SfDataGrid allows to customize the style of the individual cells and rows based on the requirements. It can be customized in the following ways:

- Using Column CellStyle
- Using QueryCellStyle Event
- Using QueryRowStyle Event

### Styling cells using column CellStyle

The SfDataGrid allows to apply cell style for a [GridColumn](#) which is used to render the cells in that column. While applying cell style, the [GridColumn](#) appears in the custom style should be the default one. To apply cell style for a GridColumn using the [CellStyle](#), follow the code example:

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridTextColumn MappingName="Freight" Format="C">
<syncfusion:GridTextColumn.CellStyle>
<Style TargetType="syncfusion:GridColumn">
<Setter Property="Foreground" Value="Red" />
</Style>
</syncfusion:GridTextColumn.CellStyle>
</syncfusion:GridTextColumn>
</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

### Styling cells using converter

The SfDataGrid also allows to apply styles for the [GridColumn](#) in a column based on conditions by writing a converter for the property in a [GridColumn](#) for which conditional styles should be applied.

To apply conditional styling for a column by writing converter, follow the code example:

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
xmlns:local="clr-namespace:DataGridSample;assembly=DataGridSample"
x:Class="DataGridSample.Sample">
<ContentPage.Resources>
<ResourceDictionary>
<local:CellStyleConverter x:Key="cellStyleConverter" />
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo}">
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridTextColumn MappingName="Freight" Format="C">
<syncfusion:GridTextColumn.CellStyle>
<Style TargetType="syncfusion:GridColumn">
<Setter Property="BackgroundColor"
Value="{Binding Freight,
Converter={StaticResource cellStyleConverter}}" />
<Setter Property="Foreground" Value="Red" />
</Style>
</syncfusion:GridTextColumn.CellStyle>
</syncfusion:GridTextColumn>
</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

```

</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
</ContentPage>

```

## C#

```

public class CellStyleConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        if (System.Convert.ToDouble(value) < 300)
            return Color.White;
        return Color.Green;
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        return null;
    }
}

```

### Styling cells using QueryCellStyle event

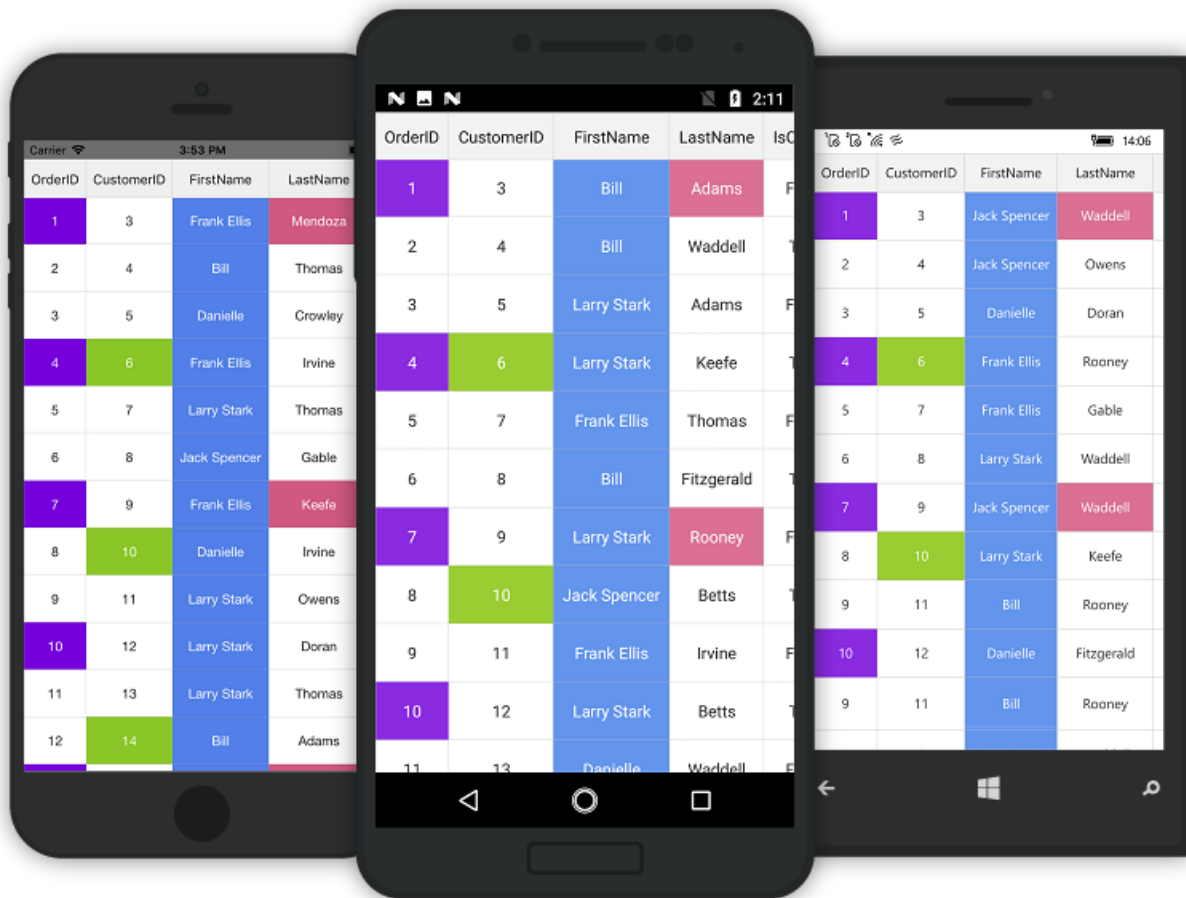

The conditional style can be applied for any cell using the [QueryCellStyle](#) event based on any condition. This event will be fired for each cell. It provides the following properties through the [QueryCellStyleEventArgs](#) in its `EventHandler`:

- [RowIndex](#): Provides the row index of current cell in iteration.

- [ColumnIndex](#): Provides the column index of current cell in iteration.
- [CellValue](#): Provides the cell value of current cell in iteration.
- [Column](#): Provides the [GridColumn](#) which belongs to current cell in iteration.
- [e.Handled](#): Should set to true to apply the changes.
- [Style](#): Sets style to the current cell in iteration.

**C#**

```
this.dataGrid.QueryCellStyle += DataGrid_QueryCellStyle;
private void DataGrid_QueryCellStyle(object sender, QueryCellStyleEventArgs e)
{
    if (e.ColumnIndex == 0 && e.RowIndex % 3 == 1)
    {
        e.Style.BackgroundColor = Color.BlueViolet;
        e.Style.ForegroundColor = Color.White;
    }
    else if (e.Column.MappingName == "FirstName")
    {
        e.Style.BackgroundColor = Color.CornflowerBlue;
        e.Style.ForegroundColor = Color.White;
    }
    else if (e.ColumnIndex == 1 && e.RowIndex % 4 == 0)
    {
        e.Style.BackgroundColor = Color.YellowGreen;
        e.Style.ForegroundColor = Color.White;
    }
    else if (e.ColumnIndex == 3 && e.RowIndex % 6 == 1)
    {
        e.Style.BackgroundColor = Color.PaleVioletRed;
        e.Style.ForegroundColor = Color.White;
    }
    e.Handled = true;
}
```

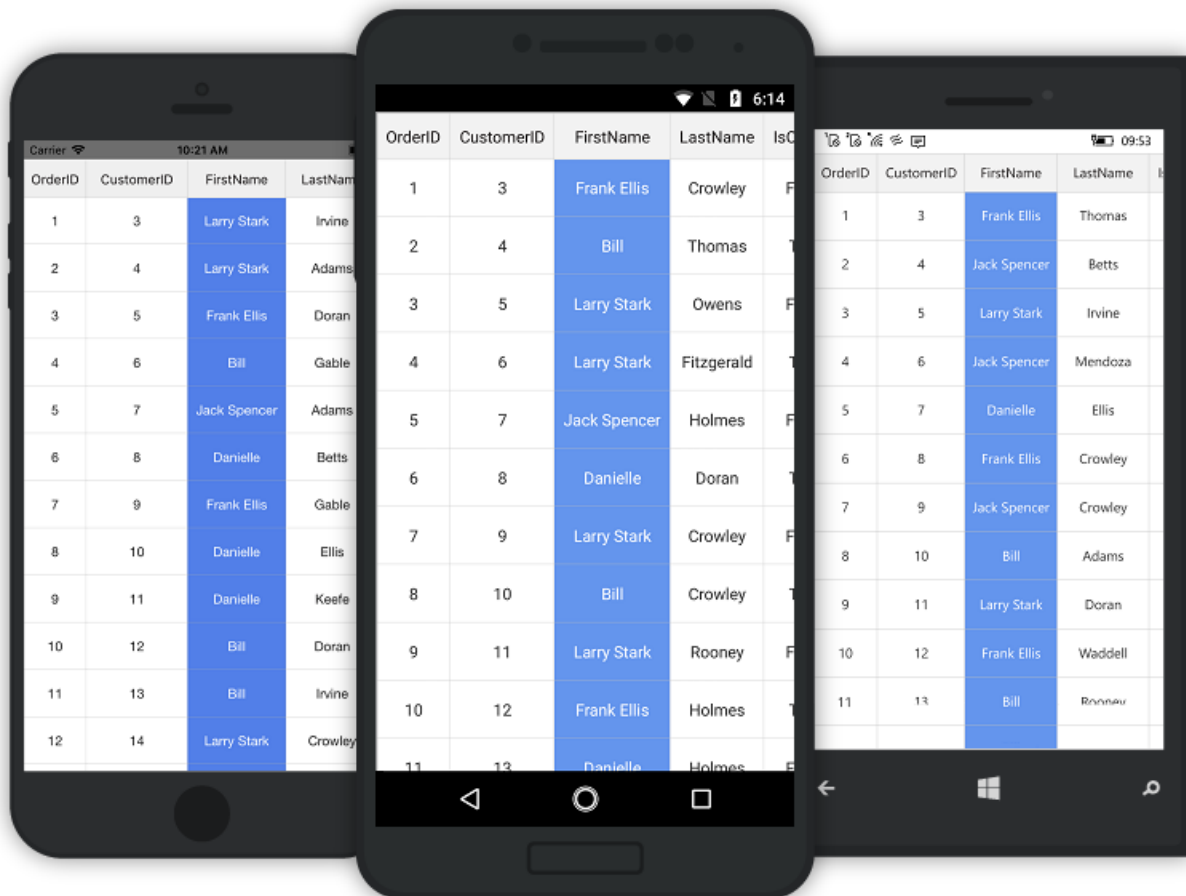

### How to style a particular column

Based on the properties of the `Column` provided in the `QueryCellStyleEventArgs` of the `QueryCellStyle` event, style can be applied to a particular column.

#### C#

```
private void DataGrid_QueryCellStyle(object sender, QueryCellStyleEventArgs e)
{
    if (e.Column.MappingName == "FirstName")
    {
        e.Style.BackgroundColor = Color.CornflowerBlue;
        e.Style.ForegroundColor = Color.White;
    }
    e.Handled = true;
}
```

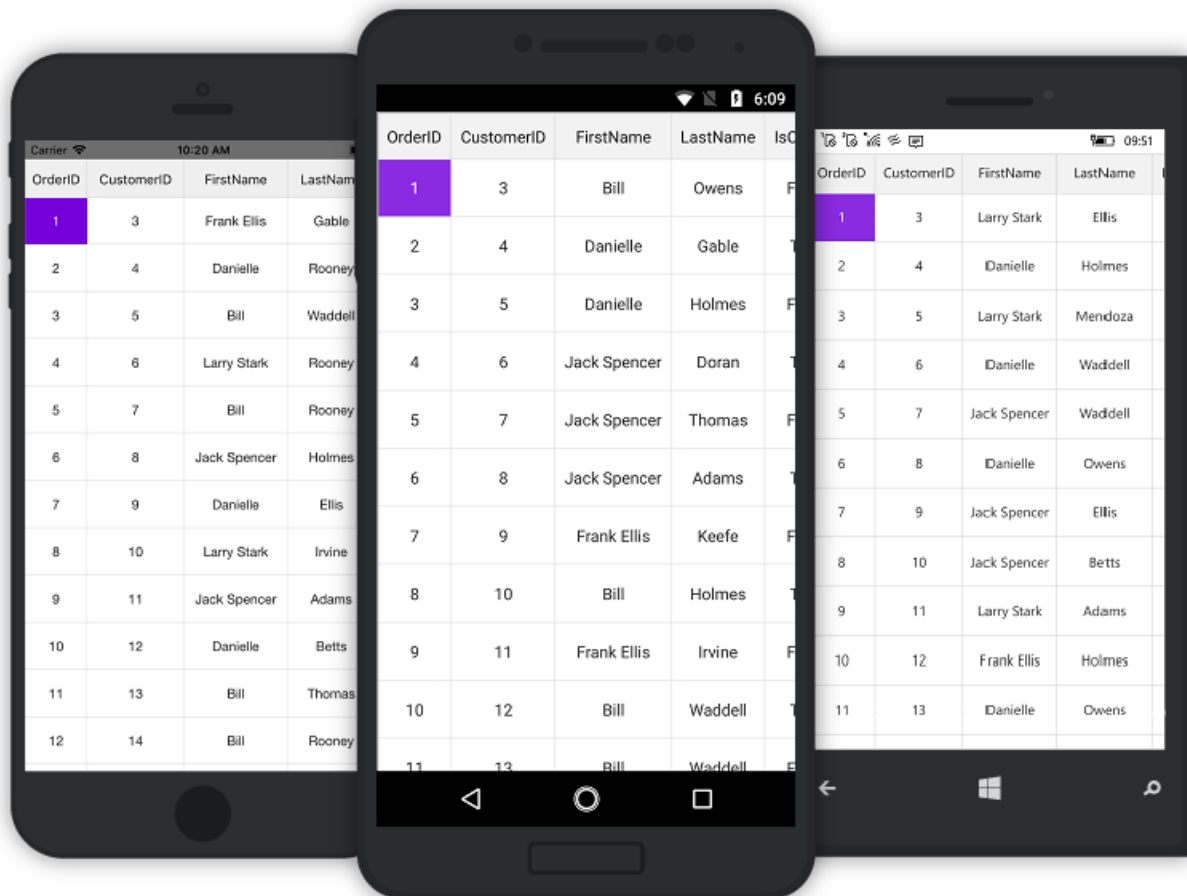

How to style a particular cell based on `RowIndex` and `ColumnIndex`

Styling can be applied to a particular cell based on the `RowIndex` and `ColumnIndex` properties in `QueryCellStyleEventArgs` of the `QueryCellStyle` event.

### C#

```
private void DataGrid_QueryCellStyle(object sender, QueryCellStyleEventArgs e)
{
    if (e.ColumnIndex == 0 && e.RowIndex == 1)
    {
        e.Style.BackgroundColor = Color.BlueViolet;
        e.Style.ForegroundColor = Color.White;
    }
    e.Handled = true;
}
```

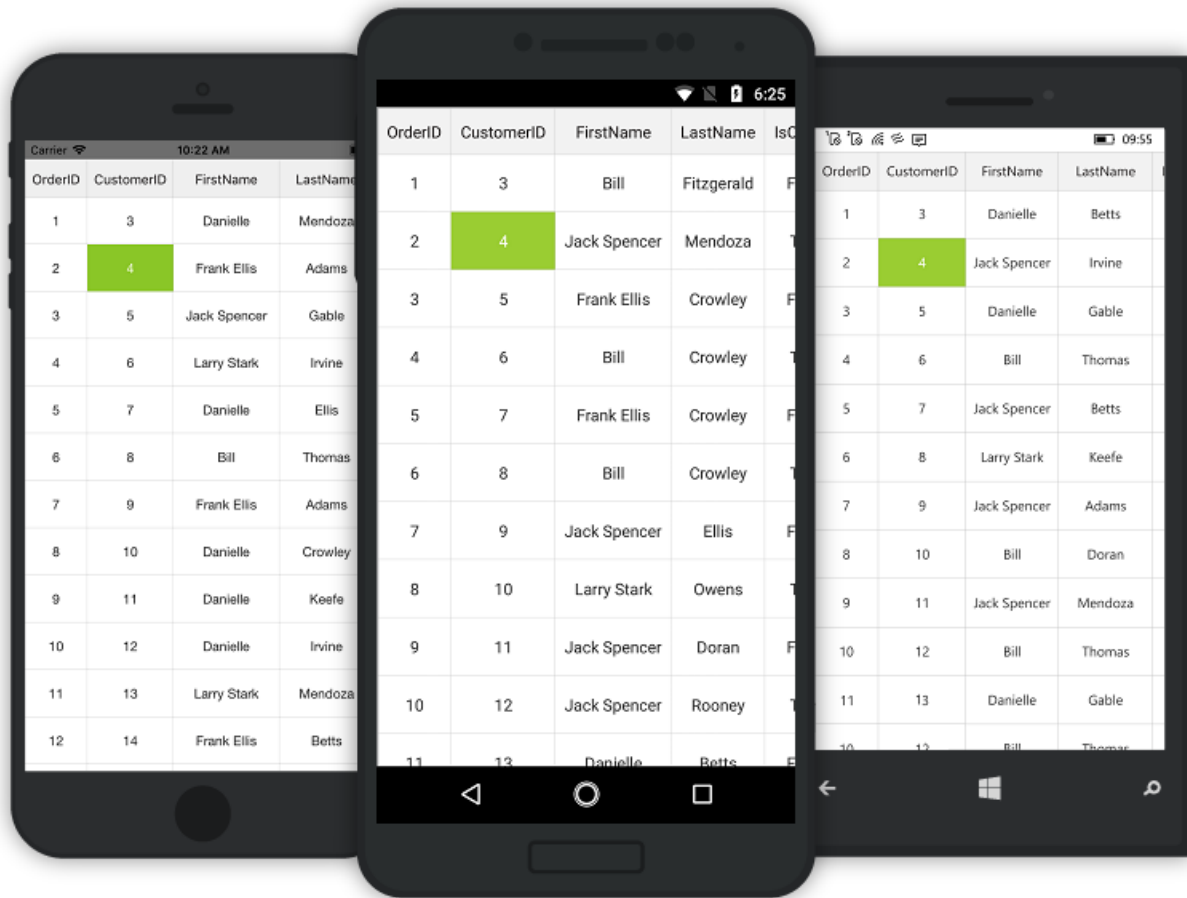

### How to style a particular cell based on CellValue

Styling can be applied to a particular cell based on `CellValue` property in `QueryCellStyleEventArgs` of the `QueryCellStyle` event.

#### C#

```
private void DataGrid_QueryCellStyle(object sender, QueryCellStyleEventArgs e)
{
    if (e.ColumnIndex == 1 && e.CellValue.ToString() == "4")
    {
        e.Style.BackgroundColor = Color.YellowGreen;
        e.Style.ForegroundColor = Color.White;
    }
    e.Handled = true;
}
```

## Styling cells using RowStyle event

The Conditional style can be applied for an entire row based on any condition using the [QueryRowStyle](#) event. This event will be fired for each row. It provides the following properties through the [QueryRowStyleEventArgs](#) in its `EventHandler`:

- [RowData](#): Provides the row data of current row in iteration.
- [RowIndex](#): Provides the row index of current row in iteration.
- [e.Handled](#): Should set to true to apply the changes.
- [Style](#): Sets style to the current row in iteration.

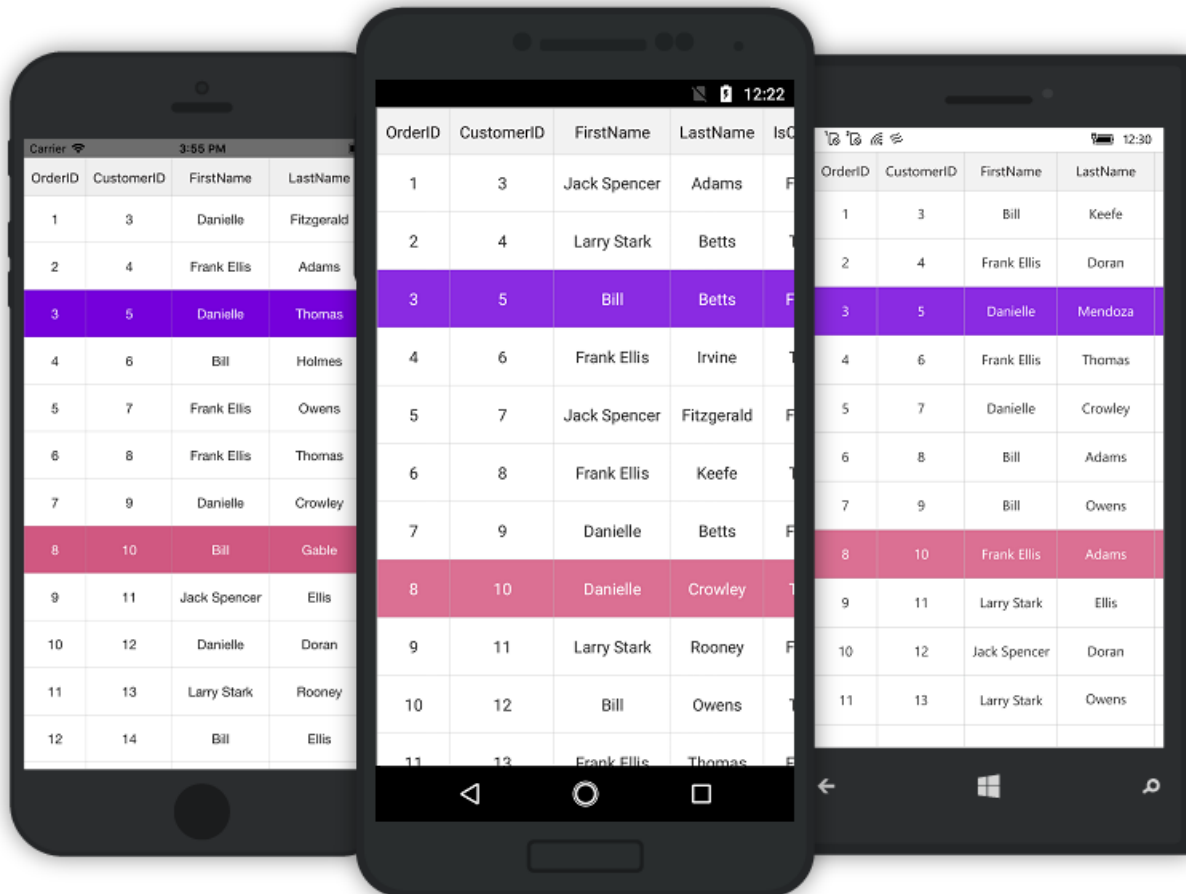

## C#

```
this.dataGrid.QueryRowStyle += DataGrid_QueryRowStyle;
private void DataGrid_QueryRowStyle(object sender, QueryRowStyleEventArgs e)
{
    if (e.RowIndex == 3)
    {
        e.Style.ForegroundColor = Color.White;
        e.Style.BackgroundColor = Color.BlueViolet;
    }
    else if (e.RowData == viewModel.OrdersInfo[7])
    {

```

```
e.Style.ForegroundColor = Color.White;
e.Style.BackgroundColor = Color.PaleVioletRed;
}
e.Handled = true;
}
```

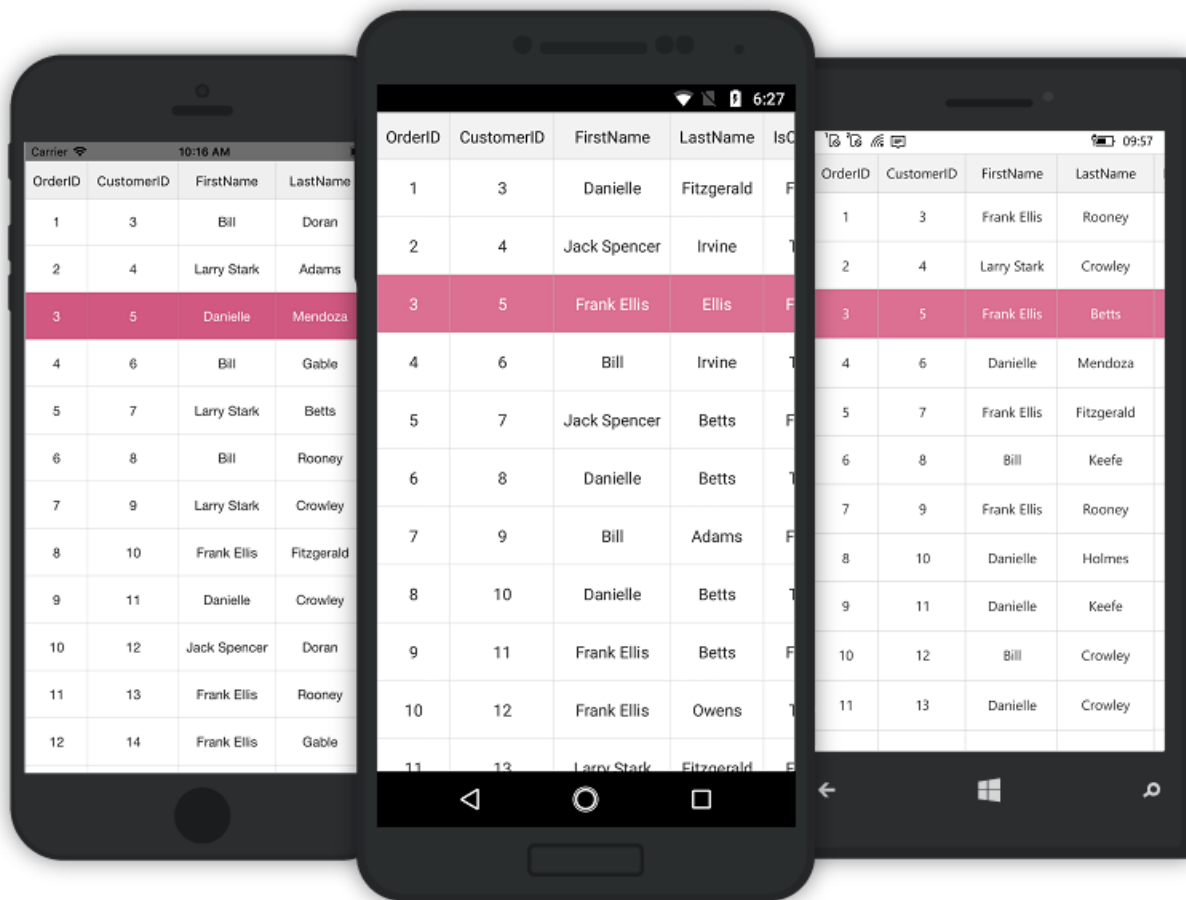

### How to style a particular row based on RowIndex

Styling can be applied to a particular row based on `RowIndex` property in `QueryRowStyleEventArgs` of the `QueryRowStyle` event.

#### C#

```
private void DataGrid_QueryRowStyle(object sender, QueryRowStyleEventArgs e)
{
    if (e.RowIndex == 3)
    {
        e.Style.ForegroundColor = Color.White;
        e.Style.BackgroundColor = Color.PaleVioletRed;
    }
    e.Handled = true;
}
```

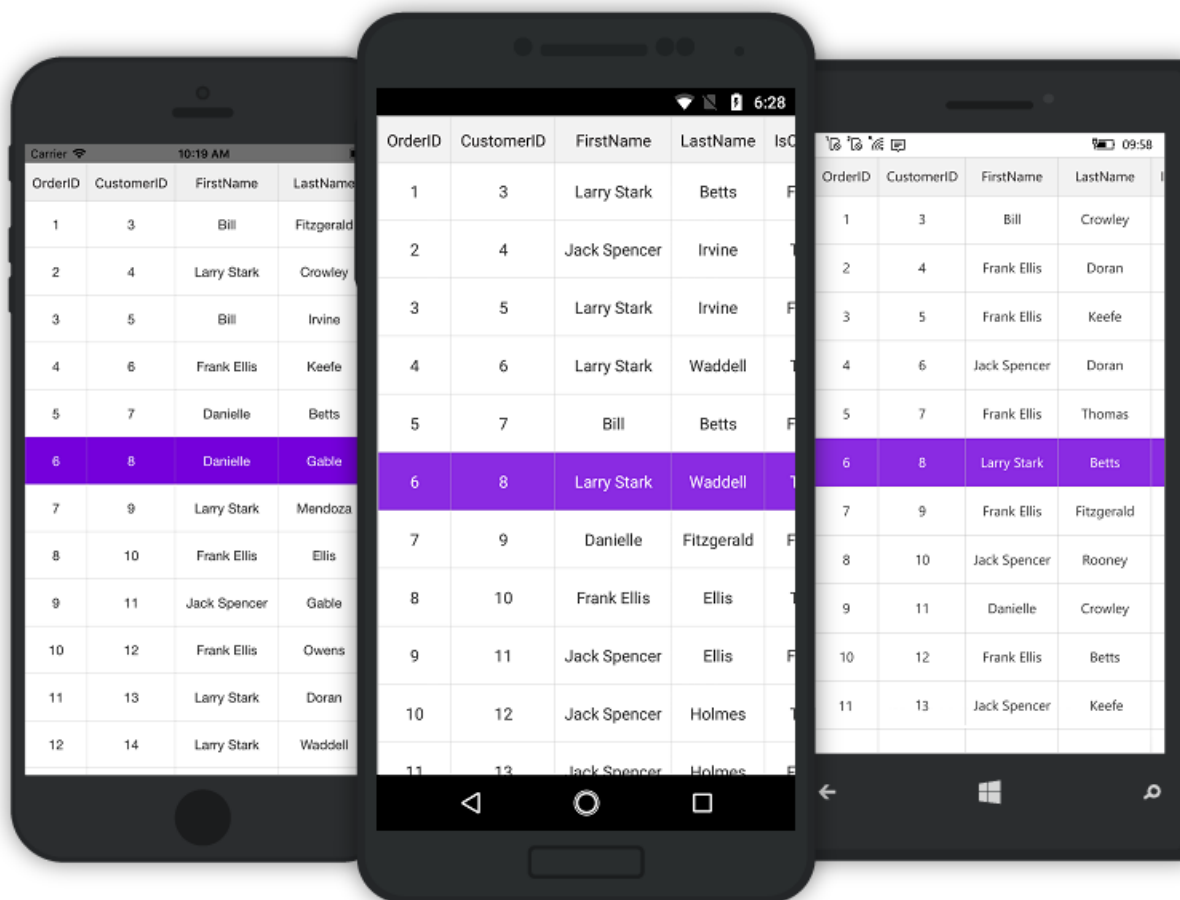

### How to style a particular row based on RowData

Styling can be applied to a particular row based on `RowData` property in `QueryRowStyleEventArgs` of the `QueryRowStyle` event.

#### C#

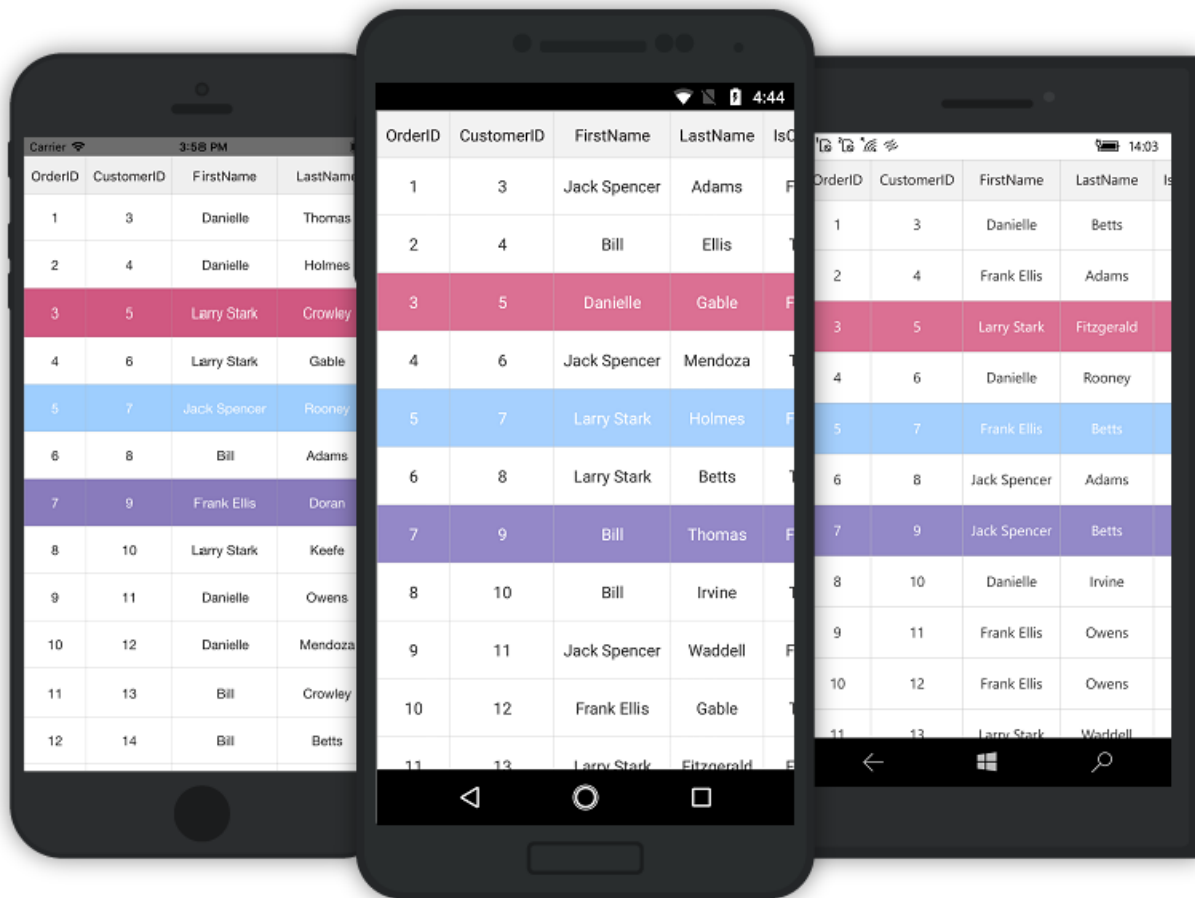

```
private void DataGrid_QueryRowStyle(object sender, QueryRowStyleEventArgs e)
{
    if (e.RowData == viewModel.OrdersInfo[5])
    {
        e.Style.ForegroundColor = Color.White;
        e.Style.BackgroundColor = Color.BlueViolet;
    }
    e.Handled = true;
}
```

**Note:** By default, only the selected background color will be applied for the selected row even if row style is applied for that row. If you want to apply selection color over while selecting row style, set the [ConditionalStylingPreference](#) property to [StylePreference.RowStyleAndSelection](#).

### C#

```
private void DataGrid_QueryRowStyle(object sender, QueryRowStyleEventArgs e)
{
    if (e.RowIndex == 3 || e.RowIndex == 7)
    {
        e.Style.ForegroundColor = Color.White;
        e.Style.BackgroundColor = Color.PaleVioletRed;
    }
    //Set the below code to display only selection
    //e.Style.ConditionalStylingPreference = StylePreference.Selection;
    e.Style.ConditionalStylingPreference = StylePreference.RowStyleAndSelection;
    e.Handled = true;
}
```

## Paging

The data grid interactively supports manipulation of data using [SfDataPager]([http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPagernamespace.html#""](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPagernamespace.html#)) control. This provides built-in options to page data on demand when dealing with large volumes of data. SfDataPager can be placed above or below based on the requirement to easily manage data paging.

To use paging functionality in the data grid, add the following namespace to the project:

[Syncfusion.SfDataGrid.XForms.DataPager]([http://help.syncfusion.com/cr/xamarin/sfdatagrid#""](http://help.syncfusion.com/cr/xamarin/sfdatagrid#))

There are two different modes in paging:

- **NormalPaging:** NormalPaging loads the entire data collection to the SfDataPager.
- **OnDemandPaging:** OnDemandPaging loads data to the current page dynamically in SfDataPager.

## Normal paging

The data grid performs paging of data using the SfDataPager. To enable paging, follow the procedure:

- Create a new SfDataPager instance, and bind the data collection to the [SfDataPager.Source](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~Source.html# "") property based on which [SfDataPager.PagedSource](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~PagedSource.html# "") is created internally.
- Bind the PagedSource property to the [ItemsSource](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.SfDataGrid~ItemsSource.html# "") of the data grid.
- Set the number of rows to be displayed on a page by setting the [SfDataPager.PageSize](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~PageSize.html# "") property.
- Set the number of buttons that should be displayed in view by setting the [SfDataPager.NumericButtonCount](http://help.syncfusion.com/cr/creffiles/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~NumericButtonCount.html# "") property.

---

**Note:** The SfDataPager.PageSize property should not be assigned with value 0.

---

The following code example illustrates using SfDataPager with the data grid control:

#### XML

```
<local:SamplePage x:Class="SampleBrowser.Paging"
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:SampleBrowser;assembly=SampleBrowser"
xmlns:sfgrid="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
xmlns:sfPager="clr-namespace:Syncfusion.SfDataGrid.XForms.DataPager;assembly=Syncfusion.SfDataGrid.XForms">
<local:SamplePage.BindingContext>
<local:DataPagerViewModel x:Name="viewModel" />
</local:SamplePage.BindingContext>
<local:SamplePage.ContentView>
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<sfPager:SfDataPager x:Name="dataPager"
Grid.Row="0"
PageSize="15"
HeightRequest="50"
NumericButtonCount="20"
Source="{Binding Info}">
<sfPager:SfDataPager.HeightRequest>
<OnPlatform x:TypeArguments="x:Double"
iOS="50"
Android="50"
WinPhone="70" />
</sfPager:SfDataPager.HeightRequest>
```

```
</sfPager:SfDataPager>
<sfgrid:SfDataGrid x:Name="dataGrid"
Grid.Row="1"
AutoGenerateColumns="true"
ColumnSizer="Star"
SelectionMode="Single"
ItemsSource="{Binding PagedSource, Source={x:Reference dataPager}}}"
>
</sfgrid:SfDataGrid>
</Grid>
</local:SamplePage.ContentView>
</local:SamplePage>
```

## C#

```
public partial class MainPage : ContentPage
{
    SfDataGrid sfGrid = new SfDataGrid();
    SfDataPager sfPager = new SfDataPager();
    ViewModel viewModel = new ViewModel();
    public MainPage()
    {
        InitializeComponent();
        sfPager.PageSize = 15; //Setting the number of rows in a page
        sfPager.Source = viewModel.Info; //Setting data source to SfDataPager
        sfGrid.ItemsSource = sfPager.PagedSource; //Setting ItemsSource to
        SfDataGrid
        sfGrid.ColumnSizer = ColumnSizer.Star;
        Grid myGrid = new Grid();
        myGrid.HorizontalOptions = LayoutOptions.FillAndExpand;
        myGrid.RowDefinitions = new RowDefinitionCollection
        {
            new RowDefinition { Height = 50 },
            new RowDefinition {},
        };
        myGrid.Children.Add(sfPager, 0, 0);
        myGrid.Children.Add(sfGrid, 0, 1);
        this.Content = myGrid;
    }
}
```

The following screenshot shows the outcome upon execution of the above code:

**Note:** The `SfDataPager` provides scrolling animation while tapping the [FirstPageButton](#) or [LastPageButton](#).

### OnDemandPaging

In normal Paging, data collection is entirely loaded initially to the `SfDataPager`. However, the control also allows loading the data for the current page dynamically by setting the `[SfDataPager.UseOnDemandPaging]` ([http://help.syncfusion.com/cr/cref\\_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~UseOnDemandPaging.html#""](http://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~UseOnDemandPaging.html#)) to `true`.

To load current page item dynamically, hook the `[OnDemandLoading]` ([http://help.syncfusion.com/cr/cref\\_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~OnDemandLoadingEV.html#""](http://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~OnDemandLoadingEV.html#)) event. In the `OnDemandLoading` event, use the `[LoadDynamicItems]` ([http://help.syncfusion.com/cr/cref\\_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~LoadDynamicItems.html#""](http://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.SfDataPager~LoadDynamicItems.html#)) method to load data for the corresponding page in the `SfDataPager`.

The `OnDemandLoading` event is triggered when the pager moves to the corresponding page. It contains the following event arguments:

- `[StartIndex]` ([http://help.syncfusion.com/cr/cref\\_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.OnDemandLoadingEventArgs~StartIndex.html#""](http://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.OnDemandLoadingEventArgs~StartIndex.html#)): Displays the corresponding page start index.
- `[PageSize]` ([http://help.syncfusion.com/cr/cref\\_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.OnDemandLoadingEventArgs~PageSize.html#""](http://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.SfDataGrid.XForms~Syncfusion.SfDataGrid.XForms.DataPager.OnDemandLoadingEventArgs~PageSize.html#)): Displays the number of items to be loaded for that page.

To load data for the `DataPager` control dynamically, follow the code example:

### C#

```
private void OnDemandPageLoading(object sender, OnDemandLoadingEventArgs args)
{
    sfDataPager.LoadDynamicItems(args.StartIndex,
    source.Skip(args.StartIndex).Take(args.PageSize));
}
```

**Note:** In on demand paging, you should not assign a value for the **Source** property. Also you have to define an integer value for **PageCount** property to generate the required numeric buttons in the view.

When using **OnDemandPaging**, **SfDataPager.PagedSource** loads only the current page data. Upon navigation to another page, **OnDemandLoading** event is fired which loads another set of data, but maintains the previous page data also. When you navigate to the previous page again, **OnDemandLoading** event is not fired, and the required data maintained in the cache is loaded. However, for further performance enhancement if you do not want to maintain the previous page data, call `[Syncfusion.Data.PagedCollectionView.ResetCache()]`([http://help.syncfusion.com/cr/cref\\_files/xamarin/Syncfusion.Data.Portable~Syncfusion.Data.PagedCollectionView~ResetCache.html#""](http://help.syncfusion.com/cr/cref_files/xamarin/Syncfusion.Data.Portable~Syncfusion.Data.PagedCollectionView~ResetCache.html#)) in **OnDemandLoading** event. **ResetCache** method call resets the cache except the current page.

To use **ResetCache** method, follow the code example:

#### C#

```
private void OnDemandPageLoading(object sender, OnDemandLoadingEventArgs args)
{
    sfDataPager.LoadDynamicItems(args.StartIndex,
    source.Skip(args.StartIndex).Take(args.PageSize));
    (sfDataPager.PagedSource as PagedCollectionView).ResetCache();
}
```

#### AppearanceManager

The data grid allows changing the appearance by writing a style class overriding from the **AppearanceManager**, and assigning it to the **SfDataPager.AppearanceManager** property.

To apply custom style, follow the code example:

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:sfgrid="clr-namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms"
xmlns:local="clr-namespace:SfDataGrid_Sample;assembly=SfDataGrid_Sample"
xmlns:sfDataPager="clr-namespace:Syncfusion.SfDataGrid.XForms.DataPager;assembly=Syncfusion.SfDataGrid.XForms"
x:Class="SfDataGrid_Sample.Page1">
<ContentPage.Resources>
<ResourceDictionary>
<local:CustomAppearance x:Key="customAppearance"/>
</ResourceDictionary>
</ContentPage.Resources>
```

```

<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<sfgrid:SfDataGrid x:Name="dataGrid" Grid.Row="1"
AutoGenerateColumns="True" />
<sfDataPager:SfDataPager x:Name="sfDataPager"
Grid.Row="0"
PageCount="10"
PageSize="10"
NumericButtonCount="10"
AppearanceManager="{StaticResource customAppearance}"
Source="{Binding OrdersInfo}">
</sfDataPager:SfDataPager>
</Grid>
</ContentPage>

```

**C#**

```

public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        this.dataGrid.ItemsSource = sfDataPager.PagedSource;
        // Apply the custom appearance to SfDataPager
        this.sfDataPager.AppearanceManager = new CustomAppearance();
    }
}

```

**C#**

```

//Custom Appearance class
public class CustomAppearance: AppearanceManager
{
    public override Color GetNumericButtonSelectionBackgroundColor()
    {
        return Color.FromRgb(255, 0, 0);
    }
    public override Color GetNumericButtonSelectionForegroundColor()
    {
        return Color.FromRgb(0, 255, 0);
    }
    public override Color GetNumericButtonBackgroundColor()
    {
        return Color.FromRgb(0, 0, 255);
    }
    public override Color GetNumericButtonForegroundColor()
    {
        return Color.FromRgb(82, 82, 82);
    }
    public override Color GetNavigationButtonBackgroundColor()

```

```
{
    return Color.FromRgb(34, 34, 34);
}
public override Color GetPagerButtonBorderColor()
{
    return Color.Black;
}
}
```

The following picture shows the customize appearance of data pager:

ProductID	Product	UserRating	ProductM...
10001	Nokia	4	Lumia_800
10002	Geneva	3	Carrera
10003	Dell	3	XPS12
10004	ROLEX	3	Submariner
10005	Samsung	1	S3
10006	HTC	2	8x
10007	SonyMobile	2	Xperia_Tipo
10008	Dell	2	XPS15
10009	Dell	3	XPS12
10010	ROLEX	1	Sea_Dweller

#### *Numeric button border color*

Based on the requirement, customize the numeric button border color by overriding the [GetPagerButtonBorderColor](#) method.

To customize the numeric button border color, follow the code example:

#### **XML**

```
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<sfgrid:SfDataGrid x:Name="dataGrid" Grid.Row="1"
AutoGenerateColumns="True" />
```

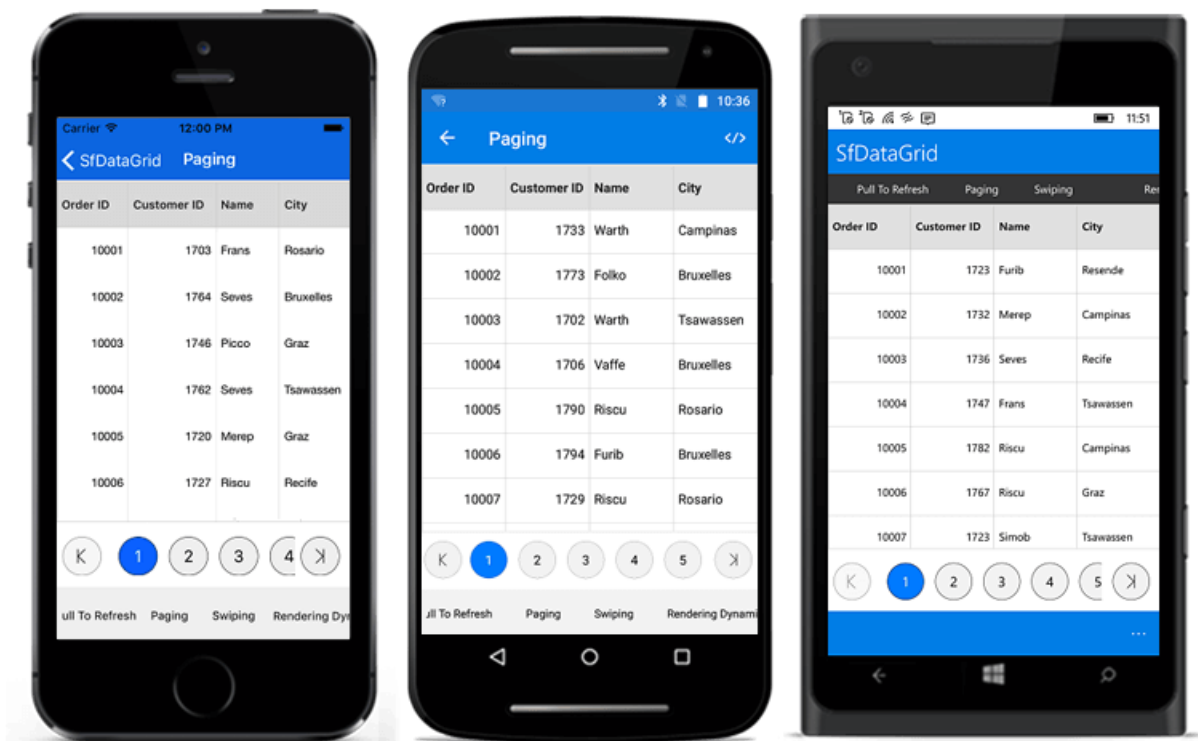

```
<sfDataPager:SfDataPager x:Name="sfDataPager"
Grid.Row="0"
PageCount="10"
PageSize="10"
NumericButtonCount="10"
AppearanceManager="{StaticResource customAppearance}"
Source="{Binding OrdersInfo}">
</sfDataPager:SfDataPager>
</Grid>
```

**C#**

```
this.dataGrid.ItemsSource = sfDataPager.PagedSource;
// Apply the custom appearance to SfDataPager
this.sfDataPager.AppearanceManager = new CustomAppearance();
```

**C#**

```
public class CustomAppearance : AppearanceManager
{
    public override Color GetPagerButtonBorderColor()
    {
        return Color.Black;
    }
}
```

## Row Height Customization

The data grid provides an option to customize the header row height and the row height of all the grid rows or a particular row. To achieve this customization, see the following sections:

### Customize HeaderRowHeight

The data grid allows you to customize the height of the header row by setting the [SfDataGrid.HeaderRowHeight](#) property. The default value of this property is 40. This property responds to runtime changes, so it can be customized. Setting [SfDataGrid.HeaderRowHeight](#) to zero will collapse the header row in the view.

To customize the header row height, follow the code example:

#### C#

```
//Customizing header row height in SfDataGrid
dataGrid.HeaderRowHeight = 50;
```

### Customize RowHeight for all rows

The data grid allows you to customize the height of grid rows in the scrolling region by setting the [SfDataGrid.RowHeight](#) property. The default value of this property is 50. This property responds to runtime changes, so it can be customized. Setting this property will change the height of all the rows in a body region with a common value. Setting [SfDataGrid.RowHeight](#) to zero will collapse all rows in the grid.

To customize header row height, follow the code example:

#### C#

```
//Customizing row height in SfDataGrid
dataGrid.RowHeight = 60;
```

### QueryRowHeight

The [SfDataGrid.QueryRowHeight](#) event returns row heights on demand. This event receives two arguments, namely the sender handles the data grid, and the [QueryRowHeightEventArgs](#). The [QueryRowHeightEventArgs](#) has the following properties:

- [RowIndex](#): This property helps to identify a particular row in the grid.
- [Height](#): This property sets and returns the height of a grid row on demand. Default line size of the rows is 50.
- [Handled](#): This property decides whether the specified height can be set to the row or not. The default value is `false`. When this property is not set, the decided height is not set to the row.

To hook the [SfDataGrid.QueryRowHeight](#) event, and customize height of a row, follow the code example:

#### C#

```
//Hooks QueryRowHeight event in SfDataGrid
dataGrid.QueryRowHeight += DataGrid_QueryRowHeight;
//Event to set the row height on demand
void DataGrid_QueryRowHeight (object sender, QueryRowHeightEventArgs e)
{
```

```
//Sets height of the fifth row
if (e.RowIndex == 5) {
    e.Height = 100;
    e.Handled = true;
}
```

#### QueryRowHeights customization

The data grid allows you to query a range of rows programmatically by using the `SfDataGrid.QueryingRowHeights` method.

`QueryRowHeights` has two arguments: start index and end index.

- Start index: Indicates from which row index the `SfDataGrid.QueryRowHeight` event has to fire.
- End index: Indicates the end row index for the `SfDataGrid.QueryRowHeight` event to fire.

To customize the row height for a range of rows, follow the code example:

#### C#

```
//Customizing the QueryingRowHeights in data grid
dataGrid.QueryingRowHeights(2,5);
//Its starts to query the rows from the second row to the fifth row.
```

#### GridRowSizingOptions

The data grid allows you to customize the height of grid rows with various customizing options while auto calculating the row height based on the content using the `GridRowSizingOptions`.

#### Calculate height based on certain columns

The data grid allows you to calculate the row height excluding certain columns using the `ExcludeColumns` property.

The following code example illustrates calculating the height of grid rows based on certain columns:

#### C#

```
private void DataGrid_QueryRowHeight(object sender, QueryRowHeightEventArgs e)
{
    GridRowSizingOptions options = new GridRowSizingOptions();
    options.ExcludeColumns.Add("Description");
    options.ExcludeColumns.Add("CustomerID");
    if (e.RowIndex == 0)
    {
        e.Height = 50;
    }
    else
    {
        e.Height = dataGrid.GetRowHeight(e.RowIndex, options);
    }
    e.Handled = true;
}
```

### Calculate height including hidden columns

Data grid allows you to calculate the row height based on content including or excluding hidden columns using the `CanIncludeHiddenColumns` property.

To calculate the height including hidden columns, follow the code example:

#### C#

```
private void DataGrid_QueryRowHeight(object sender, QueryRowHeightEventArgs e)
{
    GridRowSizingOptions options = new GridRowSizingOptions();
    options.CanIncludeHiddenColumns = true;
    if (e.RowIndex == 0)
    {
        e.Height = 50;
    }
    else
    {
        e.Height = dataGrid.GetRowHeight(e.RowIndex, options);
    }
    e.Handled = true;
}
```

### Reset row height at runtime

The data grid allows you to customize the height of a grid row on demand by handling the [SfDataGrid.QueryRowHeight](#) event. This event is raised for the grid rows whenever they come into view. So the height of a particular row can be customized on demand using the row index. Setting the height to zero will collapse all rows in the grid.

### Auto fit the grid rows based on content

The data grid supports the `AutoRowHeight` feature. The height of a row can be customized based on the content. This can be achieved using the `SfDataGrid.QueryRowHeight` event and the [SfDataGrid.GetRowHeight](#) method. The `SfDataGrid.QueryRowHeight` event returns the row height on demand. The `SfDataGrid.GetRowHeight` method returns the height of the row based on the content.

---

**Note:** The row drag and drop operation is not supported while customizing the row height based on content.

---

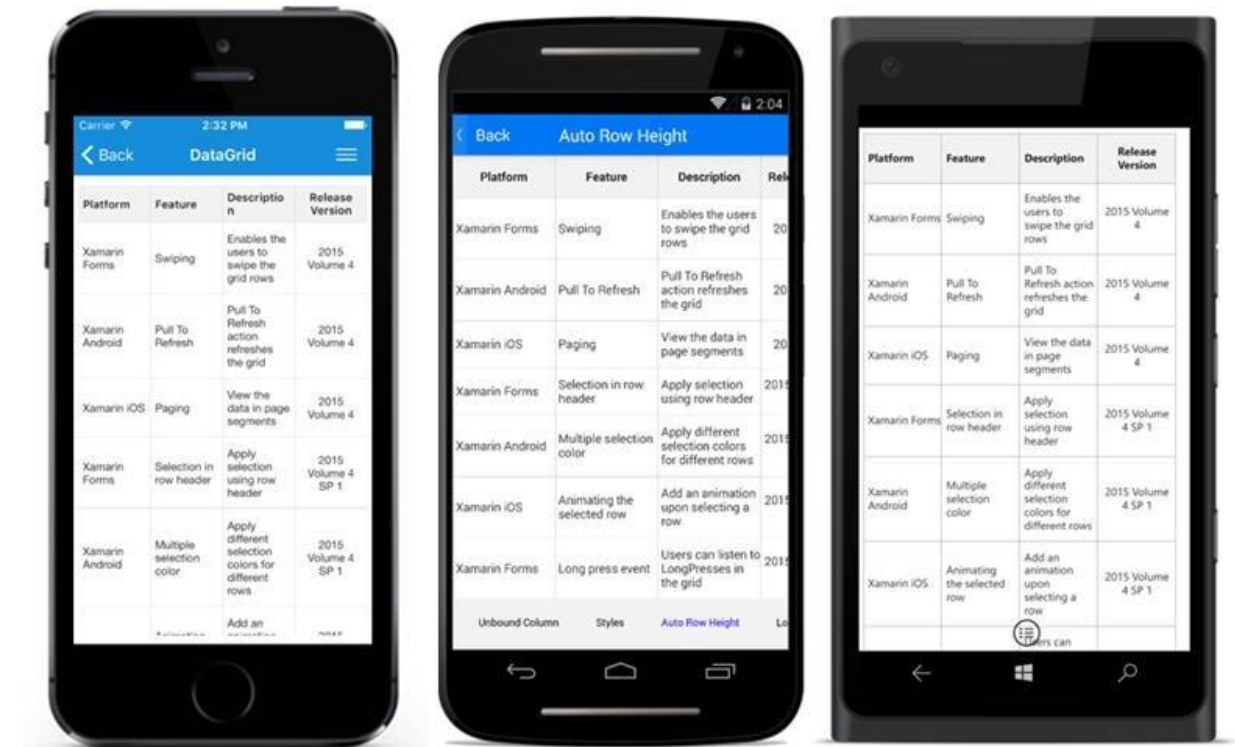

To hook the `SfDataGrid.QueryRowHeight` event and auto fit the height of a row based on content, follow the code example:

#### C#

```
//Hooks QueryRowHeight event in SfDataGrid to set the row height on demand
dataGrid.QueryRowHeight += DataGrid_QueryRowHeight;
private
void DataGrid_QueryRowHeight (object sender, QueryRowHeightEventArgs e)
{
    if (e.RowIndex != 0)
    {
        //Calculates and sets the height of the row based on its content.
        e.Height = dataGrid.GetRowHeight(e.RowIndex);
        e.Handled = true;
    }
}
```

```
}

```

### Customize header row height based on header content

The data grid allows you to customize the height of the header row based on its content using the `SfDataGrid.QueryRowHeight` event and [SfDataGrid.GetRowHeight](#) method.

To hook the `SfDataGrid.QueryRowHeight` event and change the header row height based on the content, follow the code example:

#### C#

```
//Hooks QueryRowHeight event in SfDataGrid to set the header row height on demand
dataGrid.QueryRowHeight += DataGrid_QueryRowHeight;
private void DataGrid_QueryRowHeight(object sender, QueryRowHeightEventArgs e)
{
    if (e.RowIndex == dataGrid.GetHeaderIndex())
    {
        e.Height = dataGrid.GetRowHeight(e.RowIndex);
        e.Handled = true;
    }
}
```

### Customize caption summary row height

The data grid allows you to customize the height of the `CaptionSummaryRow` by setting the height of the caption rows in the `SfDataGrid.QueryRowHeight` event. By default, the `CaptionSummaryRow` renders with the height of the `SfDataGrid.RowHeight`, which is 50.

To customize the `CaptionSummaryRow` height, follow the code example:

#### C#

```
//Hooks QueryRowHeight event in SfDataGrid to set the CaptionSummaryRow height on demand
dataGrid.QueryRowHeight += DataGrid_QueryRowHeight;
private void DataGrid_QueryRowHeight(object sender, QueryRowHeightEventArgs e)
{
    if (dataGrid.IsCaptionSummaryRow(e.RowIndex))
    {
        e.Height = 70;
        e.Handled = true;
    }
}
```

### Change TableSummaryRow height

The data grid allows you to customize the height of the **TableSummaryRow** by setting the height of the table summary rows in the **SfDataGrid.QueryRowHeight** event. By default, the **TableSummaryRow** renders with the height of the **SfDataGrid.RowHeight**, which is 50.

To customize header row height, follow the code example:

#### C#

```
//Hooks QueryRowHeight event in DataGrid to set the CaptionSummaryRow height on demand
dataGrid.QueryRowHeight += DataGrid_QueryRowHeight;
private void DataGrid_QueryRowHeight(object sender, QueryRowHeightEventArgs e)
{
    if (dataGrid.IsTableSummaryRow(e.RowIndex))
    {
        e.Height = 70;
        e.Handled = true;
    }
}
```

Order ID	Salary	First Name	Last Name	Shipping Country
10001	10001	Michael	Betts	Brazil
10002	10002	Gina	Irvine	Belgium
10003	10003	Daniel	Gable	Argentina
10004	10004	Danielle	Betts	Brazil
10005	10005	Gina	Gable	Belgium
10006	10006	Brenda	Owens	Brazil
10007	10007	William	Doran	Canada
10008	10008	Kyle	Irvine	Brazil
10009	10009	Danielle	Rooney	Argentina
Total Salary: ₹ 10,05,050.00 for 100 members				

### How to optimize performance when using QueryRowHeight event

By default, the `SfDataGrid.QueryRowHeight` event will be fired each time a row comes into view. If you want to prevent the same row from being queried again, you can check if the `Height` property in the `QueryRowHeightEventArgs` is not equal to the `SfDataGrid.RowHeight` property, which prevents the same row from being queried again. To enhance performance by preventing the same row from being queried again, follow the code example:

#### C#

```
//Hooks QueryRowHeight event in DataGrid to set the row height on demand
dataGrid.QueryRowHeight += DataGrid_QueryRowHeight;
private
void DataGrid_QueryRowHeight (object sender, QueryRowHeightEventArgs e)
{
    // Code to skip querying of a row if already queried
    if (e.Height != dataGrid.RowHeight)
        return;
    if (e.RowIndex != 0)
    {
        //Calculates and sets the height of the row based on its content.
        e.Height = dataGrid.GetRowHeight(e.RowIndex);
        e.Handled = true;
    }
}
```

### Limitations

When setting `SfDataGrid.ScrollingMode` to `ScrollingMode.Line`, the `SfDataGrid.QueryRowHeight` event is not supported.

### Scrolling

#### Scrolling mode

The data grid provides three types of scrolling mode that can be customized by using the `SfDataGrid.ScrollingMode` property. By default, the control will scroll the content based on pixel values. The scrolling modes are as follows:

- PixelLine
- Line
- Pixel

---

**Note:** The data grid supports for the vertical and horizontal scrollbars in UWP. In addition to that, mouse scrolling is also supporting in UWP desktop application.

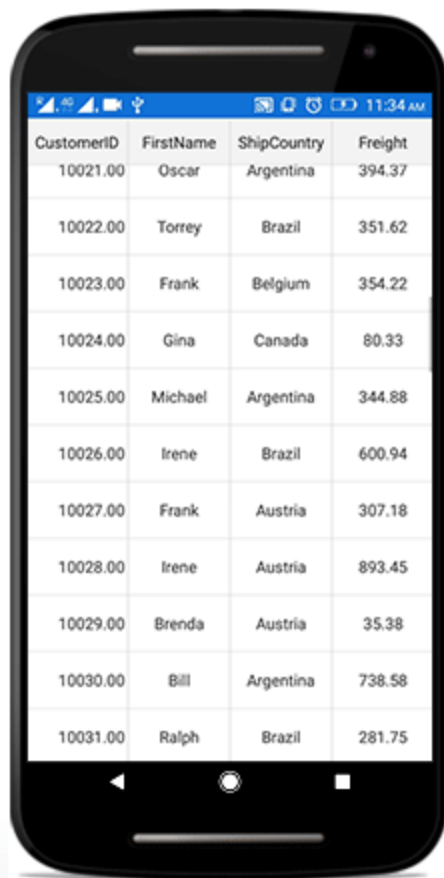

---

#### PixelLine

The `ScrollingMode.PixelLine` allows you to scroll its contents like an excel sheet i.e., whenever a row or a column is clipped on the top, the particular row or column will auto scroll to display fully in view.

#### C#

```
dataGrid.ScrollingMode = ScrollingMode.PixelLine;
```

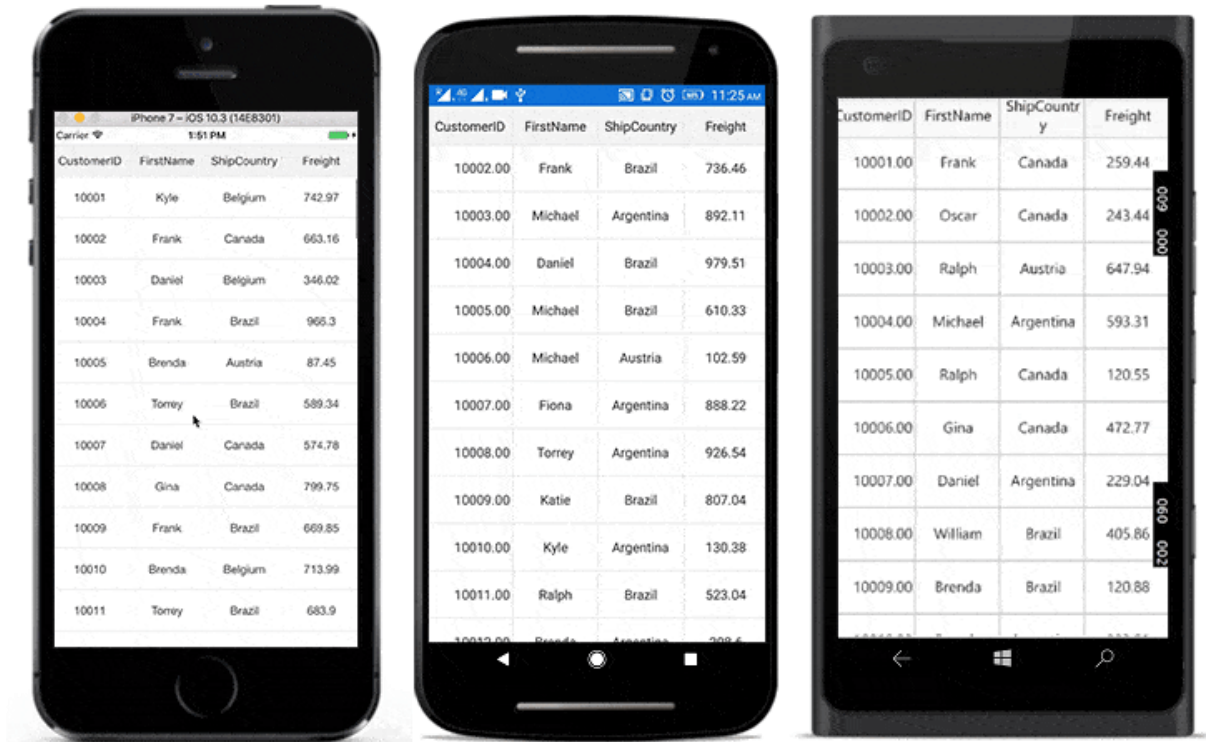

### Line

The `ScrollingMode.Line` allows you to scroll its contents based on lines i.e., the view will be updated only when the offset values reaches the origin of a row or column in the bound collection.

### C#

```
dataGrid.ScrollingMode = ScrollingMode.Line;
```

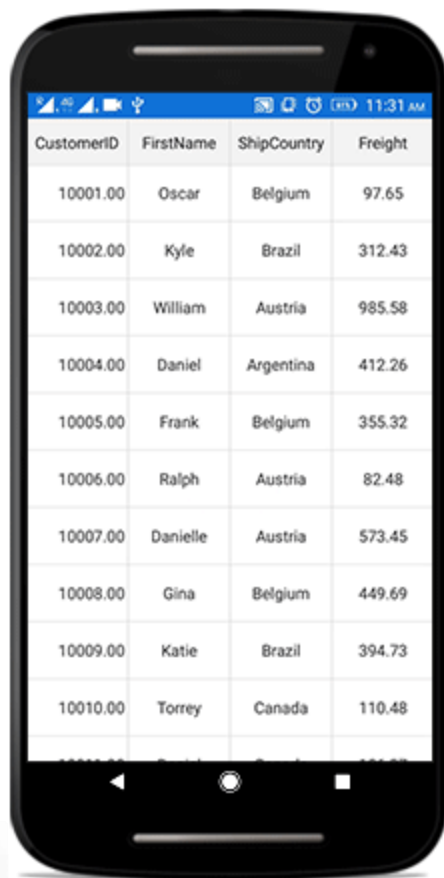

### Pixel

The `ScrollingMode.Pixel` allows you to scroll its contents based on pixel values i.e., the view will update each pixel change of the offsets, and row or column will appear clipped when offset exceeds the origin of the row or column.

### C#

```
dataGrid.ScrollingMode = ScrollingMode.Pixel;
```

CustomerID	FirstName	ShipCountry	Freight
10001.00	Oscar	Belgium	97.65
10002.00	Kyle	Brazil	312.43
10003.00	William	Austria	985.58
10004.00	Daniel	Argentina	412.26
10005.00	Frank	Belgium	355.32
10006.00	Ralph	Austria	82.48
10007.00	Danielle	Austria	573.45
10008.00	Gina	Belgium	449.69
10009.00	Katie	Brazil	394.73
10010.00	Torrey	Canada	110.48

### Programmatic scrolling

The data grid scrolls to a particular row and column index programmatically.

#### *Scroll to row and column index*

Scroll programmatically to a particular row and column using the [SfDataGrid.ScrollToRowColumnIndex](#) method by passing row and column indexes.

#### **C#**

```
dataGrid.ScrollToRowColumnIndex(int rowIndex, int columnIndex);  
//For example,  
dataGrid.ScrollToRowColumnIndex(20, 6);
```

### Scroll to row index

Scroll programmatically to a particular row using the [SfDataGrid.ScrollToRowIndex](#) method by passing the row index.

### C#

```
dataGrid.ScrollToRowIndex(int rowIndex);
//For example,
dataGrid.ScrollToRowIndex(20);
```

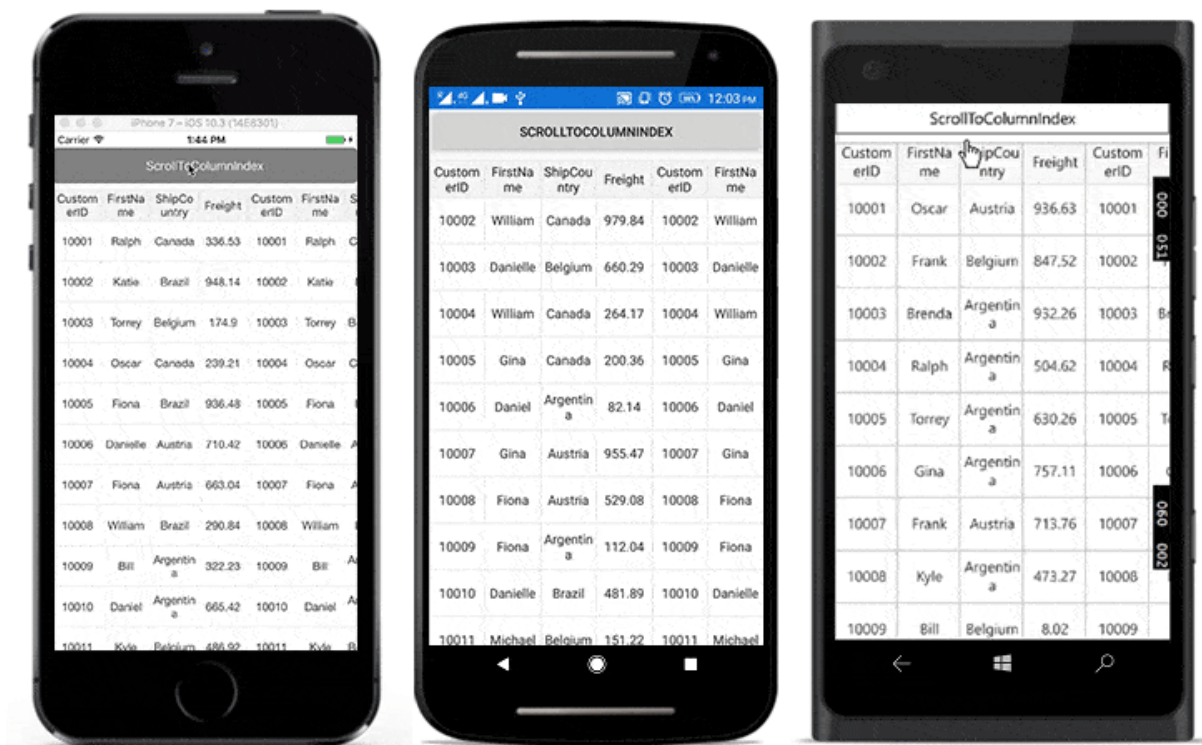

### *Scroll to column index*

Scroll programmatically to a particular column using the [SfDataGrid.ScrollToColumnIndex](#) method by passing the column index.

### **C#**

```
dataGrid.ScrollToColumnIndex(int columnIndex);
//For example,
dataGrid.ScrollToColumnIndex(7);
```

### Scroll a row/column to a specific position

The SfDataGrid allows to position the scrolled row/column in the datagrid by passing [ScrollToPosition](#) as parameter to the [ScrollToRowIndex](#), [ScrollToRowIndex](#), [ScrollToColumnIndex](#) methods. The scrolled row/column can take either of the four positions as explained below. The default position is [Start](#).

- **MakeVisible:** Scroll to make a specified row/column visible in datagrid. If the specified row/column is already in view, scrolling will not occur.
- **Start:** Scroll to make the row/column positioned at the start of the datagrid.
- **Center:** Scroll to make the row/column positioned at the center of the datagrid.
- **End:** Scroll to make the row/column positioned at the end of the datagrid.

Refer the below code snippet to scroll a column/row to a specific position.

### C#

```
// To scroll a column to a particular position,
datagrid.ScrollToColumnIndex(7,scrollToColumnPosition:
ScrollToPosition.Center);
// To scroll a row to a particular position,
datagrid.ScrollToRowIndex(7,scrollToColumnPosition:
ScrollToPosition.Center);
// To scroll a cell to a particular position,
datagrid.ScrollToRowColumnIndex(7, 7, scrollToColumnPosition:
ScrollToPosition.Center, scrollToRowPosition: ScrollToPosition.Center);
```

**Note:** Programmatic scrolling is not applicable for rows and columns that are frozen in view.

### Diagonal scrolling

By default, `SfDataGrid` supports diagonal scrolling(both vertical and horizontal scrolling simultaneously). Setting false to [SfDataGrid.AllowDiagonalScrolling](#) disables diagonal scrolling and scrolls the data grid in either horizontal or vertical direction but not simultaneously.

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo,Mode=TwoWay}"
AllowDiagonalScrolling="False">
</syncfusion:SfDataGrid>
```

#### C#

```
this.dataGrid.AllowDiagonalScrolling = false;
```

### Vertical Over Scroll Mode

The [SfDataGrid.VerticalOverScrollMode](#) property customizes the bouncing behavior of the data grid.

The `SfDataGrid.VerticalOverScrollMode` is of [VerticalScrollMode](#) type having the following two modes:

- Bounce
- None

#### Bounce

The Bounce mode allows the data grid to have bouncing effect. Default value of `SfDataGrid.VerticalOverScrollMode` is Bounce .

To customize the bouncing effect in the data grid, follow the code example:

#### C#

```
dataGrid.VerticalOverScrollMode = VerticalOverScrollMode.Bounce;
```

#### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
ColumnSizer="Star"
VerticalOverScrollMode="Bounce"
ItemsSource="{Binding OrdersInfo}">
</sfgrid:SfDataGrid>
```

### None

The **None** mode disables the bouncing effect in the data grid.

To customize the bouncing effect in the data grid, follow the code example:

### C#

```
dataGrid.VerticalOverScrollMode = VerticalOverScrollMode.None;
```

### XML

```
<sfgrid:SfDataGrid x:Name="dataGrid"
ColumnSizer="Star"
VerticalOverScrollMode="None"
ItemsSource="{Binding OrdersInfo}">
</sfgrid:SfDataGrid>
```

### Identifying scroll state changes

The **SfDataGrid** will notify the scrolling state changes via the [ScrollStateChanged](#) event.

Following states will be notified through the [ScrollState](#) property in the event argument.

- Dragging: Specifies that **SfDataGrid** is currently being dragged in the view.
- Fling: Specifies that fling action is performed on the **SfDataGrid**.
- Idle: Specifies that **SfDataGrid** is not scrolling currently.
- Programmatic: Specifies that scrolling is performed by using [ScrollToColumnIndex](#) or [ScrollToRowIndex](#) method.

### C#

```
dataGrid.ScrollStateChanged += DataGrid_ScrollStateChanged;
private void DataGrid_ScrollStateChanged(object sender,
ScrollStateChangedEventArgs e)
{
    if (e.ScrollState == ScrollState.Idle)
    {
        DisplayAlert("ScrollState", "Scrolling has stopped", "OK");
    }
}
```

### Scrolling customization using Slider

The data grid allows scrolling to a particular row by passing the row index to the `ScrollToRowIndex` method. To scroll the control when interacting with `Slider`, pass the `Slider.Value` as the row index to the `ScrollToRowIndex` method.

To customize the data grid scrolling programmatically using `Slider`, follow the code example:

#### C#

```
Slider slider = new Slider();
slider.ValueChanged += Slider_ValueChanged;
private void Slider_ValueChanged(object sender, ValueChangedEventArgs e)
{
    dataGrid.ScrollToRowIndex((int) (e.NewValue));
}
```

### Unbound Rows

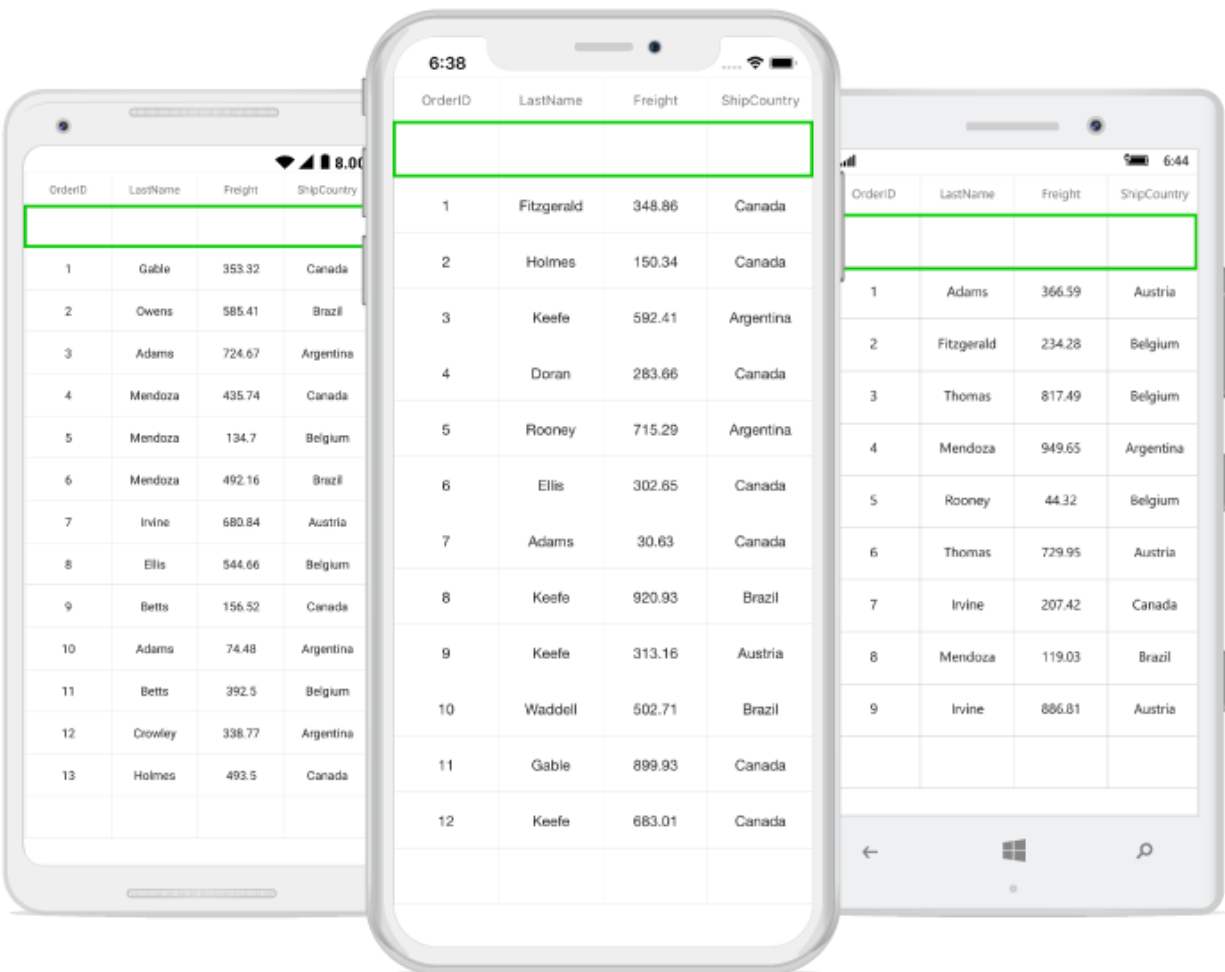

The Xamarin.Forms DataGrid allows you to add **additional rows** at top and also bottom of the DataGrid which are **not bound with data object** of underlying data source. You can add unbound rows using [SfDataGrid.UnboundRows](#) collection property. You can add any no of unbound rows to the DataGrid. Unbound rows can also be exported to pdf and excel documents.

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid" ItemsSource="{Binding
OrdersInfo}">
<syncfusion:SfDataGrid.UnboundRows>
<syncfusion:GridUnboundRow Position="Top" />
</syncfusion:SfDataGrid.UnboundRows>
</syncfusion:SfDataGrid>
```

**C#**

```
this.dataGrid.UnboundRows.Add(new GridUnboundRow() { Position =
UnboundRowsPosition.Top });
```

**Positioning unbound rows**

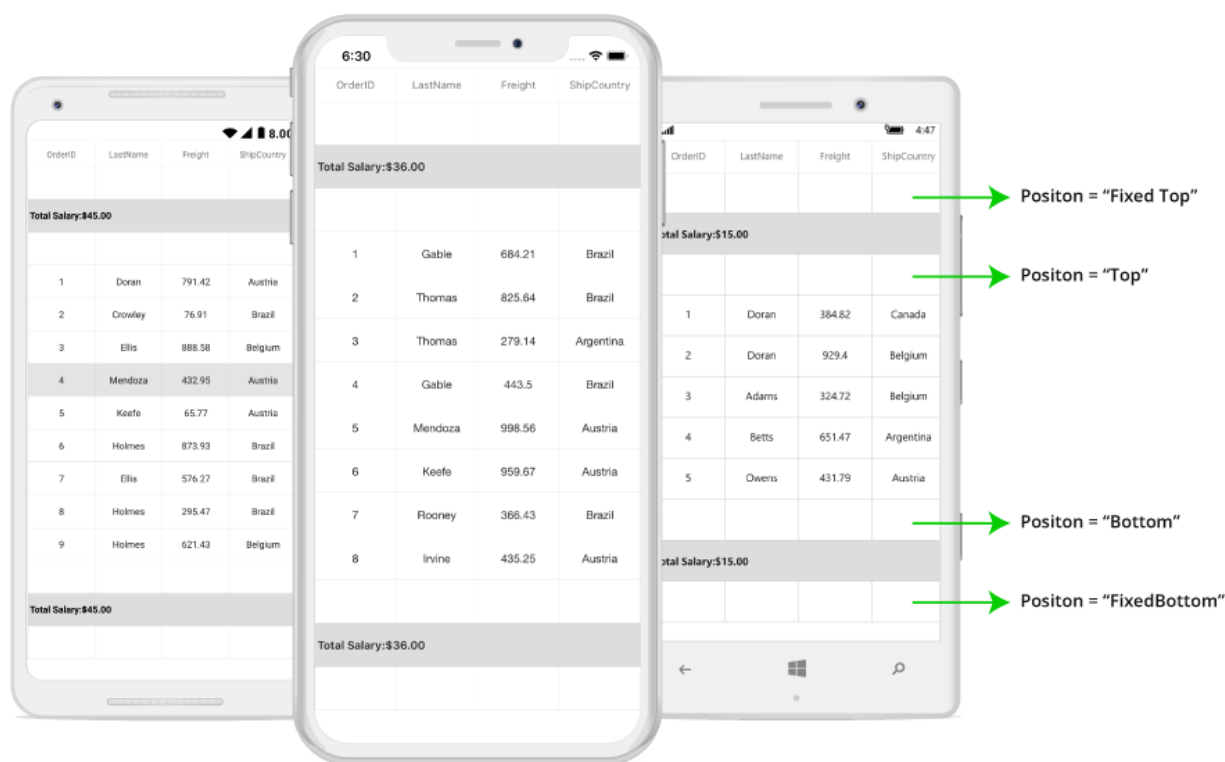

Unbound row can be placed in top or bottom of the DataGrid by setting the desired value to the [GridUnboundRow.Position](#) property.

Below table shows the available unbound row positions.

UnboundRowPosition	Position in DataGrid
--------------------	----------------------

FixedTop	Unbound row placed at top, right below the Header row. In this position, unbound row is not selectable, not editable and frozen when scrolling.
Top	Unbound row placed at top, right above the record rows. In this position, unbound row is selectable, editable and scrollable.
Bottom	Unbound row placed at bottom, right below record rows. In this position, unbound row is selectable, editable and scrollable.
FixedBottom	Unbound row placed at bottom of SfDataGrid. In this position, unbound row is not selectable, not editable and frozen when scrolling.

Below screenshot shows different unbound rows placed in all possible positions.

### Populating data for unbound rows

You can populate data for the unbound row by handling [QueryUnboundRow](#) event of Xamarin.Forms DataGrid. This event is fired for each cell of the unbound rows whenever the row gets refreshed or comes to view.

[GridUnboundRowEventArgs](#) of the [QueryUnboundRow](#) event provides information about the cell that triggered this event.

You can get or set the [GridUnboundRowEventArgs.Value](#) property based on the [UnboundAction](#). If [UnboundAction](#) is [QueryData](#) then you can set the value to be displayed. If the [UnboundAction](#) is [CommitData](#) then you can get the edited value.

### XML

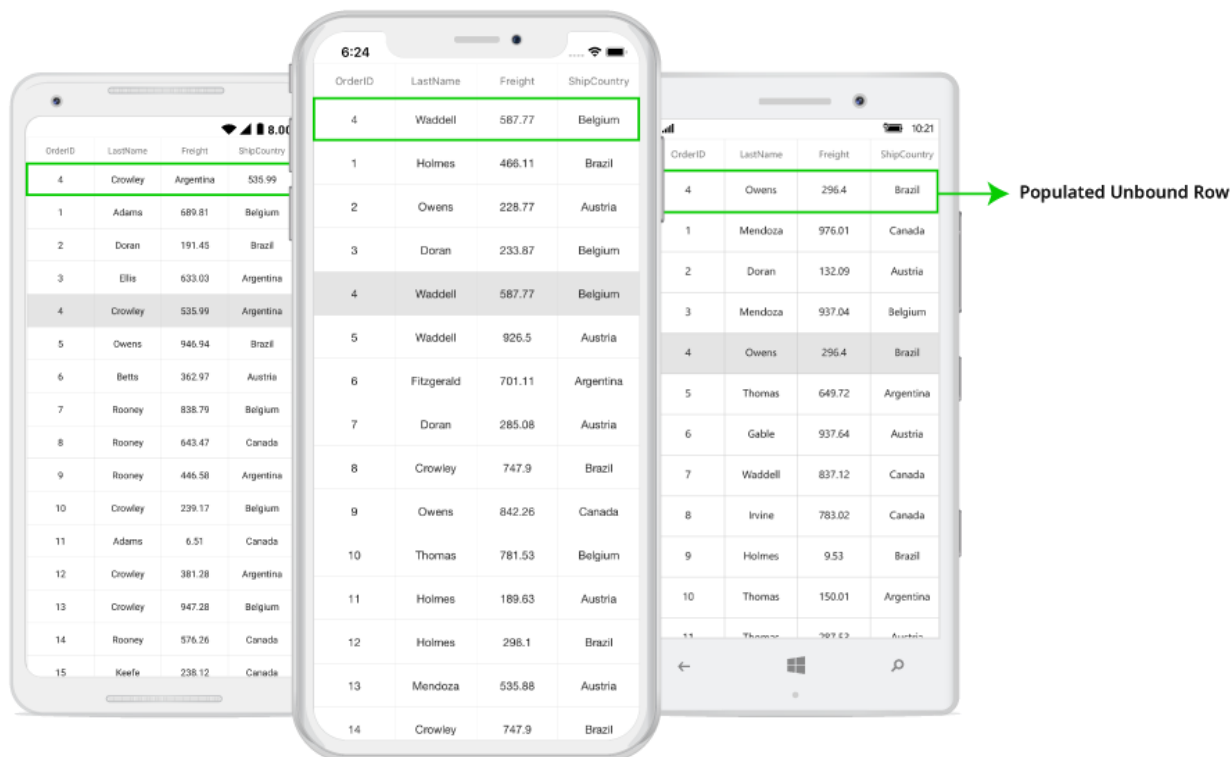

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding Orders}"
SelectionMode="Multiple" >
<syncfusion:SfDataGrid.UnboundRows>
<syncfusion:GridUnboundRow Position="Top" />
</syncfusion:SfDataGrid.UnboundRows>
</syncfusion:SfDataGrid>
```

For example, now unbound row populated based on selected items in SfDataGrid.

### C#

```
dataGrid.GridViewCreated += DataGrid_GridViewCreated;
dataGrid.QueryUnboundRow += DataGrid_QueryUnboundRow;
private void DataGrid_GridViewCreated(object sender,
GridViewCreatedEventArgs e)
{
    dataGrid.SelectedItems.Add(viewModel.OrdersInfo[3]);
}
private void DataGrid_QueryUnboundRow(object sender, GridUnboundRowEventArgs
e)
{
    if (e.UnboundAction == UnboundActions.QueryData)
    {
        if (e.RowColumnIndex.ColumnIndex == 0)
        {
            e.Value = (dataGrid.CurrentItem as OrderInfo).OrderID;
            e.Handled = true;
        }
        else if (e.RowColumnIndex.ColumnIndex == 1)
        {
            e.Value = (dataGrid.CurrentItem as OrderInfo).LastName;
        }
        else if (e.RowColumnIndex.ColumnIndex == 2)
        {
            e.Value = (dataGrid.CurrentItem as OrderInfo).Freight;
            e.Handled = true;
        }
        else if (e.RowColumnIndex.ColumnIndex == 3)
        {
            e.Value = (dataGrid.CurrentItem as OrderInfo).ShipCountry;
            e.Handled = true;
        }
    }
}
```

## Refreshing the Unbound Rows at runtime

### *Add/Remove unbound rows*

You can add or remove unbound rows using [SfDataGrid.UnboundRows](#) property which reflects in UI immediately.

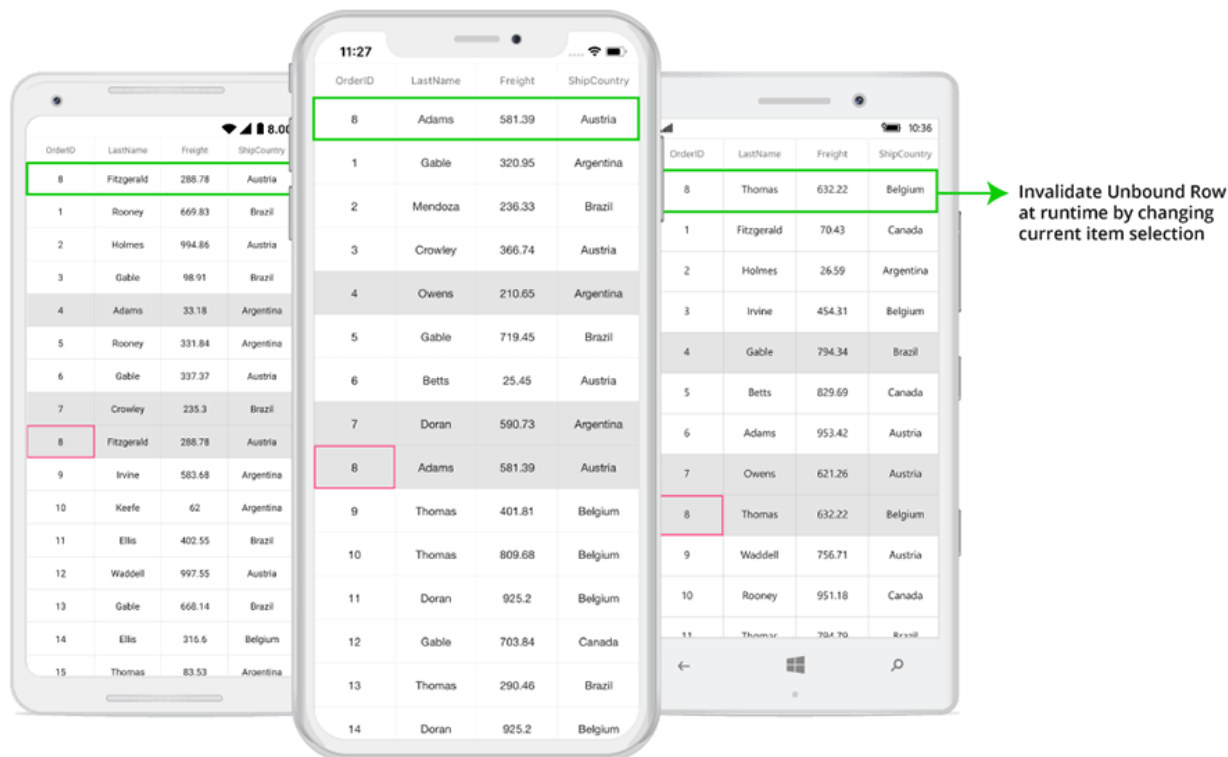

### *Trigger QueryUnboundRow event programmatically*

You can trigger the [QueryUnboundRow](#) event for the unbound row cells at runtime by calling [SfDataGrid.InValidateUnboundRow](#) method which invalidates the unbound row at the given index.

Here in the below code example, we have invalidated the unbound rows whenever selection is changed in the DataGrid.

### **C#**

```
this.dataGrid.SelectionChanged += dataGrid_SelectionChanged;
private void dataGrid_SelectionChanged(object sender,
GridSelectionChangedEventArgs e)
{
    this.dataGrid.InValidateUnboundRow(this.dataGrid.UnboundRows[0]);
}
```

## Editing in unbound rows

### *Cancel the editing for unbound row cell*

You can cancel the editing of unbound row cell in the event handler of [SfDataGrid.CurrentCellBeginEdit](#) event with the help of [SfDataGrid.GetUnboundRowAtRowIndex](#) method and row index.

### C#

```
using Syncfusion.SfDataGrid.XForms;
this.dataGrid.CurrentCellBeginEdit += DataGrid_CurrentCellBeginEdit;
private void DataGrid_CurrentCellBeginEdit(object sender,
GridCurrentCellBeginEditEventArgs e)
{
    var unboundRow =
dataGrid.GetUnboundRowAtRowIndex(e.RowColumnIndex.RowIndex);
    if (unboundRow == null)
        return;
    e.Cancel = true;
}
```

### *Saving edited unbound row cell value to external source*

You can get the edited value of unbound row cell from [GridUnboundRowEventArgs.Value](#) property of [QueryUnboundRow](#) event when [UnboundAction](#) is [CommitData](#).

### C#

```
private void DataGrid_QueryUnboundRow(object sender, GridUnboundRowEventArgs
e)
{
    if (e.UnboundAction == UnboundActions.CommitData)
```

```
{  
    var editedValue = e.Value;  
}
```

## Styling in Unbound rows

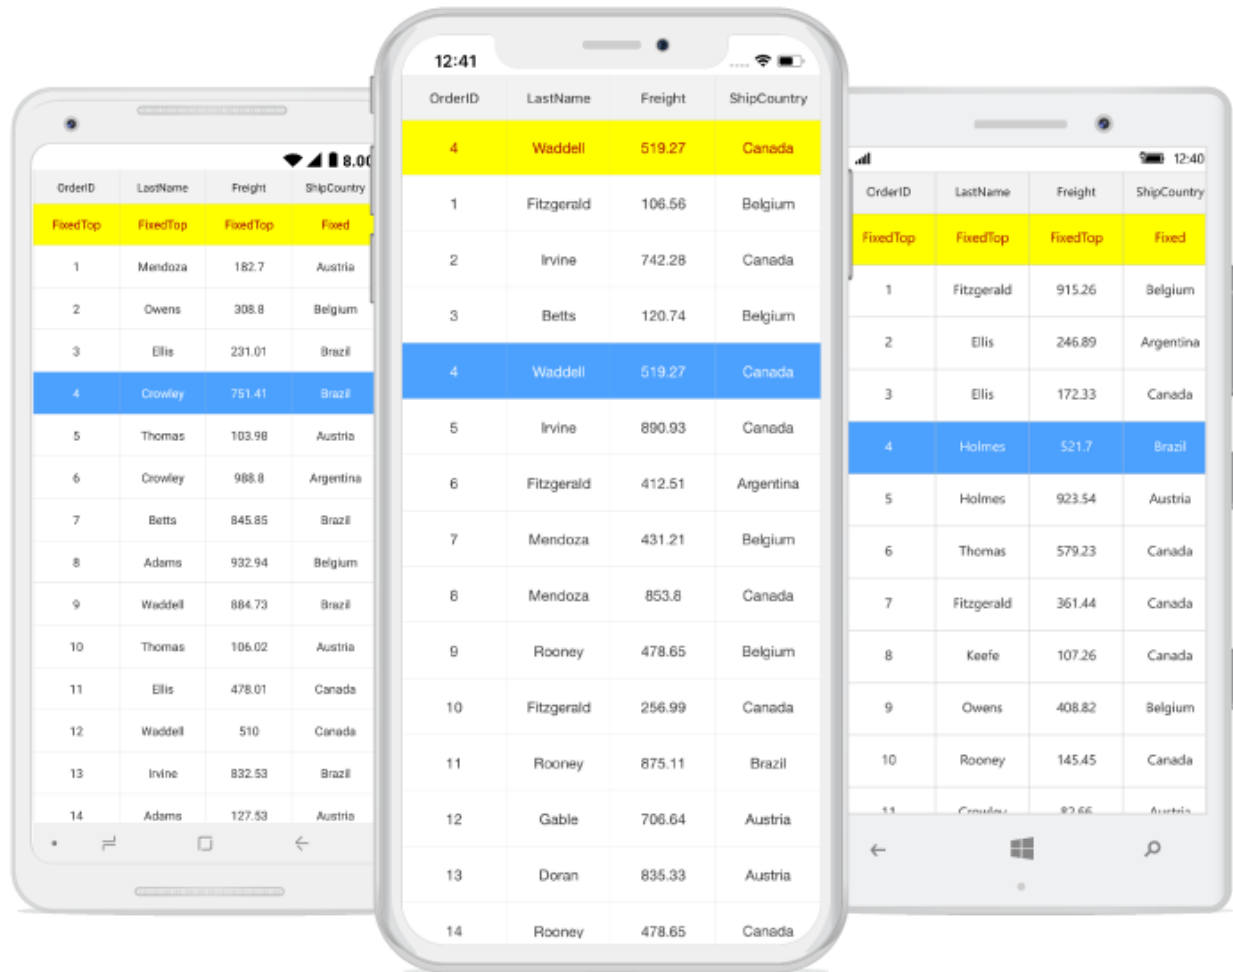

### *Override DataGrid style*

The Xamarin.Forms DataGrid applies style for unboundRow elements by writing a Style class overriding from DataGridStyle, and assigning it to the [SfDataGrid.GridStyle](#) property.

To apply custom style for UnboundRow, follow the code example:

### **C#**

```
SfDataGrid dataGrid = new SfDataGrid();  
dataGrid.GridStyle = new Dark ();  
public class UnboundRowStyle : DataGridStyle  
{  
    public UnboundRowStyle()  
    {  
    }  
    public override Color GetUnboundRowForegroundColor()  
    {  
        return Color.Red;  
    }  
    public override Color GetUnboundRowBackgroundColor()  
    {  
        return Color.Yellow;  
    }  
    public override FontAttributes GetUnboundRowFontAttribute()  
    {  
        return FontAttributes.Bold;  
    }  
}
```

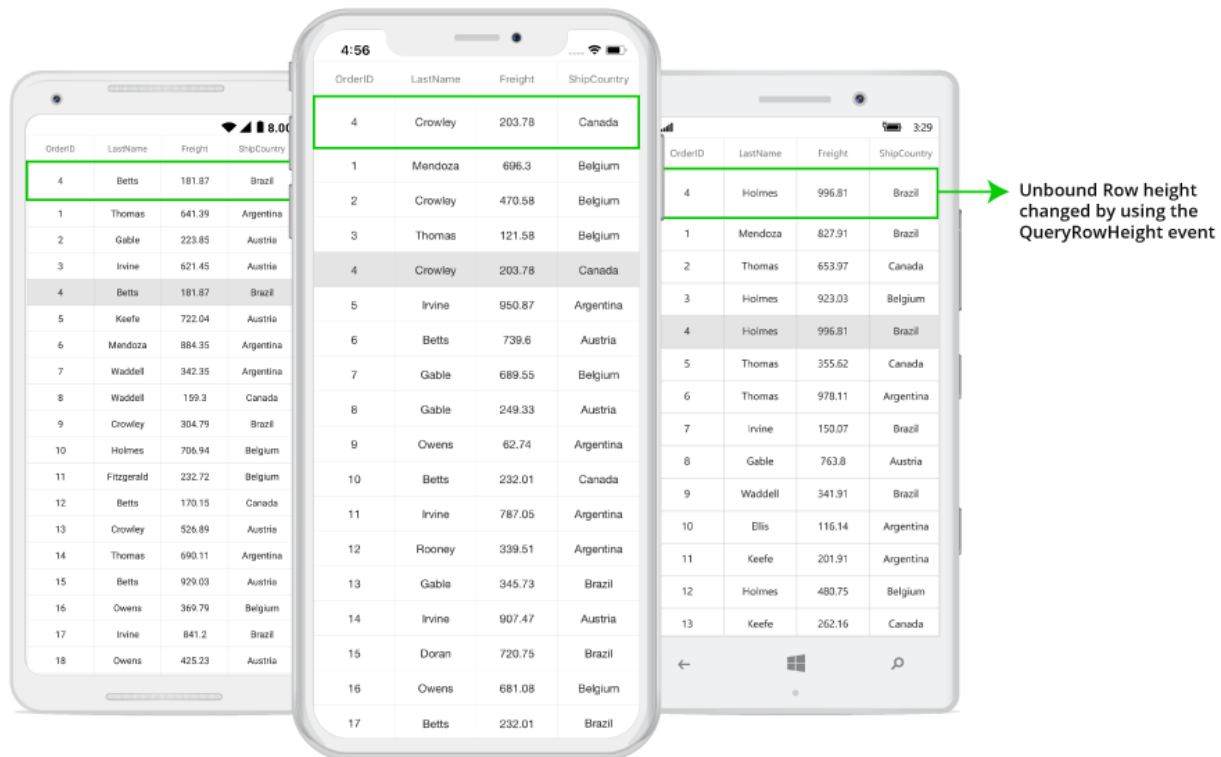

**Note:** You can also apply style to the unbound row using the `SfDataGrid.QueryCellStyle` and `SfDataGrid.QueryRowStyle` event by referring this [link](#).

### Changing unbound row height

You can change the height of unbound row using `SfDataGrid.QueryRowHeight` event.

### C#

```
using Syncfusion.SfDataGrid.XForms;
this.dataGrid.QueryRowHeight += DataGrid_QueryRowHeight;
private void DataGrid_QueryRowHeight(object sender, QueryRowHeightEventArgs e)
{
    if (dataGrid.IsUnboundRow(e.RowIndex))
    {
        e.Height = 60;
        e.Handled = true;
    }
}
```

### Get unbound rows

You can get the unbound row at the specified row index using [GetUnboundRow](#) method.

#### C#

```
using Syncfusion.SfDataGrid.XForms;
var unboundRow = dataGrid.GetUnboundRowAtRowIndex(1);
```

### Unbound Column

The data grid allows adding additional columns which are not bound with data object from the underlying data source. The unbound column can be added using the [SfDataGrid.GridUnboundColumn](#) class.

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding Orders}">
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridUnboundColumn MappingName="DiscountPrice"
HeaderText="Discount Price"
Expression="UnitPrice*Discount"
Format="C">
</syncfusion:GridUnboundColumn>
</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

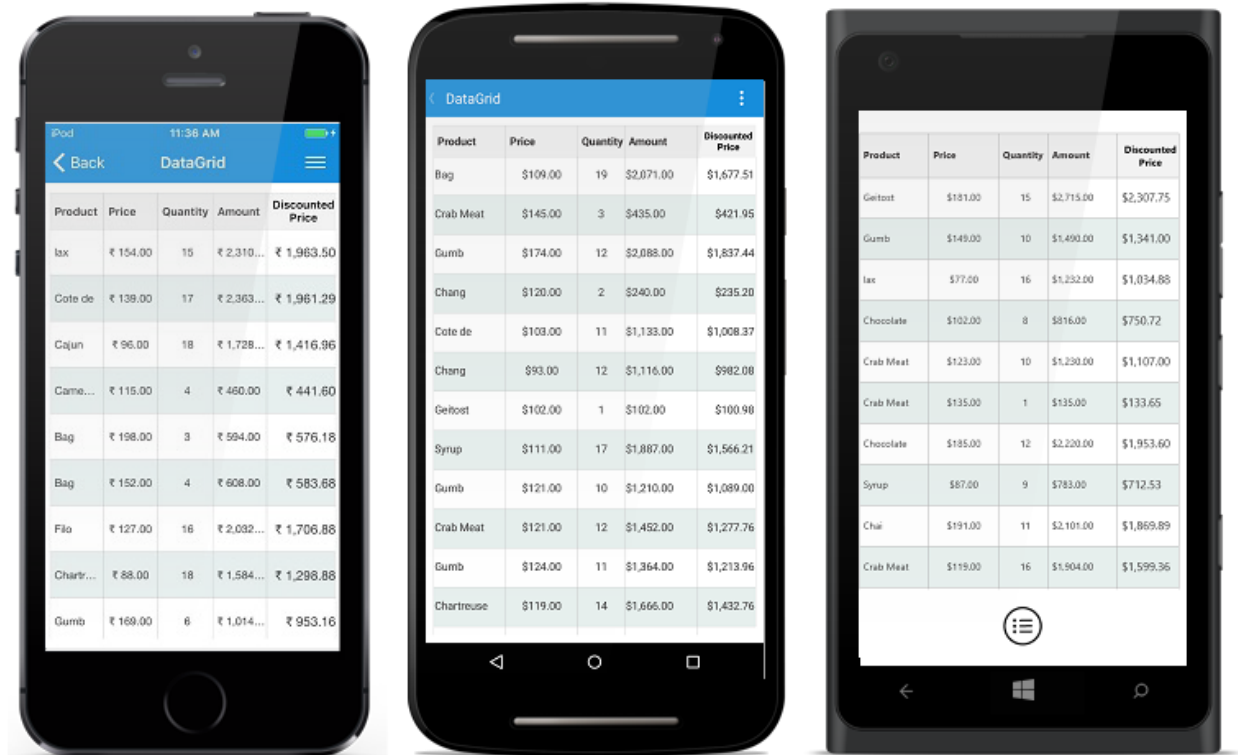

#### C#

```
SfDataGrid dataGrid = new SfDataGrid();
```

```

ViewModel viewModel = new ViewModel();
dataGrid.ItemsSource = viewModel.Orders;
GridUnboundColumn DiscountColumn = new GridUnboundColumn()
{
    MappingName = "DiscountPrice",
    HeaderText = "Discount Price",
    Expression = "UnitPrice*Discount",
    Format = "C"
};
this.dataGrid.Columns.Add(DiscountColumn);

```

**Note:** It is mandatory to specify the [GridColumn.MappingName](#) for `SfDataGrid.GridUnboundColumn` with some name to identify the column. It is not necessary to define name of the field in the data object.

### Populating data for the unbound column

Data for the unbound column can be populated by setting the [Expression](#) or [Format](#) property.

#### Using expression

The arithmetic or logic expression can be specified by using the `Expression` property to compute the display value. By default, `GridUnboundColumn` evaluates the expression with casing. The casing will be disabled while evaluating the expression by setting the [CaseSensitive](#) property to `false`.

List of supported arithmetic and logical operations are as follows:

Arithmetic operations	Operator
Add	+

Subtract	-
Multiply	*
Divide	/
Power	^
Mod	%
Greater Than	>
Less Than	<
Equal	=
GreaterThanOrEqual	>=
LessThanOrEqual	<=

### Logical Operations

Logical operations	Operators
AND	(char)135
OR	(char)136
NOT	(char)137

### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding Orders}">
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridUnboundColumn MappingName="UnboundColumn"
HeaderText="Unbound Column"
Expression="UnitPrice*Discount" />
</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

### C#

```
SfDataGrid dataGrid = new SfDataGrid();
ViewModel viewModel = new ViewModel();
dataGrid.ItemsSource = viewModel.Orders;
GridUnboundColumn DiscountColumn = new GridUnboundColumn()
{
    MappingName = "DiscountPrice",
    HeaderText = "Discount Price",
    Expression = "UnitPrice*Discount"
};
this.dataGrid.Columns.Add(DiscountColumn);
```

*Using format*

Value of other columns can be formatted, and the formatted value displayed in the unbound column using the `Format` property.

**XML**

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding Orders}">
<syncfusion:SfDataGrid.Columns>
<syncfusion:GridUnboundColumn MappingName="DiscountPrice"
HeaderText="Discount Price"
Format="'{Discount}% for {OrderID}'" />
</syncfusion:SfDataGrid.Columns>
</syncfusion:SfDataGrid>
```

**C#**

```
SfDataGrid dataGrid = new SfDataGrid();
ViewModel viewModel = new ViewModel();
dataGrid.ItemsSource = viewModel.Orders;
GridUnboundColumn DiscountColumn = new GridUnboundColumn()
{
    MappingName = "DiscountPrice",
    HeaderText = "Discount Price",
    Format = "'{Discount}% for {OrderID}'"
};
this.dataGrid.Columns.Add(DiscountColumn);
```

*Using QueryUnboundColumnValue event*

The [QueryUnboundColumnValue](#) event is fired when value for the unbound column is queried. It provides the information about the cell that triggered this event. So, you can set the desired value for the grid cells of the unbound column. This event is triggered with the [GridUnboundColumnEventArgs](#).

The `GridUnboundColumnEventArgs` provides the following properties:

- [Column](#): Gets `GridColumn` of the cell that triggers this event.
- [OriginalSender](#): Gets the data grid raising this event.
- [Record](#): Gets the underlying row data.
- [UnboundAction](#): Defines the action for triggering this event.
- [Value](#): Gets or sets the value for `GridUnboundColumn` cell based on `UnboundAction`.

---

**Note:** `UnboundActions.CommitData` and `UnboundActions.PasteData` are currently not supported, and likely to be supported in future.

---

Populate the data for the unbound column by handling `QueryUnboundColumnValue` event which allows customizing the value of the `GridUnboundColumn`. `GridUnboundColumnEventArgs` exposes `Value` property, by which you can set the value for the grid cells of the unbound column based on the `UnboundAction`.

Refer to the following code example in which data for the unbound column is populated by handling the `QueryUnboundColumnValue` event:

**C#**

```

dataGrid.QueryUnboundColumnValue += DataGrid_QueryUnboundColumnValue;
private void DataGrid_QueryUnboundColumnValue(object sender,
GridUnboundColumnEventArgs e)
{
    if (e.UnboundAction == UnboundActions.QueryData)
    {
        var quantity =
        Convert.ToInt16(e.Record.GetType().GetProperty("Quantity").GetValue(e.Record));
        var unitPrice =
        Convert.ToInt16(e.Record.GetType().GetProperty("UnitPrice").GetValue(e.Record));
        var amount = quantity * unitPrice;
        e.Value = amount;
    }
}

```

## Export to Excel

The SfDataGrid supports exporting the data to Excel with several customization options like custom appearance, excluding specific columns, excluding headers, setting custom row height, setting custom column width, etc.

The following assemblies should be added for exporting the SfDataGrid to Excel file.

Project	Required assemblies
PCL	pcl\Syncfusion.SfGridConverter.XForms.dll pcl\Syncfusion.Compression.Portable.dll pcl\Syncfusion.Pdf.Portable.dll pcl\Syncfusion.XlsIO.Portable.dll

If you are using nuget package in the package, the following NuGet package should be installed to export the SfDataGrid to Excel file.

Project	Required package
Xamarin.Forms	Syncfusion.Xamarin.DataGridExport

The following code sample demonstrates how to create and display a SfDataGrid in view.

## XML

```

<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition />
</Grid.RowDefinitions>
<StackLayout Grid.Row="0" Orientation="Vertical">
<Button x:Name="Excel" Text="ExportExcel" Clicked ="ExportToExcel_Clicked"
HeightRequest="50" />
</StackLayout>
<sfgrid:SfDataGrid x:Name="dataGrid"
AllowGroupExpandCollapse="True"

```

```
AllowSorting="True"
Grid.Row="1"
SelectionMode="Multiple"
ColumnSizer="None"
ItemsSource="{Binding OrdersInfo}"
AutoGenerateColumns="False" >
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn HeaderText="Order ID" MappingName="OrderID"/>
<sfgrid:GridTextColumn HeaderText="First Name" MappingName="FirstName"/>
<sfgrid:GridTextColumn HeaderText="Employee ID" MappingName="EmployeeID"/>
<sfgrid:GridNumericColumn HeaderText="Freight" MappingName="Freight"/>
<sfgrid:GridTextColumn HeaderText="Is Closed" MappingName="IsClosed"/>
<sfgrid:GridTextColumn HeaderText="Ship City" MappingName="ShipCity"/>
<sfgrid:GridDateTimeColumn HeaderText="Shipping Date"
MappingName="ShippingDate" />
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
</Grid>
```

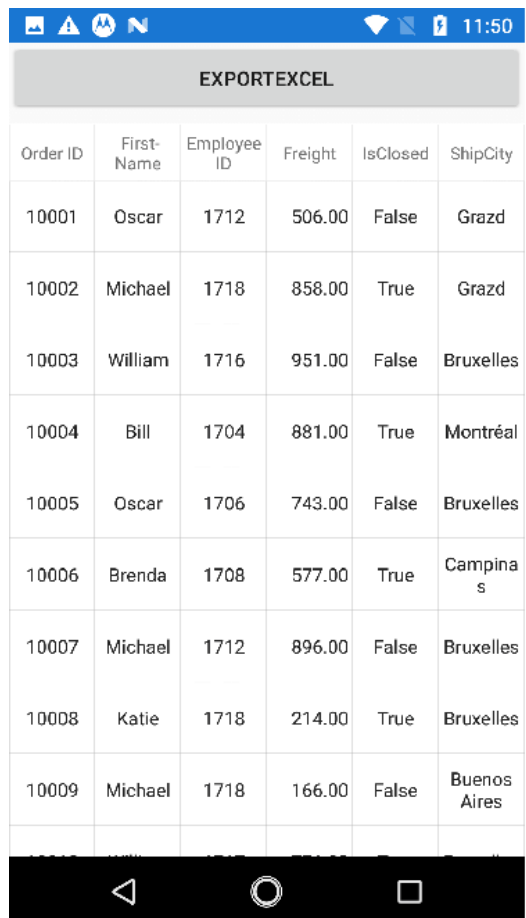

### C#

```
private void ExportToExcel_Clicked(object sender, EventArgs e)
{
    // Perform exporting to Excel sheet operations here.
}
```

You can export the data to Excel by using the [DataGridExcelExportingController.ExportToExcel](#) method by passing the SfDataGrid as an argument.

### C#

```
private void ExportToExcel_Clicked(object sender, EventArgs e)
{
    DataGridExcelExportingController excelExport = new
    DataGridExcelExportingController();
    var excelEngine = excelExport.ExportToExcel(this.dataGrid);
    var workbook = excelEngine.Excel.Workbooks[0];
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    workbook.Close();
    excelEngine.Dispose();
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.xlsx",
    "application/msexcel", stream);
}
```

SfDataGrid  
to Excel

**Note:** SfDataGrid cannot export the GridTemplateColumn to PDF or Excel, since we cannot get the loaded views and draw them with the particular range, values etc from GridTemplateColumn.

### Exporting Options

You can also export the data to Excel with various customizing options by passing the grid and [DataGridExcelExportingOption](#) as arguments to the `ExportToExcel` method.

### C#

```
DataGridExcelExportingController excelExport = new
DataGridExcelExportingController ();
DataGridExcelExportingOption exportOption = new DataGridExcelExportingOption
();
exportOption.ExportColumnWidth = false;
exportOption.DefaultColumnWidth = 150;
var excelEngine = excelExport.ExportToExcel (this.dataGrid, exportOption);
```

The SfDataGrid provides several properties in `DataGridExcelExportingOption` class to customize the grid while exporting it to Excel.

#### Exporting formatted text and actual value

By default, the actual value will only be exported to Excel. To export the display text, set the `ExportMode` property as `Text`.

{% tabs%}

**C#**

```
DataGridExcelExportingController excelExport = new
DataGridExcelExportingController ();
DataGridExcelExportingOption options = new DataGridExcelExportingOption ();
options.ExportMode = ExportMode.Text;
var excelEngine = excelExport.ExportToExcel(dataGrid, options);
var workBook = excelEngine.Excel.Workbooks[0];
```

*Getting RowIndex, ColumnIndex and GridColumns for customization**ExcelColumnIndex*

The [ExcelColumnIndex Property](#) gets or internally sets the column index being exported to the Excel. Each column is exported based on this index to identify the current exporting column index.

*ExcelRowIndex*

The [ExcelRowIndex Property](#) gets the row index being exported to the Excel. Each row is exported based on this index to identify the current exporting row index.

*GridColumns*

Using the property [System.Collections.IEnumerable columns](#) you can get or set the [ExcludedColumns](#) columns collection which contains all the columns that are to be exported. The columns in the ExcludedColumns List will not be a member of the GridColumns collection.

*Customize header, groups and table summary when exporting**Export groups*

By default, all the groups in the data grid will be exported to Excel sheet. To export the data grid without groups, set the [DataGridExcelExportingOption.ExportGroups](#) property to `false`.

**C#**

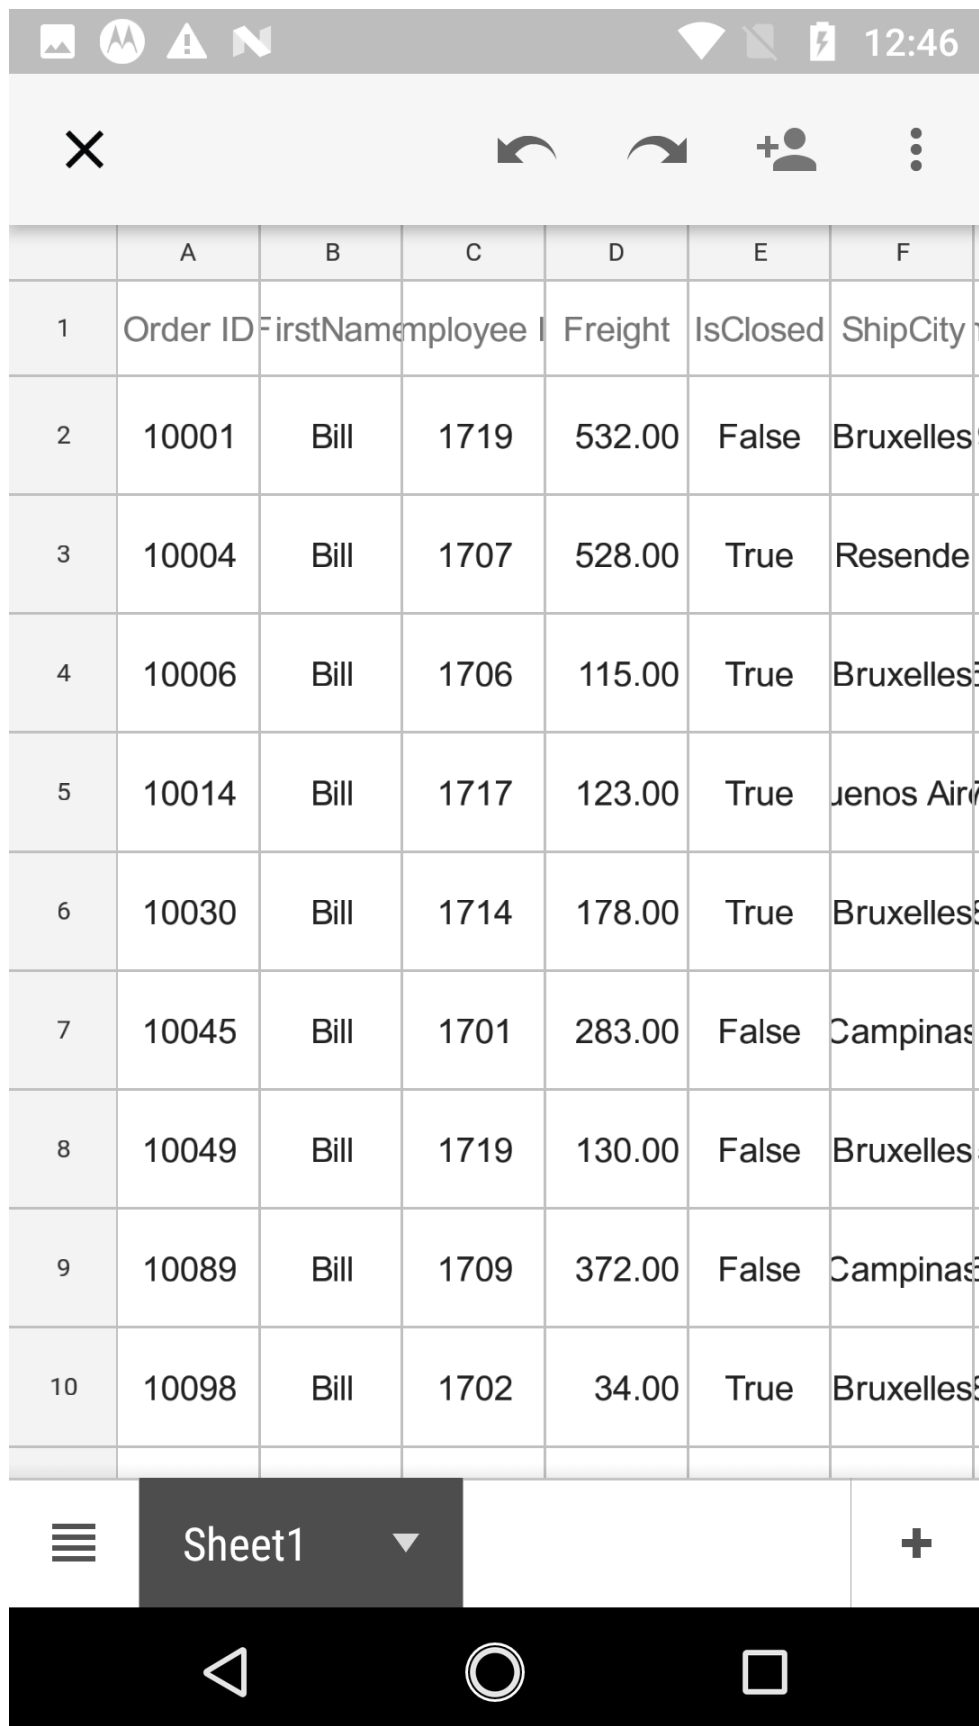

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.ExportGroups = true;
```

- `ExportGroups = true;`

	A	B	C	D	E	F
1	Order ID	FirstName	employee I	Freight	IsClosed	ShipCity

9	10089	Bill	1709	372.00	False	Campinas
10	10098	Bill	1702	34.00	True	Bruxelles

*Export header*

By default, the column headers will be exported to Excel sheet. To export the SfDataGrid without column headers, set the [DataGridExcelExportingOption.ExportHeader](#) property to `false`.

**C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.ExportHeader = false;
```

	A	B	C	D	E	F
1	10001	Frank	1712	493.00	False	o de Jane

### Export table summary

By default, table summaries in the data grid will be exported to Excel. To export the SfDataGrid without table summaries, set the [DataGridExcelExportingOption.ExportTableSummary](#) property to `false`.

### C#

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.ExportTableSummary = true;
```

- `ExportTableSummary = true;`

	A	B	C	D	E	F

7	10045	Bill	1701	283.00	False	Campinas
8	10049	Bill	1719	130.00	False	Bruxelles
9	10089	Bill	1709	372.00	False	Campinas
10	10098	Bill	1702	34.00	True	Bruxelles

*Export groups with outlines*

To export the data grid with applied grouping, enable the group expand or collapse option in the Excel sheet by setting the [DataGridExcelExportingOption.AllowOutlining](#) to true. The default value of this property is false so, you cannot expand or collapse the group in the Excel sheet.

**C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.AllowOutlining = true;
```

*Exclude columns when exporting*

By default, all the columns (including hidden columns) in the SfDataGrid will be exported to Excel. To exclude some particular columns when exporting to Excel, add those columns to the [DataGridExcelExportingOption.ExcludeColumns](#) property in [DataGridExcelExportingOption](#) list.

**C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
var list = new List<string>();
list.Add("OrderID");
list.Add("LastName");
option.ExcludedColumns = list;
```

**Excluded Columns**

Order ID	First-Name	Employee ID	Freight	IsClosed	ShipCity
10001	Irene	1700	508.00	False	Grazd
10002	Irene	1702	913.00	True	Tsawassen

10	Brenda	1700	293.00	False	Montréal	4/3/2005

### Customize Exporting Excel Version

The SfDataGrid allows exporting the data to Excel in specific versions by using the [DataGridExcelExportingOption.ExcelVersion](#) property.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.ExcelVersion = Syncfusion.XlsIO.ExcelVersion.Excel2013;
```

### *Exporting the grid from a specified row and column index*

#### *StartColumnIndex*

By default, the exported SfDataGrid will start from the 0th column in the Excel sheet. You can specify the starting column by using the [DataGridExcelExportingOption.StartColumnIndex](#) property.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.StartColumnIndex = 4;
```

	A	B	C	D	E	F
1

14			10007	William	1718	707.00
15			10008	Oscar	1703	431.00

### StartRowIndex

By default, the exported SfDataGrid will start from the 0th row in the Excel sheet. You can specify the starting row by using the [DataGridExcelExportingOption.StartRowIndex](#) property.

### C#

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.StartRowIndex = 10;
```

*Exporting with sorting and filtering*

The SfDataGrid allows exporting the data grid to Excel with sorting and filtering options enabled on the column header in Excel sheet by setting the [DataGridExcelExportingOption.AllowSortingAndFiltering](#) to `true`. The default value of this property is false.

**C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.AllowSortingAndFiltering = true;
```

AllowSorting AndFiltering

	A	B	C	D	E	F
1	OrderID	FirstName	LastName	Freight	Close	ShipCity
2	10001	Katie	1716	472.00	False	Campinas

9	10008	Daniel	1701	444.00	True	sawasse
10	10009	Gina	1718	196.00	False	Grazd

*Applying styles while exporting*

The SfDataGrid allows exporting the data with the applied GridStyle by setting the [DataGridExcelExportingOption.ApplyGridStyle](#) to `true`. By default, the data will be exported without the GridStyle.

**C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.ApplyGridStyle = true;
```

	A	B	C	D	E	F
1	Order ID	FirstName	employee ID	Freight	IsClosed	ShipCity
2	10001	Ralph	1700	467.00	False	Bruxelles

9	10008	William	1705	394.00	True	Grazd
10	10009	Kyle	1702	751.00	False	Jenos Air

### BottomTableSummaryStyle

The SfDataGrid supports exporting the bottom table summary with custom style by using the [DataGridExcelExportingOption.BottomTableSummaryStyle](#) property.

#### C#

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.BottomTableSummaryStyle = new ExportCellStyle()
{
    BackgroundColor = Xamarin.Forms.Color.Yellow,
    BorderColor = Xamarin.Forms.Color.Red,
    ForegroundColor = Xamarin.Forms.Color.Green,
};
```

217	10186	William	1712	364.00	True	Jenos Air
218	Total Freight :\$97,824.00 for 200 OrderCount					
219						

### GroupCaptionStyle

The SfDataGrid supports exporting the GroupCaptionSummaries with custom style by using the [DataGridExcelExportingOption.GroupCaptionStyle](#) property.

#### C#

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.GroupCaptionStyle = new ExportCellStyle()
{
    BackgroundColor = Xamarin.Forms.Color.Yellow,
    BorderColor = Xamarin.Forms.Color.Red,
    ForegroundColor = Xamarin.Forms.Color.Green,
};
```

	A	B	C	D	E	F
1	Order ID	FirstName	employee I	Freight	IsClosed	ShipCity
2	Total Freight :\$97,824.00					
3	Total Salary :\$6,832.00 for 16 members					
4	10006	Bill	1716	479.00	True	sawasse
5	10012	Bill	1708	474.00	True	Grazd
6	10018	Bill	1718	284.00	True	Campinas
7	10023	Bill	1702	731.00	False	Bruxelles
8	10040	Bill	1718	688.00	True	Bruxelles
9	10048	Bill	1717	855.00	True	Grazd
10	10049	Bill	1700	222.00	False	sawasse

### HeaderStyle

The SfDataGrid allows exporting the column headers with custom style by using the [DataGridExcelExportingOption.HeaderStyle](#) property.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.HeaderStyle = new ExportCellStyle()
{
    BackgroundColor = Xamarin.Forms.Color.Yellow,
    BorderColor = Xamarin.Forms.Color.Red,
    ForegroundColor = Xamarin.Forms.Color.Green,
};
```

	A	B	C	D	E	F
1	Order ID	FirstName	employee I	Freight	IsClosed	ShipCity
2	Total Freight :\$102,654.00					
3	Total Salary :\$7,671.00 for 12 members					
4	10001	Bill	1711	86.00	False	uenos Aires
5	10081	Bill	1707	908.00	False	Grazd
6	10097	Bill	1713	305.00	False	Grazd
7	10119	Bill	1703	629.00	False	Montréal
8	10128	Bill	1701	755.00	True	Bruxelles
9	10135	Bill	1703	419.00	False	sawasse
10	10143	Bill	1709	954.00	False	Bruxelles

### RecordStyle

The SfDataGrid allows exporting the records with custom style by using the [DataGridExcelExportingOption.RecordStyle](#) property.

### C#

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.RecordStyle = new ExportCellStyle()
{
    BackgroundColor = Xamarin.Forms.Color.Yellow,
    BorderColor = Xamarin.Forms.Color.Red,
    ForegroundColor = Xamarin.Forms.Color.Green,
};
```

	A	B	C	D	E	F
1	Order ID	FirstName	employee I	Freight	IsClosed	ShipCity
2	Total Freight :\$102,654.00					
3	Total Salary :\$7,671.00 for 12 members					
4	10001	Bill	1711	86.00	False	uenos Aires
5	10081	Bill	1707	908.00	False	Grazd
6	10097	Bill	1713	305.00	False	Grazd
7	10119	Bill	1703	629.00	False	Montréal
8	10128	Bill	1701	755.00	True	Bruxelles
9	10135	Bill	1703	419.00	False	sawasse
10	10143	Bill	1709	954.00	False	Bruxelles

### *TopTableSummaryStyle*

The SfDataGrid supports exporting the top table summary with custom style by using the [DataGridExcelExportingOption.TopTableSummaryStyle](#) property.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.TopTableSummaryStyle = new ExportCellStyle()
{
    BackgroundColor = Xamarin.Forms.Color.Yellow,
    BorderColor = Xamarin.Forms.Color.Red,
    ForegroundColor = Xamarin.Forms.Color.Green,
};
```

	A	B	C	D	E	F
1	Order ID	FirstName	employee I	Freight	IsClosed	ShipCity
2	Total Freight :\$97,824.00					
3	Total Salary :\$6,832.00 for 16 members					
4	10006	Bill	1716	479.00	True	sawasse
5	10012	Bill	1708	474.00	True	Grazd
6	10018	Bill	1718	284.00	True	Campinas
7	10023	Bill	1702	731.00	False	Bruxelles
8	10040	Bill	1718	688.00	True	Bruxelles
9	10048	Bill	1717	855.00	True	Grazd
10	10049	Bill	1700	222.00	False	sawasse

Sheet1

### Exporting Unbound rows

By default, the Unbound rows will not be exported to the excel document. However, you can export the unbound rows to excel by setting the [DataGridExcelExportingOption.ExportUnboundRows](#) property as `true`.

#### C#

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.ExportUnboundRows = true;
```

### Exporting unbound columns

The `SfDataGrid.GridUnboundColumns` will be exported as [SfDataGrid.GridTextColumns](#) without specifying any code. You can customize the `SfDataGrid.GridUnboundColumns` as `SfDataGrid.GridTextColumns` by using the `CellExporting` and `RowExporting` events.

#### XML

```
<sfgrid:GridUnboundColumn Expression="OrderID * 12"  
HeaderFontAttribute="Bold"  
HeaderText="Unbound"  
HeaderTextAlignment="Start"  
MappingName="Unbound"  
Padding="5, 0, 0, 0"  
TextAlignment="Start">  
</sfgrid:GridUnboundColumn>
```

The following screenshot shows that the unbound column is exported to excel sheet along with text columns.

### *ExportGroupSummary*

By default, the **GroupSummary** rows in the data grid will be exported to Excel. To export the **SfDataGrid** without group summaries, set the [DataGridExcelExportingOption.ExportGroupSummary](#) property to **false**.

### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
// Set false here to export the DataGrid without GroupSummary rows. The  
// default value is true.  
// option.ExportGroupSummary = false;
```

*GroupSummaryStyle*

SfDataGrid supports exporting the GroupSummary rows with custom style by using the [DataGridExcelExportingOption.GroupSummaryStyle](#) property.

**C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.GroupSummaryStyle = new ExportCellStyle()
{
    BackgroundColor = Xamarin.Forms.Color.Red,
    BorderColor = Xamarin.Forms.Color.Yellow,
    ForegroundColor = Xamarin.Forms.Color.White,
};
```

## Saving options

### *Save as stream*

#### **C#**

```
var excelExport = new DataGridExcelExportingController();
var options = new DataGridExcelExportingOption();
var excelEngine = excelExport.ExportToExcel(dataGrid, options);
var workBook = excelEngine.Excel.Workbooks[0];
MemoryStream stream = new MemoryStream();
workBook.SaveAs(stream);
```

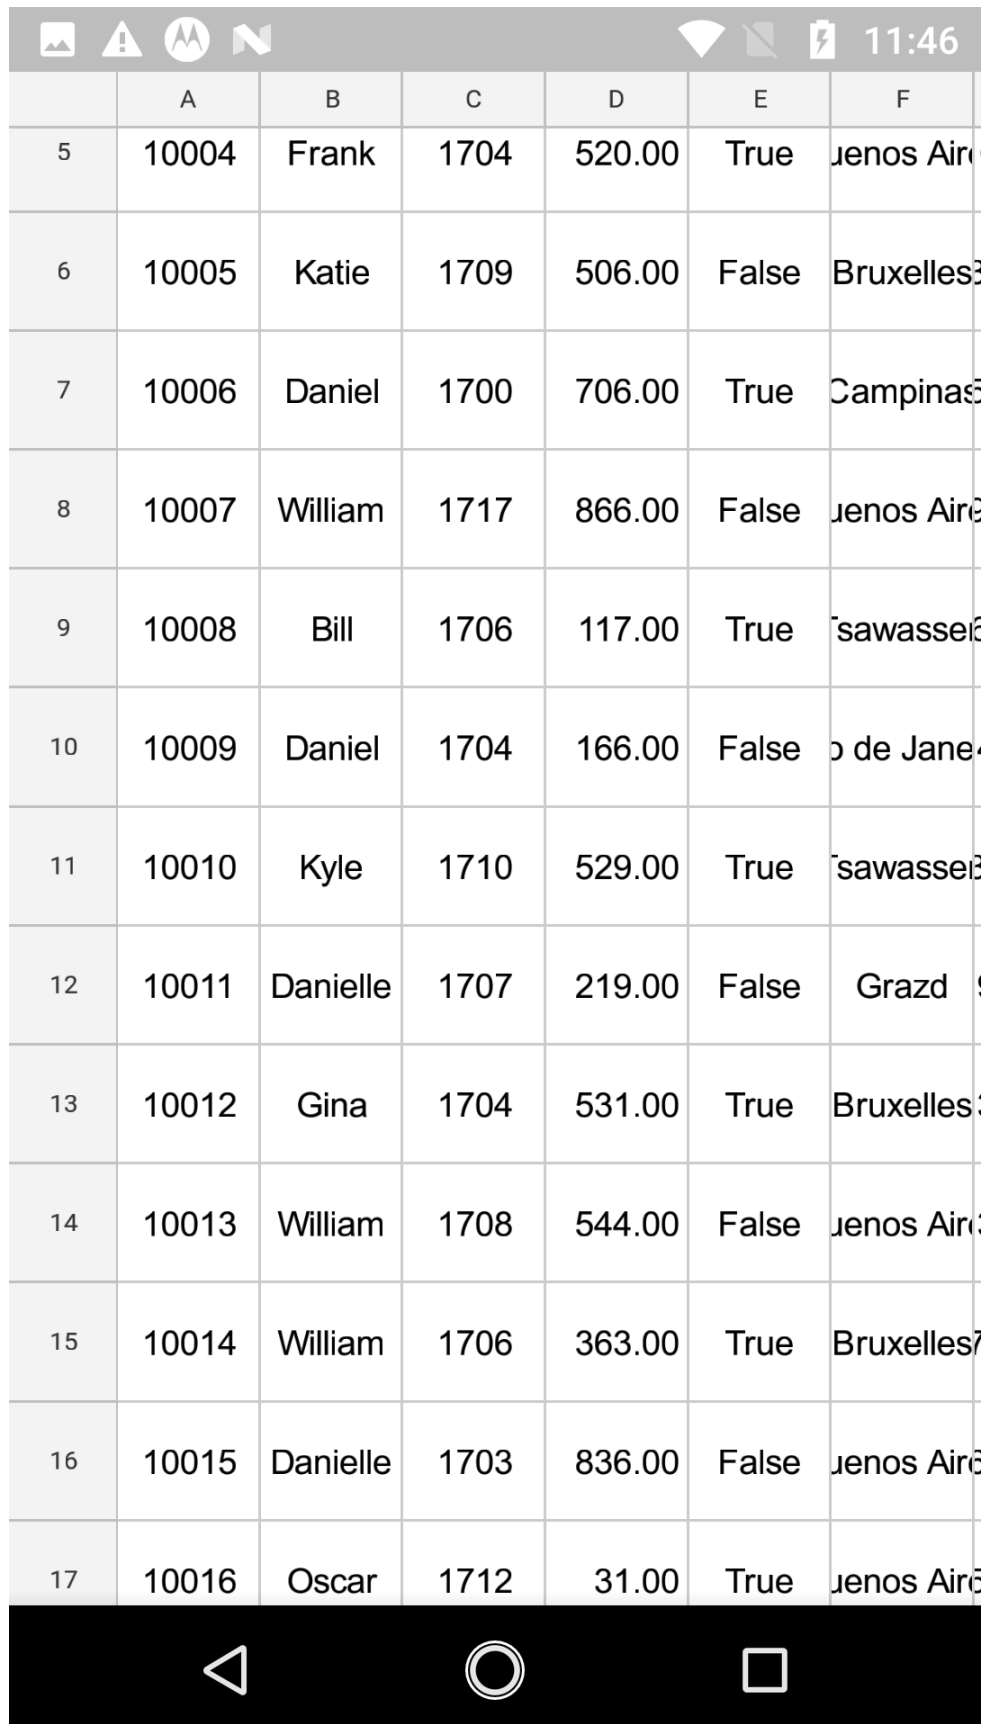

## Export AllPages in datagrid

When exporting to Excel using SfDataPager inside the SfDataGrid, it will only export the current page by default. However, you can export all the pages by setting the [DataGridExcelExportingOption.ExportAllPages](#) property to **true**.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();
option.ExportAllPages = true;
```

- ExportAllPages = true;

## Row Height and Column Width customization

### *DefaultColumnWidth*

The SfDataGrid allows customizing the column width in Excel file by using the [DataGridExcelExportingOption.DefaultColumnWidth](#) property. The `DefaultColumnWidth` value will be applied to all the columns in the Excel sheet.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.DefaultColumnWidth = 100;
```

### *DefaultRowHeight*

The SfDataGrid allows customizing the row height in Excel file by using the [DataGridExcelExportingOption.DefaultRowHeight](#) property. The `DefaultRowHeight` value will be applied to all the rows in the Excel sheet.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.DefaultRowHeight = 50;
```

	A	B	C	D	E	F
1	Order ID	FirstName	employee I	Freight	IsClosed	ShipCity
2	10001	Danielle	1713	530.00	False	uenos Air
3	10002	Frank	1704	219.00	True	Resende
4	10003	Bill	1715	347.00	False	uenos Air
5	10004	Frank	1710	65.00	True	o de Jane
6	10005	Torrey	1718	759.00	False	uenos Air
7	10006	Gina	1716	585.00	True	Resende
8	10007	Oscar	1702	75.00	False	Grazd
9	10008	Danielle	1703	335.00	True	Bruxelles
10	10009	William	1707	376.00	False	Bruxelles

### *ExportColumnWidth*

By default, the data grid columns will be exported to Excel with `DataGridExcelExportingOption.DefaultColumnWidth` value. You can also export the data grid to Excel with exact column widths by setting the [DataGridExcelExportingOption.ExportColumnWidth](#) property to `true`.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.ExportColumnWidth = true;
```

### *ExportRowHeight*

By default, the data grid rows will be exported to Excel with `DataGridExcelExportingOption.DefaultRowHeight` value. You can also export the data grid to Excel with exact row heights by setting the [DataGridExcelExportingOption.ExportRowHeight](#) property to `true`.

#### **C#**

```
DataGridExcelExportingOption option = new DataGridExcelExportingOption();  
option.ExportRowHeight = true;
```

4	10003	Oscar	1710	693.00	False	uenos Air
5	10004	Brenda	1700	463.00	True	Bruxelles
6	10005	Danielle	1708	439.00	False	Grazd

## Events

### *Styling cells based on cell type.*

You can customize the row style based on the cell type when exporting to Excel by handling the **RowExporting** event.

#### **C#**

```
DataGridExcelExportingController excelExport = new
DataGridExcelExportingController();
excelExport.RowExporting += ExcelExport_RowExporting;
private void ExcelExport_RowExporting(object sender,
DataGridRowExcelExportingEventArgs e)
{
    if (!(e.Record.Data is OrderInfo))
        return;
    if (e.RowType == ExportRowType.Record)
    {
        e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Red;
    }
}
```

## Cell customization in Excel while exporting

### *Customize cell value while exporting*

You can customize the cell values when exporting to Excel by handling the **CellExporting** event.

#### **C#**

```
DataGridExcelExportingController excelExport = new
DataGridExcelExportingController();
excelExport.CellExporting += ExcelExport_CellExporting;
private void ExcelExport_CellExporting(object sender,
DataGridCellExcelExportingEventArgs e)
{
    if (e.CellType == ExportCellType.RecordCell && e.ColumnName == "IsClosed")
    {
        if ((bool)e.CellValue)
            e.CellValue = "Y";
        else
            e.CellValue = "N";
    }
}
```

### *Changing row style in Excel based on data*

You can customize the row style based on the row data when exporting to Excel by handling the **RowExporting** event.

#### **C#**

```
DataGridExcelExportingController excelExport = new
DataGridExcelExportingController();
excelExport.RowExporting += ExcelExport_RowExporting;
private void ExcelExport_RowExporting(object sender,
DataGridRowExcelExportingEventArgs e)
{
    if (!(e.Record.Data is OrderInfo))
```

```

return;
if (e.RowType == ExportRowType.Record)
{
    if ((e.Record.Data as OrderInfo).IsClosed)
        e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Yellow;
    else
        e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Red;
}
}

```

### *Customize the cells based on column name*

You can customize the column style based on the row data when exporting to Excel by handling the **CellExporting** event.

### **C#**

```

DataGridExcelExportingController excelExport = new
DataGridExcelExportingController();
excelExport.RowExporting += ExcelExport_RowExporting;
private void ExcelExport_RowExporting(object sender,
DataGridRowExcelExportingEventArgs e)
{
    if (!(e.Record.Data is OrderInfo))
        return;
    if (e.CellType == ExportCellType.RecordCell && e.ColumnName == "FirstName")
    {
        e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Red;
    }
}

```

The SfDataGrid provides the following events when exporting to Excel:

- [RowExporting](#): Raised when exporting a row at the execution time.
- [CellExporting](#): Raised when exporting a cell at the execution time.

### *Row exporting*

The [DataGridRowExcelExportingEventHandler](#) delegate allows customizing the styles for record rows and group caption rows. The **RowExporting** event is triggered with [DataGridRowExcelExportingEventArgs](#) that contains the following properties:

- [Range](#): Specifies the Excel range to be exported. It provides full access to the exporting cell in Excel.
- [Record](#): Gets the collection of the exported underlying data objects.
- [RowType](#): Specifies the row type by using **ExportRowType** enum. You can use this property to check the row type and apply different styles based on the row type.
- [Worksheet](#): Sets the **Worksheet** properties such as sheet protection, gridlines, and so on.

You can use these events to customize the properties of exported grid rows. The following code example illustrates how to change the background color of the record rows and caption summary rows when exporting.

**C#**

```
//HandlingRowExportingEvent for exporting to excel
DataGridExcelExportingController excelExport = new
DataGridExcelExportingController ();
excelExport.RowExporting += excelExport_RowExporting;
void excelExport_RowExporting (object sender,
DataGridRowExcelExportingEventArgs e)
{
if (e.RowType == ExportRowType.Record) {
if ((e.Record.Data as OrderInfo).IsClosed)
e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Yellow;
else
e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.LightGreen;
}
if (e.RowType == ExportRowType.CaptionSummary) {
e.Range.CellStyle.ColorIndex =
Syncfusion.XlsIO.ExcelKnownColors.Grey_25_percent;
}
}
```

### CellExporting

The [DataGridCellExcelExportingEventHandler](#) delegate allows customizing the styles for header cells, record cells, and group caption cells. The [CellExporting](#) event is triggered with [DataGridCellExcelExportingEventArgs](#) that contains the following properties:

- [CellType](#): Specifies the cell type by using [ExportCellType](#) enum. Checks the cell type and apply different cell styles based on the cell type.
- [CellValue](#): Contains the exported actual value. Applies formatting in Excel by using the [Range](#) property.
- [ColumnName](#): Specifies the column name (MappingName) of the exporting cell. You can apply formatting for a particular column by checking the [column name](#).
- [Handled](#): Determines whether the cell is exported to Excel or not.
- [Range](#): Specifies the Excel range to be exported. It provides full access to the exporting cell in Excel.
- [Record](#): Gets the collection of the exported underlying data objects.

You can use these events to customize the properties of the grid cells exported to excel. The following code example illustrates how to customize the background color, foreground color, and cell value of the header cells, record cells, and caption summary cells when exporting.

### C#

```
//HandlingCellExportingEvent for exporting to Excel
DataGridExcelExportingController excelExport = new
DataGridExcelExportingController ();
excelExport.CellExporting += excelExport_CellExporting;
void excelExport_CellExporting(object sender,
DataGridCellExcelExportingEventArgs e)
{
    if (e.CellType == ExportCellType.HeaderCell) {
        e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Blue;
        e.Range.CellStyle.PatternColorIndex =
        Syncfusion.XlsIO.ExcelKnownColors.White;
        e.Range.CellStyle.BeginUpdate();
        e.Range.CellStyle.Borders.LineStyle =
        Syncfusion.XlsIO.ExcelLineStyle.Dash_dot;
        e.Range.CellStyle.Borders[ExcelBordersIndex.DiagonalDown].LineStyle =
        ExcelLineStyle.Dash_dot;
        e.Range.CellStyle.Borders[ExcelBordersIndex.DiagonalUp].LineStyle =
        ExcelLineStyle.Dash_dot_dot;
        e.Range.CellStyle.Borders.Color = ExcelKnownColors.Black;
        e.Range.CellStyle.EndUpdate();
    }
    if (e.CellType == ExportCellType.RecordCell) {
        e.Range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Yellow;
        e.Range.CellStyle.PatternColorIndex =
        Syncfusion.XlsIO.ExcelKnownColors.Black;
        e.Range.CellStyle.BeginUpdate();
        e.Range.CellStyle.Borders.LineStyle =
        Syncfusion.XlsIO.ExcelLineStyle.Dash_dot;
        e.Range.CellStyle.Borders[ExcelBordersIndex.DiagonalDown].LineStyle =
        ExcelLineStyle.Dash_dot;
    }
}
```

```

e.Range.CellStyle.Borders[ExcelBordersIndex.DiagonalUp].LineStyle =
ExcelLineStyle.Dash_dot_dot;
e.Range.CellStyle.Borders.Color = ExcelKnownColors.Black;
e.Range.CellStyle.EndUpdate();
}
if (e.CellType == ExportCellType.GroupCaptionCell) {
e.Range.CellStyle.ColorIndex =
Syncfusion.XlsIO.ExcelKnownColors.Grey_25_percent;
e.Range.CellStyle.PatternColorIndex =
Syncfusion.XlsIO.ExcelKnownColors.Blue;

### [Worksheet customization](#)

#### [Setting borders](#)

The SfDataGrid allows exporting the data to Excel with custom borders style in Excel sheet by handling the `CellExporting` event.

#### **C#**

```
private void ExcelExport_CellExporting(object sender,
DataGridCellExcelExportingEventArgs e)
{
    if (e.CellType == ExportCellType.RecordCell)
    {
        e.Range.CellStyle.BeginUpdate();
        e.Range.CellStyle.Borders.LineStyle =
        Syncfusion.XlsIO.ExcelLineStyle.Dash_dot;
        e.Range.CellStyle.Borders[ExcelBordersIndex.DiagonalDown].LineStyle =
        ExcelLineStyle.Dash_dot;
        e.Range.CellStyle.Borders[ExcelBordersIndex.DiagonalUp].LineStyle =
        ExcelLineStyle.Dash_dot_dot;
        e.Range.CellStyle.Borders.Color = ExcelKnownColors.Black;
        e.Range.CellStyle.EndUpdate();
    }
}
```

	A	B	C	D	E	F
1	Order ID	FirstName	employee	Freight	IsClosed	ShipCity

3	10002	Fiona	1701	924.00	True	Grazd
4	10003	Bill	1702	550.00	False	Bruxelles
5	10004	Bill	1701	806.00	True	Grazd
6	10005	Katie	1719	387.00	False	Campinas
7	10006	Fiona	1717	676.00	True	Grazd
8	10007	Gina	1705	98.00	False	Montréal
9	10008	Katie	1715	968.00	True	sawasse
10	10009	Ralph	1715	596.00	False	Grazd

### Enabling filters

You can show filters in exported worksheet by enabling filter for the exported range in the worksheet.

#### C#

```
var excelExport = new DataGridExcelExportingController();
var options = new DataGridExcelExportingOption();
var excelEngine = excelExport.ExportToExcel(dataGrid, options);
var workBook = excelEngine.Excel.Workbooks[0];
workBook.Worksheets[0].AutoFilters.FilterRange =
workBook.Worksheets[0].UsedRange;
MemoryStream stream = new MemoryStream();
workBook.SaveAs(stream);
```

While using stacked headers, you can specify the range based on Stacked headers count.

#### C#

```
var excelExport = new DataGridExcelExportingController();
var options = new DataGridExcelExportingOption();
options.ExportStackedHeaders = true;
var excelEngine = excelExport.ExportToExcel(dataGrid, options);
var workBook = excelEngine.Excel.Workbooks[0];
var range = "A" + (dataGrid.StackedHeaderRows.Count + 1).ToString() + ":" +
workBook.Worksheets[0].UsedRange.End.AddressLocal;
excelEngine.Excel.Workbooks[0].Worksheets[0].AutoFilters.FilterRange =
workBook.Worksheets[0].Range[range];
workBook.SaveAs("Sample.xlsx");
MemoryStream stream = new MemoryStream();
workBook.SaveAs(stream);
```

### Customize the range of cells

You can customize the range of cells after exporting to Excel by directly manipulating worksheet.

#### C#

```
var excelExport = new DataGridExcelExportingController();
var options = new DataGridExcelExportingOption();
options.ExportStackedHeaders = true;
var excelEngine = excelExport.ExportToExcel(dataGrid, options);
var workBook = excelEngine.Excel.Workbooks[0];
workBook.Worksheets[0].Range["A2:A6"].CellStyle.Color =
System.Drawing.Color.LightSlateGray;
workBook.Worksheets[0].Range["A2:A6"].CellStyle.Font.Color =
ExcelKnownColors.White;
MemoryStream stream = new MemoryStream();
workBook.SaveAs(stream);
```

### Performance improvement

Using [ExcelExportingOptions.CellsExportingEventHandler](#) to customize settings of each cell will consume more memory and time. So, avoid using `CellsExportingEventHandler` when customizing large number of cells and instead of you can do the required customizations in the exported sheet.

### *Formatting column without using CellsExportingEventHandler*

You can perform cell level customization such as row-level styling and formatting a particular column in the exported worksheet.

In the following code snippet, NumberFormat for GridNumericColumn column is changed in the exported sheet after exporting without using `CellsExportingEventHandler`.

Reference: <http://help.syncfusion.com/file-formats/xlsio/working-with-cell-or-range-formatting>

#### **C#**

```
var excelExport = new DataGridExcelExportingController();
var options = new DataGridExcelExportingOption();
options.ExportMode = ExportMode.Value;
var excelEngine = excelExport.ExportToExcel(dataGrid, options);
var workBook = excelEngine.Excel.Workbooks[0];
workBook.ActiveSheet.Columns[4].NumberFormat = "0.0";
```

### *Alternate row styling without using CellsExportingEventHandler*

In the following code snippet, the background color of the rows in Excel is changed based on the row index using conditional formatting for better performance.

Reference: <http://help.syncfusion.com/file-formats/xlsio/working-with-conditional-formatting>

#### **C#**

```
var excelExport = new DataGridExcelExportingController();
var options = new DataGridExcelExportingOption();
options.ExportMode = ExportMode.Value;
var excelEngine = excelExport.ExportToExcel(dataGrid, options);
var workBook = excelEngine.Excel.Workbooks[0];
IConditionalFormats condition =
workBook.ActiveSheet.Range[2, 1, this.dataGrid.View.Records.Count+1, this.dataGrid.Columns.Count].ConditionalFormats;
IConditionalFormat condition1 = condition.AddCondition();
condition1.FormatType = ExcelCfType.Formula;
condition1.FirstFormula = "MOD(ROW(), 2)=0";
condition1.BackColorRGB = System.Drawing.Color.Pink;
IConditionalFormat condition2 = condition.AddCondition();
condition2.FormatType = ExcelCfType.Formula;
condition2.FirstFormula = "MOD(ROW(), 2)=1";
condition2.BackColorRGB = System.Drawing.Color.LightGray;
```

### *Exporting the selected rows of SfDataGrid*

SfDataGrid allows you to export only the currently selected rows in the grid to the worksheet using the [DataGridExcelExportingController.ExportToExcel](#) method by passing the instance of the SfDataGrid and [SfDataGrid.SelectedItems](#) collection as an argument.

Refer the below code to export the selected rows alone to Excel.

#### **C#**

```
private void ExportToExcel(object sender, EventArgs e)
{
    DataGridExcelExportingController excelExport = new
    DataGridExcelExportingController();
```

```
ObservableCollection<object> selectedItems = dataGrid.SelectedItems;
var excelEngine = excelExport.ExportToExcel(this.dataGrid, selectedItems);
var workbook = excelEngine.Excel.Workbooks[0];
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
workbook.Close();
excelEngine.Dispose();
if (Device.RuntimePlatform == Device.UWP)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DataGrid.xlsx",
        "application/msexcel", stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.xlsx",
        "application/msexcel", stream);
}
```

Order ID	Customer	Ship Country	Ship City	Customer ID

Export to PDF

The SfDataGrid supports exporting the data to PDF with several customization options like custom appearance, excluding specific columns, excluding headers, setting custom row height, setting custom column width, and so on.

The following assemblies should be added for exporting to PDF file.

Project	Required assemblies
PCL	<p>pcl\Syncfusion.SfGridConverter.XForms.dll</p> <p>pcl\Syncfusion.Compression.Portable.dll</p> <p>pcl\Syncfusion.Pdf.Portable.dll</p> <p>pcl\Syncfusion.XlsIO.Portable.dll</p>

If you are using nuget package in the package, the following NuGet package should be installed to export the SfDataGrid to PDF file.

Project	Required package
Xamarin.Forms	Syncfusion.Xamarin.DataGridExport

You can export the SfDataGrid to PDF by using the following extension methods present in the Syncfusion.SfDataGrid.XForms.Exporting namespace.

- [ExportToPdf](#)
- [ExportToPdfGrid](#)

The following code illustrates how to create and display a SfDataGrid in view.

#### XML

```
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition />
</Grid.RowDefinitions>
<StackLayout Grid.Row="0" Orientation="Vertical">
<Button x:Name="Export" Text="ExportPDF" Clicked ="PDFExport_Clicked"
HeightRequest="50" />
</StackLayout>
<sfgrid:SfDataGrid x:Name="dataGrid"
AllowGroupExpandCollapse="True"
AllowSorting="True"
Grid.Row="1"
SelectionMode="Multiple"
ColumnSizer="None"
ItemsSource="{Binding OrdersInfo}"
AutoGenerateColumns="False" >
<sfgrid:SfDataGrid.Columns>
<sfgrid:GridTextColumn HeaderText="Order ID" MappingName="OrderID"/>
<sfgrid:GridTextColumn HeaderText="FirstName" MappingName="FirstName"/>
<sfgrid:GridTextColumn HeaderText="Employee ID" MappingName="EmployeeID"/>
<sfgrid:GridNumericColumn HeaderText="Freight" MappingName="Freight"/>
<sfgrid:GridTextColumn HeaderText="IsClosed" MappingName="IsClosed"/>
<sfgrid:GridTextColumn HeaderText="ShipCity" MappingName="ShipCity"/>
<sfgrid:GridDateTimeColumn HeaderText="ShippingDate"
MappingName="ShippingDate" />
</sfgrid:SfDataGrid.Columns>
</sfgrid:SfDataGrid>
</Grid>
```

#### ExportToPdf

You can export the data to PDF by using the [DataGridPdfExportingController.ExportToPdf](#) method by passing the SfDataGrid as an argument.

#### C#

```
private void PDFExport_Clicked(object sender, EventArgs e)
```

```
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, new
    DataGridPdfExportOption()
    {
        FitAllColumnsInOnePage = true,
    });
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DataGrid.pdf",
        "application/pdf", stream);
    else
        Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
        "application/pdf", stream);
}
```

### ExportToPdfGrid

You can also export the data to PDF by using the [DataGridPdfExportingController.ExportToPdfGrid](#) method by passing the SfDataGrid as an argument.

### C#

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    var pdfDoc = new PdfDocument();
    PdfPage page = pdfDoc.Pages.Add();
    var exportToPdfGrid = pdfExport.ExportToPdfGrid(this.dataGrid,
    this.dataGrid.View, new DataGridPdfExportOption()
    {
        FitAllColumnsInOnePage = true,
    }, pdfDoc);
    exportToPdfGrid.Draw(page, new PointF(10, 10));
    pdfDoc.Save(stream);
    pdfDoc.Close(true);
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DataGrid.pdf",
        "application/pdf", stream);
    else
        Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
        "application/pdf", stream);
}
```

---

**Note:** SfDataGrid cannot export the GridTemplateColumn to PDF or Excel, since we cannot get the loaded views and draw them with the particular range, values etc from GridTemplateColumn.

---

### Exporting options

#### *Exclude columns when exporting*

By default, all the columns (including hidden columns) in the SfDataGrid will be exported to PDF. To exclude some particular columns when exporting to PDF, add those columns to [DataGridPdfExportOption.ExcludeColumns](#) list.

### **C#**

```
DataGridPdfExportingController pdfExport = new
DataGridPdfExportingController ();
DataGridPdfExportOption exportOption = new DataGridPdfExportOption ();
exportOption.FitAllColumnsInOnePage = true;
var list = new List<string>();
list.Add("OrderID");
list.Add("LastName");
exportOption.ExcludedColumns = list;
var doc = pdfExport.ExportToPdf (this.dataGrid, exportOption);
```

### Getting PDF document

The [DataGridPdfExportOption.PdfDocument](#) allows exporting the SfDataGrid to an existing or a new PDF document.

#### C#

```
DataGridPdfExportOption option = new DataGridPdfExportOption();
PdfDocument pdfDocument = new PdfDocument();
pdfDocument.Pages.Add();
pdfDocument.Pages.Add();
pdfDocument.Pages.Add();
option.StartPageIndex = 1;
option.PdfDocument = pdfDocument;
```

### Getting GridColumns for customization

Using the property [GridColumns](#) you can get or set the [System.Collections.IEnumerable](#) columns collection which contains all the columns that are to be exported. The columns in the ExcludedColumns List will not be a member of the GridColumns collection.

### Column header on each page

You can show or hide the column headers on each page of the exported PDF document by using the [DataGridPdfExportOption.RepeatHeaders](#) property. The default value is true.

#### C#

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    DataGridPdfExportOption option = new DataGridPdfExportOption();
    option.RepeatHeaders = true;
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, option);
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
    "application/pdf", stream);
}
```

*Customize header, groups and table summary when exporting*

Exclude groups while exporting

By default, all the groups in the data grid will be exported to PDF document. To export the data grid without groups, set the [DataGridPdfExportOption.ExportGroups](#) property to `false`.

#### C#

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    DataGridPdfExportOption option = new DataGridPdfExportOption();
    option.ExportGroups = true;
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, option);
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
    "application/pdf", stream);
}
```

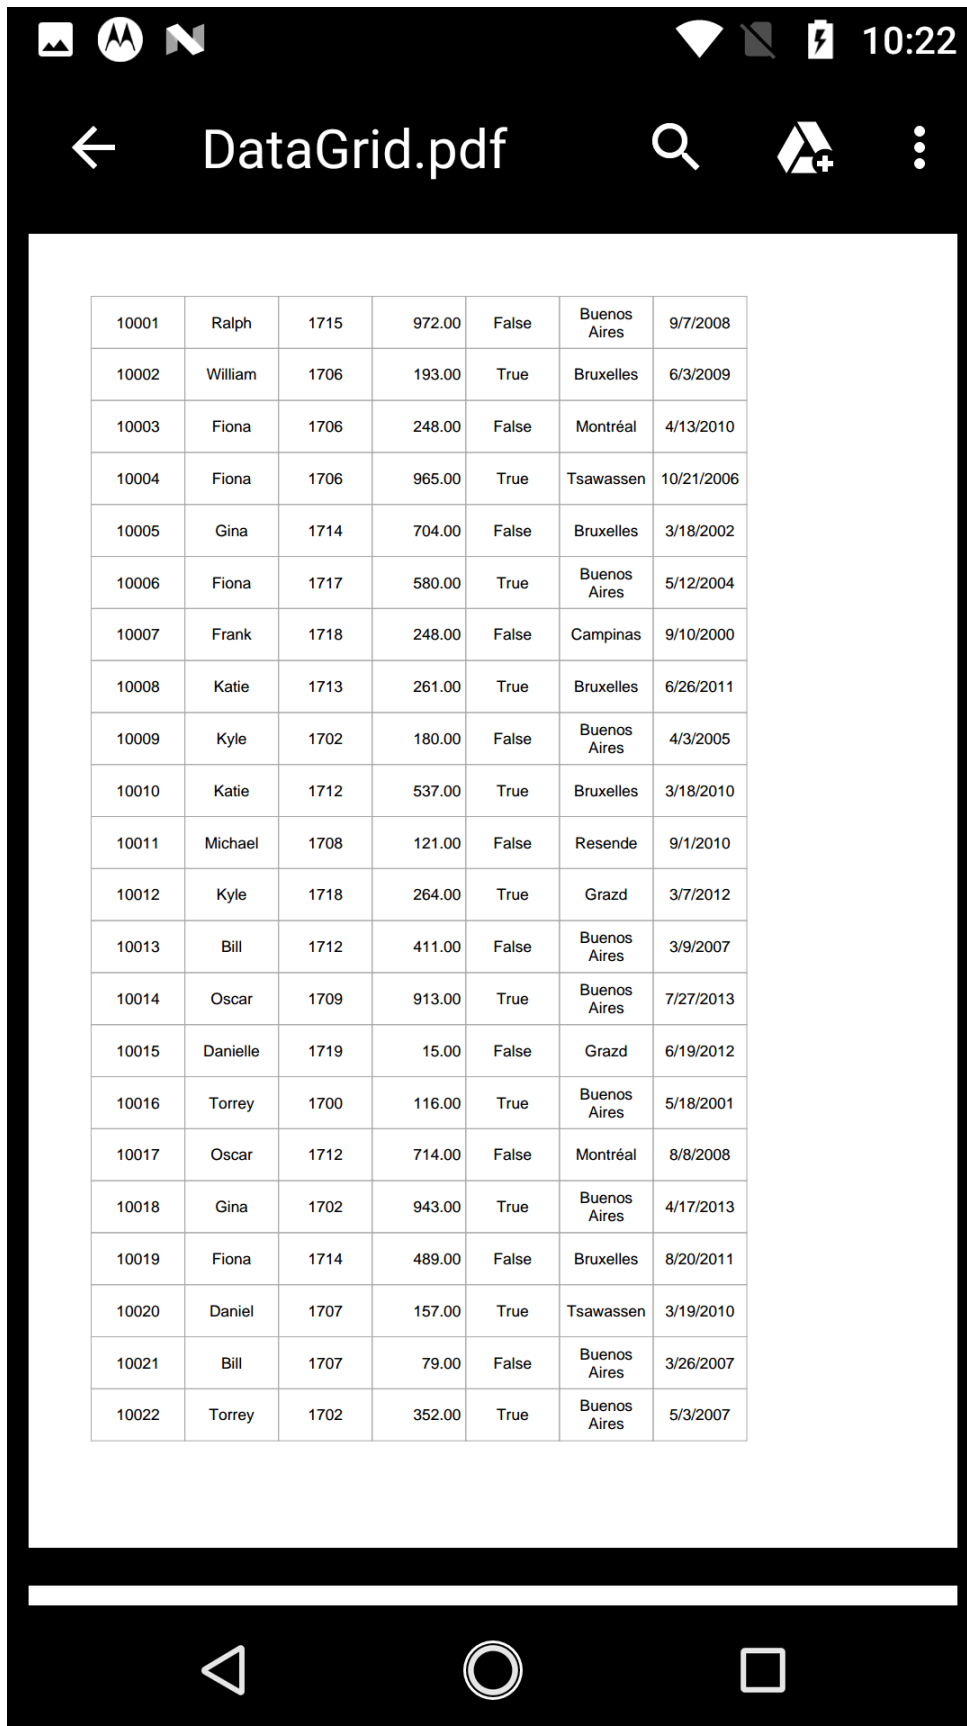

### Exclude Column header while exporting

By default, the column headers will be exported to PDF document. To export the SfDataGrid without the column headers, set the [DataGridPdfExportOption.ExportHeader](#) property to `false`.

### C#

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    DataGridPdfExportOption option = new DataGridPdfExportOption();
    option.ExportHeader = false;
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, option);
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
    "application/pdf", stream);
}
```

### Exclude table summaries while exporting

By default, table summaries in the data grid will be exported to PDF. To export the SfDataGrid without table summaries, set the [DataGridPdfExportOption.ExportTableSummary](#) property to `false`.

### C#

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    DataGridPdfExportOption option = new DataGridPdfExportOption();
    option.ExportTableSummary = false;
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, option);
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
    "application/pdf", stream);
}
```

10020	William	1713	619.00	True	Campinas	3/19/2010
10021	Frank	1710	118.00	False	Grazd	3/26/2007

### *Export all columns in one page*

Gets or sets a value indicating whether all the columns should be fitted on a page or not. To export all the columns in one page, set the [DataGridPdfExportOption.FitAllColumnsInOnePage](#) property to `true`.

### *Exporting the grid from a specified page and point*

The SfDataGrid allows exporting the data to a particular starting position on a particular PDF page using the following options:

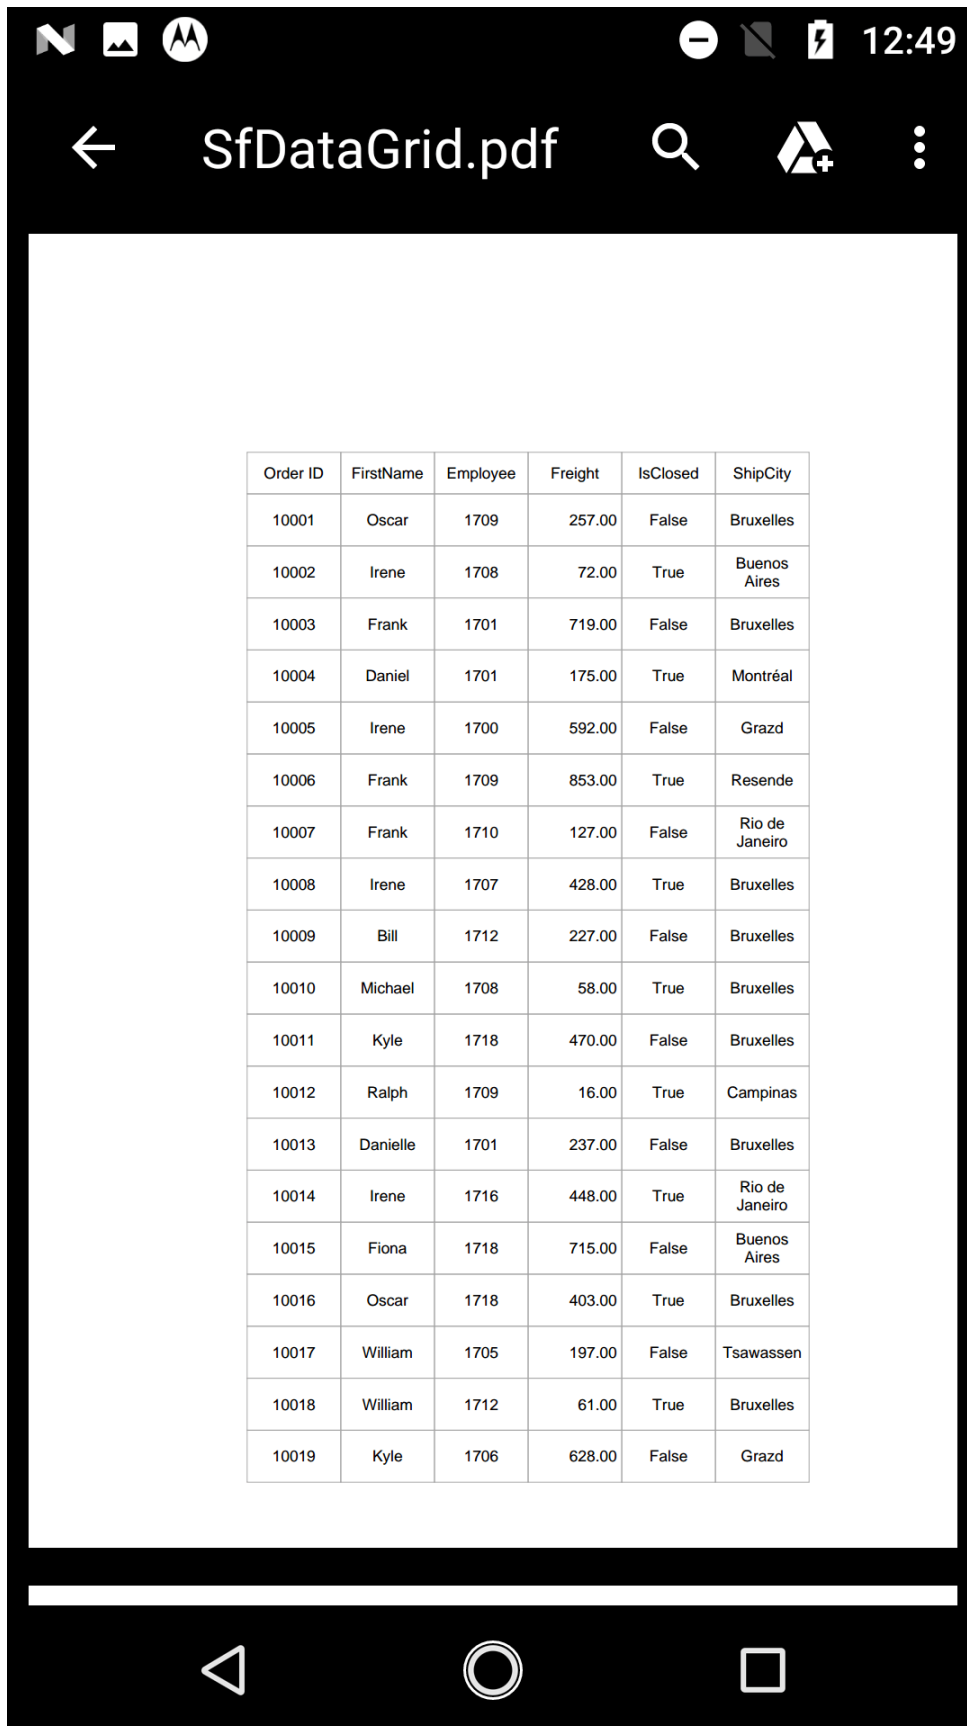

- StartPageIndex
- StartPoint

### *StartPageIndex*

The SfDataGrid allows exporting the data to a particular page in the PDF document by using the [DataGridPdfExportOption.StartPageIndex](#) property.

### **C#**

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    PdfDocument pdfDocument = new PdfDocument();
    pdfDocument.Pages.Add();
    pdfDocument.Pages.Add();
    pdfDocument.Pages.Add();
    DataGridPdfExportOption option = new DataGridPdfExportOption();
    option.PdfDocument = pdfDocument;
    option.StartPageIndex = 1;
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, option);
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
    "application/pdf", stream);
}
```

### StartPoint

The SfDataGrid allows exporting the data to a particular x,y starting point in the PDF page by using the [DataGridPdfExportOption.StartPoint](#) property.

### C#

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    DataGridPdfExportOption option = new DataGridPdfExportOption();
    option.StartPoint = new PointF(0, 500);
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, option);
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid1.pdf",
    "application/pdf", stream);
}
```

Order ID	FirstName	Employee	Freight	IsClosed	ShipCity	ShippingDa
10001	Brenda	1704	880.00	False	Bruxelles	9/7/2008
10002	Kyle	1700	614.00	True	Bruxelles	6/3/2009
10003	Gina	1713	362.00	False	Campinas	4/13/2010
10004	Danielle	1716	64.00	True	Buenos Aires	10/21/2006
10005	Torrey	1717	438.00	False	Grazd	3/18/2002
10006	Irene	1719	262.00	True	Rio de Janeiro	5/12/2004
10007	Ralph	1717	664.00	False	Buenos Aires	9/10/2000
10008	Irene	1718	456.00	True	Bruxelles	6/26/2011
10009	Gina	1703	461.00	False	Buenos Aires	4/3/2005
10010	Daniel	1713	815.00	True	Bruxelles	3/18/2010
10011	Torrey	1707	376.00	False	Buenos Aires	9/1/2010
10012	Katie	1710	884.00	True	Bruxelles	3/7/2012

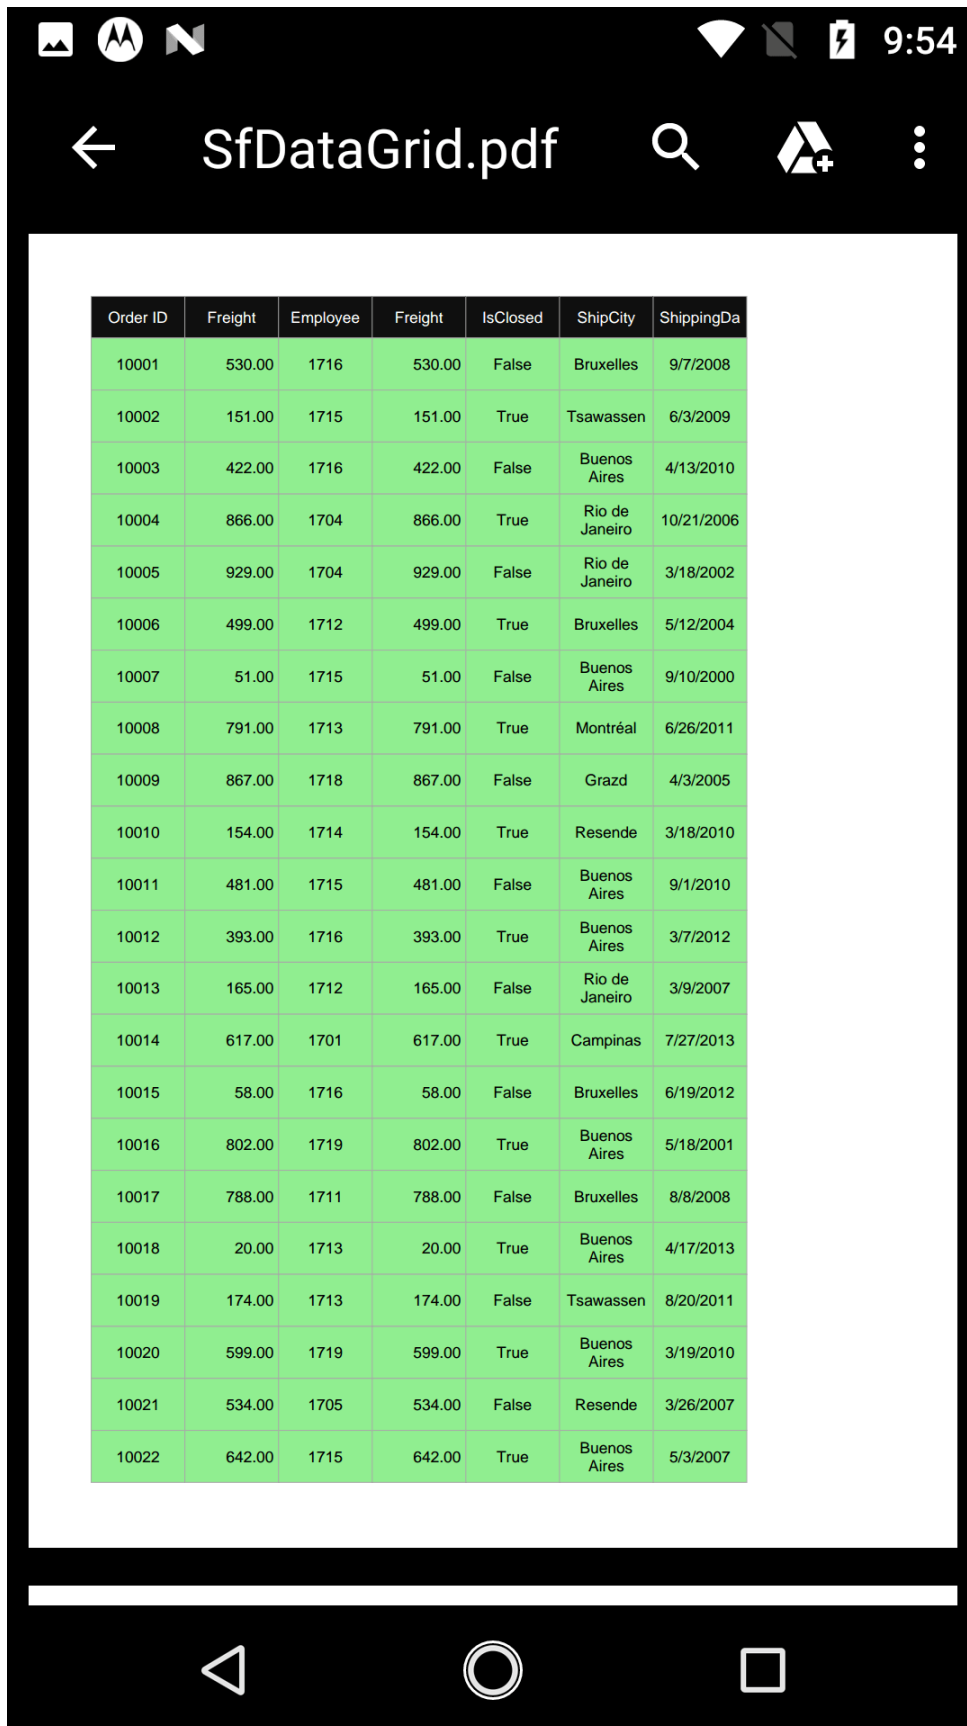

### *Applying styles while exporting*

The SfDataGrid allows exporting the data with the applied GridStyle by setting the [DataGridPdfExportOption.ApplyGridStyle](#) property to `true`. By default, data will be exported without the GridStyle.

### **C#**

```
private void PDFExport_Clicked(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    DataGridPdfExportOption option = new DataGridPdfExportOption();
    option.ApplyGridStyle = true;
    var exportToPdf = pdfExport.ExportToPdf(this.dataGrid, option);
    exportToPdf.Save(stream);
    exportToPdf.Close(true);
    Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid1.pdf",
    "application/pdf", stream);
}
```

You can also customize the following styles while exporting to PDF:

- BottomTableSummaryStyle
- GroupCaptionStyle
- HeaderStyle
- RecordStyle
- TopTableSummaryStyle

#### BottomTableSummaryStyle

The SfDataGrid supports exporting the bottom table summary with custom style by using the [DataGridPdfExportOption.BottomTableSummaryStyle](#) property.

#### C#

```
DataGridPdfExportOption option = new DataGridPdfExportOption();
option.BottomTableSummaryStyle = new PdfGridCellStyle()
{
    BackgroundBrush = PdfBrushes.Gray,
    Borders = new PdfBorders() { Bottom = PdfPens.Aqua, Left =
    PdfPens.AliceBlue, Right = PdfPens.Red, Top = PdfPens.RoyalBlue },

### *Customizing borders*

The SfDataGrid allows customizing the grid borders as follows using the [DataGridPdfExportOption.GridLineType]

([https://help.syncfusion.com/cr/cref\\_files/xamarin/sfgridconverter/Syncfusion.SfGridConverter.XForms~Syncfusion.SfDataGrid.XForms.Exporting.DataGridPdfExportOption~GridLineType.html](https://help.syncfusion.com/cr/cref_files/xamarin/sfgridconverter/Syncfusion.SfGridConverter.XForms~Syncfusion.SfDataGrid.XForms.Exporting.DataGridPdfExportOption~GridLineType.html)) property:

- Both
- Horizontal
- Vertical
- None

### *Both*

Set the [DataGridPdfExportOption.GridLineType](#) as `GridLineType.Both` to export the data grid with both horizontal and vertical borders.

### **C#**

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.GridLineType = GridLineType.Both;
```

### Horizontal

Set the [DataGridPdfExportOption.GridLineType](#) as `GridLineType.Horizontal` to export the data grid with horizontal border.

### C#

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.GridLineType = GridLineType.Horizontal;
```

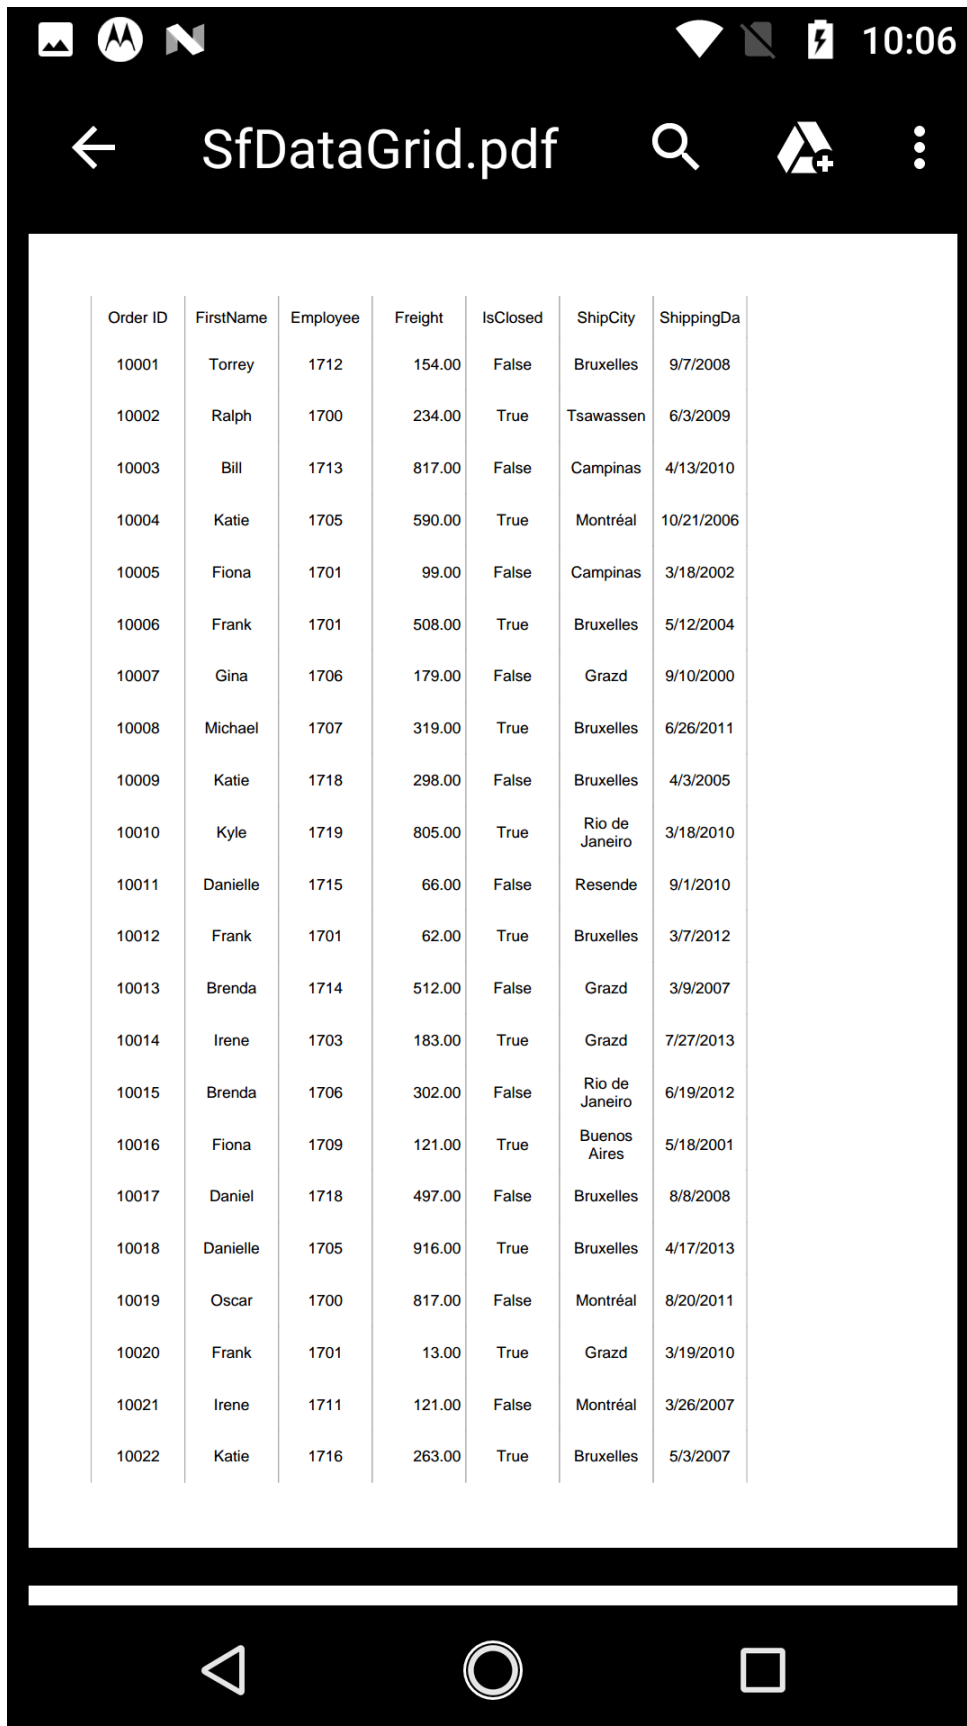

### Vertical

Set the [DataGridPdfExportOption.GridLineType](#) to `GridLineType.Vertical` to export the data grid with vertical border.

### C#

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.GridLineType = GridLineType.Vertical;
```

### Export paging

When exporting to PDF in the SfDataGrid using SfDataPager, by default it will export only the current page. You can export all the pages by setting the [DataGridPdfExportOption.ExportAllPages](#) to `true`.

### C#

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.ExportAllPages = true;
```

- `ExportAllPages = true;`

Order ID	FirstName	Employee	Freight	IsClosed	ShipCity	ShippingDa
10001	Danielle	1719	969.00	False	Rio de Janeiro	9/7/2008
10002	Brenda	1714	311.00	True	Grazd	6/3/2009
10003	Brenda	1716	414.00	False	Montréal	4/13/2010

10005	Oscar	1707	188.00	False	Tsawassen	3/18/2002
10006	Bill	1714	284.00	True	Tsawassen	5/12/2004
10007	Irene	1715	264.00	False	Grazd	9/10/2000
10008	Irene	1707	643.00	True	Campinas	6/26/2011
10009	Ralph	1712	674.00	False	Bruxelles	4/3/2005
10010	Gina	1718	596.00	True	Bruxelles	3/18/2010

### Setting header and footer

The SfDataGrid provides a way to display additional content at the top (header) or bottom (footer) of the page when exporting to PDF by handling the

`DataGridPdfExportingController.HeaderAndFooterExporting` event.

You can insert string in the header and footer in PdfHeaderFooterEventHandler. Setting PdfPageTemplateElement as PdfHeaderFooterEventArgs.PdfDocumentTemplate.Top loads the content at the top of the page. Setting the PdfPageTemplateElement as PdfHeaderFooterEventArgs.PdfDocumentTemplate.Bottom loads the content at the bottom of the page.

### C#

```
DataGridPdfExportingController pdfExport = new
DataGridPdfExportingController();
pdfExport.HeaderAndFooterExporting += PdfExport_HeaderAndFooterExporting;
private void PdfExport_HeaderAndFooterExporting(object sender,
PdfHeaderFooterEventArgs e)
{
PdfFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
var width = e.PdfPage.GetClientSize().Width;
PdfPageTemplateElement header = new PdfPageTemplateElement(width, 38);
header.Graphics.DrawString("Order Details", font, PdfPens.Black, 70, 3);
e.PdfDocumentTemplate.Top = header;
PdfPageTemplateElement footer = new PdfPageTemplateElement(width, 38);
footer.Graphics.DrawString("Order Details", font, PdfPens.Black, 70, 3);
e.PdfDocumentTemplate.Bottom = footer;
}
```

### Change PDF page orientation

You can change the page orientation of the PDF document when exporting. Default page orientation is portrait.

To change the page orientation, export PDF grid value by using the `ExportToPdfGrid` method. Then, draw that PDF grid into a PDF document by changing the `PageSettings.Orientation` property of PDF document.

#### **C#**

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
PdfDocument pdfDocument = new PdfDocument();  
pdfDocument.PageSettings.Orientation = PdfPageOrientation.Landscape;  
//pdfDocument.PageSettings.Orientation = PdfPageOrientation.Portrait;  
option.PdfDocument = pdfDocument;
```

Saving options

[Save directly as file](#)

[Save directly as file](#)

The following code snippet explains how to save the converted PDF document in our local device.

### C#

```
// Need to define the Interfaces in-order to use it in platform wise using
Dependency Service
public interface ISave
{
    void Save(string filename, string contentType, MemoryStream stream);
}
public interface ISaveWindows
{
    Task Save(string filename, string contentType, MemoryStream stream);
}
// In Android renderer project
public class SaveAndroid : ISave
{
    public void Save(string filename, string contentType, MemoryStream stream)
    {
        string exception = string.Empty;
        string root = null;
        if (Android.OS.Environment.IsExternalStorageEmulated)
        {
            root = Android.OS.Environment.ExternalStorageDirectory.ToString();
        }
        else
        {
            root = Environment.GetFolderPath(Environment.SpecialFolder.MyDocuments);
            Java.IO.File myDir = new Java.IO.File(root + "/Syncfusion");
            myDir.Mkdir();
            Java.IO.File file = new Java.IO.File(myDir, filename);
            if (file.Exists()) file.Delete();
            try
            {
                FileOutputStream outs = new FileOutputStream(file);
                outs.Write(stream.ToArray());
                outs.Flush();
                outs.Close();
            }
            catch (Exception e)
            {
                exception = e.ToString();
            }
            if (file.Exists() && contentType != "application/html")
            {
                Android.Net.Uri path = Android.Net.Uri.FromFile(file);

            break;
    }
    storageFile = await savePicker.PickSaveFileAsync();
    using (Stream outputStream = await storageFile.OpenStreamForWriteAsync())
    {
        outputStream.Write(stream.ToArray(), 0, (int)stream.Length);
        outputStream.Flush();
        outputStream.Dispose();
    }
    stream.Flush();
    stream.Dispose();
    await Windows.System.Launcher.LaunchFileAsync(storageFile);
}
}
}

```

#### *Save as stream*

You can also save the manipulated PDF document to stream by using overloads of the Save method.

#### **C#**

```
//Load an existing PDF document  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");  
//To-Do some manipulation  
//To-Do some manipulation  
//Creates an instance of memory stream  
MemoryStream stream = new MemoryStream();  
//Save the document stream  
loadedDocument.Save(stream);
```

## Row height and column width customization

### *ExportColumnWidth*

By default, the data grid columns will be exported to PDF with

`DataGridPdfExportOption.DefaultColumnWidth` value. To export the data grid to PDF with exact column widths, set the [DataGridPdfExportOption.ExportColumnWidth](#) to `true`.

### **C#**

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.ExportColumnWidth = true;
```

### *ExportRowHeight*

By default, the data grid rows will be exported to PDF with

`DataGridPdfExportOption.DefaultRowHeight` value. To export the data grid to PDF with exact row heights, set the [DataGridPdfExportOption.ExportRowHeight](#) to `true`.

### **C#**

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.ExportRowHeight = true;
```

### *DefaultColumnWidth*

The SfDataGrid allows customizing column width in the PDF document using the [DataGridPdfExportOption.DefaultColumnWidth](#) property. The `DefaultColumnWidth` value will be applied to all the columns in the document.

#### **C#**

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.DefaultColumnWidth = 100;
```

### *DefaultRowHeight*

The SfDataGrid allows customizing row height in the PDF document using the [DataGridPdfExportOption.DefaultRowHeight](#) property. The `DefaultRowHeight` value will be applied to all the rows in the document.

#### **C#**

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.DefaultRowHeight = 50;
```

## Events

### Exporting customization

#### *Styling cells based on CellType in PDF*

The SfDataGrid provides you the following events for exporting:

- [RowExporting](#): Raised when exporting a row at the execution time.
- [CellExporting](#): Raised when exporting a cell at the execution time.

#### *RowExporting*

The [DataGridRowPdfExportingEventHandler](#) delegate allows customizing the styles of record rows and group caption rows. The **RowExporting** event is triggered with [DataGridRowPdfExportingEventArgs](#) that contains the following properties:

- [PdfGrid](#): Customizes the pdfGrid properties such as **Background**, **CellPadding**, **CellSpacing**, and so on.
- [PdfRow](#): Specifies the **PDFGridRow** to be exported. Customizes the properties of a particular row.
- [Record](#): Gets the collection of exported underlying data objects.
- [RowType](#): Specifies the row type using **ExportRowType** enum. Checks the row type and applies different styles based on the row type.

You can use this event to customize the properties of the grid rows exported to PDF. The following code example illustrates how to change the background color of the record rows and caption summary rows when exporting.

#### **C#**

```
//HandlingRowExportingEvent for exporting to PDF
DataGridPdfExportingController pdfExport = new
DataGridPdfExportingController ();
pdfExport.RowExporting += pdfExport_RowExporting;
void pdfExport_RowExporting (object sender, DataGridRowPdfExportingEventArgs
e)
{
    if (e.RowType == ExportRowType.Record) {
        if ((e.Record.Data as OrderInfo).IsClosed)
            e.PdfRow.Style.BackgroundBrush = PdfBrushes.Yellow;
        else
            e.PdfRow.Style.BackgroundBrush = PdfBrushes.LightGreen;
    }
    // You can also set the desired background colors for the CaptionSummary row
    // and GroupSummary row as shown below
    // if (e.RowType == ExportRowType.CaptionSummary) {
    //     e.PdfRow.Style.BackgroundBrush = PdfBrushes.LightGray;
    // }
    // if (e.RowType == ExportRowType.GroupSummary) {
    //     e.PdfRow.Style.BackgroundBrush = PdfBrushes.Red;
    // }
}
```

Order ID	FirstName	Employee	Freight	IsClosed	ShipCity
10001	Daniel	1707	469.00	False	Resende
10002	Kyle	1711	731.00	True	Resende
10003	William	1714	574.00	False	Rio de Janeiro
10004	Bill	1703	134.00	True	Buenos Aires
10005	William	1707	567.00	False	Rio de Janeiro
10006	Danielle	1711	341.00	True	Tsawassen
10007	Katie	1700	123.00	False	Rio de Janeiro
10008	Torrey	1702	623.00	True	Montréal
10009	Fiona	1718	854.00	False	Rio de Janeiro
10010	Daniel	1705	369.00	True	Grazd
10011	Katie	1710	991.00	False	Buenos Aires
10012	Gina	1701	530.00	True	Resende
10013	Bill	1717	500.00	False	Tsawassen
10014	Torrey	1702	678.00	True	Grazd

### CellExporting

The [DataGridCellPdfExportingEventHandler](#) delegate allows customizing the styles for the header cells, record cells, group caption cells, and group summary cells. The [CellExporting](#) event is triggered with [DataGridCellPdfExportingEventArgs](#) that contains the following properties:

The [DataGridCellPdfExportingEventHandler](#) delegate allows customizing the styles for header cells, record cells, and group caption cells. The [CellExporting](#) event is triggered with [DataGridCellPdfExportingEventArgs](#) that contains the following properties:

- [CellType](#): Specifies the cell type using [ExportCellType](#) enum. Checks the cell type and applies different cell styles based on the cell type.
- [CellValue](#): Contains the exported actual value to format the PDF using the [Range](#) property.
- [ColumnName](#): Specifies the column name (MappingName) of the exporting cell. Applies formatting for a particular column by checking the [ColumnName](#).
- [Handled](#): Determines whether the cell is exported to PDF or not.
- [PdfGrid](#): Specifies the [PDFGridCell](#) to be exported. Customizes Background, Foreground, Font, Alignment, etc., properties of a particular cell.
- [Record](#): Gets the collection of exported underlying data objects.

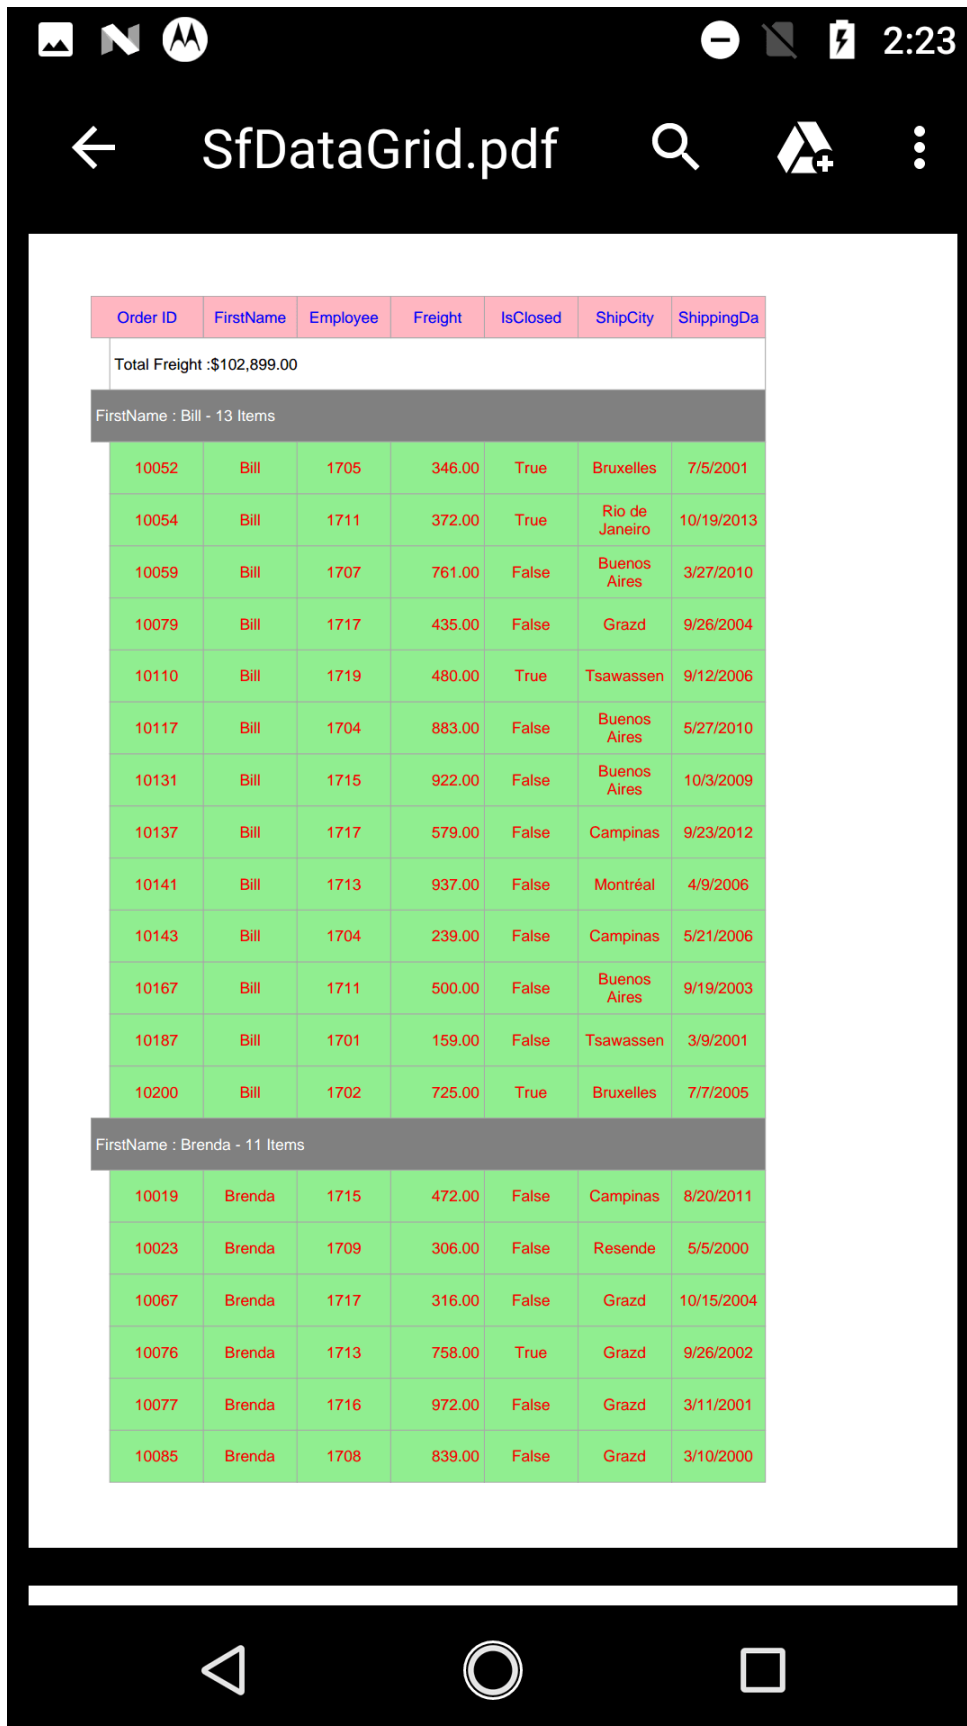

You can use this event to customize the properties of the grid cells exported to PDF. The following code example illustrates how to customize the background color, foreground color, and cell value of the header cells, record cells, and caption summary cells when exporting.

### C#

```
//HandlingCellExportingEvent for exporting to PDF
DataGridPdfExportingController pdfExport = new
DataGridPdfExportingController ();
pdfExport.CellExporting += pdfExport_CellExporting;
void pdfExport_CellExporting(object sender,
DataGridCellPdfExportingEventArgs e)
{
    if (e.CellType == ExportCellType.HeaderCell)
    {
        e.PdfGridCell.Style.BackgroundBrush = PdfBrushes.LightPink;
        e.PdfGridCell.Style.TextBrush = PdfBrushes.Blue;
    }
    if (e.CellType == ExportCellType.RecordCell)
    {
        e.PdfGridCell.Style.BackgroundBrush = PdfBrushes.LightGreen;
        e.PdfGridCell.Style.TextBrush = PdfBrushes.Red;
    }
    // You can also set the desired values for the CaptionSummary rows and
    // GroupSummary rows as shown below
    // if (e.CellType == ExportCellType.GroupCaptionCell)
    // {
    //     e.PdfGridCell.Style.BackgroundBrush = PdfBrushes.Gray;
    //     e.PdfGridCell.Style.TextBrush = PdfBrushes.White;
    // }
    // if (e.CellType == ExportCellType.GroupSummaryCell)
    // {
    //     e.PdfGridCell.Style.BackgroundBrush = PdfBrushes.Blue;
    //     e.PdfGridCell.Style.TextBrush = PdfBrushes.Orange;
    // }
```

```
// }  
}
```

### Exporting Unbound rows

By default the unbound rows will not be exported to pdf document. However, You can export the unbound rows to PDF by setting the [DataGridPdfExportOption.ExportUnboundRows](#) property as `true`.

#### C#

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
option.ExportUnboundRows = true;
```

### Exporting unbound columns

The `SfDataGrid.GridUnboundColumns` will be exported as [SfDataGrid.GridTextColumns](#) without any specific code. You can customize the `SfDataGrid.GridUnboundColumns` as `SfDataGrid.GridTextColumns` by using the `CellExporting` and `RowExporting` events.

#### XML

```
<sfgrid:GridUnboundColumn Expression="OrderID * 12"  
HeaderFontAttribute="Bold"  
HeaderText="Unbound"  
HeaderTextAlignment="Start"  
MappingName="Unbound"  
Padding="5, 0, 0, 0"  
TextAlignment="Start">  
</sfgrid:GridUnboundColumn>
```

The following screenshot shows that the unbound column is exported to PDF document with text columns.

Carrier  12:46 PM

### *ExportGroupSummary*

By default, the **GroupSummary** rows in the data grid will be exported to PDF. To export the **SfDataGrid** without group summaries, set the [DataGridPdfExportingOption.ExportGroupSummary](#) property to **false**.

### **C#**

```
DataGridPdfExportOption option = new DataGridPdfExportOption();  
// Set false here to export the DataGrid without GroupSummary rows. The  
// default value is true.  
// option.ExportGroupSummary = false;
```

*Embedding fonts in PDF file*

By default, some fonts (such as Unicode font) are not supported in PDF. In this case, embed the font in the PDF document with the help of PdfTrueTypeFont.

**C#**

```
Stream fontStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("SfDataGridSample.Pacifico.ttf");
private void PdfExport_CellExporting(object sender,
DataGridCellPdfExportingEventArgs e)
{
if (e.CellValue != null)
{
PdfFont font = e.PdfGridCell.Style.Font;
if (font != null)
{
PdfTrueTypeFont unicodeFont = new PdfTrueTypeFont(fontStream, font.Size,
font.Style);
e.PdfGridCell.Style.Font = unicodeFont;
}
}
}
```

Order ID	FirstName	Employee ID	Freight	IsClosed	ShipCity

## Cell customization in PDF while exporting

### *Customize cell values while exporting*

You can customize the cell values when exporting to PDF by handling the **CellExporting** event.

#### **C#**

```
DataGridPdfExportingController pdfExport = new
DataGridPdfExportingController();
pdfExport.CellExporting += PdfExport_CellExporting;
private void PdfExport_CellExporting(object sender,
DataGridCellPdfExportingEventArgs e)
{
    if (e.CellType == ExportCellType.RecordCell && e.ColumnName == "IsClosed")
    {
        if ((bool)e.CellValue)
            e.CellValue = "Y";
        else
            e.CellValue = "N";
    }
}
```

In the following screenshot, IsClosed column value has been changed based on the condition.

Order ID	FirstName	Employee	Freight	IsClosed	ShipCity	ShippingDa
10001	Irene	1703	893.00	N	Tsawassen	9/7/2008
10002	Oscar	1712	358.00	Y	Buenos Aires	6/3/2009
10003	Irene	1703	736.00	N	Bruxelles	4/13/2010
10004	Oscar	1704	937.00	Y	Bruxelles	10/21/2006
10005	Ralph	1708	331.00	N	Grazd	3/18/2002
10006	Katie	1716	620.00	Y	Campinas	5/12/2004
10007	Ralph	1716	365.00	N	Grazd	9/10/2000

*Changing row style in PDF based on data*

You can customize the row style based on the row data when exporting to PDF by handling the **RowExporting** event.

**C#**

```
DataGridPdfExportingController pdfExport = new
DataGridPdfExportingController();
pdfExport.RowExporting += PdfExport_RowExporting;
private void PdfExport_RowExporting(object sender,
DataGridRowPdfExportingEventArgs e)
{
    if (!(e.Record.Data is OrderInfo))
        return;
    if (e.RowType == ExportRowType.Record)
    {
        if ((e.Record.Data as OrderInfo).IsClosed)
            e.PdfRow.Style.BackgroundBrush = PdfBrushes.Yellow;
        else
            e.PdfRow.Style.BackgroundBrush = PdfBrushes.LightGreen;
    }
}
```

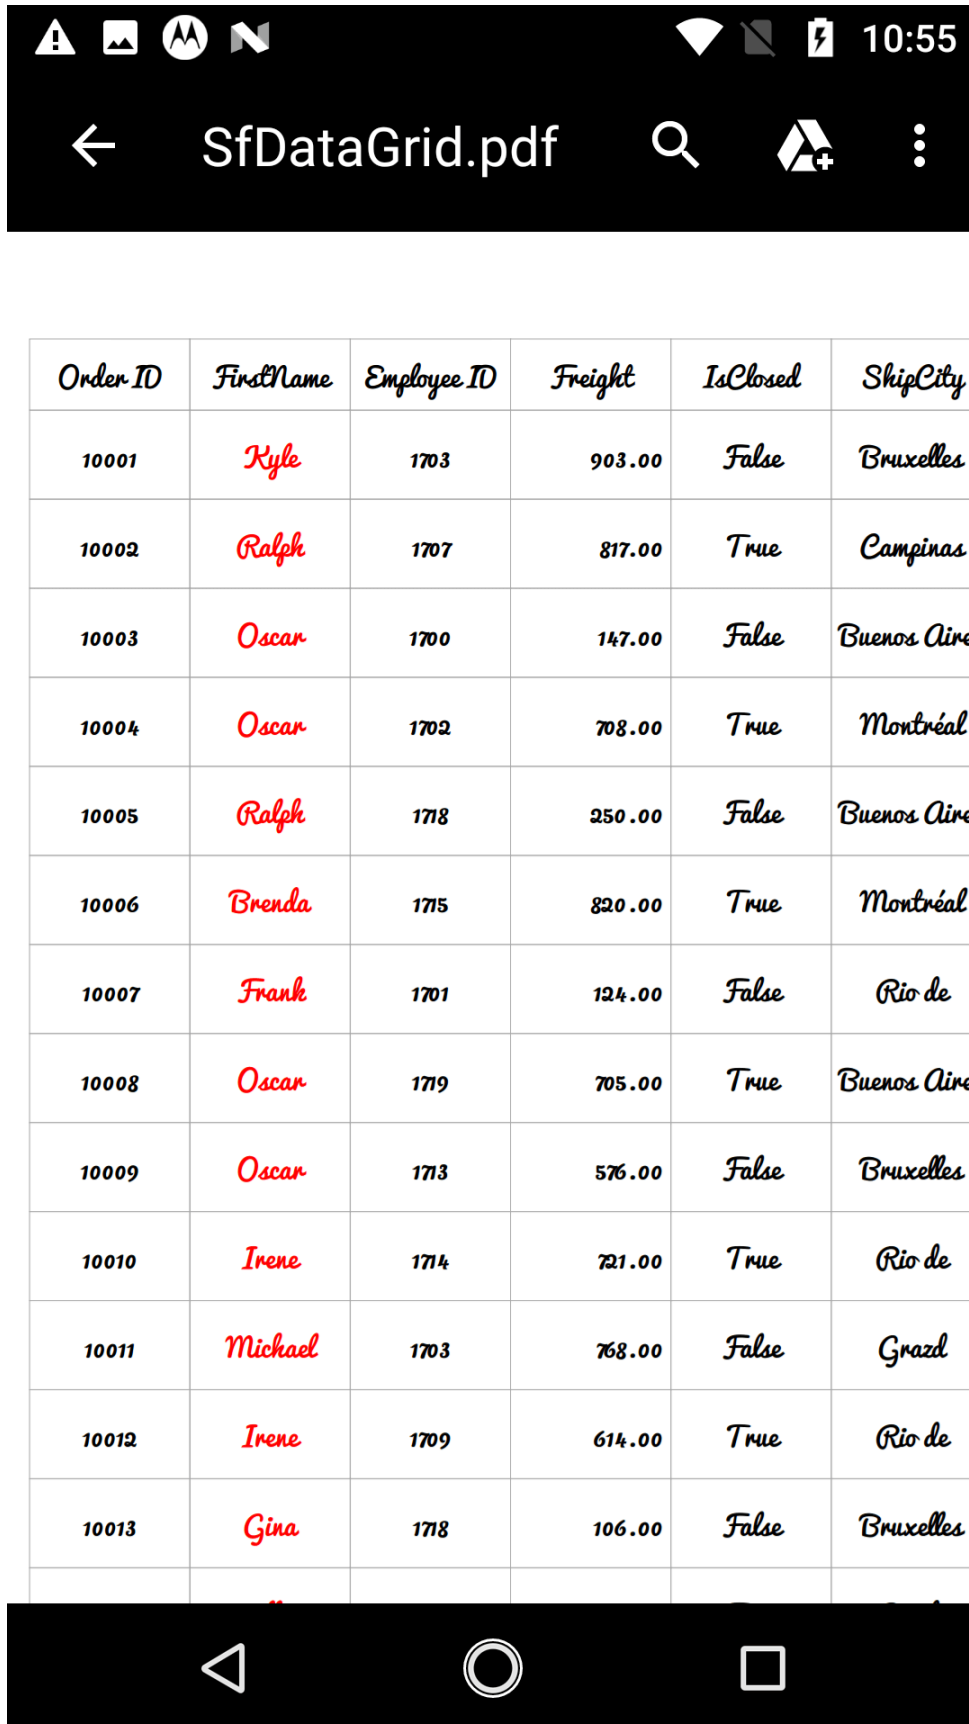

Order ID	FirstName	Employee	Freight	IsClosed	ShipCity
10001	Daniel	1707	469.00	False	Resende
10002	Kyle	1711	731.00	True	Resende
10003	William	1714	574.00	False	Rio de Janeiro
10004	Bill	1703	134.00	True	Buenos Aires
10005	William	1707	567.00	False	Rio de Janeiro
10006	Danielle	1711	341.00	True	Tsawassen
10007	Katie	1700	123.00	False	Rio de Janeiro
10008	Torrey	1702	623.00	True	Montréal
10009	Fiona	1718	854.00	False	Rio de Janeiro
10010	Daniel	1705	369.00	True	Grazd
10011	Katie	1710	991.00	False	Buenos Aires
10012	Gina	1701	530.00	True	Resende
10013	Bill	1717	500.00	False	Tsawassen
10014	Torrey	1702	678.00	True	Grazd

*Customize the cells based on column name*

You can customize the column style based on the row data when exporting to PDF by handling the `CellExporting` event.

**C#**

```
DataGridPdfExportingController pdfExport = new
DataGridPdfExportingController();
pdfExport.CellExporting += PdfExport_CellExporting;
private void PdfExport_CellExporting(object sender,
DataGridCellPdfExportingEventArgs e)
{
    if (e.CellType == ExportCellType.RecordCell && e.ColumnName == "FirstName")
    {
        e.PdfGridCell.Style.TextBrush = PdfBrushes.Red;
    }
}
```

The image shows a mobile application interface. At the top is a black header bar with a back arrow, the title 'SfDataGrid.pdf', a search icon, a share icon, and a menu icon. Below the header is a table with 6 columns: Order ID, FirstName, Employee ID, Freight, IsClosed, and ShipCity. The table contains 13 rows of data. At the bottom is a black navigation bar with three icons: a back arrow, a circle, and a square.

Order ID	FirstName	Employee ID	Freight	IsClosed	ShipCity
10001	Kyle	1703	903.00	False	Bruxelles
10002	Ralph	1707	817.00	True	Campinas
10003	Oscar	1700	147.00	False	Buenos Aires
10004	Oscar	1702	708.00	True	Montréal
10005	Ralph	1718	250.00	False	Buenos Aires
10006	Brenda	1715	820.00	True	Montréal
10007	Frank	1701	124.00	False	Rio de
10008	Oscar	1719	705.00	True	Buenos Aires
10009	Oscar	1713	576.00	False	Bruxelles
10010	Irene	1714	721.00	True	Rio de
10011	Michael	1703	768.00	False	Graz
10012	Irene	1709	614.00	True	Rio de
10013	Gina	1718	106.00	False	Bruxelles

*Exporting middle Eastern languages (Arabic and Hebrew) from SfDataGrid to PDF*

By default, [Middle Eastern languages](#) (Arabic and Hebrew) in the SfDataGrid are exported as left to right in PDF. You can export them as displayed (export from right to left) by enabling the `RightToLeft` property in PdfStringFormat class and apply the format to the PdfGridCell by using CellsExportingEventHandler.

**C#**

```
PdfExportingOptions options = new PdfExportingOptions();
options.CellsExportingEventHandler = CellsExportingEventHandler;
var document = dataGrid.ExportToPdf(options);
document.Save("Sample.pdf");
private void CellsExportingEventHandler(object sender,
GridCellPdfExportingEventArgs e)
{
    if (e.CellType != ExportCellType.RecordCell)
        return;
    PdfStringFormat format = new PdfStringFormat();
    //format the string from right to left.
    format.RightToLeft = true;
    e.PdfGridCell.StringFormat = format;
}
```

*Exporting images to PDF document*

By default, images loaded in the GridTemplateColumn will not be exported to PDF. You can export it by handling the CellExporting event. In DataGridCellPdfExportingEventHandler, the required image is loaded in the PdfGridCell.

**C#**

```
private void PdfExport_CellExporting(object sender,
DataGridCellPdfExportingEventArgs e)
{
    if (e.CellType == ExportCellType.RecordCell && e.ColumnName == "IsClosed")
    {
        var style = new PdfGridCellStyle();
        PdfPen normalBorder = new PdfPen(PdfBrushes.DarkGray, 0.2f);
        Xamarin.Forms.Image trueImage = new Xamarin.Forms.Image();
        Xamarin.Forms.Image falseImage = new Xamarin.Forms.Image();
        if ((bool)e.CellValue)
            trueImage.Source = ImageSource.FromResource("SfDataGridSample.True.jpg");
        else
            falseImage.Source = ImageSource.FromResource("SfDataGridSample.False.jpg");
        Assembly assembly = null;
        assembly = e.Record.Data.GetType().GetTypeInfo().Assembly;
        var streamImageSource = trueImage.Source as StreamImageSource;
        if (streamImageSource != null)
        {
            var imageStream =
                assembly.GetManifestResourceStream(ExportingHelper.GetImagePath(streamImageSource));
            if (imageStream != null)
            {
                PdfImage pdfImage = PdfImage.FromStream(imageStream);
                style.BackgroundImage = pdfImage;
            }
        }
    }
}
```

```
e.PdfGridCell.ImagePosition = PdfGridImagePosition.Fit;  
e.PdfGridCell.Style = style;  
imageStream.Flush();  
e.CellValue = null;  
}  
}  
}  
}
```

### Exporting the selected rows of SfDataGrid

SfDataGrid allows you to export only the currently selected rows in the grid to the document using the [DataGridPdfExportingController.ExportToPdf](#) method by passing the instance of the SfDataGrid and [SfDataGrid.SelectedItems](#) collection as an argument.

Refer the below code to export the selected rows alone to the PDF document.

#### C#

```
private void ExportToPDF(object sender, EventArgs e)
{
    DataGridPdfExportingController pdfExport = new
    DataGridPdfExportingController();
    MemoryStream stream = new MemoryStream();
    ObservableCollection<object> selectedItem = dataGrid.SelectedItems;
    var doc = pdfExport.ExportToPdf(this.dataGrid, selectedItem);
    doc.Save(stream);
    doc.Close(true);
    if (Device.RuntimePlatform == Device.UWP)
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DataGrid.pdf",
        "application/pdf", stream);
    else
        Xamarin.Forms.DependencyService.Get<ISave>().Save("DataGrid.pdf",
        "application/pdf", stream);
}
```

### Localization

Localization is the process of translating application resources into different languages for specific cultures. SfDataGrid uses the following static text that can be localized in application level:

- LOAD MORE ITEMS
- Drop below
- Drop above
- Cancel drop

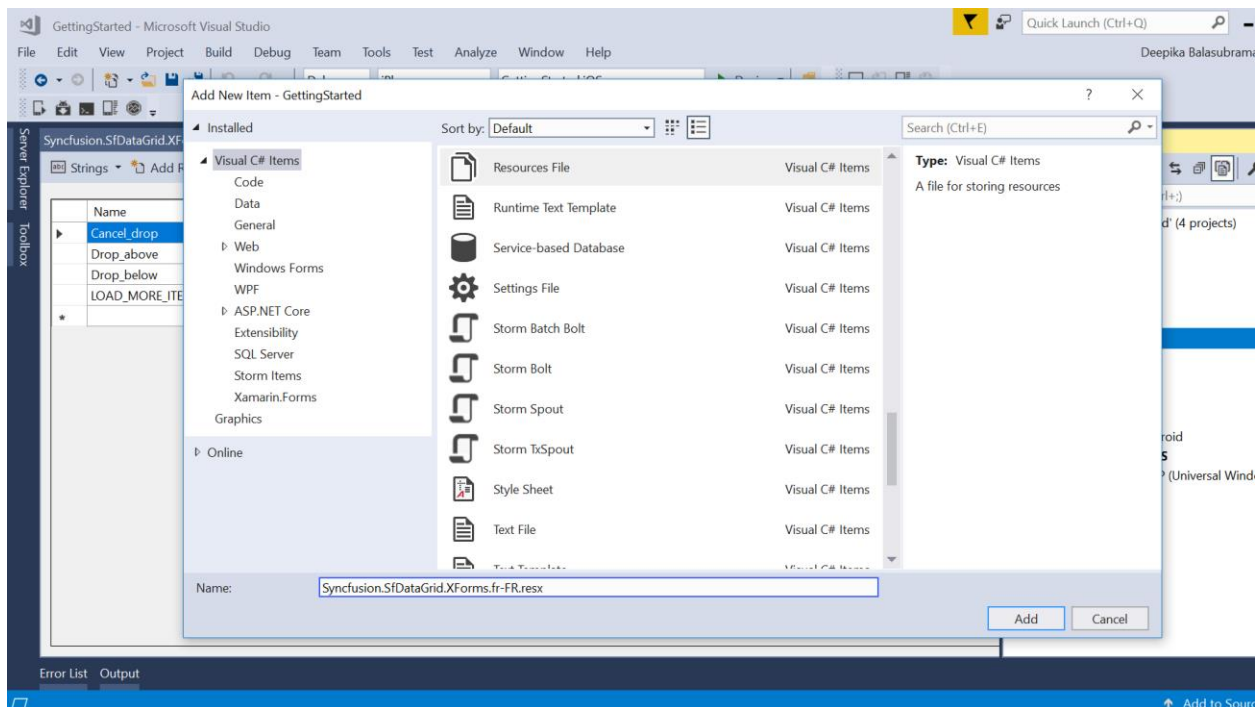

To localize the SfDataGrid, follow the steps in application level:

1. Add a .resx file.
2. Convert the platform specific language format to .NET format.
3. Apply the converted format.

### Add a .resx file

In the portable project of your application, add a .resx file inside the resources folder with **Build Action -> EmbeddedResource**. The file name should be **Syncfusion control's Namespace + language code** format.

For example, to set the culture as French, the file should be named as **Syncfusion.SfDataGrid.XForms.fr-FR.resx**.

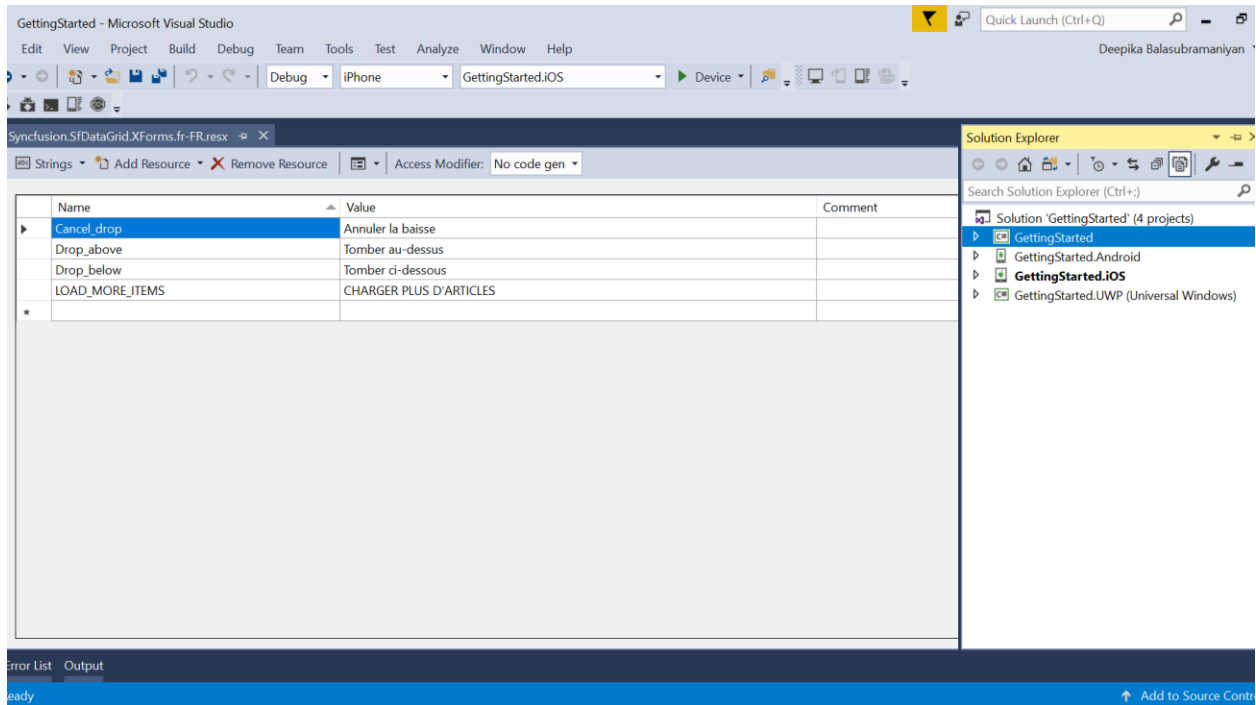

Based on the language, set the appropriate equivalent text to the static text in the .resx file.

---

**Note:** You should create and add separate .resx files for the individual languages.

---

Convert the platform specific language format to .NET format

To get the localized text from the added .resx file, declare an interface named `ILocalize` in your PCL project and implement the interface in each platform renderer. This will query the language set in the device using platform specific code and convert this platform specific format to .NET format.

Refer to the following code snippet to declare the interface in PCL project.

### C#

```
public interface ILocalize
{
    CultureInfo GetCurrentCultureInfo();
    void SetLocale(CultureInfo cultureInfo);
}

public class PlatformCulture
{
    public PlatformCulture(string platformCultureString)
    {
        if (String.IsNullOrEmpty(platformCultureString))
            throw new ArgumentException("Expected culture identifier",
                "platformCultureString"); // in C# 6 use nameof(platformCultureString)
        PlatformString = platformCultureString.Replace("_", "-"); // .NET expects
        // dash, not underscore
        var dashIndex = PlatformString.IndexOf("-", StringComparison.Ordinal);
        if (dashIndex > 0)
        {
            var parts = PlatformString.Split('-');
            LanguageCode = parts[0];
            LocaleCode = parts[1];
        }
        else
        {
            LanguageCode = PlatformString;
        }
    }
}
```

```
LocaleCode = "";
}
}
public string PlatformString
{
    get; private set;
}
public string LanguageCode
{
    get; private set;
}
public string LocaleCode
{
    get; private set;
}
public override string ToString()
{
    return PlatformString; ;
}
}
```

Refer to the following code to implement the interface in Android renderer project.

### C#

```
public class Localize : ILocalize
{
    public void SetLocale(CultureInfo cultureInfo)
    {
        Thread.CurrentThread.CurrentCulture = cultureInfo;
        Thread.CurrentThread.CurrentUICulture = cultureInfo;
    }
    public CultureInfo GetCurrentCultureInfo()
    {
        var netLanguage = "en";
        var androidLocale = Java.Util.Locale.Default;
        netLanguage = AndroidToDotnetLanguage(androidLocale.ToString().Replace("_",
        "-"));
        // this gets called a lot - try/catch can be expensive so consider caching
        or something
        CultureInfo cultureInfo = null;
        try
        {
            cultureInfo = new CultureInfo(netLanguage);
        }
        catch
        {
            // iOS locale not valid .NET culture (eg. "en-ES" : English in Spain)
            // fallback to first characters, in this case "en"
            try
            {
                var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
                cultureInfo = new CultureInfo(fallback);
            }
            catch
            {

```

```

// iOS language not valid .NET culture, falling back to English
cultureInfo = new CultureInfo("en");
}
}
return cultureInfo;
}
private string AndroidToDotnetLanguage(string androidLanguage)
{
var netLanguage = androidLanguage;
//certain languages need to be converted to CultureInfo equivalent
switch (androidLanguage)
{
case "ms-BN": // "Malaysian (Brunei)" not supported .NET culture
case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
netLanguage = "ms"; // closest supported
break;
case "in-ID": // "Indonesian (Indonesia)" has different code in .NET
netLanguage = "id-ID"; // correct code for .NET
break;
case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
culture
netLanguage = "de-CH"; // closest supported
break;
// add more application-specific cases here (if required)
// ONLY use cultures that have been tested and known to work
}
return netLanguage;
}
private string ToDotnetFallbackLanguage(PlatformCulture platformCulture)
{
var netLanguage = platformCulture.LanguageCode; // use the first part of the
identifier (two chars, usually);
switch (platformCulture.LanguageCode)
{
case "gsw":
netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
break;
// add more application-specific cases here (if required)
// ONLY use cultures that have been tested and known to work
}
return netLanguage;
}
}

```

Refer to the following code to implement the interface in iOS renderer project.

### C#

```

public class Localize : ILocalize
{
public void SetLocale(CultureInfo cultureInfo)
{
Thread.CurrentThread.CurrentCulture = cultureInfo;
Thread.CurrentThread.CurrentUICulture = cultureInfo;
}
}

```

```

public CultureInfo GetCurrentCultureInfo()
{
    var netLanguage = "en";
    if (NSLocale.PreferredLanguages.Length > 0)
    {
        var pref = NSLocale.PreferredLanguages[0];
        netLanguage = iOSToDotnetLanguage(pref);
    }
    // this gets called a lot - try/catch can be expensive so consider caching
    // or something
    CultureInfo cultureInfo = null;
    try
    {
        cultureInfo = new CultureInfo(netLanguage);
    }
    catch
    {
        // iOS locale not valid .NET culture (eg. "en-ES" : English in Spain)
        // fallback to first characters, in this case "en"
        try
        {
            var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
            cultureInfo = new CultureInfo(fallback);
        }
        catch
        {
            // iOS language not valid .NET culture, falling back to English
            cultureInfo = new CultureInfo("en");
        }
    }
    return cultureInfo;
}

private string iOSToDotnetLanguage(string iOSLanguage)
{
    var netLanguage = iOSLanguage;
    //certain languages need to be converted to CultureInfo equivalent
    switch (iOSLanguage)
    {
        case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
        case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
            netLanguage = "ms"; // closest supported
            break;
        case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
            culture
            netLanguage = "de-CH"; // closest supported
            break;
        // add more application-specific cases here (if required)
        // ONLY use cultures that have been tested and known to work
    }
    return netLanguage;
}

private string ToDotnetFallbackLanguage(PlatformCulture platCulture)
{
    var netLanguage = platCulture.LanguageCode; // use the first part of the
    identifier (two chars, usually);
    switch (platCulture.LanguageCode)
    {

```

```
//
case "pt":
netLanguage = "pt-PT"; // fallback to Portuguese (Portugal)
break;
case "gsw":
netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
break;
// add more application-specific cases here (if required)
// ONLY use cultures that have been tested and known to work
}
return netLanguage;
}
}
```

Implementation of the interface is not required for UWP project, since the resources automatically recognizes the selected language.

#### Apply the converted format

After setting the root/main page of the application in your App.Xaml.cs file of the PCL project, initialize a new instance of the `ResourceManager` class and set it to the [DataGridResourceManager.Manager](#) property to look up into the resources with specified root name in the given assembly. Using `DependencyService`, call `SetLocale()` of the implemented interface with necessary language code as parameter.

#### C#

```
public partial class App : Application
{
    public App()
    {
        InitializeComponent();
        MainPage = new GettingStarted.MainPage();
        if (Device.RuntimePlatform == Device.iOS || Device.RuntimePlatform == Device.Android)
        {
            DataGridResourceManager.Manager = new
            ResourceManager("GettingStarted.Resources.Syncfusion.SfDataGrid.XForms",
            this.GetType().GetTypeInfo().Assembly);
            // the ResourceManager class constructor has two parameters.
            // 1. ResXPath => Full path of the resx file in the application. Here in the
            // above line GettingStarted refers to the namespace of the Application
            // 2. Assembly => Application assembly (PCL)
            // Sets the required culture to the static texts in the control.
            DependencyService.Get<ILocalize>().SetLocale(new CultureInfo("fr-FR"));
        }
    }
}
```

For Android and iOS, it is mandatory to implement the previous steps. However, to set a specific language to the application irrespective of the selected language in the device, use `CultureInfo.CurrentCulture` in a specific project of UWP platform.

Refer to the following code example to localize the text in UWP platform.

MainPage.Xaml.cs

**C#**

```
public MainPage()
{
    this.InitializeComponent();
    SfDataGridRenderer.Init();
    // Applying localization for UWP
    CultureInfo.CurrentUICulture = new CultureInfo("fr");
    LoadApplication(new GettingStarted.App());
}
```

OrderID	EmployeeID	CustomerID	FirstName
CHARGER PLUS D'ARTICLES			
10002	9002	Linod	Kyle
10003	9003	Welli	Daniel
10004	9004	Frans	Danielle

10009	9009	Welli	Kyle
10010	9010	Linod	Frank
10011	9011	Blonp	Frank
10012	9012	Welli	William

You can download the sample [here](#).

### AutomationId

SfDataGrid and SfDataPager support built-in [AutomationId](#) for all their inner elements. These **AutomationId** values allow the automation framework to find and interact with the inner elements when the test scripts are run. A unique **AutomationId** is maintained for each inner element by prefixing the control's **AutomationId** with the inner element's Id.

### DataGrid

The below table illustrates the predefined automation values set internally which can be used to identify the SfDataGrid elements.

Element	Value	Example
Header Row	"Row" +RowIndex	R0
Header Cell	"R" +RowIndex + "C" + ColumnIndex	R0C2
Row	"Row" +RowIndex	R4
Grid Cell	"R" +RowIndex + "C" + ColumnIndex	R4C2
Group Header	"Row" +RowIndex	R5
LoadMore View	"LOAD MORE ITEMS"	LOAD MORE ITEMS

The following screenshots illustrate the **AutomationId** values of grid cells, rows, and other inner elements of SfDataGrid.

Order Shipment Details				SyncfusionGrid Row0

SyncfusionGrid LOAD MORE ITEMS

The following code snippet demonstrates how to set the AutomationId to data grid.

#### XML

```
<syncfusion:SfDataGrid x:Name="dataGrid"
ItemsSource="{Binding OrdersInfo,Mode=TwoWay}"
AutomationId="SyncfusionGrid"
AllowGroupExpandCollapse="True">
<sfgrid:SfDataGrid.GroupColumnDescriptions>
<sfgrid:GroupColumnDescription ColumnName="OrderID" />
</sfgrid:SfDataGrid.GroupColumnDescriptions>
<sfgrid:SfDataGrid.CaptionSummaryRow>
<sfgrid:GridGroupSummaryRow Title="Total Count of OrderId:{OrderID}"
ShowSummaryInRow="True">
<sfgrid:GridGroupSummaryRow.SummaryColumns>
<sfgrid:GridSummaryColumn Name="OrderID"
```

```

MappingName="OrderID"
Format="{Count}"
SummaryType="CountAggregate" />
</sfgrid:GridGroupSummaryRow.SummaryColumns>
</sfgrid:GridGroupSummaryRow>
</sfgrid:SfDataGrid.CaptionSummaryRow>
</syncfusion:SfDataGrid>

```

**C#**

```

ViewModel viewModel = new ViewModel();
SfDataGrid dataGrid = new SfDataGrid();
dataGrid.ItemsSource = viewModel.OrderInfoCollection;
dataGrid.AutomationId = "SyncfusionGrid";
dataGrid.AllowGroupExpandCollapse = true;
this.sfGrid.GroupColumnDescriptions.Add(new GroupColumnDescription()
{
    ColumnName = "OrderID",
});
GridGroupSummaryRow summaryRow = new GridGroupSummaryRow();
summaryRow.Title = "Total Count of OrderId:{OrderID}";
summaryRow.ShowSummaryInRow = true;
summaryRow.SummaryColumns.Add(new GridSummaryColumn()
{
    Name = "OrderID",
    MappingName = "OrderID",
    Format = "{Count}",
    SummaryType = SummaryType.CountAggregate
});
sfGrid.CaptionSummaryRow = summaryRow;

```

Refer to the following code snippet to access the inner elements of data grid from the automation script.

**C#**

```

[Test]
[Description("SfDataGrid Automation Id")]
public void SfDataGrid_AutomationId()
{
    // To enter edit mode for the grid cell at fourth row and second column.
    App.DoubleTap("SyncfusionGrid R4C1");
    // To tap group expand and collapse icon
    App.Tap("SyncfusionGrid Row5");
    // To apply sorting
    App.Tap("SyncfusionGrid R2C1");
    // To click LoadMoreView for loading more items
    App.Tap("SyncfusionGrid LOAD MORE ITEMS");
}

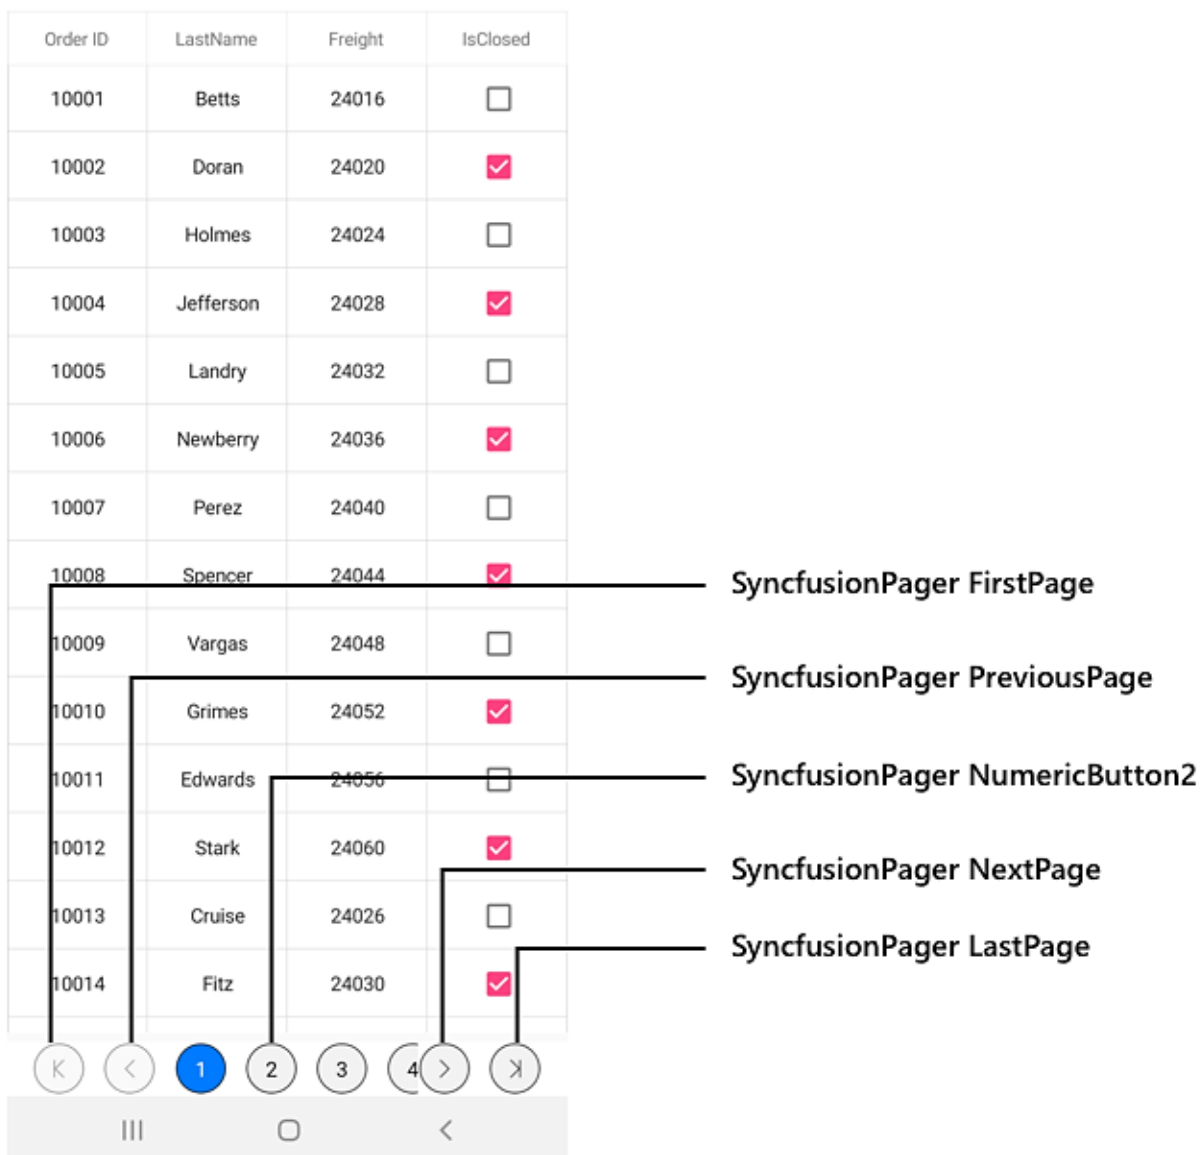

```

**DataPager**

The below table illustrates the predefined automation values set internally which can be used to identify the SfDataPager elements.

Element	Value
First page button	"FirstPage"
Previous page button	"PreviousPage"
Numeric buttons	"NumericButton" + NumericButtonIndex Example : NumericButton3
Next page button	"NextPage"
Last page button	"LastPage"

The following screenshot illustrates the **AutomationId** values of the pager buttons in SfDataPager.

The following code snippet demonstrates how to set AutomationId to dataPager.

### XML

```
<Grid>
  <Grid.RowDefinitions>
    <RowDefinition Height="*" />
    <RowDefinition Height="Auto" />
  </Grid.RowDefinitions>
  <sfPager:SfDataPager x:Name="dataPager"
    Grid.Row="1"
    PageSize="10"
    HeightRequest="50"
    NumericButtonCount="20"
    Source="{Binding OrdersInfo}"
    AutomationId="SyncfusionPager">
  </sfPager:SfDataPager>
  <sfgrid:SfDataGrid x:Name="dataGrid"
    Grid.Row="0"
    ItemsSource="{Binding PagedSource, Source={x:Reference dataPager}}" >
  </sfgrid:SfDataGrid>
</Grid>
```

### C#

```
SfDataGrid sfGrid = new SfDataGrid();
SfDataPager sfPager = new SfDataPager();
ViewModel viewModel = new ViewModel();
sfPager.PageSize = 15;
sfPager.Source = viewModel.Info;
sfGrid.ItemsSource = sfPager.PagedSource;
sfPager.AutomationId = "SyncfusionPager";
Grid gridLayout = new Grid();
gridLayout.HorizontalOptions = LayoutOptions.FillAndExpand;
gridLayout.RowDefinitions = new RowDefinitionCollection
{
    new RowDefinition { },
    new RowDefinition { Height = 50 },
};
gridLayout.Children.Add(sfGrid, 0, 0);
gridLayout.Children.Add(sfPager, 0, 1);
this.Content = gridLayout;
```

Refer to the following code snippet to access the inner elements of data pager from automation script.

### C#

```
[Test]
[Description("SfDataPager Automation Id")]
public void SfDataPager_AutomationId()
{
    // To tap the first page numeric button
    App.Tap("SyncfusionPager FirstPage");
    // To tap the previous page numeric button
    App.Tap("SyncfusionPager PreviousPage");
    // To tap the next page numeric button
```

```

App.Tap ("SyncfusionPager NextPage");
// To tap the next last page numeric button
App.Tap ("SyncfusionPager LastPage");
// To tap the second numeric button
App.Tap ("SyncfusionPager NumericButton2");
}

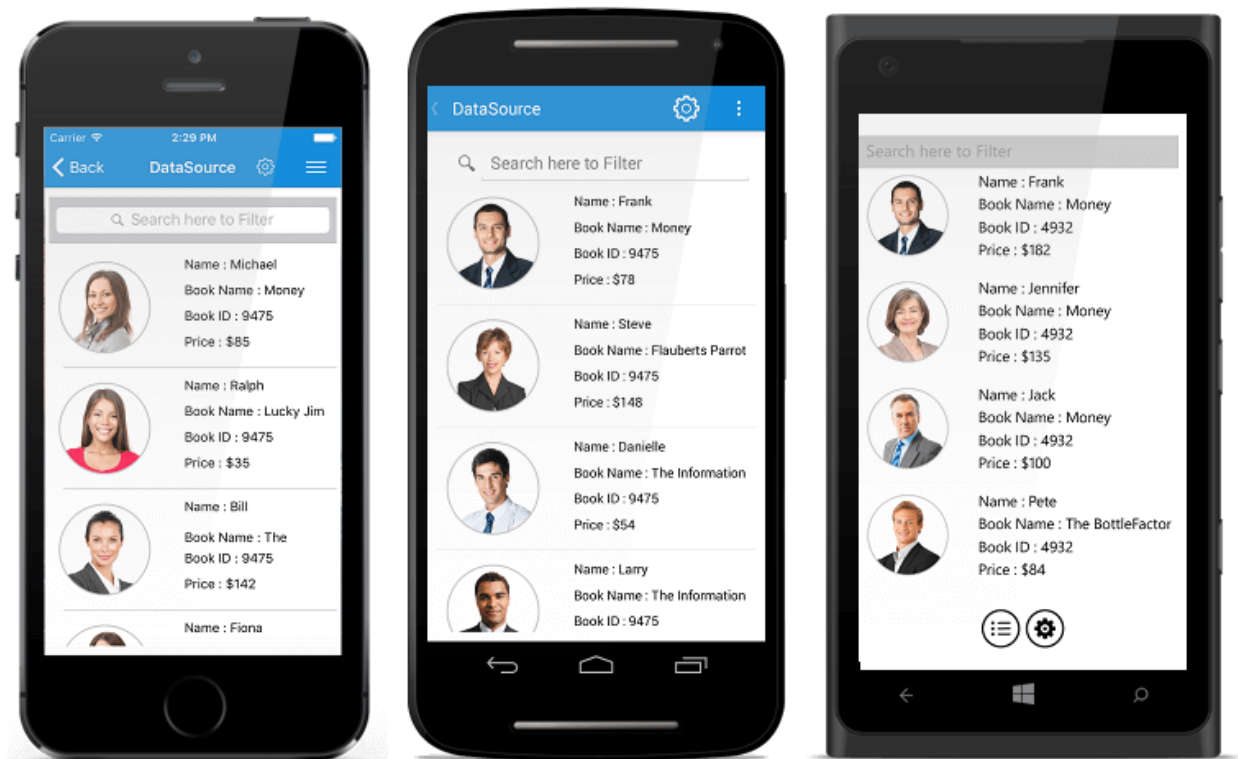

```

## DataSource

### DataSource

#### Overview

DataSource is a non UI component that consumes raw data and processes data operations such as sorting, filtering and grouping saving developers' time and efforts in building the functionality themselves. We can apply DataSource to any data bound control which can be further processed using the bound DataSource.

#### Getting started

##### Assembly deployment

After installing Essential Studio for Xamarin, you can find all the required assemblies in the following installation folders,

{Syncfusion Essential Studio Installed location}\Essential Studio\{Syncfusion release version}\lib

Refer [control dependencies](#) section to get the list of assemblies or NuGet package needs to be added as reference to use the DataSource control in any application.

**Note:** Assemblies can be found in an unzipped package location in Mac.

### Adding DataSource reference

You can add DataSource reference using one of the following methods:

#### Method 1: Adding DataSource reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org). To add DataSource to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.DataSource](#), and then install it.

![Adding DataSource reference from NuGet](DataSource-GettingStarted\_images/Adding DataSource reference.png)

---

**Note:** Install the same version of DataSource NuGet in all the projects.

---

#### Method 2: Adding DataSource reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the DataSource control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding DataSource assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.DataSource.Portable.dll Syncfusion.Licensing.dll
-----	--

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Creating your first DataSource in Xamarin.Forms

- This is how the final output will look like on iOS, Android and Windows Phone devices. You can also download the entire source code of this demo from [here](#).

- Create a new blank ([Xamarin.Forms.NET Standard](#)) application in Xamarin Studio or Visual Studio for Xamarin.Forms.
- Now, create a simple data source as shown in the following code example. Add the following code example in a newly created class file and save it as **Contacts.cs** file.

### C#

```
public class Contacts : INotifyPropertyChanged
{
    private string contactName;
    public Contacts(string name)
    {
        contactName = name;
    }
    public string ContactName
    {
        get { return contactName; }
        set
        {
            if (contactName != value)
            {
                contactName = value;
                this.RaisedOnPropertyChanged("ContactName");
            }
        }
    }
    public event PropertyChangedEventHandler PropertyChanged;
    public void RaisedOnPropertyChanged(string _PropertyName)
    {
        if (PropertyChanged != null)
        {
            PropertyChanged(this, new PropertyChangedEventArgs(_PropertyName));
        }
    }
}
```

- Add the following code example in a newly created class file and save it as **ContactList.cs** file.

**C#**

```
public class ContactsList : ObservableCollection<Contacts>,
INotifyPropertyChanged
{
    public ContactsList()
    {
        foreach (var customerName in CustomerNames)
        {
            var contact = new Contacts(customerName);
            this.Add(contact);
        }
    }
    string[] CustomerNames = new string[] {
        "Kyle",
        "Gina",
        "Irene",
        "Katie",
        "Michael",
        "Oscar",
        "Ralph",
        "Torrey",
        "William",
        "Bill",
        "Daniel",
        "Frank",
        "Brenda",
        "Danielle",
        "Fiona",
        "Howard",
        "Jack",
        "Larry",
    };
}
```

- You can set the source for the DataSource by using the [DataSource.Source](#) property. You can bind the [DataSource.DisplayItems](#) as `ItemsSource` for any data bound control.

**C#**

```
public App()
{
    DataSource dataSource = new DataSource();
    dataSource.Source = new ContactsList();
}
```

**Sorting**

DataSource allows sorting the bound source by using the [DataSource.SortDescriptors](#) property. You can create a [SortDescriptor](#) for the property to be sorted and add it in the `DataSource.SortDescriptors` collection.

The **SortDescriptor** object holds following three properties:

- **PropertyName**: Specifies name of the sorted property.
- **Direction**: Specifies an object of type [ListSortDirection](#) that defines the sorting direction.
- **Comparer**: Specifies a comparer to be applied when sorting take place.

The following code illustrates this.

#### C#

```
dataSource.SortDescriptors.Add(new SortDescriptor("ContactName"));
```

### Grouping

DataSource allows sorting the bound source by using the [DataSource.GroupDescriptors](#) property. You can create a [GroupDescriptor](#) for the property to be grouped and add it in the **DataSource.GroupDescriptors** collection.

**GroupDescriptor** object holds following two properties:

- **PropertyName**: Specifies name of the grouped property.
- **KeySelector**: Sets the [KeySelector](#) for grouping.
- **Comparer**: Comparer to be applied in when sorting take place

The following code example illustrates this without **KeySelector**.

#### C#

```
dataSource.GroupDescriptors.Add(new GroupDescriptor("ContactName"));
```

The following code example illustrates this with **KeySelector**.

#### C#

```
dataSource.GroupDescriptors.Add(new GroupDescriptor()  
{  
    PropertyName = "ContactName",  
    KeySelector = (object obj1) =>  
    {  
        var item = (obj1 as Contacts);  
        return item.ContactName[0].ToString();  
    }  
});
```

### Binding DataSource to a ListView

Please refer the below code example that illustrates binding the created DataSource to a ListView control.

#### C#

```
public App()  
{  
    DataSource dataSource = new DataSource();  
    dataSource.Source = new ContactsList();  
}
```

```

dataSource.SortDescriptors.Add(new SortDescriptor("ContactName"));
dataSource.GroupDescriptors.Add(new GroupDescriptor()
{
    PropertyName = "ContactName",
    KeySelector = (object obj1) =>
    {
        var item = (obj1 as Contacts);
        return item.ContactName[0].ToString();
    }
});
StackLayout stack = new StackLayout();
stack.Children.Add(new Label()
{
    TextColor = Color.Black,
    FontSize = 14,
    HeightRequest = 50,
    Text = "Contact List",
    HorizontalTextAlignment = TextAlignment.Center,
    VerticalTextAlignment = TextAlignment.Center,
    BackgroundColor = Color.Gray
});
listView = new ListView();
listView.ItemTemplate = new DataTemplate(() =>
{
    var label = new Label()
    {
        TextColor = Color.Black,
        FontSize = 12,
        VerticalTextAlignment = TextAlignment.Center,
        BackgroundColor = Color.White,
    };
    label.SetBinding(Label.TextProperty, new Binding("ContactName"));
    var viewCell = new ViewCell() { View = label };
    viewCell.BindingContextChanged += ViewCell_BindingContextChanged;
    return viewCell;
});
listView.ItemsSource = dataSource.DisplayItems;
stack.Children.Add(listView);
MainPage = new ContentPage { Content = stack };
Device.OnPlatform(iOS:() => MainPage.Padding = new Thickness(0, 20, 0, 0));
}
//Will be executed only in grouping case. Existing view in view cell will be
replaced by label.
private void ViewCell_BindingContextChanged(object sender, EventArgs e)
{
    var viewCell = sender as ViewCell;
    if (viewCell.BindingContext is GroupResult)
    {
        var label = new Label()
        {
            TextColor = Color.Black,
            FontSize = 14,
            HeightRequest = 50,
            HorizontalTextAlignment = TextAlignment.Center,
            VerticalTextAlignment = TextAlignment.Center,
            BackgroundColor = Color.Gray
        };
    }
}

```

```
label.SetBinding(Label.TextProperty, new Binding("Key"));  
viewCell.View = label;  
}  
}
```

### Defining the LiveDataUpdateMode

**DataSource** listens manipulation operations such as add, delete, and data update (property change) at runtime and responds based on the [LiveDataUpdateMode](#) property. Default value is **LivDataUpdateMode.Default**. The **LivDataUpdateMode** property holds the following two enumeration values:

- Default: Refreshes an item in view when the underlying property is changed.
- AllowDataShaping: Refreshes an item in view and also updates the collection when the underlying property is changed.

### C#

```
private void UpdateData_Clicked(object sender, EventArgs e)  
{  
    DataSource.LiveDataUpdateMode = LiveDataUpdateMode.AllowDataShaping;  
    ViewModel.Items[0].Title = "DataSourceItem_0";  
}
```

### Defining the source data type

When the [Source](#) property binds with different types of underlying collection derived from the same type, set the [SourceType](#) as base type for all different types.

### C#

```
DataSource.SourceType = typeof(Contacts);
```

## SfDateTimeRangeNavigator

### Overview

The Date Time Range Navigator control provides an intuitive interface for selecting a smaller date range from a larger collection. It is commonly used in financial dashboards to filter the date range for which the data needs to be visualized.

### Key features

Main capabilities of the control are listed below

- Major scale displays a date time scale that is one or more level higher than the minor scale.
- Visualize data with the available built-in chart types.
- Intuitive user interface to select a particular time range.

## Getting started

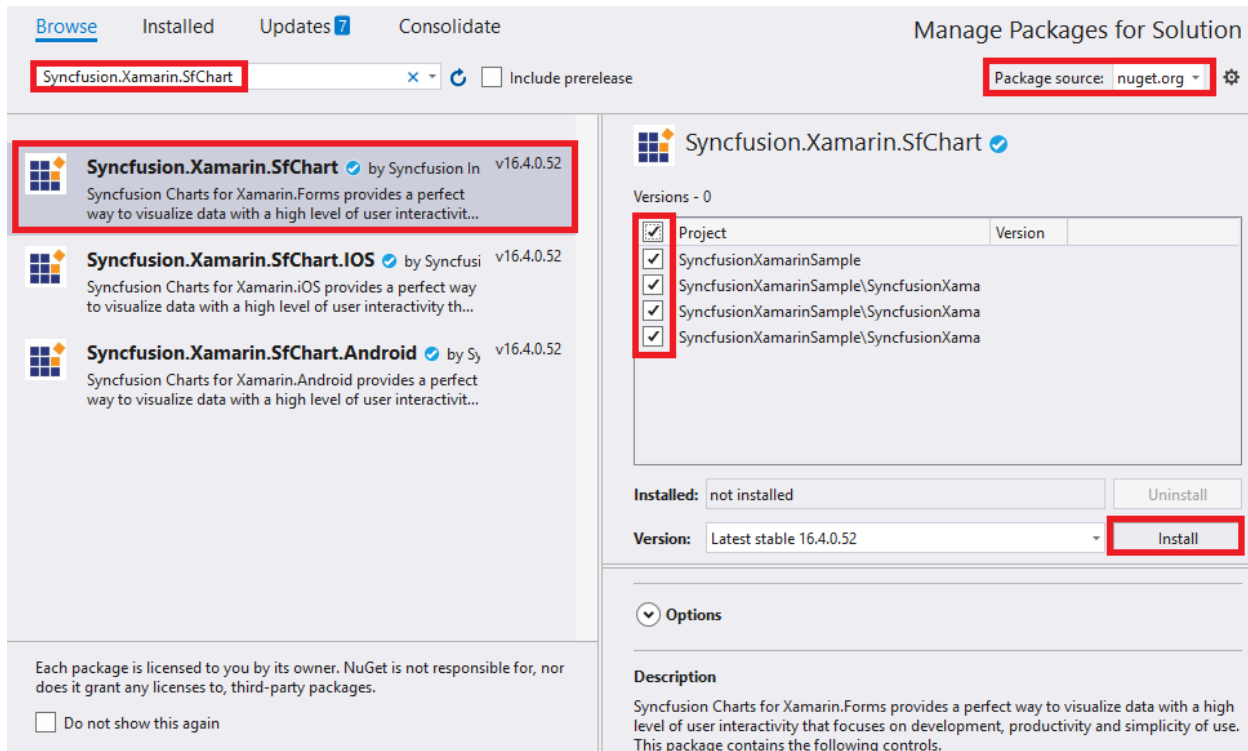

This section walks you through the steps required to add [SfDateTimeRangeNavigator](#) and populate it with data, and also explains how to respond to range selection performed in the control.

### Adding SfDateTimeRangeNavigator reference

You can add SfDateTimeRangeNavigator reference in one of the following methods:

#### Method 1: Adding SfDateTimeRangeNavigator reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfChart). To add SfDateTimeRangeNavigator to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfChart](#), and then install it.

**Note:** Install the same version of the SfChart NuGet in all the projects.

#### Method 2: Adding SfDateTimeRangeNavigator reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfDateTimeRangeNavigator control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfDateTimeRangeNavigator assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfChart.XForms.Android.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfChart.XForms.iOS.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfChart.UWP.dll Syncfusion.SfChart.XForms.UWP.dll Syncfusion.SfChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the application on each platform with range navigator

To use the range navigator inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, below steps are not needed.

#### iOS

To launch the range navigator in iOS, call the `SfRangeNavigatorRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms framework initialization and before the `LoadApplication` method is called as demonstrated in the following code sample:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
```

```
{  
...  
global::Xamarin.Forms.Forms.Init();  
Syncfusion.RangeNavigator.XForms.iOS.SfRangeNavigatorRenderer.Init();  
LoadApplication(new App());  
...  
}
```

### Universal Windows Platform (UWP)

To launch the range navigator in UWP, call the `SfRangeNavigatorRenderer.Init()` method in the constructor of `MainPage` before the `LoadApplication` method is called as demonstrated in the following code sample.

#### C#

```
public MainPage()  
{  
...  
Syncfusion.RangeNavigator.XForms.UWP.SfRangeNavigatorRenderer.Init();  
LoadApplication (new App ());  
...  
}
```

In addition to the above configurations, you need to initialize the control assemblies in `App.xaml.cs` in UWP project as shown in the below code snippets. This is required to deploy application with range navigator in **Release** mode in UWP platform.

#### C#

```
// In App.xaml.cs  
protected override void OnLaunched(LaunchActivatedEventArgs e)  
{  
...  
if (rootFrame == null)  
{  
List<Assembly> assembliesToInclude = new List<Assembly>();  
assembliesToInclude.Add(typeof(Syncfusion.RangeNavigator.XForms.UWP.  
SfRangeNavigatorRenderer).GetTypeInfo().Assembly);  
Xamarin.Forms.Forms.Init(e, assembliesToInclude);  
}  
...  
}
```

### Android

The Android platform does not require any additional configuration to render the range navigator.

### Adding and configuring SfDateTimeRangeNavigator

First, let us initialize the control with major and minor date time scales by specifying the minimum and maximum date to be visualized in the control using [Minimum](#) and [Maximum](#) properties.

Following code example illustrates this,

#### XML

```
<rangnavigator:SfDateTimeRangeNavigator Minimum="2015,01,01"
Maximum="2016,01,01"/>
```

**C#**

```
[C#]
SfDateTimeRangeNavigator rangeNavigator = new SfDateTimeRangeNavigator();
rangeNavigator.Minimum = new DateTime(2015, 01, 01);
rangeNavigator.Maximum = new DateTime(2016, 01, 01);
```

**Note:** If you don't specify [Minimum](#) and [Maximum](#) properties, minimum and maximum dates will be chosen automatically based on the provided data using [ItemsSource](#) property, which is explained in the next step in this section.

Next, create a data model representing the list of sample data.

**C#**

```
[C#]
public class DataModel
{
    public ObservableCollection<Model> DateTimeData;
    DataModel()
    {
        DateTimeData = new ObservableCollection<Model>()
        {
            new Model (new DateTime(2015, 01, 01), 14),
            new Model (new DateTime(2015, 02, 01), 54),
            new Model (new DateTime(2015, 03, 01), 23),
            new Model (new DateTime(2015, 04, 01), 53),
            new Model (new DateTime(2015, 05, 01), 25),
            new Model (new DateTime(2015, 06, 01), 32),
            new Model (new DateTime(2015, 07, 01), 78),
            new Model (new DateTime(2015, 08, 01), 100),
            new Model (new DateTime(2015, 09, 01), 55),
            new Model (new DateTime(2015, 10, 01), 38),
            new Model (new DateTime(2015, 11, 01), 27),
            new Model (new DateTime(2015, 12, 01), 56),
            new Model (new DateTime(2016, 01, 01), 33)
        };
    }
}

public class Model
{
    public DateTime Date { get; set; }
    public double Value { get; set; }
    public Model(DateTime dateTime, double value)
    {
        Date = dateTime;
    }
}
```

```
Value = value;
}
}
```

Then, let us populate the chart, which is displayed inside the [SfDateTimeRangeNavigator](#), by setting the above data using [ItemsSource](#) property. And then specify the property names which contain the x and y values in the model using [XBindingPath](#) and [YBindingPath](#) properties.

**Note:** By default, data is visualized using line series. You can change the chart type or add more series by accessing the SfChart instance using [SfDateTimeRangeNavigator.Content](#) property.

### XML

```
<rangnavigator:SfDateTimeRangeNavigator ItemsSource="{Binding
DateTimeData}" XBindingPath="Date" YBindingPath="Value"/>
```

### C#

```
[C#]
SfDateTimeRangeNavigator rangeNavigator = new SfDateTimeRangeNavigator()
{
    rangeNavigator.ItemsSource = dataModel.DateTimeData,
    rangeNavigator.XBindingPath = "Date",
    rangeNavigator.YBindingPath = "Value"
};
```

### Handle range selection

In real time, other controls like chart, grid etc., are updated in response to the range selection performed in SfDateTimeRangeNavigator. You can handle the selection using [RangeChanged](#) event and update other controls based on the selected date time or perform some other tasks using the selected data.

**Note:** You can get the selected start and end date using [ViewRangeStart](#) and [ViewRangeEnd](#) properties or get the collection of selected data using [SelectedData](#) property.

Following code example illustrates how to handle range selection and update chart's date time axis range,

### C#

```
[C#]
rangeNavigator.RangeChanged += rangeNavigator_RangeChanged;
private void rangeNavigator_RangeChanged(object sender,
RangeChangedEventArgs e)
{
    //Updating chart's date time range
    dateTimeAxis.Minimum = e.ViewRangeStartDate;
    dateTimeAxis.Maximum = e.ViewRangeEndDate;
}
```

```
}
```

You can find the complete getting started sample from this [link](#).

## Content

[SfDateTimeRangeNavigator](#) allows you to set [SfChart](#) as its content, explicitly, using [Content](#) property. However, if you provide data source using [ItemsSource](#) property, the Chart with line series will be created for the provided [ItemsSource](#) and will be set as the content of range navigator internally, by default. But, if you configure the range navigator using [Minimum](#) and [Maximum](#) properties, you have to manually configure the Chart with data source.

**Note:** Though the [Content](#) property's data type is View and it can accept any View as its value, but currently [SfDateTimeRangeNavigator](#) can accept only [SfChart](#) as its content.

The following code snippet shows how to configure the range navigator using [ItemsSource](#) property.

### XML

```
Namespace:
xmlns:rangenavigator="clr-
namespace:Syncfusion.RangeNavigator.XForms;assembly=Syncfusion.SfChart.XForms
s"
...
<rangenavigator:SfDateTimeRangeNavigator ItemsSource="{Binding
DateTimeRangeData}" XBindingPath="XValue" YBindingPath="YValue"/>
```

### C#

```
Namespace:
using Syncfusion.RangeNavigator.XForms;
...
SfDateTimeRangeNavigator rangeNavigator = new SfDateTimeRangeNavigator();
ViewModel viewModel = new ViewModel();
```

```
rangeNavigator.ItemsSource = viewModel.DateTimeRangeData;
rangeNavigator.XBindingPath = "XValue";
rangeNavigator.YBindingPath = "YValue";
```

**C#**

```
[C#]
public class ViewModel
{
    public ObservableCollection<ChartDataPoint> DateTimeRangeData { get; set; }
    public ViewModel()
    {
        DateTimeRangeData = new ObservableCollection<ChartDataPoint>
        {
            new ChartDataPoint(new DateTime(2015, 01, 1), 14),
            new ChartDataPoint(new DateTime(2015, 02, 1), 54),
            new ChartDataPoint(new DateTime(2015, 03, 1), 23),
            new ChartDataPoint(new DateTime(2015, 04, 1), 53),
            new ChartDataPoint(new DateTime(2015, 05, 1), 25),
            new ChartDataPoint(new DateTime(2015, 06, 1), 32),
            new ChartDataPoint(new DateTime(2015, 07, 1), 78),
            new ChartDataPoint(new DateTime(2015, 08, 1), 100),
            new ChartDataPoint(new DateTime(2015, 09, 1), 55),
            new ChartDataPoint(new DateTime(2015, 10, 1), 38),
            new ChartDataPoint(new DateTime(2015, 11, 1), 27),
            new ChartDataPoint(new DateTime(2015, 12, 1), 56),
            new ChartDataPoint(new DateTime(2015, 12, 31), 35),
        };
    }
}
```

The following code snippet shows how to configure the range navigator using [Minimum](#) and [Maximum](#) properties.

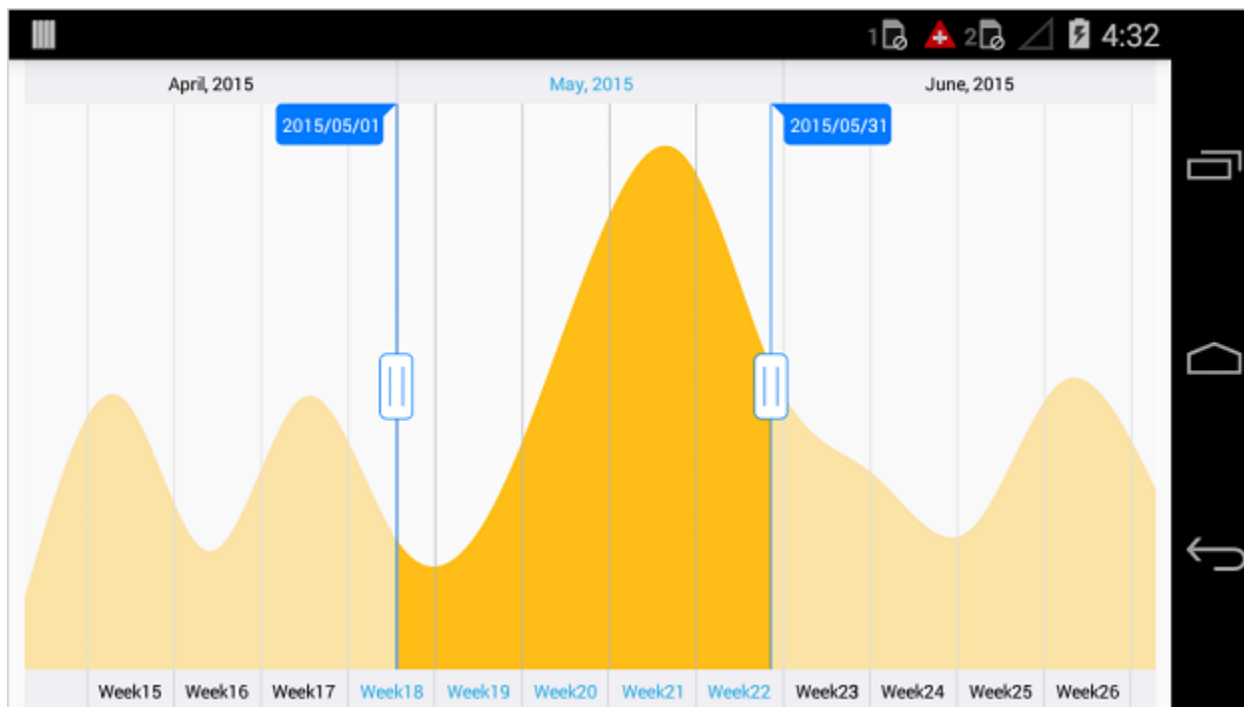

**XML**

```
Namespace:
xmlns:rangenavigator="clr-
namespace:Syncfusion.RangeNavigator.XForms;assembly=Syncfusion.SfChart.XForm
s"
xmlns:chart="clr-
namespace:Syncfusion.SfChart.XForms;assembly=Syncfusion.SfChart.XForms"
...
<rangenavigator:SfDateTimeRangeNavigator ViewRangeStart="5/1/2015"
ViewRangeEnd="5/30/2015" Minimum="4/1/2015" Maximum="6/30/2015">
<rangenavigator:SfDateTimeRangeNavigator.Content>
<chart:SfChart>
. . .
</chart:SfChart>
</rangenavigator:SfDateTimeRangeNavigator.Content>
```

**C#**

```
Namespace:
using Syncfusion.RangeNavigator.XForms;
```

```
using Syncfusion.SfChart.XForms;
...
SfDateTimeRangeNavigator rangeNavigator = new SfDateTimeRangeNavigator();
rangeNavigator.Minimum = new DateTime(2015, 4, 1);
rangeNavigator.Maximum = new DateTime(2015, 6, 30);
rangeNavigator.ViewRangeStart = new DateTime(2015, 5, 1);
rangeNavigator.ViewRangeEnd = new DateTime(2015, 5, 31);
SfChart chart = new SfChart();
...
rangeNavigator.Content = chart;
```

### Selecting Range

The left and right thumb of [SfDateTimeRangeNavigator](#) are used to indicate the selected range in the large collection of data. Following are the ways you can select a range.

- By dragging the thumbs.
- By tapping on the minor and major labels.
- By setting the [ViewRangeStart](#) and [ViewRangeEnd](#) properties.

Following code example shows how to configure the selected range using [ViewRangeStart](#) and [ViewRangeEnd](#) properties of [SfDateTimeRangeNavigator](#).

#### XML

```
<rangnavigator:SfDateTimeRangeNavigator x:Name ="dateTime"
Minimum="1/1/2015"
Maximum="1/1/2017" ViewRangeStart="5/1/2015" ViewRangeEnd="10/1/2016"/>
```

#### C#

```
SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
dateTime.ViewRangeStart = new DateTime(2015, 5, 1);
dateTime.ViewRangeEnd = new DateTime(2016, 10, 1);
```

### Selected Data

The [SelectedData](#) property of [SfDateTimeRangeNavigator](#) used to get the underlying data collection of the selected range. You can directly bind this property to other data visualization control to visualize the selected range of data.

### Overlay Color

The [OverlayColor](#) property of [SfDateTimeRangeNavigator](#) is used to customize the color of unselected area in date-time range navigator.

### Deferred Update

[RangeChanged](#) event will be fired whenever you drag the thumbs. If you are doing some long running tasks in this event handler, then dragging the thumbs will not be smooth. You can delay this event by enabling [EnableDeferredUpdate](#) property. If this property is set to true, the [RangeChanged](#) event will get fired only when you stop dragging or if the thumb is held for more than 500 milliseconds. If it is false, the range will be updated for every movement of the thumb. However, It is true by default.

The delay of update is 500 milliseconds by default. However, it can be changed using [DeferredUpdateDelay](#) property of [SfDateTimeRangeNavigator](#).

### XML

```
<rangnavigator:SfDateTimeRangeNavigator x:Name ="dateTime"
Minimum="1/1/2015"
Maximum="1/1/2017" EnableDeferredUpdate="False" DeferredUpdateDelay="600" />
```

### C#

```
SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
dateTime.EnableDeferredUpdate = false;
dateTime.DeferredUpdateDelay = 600;
```

### RangeChanged Event

This event is triggered when the selected range of the [SfDateTimeRangeNavigator](#) is changed. The argument contains the following information.

- [ViewRangeStartDate](#) – used to get the start date of the selected range.
- [ViewRangeEndDate](#) – used to get the end date of the selected range.

### Thumb

The [LeftThumbStyle](#) and [RightThumbStyle](#) properties are used to configure the left and right thumb of the [SfDateTimeRangeNavigator](#). Following properties are available in thumb style to configure left and right thumb individually.

- [BorderColor](#) – used to change the stroke color of the thumb.
- [BackgroundColor](#) – used to change the background color of the thumb.
- [BorderWidth](#) – used to change the stroke width of the thumb.
- [Width](#) – used to change the width of the thumb.
- [Height](#) – used to change the height of the thumb.
- [LineColor](#) – used to change the line color of the thumb.
- [LineWidth](#) – used to change the line width of the thumb.
- [LineDashArray](#) – used to change the dash array of the thumb line.

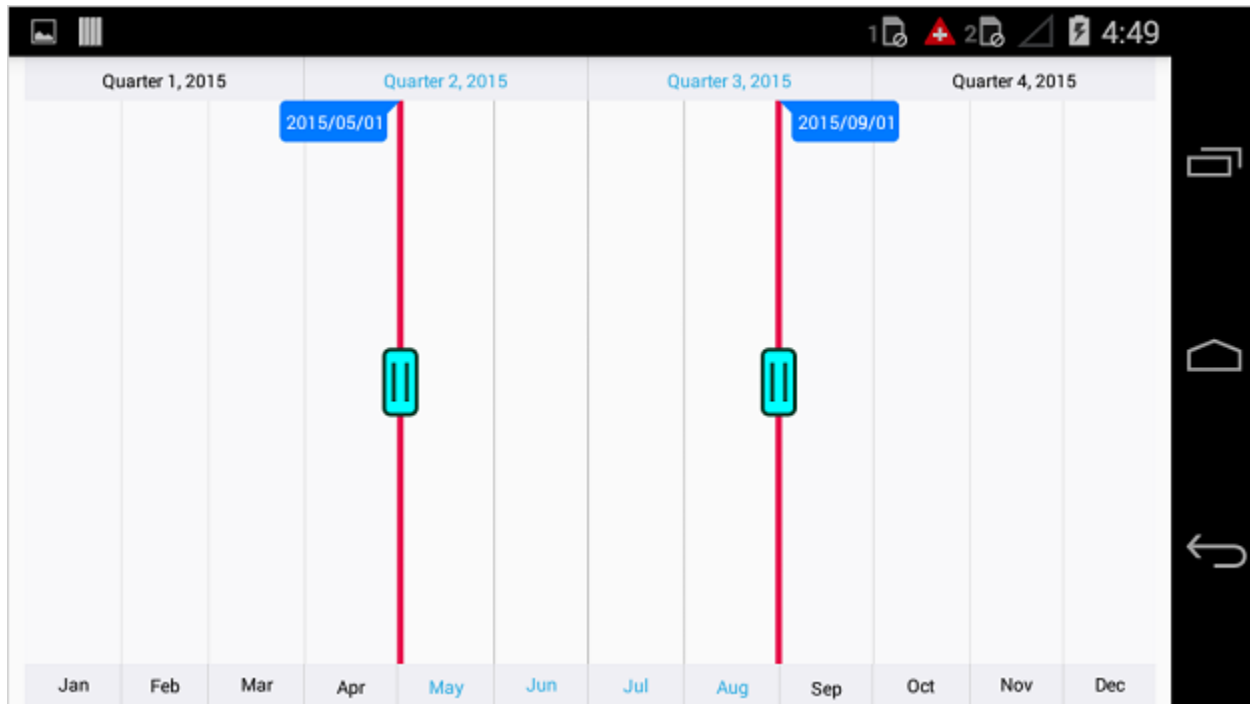

### XML

```
<rangnavigator:SfDateTimeRangeNavigator HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand" Minimum="1/1/2015"
Maximum="12/31/2015">
  <rangnavigator:SfDateTimeRangeNavigator.LeftThumbStyle>
    <rangnavigator:ThumbStyle BorderColor="#083928" BackgroundColor="Aqua"
    BorderWidth="3" LineColor="#E70E49"
    LineWidth="5"/>
  </rangnavigator:SfDateTimeRangeNavigator.LeftThumbStyle>
  <rangnavigator:SfDateTimeRangeNavigator.RightThumbStyle>
    <rangnavigator:ThumbStyle BorderColor="#083928" BackgroundColor="Aqua"
    BorderWidth="3" LineColor="#E70E49"
    LineWidth="5"/>
  </rangnavigator:SfDateTimeRangeNavigator.RightThumbStyle>
</rangnavigator:SfDateTimeRangeNavigator>
```

### C#

```
SfDateTimeRangeNavigator rangeNavigator = new SfDateTimeRangeNavigator();
...
rangeNavigator.LeftThumbStyle.BackgroundColor = Color.Aqua;
rangeNavigator.LeftThumbStyle.BorderColor = Color.FromHex("#083928");
rangeNavigator.LeftThumbStyle.BorderWidth = 3;
rangeNavigator.LeftThumbStyle.LineColor = Color.FromHex("#E70E49");
rangeNavigator.LeftThumbStyle.LineWidth = 5;
```

```
rangeNavigator.RightThumbStyle.BackgroundColor = Color.Aqua;
rangeNavigator.RightThumbStyle.BorderColor = Color.FromHex("#083928");
rangeNavigator.RightThumbStyle.BorderWidth = 3;
rangeNavigator.RightThumbStyle.LineColor = Color.FromHex("#E70E49");
rangeNavigator.RightThumbStyle.LineWidth = 5;
```

### Grid Lines

The [MinorScaleStyle](#) and [MajorScaleStyle](#) properties of [SfDateTimeRangeNavigator](#) used to customize the minor and major grid lines. Following properties are available in each scale style to configure the grid lines.

- [ShowGridLines](#) – used to set the visibility of grid lines.
- [GridLineWidth](#) – used to set the width for grid lines.
- [GridLineColor](#) – used to set the color for grid lines.
- [GridLineDashes](#) – used to set dashes for grid lines.

### XML

```
<rangnavigator:SfDateTimeRangeNavigator HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand" Minimum="1/5/2015"
Maximum="11/7/2015">
  <rangnavigator:SfDateTimeRangeNavigator.MajorScaleStyle>
    <rangnavigator:ScaleStyle GridLineColor="#F109D7" GridLineWidth="10"
ShowGridLines="True"/>
  </rangnavigator:SfDateTimeRangeNavigator.MajorScaleStyle >
  <rangnavigator:SfDateTimeRangeNavigator.MinorScaleStyle>
    <rangnavigator:ScaleStyle GridLineColor="Red" GridLineWidth="3"
ShowGridLines="True"/>
  </rangnavigator:SfDateTimeRangeNavigator.MinorScaleStyle >
</rangnavigator:SfDateTimeRangeNavigator>
```

**C#**

```
SfDateTimeRangeNavigator rangeNavigator = new SfDateTimeRangeNavigator();
...
rangeNavigator.MajorScaleStyle.ShowGridLines = true;
rangeNavigator.MajorScaleStyle.GridLineColor = Color.FromHex("#F109D7");
rangeNavigator.MajorScaleStyle.GridLineWidth = 10;
rangeNavigator.MinorScaleStyle.ShowGridLines = true;
rangeNavigator.MinorScaleStyle.GridLineColor = Color.Red;
rangeNavigator.MinorScaleStyle.GridLineWidth = 3;
rangeNavigator.MinorScaleStyle.GridLineDashArray = new double[2] { 4, 4 };
```

**Tooltip**

The tooltip is used to show the selected range start and end value of the [SfDateTimeRangeNavigator](#).

**Tooltip Visibility**

The [EnableTooltip](#) property of [SfDateTimeRangeNavigator](#) is used to control the visibility of the left and right tooltip. It is true by default.

**XML**

```
<rangnavigator:SfDateTimeRangeNavigator Minimum="1/1/2015"
Maximum="1/1/2016" ViewRangeStart="5/1/2015"
ViewRangeEnd="9/1/2016" EnableTooltip="False"/>
```

**C#**

```
SfDateTimeRangeNavigator dateTimeRangeNavigator = new
SfDateTimeRangeNavigator();
dateTimeRangeNavigator.EnableTooltip = false;
```

### Tooltip Format

You can format the date value of the tooltip using [TooltipFormat](#) property of **SfDateTimeRangeNavigator**.

### XML

```
<rangnavigator:SfDateTimeRangeNavigator TooltipFormat="yyyy/MM" />
```

### C#

```
dateTimeRangeNavigator.TooltipFormat = "yyyy/MM";
```

### Appearance Customization

The [LeftTooltipStyle](#) and [RightTooltipStyle](#) properties of [SfDateTimeRangeNavigator](#) are used to customize the left and right tooltip. Following properties are available in each tooltip style to customize the appearance of the tooltip.

- [TextColor](#) – used to change the color of the tooltip text.
- [BackgroundColor](#) – used to change the background color of the tooltip.
- [BorderColor](#) – used to change the border color of the tooltip.
- [BorderWidth](#) – used to change the width of the tooltip border.
- [FontFamily](#) – used to change the font family of the tooltip text.
- [FontSize](#) – used to change the font size of the tooltip text.
- [FontAttributes](#) – used to change the font attribute of the tooltip text.
- [Margin](#) - used to change the margin size of the tooltip text.

### XML

```
<rangnavigator:SfDateTimeRangeNavigator Minimum="1/1/2015"
Maximum="1/1/2016" ViewRangeStart="5/1/2015" ViewRangeEnd="9/1/2016">
  <rangnavigator:SfDateTimeRangeNavigator.LeftTooltipStyle>
    <rangnavigator:TooltipStyle TextColor="Blue" BackgroundColor="White"
    BorderColor="Blue" BorderWidth="2"
    FontSize="30" Margin="15"/>
  </rangnavigator:SfDateTimeRangeNavigator.LeftTooltipStyle>
  <rangnavigator:SfDateTimeRangeNavigator.RightTooltipStyle>
    <rangnavigator:TooltipStyle TextColor="Blue" BackgroundColor="White"
    BorderColor="Blue" BorderWidth="2"
    FontSize="30" Margin="15"/>
  </rangnavigator:SfDateTimeRangeNavigator.RightTooltipStyle>
</rangnavigator:SfDateTimeRangeNavigator>
```

**C#**

```

dateTimeRangeNavigator.LeftTooltipStyle.TextColor = Color.Blue;
dateTimeRangeNavigator.LeftTooltipStyle.BackgroundColor = Color.White;
dateTimeRangeNavigator.LeftTooltipStyle.BorderColor = Color.Blue;
dateTimeRangeNavigator.LeftTooltipStyle.BorderWidth = 2;
dateTimeRangeNavigator.LeftTooltipStyle.FontSize = 30;
dateTimeRangeNavigator.LeftTooltipStyle.Margin = 15;
dateTimeRangeNavigator.RightTooltipStyle.TextColor = Color.Blue;
dateTimeRangeNavigator.RightTooltipStyle.BackgroundColor = Color.White;
dateTimeRangeNavigator.RightTooltipStyle.BorderColor = Color.Blue;
dateTimeRangeNavigator.RightTooltipStyle.BorderWidth = 2;
dateTimeRangeNavigator.RightTooltipStyle.FontSize = 30;
dateTimeRangeNavigator.RightTooltipStyle.Margin = 15;

```

**Major and Minor Scales**

The SfDateTimeRangeNavigator control displays major and minor scales at the top and bottom position of the control.

**Intervals**

By default, best possible interval component will be chosen for both major and minor scales based on the available size of the view. For example, if the available space is sufficient to show only year labels without overlapping, interval will be displayed in years. However, you can also set specific [DateTimeIntervalType](#) components using [Intervals](#) property as demonstrated in the below code snippet.

**XML**

```

<rangenavigator:SfDateTimeRangeNavigator Minimum="1/1/2015"
Maximum="1/1/2016" ViewRangeStart="5/1/2015"
ViewRangeEnd="9/1/2016" Intervals="Year,Month" />

```

**C#**

```
SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
dateTime.Intervals = DateTimeIntervalType.Year | DateTimeIntervalType.
Month;
```

**Appearance Customization**

The [MajorScaleStyle](#) and [MinorScaleStyle](#) properties of [SfDateTimeRangeNavigator](#) are used to customize the appearance of ticks and labels.

- [Position](#) – used to position the labels and ticks [inside](#) or [outside](#) of the range navigator.
- [LabelAlignment](#) – used to align the label at [Left](#), [Center](#) and [Right](#).
- [LabelTextColor](#) – used to change the text color of the labels.
- [LabelFontSize](#) – used to change the font size of the labels.
- [LabelFontAttributes](#) – used to change the font attribute of the labels.
- [LabelFontFamily](#) – used to change the font family of the labels.
- [SelectedLabelFontSize](#) – used to change the font size of the selected labels.
- [SelectedLabelFontAttributes](#) – used to change the font attribute of the selected labels.
- [SelectedLabelFontFamily](#) – used to change the font family of the selected labels.
- [LabelMargin](#) – used to change the margin size of the labels.
- [SelectedLabelTextColor](#) – used to change the text color of the selected labels.
- [SelectedLabelMargin](#) – used to change the margin of the selected labels.
- [TickLineWidth](#) - used to change the thickness of the tick line.
- [TickLineColor](#) - used to change the color of the tick line.

**XML**

```
<rangnavigator:SfDateTimeRangeNavigator Minimum="1/1/2015"
Maximum="1/1/2016" ViewRangeStart="5/1/2015"
```

```
ViewRangeEnd="9/1/2016">
<rangnavigator:SfDateTimeRangeNavigator.MajorScaleStyle>
<rangnavigator:ScaleStyle Position="Inside" LabelAlignment="Right"
SelectedLabelTextColor="Blue"
SelectedLabelFontSize="20" SelectedLabelMargin="15" LabelTextColor="Black"
LabelFontSize="20" LabelMargin="15"/>
</rangnavigator:SfDateTimeRangeNavigator.MajorScaleStyle>
<rangnavigator:SfDateTimeRangeNavigator.MinorScaleStyle>
<rangnavigator:ScaleStyle Position="Inside" LabelAlignment="Left"
SelectedLabelTextColor="Black"
SelectedLabelFontSize="20" SelectedLabelMargin="15" LabelTextColor="Red"
LabelFontSize="20" LabelMargin="15" />
</rangnavigator:SfDateTimeRangeNavigator.MinorScaleStyle>
</rangnavigator:SfDateTimeRangeNavigator>
```

## C#

```
SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
dateTime.MajorScaleStyle.Position = ScalePosition.Inside;
dateTime.MajorScaleStyle.LabelTextColor = Color.Black;
dateTime.MajorScaleStyle.LabelMargin = 15;
dateTime.MajorScaleStyle.LabelFontSize = 20;
dateTime.MajorScaleStyle.LabelAlignment = LabelAlignment.Right;
dateTime.MajorScaleStyle.SelectedLabelTextColor = Color.Red;
dateTime.MajorScaleStyle.SelectedLabelMargin = 15;
dateTime.MajorScaleStyle.SelectedLabelFontSize = 20;
dateTime.MinorScaleStyle.Position = ScalePosition.Inside;
dateTime.MinorScaleStyle.LabelTextColor = Color.Red;
dateTime.MinorScaleStyle.LabelMargin = 15;
dateTime.MinorScaleStyle.LabelFontSize = 20;
dateTime.MinorScaleStyle.LabelAlignment = LabelAlignment.Left;
dateTime.MinorScaleStyle.SelectedLabelTextColor = Color.Black;
dateTime.MinorScaleStyle.SelectedLabelMargin = 15;
dateTime.MinorScaleStyle.SelectedLabelFontSize = 20;
```

### Scale visibility

You can also control the visibility of minor scale and major scale using the [MajorScaleStyle.IsVisible](#) and [MinorScaleStyle.IsVisible](#) properties.

### Hide minor scale

#### XML

```
<rangenavigator:SfDateTimeRangeNavigator Minimum="2015,01,01"
Maximum="2019,01,01">
  <rangenavigator:SfDateTimeRangeNavigator.MinorScaleStyle>
    <rangenavigator:ScaleStyle IsVisible="false" />
  </rangenavigator:SfDateTimeRangeNavigator.MinorScaleStyle>
</rangenavigator:SfDateTimeRangeNavigator>
```

#### C#

```
SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
dateTime.Minimum = new DateTime(2015, 01, 01);
dateTime.Maximum = new DateTime(2019, 01, 01);
dateTime.MinorScaleStyle.IsVisible = false;
```

*Hide major scale*

### **XML**

```
<rangenavigator:SfDateTimeRangeNavigator Minimum="2015,01,01"
Maximum="2019,01,01">
  <rangenavigator:SfDateTimeRangeNavigator.MajorScaleStyle>
    <rangenavigator:ScaleStyle IsVisible="false" />
  </rangenavigator:SfDateTimeRangeNavigator.MajorScaleStyle>
</rangenavigator:SfDateTimeRangeNavigator>
```

### **C#**

```
SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
dateTime.Minimum = new DateTime(2015, 01, 01);
dateTime.Maximum = new DateTime(2019, 01, 01);
dateTime.MajorScaleStyle.IsVisible = false;
```

### MinorScaleLabelsCreated event

This event occurs when the minor scale labels are created initially. The argument of this event contains the following information:

- **MinorScaleLabels** - Gets the **Content** of the each minor scale label.

### XML

```
<rangnavigator:SfDateTimeRangeNavigator Minimum="2015,01,01"
Maximum="2019,01,01" MinorScaleLabelsCreated="MinorScaleLabelsCreated" >
```

### C#

```
public MainPage()
{
    InitializeComponent();
    SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
    dateTime.Minimum = new DateTime(2015, 01, 01);
    dateTime.Maximum = new DateTime(2019, 01, 01);
    dateTime.MinorScaleLabelsCreated += MinorScaleLabelsCreated;
}
private void MinorScaleLabelsCreated(object sender,
Syncfusion.RangeNavigator.XForms.MinorScaleLabelsCreatedEventArgs e)
{
    // handle event action.
}
```

### MajorScaleLabelsCreated event

This event occurs when the major scale labels are created initially. The argument of this event contains the following information:

- **MajorScaleLabels** - Gets the **Content** of the each major scale label.

### XML

```
<rangnavigator:SfDateTimeRangeNavigator Minimum="2015,01,01"
Maximum="2016,01,01" MajorScaleLabelsCreated="MajorScaleLabelsCreated" >
```

### C#

```
public MainPage()
{
    InitializeComponent();
    SfDateTimeRangeNavigator dateTime = new SfDateTimeRangeNavigator();
    dateTime.Minimum = new DateTime(2015, 01, 01);
    dateTime.Maximum = new DateTime(2016, 01, 01);
    dateTime.MajorScaleLabelsCreated += MajorScaleLabelsCreated;
}
private void MajorScaleLabelsCreated(object sender,
Syncfusion.RangeNavigator.XForms.MajorScaleLabelsCreatedEventArgs e)
{
    // handle event action.
}
```

```
}

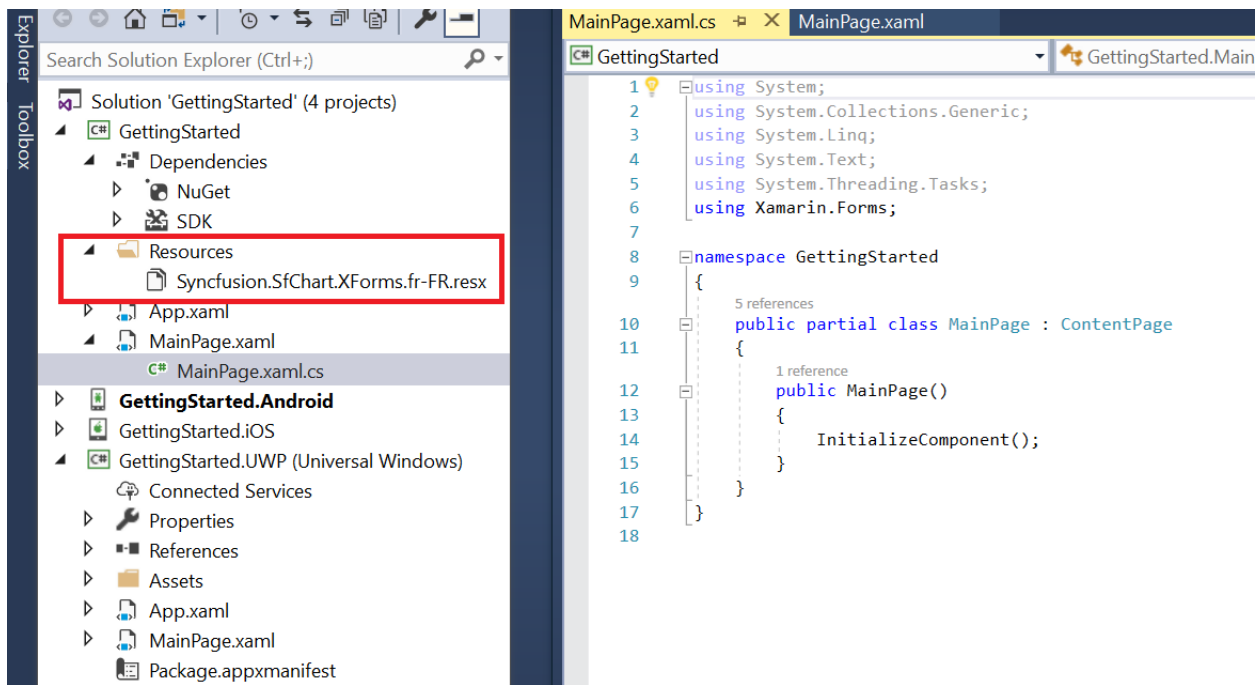

```

## Localization

You can localize [SfDateTimeRangeNavigator](#) in all the platforms by adding a .resx file in a .NET Standard project alone. The following steps describe how to localize SfDateTimeRangeNavigator in a project.

**Note:** Here, the resources have been already created for some cultures and shared them on [Syncfusion GitHub](#) for your convenience.

1. Add a new folder in the .NET Standard project named Resources.
2. Add resource files for the languages you wish to support and set their Build Action to EmbeddedResource. The name of the resource file should be \$name of the Syncfusion component\$+\$language code\$+.resx. For example, if you add a resource file for the French culture, add the Syncfusion.SfChart.XForms.fr-FR.resx file to Resources folder as illustrated in the following screenshot.

3. Provide the French values for each key in the respective .resx files. Here, “Quarter” and “Week” are the keys, and “Trimestre” and “La semaine” are their respective French values.

## XML

```
<data name="Quarter" xml:space="preserve">
<value>Trimestre</value>
</data>
<data name="Week" xml:space="preserve">
<value>La semaine</value>
</data>
```

4. Set resource manager to '[RangeNavigatorResourceManager.Manager](#)' to get the resource manager from users as demonstrated in the following code sample. For more details, please refer [Localization](#).

**C#**

```
RangeNavigatorResourceManager.Manager = new  
ResourceManager("GettingStarted.Resources.Syncfusion.SfChart.XForms",  
Application.Current.GetType().Assembly);
```

**Localize at application level**

You can also localize the text at application-level regardless of the language selected on the device. The following platform-specific codes are needed to localize the text at application-level. Use the [DependencyServices](#) to set this from .NET Standard project.

**C#**

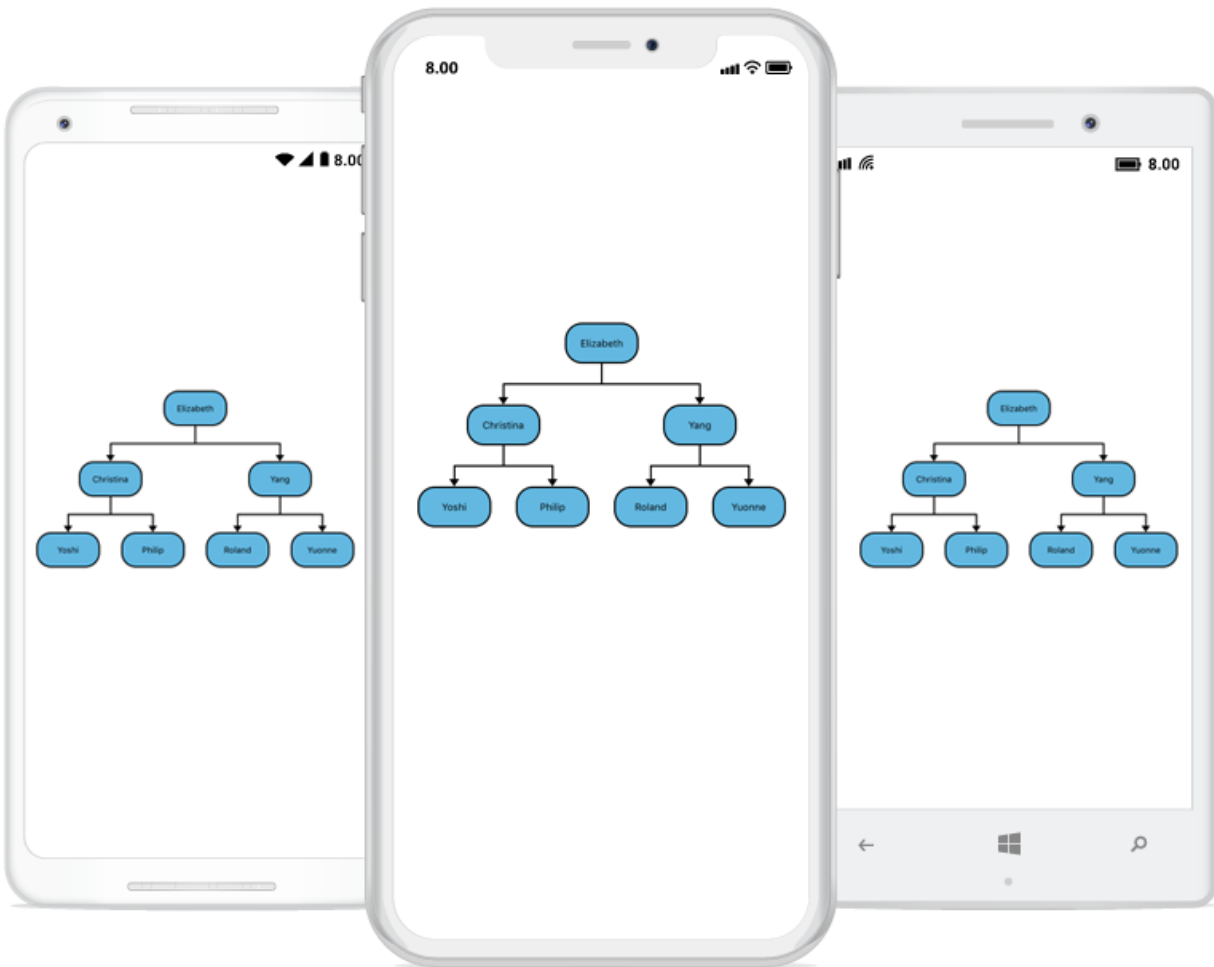

```
//For Android and iOS,  
Thread.CurrentThread.CurrentUICulture = new CultureInfo("fr-FR");  
//For UWP,  
CultureInfo.CurrentUICulture = new CultureInfo("fr-FR");
```

## SfDiagram

### Overview

The diagram control allows to create different types of diagrams such as flowcharts, use case diagrams, workflow process diagrams, etc.

## Key features

- **Node, Connector, Port:** Elements that is used to compose diagrams.
- **Interaction:** Zoom, pan.
- **Layouts:** Arrange nodes in a tree like structure based on the relationship on Nodes.
- **Clipboard Commands:** Performs cut, copy, and paste operations.
- **Undo/Redo:** Performs correction in the recent changes.
- **Serialization:** Save the current state of the diagram, and load it back when needed.
- **Stencil:** It holds a list of symbols that is dropped over the diagram.

## Getting started

This section provides a quick overview for working with Diagram for Xamarin.Forms. This walkthrough demonstrates that, how to create a simple flow chart and an organization chart.

### Adding SfDiagram reference

You can add SfDiagram reference using one of the following methods:

#### Method 1: Adding SfDiagram reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfDiagram). To add SfDiagram to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfDiagram](https://www.nuget.org/packages/Syncfusion.Xamarin.SfDiagram), and then install it.

![Adding SfDiagram reference from NuGet](Getting-Started\_images/Adding SfDiagram reference.png)

**Note:** Install the same version of SfDiagram NuGet in all the projects.

### Method 2: Adding SfDiagram reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfDiagram control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfDiagram assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

.NET Standard	Syncfusion.SfDiagram.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfDiagram.XForms.Android.dll Syncfusion.SfDiagram.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfDiagram.XForms.iOS.dll Syncfusion.SfDiagram.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfDiagram.UWP.dll Syncfusion.SfDiagram.XForms.UWP.dll Syncfusion.SfDiagram.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** If you are adding the references from toolbox, this step is not needed.

### Additional step for iOS

To launch SfDiagram in iOS, call the `SfDiagramRenderer.Init()` in `FinishedLaunching` overridden method of `AppDelegate` class in iOS Project, as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    SfDiagramRenderer.Init();
    return base.FinishedLaunching(app, options);
}
```

---

**Information:** We need to create an instance of the `SfDiagramRenderer` in iOS and UWP projects as shown in this [KB article](#).

---

### Additional step for UWP

This step is required only if the application is deployed in Release mode with .NET native tool chain enabled and it is for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the SfDiagram assembly at `OnLaunched` overridden method of the `App` class in UWP project is the suggested work around, as demonstrated in the following code example.

#### C#

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    .....
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add 'using System.Reflection;'
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfDiagramRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    .....
}
```

---

**Information:** You can refer to the [KB article](#) for more details.

---

### Basic building blocks of Diagram

- **Diagram-** It represents the drawing surface where all the graphical elements like nodes and connectors resides, can be used to display various types of diagrams and it is the root instance of the diagram control. A Diagram instance contains a collection of nodes and connectors to represent the graphical diagram.
- **Nodes-** This represents the geometric shapes such as flowchart elements, network diagram elements, use case elements, etc.
- **Connectors-** These are the objects used to create link between two nodes, to represent the relationships between them in the diagram.

- **Ports**-It represents a point in the node, where the connectors can be connected. A Node can contain any number of ports.
- **Annotation**-It is a block of the text that can be displayed over a Node or Connector. Annotation is used to textually represent an object with a string that can be edited at run time.

### Creating a simple flow chart

Create a new cross platform app (Xamarin.Forms) with portable class library in the Visual Studio and name the project as "GettingStarted" and refer to the above mentioned assemblies to the respective projects.

An additional step is required to render the SfDiagram control in iOS project. You need to create an instance of the SfDiagramRenderer class within FinishedLaunching method of AppDelegate class in iOS project as shown as follows

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    new SfDiagramRenderer();
    return base.FinishedLaunching(app, options);
}
```

### Adding SfDiagram in Xamarin.Forms

1. Import SfDiagram control namespace as xmlns:syncfusion="clr-namespace:Syncfusion.SfDiagram.XForms;assembly=Syncfusion.SfDiagram.XForms in XAML Page.
2. Set the SfDiagram control as content to the ContentPage.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
xmlns:syncfusion="clr-namespace:Syncfusion.SfDiagram.XForms;assembly=Syncfusion.SfDiagram.XForms"
x:Class="GettingStarted.Sample">
    <ContentPage.Content>
        <!--Initializes the SfDiagram-->
        <syncfusion:SfDiagram x:Name="diagram" />
    </ContentPage.Content>
</ContentPage>
```

#### C#

```
using Syncfusion.SfDiagram.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
```

```
public class App : Application
{
    SfDiagram diagram;
    public App()
    {
        //Initializes the SfDiagram
        diagram= new SfDiagram();
        MainPage = new ContentPage { Content = diagram};
    }
}
```

The following code snippet illustrates the creation of Nodes and Connectors in the diagram.

### C#

```
public GettingStarted()
{
    InitializeComponent();
    //Initializes the SfDiagram
    SfDiagram diagram = new SfDiagram();
    Node Begin = AddNode("Begin", 150, 60, 120, 40, "Begin", ShapeType.Ellipse);
    Node Process = AddNode("Process", 150, 140, 120, 60, "Process",
        ShapeType.Rectangle);
    Node End = AddNode("End", 190, 225, 40, 40, "End", ShapeType.Ellipse);
    //Add nodes to the SfDiagram
    diagram.AddNode(Begin);
    diagram.AddNode(Process);
    diagram.AddNode(End);
    Connector connector1 = new Connector()
    {
        SourceNode = Begin,
        TargetNode = Process,
    };
    Connector connector2 = new Connector()
    {
        SourceNode = Process,
        TargetNode = End,
    };
    //Add connectors to the SfDiagram
    diagram.AddConnector(connector1);
    diagram.AddConnector(connector2);
    this.Content = diagram;
}

///
///
///
public Node AddNode(string id, float offsetX, float offsetY, float width,
    float height, string text, ShapeType shape)
{
    Node node = new Node();
    node.OffsetX = offsetX;
    node.OffsetY = offsetY;
    node.Height = height;
    node.Width = width;
    node.ShapeType = shape;
}
```

```
node.Style.Brush = new SolidBrush(Color.FromRgb(100, 149, 237));
node.Annotations.Add(new Annotation() { Content = text});
return node;
}
```

The flow chart will get displayed in the SfDiagram as follows

This demo project can be downloaded from the following link [GettingStarted Demo](#).

### Create a simple organizational chart

SfDiagram provides support to auto-arrange the nodes based on hierarchical relation. Organization chart is an example of displaying hierarchical information.

Now, you have to create a class named “Employee” to store the employee’s information like name, designation, ID, reporting person ID, etc. Also, create a collection class that stores a collection of the employees.

### C#

```
//Employee Business Object
public class Employee
{
    public string ParentId { get; set; }
    public string Name { get; set; }
    public string Designation { get; set; }
    public int EmpId { get; set; }
}

//Employee Collection
public class Employees : ObservableCollection<Employee>
{
}
```

### Initialize Employee data

Define Employee Information as a Collection. The below code example shows an employee array whose,

- Name is used as a unique identifier and
- ParentId is used to identify the person to whom an employee report to, in the organization.

### XML

```

<!-- Initializes the employee collection-->
<local:Employees x:Key="employees">
<local:Employee Name="Elizabeth" Employee_Id="1" ParentId=""
Designation="CEO"/>
<local:Employee Name="Christina" Employee_Id="2" ParentId="1"
Designation="Manager"/>
<local:Employee Name="Yang" Employee_Id="3" ParentId="1"
Designation="Manager"/>
<local:Employee Name="Yoshi" Employee_Id="4" ParentId="2" Designation="Team
Lead"/>
<local:Employee Name="Philip" Employee_Id="5" ParentId="2" Designation="S/w
Developer"/>
<local:Employee Name="Roland" Employee_Id="6" ParentId="3"
Designation="TeamLead"/>
<local:Employee Name="Yvonne" Employee_Id="7" ParentId="3"
Designation="Testing Engineer"/>
</local:Employees>
<!--Initializes the DataSourceSettings -->
<syncfusion:DataSourceSettings x:Key="DataSourceSettings"
DataSource="{StaticResource employees}" ParentId="ParentId" Id="Employee_Id"
Root="1"/>
<!--Initializes the Layout-->
<syncfusion:DirectedTreeLayout x:Key="treeLayout" HorizontalSpacing="80"
VerticalSpacing="50" SpaceBetweenSubTrees="20" Orientation="TopToBottom"/>
<syncfusion:LayoutManager x:Key="layoutManager" Layout="{StaticResource
treeLayout}"/>
<!--Initializes the SfDiagram-->
<syncfusion:SfDiagram x:Name="diagram" LayoutManager="{StaticResource
layoutManager}" DataSourceSettings="{StaticResource DataSourceSettings}">

```

## C#

```

//Initializes the employee collection
ObservableCollection<Employee> employees = new
ObservableCollection<Employee>();
employees.Add(new Employee() { Name = "Elizabeth", Employee_Id = "1",
ParentId = "", Designation = "CEO" });
employees.Add(new Employee() { Name = "Christina", Employee_Id = "2",
ParentId = "1", Designation = "Manager" });
employees.Add(new Employee() { Name = "Yang", Employee_Id = "3", ParentId =
"1", Designation = "Manager" });
employees.Add(new Employee() { Name = "Yoshi", Employee_Id = "4", ParentId =
"2", Designation = "Team Lead" });
employees.Add(new Employee() { Name = "Philip", Employee_Id = "5", ParentId
= "2", Designation = "S/w Developer" });
employees.Add(new Employee() { Name = "Roland", Employee_Id = "6", ParentId
= "3", Designation = "TeamLead" });
employees.Add(new Employee() { Name = "Yvonne", Employee_Id = "7", ParentId
= "3", Designation = "Testing Engineer" });
//Initializes the DataSourceSettings
diagram.DataSourceSettings = new DataSourceSettings() { DataSource =
employees, Id = "Employee_Id", ParentId = "ParentId" };
//Initializes the Layout
DirectedTreeLayout treeLayout = new DirectedTreeLayout() { HorizontalSpacing
= 80, VerticalSpacing = 50, TreeOrientation = TreeOrientation.TopToBottom };
diagram.LayoutManager = new LayoutManager() { Layout = treeLayout };

```

The Employee data is displayed in the SfDiagram as follows

This demo project can be downloaded from the following link [OrganizationalChart Demo](#).

### Diagram

Diagram control allows to create different types of diagrams such as flow charts, use case diagrams, workflow process diagrams, and more.

### Page settings

Page settings enable to customize the appearance, width, and height of the Diagram page. The size and appearance of the Diagram pages can be customized with the PageSettings property.

The PageWidth and PageHeight properties of page settings define the size of the page. You can also customize the appearance of off-page regions with the property BackgroundColor.

The following code illustrates how to customize the page size and the appearance of page and off-page.

### XML

```
<diagram:SfDiagram x:Name="diagram" BackgroundColor="Lime">
  <diagram:SfDiagram.PageSettings>
    <diagram:PageSettings PageWidth="500" PageHeight="50" PageBackGround="White"
    />
  </diagram:SfDiagram.PageSettings>
</diagram:SfDiagram>
```

### C#

```
//Sets Page background
diagram.BackgroundColor = Color.Lime;
//Sets Page size
diagram.PageSettings.PageWidth = 500;
diagram.PageSettings.PageHeight = 500;
//Customizes the appearance of Page
diagram.PageSettings.PageBackGround= Color.White;
```

### Stencil:

Stencil has a collection of Symbols. Stencil is used to clone the desired symbol by dragging it from the Stencil and dropping it into the SfDiagram.

The following code snippet illustrates to add the stencil.

### XML

```
<syncfusion:Stencil x:Name="stencil" >
</syncfusion:Stencil>
```

**C#**

```
Stencil stencil = new Stencil();
this.Content = stencil;
```

**Node template:**

You can replace the entire node template with your own design using SfDiagram.NodeTemplate property.

The following code snippet and screenshot illustrates this.

**XML**

```
<DataTemplate x:Key="template">
<Grid WidthRequest="80" HeightRequest="80">
<Image Source="diagram.png"/>
</Grid>
</DataTemplate>
<control:SfDiagram x:Name="diagram" NodeTemplate="{StaticResource
template}">
```

**C#**

```
var template = new DataTemplate(() =>
{
    Grid grid = new Grid();
    grid.WidthRequest = 80;
    grid.HeightRequest = 80;
    Image image = new Image();
    image.Source = "employee.png";
    grid.Children.Add(image);
    return grid;
});
diagram.NodeTemplate = template;
```

**Diagram constraints**

The constraints property of Diagram allows you to enable/disable certain features.

Diagram Constraints allow to enable or disable the following behaviors of Node.

Drag

Resize

Rotate

AnnotationEditing

EnableSelectors

EnableZoomAndPan

IsReadOnly

## Example

The following code illustrates how to disable the item dragging.

### XML

```
<syncfusion:SfDiagram x:Name="diagram" EnableDrag="False">
</syncfusion:SfDiagram>
```

### C#

```
SfDiagram diagram = new SfDiagram();
// Disable the item dragging
diagram.EnableDrag = false;
this.Content = diagram;
```

## Diagram style settings

It is easier to apply default rendering styles to all shapes, connectors, stencil symbol, and stencil header in a diagram. Pass the following arguments to diagram style setting constructor:

- **DefaultNodeStyle** argument: Defines the node style properties.
- **DefaultConnectorStyle** argument: Defines the connector style properties.
- **DefaultSymbolStyle** argument: Defines the symbol style properties.
- **DefaultHeaderStyle** argument: Defines the header style properties.

The following code shows how to define the diagram style settings for the diagram object.

### C#

```
// Diagram style settings
Syncfusion.SfDiagram.XForms.Style NodeStyle = new
Syncfusion.SfDiagram.XForms.Style() { Brush = new SolidBrush(Color.Blue),
StrokeBrush = new SolidBrush(Color.Brown), StrokeWidth = 2, StrokeStyle =
StrokeStyle.Dashed };
Syncfusion.SfDiagram.XForms.Style ConnectorStyle = new
Syncfusion.SfDiagram.XForms.Style() { StrokeBrush = new
SolidBrush(Color.DeepSkyBlue), StrokeWidth = 3.0f, StrokeStyle =
StrokeStyle.Dotted };
SymbolStyle SymbolStyle = new SymbolStyle() { Width = 70, Height = 70,
BorderThickness = 4, BorderBrush = Color.Gray }; HeaderStyle HeaderStyle =
new HeaderStyle() { FontSize = 24, TextBrush = Color.White, Fill =
Color.SteelBlue, FontStyle = FontStyle.Italic, HorizontalAlignment =
HorizontalAlignment.Center };
DiagramStyleSettings diagramStyleSettings = new
DiagramStyleSettings(NodeStyle, ConnectorStyle, SymbolStyle, HeaderStyle);
//Passing diagram style settings instance to SfDiagram constructor
SfDiagram diagram = new SfDiagram(diagramStyleSettings);
```

## Zooming enhancement

Supports customizing the zoom levels. You can set minimum zoom level value to 0.01f and maximum to 'infinite'.

### XML

```
<!-- Define the minimum and maximum zoom factor value -->
<control:SfDiagram x:Name="diagram" MinimumZoomFactor="0.01"
MaximumZoomFactor="5.00" />
```

## C#

```
// Define the minimum and maximum zoom factor value
diagram.MinimumZoomFactor = 0.01f;
diagram.MaximumZoomFactor = 5.00f;
```

**Note:** Diagram supports zooming with custom option in Xamarin.Forms.Android and Xamarin.Forms.iOS alone.

## Node

Nodes are graphical objects used to visually represent the geometrical information, process flow, internal business procedure or any other kind of data and it represents the functions of a complete system in regards to how it interacts with external entities.

### Create node

A Node can be created and added to the Diagram, either programmatically or interactively. Nodes are stacked on the Diagram area from bottom to top in the order they are added.

The following code snippet illustrates how to create the node.

## XML

```
<!--Initialize SfDiagram-->
<syncfusion:SfDiagram x:Name="diagram">
  <!--Initialize NodeCollection-->
  <syncfusion:SfDiagram.Nodes>
    <syncfusion:NodeCollection>
      <!--Initialize Node-->
      <syncfusion:Node Width="100" Height="100" OffsetX="200" OffsetY="200">
      </syncfusion:Node>
    </syncfusion:NodeCollection>
  </syncfusion:SfDiagram.Nodes>
</syncfusion:SfDiagram>
```

## C#

```
//Initialize Node
Node n = new Node() { Width = 120, Height = 40, OffsetX = 300, OffsetY = 60,
ShapeType = ShapeType.Ellipse };
//Adds the node to the SfDiagram
diagram.AddNode(n);
```

Create a node with custom path/shape

Node can be created with different custom shapes and path using SfGraphics.

The following code snippet is used to create the Node with custom shape/path.

#### C#

```
//Initialize Node
Node node = new Node();
//Initialize SfGraphics
SfGraphics graphics = new SfGraphics();
Pen pen = new Pen();
pen.StrokeBrush = new SolidBrush(Color.Red);
pen.StrokeWidth = 2;
SolidBrush brush = new SolidBrush(Color.Yellow);
brush.FillColor = Color.Yellow;
pen.Brush = brush2;
graphics.DrawRectangle(pen, new Rectangle(0, 0, 50, 50));
//Update the SfGraphics to the node
node.UpdateSfGraphics(graphics);
```

### Accessing a node from the diagram instance

We can access the Node from the diagram instance using the following code snippet.

#### C#

```
//Access the node from the diagram instance.  
Node node = diagram.Nodes[0];
```

### Remove a node

The following code snippet is used to remove the node from the diagram.

#### C#

```
//Remove the node from the diagram.  
Node node = new Node();  
diagram.RemoveNode(node);
```

### Customization:

We can Customize the entire node with our own customized design using Template property.

#### XML

```
<!--Initialize the DataTemplate-->  
<DataTemplate x:Key="template">  
  <Grid WidthRequest="80" HeightRequest="80">  
    <Image Source="diagram.png"/>  
  </Grid>  
</DataTemplate>  
<!--Initialize node-->  
<diagram:Node OffsetX="300" OffsetY="300" Width="60" Height="70"  
  Template="{StaticResource template}" >
```

#### C#

```
//Initialize the template  
var template = new DataTemplate(() =>  
{  
  Grid grid = new Grid();  
  grid.WidthRequest = 80;  
  grid.HeightRequest = 80;  
  Image image = new Image();  
  image.Source = "employee.png";  
  grid.Children.Add(image);  
  return grid;  
});  
//Initialize node with template.  
Node node = new Node() { Width = 120, Height = 40, OffsetX = 300, OffsetY =  
60, Template = template};
```

### Constraints

Node Constraints allow us to enable or disable the following behaviors of Node.

- Drag
- Resize

- Rotate
- AnnotationEditing
- IsLocked.

#### Example

The following code illustrates how to disable node dragging.

#### XML

```
<!--Initialize the node with constraints-->
<syncfusion:Node OffsetX="300" OffsetY="60" Width="120" Height="40"
ShapeType="Ellipse" EnableDrag="False">
```

#### C#

```
//Initialize the node with constraints
Node node = new Node() {EnableDrag = false;, Width = 50, Height = 50,
OffsetX = 100, OffsetY = 100};
```

### Connector

Connectors are objects used to create link between two Points, Nodes or ports to represent the relationships between them.

#### Create connector

Connector can be created by defining the start and end points.

#### XML

```
<!--creating connector instance-->
<control:SfDiagram.Connectors>
<control:ConnectorCollection>
<control:Connector SourcePoint="100,100" TargetPoint="300,300">
</control:Connector>
</control:ConnectorCollection>
</control:SfDiagram.Connectors>
```

#### C#

```
// creating connector instance
var connector1 = new Connector()
{
SourcePoint = new Point(100,100),
TargetPoint = new Point(300,300)
};
diagram.AddConnector(connector1);
```

### Connections with nodes

The SourceNode and TargetNode properties allow to define the Nodes to be connected. The following code example illustrates how to connect two Nodes.

#### C#

```
// creating node instance
```

```
var node1 = new Node(100, 300, 100, 100);  
diagram.AddNode(node1);  
var node2 = new Node(300, 300, 100, 100);  
diagram.AddNode(node2);  
// creating connector instance and connecting nodes with it  
var connector1 = new Connector()  
{  
    SourceNode = node1,  
    TargetNode = node2  
};  
diagram.AddConnector(connector1);
```

### Connections with ports

The SourcePort and TargetPort properties allow to create connections between some specific points of Source/Target Nodes. The following code examples illustrates how to use Port to Port connection.

### Using port

The following code example illustrates how to create Port and connect using that ports.

### C#

```
// creating node instance
```

```
var node1 = new Node(100, 100, 100, 100);  
//adding port instance to the node  
node1.Ports.Add(new Port() { NodeOffsetX = 0.5, NodeOffsetY = 0 });  
//adding node to the diagram  
diagram.AddNode(node1);  
// creating node instance  
var node2 = new Node(300, 300, 100, 100);  
//adding port instance to the node  
node2.Ports.Add(new Port() { NodeOffsetX = 0.5, NodeOffsetY = 1 });  
//adding node to the diagram  
diagram.AddNode(node2);  
//creating and connecting the ports with connector  
var connector1 = new Connector()  
{  
    SourceNode = node1,  
    TargetNode = node2,  
    SourcePort=node1.Ports[0],  
    TargetPort=node2.Ports[0],  
    SegmentType = SegmentType.OrthoSegment  
};  
diagram.AddConnector(connector1);
```

## Segments

The path of the Connector is defined with a collection of segments.

### Straight

Straight segment allows to create a straight line. To create a straight line, you should specify the segment as `StraightSegment`. The following code example illustrates how to create a default straight segment.

#### XML

```
<!--creating connector instance with define its segment type-->  
<control:SfDiagram.Connectors>  
  <control:ConnectorCollection>  
    <control:Connector SourcePoint="100,100" TargetPoint="300,300"  
      SegmentType="StraightSegment">  
    </control:Connector>  
  </control:ConnectorCollection>  
</control:SfDiagram.Connectors>
```

#### C#

```
// creating connector instance with define its segment type  
var connector1 = new Connector()  
{  
    SourcePoint = new Point(100,100),  
    TargetPoint = new Point(300,300),  
    SegmentType = SegmentType.StraightSegment  
};  
diagram.AddConnector(connector1);
```

### Orthogonal

Orthogonal segments are used to create segments that are perpendicular to each other.

Set the segment as `OrthogonalSegment` to create the default orthogonal segment. The following code example illustrates how to create a default orthogonal segment.

#### XML

```
<!--creating connector instance with define its segment type-->
<control:SfDiagram.Connectors>
  <control:ConnectorCollection>
    <control:Connector SourcePoint="100,100" TargetPoint="300,300"
      SegmentType="OrthoSegment">
    </control:Connector>
  </control:ConnectorCollection>
</control:SfDiagram.Connectors>
```

#### C#

```
// creating connector instance with define its segment type
var connector1 = new Connector()
{
```

```
SourcePoint = new Point(100, 100),  
TargetPoint = new Point(300, 300),  
SegmentType = SegmentType.OrthoSegment  
};  
diagram.AddConnector(connector1);
```

## Curve

Curve segments are used to create links between two points, nodes or ports with curve segments. The following code example illustrates how to create a default curve segment.

### C#

```
// creating connector instance with define its segment type  
Connector connector = new Connector(this);  
connector.SourcePoint = new Point(100, 100);  
connector.TargetPoint = new Point(300, 300);  
connector.SegmentType = SegmentType.CurveSegment;  
diagram.AddConnector(connector);
```

### Decorator

Start and end points of a Connector can be decorated with some customizable shapes like arrows, circles, diamond and square. You can decorate the connection end points with the `SourceDecorator` and `TargetDecorator` properties of `Connector`.

The `SourceDecoratorStyle` and `TargetDecoratorStyle` properties allows to define the shape of the decorators. The following code example illustrates how to create decorators of various shapes.

### XML

```
<!--creating connector instance with decorator-->
<control:SfDiagram.Connectors>
  <control:ConnectorCollection>
    <control:Connector SourcePoint="100,100" TargetPoint="300,300"
      SegmentType="StraightSegment" TargetDecoratorType="Diamond"
      SourceDecoratorType="Circle">
    </control:Connector>
  </control:ConnectorCollection>
</control:SfDiagram.Connectors>
```

### C#

```
//creating connector instance with decorator-->  
var connector1 = new Connector()  
{  
    SourcePoint = new Point(100,100),  
    TargetPoint = new Point(300,300),  
    SourceDecoratorType = DecoratorType.Circle,  
    TargetDecoratorType = DecoratorType.Diamond,  
    SegmentType= SegmentType.StraightSegment  
};  
diagram.AddConnector(connector1);
```

### Remove connector

Connector can be removed or detached from connection in two ways.

1. passing the connector as parameter to Remove connector method in diagram

The following code example illustrates how to remove a connector from connection

### C#

```
//creating connector instance
```

```

var connector1 = new Connector()
{
    SourcePoint = new Point(100,100),
    TargetPoint = new Point(300,300)
};
//adding connector to the diagram
diagram.AddConnector(connector1);
//removing connector from the diagram using object.
diagram.RemoveConnector(connector1);

```

## 2. passing the index value of the connector to connector collection (using RemoveAt method)

The following code example illustrates how to remove a connector from connection

### C#

```

//creating connector instance
var connector1 = new Connector()
{
    SourcePoint = new Point(100,100),
    TargetPoint = new Point(300,300)
};
//adding connector to the diagram
diagram.AddConnector(connector1);
//removing connector from the diagram using index.
diagram.Connectors.RemoveAt(0);

```

### Appearance

StrokeThickness, Stroke and style of the LineConnector and Decorators can be customized with a set of defined properties.

### Connector appearance

The following code example illustrates how to customize the Connector appearance.

### XML

```

<!--creating connector instance-->
<control:SfDiagram.Connectors>
<control:ConnectorCollection>
<control:Connector SourcePoint="100,100" TargetPoint="300,300">
<!--defining connector styles-->
<control:Connector.Style>
<control:Style StrokeStyle="Dashed" StrokeWidth="4"/>
</control:Connector.Style>
</control:Connector>
</control:ConnectorCollection>
</control:SfDiagram.Connectors>

```

### C#

```

// creating connector instance
var connector1 = new Connector()
{
    SourcePoint = new Point(100,100),

```

```
TargetPoint = new Point(300, 300),
SegmentType = SegmentType.StraightSegment
};
//defining connector styles
connector1.Style = new Syncfusion.SfDiagram.XForms.Style()
{
    StrokeBrush = new SolidBrush(Color.Gray),
    StrokeStyle = StrokeStyle.Dashed,
    StrokeWidth = 4
};
diagram.AddConnector(connector1);
```

### Decorator appearance

The following code example illustrates how to customize the appearance of the decorator.

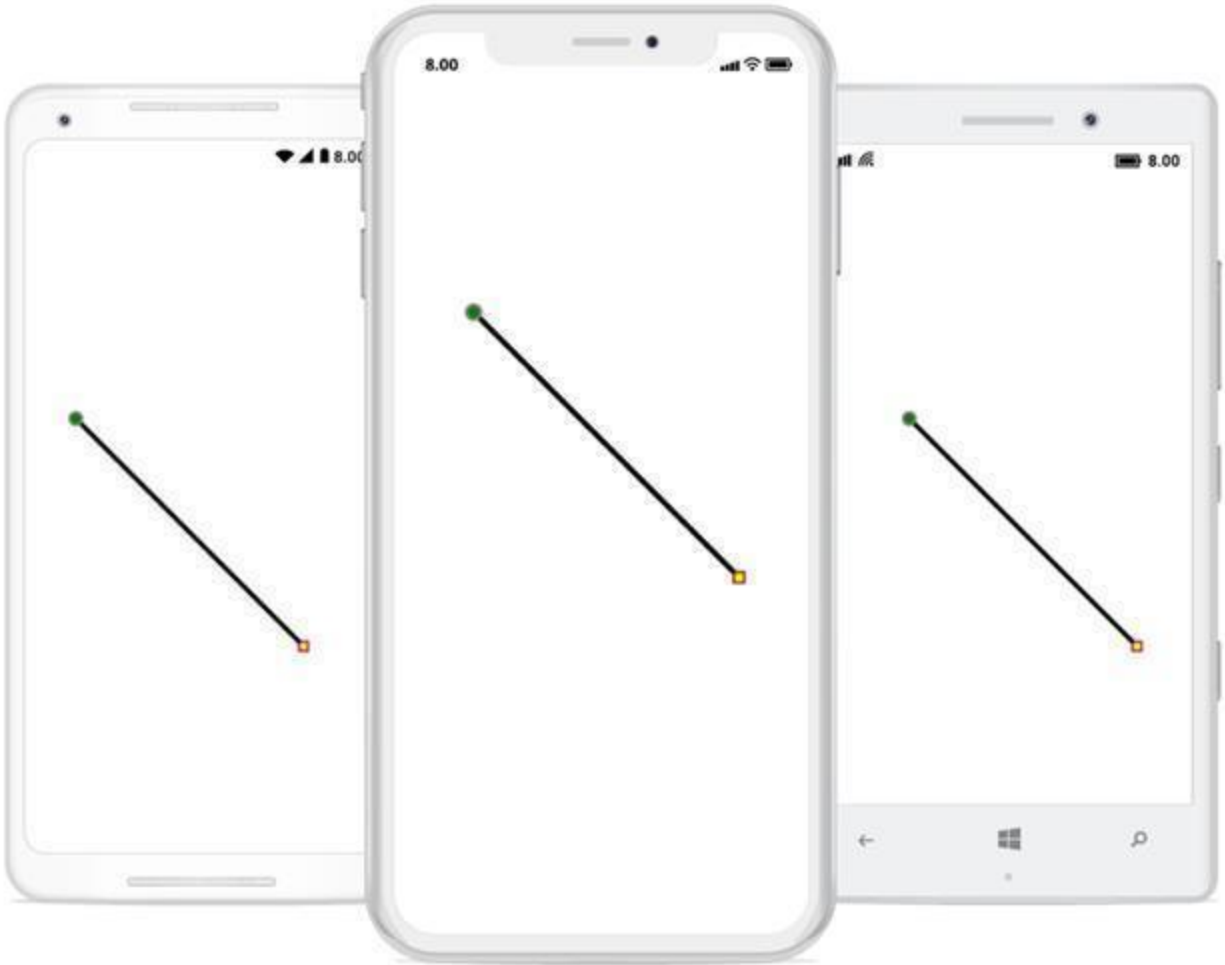

#### XML

```
<!--creating connector instance with decorator-->
<control:SfDiagram.Connectors>
  <control:ConnectorCollection>
    <control:Connector SourcePoint="100,100" TargetPoint="300,300"
      TargetDecoratorType="Diamond" SourceDecoratorType="Circle">
```

```
<!--defining decorator style for a connector-->
<control:Connector.SourceDecoratorStyle>
<control:DecoratorStyle Fill="Green" Stroke="Grey" StrokeThickness="5"
Width="12"/>
</control:Connector.SourceDecoratorStyle>
<!--defining decorator style for a connector-->
<control:Connector.TargetDecoratorStyle>
<control:DecoratorStyle Fill="Yellow" Stroke="Brown" StrokeThickness="4"
Width="10"/>
</control:Connector.TargetDecoratorStyle>
</control:Connector>
</control:ConnectorCollection>
</control:SfDiagram.Connectors>
```

## C#

```
// creating connector instance with decorator
var connector1 = new Connector()
{
    SourcePoint=new Point(100,100),
    TargetPoint= new Point(300,300),
    SegmentType= SegmentType.StraightSegment,
    SourceDecoratorType = DecoratorType.Circle,
    TargetDecoratorType = DecoratorType.Diamond
};
//defining decorator style for a connector
connector1.TargetDecoratorStyle = new DecoratorStyle()
{
    Fill = Color.Yellow,
    Stroke = Color.Brown,
    StrokeThickness = 4,
    Width = 12
};
// defining decorator style for a connector
connector1.SourceDecoratorStyle = new DecoratorStyle()
{
    Fill = Color.Green,
    Stroke = Color.Gray,
    StrokeThickness = 5,
    Width = 12
};
diagram.AddConnector(connector1);
```

## Annotations

Annotation is a block of text that can be displayed over a Node or Connector. Annotation is used to textually represent an object with a string that can be edited at run time.

You can add Multiple Labels to a Node/Connector.

### Create annotation

You can add an Annotation to a Node/Connector by defining the Annotation and adding that to the Annotations property of Node/Connector. The Content property of Annotation defines the object to be displayed. The following code illustrates how to create an Annotation.

### XML

```
<!-- To Add Annotation for Node -->
<control:SfDiagram x:Name="diagram">
  <control:SfDiagram.Nodes>
    <control:Node OffsetX="100" OffsetY="300" Width="100" Height="100">
      <control:Node.Annotations>
        <control:AnnotationCollection>
          <control:Annotation Content="Lable"/>
        </control:AnnotationCollection>
      </control:Node.Annotations>
    </control:Node>
  </control:SfDiagram.Nodes>
</control:SfDiagram>
```

```
</control:Node>
</control:SfDiagram.Nodes>
<!-- To Add Annotation for Connector-->
<control:SfDiagram.Connectors>
<control:Connector SourcePoint="100,100" TargetPoint="200,200"
SegmentType="OrthoSegment">
<control:Connector.Annotations>
<control:AnnotationCollection>
<control:Annotation Content="Lable"/>
</control:AnnotationCollection>
</control:Connector.Annotations>
</control:Connector>
</control:SfDiagram.Connectors>
</control:SfDiagram>
```

## **C#**

```
//To Add Annotation for Node
Node node1 = new Node(100, 300, 100, 100);
node1.Annotations.Add(new Annotation() { Content = "Label" });
diagram.AddNode(node1);
// To Add Annotation for Connector
Connector Connector1 = new Connector();
Connector1.SourcePoint = new Point(100, 100);
Connector1.TargetPoint = new Point(200, 200);
Connector1.Annotations.Add(new Annotation() { Content = "Label"
});diagram.AddConnector(Connector1);
```

### Accessing an annotation from node and connector instance

User can able to access the node or connector annotation using annotation name. The following code illustrates how to access an Annotation.

#### C#

```
// Accessing Annotation
Connector Connector1 = new Connector();
Connector1.SourcePoint = new Point(100, 100);
Connector1.TargetPoint = new Point(300, 300);
var label = new Annotation() { Content = "Label" };
Connector1.Annotations.Add(label);
diagram.AddConnector(Connector1);
Connector1.Annotations.Remove(label);
```

### Remove an annotation

User can able to remove the annotation using index value. The following code illustrates how to remove an Annotation.

#### C#

```
//Remove Annotation using Index
```

```
Connector Connector1 = new Connector();
Connector1.SourcePoint = new Point(100, 100);
Connector1.TargetPoint = new Point(300, 300);
var label = new Annotation() { Content = "Label" };
Connector1.Annotations.Add(label);
diagram.AddConnector(Connector1);
Connector1.Annotations.RemoveAt(0);
```

### Annotation customization

User can able to customize the annotation using properties. The following code illustrates how to remove an Annotation.

#### XML

```
<!-- Annotation customization for node -->
<control:SfDiagram.Nodes>
<control:Node OffsetX="100" OffsetY="300" Width="100" Height="100">
<control:Node.Annotations>
<control:AnnotationCollection>
<control:Annotation Content="Lable" FontFamily="Arial" FontSize="14"/>
</control:AnnotationCollection>
</control:Node.Annotations>
</control:Node>
</control:SfDiagram.Nodes>
<!-- Annotation customization for connector -->
<control:SfDiagram.Connectors>
<control:Connector SourcePoint="100,100" TargetPoint="200,200"
SegmentType="OrthoSegment">
<control:Connector.Annotations>
<control:AnnotationCollection>
<control:Annotation Content="Lable" FontFamily="Arial" FontSize="14"/>
</ontrol:AnnotationCollection>
</control:Connector.Annotations>
</control:Connector>
</control:SfDiagram.Connectors>
```

#### C#

```
// Annotation customization for node
Node node1 = new Node(100, 300, 100, 100);
var label = new Annotation()
{
    Content = "Label",
    FontFamily = "Arial",
    FontSize = 14,
    TextBrush = new SolidBrush(Color.Red)
};
node1.Annotations.Add(label);
diagram.AddNode(node1);
// Annotation customization for connector
Connector Connector1 = new Connector();
Connector1.SourcePoint = new Point(100, 100);
Connector1.TargetPoint = new Point(200, 200);
var label = new Annotation()
{
```

```

Content = "Label",
FontFamily = "Arial",
FontSize = 14,
TextBrush = new SolidColorBrush(Color.Red)
} ;
Connector1.Annotations.Add(label);
diagram.AddConnector(Connector1);

```

The following output is displayed as result of the above code example.

### Alignment

Annotation can be aligned relative to the Node boundaries. It has Horizontal and Vertical Alignment settings. It is quite tricky when all four alignments are used together but gives you more control over alignment.

### XML

```

<!--Annotation alignment for Node-->
<control:SfDiagram x:Name="diagram">
  <control:SfDiagram.Nodes>
    <control:Node OffsetX="100" OffsetY="300" Width="100" Height="100">
      <control:Node.Annotations>

```

```

<control:AnnotationCollection>
<control:Annotation Content="Lable" HorizontalAlignment="Center"
VerticalAlignment="Top"/>
</control:AnnotationCollection>
</control:Node.Annotations>
</control:Node>
</control:SfDiagram.Nodes>
<!--Annotation alignment for connector -->
<control:SfDiagram.Connectors>
<control:Connector SourcePoint="100,100" TargetPoint="200,200"
SegmentType="OrthoSegment">
<control:Connector.Annotations>
<control:AnnotationCollection>
<control:Annotation Content="Lable" HorizontalAlignment="Center"
VerticalAlignment="Center"/>
</control:AnnotationCollection>
</control:Connector.Annotations>
</control:Connector>
</control:SfDiagram.Connectors>
</control:SfDiagram>

```

**C#**

```

// Annotation alignment for Node
Node node1 = new Node(100, 300, 100, 100);
Annotation label = new Annotation()
{
    Content = "Label",
    HorizontalAlignment = HorizontalAlignment.Center,
    VerticalAlignment = VerticalAlignment.Top
};
node1.Annotations.Add(label);
diagram.AddNode(node1);
//Annotation alignment for Connector
Connector Connector1 = new Connector();
Connector1.SourcePoint = new Point(100, 100);
Connector1.TargetPoint = new Point(200, 200);
Connector1.Annotations.Add(new Annotation() { Content = "Label",
    HorizontalAlignment = HorizontalAlignment.Center,
    VerticalAlignment = VerticalAlignment.Center
});
diagram.AddConnector(Connector1);

```

The following output is displayed as result of the above code example.

## Port

SfDiagram provides support to define custom ports for making connections. When a Connector is connected between two Nodes, its end points are automatically docked to Node's nearest boundary, Port act as the connection points of node and allows to create connections with only specific points.

### Create ports for a node

To add a port, you need to define the port object and add it to Ports property of Node. The NodeOffsetX and NodeOffsetY property of Port accepts an object of fractions and used to determine the position of Ports. The following code illustrates how to add ports when initializing the Node.

The following code illustrates how to add ports to Node.

### XML

```
<!--creating node instance-->
<control:Node x:Name="node1" OffsetX="300" OffsetY="300" Width="100"
Height="100" ShapeType="Rectangle" >
  <!--creating port instance-->
  <control:Node.Ports >
    <control:PortCollection>
      <control:Port x:Name="port1" NodeOffsetX="0.5" NodeOffsetY="1"/>
    </control:PortCollection>
  </control:Node.Ports >
</control:Node>
```

```
</control:Node.Ports >  
</control:Node>
```

## C#

```
//Creating node instance  
Node node1 = new Node() { OffsetX = 300, OffsetY = 300, Width = 100, Height  
= 100, ShapeType = ShapeType.Rectangle };  
sfDiagram.AddNode(node1);  
Node node2 = new Node() { OffsetX = 600, OffsetY = 600, Width = 100, Height  
= 100, ShapeType = ShapeType.Rectangle };  
sfDiagram.AddNode(node2);  
// creating port instance  
Port port1 = new Port();  
port1.NodeOffsetX = 0.5;  
port1.NodeOffsetY = 0;  
Port port2 = new Port();  
port2.NodeOffsetX = 0.5;  
port2.NodeOffsetY = 1;  
//adding port to the node instance  
node1.Ports.Add(port1);  
node2.Ports.Add(port2);  
//creating and connecting the ports with connector  
Connector connector = new Connector() { SourceNode = node1, TargetNode =  
node2, SourcePort = port1, TargetPort = port2 };  
sfDiagram.AddConnector(connector);
```

### Accessing a port from the node instance

You can access the port by its index from the Ports property in a node.

The following code illustrates how to access a port from the node instance.

#### **C#**

```
Node node = sfDiagram.Nodes[0];  
//Accessing the port by index from the Port collection in node  
Port port = node.Ports[0];
```

### Remove a port from the node

To remove the port from a node. You can use Remove() method in Ports property in a node.

The following code illustrates how to remove a port from the node.

#### **C#**

```
Node node = sfDiagram.Nodes[0];  
//Accessing the port by index from the Port collection in node  
Port port = node.Ports[0];  
//Removing the port for the node  
node.Ports.Remove(port);
```

## Customization

You can customize a port by resizing it and applying style to it.

The following code illustrates how to customization a port.

### XML

```
<control:Node x:Name="node1" OffsetX="300" OffsetY="300" Width="100"
Height="100" ShapeType="Rectangle" >
  <!--creating port instance-->
  <control:Node.Ports >
    <control:PortCollection>
      <control:Port x:Name="port1" NodeOffsetX="0.5" NodeOffsetY="1" Height="10"
Width="10" ShapeType=" Circle">
        <control:Port.Style>
          <control:Style StrokeWidth="3" />
        </control:Port.Style>
      </control:Port>
    </control:PortCollection>
  </control:Node.Ports >
</control:Node>
```

### C#

```
//Creating a node
Node node1 = new Node() { OffsetX = 300, OffsetY = 300, Width = 100, Height
= 100, ShapeType = ShapeType.Rectangle };
sfDiagram.AddNode(node1);
// creating a port
Port port = new Port();
port.NodeOffsetX = 0.5;
port.NodeOffsetY = 1;
//adding the port to the node instance
node1.Ports.Add(port);
port.Height = 10;
port.Width = 10;
//Setting the shape type for the port
port.ShapeType = ShapeType.Circle;
//Creating style instance for the port
Style style = new Style();
style.StrokeWidth = 3;
style.Brush = new SolidBrush(Color.Black);
port.Style = style;
```

## Stencil

Stencil has a collection of Symbols. Stencil is used to clone the desired symbol by dragging it from the Stencil and dropping it into the SfDiagram. Each symbol can be grouped together by using the SymbolGroup .

### XML

```
<!-- Add namespace in xaml page -->
xmlns:sfDiagram="clr-
namespace:Syncfusion.SfDiagram.XForms;assembly=Syncfusion.SfDiagram.XForms"
```

## Add default shapes into stencil

The following example illustrates how to add the Symbol into a Collection:

### XML

```
<ContentPage.Resources>
  <ResourceDictionary>
    <!-- Add Symbols into SymbolCollection -->
    <control:SymbolCollection x:Key="collection1">
      <control:Node Height="50" Width="50" ShapeType="Rectangle" />
      <control:Node Height="50" Width="50" ShapeType="Ellipse" />
      <control:Node Height="50" Width="50" ShapeType="Triangle" />
      <control:Node Height="50" Width="50" ShapeType="RightAngleTriangle" />
    </control:SymbolCollection>
    <!-- Add collection into SymbolGroup -->
    <control:SymbolGroups x:Key="groups">
      <control:SymbolGroup SymbolSource="{StaticResource collection1}"
        HeaderName="BasicShapes" />
    </control:SymbolGroups>
  </ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
  <Grid x:Name="grid">
    <Grid.ColumnDefinitions>
      <ColumnDefinition Width="500"/>
      <ColumnDefinition Width="500"/>
    </Grid.ColumnDefinitions>
    <!-- Add SfDiagram and stencil in xaml page -->
    <control:SfDiagram x:Name="diagram">
    </control:SfDiagram>
    <control:Stencil x:Name="stencil" SymbolGroups="{StaticResource groups}" >
    </control:Stencil>
  </Grid>
</ContentPage.Content>
```

### C#

```
//Add Symbols into SymbolCollection
SymbolCollection Collection1 = new SymbolCollection();
Collection1.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.Rectangle});
Collection1.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.Ellipse});
Collection1.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.Triangle});
Collection1.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.RightAngleTriangle});
//Add collection into SymbolGroup
stencil.SymbolGroups.Add(new SymbolGroup() { SymbolSource = coll, HeaderName
= "BasicShapes" });
```

This Collection will be the SymbolSource to the Stencil. Based on the SymbolSource, the Stencil will populate the Symbols.

[Add custom shapes into stencil](#)

The following example illustrates how to add the custom shapes into a Collection:

#### **C#**

```
//Custom shapes
Pen pen = new Pen();
pen.StrokeBrush = new SolidBrush(Color.Red);
pen.StrokeWidth = 2;
SolidBrush brush = new SolidBrush(Color.Yellow);
pen.Brush = brush;
Pen pen1 = new Pen();
pen1.StrokeBrush = new SolidBrush(Color.Gray);
pen1.StrokeWidth = 2;
SolidBrush brush1 = new SolidBrush(Color.Blue);
brush1.FillColor = Color.Blue;
pen1.Brush = brush1;
Node custom = new Node();
SfGraphics graphics = new SfGraphics();
Pen pen2 = new Pen();
pen2.StrokeBrush = new SolidBrush(Color.Blue);
pen2.StrokeWidth = 2;
SolidBrush brush2 = new SolidBrush(Color.FromRgb(99, 184, 225));
```

```
brush2.FillColor = Color.FromRgb(99, 184, 225);
pen2.Brush = brush2;
graphics.DrawRectangle(pen2, new Xamarin.Forms.Rectangle(0, 0, 50, 50));
custom.UpdateSfGraphics(graphics);
Node custom1 = new Node();
SfGraphics grap4 = new SfGraphics();
SfGraphicsPath sfp4 = new SfGraphicsPath();
Pen pen14 = new Pen();
pen14.StrokeBrush = new SolidBrush(Color.Blue);
pen14.StrokeWidth = 2;
SolidBrush brush14 = new SolidBrush(Color.Transparent);
brush14.FillColor = Color.Transparent;
pen14.Brush = brush14;
List<Point> coll4 = new List<Point>();
coll4.Add(new Point(0, 12));
coll4.Add(new Point(12, 12));
coll4.Add(new Point(12, 6));
coll4.Add(new Point(12, 42));
coll4.Add(new Point(12, 30));
coll4.Add(new Point(0, 30));
grap4.DrawLine(pen14, coll4.ToArray());
sfp4.MoveTo(12, 6);
sfp4.CubicTo(12, 6, 38, 20, 12, 36);
grap4.DrawPath(sfp4);
custom1.UpdateSfGraphics(grap4);
Node custom2 = new Node();
SfGraphics grap5 = new SfGraphics();
SfGraphicsPath sfp5 = new SfGraphicsPath();
List<Point> pointscol5 = new List<Point>();
pointscol5.Add(new Point(0, 15));
pointscol5.Add(new Point(15, 15));
pointscol5.Add(new Point(15, 0));
pointscol5.Add(new Point(30, 15));
pointscol5.Add(new Point(15, 30));
pointscol5.Add(new Point(15, 15));
sfp5.AddLines(pointscol5.ToArray());
grap5.DrawPath(sfp5);
custom2.UpdateSfGraphics(grap5);
Node custom3 = new Node();
Pen pen4 = new Pen();
pen4.StrokeBrush = new SolidBrush(Color.Blue);
pen4.StrokeWidth = 2;
SolidBrush brush4 = new SolidBrush(Color.White);
brush4.FillColor = Color.White;
pen4.Brush = brush4;
SfGraphics grap6 = new SfGraphics();
SfGraphicsPath sfp6 = new SfGraphicsPath();
List<Point> pointscol6 = new List<Point>();
pointscol6.Add(new Point(0, 15));
pointscol6.Add(new Point(15, 15));
pointscol6.Add(new Point(15, 0));
pointscol6.Add(new Point(30, 15));
pointscol6.Add(new Point(15, 30));
pointscol6.Add(new Point(15, 15));
sfp6.AddLines(pointscol5.ToArray());
grap6.DrawPath(sfp6);
grap6.DrawEllipse(pen4, new Xamarin.Forms.Rectangle(30, 12, 5, 5));
```

```

custom3.UpdateSfGraphics(grap6);
SymbolCollection CustomShapeCollection = new SymbolCollection();
col4.Add(custom);
col4.Add(custom1);
col4.Add(custom2);
col4.Add(custom3);
//Add custom shapes into group
stencil.SymbolGroups.Add(new SymbolGroup() { SymbolSource =
CustomShapeCollection , HeaderName = "Custom Shapes" });

```

### Add category heading text

We can able to add category of symbol group heading in stencil. The following example illustrates how to add category heading text in stencil.

#### XML

```

<ResourceDictionary>
  <!--SymbolCollection1-->
  <control:SymbolCollection x:Key="collection1">
    <control:Node Height="50" Width="50" ShapeType="Rectangle" />
    <control:Node Height="50" Width="50" ShapeType="Ellipse" />
    <control:Node Height="50" Width="50" ShapeType="Triangle" />
  </control:SymbolCollection>

```

```

<control:Node Height="50" Width="50" ShapeType="RightAngleTriangle" />
</control:SymbolCollection>
<!--SymbolCollection2-->
<control:SymbolCollection x:Key="collection2">
<control:Node Height="50" Width="50" ShapeType="RoundedRectangle" />
<control:Node Height="50" Width="50" ShapeType="Rectangle" />
<control:Node Height="50" Width="50" ShapeType="Diamond" />
<control:Node Height="50" Width="50" ShapeType="Parallelogram" />
</control:SymbolCollection>
<!--SymbolCollection3-->
<control:SymbolCollection x:Key="collection3">
<control:Connector SourcePoint="50,50" TargetPoint="100,100"
SegmentType="OrthoSegment" />
<control:Connector SourcePoint="50,50" TargetPoint="100,100"
SegmentType="StraightSegment" />
</control:SymbolCollection>
<!--Add category of symbolgroup with heading text -->
<control:SymbolGroups x:Key="groups">
<control:SymbolGroup SymbolSource="{StaticResource collection1}"
HeaderName="BasicShapes" />
<control:SymbolGroup SymbolSource="{StaticResource collection2}"
HeaderName="Flow Chart" />
<control:SymbolGroup SymbolSource="{StaticResource collection3}"
HeaderName="Connectors" />
</control:SymbolGroups>
</ResourceDictionary>

```

## C#

```

//SymbolCollection1
SymbolCollection coll = new SymbolCollection();
coll.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.Rectangle, Style = new Syncfusion.SfDiagram.XForms.Style() { Brush =
new SolidColorBrush(Color.White), StrokeBrush = new SolidColorBrush(Color.Gray) }
});
coll.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.Ellipse, Style = new Syncfusion.SfDiagram.XForms.Style() { Brush =
new SolidColorBrush(Color.White), StrokeBrush = new SolidColorBrush(Color.Gray) } });
coll.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.Triangle, Style = new Syncfusion.SfDiagram.XForms.Style() { Brush =
new SolidColorBrush(Color.White), StrokeBrush = new SolidColorBrush(Color.Gray) }
});
coll.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.RightAngleTriangle, Style = new
Syncfusion.SfDiagram.XForms.Style() { Brush = new SolidColorBrush(Color.White),
StrokeBrush = new SolidColorBrush(Color.Gray) } });
//SymbolCollection2
SymbolCollection coll1 = new SymbolCollection();
coll1.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.RoundedRectangle, Style = new Syncfusion.SfDiagram.XForms.Style()
{ Brush = new SolidColorBrush(Color.White), StrokeBrush = new
SolidColorBrush(Color.Gray) } });
coll1.Add(new Node() { Width = 50, Height = 50, ShapeType =
ShapeType.Rectangle, Style = new Syncfusion.SfDiagram.XForms.Style() { Brush =
new SolidColorBrush(Color.White), StrokeBrush = new SolidColorBrush(Color.Gray) }
});

```

```
coll1.Add(new Node() { Width = 50, Height = 50, ShapeType =  
ShapeType.Diamond, Style = new Syncfusion.SfDiagram.XForms.Style() { Brush =  
new SolidBrush(Color.White), StrokeBrush = new SolidBrush(Color.Gray) } });  
coll1.Add(new Node() { Width = 50, Height = 50, ShapeType =  
ShapeType.Parallelogram, Style = new Syncfusion.SfDiagram.XForms.Style() {  
Brush = new SolidBrush(Color.White), StrokeBrush = new  
SolidBrush(Color.Gray) } });  
//SymbolCollection3  
SymbolCollection con1 = new SymbolCollection();  
con1.Add(new Connector() { SegmentType = SegmentType.OrthoSegment,  
SourcePoint = new Point(0, 0), TargetPoint = new Point(50, 50) });  
con1.Add(new Connector() { SegmentType = SegmentType.StraightSegment,  
SourcePoint = new Point(0, 0), TargetPoint = new Point(50, 50) });  
//Add category of symbol group with heading text  
stencil.SymbolGroups.Add(new SymbolGroup() { SymbolSource = coll, HeaderName  
= "BasicShapes" });  
stencil.SymbolGroups.Add(new SymbolGroup() { SymbolSource = coll1,  
HeaderName = "Flow Chart" });  
stencil.SymbolGroups.Add(new SymbolGroup() { SymbolSource = coll2,  
HeaderName = "CustomShapes" });  
stencil.SymbolGroups.Add(new SymbolGroup() { SymbolSource = con1, HeaderName  
= "Connectors" });  
diagram.Stencil=stencil;
```

## Layouts

SfDiagram provides support to auto-arrange the nodes in the Diagram area that is referred as **Layout**.

We have explained the Automatic Layout with Employee class and DataSourceSettings. The followings are initial steps for all the Layout.

### Create class for data

Now, you have to create a class, Employee with properties to store the employee's information like Team, Role, ID, reporting person ID, etc. You also have to create a collection that stores a collection of the employees.

### C#

```
//Employee Business Object
public class Employee
{
    public string Team { get; set; }
    public string Role { get; set; }
    public int EmployeeId { get; set; }
}

//Employee Collection
public class Employees : ObservableCollection<Employee>
```

```
{
}
```

Initialize data source settings

#### XML

```
<!--Initializes the DataSourceSettings -->
<control:SfDiagram.DataSourceSettings>
<control:DataSourceSettings x:Key="DataSourceSettings" ParentId="Team"
Id="EmployeeId"
DataSource="{StaticResource Employees}" />
</control:SfDiagram.DataSourceSettings>
```

#### C#

```
// Initializes the DataSourceSettings
DataSourceSettings setting = new DataSourceSettings();
setting.DataSource = employee;
setting.Id = "ID";
setting.ParentId = "ReportingId";
diagram.DataSourceSettings = setting;
```

Organization layout

An organizational chart is a Diagram that displays the structure of an organization and relationships. To create an organizational chart, Type should be set as LayoutType.Organization. The following code example illustrates how to create an organizational chart.

#### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<local:Employees x:Key="Employees">
<!--Employee Collection -->
<local:Employee EmployeeId="0" Role="Project Management" />
<local:Employee EmployeeId= "1" Role= "R and D Team" Team= "0"/>
<local:Employee EmployeeId= "3" Role= "Philosophy" Team= "1"/>
<local:Employee EmployeeId= "4" Role= "Organization" Team= "1"/>
<local:Employee EmployeeId= "5" Role= "Technology" Team= "1"/>
<local:Employee EmployeeId= "7" Role= "Funding" Team= "1"/>
<local:Employee EmployeeId= "8" Role= "Resource Allocation" Team= "1"/>
<local:Employee EmployeeId= "9" Role= "Targeting" Team= "1"/>
<local:Employee EmployeeId= "11" Role= "Evaluation" Team= "1"/>
<local:Employee EmployeeId= "156" Role= "HR Team" Team= "0"/>
<local:Employee EmployeeId= "13" Role= "Recruitment" Team= "156"/>
<local:Employee EmployeeId= "113" Role= "Training" Team= "156"/>
<local:Employee EmployeeId= "112" Role= "Employee Relation" Team= "156"/>
<local:Employee EmployeeId= "14" Role= "Record Keeping" Team= "156"/>
<local:Employee EmployeeId= "17" Role= "Production and Sales Team" Team=
"0"/>
<local:Employee EmployeeId= "119" Role= "Design" Team= "17"/>
<local:Employee EmployeeId= "19" Role= "Operation" Team= "17"/>
<local:Employee EmployeeId= "20" Role= "Support" Team= "17"/>
<local:Employee EmployeeId= "21" Role= "Quality Assurance" Team= "17"/>
<local:Employee EmployeeId= "23" Role= "Customer Interaction" Team= "17"/>
```

```

<local:Employee EmployeeId= "24" Role= "Support and Maintenance" Team=
"17"/>
<local:Employee EmployeeId= "25" Role= "Task Coordination" Team= "17"/>
</local:Employees>
<control:DirectedTreeLayout x:Key="TreeLayout" TreeOrientation="TopToBottom"
Type="Organization"/>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<Grid x:Name="grid">
<control:SfDiagram x:Name="diagram" >
<!--Initializes the DataSourceSettings-->
<control:SfDiagram.DataSourceSettings>
<control:DataSourceSettings x:Key="DataSourceSettings" ParentId="Team"
Id="EmployeeId"
DataSource="{StaticResource Employees}" />
</control:SfDiagram.DataSourceSettings>
<!--Initializes the Layout-->
<control:SfDiagram.LayoutManager>
<control:LayoutManager x:Key="LayoutManager"
Layout="{StaticResource TreeLayout}" />
</control:SfDiagram.LayoutManager> </control:SfDiagram>
</Grid>
</ContentPage.Content>

```

## C#

```

//Employee Collection
ObservableCollection<Employee> employee = new
ObservableCollection<Employee>();
employee.Add(new Employee { EmployeeId = 0, Role = "Project Management" });
employee.Add(new Employee { EmployeeId = 1, Role = "R and D Team", Team =
"0" });
employee.Add(new Employee { EmployeeId = 3, Role = "Philosophy", Team = "1"
});
employee.Add(new Employee { EmployeeId = 4, Role = "Organization", Team =
"1" });
employee.Add(new Employee { EmployeeId = 5, Role = "Technology", Team = "1"
});
employee.Add(new Employee { EmployeeId = 7, Role = "Funding", Team = "1"
});
employee.Add(new Employee { EmployeeId = 8, Role = "Resource Allocation"
, Team = "1" });
employee.Add(new Employee { EmployeeId = 9, Role = "Targeting", Team = "1"
});
employee.Add(new Employee { EmployeeId = 11, Role = "Evaluation", Team =
"1" });
employee.Add(new Employee { EmployeeId = 156, Role = "HR Team", Team = "0"
});
employee.Add(new Employee { EmployeeId = 13, Role = "Recruitment", Team =
"156" });
employee.Add(new Employee { EmployeeId = 113, Role = "Training", Team =
"156" });
employee.Add(new Employee { EmployeeId = 112, Role = "Employee Relation"
, Team = "156" });

```

```

employee.Add(new Employee { EmployeeId = 14 , Role = "Record Keeping", Team
= "156" });
employee.Add(new Employee { EmployeeId = 17 , Role = "Production and Sales
Team" ,Team = "0" });
employee.Add(new Employee { EmployeeId = 119, Role = "Design", Team = "17"
});
employee.Add(new Employee { EmployeeId = 19 , Role = "Operation", Team =
"17" });
employee.Add(new Employee { EmployeeId = 20 , Role = "Support" ,Team = "17"
});
employee.Add(new Employee { EmployeeId = 21 , Role = "Quality Assurance"
,Team = "17" });
employee.Add(new Employee { EmployeeId = 23 , Role = "Customer Interaction"
,Team = "17" });
employee.Add(new Employee { EmployeeId = 24 , Role = "Support and
Maintenance" ,Team = "17" });
employee.Add(new Employee { EmployeeId = 25 , Role = "Task Coordination",
Team = "17" });
//Set parentId and id for DataSourceSettings
DataSourceSettings setting = new DataSourceSettings();
setting.DataSource = employee;
setting.Id = "EmployeeId";
setting.ParentId = "Team";
diagram.DataSourceSettings = setting;
diagram.LayoutManager = new LayoutManager() { Layout = new
DirectedTreeLayout() { TreeOrientation = TreeOrientation.TopToBottom, Type =
LayoutType.Organization } };

```

Organizational chart layout starts parsing from root and iterate through all its child elements.

“BeginNodeLayout” event provides necessary information of a Node’s children and the way to arrange (Orientation, Type etc.) them.

### BeginNodeLayout

User can change ChartType and Orientation by using BeginNodeLayout event of the SfDiagram. This event will fire for each Node added in Layout when the layout is getting updated. Default ChartType is Alternate and default orientation is Vertical. The following code example illustrates how to register an event and how to change ChartType and orientation.

### C#

```

// Registering an event
diagram.BeginNodeLayout += Diagram_BeginNodeLayout;
private void Diagram_BeginNodeLayout(object sender, BeginNodeLayoutEventArgs
args)
{
    if (!args.HasSubTree)
    {
        args.Type = ChartType.Left;
        args.Orientation = Orientation.Vertical;
    }
}

```

### BeginNodeRender

User can change node content using BeginNodeRender event of the SfDiagram. This event will fire for each Node added in Layout when the layout is getting updated.

#### C#

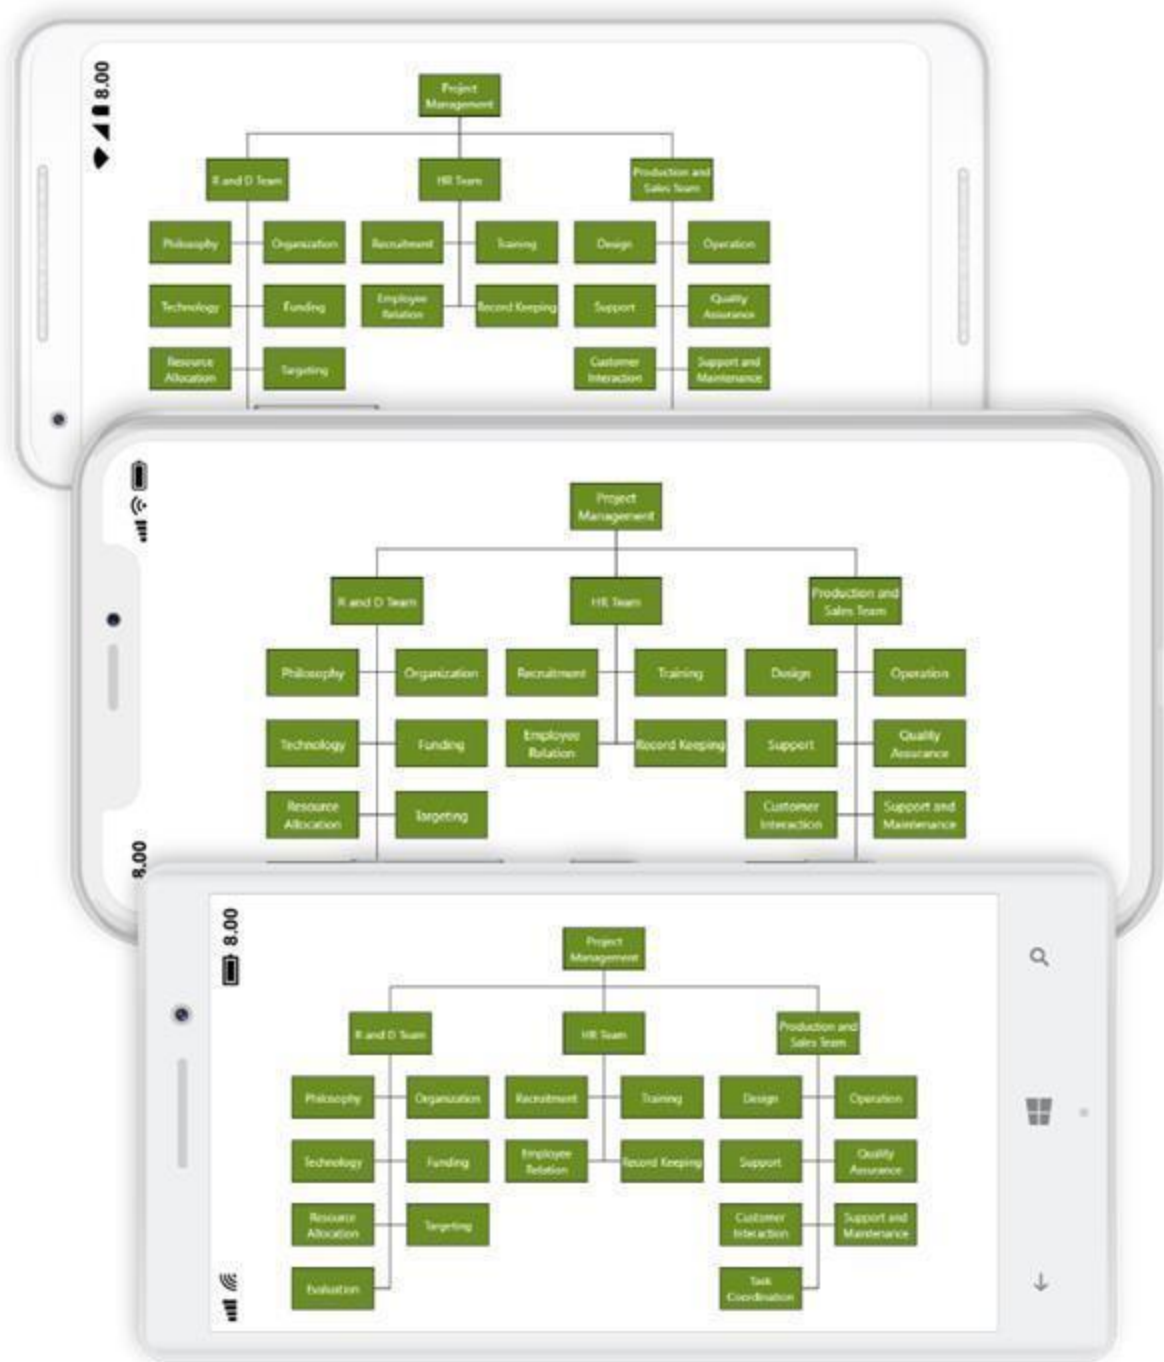

```
// Registering an event
diagram.BeginNodeRender += Diagram_BeginNodeRender;
private void Diagram_BeginNodeRender(object sender, BeginNodeRenderEventArgs args)
{
    Node node = args.Item as Node;
    node.Width = 150;
    node.Height = 60;
    node.ShapeType = ShapeType.Rectangle;
    Syncfusion.SfDiagram.XForms.Style style = new
    Syncfusion.SfDiagram.XForms.Style() {Brush = new SolidColorBrush(Color.OliveDrab)
    };
    node.Style = style;
    AnnotationCollection annotations = new AnnotationCollection();
    Annotation annotation = new Annotation()
    {
        Content = (node.Content as Employee).Role,
        HorizontalAlignment = HorizontalAlignment.Center,
        VerticalAlignment = VerticalAlignment.Center,
        TextBrush = new SolidColorBrush(Color.White)
    };
    annotations.Add(annotation);
    node.Annotations = annotations;
}
```

### Expand and collapse node

User can able to expand and collapse the parent node using NodeClicked event of the SfDiagram. This event will fire when click node in Layout.

#### C#

```
// Registering an event
diagram.BeginNodeLayout += Diagram_BeginNodeLayout;
void Diagram_NodeClicked(object sender, NodeClickedEventArgs args)
{
    if ((args.Item.Content as Employee).HasChild && args.Item.IsExpanded)
    {
        args.Item.IsExpanded = false;
    }
    else if ((args.Item.Content as Employee).HasChild && !args.Item.IsExpanded)
    {
        args.Item.IsExpanded = true;
    }
}
```

**Note:** Diagram supports expand and collapse in Xamarin.Forms.Android and Xamarin.Forms.iOS alone.

#### [Drag-and-drop support for directed tree layout](#)

It is easier to drag a child or parent node to some other node in the directed tree layout. The following code shows how to enable draggable option in layout.

#### C#

```
(diagram.LayoutManager.Layout as DirectedTreeLayout).IsDraggable = true;
```

The following code shows how to add the child of dropped node while dragging the node using the `LayoutNodeDropped` event.

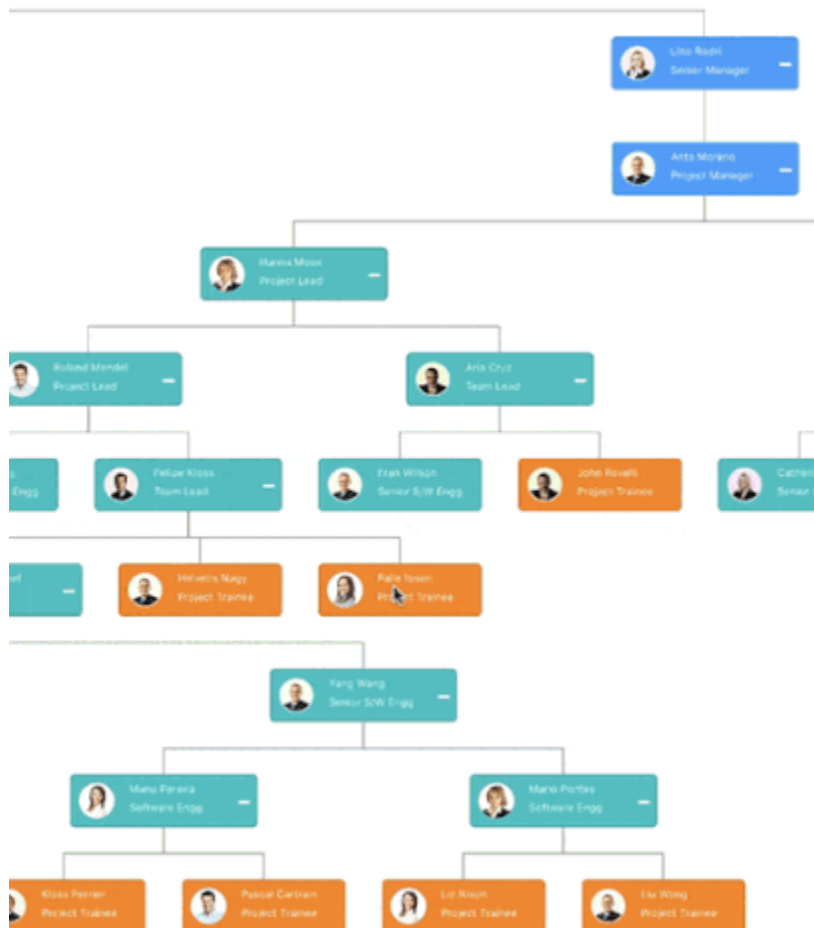

### C#

```
// Registering an event
diagram.LayoutNodeDropped += Diagram_OnLayoutNodeDropped;
//Define the LayoutNodeDropped event
private void Diagram_OnLayoutNodeDropped(object sender,
LayoutNodeDroppedEventArgs args)
{
    Node draggedNode = args.DraggedItem as Node;
    Node droppedNode = args.DroppedItem as Node;
    bool contain = true;
    if (draggedNode != RootNode && draggedNode != droppedNode)
    {
        Node ParentNode = GetParent((droppedNode.Content as
DiagramEmployee).ReportingPerson);
        do
        {
            if (ParentNode != draggedNode)
            {
                contain = false;
            }
            else
            {
                contain = true;
                break;
            }
            ParentNode = GetParent((ParentNode.Content as
DiagramEmployee).ReportingPerson);
        } while (ParentNode != RootNode);
        if (!contain)
        {
            List<Connector> connectors = draggedNode.InConnectors as List<Connector>;
            Connector con; bool hasChild = false;
            for (int i = 0; i < connectors.Count; i++)
            {
                con = connectors[i];
                con.SourceNode = droppedNode;
                hasChild = true;
            }
            if (hasChild)
            {
                Node PrevParentNode = GetParent((draggedNode.Content as
DiagramEmployee).ReportingPerson);
                if (PrevParentNode != null && PrevParentNode.OutConnectors.Count == 0)
                {
                    (PrevParentNode.Content as DiagramEmployee).HasChild = false;
                    UpdateTemplate(PrevParentNode, "-");
                }
                DiagramEmployee ParentEmployee = (droppedNode.Content as DiagramEmployee);
                (draggedNode.Content as DiagramEmployee).ReportingPerson =
                ParentEmployee.Name;
                ParentEmployee.HasChild = true;
            }
        }
    }
}
```

```

UpdateTemplate(droppedNode, "-");
}
droppedNode.IsExpanded = true;
diagram.LayoutManager.Layout.UpdateLayout();
}
}
}
private Node GetParent(string parentId)
{
    foreach (Node node in diagram.Nodes)
    {
        if ((node.Content as DiagramEmployee).Name == parentId)
        {
            return node;
        }
    }
    return RootNode;
}

```

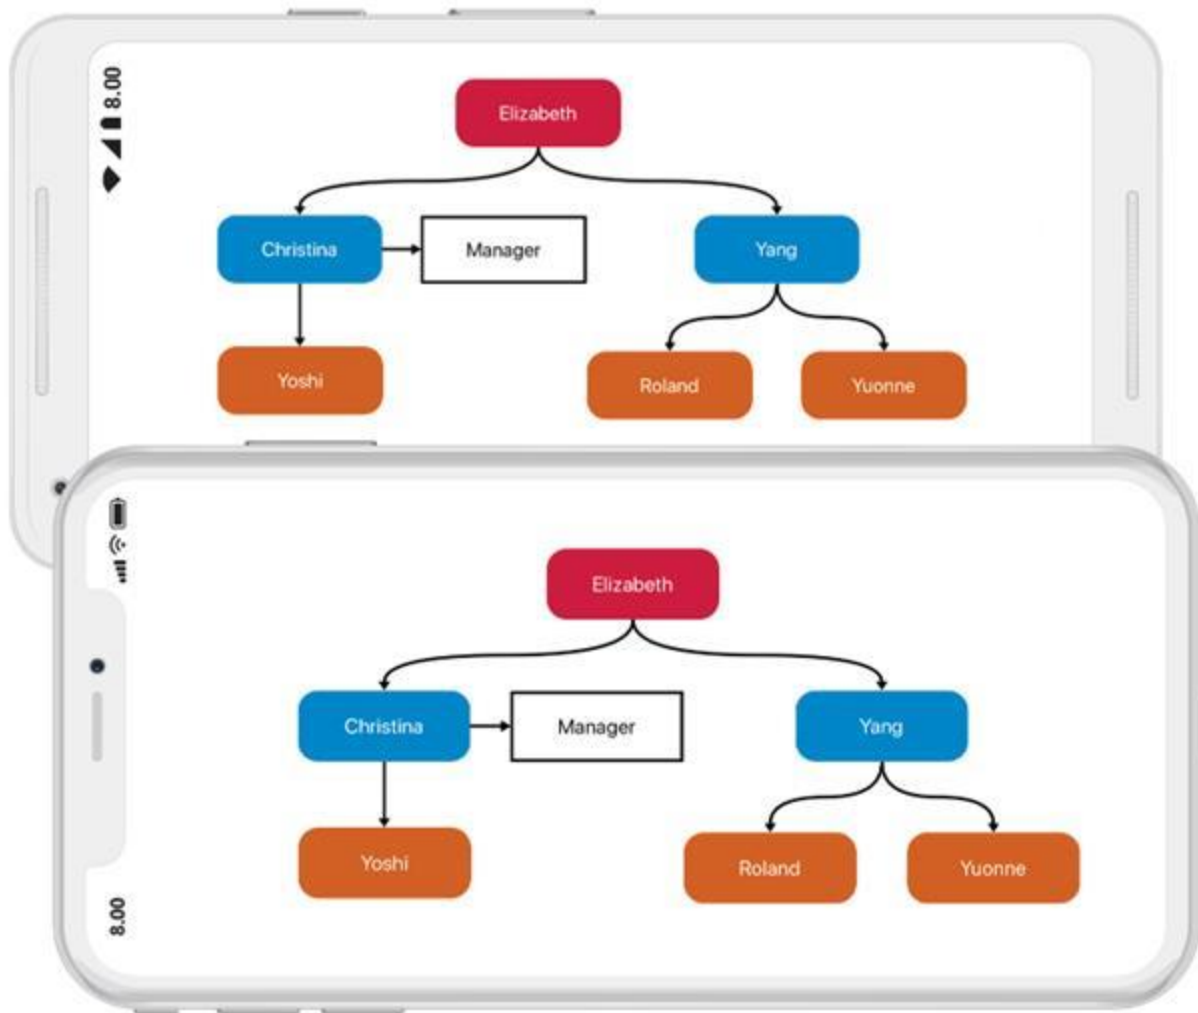

**Note:** Diagram supports drag and drop in Xamarin.Forms.Android and Xamarin.Forms.iOS alone.

### Layout sibling spacing

It is easier to provide spacing between sibling nodes of any branch on the directed tree layout. Nodes can also be excluded from the layout. You can provide space for each node by customizing the “SiblingSpace” property of the node. The following code illustrates how to add space to nodes using sibling spacing class instance.

#### C#

```
//Define the sibling spacing for node
private void Diagram_BeginNodeRender(object sender, BeginNodeRenderEventArgs
args)
{
    Node node = (args.Item as Node);
    node.ShapeType = ShapeType.RoundedRectangle;
    node.Width = 90;
    node.Height = 50;
    SiblingSpace siblingSpacing = new SiblingSpace(100,100);
    node.SiblingSpace = siblingSpacing;
    node.Annotations.Add(new Annotation() { Content = ((args.Item as
Node).Content as Employee).Name });
}
```

**Note:** Diagram supports layout sibling with spacing in Xamarin.Forms.Android and Xamarin.Forms.iOS alone.

### Mind map layout

A mind map is a diagram used to visually organize the information. It is hierarchical and shows relationship of the whole idea. It consists of a central ideas, related ideas, and lines connecting them together. It is used for brainstorming, planning, and information gathering etc. The following code example illustrates how to create and mind map layout:

#### C#

```

List<Color> FColor = new List<Color>();
List<Color> SColor = new List<Color>();
Random random = new Random();
int index;
int width=150;int height=75;
//Alternate color selection for child nodes
SColor.Add(Color.FromHex("#d1afdf"));
  
```

```

SColor.Add(Color.FromHex("#90C8C2"));
SColor.Add(Color.FromHex("#8BC1B7"));
SColor.Add(Color.FromHex("#E2C180"));
SColor.Add(Color.FromHex("#BBBFD6"));
SColor.Add(Color.FromHex("#ACCBAA"));
FColor.Add(Color.FromHex("#e9d4f1"));
FColor.Add(Color.FromHex("#d4efed"));
FColor.Add(Color.FromHex("#c4f2e8"));
FColor.Add(Color.FromHex("#f7e0b3"));
FColor.Add(Color.FromHex("#DEE2FF"));
FColor.Add(Color.FromHex("#E5FEE4"));
//Add Root node
var node = AddNode(300, 400, width, height, "Goals");
AddNodeStyle(node, Color.FromHex("#d0ebff"), Color.FromHex("#81bfea"));
RootNode = node;
diagram.AddNode(node);
//Add child nodes for root node
var branch1 = AddNode(100, 100, width, height, "Financial");
index = random.Next(5);
AddNodeStyle(branch1, FColor[index], SColor[index]);
diagram.AddNode(branch1);
var branch1Child1 = AddNode(100, 100, width, height, "Investment");
AddNodeStyle(branch1Child1, (branch1.Style.Brush as SolidBrush).FillColor,
(branch1.Style.StrokeBrush as SolidBrush).FillColor);
diagram.AddNode(branch1Child1);
var branch2 = AddNode(100, 600, width, height, "Social");
index = random.Next(5);
AddNodeStyle(branch2, FColor[index], SColor[index]);
diagram.AddNode(branch2);
var branch2Child1 = AddNode(100, 100, width, height, "Friends");
AddNodeStyle(branch2Child1, (branch2.Style.Brush as SolidBrush).FillColor,
(branch2.Style.StrokeBrush as SolidBrush).FillColor);
diagram.AddNode(branch2Child1);
var branch2Child2 = AddNode(100, 100, width, height, "Family");
AddNodeStyle(branch2Child2, (branch2.Style.Brush as SolidBrush).FillColor,
(branch2.Style.StrokeBrush as SolidBrush).FillColor);
diagram.AddNode(branch2Child2);
var branch3 = AddNode(500, 100, width, height, "Personal");
index = random.Next(5);
AddNodeStyle(branch3, FColor[index], SColor[index]);
diagram.AddNode(branch3);
var branch3Child1 = AddNode(500, 100, width, height, "Sports");
AddNodeStyle(branch3Child1, (branch3.Style.Brush as SolidBrush).FillColor,
(branch3.Style.StrokeBrush as SolidBrush).FillColor);
diagram.AddNode(branch3Child1);
var branch3Child2 = AddNode(500, 100, width, height, "Food");
AddNodeStyle(branch3Child2, (branch3.Style.Brush as SolidBrush).FillColor,
(branch3.Style.StrokeBrush as SolidBrush).FillColor);
diagram.AddNode(branch3Child2);
var branch4 = AddNode(500, 600, width, height, "Work");
index = random.Next(5);
AddNodeStyle(branch4, FColor[index], SColor[index]);
diagram.AddNode(branch4);
var branch4Child1 = AddNode(500, 100, width, height, "Project");
AddNodeStyle(branch4Child1, (branch4.Style.Brush as SolidBrush).FillColor,
(branch4.Style.StrokeBrush as SolidBrush).FillColor);
diagram.AddNode(branch4Child1);

```

```

var branch4Child2 = AddNode(500, 100, width, height, "Career");
AddNodeStyle(branch4Child2, (branch4.Style.Brush as SolidBrush).FillColor,
(branch4.Style.StrokeBrush as SolidBrush).FillColor);
diagram.AddNode(branch4Child2);
//Add connector
diagram.AddConnector(AddConnector(node, branch1));
diagram.AddConnector(AddConnector(node, branch2));
diagram.AddConnector(AddConnector(node, branch3));
diagram.AddConnector(AddConnector(node, branch4));
diagram.AddConnector(AddConnector(branch1, branch1Child1));
diagram.AddConnector(AddConnector(branch2, branch2Child1));
diagram.AddConnector(AddConnector(branch2, branch2Child2));
diagram.AddConnector(AddConnector(branch3, branch3Child1));
diagram.AddConnector(AddConnector(branch3, branch3Child2));
diagram.AddConnector(AddConnector(branch4, branch4Child1));
diagram.AddConnector(AddConnector(branch4, branch4Child2));
//Add connector method
private Connector AddConnector(Node node, Node BranchNode)
{
var connector = new Connector();
connector.SourceNode = node;
connector.TargetNode = BranchNode;
connector.Style.StrokeBrush = new
SolidBrush((connector.TargetNode.Style.StrokeBrush as
SolidBrush).FillColor);
connector.Style.StrokeStyle = StrokeStyle.Dashed;
connector.Style.StrokeWidth = 3;
if (Device.RuntimePlatform == Device.Android)
connector.TargetDecoratorStyle.Width = connector.TargetDecoratorStyle.Width
* App.factor;
connector.TargetDecoratorStyle.Fill =
(connector.TargetNode.Style.StrokeBrush as SolidBrush).FillColor;
connector.TargetDecoratorStyle.Stroke =
(connector.TargetNode.Style.StrokeBrush as SolidBrush).FillColor;
connector.SegmentType = SegmentType.CurveSegment;
return connector;
}
//Add node style method
private void AddNodeStyle(Node node, Color fill, Color Stroke)
{
node.Style.Brush = new SolidBrush(fill);
node.Style.StrokeBrush = new SolidBrush(Stroke);
}
//Add node method
Node AddNode(int x, int y, int w, int h, string text)
{
var node = new Node(x, y, w, h);
node.ShapeType = ShapeType.RoundedRectangle;
node.Style.StrokeWidth = 3;
if (Device.RuntimePlatform == Device.Android)
node.Annotations.Add(new Annotation() { Content = text, FontSize = 14 *
App.factor, TextBrush = new SolidBrush(Color.Black) });
else if (Device.RuntimePlatform == Device.iOS)
node.Annotations.Add(new Annotation() { Content = text, FontSize = 15,
TextBrush = new SolidBrush(Color.Black) });
return node;
}

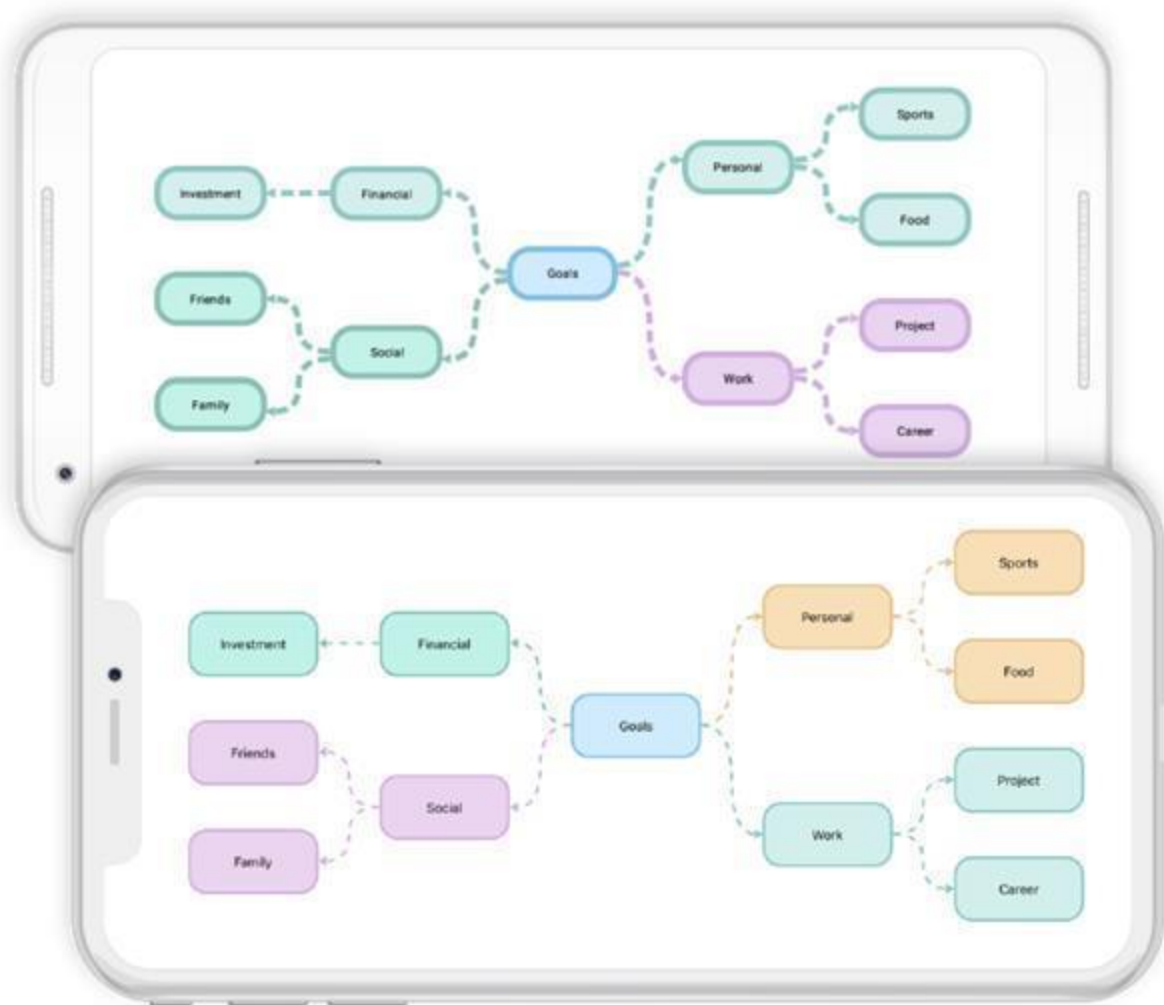

```

### Initializing the mind map layout

The following code illustrates how to initialize the mind map layout in diagram loaded event:

#### C#

```
//Diagram loaded event
diagram.Loaded += Diagram_Loaded;
private void Diagram_Loaded(object sender)
{
    diagram.LayoutManager = new LayoutManager()
    {
        Layout = new MindMapLayout()
        {
            MindMapOrientation = Orientation.Horizontal,
            HorizontalSpacing = 70,
        }
    };
//Updating the layout
    diagram.LayoutManager.Layout.UpdateLayout();
}
```

### Mind map layout style

Mind map styles are defined as a collection of node style with a single connector style. Collection of node style is applied from root node to leaf node either through branch wise or level wise.

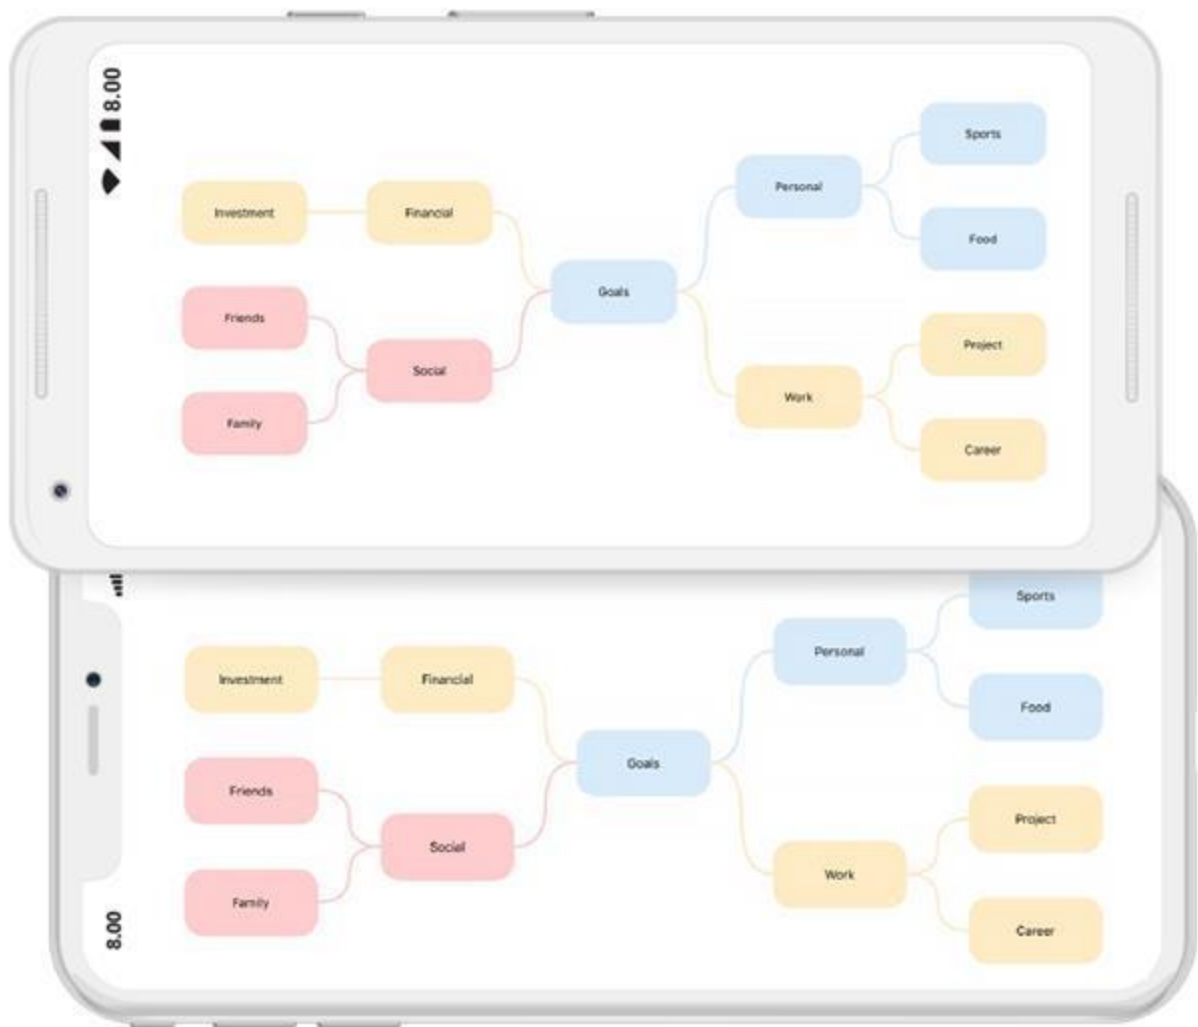

### Branch wise node style

Defined node style collection is applied from branch wise by setting the “ApplyNodeStyleBy” property to branch. The following code example illustrates how to apply style for mind map branch wise.

### C#

```
//Update mind map layout style
private void UpdateTheme()
{
    bool repeat_mode = true;
    nodeStyleCollection.Clear();
    nodeStyleCollection.Add(new NodeStyle(new
    SolidBrush(Color.FromHex("#d7ebfb")), Color.FromHex("#d7ebfb"), objShape1,
    StrokeStyle.Default,
```

```
new Syncfusion.SfDiagram.XForms.TextStyle((int)(14), Color.Black, ".SF UI
Text", HorizontalAlignment.Center, VerticalAlignment.Center));
nodeStyleCollection.Add(new NodeStyle(new
SolidBrush(Color.FromHex("#ffeabc4")), Color.FromHex("#ffeabc4"), objShape2,
StrokeStyle.Default,
new Syncfusion.SfDiagram.XForms.TextStyle((int)(14), Color.Black, ".SF UI
Text", HorizontalAlignment.Center, VerticalAlignment.Center));
nodeStyleCollection.Add(new NodeStyle(new
SolidBrush(Color.FromHex("#ffcdcd")), Color.FromHex("#ffcdcd"), objShape4,
StrokeStyle.Default,
new Syncfusion.SfDiagram.XForms.TextStyle((int)(14), Color.Black, ".SF UI
Text", HorizontalAlignment.Center, VerticalAlignment.Center));
lineStyle = new LineStyle(SegmentType.CurveSegment, StrokeStyle.Default, 3,
ApplyColorFrom.TargetFill, DecoratorType.None, ApplyColorFrom.None,
ApplyColorFrom.None);
(diagram.LayoutManager.Layout as MindMapLayout).UpdateLayoutStyle(new
LayoutStyle(nodeStyleCollection, lineStyle, ApplyNodeStyleBy.Branch,
repeat_mode));
}
private void Diagram_Loaded(object sender)
{
    //hook update theme method in diagram loaded event
    UpdateTheme();
}
```

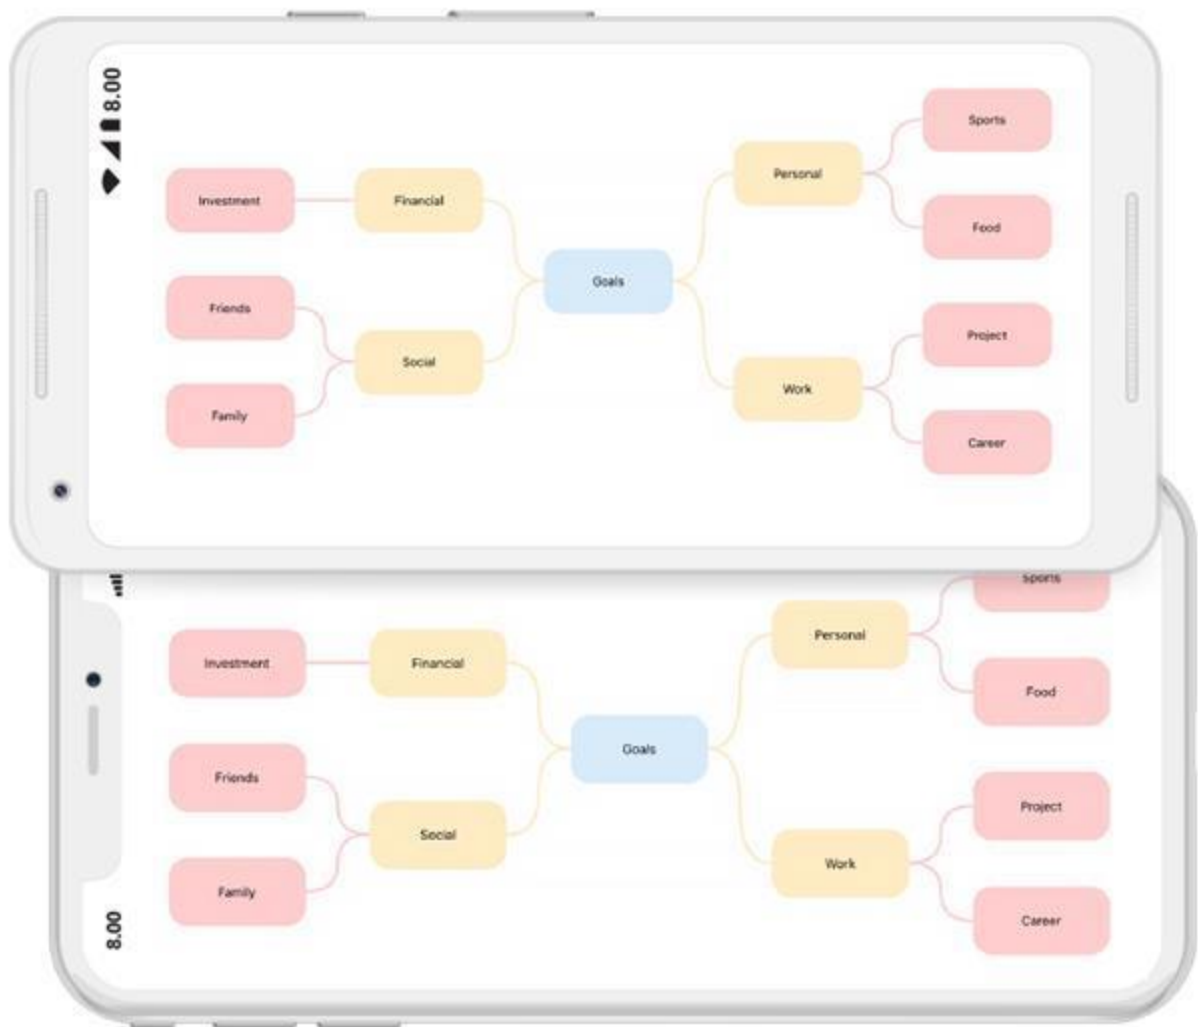

### Level wise node style

Defined node style collection is applied from level wise by setting the “ApplyNodeStyleBy” property to level. The following code example illustrates how to apply style for mind map level wise.

### C#

```
//Update mind map layout style
private void UpdateTheme()
{
    bool repeat_mode = true;
    nodeStyleCollection.Clear();
    nodeStyleCollection.Add(new NodeStyle(new
        SolidBrush(Color.FromHex("#d7ebfb")), Color.FromHex("#d7ebfb"), objShape1,
        StrokeStyle.Default,
        new Syncfusion.SfDiagram.XForms.TextStyle((int)(14), Color.Black, ".SF UI
        Text", HorizontalAlignment.Center, VerticalAlignment.Center)));
}
```

```
nodeStyleCollection.Add(new NodeStyle(new
SolidBrush(Color.FromHex("#ffe4c4")), Color.FromHex("#ffe4c4"), objShape2,
StrokeStyle.Default,
new Syncfusion.SfDiagram.XForms.TextStyle((int)(14), Color.Black, ".SF UI
Text", HorizontalAlignment.Center, VerticalAlignment.Center)));
nodeStyleCollection.Add(new NodeStyle(new
SolidBrush(Color.FromHex("#ffcdcd")), Color.FromHex("#ffcdcd"), objShape4,
StrokeStyle.Default,
new Syncfusion.SfDiagram.XForms.TextStyle((int)(14), Color.Black, ".SF UI
Text", HorizontalAlignment.Center, VerticalAlignment.Center)));
lineStyle = new LineStyle(SegmentType.CurveSegment, StrokeStyle.Default, 3,
ApplyColorFrom.TargetFill, DecoratorType.None, ApplyColorFrom.None,
ApplyColorFrom.None);
(diagram.LayoutManager.Layout as MindMapLayout).UpdateLayoutStyle(new
LayoutStyle(nodeStyleCollection, lineStyle, ApplyNodeStyleBy.Level,
repeat_mode));
}
private void Diagram_Loaded(object sender)
{
    //hook update theme method in diagram loaded event
    UpdateTheme();
}
```

### Repeat mode

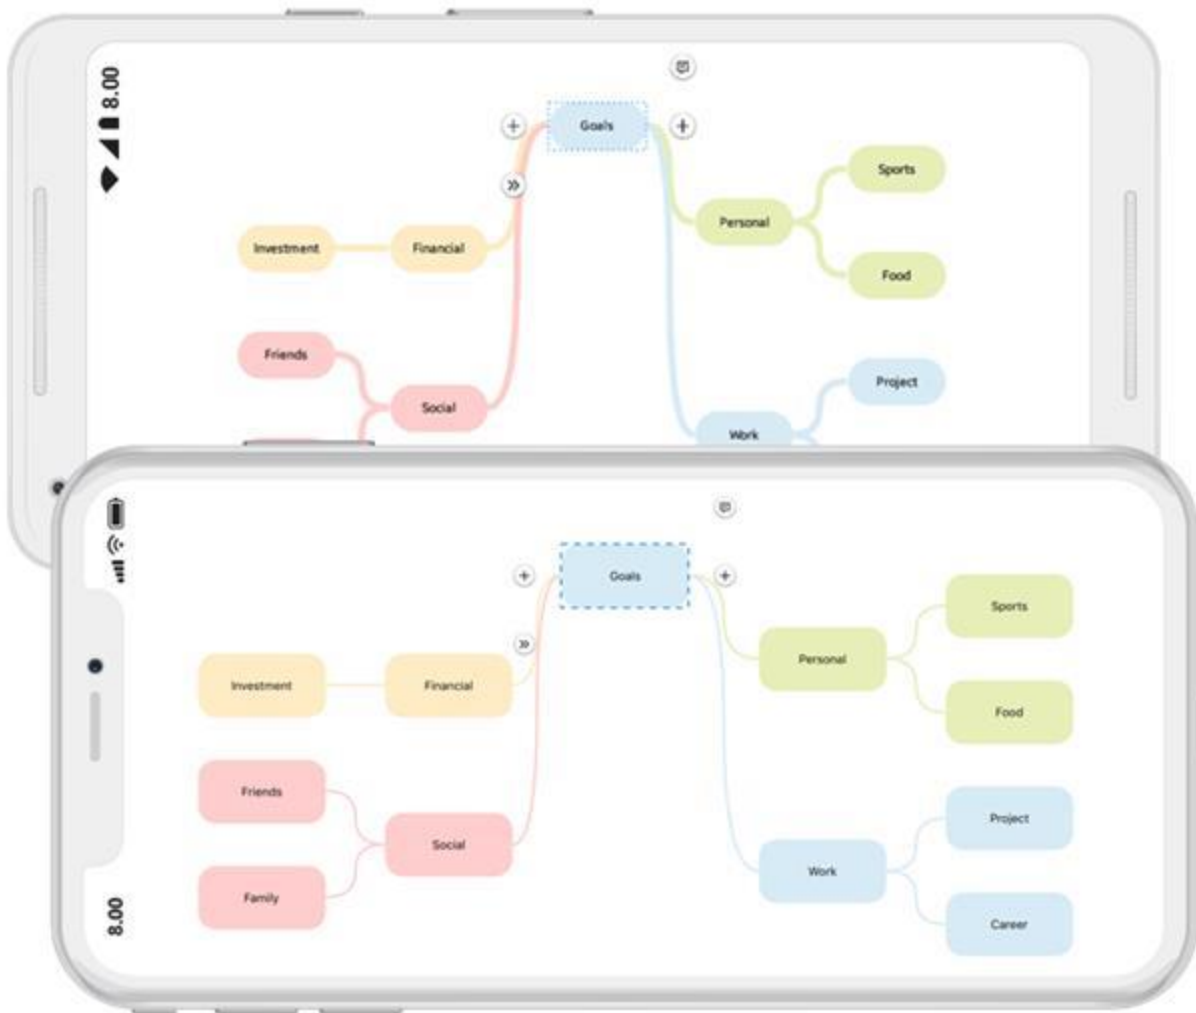

When style collection ends, the next level or branch can have styles. To be cyclic, enable repeat mode or disable it to continue with last style.

### Free form layout

The mind map free form layout provides an option to rearrange nodes in a layout. Mind map layout allows you to enable or disable free form using the “EnableFreeForm” property.

### C#

```
(diagram.LayoutManager.Layout as MindMapLayout).EnableFreeForm = true;
```

**Note:** Diagram supports mind map layout in Xamarin.Forms.Android and Xamarin.Forms.iOS alone.

### Drawing mode

Drawing mode is used to draw continuously on the diagram area for selected mode dynamically.

### Text node

This node has default annotation. TextNode mode will add continuous text node. The following code example illustrates how to enable TextNode mode.

### XML

```
<diagram:SfDiagram x:Name="diagram" DrawingMode="TextNode">
</diagram:SfDiagram>
```

### C#

```
diagram.DrawingMode = DrawingMode.TextNode;
```

## Connector

Connector mode add continuous orthogonal connectors on the diagram area. In this mode, you can connect connectors in between Points, Nodes, or Ports. The following code example illustrates how to enable Connector mode.

### XML

```
<diagram:SfDiagram x:Name="diagram" DrawingMode="Connector">
</diagram:SfDiagram>
```

### C#

```
diagram.DrawingMode = DrawingMode.Connector;
```

## Gridlines

Gridlines are the pattern of lines drawn behind the diagram elements. It provides a visual guidance when dragging or arranging the node on the diagram surface.

### Gridlines visibility

The “ShowGrid” property in PageSettings will show or hide the gridlines. The following code example illustrates how to enable grid visibility.

### XML

```
<diagram:SfDiagram x:Name="diagram" >
<diagram:SfDiagram.PageSettings>
<diagram:PageSettings ShowGrid ="true"/>
</diagram:SfDiagram.PageSettings>
</diagram:SfDiagram>
```

**C#**

```
diagram.PageSettings.ShowGrid = true;
```

**Customizing gridlines**

Grid cell size and gridline color can be modified using the “GridSize” and “GridColor” properties respectively. The following code example illustrates how to customize the grid.

**XML**

```
<diagram:SfDiagram x:Name="diagram" >
  <diagram:SfDiagram.PageSettings>
    <diagram:PageSettings GridColor="Pink" GridSize="14"/>
  </diagram:SfDiagram.PageSettings>
</diagram:SfDiagram>
```

**C#**

```
diagram.PageSettings.GridColor = Color.Pink;
diagram.PageSettings.GridSize = 14;
```

**Snapping gridlines**

Nodes can be aligned and resized easily using gridlines by enabling the snap to grid. The following code example illustrates how to enable the snap to grid.

**XML**

```
<diagram:SfDiagram x:Name="diagram" >
  <diagram:SfDiagram.PageSettings>
    <diagram:PageSettings SnapToGrid="true"/>
  </diagram:SfDiagram.PageSettings>
</diagram:SfDiagram>
```

**C#**

```
diagram.PageSettings.SnapToGrid = true;
```

## User handles

User handles are customizable handles which can be used to perform custom actions and also default clipboard actions. You can able to customize the user handles using:

- SfGraphicPath
- Template

The following code illustrates how to add custom user handle in diagram:

### C#

```
//Add graphic path into an user handle collection
SfGraphics graph = new SfGraphics();
Pen stroke = new Pen();
stroke.Brush = new SolidBrush(Color.Transparent);
stroke.StrokeWidth = 3;
stroke.StrokeBrush = new SolidBrush(Color.FromRgb(24, 161, 237));
graph.DrawEllipse(stroke, new Rectangle(10, 0, 20, 20));
graph.DrawArc(stroke, 0, 20, 40, 40, 180, 180);
//Add template into an user handles collection
var deleteTemplate = new DataTemplate(() =>
{
    var root = new StackLayout()
    {
        Orientation = StackOrientation.Horizontal,
        BackgroundColor = Color.Transparent
    };
    Image image = new Image();
    image.WidthRequest = 25;
    image.HeightRequest = 25;
    if (Device.RuntimePlatform == Device.iOS)
        image.Source = "Images/delete.png";
    else
        image.Source = "delete.png";
    root.Children.Add(image);
});
```

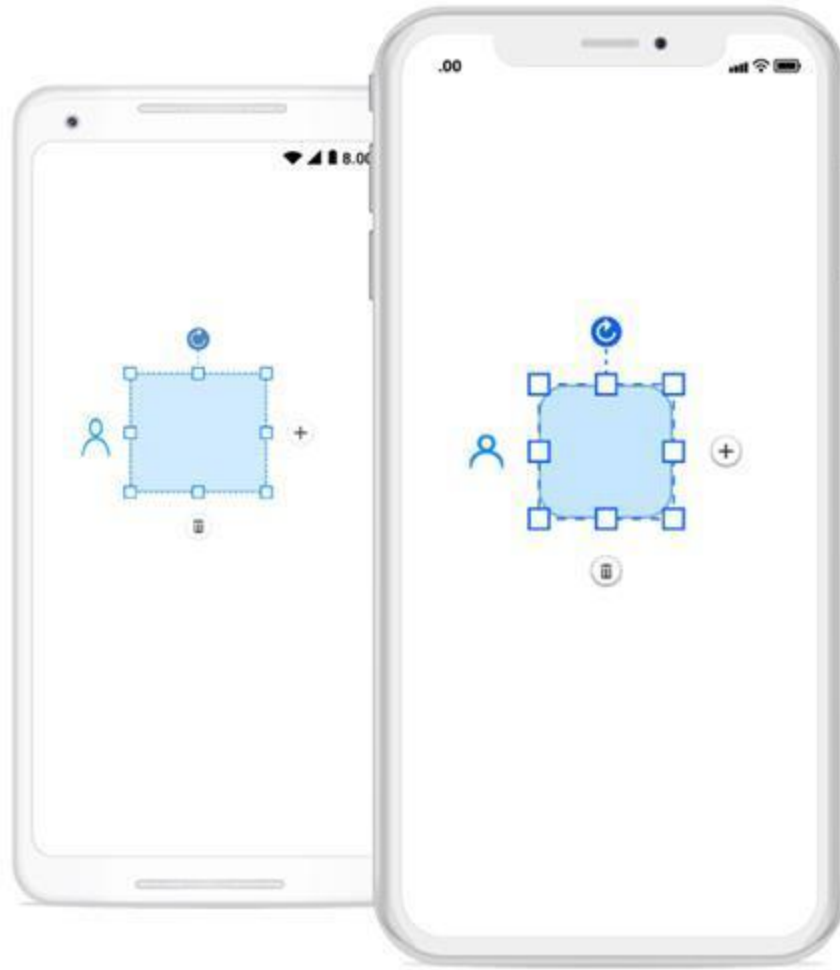

```
return root;
});
var plusTemplate = new DataTemplate(() =>
{
var root = new StackLayout()
{
Orientation = StackOrientation.Horizontal,
BackgroundColor = Color.Transparent
};
Image image = new Image();
image.WidthRequest = 25;
image.HeightRequest = 25;
if (Device.RuntimePlatform == Device.iOS)
image.Source = "Images/plus.png";
else
image.Source = "plus.png";
root.Children.Add(image);
return root;
});
//Add user handle into an user handles collection
diagram.UserHandles.Add(new Syncfusion.SfDiagram.XForms.UserHandle("delete",
UserHandlePosition.Bottom, deleteTemplate) { });
diagram.UserHandles.Add(new Syncfusion.SfDiagram.XForms.UserHandle("graphic
path", UserHandlePosition.Left, graph) { });
diagram.UserHandles.Add(new Syncfusion.SfDiagram.XForms.UserHandle("plus",
UserHandlePosition.Right, plusTemplate) { });
```

### User handles clicked event

The following code illustrate how to define use handles clicked event and its action.

#### C#

```
//User handles clicked event
diagram.UserHandleClicked+=HandleUserHandleClickedEventHandler;
void HandleUserHandleClickedEventHandler(object sender,
UserHandleClickedEventArgs args)
{
//delete user handle click event action
if (args.Item.Name == "delete")
{
diagram.Delete();
}
}
```

### Customizing user handle position

User handle position can be moved or adjusted from its default position. The following code shows how to adjust the position using the “MoveBy” method.

#### C#

```
//Define the user handle
UserHandleCollection userHandles = new UserHandleCollection();
UserHandle left = new UserHandle("Left", UserHandlePosition.Left,
plusTemplate) { Visible = true };
//Customize the user handle position using move by method
left.MoveBy(-10, -10);
userHandles.Add(left);
userHandles.Add(new UserHandle("Right", UserHandlePosition.Right,
m_expandTemplate) { Visible = true });
userHandles.Add(new UserHandle("Delete", UserHandlePosition.Bottom,
deleteTemplate) { Visible = true });
diagram.UserHandles = userHandles;
```

---

**Note:** Diagram supports user handle in Xamarin.Forms.Android and Xamarin.Forms.iOS alone.

---

### OverviewPanel

The overview panel is used to display the preview (overall mini view) of the entire content of a diagram. This helps you to see the overall picture of a large diagram and easily navigate to a position of the page using view port rectangle.

When working on a large diagram, to navigate, you have to zoom out the entire diagram to find where you are. This solution is not suitable when frequent navigation is required.

The overview control solves this problem by displaying a preview (overall view) of the entire diagram, A rectangle indicates the viewport of the diagram. Navigation is made easy by dragging this rectangle.

### Create overview panel

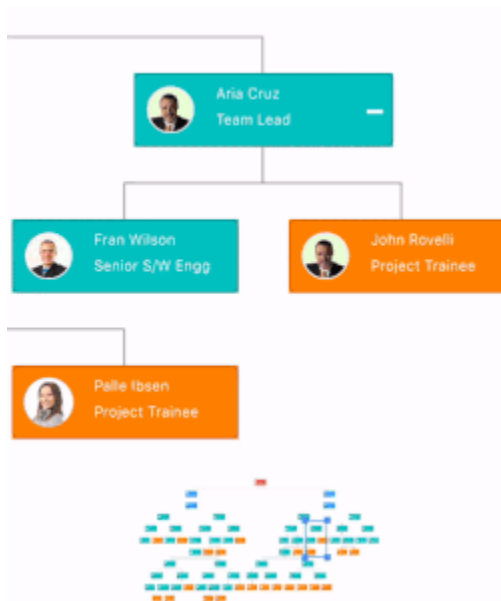

The following code shows how to create overview panel in a diagram.

**XML**

```
<sfdiagram:OverviewPanel x:Name="overview" >
</sfdiagram:OverviewPanel>
```

**C#**

```
//Define over view panel
OverviewPanel overview = new OverviewPanel();
overview.Width = 500;
overview.Height = 500;
overview.IsVisible = true;
diagram.OverviewPanel = overview;
```

*Prevent refresh*

Prevents diagram being updated in overview panel if any interaction takes place in the diagram layer. Prevents the diagram update for the entire actions till the property is set to true. This property is helpful when there is no need for frequent refreshing in the overview panel.

**C#**

```
//Define prevent refresh property
overview.PreventRefresh = true;
```

*Force refresh*

This method force refreshes the diagram in the overview panel. When the overview panel is prevented from updating diagram interaction by enabling PreventRefresh, force refresh is used to update the diagram in the overview panel.

**C#**

```
//Define force refresh method
overview.ForceRefresh();
```

### Customizing view port rect

The “StartX” and “StartY” properties are used to define the start position of the view port rect over the overview panel. The following code shows how to customize the view port rect.

#### C#

```
//Customize the view port rect  
ViewportRect ViewportRect = new ViewportRect(overview);  
ViewportRect.StrokeColor = Color.Black;  
ViewportRect.StartX = 300;  
ViewportRect.StartY = 100;
```

## SfDigitalGauge

### Overview

The digital gauge control is used to display alphanumeric characters in digital (LED display) mode. This control displays a range of values that uses character in combination with numbers.

#### Key features

The digital gauge is composed of several segments which are major UI components. [SfDigitalGauge](#) comprises the following segments to display digital characters:

- 7-segment display
- 14-segment display
- 16-segment display
- 8\*8 dot matrix display

#### *7-segment display*

This type of digital gauge displays digital characters in 7 segments. It is mainly used to display numbers.

#### *14-segment display*

This type of digital gauge displays digital characters in 14 segments. It is mainly used to display both the numbers and alphabet.

#### *16-segment display*

This type of digital gauge displays digital characters in 16 segments. It is also mainly used to display both the numbers and alphabet.

#### *8 \* 8 dot matrix display*

This type of digital gauge displays digital characters in 8\*8 dot matrix segments, in which the characters are spotted by the regular brush and the remaining dots are spotted by the dimmed brush. It is mainly used to display numbers, characters, and special characters.

## Getting Started

This section explains the steps required to configure the [SfDigitalGauge](#) and add basic elements to it using various APIs.

### Adding SfDigitalGauge reference

You can add SfDigitalGauge reference using one of the following methods:

#### Method 1: Adding SfDigitalGauge reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfDigitalGauge to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfGauge](#), and then install it.

![Adding SfDigitalGauge reference from NuGet](Getting-Started\_images/Adding SfDigitalGauge reference.png)

---

**Note:** Install the same version of SfDigitalGauge NuGet in all the projects.

---

#### Method 2: Adding SfDigitalGauge reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfDigitalGauge control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfDigitalGauge assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfGauge.Android.dll Syncfusion.SfGauge.XForms.Android.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfGauge.iOS.dll Syncfusion.SfGauge.XForms.iOS.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfGauge.UWP.dll Syncfusion.SfGauge.XForms.UWP.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

[Launching an application on each platform with SfDigitalGauge.](#)

To use the SfDigitalGauge control inside an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the SfDigitalGauge in iOS, call the `SfDigitalGaugeRenderer.Init()` in the `FinishedLaunching` overridden method of the AppDelegate class after the Xamarin.Forms Framework has been initialized and before the LoadApplication is called, as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
...
global::Xamarin.Forms.Forms.Init ();
Syncfusion.SfGauge.XForms.iOS.SfGaugeRenderer.Init();
LoadApplication (new App ());
...
}
```

### Universal Windows Platform (UWP)

You need to initialize the digital gauge view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with digital gauge in Release mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
...
rootFrame.NavigationFailed += OnNavigationFailed;
// Add `using System.Reflection;`
List<Assembly> assembliesToInclude = new List<Assembly>();
// Now, add all the assemblies your app uses
assembliesToInclude.Add(typeof(Syncfusion.SfGauge.XForms.UWP.SfGaugeRenderer
).GetTypeInfo().Assembly);
// Replaces Xamarin.Forms.Forms.Init(e);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
...
}
```

### Android

The Android platform does not require any additional configuration to render the digital gauge.

#### Adding namespace for the assemblies

##### XML

```
xmlns:gauge="clr-
namespace:Syncfusion.SfGauge.XForms;assembly=Syncfusion.SfGauge.XForms"
```

#### C#

```
using Syncfusion.SfGauge.XForms;
```

#### Initialize gauge

You can initialize the [SfDigitalGauge](#) control with a required optimal name using the included namespace.

##### XML

```
<gauge:SfDigitalGauge/>
```

## C#

```
SfDigitalGauge sfDigitalGauge = new SfDigitalGauge();  
this.Content = sfDigitalGauge;
```

### Setting value for digital gauge

The [SfDigitalGauge](#) control provides options to display special characters or values using the [Value](#) property.

## XML

```
<gauge:SfDigitalGauge Value="1 2 3 4"/>
```

## C#

```
SfDigitalGauge sfDigitalGauge = new SfDigitalGauge();  
sfDigitalGauge.Value = "11:59:50 PM";
```

### Setting character type for digital gauge

By using the [CharacterType](#) property, you can set the segments for digital gauge. The digital characters can be drawn in the following four different segments:

- EightCrossEightDotMatrix
- SegmentFourteen
- SegmentSeven
- SegmentSixteen

## XML

```
<gauge:SfDigitalGauge CharacterType="EightCrossEightDotMatrix"/>
```

## C#

```
SfDigitalGauge digital = new SfDigitalGauge();  
digital.CharacterType = CharacterType.EightCrossEightDotMatrix;
```

### Configuring properties

The [CharacterHeight](#), [CharacterWidth](#), and [CharacterStroke](#) properties are used to display characters, which can be customized as shown in the following code snippets:

## XML

```
<gauge:SfDigitalGauge CharacterHeight="60" CharacterWidth="25"  
CharacterStrokeColor="#146CED"/>
```

## C#

```
SfDigitalGauge digital = new SfDigitalGauge();  
digital.CharacterHeight = 60;  
digital.CharacterWidth = 25;  
digital.CharacterStrokeColor = Color.FromRgb(20, 108, 237);
```

The following code example is the complete code of the previous configurations.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GaugeGettingStarted"
x:Class="GaugeGettingStarted.MainPage"
xmlns:gauge="clr-
namespace:Syncfusion.SfGauge.XForms;assembly=Syncfusion.SfGauge.XForms">
<gauge:SfDigitalGauge Value="11:59:50 PM" SegmentStrokeWidth="5"
BackgroundColor="White"
HeightRequest="100" WidthRequest="375"
DisabledSegmentAlpha="25" DisabledSegmentColor="Gray"
CharacterHeight="90" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="EightCrossEightDotMatrix"
CharacterStrokeColor="#146CED"/>
</ContentPage>
```

### C#

```
using Xamarin.Forms;
using Syncfusion.SfGauge.XForms;
namespace GaugeGettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            //Initialize digital gauge
            SfDigitalGauge digital = new SfDigitalGauge();
            digital.BackgroundColor = Color.White;
            digital.HeightRequest = 100;
            digital.WidthRequest = 375;
            digital.Value = "11:59:50 PM";
            digital.CharacterHeight = 90;
            digital.CharacterWidth = 25;
            digital.HorizontalOptions = LayoutOptions.Center;
            digital.VerticalOptions = LayoutOptions.Center;
            digital.SegmentStrokeWidth = 5;
            digital.CharacterType = CharacterType.EightCrossEightDotMatrix;
            digital.DisabledSegmentAlpha = 25;
            digital.CharacterStrokeColor = Color.FromRgb(20, 108, 237);
            digital.DisabledSegmentColor = Color.Gray;
            this.Content = digital;
        }
    }
}
```

The following screenshot illustrates the result of the previous codes.

You can find the complete getting started sample from this [link](#).

### Customize character segments

The characters of a digital gauge can be customized in terms of [CharacterWidth](#), [CharacterHeight](#), [CharacterSpacing](#), and [CharacterStrokeColor](#).

#### customize character size

The values of digital characters are scaled by altering the height and width of digital characters. It is achieved by setting the [CharacterHeight](#) and [CharacterWidth](#) properties in the digital gauge. Default value of [CharacterHeight](#) and [CharacterWidth](#) is 25.

#### XML

```
<gauge:SfDigitalGauge Value="SYNCFUSION" SegmentStrokeWidth="4"
HeightRequest="120" WidthRequest="330" BackgroundColor="Black"
DisabledSegmentAlpha="30" DisabledSegmentColor="#146CED"
CharacterHeight="117" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="SegmentSeven"
CharacterStrokeColor="#146CED"/>
```

**C#**

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 120;
digital.WidthRequest = 330;
digital.Value = "SYNCFUSION";
digital.CharacterHeight = 117;
digital.CharacterWidth = 25;
digital.HorizontalOptions = LayoutOptions.Center;
digital.VerticalOptions = LayoutOptions.Center;
digital.SegmentStrokeWidth = 4;
digital.CharacterType = CharacterType.SegmentSeven;
digital.DisabledSegmentAlpha = 30;
digital.BackgroundColor = Color.Black;
digital.CharacterStrokeColor = Color.FromRgb(20, 108, 237);
digital.DisabledSegmentColor = Color.FromRgb(20, 108, 237);
```

**Setting character spacing**

The values of digital characters are spaced by altering the space of digital characters. It is achieved by setting the [CharacterSpacing](#) property.

**XML**

```
<gauge:SfDigitalGauge Value="01-01-18" SegmentStrokeWidth="3"
HeightRequest="100" WidthRequest="360" CharacterSpacing="10"
DisabledSegmentAlpha="30" DisabledSegmentColor="#146CED"
CharacterHeight="90" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="EightCrossEightDotMatrix"
CharacterStrokeColor="#146CED"/>
```

**C#**

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
digital.WidthRequest = 360;
digital.Value = "01-01-18";
digital.CharacterHeight = 90;
digital.CharacterWidth = 25;
digital.HorizontalOptions = LayoutOptions.Center;
digital.VerticalOptions = LayoutOptions.Center;
digital.SegmentStrokeWidth = 3;
digital.CharacterSpacing = 10;
```

```
digital.CharacterType = CharacterType.EightCrossEightDotMatrix;
digital.DisabledSegmentAlpha = 30;
digital.CharacterStrokeColor = Color.FromRgb(20, 108, 237);
digital.DisabledSegmentColor = Color.FromRgb(20, 108, 237);
```

### Customize character segment stroke

The values of digital characters color can be customized using the [CharacterStrokeColor](#) property.

### XML

```
<gauge:SfDigitalGauge Value="1 2 3 4 5" SegmentStrokeWidth="3"
HeightRequest="100" WidthRequest="300"
DisabledSegmentAlpha="20" DisabledSegmentColor="#146CED"
CharacterHeight="90" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="SegmentSeven"
CharacterStrokeColor="Purple"/>
```

### C#

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
digital.WidthRequest = 300;
digital.Value = "1 2 3 4 5";
digital.CharacterHeight = 90;
digital.CharacterWidth = 25;
digital.HorizontalOptions = LayoutOptions.Center;
digital.VerticalOptions = LayoutOptions.Center;
digital.SegmentStrokeWidth = 3;
digital.CharacterType = CharacterType.SegmentSeven;
digital.DisabledSegmentAlpha = 20;
digital.CharacterStrokeColor = Color.Purple;
digital.DisabledSegmentColor = Color.FromRgb(20, 108, 237);
```

### Customize disabled segment

You can customize the color and opacity of disabled segments using the [DisabledSegmentColor](#) and [DisabledSegmentAlpha](#) properties. The width of the digital character value can be customized using the [SegmentStrokeWidth](#) property.

#### XML

```
<gauge:SfDigitalGauge Value="1 2 3 4 5" SegmentStrokeWidth="5"
HeightRequest="100" WidthRequest="300"
DisabledSegmentAlpha="25" DisabledSegmentColor="LightSkyBlue"
CharacterHeight="90" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="SegmentSeven"
CharacterStrokeColor="#146CED"/>
```

#### C#

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
digital.WidthRequest = 300;
this.BackgroundColor = Color.White;
digital.Value = "1 2 3 4 5";
digital.CharacterHeight = 90;
digital.CharacterWidth = 25;
digital.HorizontalOptions = LayoutOptions.Center;
digital.VerticalOptions = LayoutOptions.Center;
digital.SegmentStrokeWidth = 5;
digital.CharacterType = CharacterType.SegmentSeven;
digital.DisabledSegmentAlpha = 25;
digital.CharacterStrokeColor = Color.FromRgb(20, 108, 237);
digital.DisabledSegmentColor = Color.LightSkyBlue;
```

### Customize background color of digital gauge

You can customize the background color of the digital gauge using the [BackgroundColor](#) property.

#### XML

```
<gauge:SfDigitalGauge Value="1 2 3 4 5" SegmentStrokeWidth="5"
HeightRequest="100" WidthRequest="300"
DisabledSegmentAlpha="25" DisabledSegmentColor="LightSkyBlue"
CharacterHeight="90" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="SegmentSeven" BackgroundColor="LightPink"
CharacterStrokeColor="#146CED"/>
```

**C#**

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
digital.WidthRequest = 300;
this.BackgroundColor = Color.White;
digital.Value = "1 2 3 4 5";
digital.CharacterHeight = 90;
digital.CharacterWidth = 25;
digital.HorizontalOptions = LayoutOptions.Center;
digital.VerticalOptions = LayoutOptions.Center;
digital.SegmentStrokeWidth = 5;
digital.CharacterType = CharacterType.SegmentSeven;
digital.DisabledSegmentAlpha = 25;
digital.CharacterStrokeColor = Color.FromRgb(20, 108, 237);
digital.DisabledSegmentColor = Color.LightSkyBlue;
digital.BackgroundColor = Color.LightPink;
```

**Character types**

The digital characters can be drawn in the following four different segments:

- Seven
- Fourteen
- Sixteen
- EightCrossEightDotMatrix

**Seven segment**

The seven-segment type is capable of displaying numbers and a few uppercase letters efficiently.

**XML**

```
<gauge:SfDigitalGauge Value="SYNCFUSION" SegmentStrokeWidth="4"
HeightRequest="100" WidthRequest="340"
DisabledSegmentAlpha="25" DisabledSegmentColor="Gray"
CharacterHeight="90" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="SegmentSeven"
CharacterStrokeColor="#146CED"/>
```

**C#**

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
```

```
digital.WidthRequest = 340;  
digital.Value = "SYNCFUSION";  
digital.CharacterHeight = 90;  
digital.CharacterWidth = 25;  
digital.HorizontalOptions = LayoutOptions.Center;  
digital.VerticalOptions = LayoutOptions.Center;  
digital.SegmentStrokeWidth = 4;  
digital.CharacterType = CharacterType.SegmentSeven;  
digital.DisabledSegmentAlpha = 25;  
digital.CharacterStrokeColor = Color.FromRgb(20, 108, 237);  
digital.DisabledSegmentColor = Color.Gray;
```

The image shows the word "SYNCFUSION" rendered in a digital font style using a fourteen-segment character type. The characters are composed of blue segments on a light gray background. The font is clean and modern, with a slight shadow effect behind the characters.

#### Fourteen segment

The fourteen-segment type is capable of displaying numbers and alphabet efficiently.

The image shows the word "SYNCFUSION" rendered in a digital font style using a sixteen-segment character type. The characters are composed of blue segments on a light gray background. The font is clean and modern, with a slight shadow effect behind the characters.

#### Sixteen segment

The sixteen-segment type is capable of displaying numbers and alphabet clearly.

The image shows the word "SYNCFUSION" rendered in a digital font style using an EightCrossEightDotMatrix character type. The characters are composed of blue segments on a light gray background. The font is clean and modern, with a slight shadow effect behind the characters.

#### EightCrossEightDotMatrix segment

The dot matrix segment type is capable of displaying numbers, alphabet, and special characters efficiently.

### Display value types

The digital gauge displays numbers, alphabet, and special characters, which are given in the value property.

#### Setting value to number

Numbers can be displayed in digital gauge in different formats using the `CharacterType` property.

#### XML

```
<gauge:SfDigitalGauge Value="12 34 56" SegmentStrokeWidth="3"
HeightRequest="100" WidthRequest="330"
DisabledSegmentAlpha="25" DisabledSegmentColor="DarkGoldenrod"
CharacterHeight="90" CharacterWidth="30"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="SegmentSeven"
CharacterStrokeColor="DarkGoldenrod"/>
```

#### C#

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
digital.WidthRequest = 330;
digital.Value = "12 34 56";
digital.CharacterHeight = 90;
digital.CharacterWidth = 30;
digital.HorizontalOptions = LayoutOptions.Center;
digital.VerticalOptions = LayoutOptions.Center;
digital.SegmentStrokeWidth = 3;
digital.CharacterType = CharacterType.SegmentSeven;
digital.DisabledSegmentAlpha = 25;
digital.CharacterStrokeColor = Color.DarkGoldenrod;
digital.DisabledSegmentColor = Color.DarkGoldenrod;
```

#### Setting value to alphabet

Alphabet can be displayed in digital gauge using any one of the character format types.

**XML**

```
<gauge:SfDigitalGauge Value="SYNCFUSION" SegmentStrokeWidth="3"
HeightRequest="100" WidthRequest="340"
DisabledSegmentAlpha="25" DisabledSegmentColor="Green"
CharacterHeight="90" CharacterWidth="25"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="SegmentSixteen"
CharacterStrokeColor="Green"/>
```

**C#**

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
digital.WidthRequest = 340;
digital.Value = "SYNCFUSION";
digital.CharacterHeight = 90;
digital.CharacterWidth = 25;
digital.HorizontalOptions = LayoutOptions.Center;
digital.VerticalOptions = LayoutOptions.Center;
digital.SegmentStrokeWidth = 3;
digital.CharacterType = CharacterType.SegmentSixteen;
digital.DisabledSegmentAlpha = 25;
digital.CharacterStrokeColor = Color.Green;
digital.DisabledSegmentColor = Color.Green;
```

## Setting value to special characters

Special characters can also be displayed in digital gauge using the EightCrossEightDotMatrix character format type.

**XML**

```
<gauge:SfDigitalGauge Value="@ # $ % *" SegmentStrokeWidth="3"
HeightRequest="100" WidthRequest="350"
DisabledSegmentAlpha="25" DisabledSegmentColor="Red"
CharacterHeight="90" CharacterWidth="30"
HorizontalOptions="Center" VerticalOptions="Center"
CharacterType="EightCrossEightDotMatrix"
CharacterStrokeColor="Red"/>
```

**C#**

```
SfDigitalGauge digital = new SfDigitalGauge();
digital.HeightRequest = 100;
digital.WidthRequest = 350;
digital.Value = "@ # $ % *";
```

```
digital.CharacterHeight = 90;  
digital.CharacterWidth = 30;  
digital.HorizontalOptions = LayoutOptions.Center;  
digital.VerticalOptions = LayoutOptions.Center;  
digital.SegmentStrokeWidth = 3;  
digital.CharacterType = CharacterType.EightCrossEightDotMatrix;  
digital.DisabledSegmentAlpha = 25;  
digital.CharacterStrokeColor = Color.Red;  
digital.DisabledSegmentColor = Color.Red;
```

## SfEffectsView

### Overview

The Effects View is a container control that provides modern effects like ripple, selection, scaling, and rotation. Users can render these effects through touch interactions such as touch down, touch up, long press, and also by calling the APIs.

ROTATE TO 180°

### Key features

- Supports highlight and ripple animation.
- Supports selection effect with built-in support for notifications during selection state changes.
- Provides scale down, scale up, and rotation effects.

### Getting Started

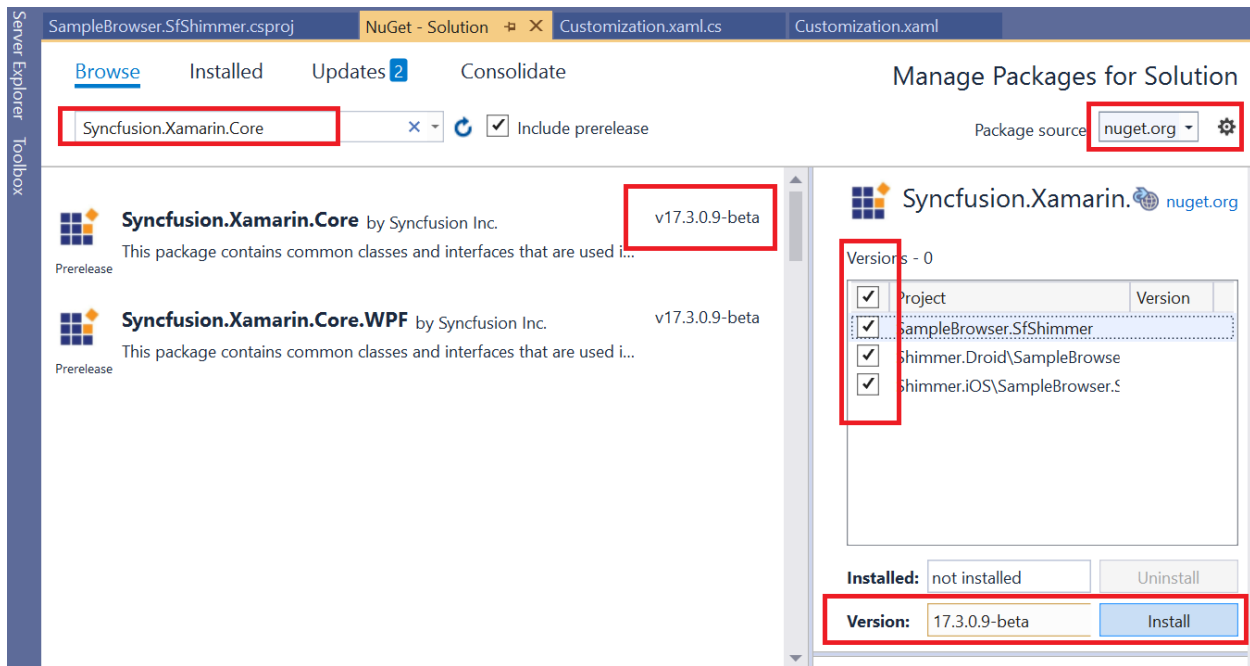

This section explains the steps required to configure the SfEffectsView control.

#### Adding SfEffectsView reference

You can add SfEffectsView reference using one of the following methods:

##### Method 1: Adding SfEffectsView reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Core). To add SfEffectsView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Core](https://www.nuget.org/packages/Syncfusion.Xamarin.Core), and then install it.

**Note:** SfEffectsView is supported in Android and iOS.

### Method 2: Adding SfEffectsView reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfEffectsView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfEffectsView assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching an application on each platform with SfEffectsView

To use the SfEffectsView inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and are discussed in the following sections:

---

**Note:** If you are adding the references from toolbox, the following steps are not needed.

---

#### iOS

To launch the SfEffectsView in iOS, call the `SfEffectsViewRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    global::Xamarin.Forms.Forms.Init();
    SfEffectsViewRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### Android

Android platform does not require any additional configuration to render the SfEffectsView control.

#### Initializing SfEffectsView

Import the [SfEffectsView](#) control namespace in respective page as demonstrated in the following code sample.

#### XML

```
xmlns:sfEffectsView="clr-
namespace:Syncfusion.XForms.EffectsView;assembly=Syncfusion.Core.XForms"
```

#### C#

```
using Syncfusion.XForms.EffectsView;
```

Then, initialize the SfEffectsView as demonstrated in the following code example.

#### XML

```
<sfEffectsView:SfEffectsView x:Name="EffectsView" Margin="0,5,0,10"
CornerRadius="0,25,0,25"
RippleAnimationDuration="800">
    <Grid>
        <sfBorder:SfBorder BackgroundColor="#2196F3" BorderColor="Transparent"
BorderWidth="0">
            ...
        </sfBorder:SfBorder>
    </Grid>
</sfEffectsView:SfEffectsView>
```

**C#**

```
SfEffectsView effectsView = new SfEffectsView();
effectsView.Margin = new Thickness(0, 5, 0, 10);
effectsView.CornerRadius = new Thickness(0, 25, 0, 25);
effectsView.RippleAnimationDuration = 800;
Grid grid = new Grid();
SfBorder border = new SfBorder();
border.BackgroundColor = Color.FromHex("#2196F3");
border.BorderColor = Color.Transparent;
border.BorderWidth = 0;
...
grid.Children.Add(border);
effectsView.Content = grid;
```

**Effects**

The [SfEffectsView](#) control provides support to ripple effect, highlight effect, and more. This section explains about different effects available in the effects view control.

**Highlight**

**SfEffects.Highlight** is a smooth transition on the background color of the [SfEffectsView](#).

**XML**

```
<sfEffectsView:SfEffectsView TouchDownEffects="Highlight"
HighlightColor="#FF0000">
  <Grid BackgroundColor="White">
    <Grid.ColumnDefinitions>
      <ColumnDefinition Width="3*" />
      <ColumnDefinition Width="7*" />
    </Grid.ColumnDefinitions>
    <Grid.RowDefinitions>
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
    </Grid.RowDefinitions>
    <Image Source="Person.png" Margin="7"
Grid.RowSpan="4" />
    <Label Text="Laura Steffi" Grid.Column="1"
FontAttributes="Bold" Grid.Row="0" VerticalTextAlignment="Center"
Margin="15,0,0,0" Font="17" />
    <Label Text="Data Science Analyst" Grid.Column="1" Grid.Row="1"
VerticalTextAlignment="Center" FontAttributes="Bold"
Margin="15,0,0,0" Font="14" />
```

```
<Label Text="laurasteffi@gmail.com" Grid.Column="1" Grid.Row="2"
VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14"/>
<Label Text="011-253-321" Grid.Column="1" Grid.Row="3"
VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14"/>
</Grid>
</sfEffectsView:SfEffectsView>
```

**C#**

```
var effectsView = new SfEffectsView
{
    HighlightColor = Color.FromHex("#FF0000"),
    TouchDownEffects = SfEffects.Highlight,
};
var grid = new Grid
{
    BackgroundColor = Color.White,
    ColumnDefinitions = new ColumnDefinitionCollection()
    {
        new ColumnDefinition{ Width = new GridLength(3, GridUnitType.Star) },
        new ColumnDefinition{ Width = new GridLength(7, GridUnitType.Star) }
    },
};
var image = new Image
{
    Source = "Person.png",
    Margin = 7
};
var name = new Label
{
    Text = "Laura Steffi",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15,0,0,0),
    FontSize = 17
};
var designation = new Label
{
    Text = "Data Science Analyst",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var email = new Label
{
    Text = "laurasteffi@gmail.com",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var phone = new Label
{
    Text = "011-253-321",
    FontAttributes = FontAttributes.Bold,
```

```

VerticalTextAlignment = TextAlignment.Center,
Margin = new Thickness(15, 0, 0, 0),
FontSize = 14
};
grid.Children.Add(image, 0, 0);
Grid.SetRowSpan(image, 4);
grid.Children.Add(name, 1, 0);
grid.Children.Add(designation, 1, 1);
grid.Children.Add(email, 1, 2);
grid.Children.Add(phone, 1, 3);
effectsView.Content = grid;
this.Content = effectsView;

```

### Ripple

The `SfEffects.Ripple` is a growable circle, which is initially placed on the tapped location, and it grows till the whole layout is filled. `SfEffects.Ripple` is rendered based on [InitialRippleFactor](#).

### XML

```

<sfEffectsView:SfEffectsView HorizontalOptions="Center"
TouchDownEffects="Ripple">
<Label BackgroundColor="#D3D2D5" FontAttributes="Bold" FontSize="18"
HeightRequest="50" HorizontalTextAlignment="Center" Text="Ripple"
VerticalOptions="Center" VerticalTextAlignment="Center" WidthRequest="90" />
</sfEffectsView:SfEffectsView>

```

### C#

```

var effectsView = new SfEffectsView()
{
    TouchDownEffects = SfEffects.Ripple,
    HorizontalOptions = LayoutOptions.Center,
    Content = new Label()
    {
        Text = "Ripple",
        HeightRequest = 50,
        WidthRequest = 90,
        BackgroundColor = Color.FromHex("#D3D2D5"),
        FontAttributes = FontAttributes.Bold,
        FontSize = 18,
    }
};

```

```
HorizontalTextAlignment = TextAlignment.Center,
VerticalTextAlignment = TextAlignment.Center,
VerticalOptions = LayoutOptions.Center,
};
this.Content = effectsView;
```

### Scale

**SfEffects.Scale** is a smooth transition from actual size of the object to the size calculated based on [ScaleFactor](#) in pixels.

### XML

```
<sfEffectsView:SfEffectsView TouchDownEffects="None" TouchUpEffects="None"
LongPressEffects="Scale" ScaleFactor="0.85">
<Image Source="Biscuits.png" Aspect="Fill"/>
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView
{
    ScaleFactor = 0.85,
    TouchDownEffects = SfEffects.None,
    TouchUpEffects = SfEffects.None,
    LongPressEffects = SfEffects.Scale,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;
```

### Selection

**SfEffects.Selection** is a smooth color transition to indicate the view state is moved to selected state.

### XML

```
<sfEffectsView:SfEffectsView SelectionColor="#FF0000"  
LongPressEffects="Selection">  
<Image Source="Biscuits.png" Aspect="Fill"/>  
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView  
{  
    SelectionColor = Color.FromHex("#FF0000"),  
    LongPressEffects = SfEffects.Selection,  
    Content = new Image()  
    {  
        Source = "Biscuits.png",  
        Aspect = Aspect.Fill  
    }  
};  
this.Content = effectsView;
```

### Rotation

`SfEffects.Rotation` provides a circular movement to the [SfEffectsView](#) around the center of the [SfEffectsView](#) based on the specified [Angle](#).

### XML

```
<sfEffectsView:SfEffectsView Angle="180" TouchDownEffects="Rotation">  
<Image Source="Arrow.png" HeightRequest="70" WidthRequest="70"/>  
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView  
{  
    Angle = 180,  
    TouchDownEffects = SfEffects.Rotation,  
    Content = new Image()  
    {  
        Source = "Arrow.png",  
        Aspect = Aspect.Fill  
    }  
};  
this.Content = effectsView;
```

### Combinations

The [SfEffectsView](#) control provides support to apply multiple [SfEffects](#) in combination. The following are some valid combinations of [SfEffects](#):

#### *Highlight and Ripple*

##### **XML**

```
<sfEffectsView:SfEffectsView TouchDownEffects="Highlight,Ripple">
<Label Text="Ripple" FontAttributes="Bold" FontSize="18" HeightRequest="50"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center" />
</sfEffectsView:SfEffectsView>
```

##### **C#**

```
var effectsView = new SfEffectsView()
{
    TouchDownEffects = SfEffects.Highlight | SfEffects.Ripple,
    Content = new Label()
    {
        Text = "Ripple",
        FontAttributes = FontAttributes.Bold,
        FontSize = 18,
        HeightRequest = 50,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center,
    }
};
this.Content = effectsView;
```

#### *Highlight and Selection*

##### **XML**

```
<sfEffectsView:SfEffectsView TouchDownEffects="Highlight"
LongPressEffects="Selection">
<Label Text="Sign up" FontAttributes="Bold" FontSize="18" HeightRequest="50"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center" />
</sfEffectsView:SfEffectsView>
```

##### **C#**

```
var effectsView = new SfEffectsView()
{
    TouchDownEffects = SfEffects.Highlight,
    LongPressEffects = SfEffects.Selection,
    Content = new Label()
    {
        Text = "Sign up",
        HeightRequest = 50,
        FontAttributes = FontAttributes.Bold,
        FontSize = 18,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center,
    }
};
this.Content = effectsView;
```

*Ripple and Selection***XML**

```
<sfEffectsView:SfEffectsView TouchDownEffects="Ripple"
TouchUpEffects="Selection">
<Label Text="Sign up" FontAttributes="Bold" FontSize="18" HeightRequest="50"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center" />
</sfEffectsView:SfEffectsView>
```

**C#**

```
var effectsView = new SfEffectsView()
{
    TouchDownEffects = SfEffects.Ripple,
    TouchUpEffects = SfEffects.Selection,
    Content = new Label()
    {
        Text = "Sign up",
        HeightRequest = 50,
        FontAttributes = FontAttributes.Bold,
        FontSize = 18,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center,
    }
};
this.Content = effectsView;
```

*Highlight, Ripple and Selection***XML**

```
<sfEffectsView:SfEffectsView TouchDownEffects="Highlight,Ripple"
LongPressEffects="Selection">
<Label Text="Sign up" FontAttributes="Bold" FontSize="18" HeightRequest="50"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center" />
</sfEffectsView:SfEffectsView>
```

**C#**

```
var effectsView = new SfEffectsView()
{
    TouchDownEffects = SfEffects.Highlight | SfEffects.Ripple,
    LongPressEffects = SfEffects.Selection,
    Content = new Label()
    {
        Text = "Sign up",
        HeightRequest = 50,
        FontAttributes = FontAttributes.Bold,
        FontSize = 18,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center,
    }
};
this.Content = effectsView;
```

*Scale and Selection***XML**

```
<sfEffectsView:SfEffectsView LongPressEffects="Scale,Selection">
  <Label Text="Sign up" FontAttributes="Bold" FontSize="18" HeightRequest="50"
    HorizontalTextAlignment="Center" VerticalTextAlignment="Center" />
</sfEffectsView:SfEffectsView>
```

**C#**

```
var effectsView = new SfEffectsView()
{
    LongPressEffects = SfEffects.Scale | SfEffects.Selection,
    Content = new Label()
    {
        Text = "Sign up",
        HeightRequest = 50,
        FontAttributes = FontAttributes.Bold,
        FontSize = 18,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center,
    }
};
this.Content = effectsView;
```

## Features in SfEffectsView

The [SfEffectsView](#) control provides the following additional features to enhance the effects.

## FadeOutRipple

By enabling the [FadeOutRipple](#) property of [SfEffectsView](#), the growable circle will lose its opacity to 0.

**XML**

```
<sfEffectsView:SfEffectsView FadeOutRipple="True"
  RippleAnimationDuration="1000">
  <Grid BackgroundColor="White">
    <Grid.ColumnDefinitions>
      <ColumnDefinition Width="3*" />
      <ColumnDefinition Width="7*" />
    </Grid.ColumnDefinitions>
    <Grid.RowDefinitions>
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
    </Grid.RowDefinitions>
    <Image
      Grid.RowSpan="4"
      Margin="7"
      Source="{local:ImageSourceExt SampleBrowser.SfEffectsView.Person.png}" />
    <Label
      Grid.Row="0"
      Grid.Column="1"
      Margin="15,0,0,0"
```

```
Font="17"
FontAttributes="Bold"
Text="Laura Steffi"
VerticalTextAlignment="Center" />
<Label
Grid.Row="1"
Grid.Column="1"
Margin="15,0,0,0"
Font="14"
FontAttributes="Bold"
Text="Data Science Analyst"
VerticalTextAlignment="Center" />
<Label
Grid.Row="2"
Grid.Column="1"
Margin="15,0,0,0"
Font="14"
Text="laurasteffi@gmail.com"
VerticalTextAlignment="Center" />
<Label
Grid.Row="3"
Grid.Column="1"
Margin="15,0,0,0"
Font="14"
Text="011-253-321"
VerticalTextAlignment="Center" />
</Grid>
</sfEffectsView:SfEffectsView>
```

## C#

```
var effectsView = new SfEffectsView
{
    FadeOutRipple = true,
    RippleAnimationDuration = 1000
};
var grid = new Grid
{
    BackgroundColor = Color.White,
    ColumnDefinitions = new ColumnDefinitionCollection()
    {
        new ColumnDefinition{ Width = new GridLength(3, GridUnitType.Star) },
        new ColumnDefinition{ Width = new GridLength(7, GridUnitType.Star) }
    },
};
var image = new Image
{
    Source = "Person.png",
    Margin = 7
};
var name = new Label
{
    Text = "Laura Steffi",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
```

```
FontSize = 17
};
var designation = new Label
{
    Text = "Data Science Analyst",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var email = new Label
{
    Text = "laurasteffi@gmail.com",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var phone = new Label
{
    Text = "011-253-321",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
grid.Children.Add(image, 0, 0);
Grid.SetRowSpan(image, 4);
grid.Children.Add(name, 1, 0);
grid.Children.Add(designation, 1, 1);
grid.Children.Add(email, 1, 2);
grid.Children.Add(phone, 1, 3);
effectsView.Content = grid;
this.Content = effectsView;
```

### IsSelected

Enabling the [IsSelected](#) property of [SfEffectsView](#) sets the view state as selected.

### XML

```
<sfEffectsView:SfEffectsView IsSelected="true" LongPressEffects="Selection">
<Image Source="Biscuits.png" Aspect="Fill"/>
```

```
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView
{
    IsSelected = true,
    LongPressEffects = SfEffects.Selection,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;
```

### ShouldIgnoreTouches

Enabling the [ShouldIgnoreTouches](#) property of [SfEffectsView](#) cancels the direct interaction of the [SfEffectsView](#).

### XML

```
<sfEffectsView:SfEffectsView ShouldIgnoreTouches="true">
<Image Source="Biscuits.png" Aspect="Fill"/>
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView
{
    ShouldIgnoreTouches = true,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;
```

### Interaction in SfEffectsView

You can set the effects on different interactions. This section explains how to set effects on different interactions available in effects view.

### TouchDownEffects

The [TouchDownEffects](#) property of [SfEffectsView](#) is used to render the effects in touch-down interaction.

### XML

```
<sfEffectsView:SfEffectsView TouchDownEffects="Ripple">
<Image Source="Biscuits.png" Aspect="Fill"/>
</sfEffectsView:SfEffectsView>
```

**C#**

```
var effectsView = new SfEffectsView
{
    TouchDownEffects = SfEffects.Ripple,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;
```

## LongPressEffects

The [LongPressEffects](#) property of [SfEffectsView](#) is used to render the effects in long-press interaction.

**XML**

```
<sfEffectsView:SfEffectsView LongPressEffects="Ripple">
<Image Source="Biscuits.png" Aspect="Fill"/>
</sfEffectsView:SfEffectsView>
```

**C#**

```
var effectsView = new SfEffectsView
{
    LongPressEffects = SfEffects.Ripple,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;
```

## TouchUpEffects

The [TouchUpEffects](#) property of [SfEffectsView](#) is used to render the effects in touch-up interaction.

**XML**

```
<sfEffectsView:SfEffectsView TouchUpEffects="Ripple">
<Image Source="Biscuits.png" Aspect="Fill"/>
</sfEffectsView:SfEffectsView>
```

**C#**

```
var effectsView = new SfEffectsView
{
    TouchUpEffects = SfEffects.Ripple,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
```

```
this.Content = effectsView;
```

## Methods

You can add or remove effect programmatically using the [ApplyEffects](#) or [Reset](#) method.

### ApplyEffects

The [ApplyEffects](#) method is used to trigger the effects rendering with or without repetition. The following are the optional parameters to be passed:

- **effects** - [SfEffects](#) to be applied. By default, [SfEffects.Ripple](#) will be applied.
- **rippleStartPosition** - [RippleStartPosition](#) can be left, top, right, bottom, or default. By default, ripple starts from the center.
- **rippleStartPoint** - point at which ripple animation starts. The default value is null.
- **repeat** - bool value used to set whether to repeat the applied effect. The default value is false. Only [SfEffects.Ripple](#) and [SfEffects.Highlight](#) can be repeated.

## XML

```
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto" />
<RowDefinition Height="Auto" />
</Grid.RowDefinitions>
<Grid.ColumnDefinitions>
<ColumnDefinition />
<ColumnDefinition />
</Grid.ColumnDefinitions>
<Grid Grid.ColumnSpan="2">
<sfEffectsView:SfEffectsView
x:Name="effectsView"
RippleAnimationDuration="500"
VerticalOptions="Center">
<Image Aspect="Fill" Source="Biscuits.png" />
</sfEffectsView:SfEffectsView>
</Grid>
<Button
x:Name="ApplyScaleEffectButton"
Grid.Row="1"
BackgroundColor="Accent"
Clicked="ApplyScaleEffectButton_Clicked"
HeightRequest="40"
HorizontalOptions="CenterAndExpand"
Text="Apply Effect"
TextColor="White"
VerticalOptions="CenterAndExpand"
WidthRequest="120" />
<Button
x:Name="ScaleResetButton"
Grid.Row="1"
Grid.Column="1"
BackgroundColor="Accent"
Clicked="ScaleResetButton_Clicked"
HeightRequest="40"
```

```
HorizontalOptions="CenterAndExpand"
Text="Reset"
TextColor="White"
VerticalOptions="Center"
WidthRequest="120" />
</Grid>
```

**C#**

```
private void ApplyEffectClicked(object sender, EventArgs e)
{
    effectsView.ApplyEffects(effects: SfEffects.Ripple, repeat: true);
}
```

**Note:** The [SfEffects](#) applied using [ApplyEffects](#) method will be removed only after calling the [Reset](#) method.

**Reset**

The [Reset](#) method is used to reset the `SfEffects.Highlight` and `SfEffects.Ripple` effects, which are applied using the [ApplyEffects](#) method.

**XML**

```
<Grid>
  <Grid.RowDefinitions>
    <RowDefinition Height="Auto" />
    <RowDefinition Height="Auto" />
  </Grid.RowDefinitions>
  <Grid.ColumnDefinitions>
    <ColumnDefinition />
    <ColumnDefinition />
  </Grid.ColumnDefinitions>
  <Grid Grid.ColumnSpan="2">
    <sfEffectsView:SfEffectsView
      x:Name="effectsView"
      RippleAnimationDuration="500"
      VerticalOptions="Center">
      <Image Aspect="Fill" Source="Biscuits.png" />
    </sfEffectsView:SfEffectsView>
  </Grid>
  <Button
    x:Name="ApplyScaleEffectButton"
    Grid.Row="1"
    BackgroundColor="Accent"
    Clicked="ApplyScaleEffectButton_Clicked"
    HeightRequest="40"
    HorizontalOptions="CenterAndExpand"
    Text="Apply Effect"
    TextColor="White"
    VerticalOptions="CenterAndExpand"
    WidthRequest="120" />
  <Button
    x:Name="ScaleResetButton"
    Grid.Row="1"
    Grid.Column="1"
```

```

BackgroundColor="Accent"
Clicked="ScaleResetButton_Clicked"
HeightRequest="40"
HorizontalOptions="CenterAndExpand"
Text="Reset"
TextColor="White"
VerticalOptions="Center"
WidthRequest="120" />
</Grid>

```

**C#**

```

private void ResetEffectClicked(object sender, EventArgs e)
{
    effectsView.Reset();
}

```

## Customization of SfEffectsView

The [SfEffectsView](#) control provides support to customize the corner radius, animation duration, color, and more. This section explains how to customize the effects view control.

## RippleAnimationDuration

The [RippleAnimationDuration](#) property of [SfEffectsView](#) is used to customize the duration of ripple animation.

**XML**

```

<sfEffectsView:SfEffectsView RippleAnimationDuration="800">
<Image Source="Icon.png" HeightRequest="70" WidthRequest="70"/>
</sfEffectsView:SfEffectsView>

```

**C#**

```

var effectsView = new SfEffectsView()
{
    RippleAnimationDuration = 800,
    Content = new Image()
    {
        Source = "Icon.png",
        HeightRequest = 70,
        WidthRequest = 70
    }
};
this.Content = effectsView;

```

### ScaleAnimationDuration

The [ScaleAnimationDuration](#) property of [SfEffectsView](#) is used to customize the duration of scale animation.

#### XML

```
<sfEffectsView:SfEffectsView ScaleAnimationDuration="800"
LongPressEffects="Scale">
<Image Source="Icon.png" HeightRequest="70" WidthRequest="70"/>
</sfEffectsView:SfEffectsView>
```

#### C#

```
var effectsView = new SfEffectsView()
{
    ScaleAnimationDuration = 800,
    LongPressEffects = SfEffects.Scale,
    Content = new Image()
    {
        Source = "Icon.png",
        HeightRequest = 70,
        WidthRequest = 70
    }
};
this.Content = effectsView;
```

### RotationAnimationDuration

The [RotationAnimationDuration](#) property of [SfEffectsView](#) is used to customize the duration of rotation animation.

#### XML

```
<sfEffectsView:SfEffectsView RotationAnimationDuration="800"
TouchDownEffects="Rotation">
<Image Source="Icon.png" HeightRequest="70" WidthRequest="70"/>
</sfEffectsView:SfEffectsView>
```

#### C#

```
var effectsView = new SfEffectsView()
{
    RotationAnimationDuration = 800,
    LongPressEffects = SfEffects.Rotation,
    Content = new Image()
    {
        Source = "Icon.png",
        HeightRequest = 70,
        WidthRequest = 70
    }
};
this.Content = effectsView;
```

### InitialRippleFactor

The [InitialRippleFactor](#) property of [SfEffectsView](#) is used to customize the initial radius of ripple.

**XML**

```

<sfEffectsView:SfEffectsView InitialRippleFactor="0.1">
<Grid BackgroundColor="#2196F3">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="3*" />
<ColumnDefinition Width="7*" />
</Grid.ColumnDefinitions>
<Grid.RowDefinitions>
<RowDefinition />
<RowDefinition />
<RowDefinition />
<RowDefinition />
</Grid.RowDefinitions>
<Image Source="Person.png" Margin="7"
Grid.RowSpan="4" />
<Label Text="Laura Steffi" Grid.Column="1" TextColor="White"
FontAttributes="Bold" Grid.Row="0" VerticalTextAlignment="Center"
Margin="15,0,0,0" Font="17" />
<Label Text="Data Science Analyst" Grid.Column="1" Grid.Row="1"
TextColor="WhiteSmoke"
VerticalTextAlignment="Center" FontAttributes="Bold"
Margin="15,0,0,0" Font="14" />
<Label Text="laurasteffi@gmail.com" Grid.Column="1" Grid.Row="2"
TextColor="WhiteSmoke"
VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14" />
<Label Text="011-253-321" Grid.Column="1" Grid.Row="3"
TextColor="WhiteSmoke"
VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14" />
</Grid>
</sfEffectsView:SfEffectsView>

```

**C#**

```

var effectsView = new SfEffectsView
{
    InitialRippleFactor = 0.1
};
var grid = new Grid
{
    BackgroundColor = Color.FromHex("#2196F3"),
    ColumnDefinitions = new ColumnDefinitionCollection()
    {
        new ColumnDefinition{ Width = new GridLength(3, GridUnitType.Star) },
        new ColumnDefinition{ Width = new GridLength(7, GridUnitType.Star) }
    },
};
var image = new Image
{
    Source = "Person.png",
    Margin = 7
};
var name = new Label
{
    Text = "Laura Steffi",
    TextColor = Color.White,

```

```

FontAttributes = FontAttributes.Bold,
VerticalTextAlignment = TextAlignment.Center,
Margin = new Thickness(15, 0, 0, 0),
FontSize = 17
};
var designation = new Label
{
    Text = "Data Science Analyst",
    TextColor = Color.WhiteSmoke,
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var email = new Label
{
    Text = "laurasteffi@gmail.com",
    TextColor = Color.WhiteSmoke,
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var phone = new Label
{
    Text = "011-253-321",
    TextColor = Color.WhiteSmoke,
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
grid.Children.Add(image, 0, 0);
Grid.SetRowSpan(image, 4);
grid.Children.Add(name, 1, 0);
grid.Children.Add(designation, 1, 1);
grid.Children.Add(email, 1, 2);
grid.Children.Add(phone, 1, 3);
effectsView.Content = grid;
this.Content = effectsView;

```

### ScaleFactor

The [ScaleFactor](#) property of [SfEffectsView](#) is used to customize the scale of the view.

### XML

```

<sfEffectsView:SfEffectsView TouchDownEffects="None" TouchUpEffects="None"
LongPressEffects="Scale" ScaleFactor="0.85">
<Image Source="Biscuits.png" Aspect="Fill"/>
</sfEffectsView:SfEffectsView>

```

**C#**

```

var effectsView = new SfEffectsView
{
    ScaleFactor = 0.85,
    TouchDownEffects = SfEffects.None,
    TouchUpEffects = SfEffects.None,
    LongPressEffects = SfEffects.Scale,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;

```

**HighlightColor**

The [HighlightColor](#) property of [SfEffectsView](#) is used to customize the color of highlight effect.

**XML**

```

<sfEffectsView:SfEffectsView TouchDownEffects="Highlight"
HighlightColor="#2196F3">
  <Grid BackgroundColor="White">
    <Grid.ColumnDefinitions>
      <ColumnDefinition Width="3*" />
      <ColumnDefinition Width="7*" />
    </Grid.ColumnDefinitions>
    <Grid.RowDefinitions>
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
    </Grid.RowDefinitions>
    <Image Source="Person.png" Margin="7"
Grid.RowSpan="4" />
    <Label Text="Laura Steffi" Grid.Column="1"
FontAttributes="Bold" Grid.Row="0" VerticalTextAlignment="Center"
Margin="15,0,0,0" Font="17" />
    <Label Text="Data Science Analyst" Grid.Column="1" Grid.Row="1"
VerticalTextAlignment="Center" FontAttributes="Bold"
Margin="15,0,0,0" Font="14" />
    <Label Text="laurasteffi@gmail.com" Grid.Column="1" Grid.Row="2"
VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14" />
    <Label Text="011-253-321" Grid.Column="1" Grid.Row="3"
VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14" />
  </Grid>
</sfEffectsView:SfEffectsView>

```

**C#**

```
var effectsView = new SfEffectsView
{
    HighlightColor = Color.FromHex("#2196F3"),
    TouchDownEffects = SfEffects.Highlight,
};
var grid = new Grid
{
    BackgroundColor = Color.White,
    ColumnDefinitions = new ColumnDefinitionCollection()
    {
        new ColumnDefinition{ Width = new GridLength(3, GridUnitType.Star) },
        new ColumnDefinition{ Width = new GridLength(7, GridUnitType.Star) }
    },
};
var image = new Image
{
    Source = "Person.png",
    Margin = 7
};
var name = new Label
{
    Text = "Laura Steffi",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 17
};
var designation = new Label
{
    Text = "Data Science Analyst",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var email = new Label
{
    Text = "laurasteffi@gmail.com",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var phone = new Label
{
    Text = "011-253-321",
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
grid.Children.Add(image, 0, 0);
Grid.SetRowSpan(image, 4);
grid.Children.Add(name, 1, 0);
grid.Children.Add(designation, 1, 1);
```

```
grid.Children.Add(email, 1, 2);  
grid.Children.Add(phone, 1, 3);  
effectsView.Content = grid;  
this.Content = effectsView;
```

### RippleColor

The [RippleColor](#) property of [SfEffectsView](#) is used to customize the color of ripple.

### XML

```
<sfEffectsView:SfEffectsView RippleColor="#2196F3">  
<Image Source="Biscuits.png" Aspect="Fill"/>  
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView  
{  
    RippleColor = Color.FromHex("#2196F3"),  
    Content = new Image()  
    {  
        Source = "Biscuits.png",  
        Aspect = Aspect.Fill  
    }  
};  
this.Content = effectsView;
```

### SelectionColor

The [SelectionColor](#) property of [SfEffectsView](#) is used to customize the color of selection effect.

### XML

```
<sfEffectsView:SfEffectsView SelectionColor="#2196F3"
LongPressEffects="Selection">
<Image Source="Biscuits.png" Aspect="Fill"/>
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView
{
    SelectionColor = Color.FromHex("#2196F3"),
    LongPressEffects = SfEffects.Selection,
    Content = new Image()
    {
        Source = "Biscuits.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;
```

### CornerRadius

The [CornerRadius](#) property of [SfEffectsView](#) is used to customize the corner radius of the [SfEffectsView](#) control.

### XML

```
<sfEffectsView:SfEffectsView CornerRadius="0,25">
  <Grid BackgroundColor="#2196F3">
    <Grid.ColumnDefinitions>
      <ColumnDefinition Width="3*" />
      <ColumnDefinition Width="7*" />
    </Grid.ColumnDefinitions>
    <Grid.RowDefinitions>
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
      <RowDefinition />
    </Grid.RowDefinitions>
    <Image Source="Person.png" Margin="7"
      Grid.RowSpan="4" />
    <Label Text="Laura Steffi" Grid.Column="1" TextColor="White"
      FontAttributes="Bold" Grid.Row="0" VerticalTextAlignment="Center"
      Margin="15,0,0,0" Font="17" />
    <Label Text="Data Science Analyst" Grid.Column="1" Grid.Row="1"
      TextColor="WhiteSmoke"
      VerticalTextAlignment="Center" FontAttributes="Bold"
      Margin="15,0,0,0" Font="14" />
    <Label Text="laurasteffi@gmail.com" Grid.Column="1" Grid.Row="2"
      TextColor="WhiteSmoke"
      VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14" />
    <Label Text="011-253-321" Grid.Column="1" Grid.Row="3"
      TextColor="WhiteSmoke"
      VerticalTextAlignment="Center" Margin="15,0,0,0" Font="14" />
  </Grid>
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView
{
    CornerRadius = new Thickness(0, 25)
};
var grid = new Grid
{
    BackgroundColor = Color.FromHex("#2196F3"),
    ColumnDefinitions = new ColumnDefinitionCollection()
    {
        new ColumnDefinition{ Width = new GridLength(3, GridUnitType.Star) },
        new ColumnDefinition{ Width = new GridLength(7, GridUnitType.Star) }
    },
};
var image = new Image
{
    Source = "Person.png",
    Margin = 7
};
```

```
var name = new Label
{
    Text = "Laura Steffi",
    TextColor = Color.White,
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 17
};
var designation = new Label
{
    Text = "Data Science Analyst",
    TextColor = Color.WhiteSmoke,
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var email = new Label
{
    Text = "laurasteffi@gmail.com",
    TextColor = Color.WhiteSmoke,
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
var phone = new Label
{
    Text = "011-253-321",
    TextColor = Color.WhiteSmoke,
    FontAttributes = FontAttributes.Bold,
    VerticalTextAlignment = TextAlignment.Center,
    Margin = new Thickness(15, 0, 0, 0),
    FontSize = 14
};
grid.Children.Add(image, 0, 0);
Grid.SetRowSpan(image, 4);
grid.Children.Add(name, 1, 0);
grid.Children.Add(designation, 1, 1);
grid.Children.Add(email, 1, 2);
grid.Children.Add(phone, 1, 3);
effectsView.Content = grid;
this.Content = effectsView;
```

### Angle

The [Angle](#) property of [SfEffectsView](#) is used to customize the rotation angle.

### XML

```
<sfEffectsView:SfEffectsView Angle="180" TouchDownEffects="Ripple,Rotation">
  <Image Source="Arrow.png" HeightRequest="70" WidthRequest="70"/>
</sfEffectsView:SfEffectsView>
```

### C#

```
var effectsView = new SfEffectsView
{
    Angle = 180,
    TouchDownEffects = SfEffects.Ripple | SfEffects.Rotation,
    Content = new Image()
    {
        Source = "Arrow.png",
        Aspect = Aspect.Fill
    }
};
this.Content = effectsView;
```

ROTATE TO 180°

## SfExpander

### Getting started

The Expander control provides a way to expand and collapse when tapping a header. This section provides a quick overview for working with the `SfExpander` for Xamarin.Forms. This section covers the minimal features that you need to know to get started with the Expander.

### Assembly deployment

After installing Essential Studio for Xamarin, you can find all the required assemblies in the installation folders, {Syncfusion Essential Studio Installed location} \Essential Studio\16.x.x.x\Xamarin\lib

Eg: C:\Program Files (x86) \Syncfusion\Essential Studio\16.1.0.24\Xamarin\lib

---

**Note:** Assemblies can be found in unzipped package location in Mac.

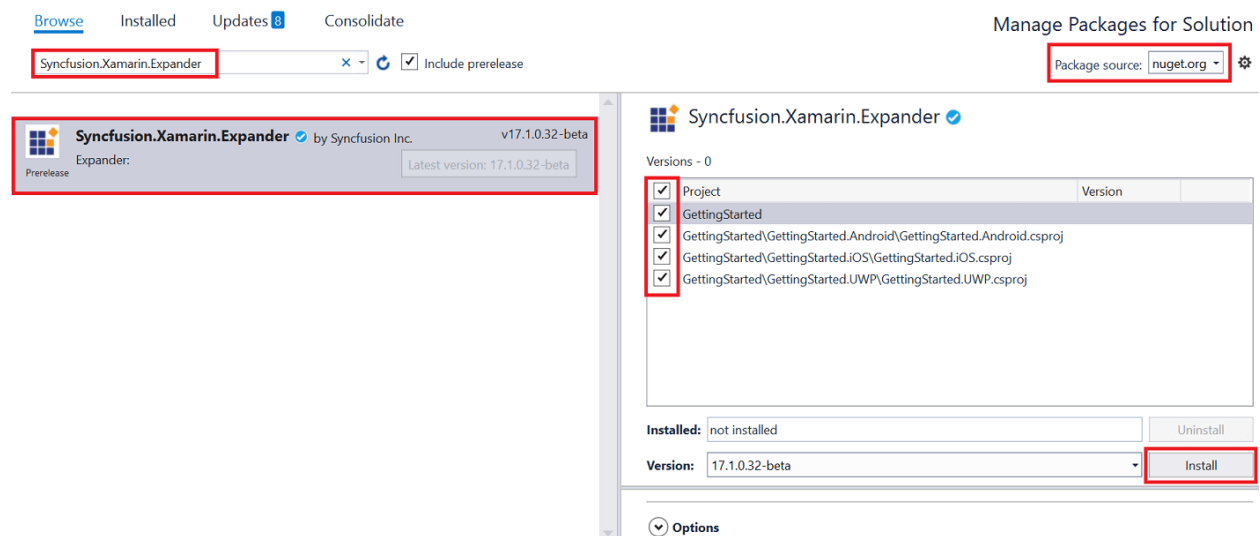

---

### Adding SfExpander reference

You can add SfExpander reference using one of the following methods:

#### Method 1: Adding SfExpander reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Expander). To add SfExpander to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Expander](https://www.nuget.org/packages/Syncfusion.Xamarin.Expander), and then install it.

---

**Note:** Install the same version of Expander NuGet in all the projects.

---

#### Method 2: Adding SfExpander reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfExpander control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfExpander assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Expander.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Expander.XForms.dll Syncfusion.Expander.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Expander.XForms.dll Syncfusion.Expander.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Expander.XForms.dll Syncfusion.Expander.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the expander on each platform

To use the expander in an application, each platform application must initialize the expander renderer. This initialization step varies from platform to platform and is discussed in the following sections:

#### Android

The Android launches the expander without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the expander in iOS, call the `SfExpanderRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework initialization and before the `LoadApplication` is called, as demonstrated in the following code example:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.XForms.iOS.Expander.SfExpanderRenderer.Init();
}
```

```
LoadApplication (new App ());  
...  
}
```

### Universal Windows Platform (UWP)

The UWP launches the expander without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

### ReleaseMode issue in UWP platform

The known Framework issue in UWP platform is that the custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the expander assemblies in **App.xaml.cs** file in UWP project as in the following code snippet:

### C#

```
// In App.xaml.cs  
protected override void OnLaunched(LaunchActivatedEventArgs e)  
{  
    ...  
    rootFrame.NavigationFailed += OnNavigationFailed;  
    // you'll need to add `using System.Reflection;`  
    List<Assembly> assembliesToInclude = new List<Assembly>();  
    //Now, add all the assemblies your app uses  
    assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Expander.SfExpanderRender  
er).GetType().Assembly);  
    // replaces Xamarin.Forms.Forms.Init(e);  
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);  
    ...  
}
```

### Creating the Expander

This section explains how to create a simple Xamarin.Forms application with [SfExpander](#). The control should be configured entirely in C# code or by using XAML markup.

- Creating the project.
- Adding expander in Xamarin.Forms.
- Defining expander.

### Creating the project

Create a new blank (.Net Standard) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding expander in Xamarin.Forms:

To add the expander to your application, follow the steps:

1. Add required assemblies as discussed in assembly deployment section.
2. Import the control namespace as `xmlns:syncfusion="clr-namespace:Syncfusion.XForms.Expander;assembly=Syncfusion.Expander.XForms"` in XAML Page.
3. Create an instance of expander control and add as content for content page.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.Expander;assembly=Syncfusion.Expander.XForms">
<ContentPage.Content>
<syncfusion:SfExpander x:Name="expander"/>
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.Expander;
using Xamarin.Forms;
namespace GettingStarted
{
public partial class MainPage : ContentPage
{
SfExpander expander;
public MainPage()
{
InitializeComponent();
expander = new SfExpander();
}
}
}
```

*Defining expander*

**SfExpander** is a layout control comprise of Header and Content. You can load any View in [Header](#) and [Content](#). Content visibility of expander can be set by using **IsExpanded** property of Expander. User can expand or collapse the Content view by tapping Header.

Here, Labels are loaded in Header and Content of expander.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.Expander;assembly=Syncfusion.Expander.XForms">
<ContentPage.Content>
<ScrollView BackgroundColor="#EDF2F5" Grid.Row="1">
<StackLayout>
<syncfusion:SfExpander>
<syncfusion:SfExpander.Header>
<Label TextColor="#495F6E" Text="Veg Pizza" VerticalTextAlignment="Center"
/>
</syncfusion:SfExpander.Header>
<syncfusion:SfExpander.Content>
```

```
<Grid Padding="10,10,10,10" BackgroundColor="#FFFFFF">
<Label TextColor="#303030" Text="Veg pizza is prepared with the items that
meet vegetarian standards by not including any meat or animal tissue
products." HeightRequest="50" VerticalTextAlignment="Center"/>
</Grid>
</syncfusion:SfExpander.Content>
</syncfusion:SfExpander>
<syncfusion:SfExpander>
<syncfusion:SfExpander.Header>
<Label TextColor="#495F6E" Text="Non-veg Pizza"
VerticalTextAlignment="Center" />
</syncfusion:SfExpander.Header>
<syncfusion:SfExpander.Content>
<Grid Padding="10,10,10,10" BackgroundColor="#FFFFFF">
<Label TextColor="#303030" Text="Non-veg pizza is prepared by including the
meat and animal tissue products." HeightRequest="50"
VerticalTextAlignment="Center"/>
</Grid>
</syncfusion:SfExpander.Content>
</syncfusion:SfExpander>
</StackLayout>
</ScrollView>
</ContentPage.Content>
</ContentPage>
```

Now, run the application to render the following output.

### ^ Veg Pizza

Veg pizza is prepared with the items that meet vegetarian standards by not including any meat or animal tissue products.

### ^ Non-veg Pizza

Non-veg pizza is prepared by including the meat and animal tissue products.

You can download expander sample for Xamarin.Forms from here [ExpanderGettingStarted](#).

### Animation duration

**SfExpander** allows to customize the expanding and collapsing duration by using [AnimationDuration](#) property. By default, the animation duration is 150 milliseconds.

#### XML

```
<syncfusion:SfExpander x:Name="expander" AnimationDuration="250"/>
```

#### C#

```
expander.AnimationDuration = 250;
```

### Animation easing

**SfExpander** allows to customize the rate of change of parameter over time or animation style by using [AnimationEasing](#) property. By default, the animation easing is **Linear**.

#### XML

```
<syncfusion:SfExpander x:Name="expander" AnimationEasing="SinOut"/>
```

#### C#

```
expander.AnimationEasing =  
Syncfusion.XForms.Expander.AnimationEasing.SinOut;
```

### Expand and Collapse

**SfExpander** allows to programmatically expand and collapse by using [IsExpanded](#) property of **SfExpander**. Also, expand & collapse interaction by user can be control by handling **Expanding** and **Collapsing** events.

#### XML

```
<syncfusion:SfExpander x:Name="expander" IsExpanded="True"/>
```

#### C#

```
expander.IsExpanded = true;
```

### Appearance

The **Expander** allows customizing appearance of the Icon, and provides various functionalities to the end-user.

### Header icon position

The [SfExpander](#) allows to customize the position of the header icon by using [HeaderIconPosition](#) property. By default, the header icon position is **Start**.

#### XML

```
<syncfusion:SfExpander x:Name="expander" HeaderIconPosition="End" />
```

#### C#

```
expander.HeaderIconPosition = Syncfusion.XForms.Expander.IconPosition.End;
```

### Header background color customization

The [SfExpander](#) allows to customize the background color of the expander header by using [HeaderBackgroundColor](#) property.

#### XML

```
<syncfusion:SfExpander x:Name="expander" HeaderBackgroundColor="Pink"/>
```

#### C#

```
expander.HeaderBackgroundColor = Color.Pink;
```

### Icon color customization

The [SfExpander](#) allows to customize the color of the expander icon by using [IconColor](#) property. By default, [IconColor](#) is black.

#### XML

```
<syncfusion:SfExpander x:Name="expander" IconColor="Accent"/>
```

#### C#

```
expander.IconColor = Color.Accent;
```

### Visual State Manager

The appearance of the [SfExpander](#) can be customized using the following two [VisualStates](#):

- Expanded
- Collapsed

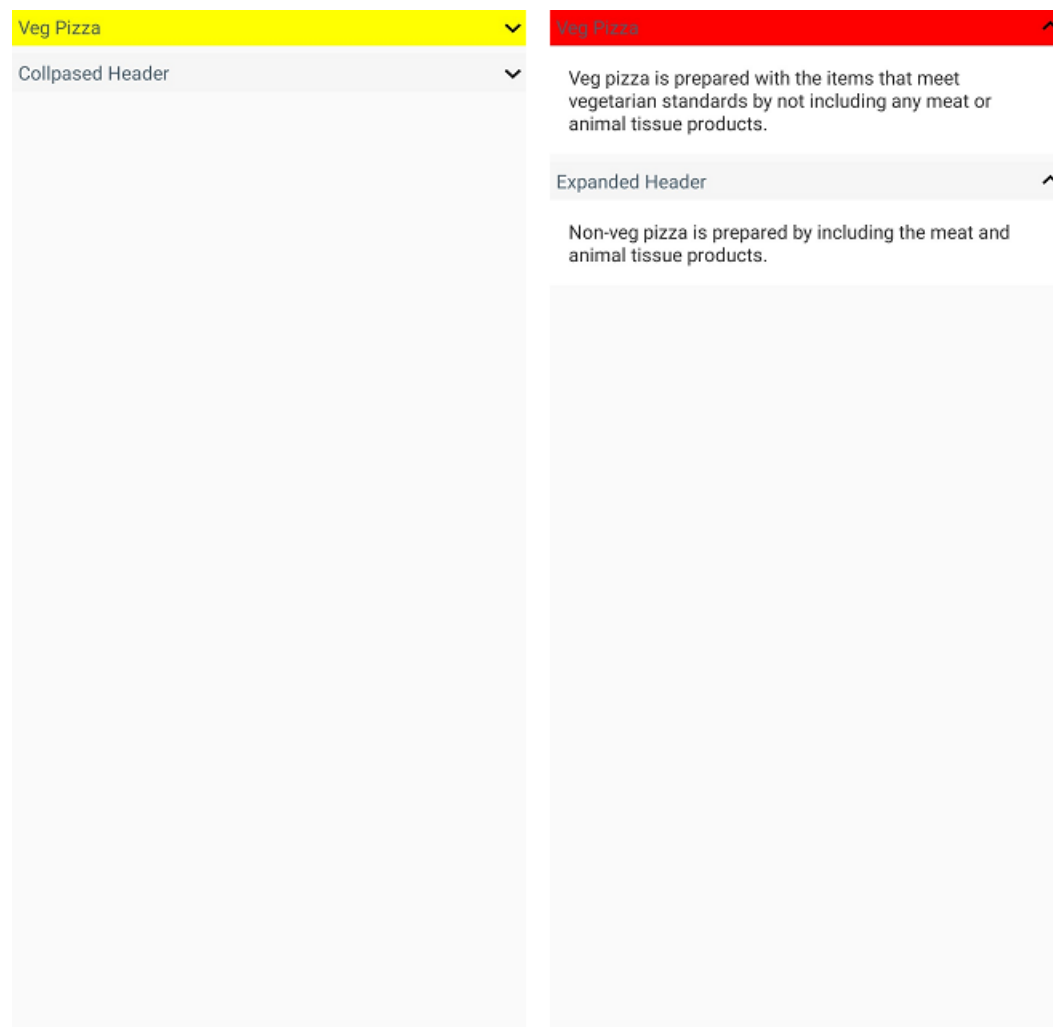

#### XML

```
<syncfusion:SfExpander x:Name="expander">
  <syncfusion:SfExpander.Header>
    <Label Text="Veg Pizza" VerticalTextAlignment="Center"/>
  </syncfusion:SfExpander.Header>
  <syncfusion:SfExpander.Content>
    <Label HeightRequest="50" Text="Veg pizza is prepared with the items that
    meet vegetarian standards by not including any meat or animal tissue
    products." VerticalTextAlignment="Center"/>
  </syncfusion:SfExpander.Content>
  <VisualStateManager.VisualStateGroups>
    <VisualStateGroupList>
      <VisualStateGroup>
        <VisualState Name="Expanded">
          <VisualState.Setters>
            <Setter Property="HeaderBackgroundColor" Value="Red"/>
          </VisualState.Setters>
        </VisualState>
        <VisualState Name="Collapsed">
```

```
<VisualState.Setters>
<Setter Property="HeaderBackgroundColor" Value="Green"/>
</VisualState.Setters>
</VisualState>
</VisualStateGroup>
</VisualStateGroupList>
</VisualStateManager.VisualStateGroups>
</syncfusion:SfExpander>
```

## C#

```
SfExpander expander = new SfExpander();
expander.Header = new Label()
{
    Text="Veg Pizza"
};
expander.Content = new Label()
{
    Text="Veg pizza is prepared with the items that meet vegetarian standards by not including any meat or animal tissue products."
};
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState expanded = new VisualState
{
    Name = "Expanded"
};
expanded.Setters.Add(new Setter { Property =
SfExpander.HeaderBackgroundColorProperty, Value = Color.Red });
expanded.Setters.Add(new Setter { Property =
SfExpander.HeaderBackgroundColorProperty, Value = Color.Red });
VisualState collapsed = new VisualState
{
    Name = "Collapsed"
};
collapsed.Setters.Add(new Setter { Property =
SfExpander.HeaderBackgroundColorProperty, Value = Color.Green });
collapsed.Setters.Add(new Setter { Property =
SfExpander.HeaderBackgroundColorProperty, Value = Color.Green });
commonStateGroup.States.Add(expanded);
commonStateGroup.States.Add(collapsed);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(expander, visualStateGroupList);
this.Content = expander;
```

You can download the entire source of this demo from [here](#).

## SfGradientView

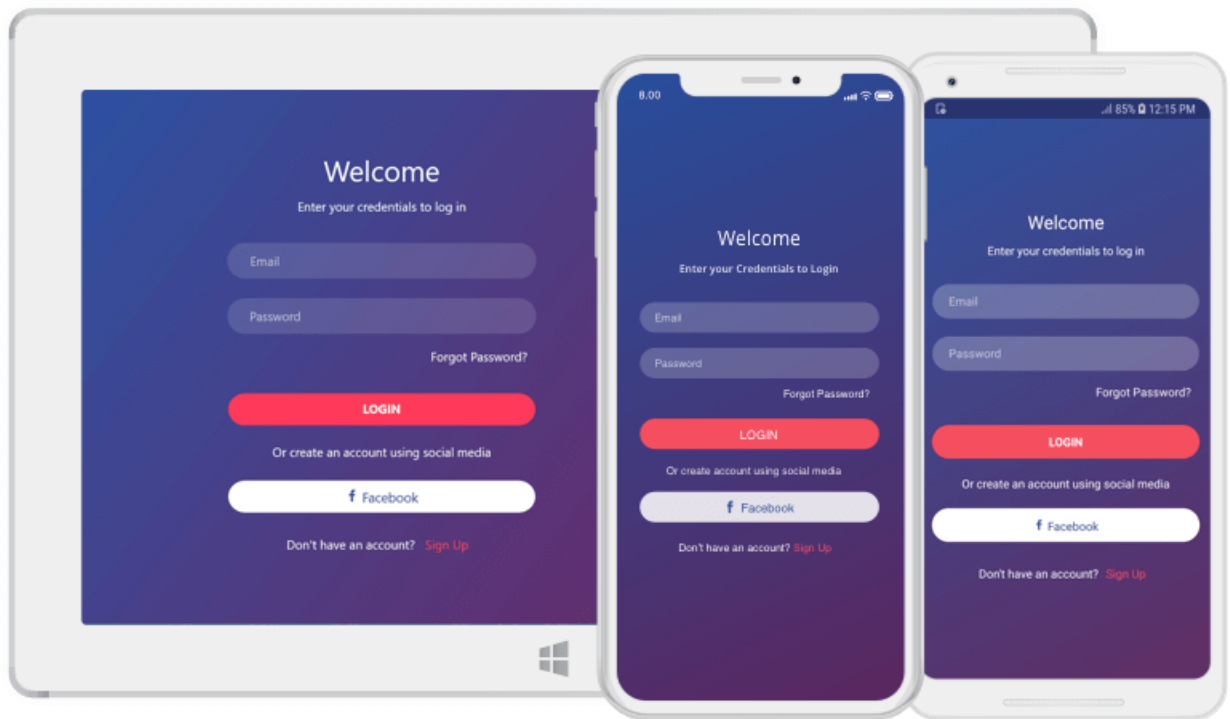

### Overview

The Xamarin.Forms SfGradientView control provides the gradient background to various views of applications. The SfGradientView control supports the following two types of gradient:

- Linear gradient
- Radial gradient

### Key Features

- Customize the background with a linear gradient. To create a linear gradient effect you must define at least two color stops.
- Customize the background with a radial gradient. To create a radial gradient effect you must define at least two color stops.

## Getting Started

This section explains the steps required to work with the gradient view control for Xamarin.Forms.

### Adding SfGradientView reference

You can add SfGradientView reference using one of the following methods:

#### Method 1: Adding SfGradientView reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Core). To add SfGradientView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Core](https://www.nuget.org/packages/Syncfusion.Xamarin.Core), and then install it.

![Xamarin Forms SfGradientView Nuget reference](images/Adding SfGradientView reference.png)

---

**Note:** Install the same version of Syncfusion.Core.XForms NuGet in all the projects.

---

#### Method 2: Adding SfGradientView reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfGradientView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfGradientView assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
-----	--

Android	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v17.1.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

Launching an application on each platform with SfGradientView.

To use the SfGradientView control inside an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the SfGradientView in iOS, call the `SfGradientViewRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms Framework` has been initialized and before the `LoadApplication` is called, as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.XForms.iOS.Graphics.SfGradientViewRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

#### Universal Windows Platform (UWP)

You need to initialize the gradient view assemblies in `App.xaml.cs` in UWP project as demonstrated in the following code samples. This is required to deploy the application with gradient view in Release mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
```

```
{
...
rootFrame.NavigationFailed += OnNavigationFailed;
// Add `using System.Reflection;`
List<Assembly> assembliesToInclude = new List<Assembly>();
// Now, add all the assemblies your app uses
assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Graphics.SfGradientView
Renderer).GetTypeInfo().Assembly);
// Replaces Xamarin.Forms.Forms.Init(e);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
...
}
```

### Android

The Android platform does not require any additional configuration to render the gradient view.

### Adding Gradient View

The **SfGradientView** control is configured entirely in C# code or in XAML markup. The **SfGradientView** supports linear gradient and radial gradient. Each gradient is a collection of gradient stops which used to set colors with different offsets. The following steps explain how to create a **SfGradientView** and configure its elements.

### Adding namespace for referred assemblies

#### XML

```
xmlns:gradient="clr-
namespace:Syncfusion.XForms.Graphics;assembly=Syncfusion.Core.XForms"
```

#### C#

```
using Syncfusion.XForms.Graphics;
```

### Adding Linear Gradient Brush

**SfLinearGradientBrush** is used to create linear gradient effects.

#### XML

```
<Grid>
<gradient:SfGradientView>
<gradient:SfGradientView.BackgroundBrush>
<gradient:SfLinearGradientBrush>
<gradient:SfLinearGradientBrush.GradientStops>
<gradient:SfGradientStop Color="#2d265b" Offset="0.0" />
<gradient:SfGradientStop Color="#b8495c" Offset="1.0" />
</gradient:SfLinearGradientBrush.GradientStops>
</gradient:SfLinearGradientBrush>
</gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
</Grid>
```

#### C#

```
using Xamarin.Forms;
using Syncfusion.XForms.Graphics;
```

```
using System;
namespace GradientViewGettingStarted
{
    public partial class MainPage : ContentPage
    {
        Public MainPage()
        {
            InitializeComponent();
            Grid grid = new Grid();
            SfGradientView gradientView = new SfGradientView();
            SfLinearGradientBrush linearGradientBrush = new SfLinearGradientBrush();
            linearGradientBrush.GradientStops = new GradientStopCollection()
            {
                new SfGradientStop() { Color = Color.FromHex("#2d265b"), Offset=0.0},
                new SfGradientStop() { Color = Color.FromHex("#b8495c"), Offset=1.0},
            };
            gradientView.BackgroundBrush = linearGradientBrush;
            grid.Children.Add(gradientView);
            this.Content = grid;
        }
    }
}
```

#### Adding Radial Gradient Brush

**SfRadialGradientBrush** is used to create radial gradient effects.

#### XML

```
<Grid>
    <gradient:SfGradientView>
```

```
<gradient:SfGradientView.BackgroundBrush>
<gradient:SfRadialGradientBrush>
<gradient:SfRadialGradientBrush.GradientStops>
<gradient:SfGradientStop Color="Red" Offset="0.0" />
<gradient:SfGradientStop Color="Yellow" Offset="0.5" />
<gradient:SfGradientStop Color="LightGreen" Offset="1.0" />
</gradient:SfRadialGradientBrush.GradientStops>
</gradient:SfRadialGradientBrush>
</gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
</Grid>
```

## C#

```
using Xamarin.Forms;
using Syncfusion.XForms.Graphics;
using System;
namespace GradientViewGettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            Grid grid = new Grid();
            SfGradientView gradientView = new SfGradientView();
            SfRadialGradientBrush radialGradientBrush = new SfRadialGradientBrush();
            radialGradientBrush.GradientStops = new GradientStopCollection()
            {
                new SfGradientStop() { Color = Color.Red, Offset=0.0},
                new SfGradientStop() { Color = Color.Yellow, Offset=0.5},
                new SfGradientStop() { Color = Color.LightGreen, Offset=1.0},
            };
            gradientView.BackgroundBrush = radialGradientBrush;
            grid.Children.Add(gradientView);
            this.Content = grid;
        }
    }
}
```

You can find the complete getting started sample from [this](#) link.

### Customization

The SfGradientView control supports customizing the following properties:

- The **GradientStops** for both linear and radial gradients.
- The **StartPoint** and **EndPoint** for linear gradient brush.
- The **Center** and **Radius** for radial gradient brush.

### GradientStops

**GradientStops** is a collection of **SfGradientStop** for both linear gradient and radial gradient; it is used for smooth color transition by specifying the **Color** and **Offset** properties of **SfGradientStop**. An **Offset** ranges from 0 to 1.

### SfLinearGradientBrush

You can customize the linear gradient using the **StartPoint** and **EndPoint** properties of **SfLinearGradientBrush**. By default, the value of **StartPoint** is (0,0) and the value of **EndPoint** is (1,1).

### XML

```
<gradient:SfGradientView>
  <gradient:SfGradientView.BackgroundBrush>
    <gradient:SfLinearGradientBrush>
      <gradient:SfLinearGradientBrush.GradientStops>
        <gradient:SfGradientStop Color="Red" Offset="0.0" />
        <gradient:SfGradientStop Color="Yellow" Offset="0.5" />
        <gradient:SfGradientStop Color="Blue" Offset="1.0" />
      </gradient:SfLinearGradientBrush.GradientStops>
    </gradient:SfLinearGradientBrush>
  </gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
```

### C#

```
SfGradientView gradientView = new SfGradientView();
SfLinearGradientBrush linearGradient = new SfLinearGradientBrush();
```

```
linearGradient.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.Red, Offset = 0.0 },
    new SfGradientStop() { Color = Color.Yellow, Offset = 0.5 },
    new SfGradientStop() { Color = Color.Blue, Offset = 1.0 }
};
gradientView.BackgroundBrush = linearGradient
```

*Horizontal linear gradient*

You can use the values of `StartPoint` and `EndPoint` properties of `SfLinearGradientBrush` as (0, 0.5) and (1, 0.5), respectively to align the gradient of background horizontally.

#### XML

```
<gradient:SfGradientView>
<gradient:SfGradientView.BackgroundBrush>
<gradient:SfLinearGradientBrush StartPoint="0, 0.5" EndPoint="1, 0.5">
<gradient:SfLinearGradientBrush.GradientStops>
<gradient:SfGradientStop Color="Red" Offset="0.0" />
<gradient:SfGradientStop Color="Yellow" Offset="0.5" />
<gradient:SfGradientStop Color="Blue" Offset="1.0" />
</gradient:SfLinearGradientBrush.GradientStops>
</gradient:SfLinearGradientBrush>
</gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
```

#### C#

```
SfGradientView gradientView = new SfGradientView();
SfLinearGradientBrush linearGradient = new SfLinearGradientBrush();
linearGradient.StartPoint = new Point(0, 0.5);
linearGradient.EndPoint = new Point(1, 0.5);
linearGradient.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.Red, Offset = 0.0 },
    new SfGradientStop() { Color = Color.Yellow, Offset = 0.5 },
    new SfGradientStop() { Color = Color.Blue, Offset = 1.0 }
};
```

```
gradientView.BackgroundBrush = linearGradient;
```

#### *Vertical linear gradient*

You can use the values of `StartPoint` and `EndPoint` properties of `SfLinearGradientBrush` as (0.5, 0) and (0.5, 1), respectively to align the gradient of background vertically.

#### **XML**

```
<gradient:SfGradientView>
<gradient:SfGradientView.BackgroundBrush>
<gradient:SfLinearGradientBrush StartPoint="0.5, 0" EndPoint="0.5, 1">
<gradient:SfLinearGradientBrush.GradientStops>
<gradient:SfGradientStop Color="Red" Offset="0.0" />
<gradient:SfGradientStop Color="Yellow" Offset="0.5" />
<gradient:SfGradientStop Color="Blue" Offset="1.0" />
</gradient:SfLinearGradientBrush.GradientStops>
</gradient:SfLinearGradientBrush>
</gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
```

#### **C#**

```
SfLinearGradientBrush linearGradient = new SfLinearGradientBrush();
linearGradient.StartPoint = new Point(0.5, 0);
linearGradient.EndPoint = new Point(0.5, 1);
linearGradient.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.Red, Offset = 0.0 },
    new SfGradientStop() { Color = Color.Yellow, Offset = 0.5 },
    new SfGradientStop() { Color = Color.Blue, Offset = 1.0 }
};
gradientView.BackgroundBrush = linearGradient;
```

### SfRadialGradientBrush

You can customize the following properties of **SfRadialGradientBrush**:

- Center
- Radius

By default, the value of center is (0.5, 0.5) and value of radius is 0.5.

### XML

```
<gradient:SfGradientView>
<gradient:SfGradientView.BackgroundBrush>
<gradient:SfRadialGradientBrush>
<gradient:SfRadialGradientBrush.GradientStops>
<gradient:SfGradientStop Color="Red" Offset="0.0" />
<gradient:SfGradientStop Color="Yellow" Offset="0.5" />
<gradient:SfGradientStop Color="LightGreen" Offset="1.0" />
</gradient:SfRadialGradientBrush.GradientStops>
</gradient:SfRadialGradientBrush>
</gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
```

### C#

```
SfGradientView gradientView = new SfGradientView();
SfRadialGradientBrush radialGradient = new SfRadialGradientBrush();
radialGradient.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.Red, Offset = 0.0 },
    new SfGradientStop() { Color = Color.Yellow, Offset = 0.5 },
    new SfGradientStop() { Color = Color.LightGreen, Offset = 1.0 }
};
gradientView.BackgroundBrush = radialGradient;
```

#### *Customize the center*

You can customize the center point of radial gradient brush using the `Center` property of `SfRadialGradientBrush`.

#### XML

```
<gradient:SfGradientView>
<gradient:SfGradientView.BackgroundBrush>
<gradient:SfRadialGradientBrush Center="0, 0.5">
<gradient:SfRadialGradientBrush.GradientStops>
<gradient:SfGradientStop Color="Red" Offset="0.0" />
<gradient:SfGradientStop Color="Yellow" Offset="0.5" />
<gradient:SfGradientStop Color="LightGreen" Offset="1.0" />
</gradient:SfRadialGradientBrush.GradientStops>
</gradient:SfRadialGradientBrush>
</gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
```

#### C#

```
SfGradientView gradientView = new SfGradientView();
SfRadialGradientBrush radialGradient = new SfRadialGradientBrush();
radialGradient.Center = new Point(0, 0.5);
radialGradient.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.Red, Offset = 0.0 },
    new SfGradientStop() { Color = Color.Yellow, Offset = 0.5 },
    new SfGradientStop() { Color = Color.LightGreen, Offset = 1.0 }
};
gradientView.BackgroundBrush = radialGradient;
```

### *Customize the radius*

You can customize the radius of the radial gradient brush using `Radius` property of `SfRadialGradientBrush`. The `Radius` property ranges from 0 to 1.

### **XML**

```
<gradient:SfGradientView>
<gradient:SfGradientView.BackgroundBrush>
<gradient:SfRadialGradientBrush Center="0, 0.5" Radius="1">
<gradient:SfRadialGradientBrush.GradientStops>
<gradient:SfGradientStop Color="Red" Offset="0.0" />
<gradient:SfGradientStop Color="Yellow" Offset="0.5" />
<gradient:SfGradientStop Color="LightGreen" Offset="1.0" />
</gradient:SfRadialGradientBrush.GradientStops>
</gradient:SfRadialGradientBrush>
</gradient:SfGradientView.BackgroundBrush>
</gradient:SfGradientView>
```

### **C#**

```
SfGradientView gradientView = new SfGradientView();
SfRadialGradientBrush radialGradient = new SfRadialGradientBrush();
radialGradient.Center = new Point(0, 0.5);
radialGradient.Radius = 1;
radialGradient.GradientStops = new GradientStopCollection()
{
    new SfGradientStop() { Color = Color.Red, Offset = 0.0 },
    new SfGradientStop() { Color = Color.Yellow, Offset = 0.5 },
    new SfGradientStop() { Color = Color.LightGreen, Offset = 1.0 }
};
gradientView.BackgroundBrush = radialGradient;
```

## SfImageEditor

### Overview

The image editor control for Xamarin.Forms is a very handy tool, which is used to edit an image by annotating with free hand drawing paths, text, and built-in shapes; it also allows to crop and flip a image. This control has a built-in toolbar that helps to perform editing operations.

### Key features

- Crop, rotate, and flip operations.
- Adds text, path, and shapes such as rectangle, circle, and arrow.
- Undo and redo operations.
- Zoom and pan operations.
- Localization.
- Custom view annotations.
- Customizing toolbar.
- Z-order.
- Saving images to device.
- Built-in toolbar.

### Getting Started

This section explains the steps required to load an image to the image editor control.

To get start quickly with Xamarin Image Editor control, you can check on this video:

```
<style>#xamarinImageEditorVideoTutorial{width : 90% !important; height: 300px !important }</style>
```

```
<iframe id='xamarinImageEditorVideoTutorial'  
src='https://www.youtube.com/embed/SW1fsk7YbeA'></iframe>
```

### Adding SfImageEditor reference

You can add SfImageEditor reference using one of the following methods:

#### Method 1: Adding SfImageEditor reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.syncfusion.com/nuget-packages). To add SfImageEditor to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfImageEditor](https://www.syncfusion.com/nuget-packages), and then install it.

![[Adding SfImageEditor reference from NuGet]](ImageEditor\_images/Adding SfImageEditor reference.png)

---

**Note:** Install the same version of SfImageEditor NuGet in all the projects.

---

### Method 2: Adding SfImageEditor reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfImageEditor control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfImageEditor assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfImageEditor.XForms.dll Syncfusion.Core.XForms.dll
Android	Syncfusion.SfImageEditor.XForms.Android.dll Syncfusion.SfImageEditor.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll
iOS	Syncfusion.SfImageEditor.XForms.iOS.dll Syncfusion.SfImageEditor.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll
UWP	Syncfusion.SfImageEditor.UWP.dll Syncfusion.SfImageEditor.XForms.UWP.dll Syncfusion.SfImageEditor.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

### Launching the application in iOS

To launch the image editor in iOS, call the `SfImageEditorRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as shown in the following code sample.

### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
...
global::Xamarin.Forms.Forms.Init();
Syncfusion.SfImageEditor.XForms.iOS.SfImageEditorRenderer.Init();
LoadApplication(new App());
...
}
```

### Universal Windows Platform (UWP)

You need to initialize the image editor view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with image editor in Release mode in UWP platform.

### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
...
rootFrame.NavigationFailed += OnNavigationFailed;
// Add `using System.Reflection;`
List<Assembly> assembliesToInclude = new List<Assembly>();
// Now, add all the assemblies your app uses
assembliesToInclude.Add(typeof(Syncfusion.SfImageEditor.XForms.UWP.SfImageEd
itorRenderer).GetTypeInfo().Assembly);
// Replaces Xamarin.Forms.Forms.Init(e);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
...
}
```

### Android

The Android platform does not require any additional configuration to render the image editor.

### Initializing image editor

1. Import SfImageEditor control namespace as `xmlns:syncfusion="clr-namespace:Syncfusion.SfImageEditor.XForms;assembly=Syncfusion.SfImageEditor.XForms" in XAML page.`
2. Set the SfImageEditor control as content to the ContentPage.

### XML

```
<?xml version="1.0" encoding="UTF-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" x:Class="ImageEditor_
GettingStarted.ImageEditor_GettingStartedPage"
xmlns:imageeditor="clr-
namespace:Syncfusion.SfImageEditor.XForms;assembly=Syncfusion.SfImageEditor.
XForms">
<ContentPage.Content>
<imageeditor:SfImageEditor />
</ContentPage.Content>
```

---

</ContentPage>

---

**C#**

```
using Syncfusion.SfImageEditor.XForms;
using Xamarin.Forms;
public class App : Application
{
    public App()
    {
        MainPage = new ImageEditor_GettingStartedPage();
    }
}
Public class ImageEditor_GettingStartedPage : ContentPage
{
    public ImageEditor_GettingStartedPage()
    {
        InitializeComponent();
        SfImageEditor editor = new SfImageEditor();
        this.Content = editor;
    }
}
```

- If image is not set to the **Source** property, the appearance of the image will be shown as white canvas. You can perform editing action using built-in toolbar.

## Loading an image to image editor

Refer to the following steps to add an image to the pcl project:

1. Right-click your pcl project.
2. Select **Add Files** submenu from **Add** menu, and a dialog box will appear.
3. Choose and import the desired image to the pcl project.
4. After the image has been imported, ensure whether the image Build Action has been set to **EmbeddedResource**.

---

**Note:** Image formats such as JPEG and PNG can be loaded to the image editor.

---

The following code shows adding an image to the image editor control with the format as "JPEG" and name as "image".

**XML**

```
<?xml version="1.0" encoding="UTF-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" x:Class="ImageEditor_
GettingStarted.ImageEditor_GettingStartedPage"
xmlns:imageeditor="clr-
namespace:Syncfusion.SfImageEditor.XForms;assembly=Syncfusion.SfImageEditor.
XForms">
<ContentPage.Content>
<imageeditor:SfImageEditor Source="{Binding Image}" />
</ContentPage.Content>
```

---

</ContentPage>

---

## C#

```
using Syncfusion.SfImageEditor.XForms;
using Xamarin.Forms;
public class App : Application
{
    public App()
    {
        MainPage = new ImageEditor_GettingStartedPage();
    }
}
Public class ImageEditor_GettingStartedPage : ContentPage
{
    public ImageEditor_GettingStartedPage()
    {
        InitializeComponent();
        BindingContext = new ImageModel();
        SfImageEditor editor = new SfImageEditor();
        this.Content = editor;
    }
}
class ImageModel
{
    public ImageSource Image { get; set; }
    public ImageModel()
    {
        Image = ImageSource.FromResource("ImageEditor_GettingStarted.Image.jpg");
    }
}
```

---

**Note:** Refer to this [link](#) to know more about loading an image to the image editor source property in different formats.

---

- The following screenshot depicts loading an image to the image editor. You can edit the image using built-in toolbar.

You can find the complete getting started sample from this [link](#).

### Text

You can annotate the desired text elements to an image using the `AddText` method with customization options.

### C#

```
editor.AddText("New Text");
```

### Customize text with TextSettings

You can customize the appearance of the text using the `TextSettings` property.

The `TextSettings` property consists of the following properties:

- [Color](#): Defines the color of the desired text.
- [FontSize](#): Specifies the desired font size of the text under text settings.
- [FontFamily](#): Specifies the desired font family for text. Six types of font families are available in toolbar: `Arial`, `Noteworthy`, `Marker Felt`, `SignPainter`, `Bradley Hand`, `Snell Round hand`.

- [Bounds](#): Allows to set frame for the newly added **Text**. You can position the text wherever you want on the image. In percentage, the value of the text frame should fall between 0 and 100.
- [Opacity](#): Changes the opacity of text.
- [Angle](#): Changes the angle of text.
- [TextEffects](#): Changes the effects of the text such as **Bold**, **Italic** and **Underline**.

## C#

```
editor.AddText("New Text", new TextSettings() { Color = Color.Black, FontSize = 16d, FontFamily="Arial", Bounds = new Rectangle(20, 20, 35, 35), Opacity=0.5f, Angle=45, TextEffects = TextEffects.Bold | TextEffects.Italic | TextEffects.Underline});
```

## Custom font family

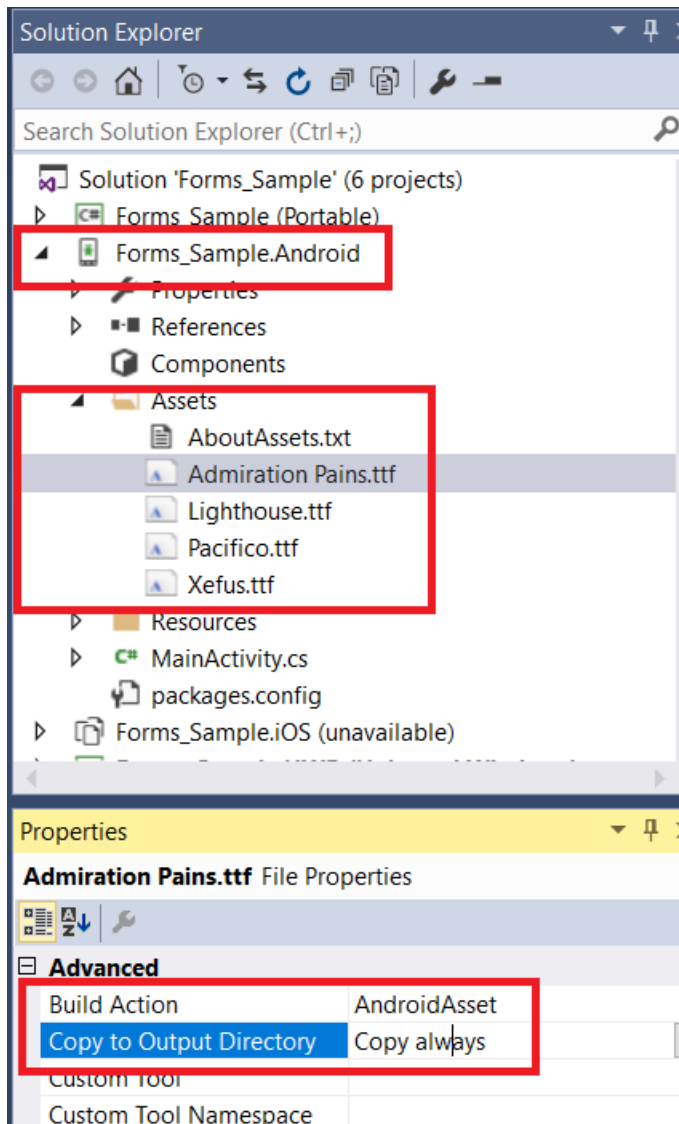

Using a font that is not in the built-in typeface requires some platform-specific coding. The steps required for each platform are shown as follows.

Download the custom fonts in ttf file format, and add these fonts to required folder in particular project file.

### Android

Add the custom fonts to Assets folder in sample.Droid project.

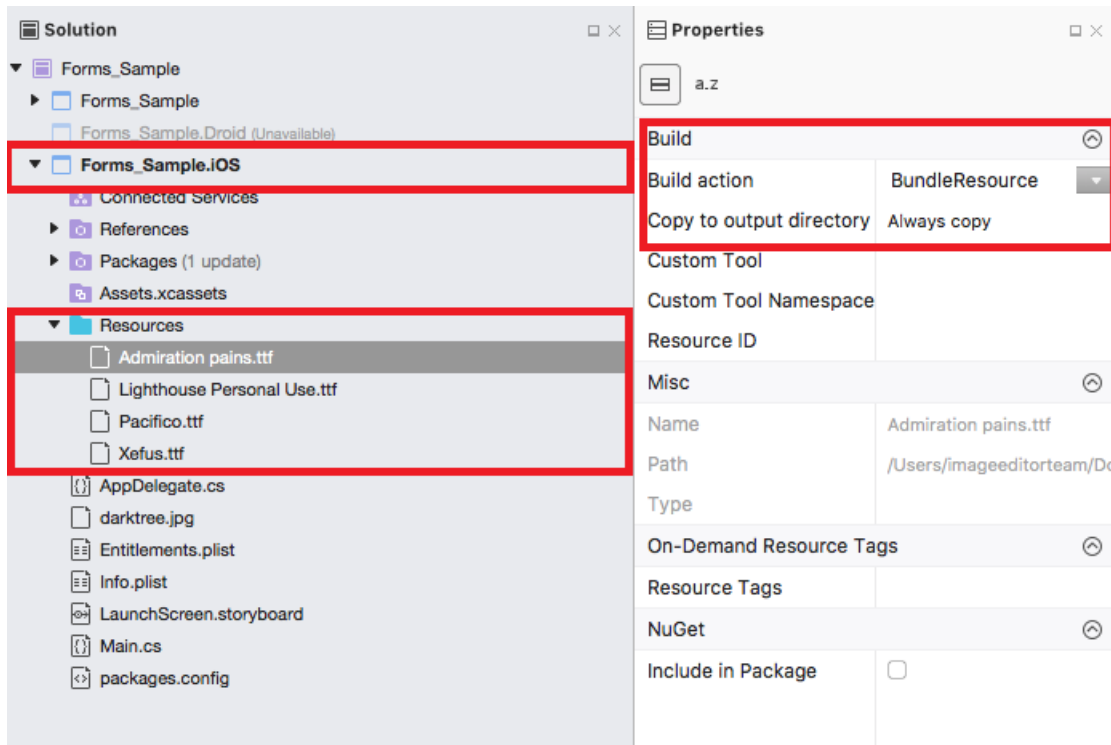

Right-click the font file, and open properties. In properties, change the "Build Action" property of every font file to **AndroidAsset** and "Copy to output directory" to **Copy Always**.

### iOS

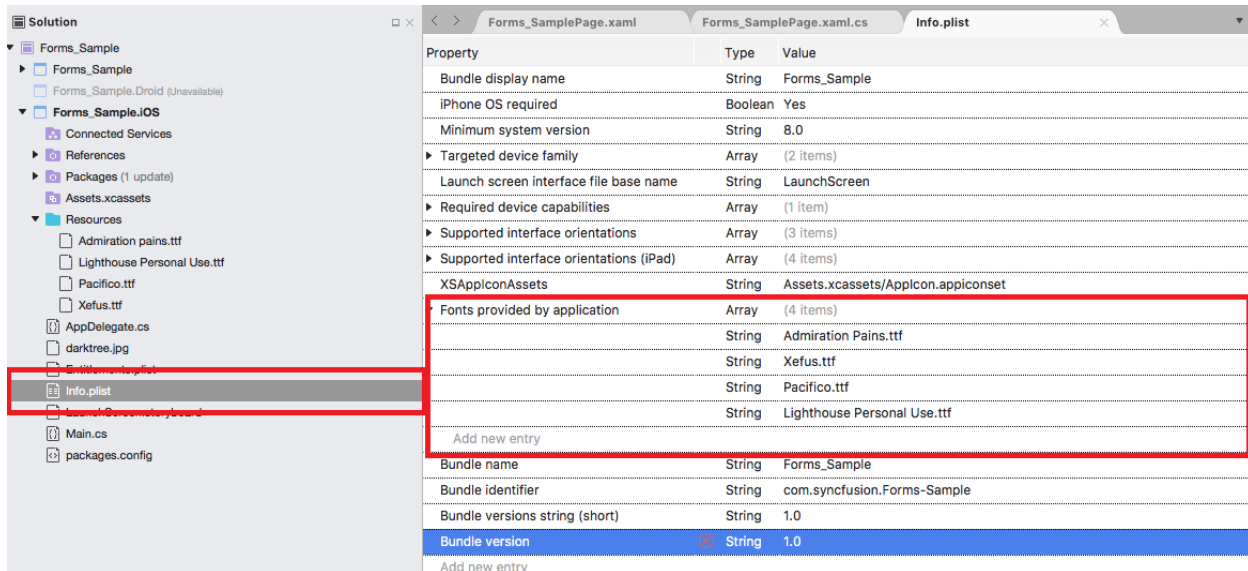

Add custom fonts to resource file in sample.iOS project.

Change the "Build Action" property of every font file to **BundleResource** and "Copy to output directory" to **Copy Always**.

Open the `info.plist` file, and select "Source" at the bottom of the file.

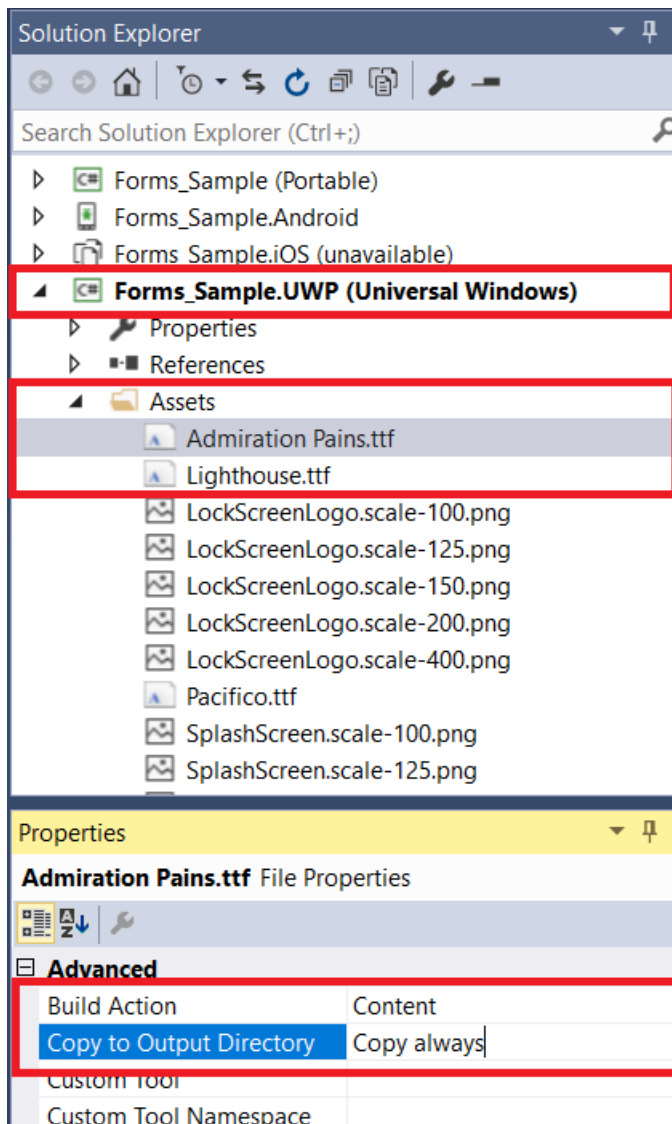

After opened the source file, add "Fonts provided by application" to source file, and add the downloaded custom fonts name with .ttf extension.

UWP

Add custom fonts to Assets folder in sample.UWP project.

Right-click the font file, and open properties. In properties, change the "Build Action" property of every font file to `Content` and "Copy to output directory" to `Copy Always`.

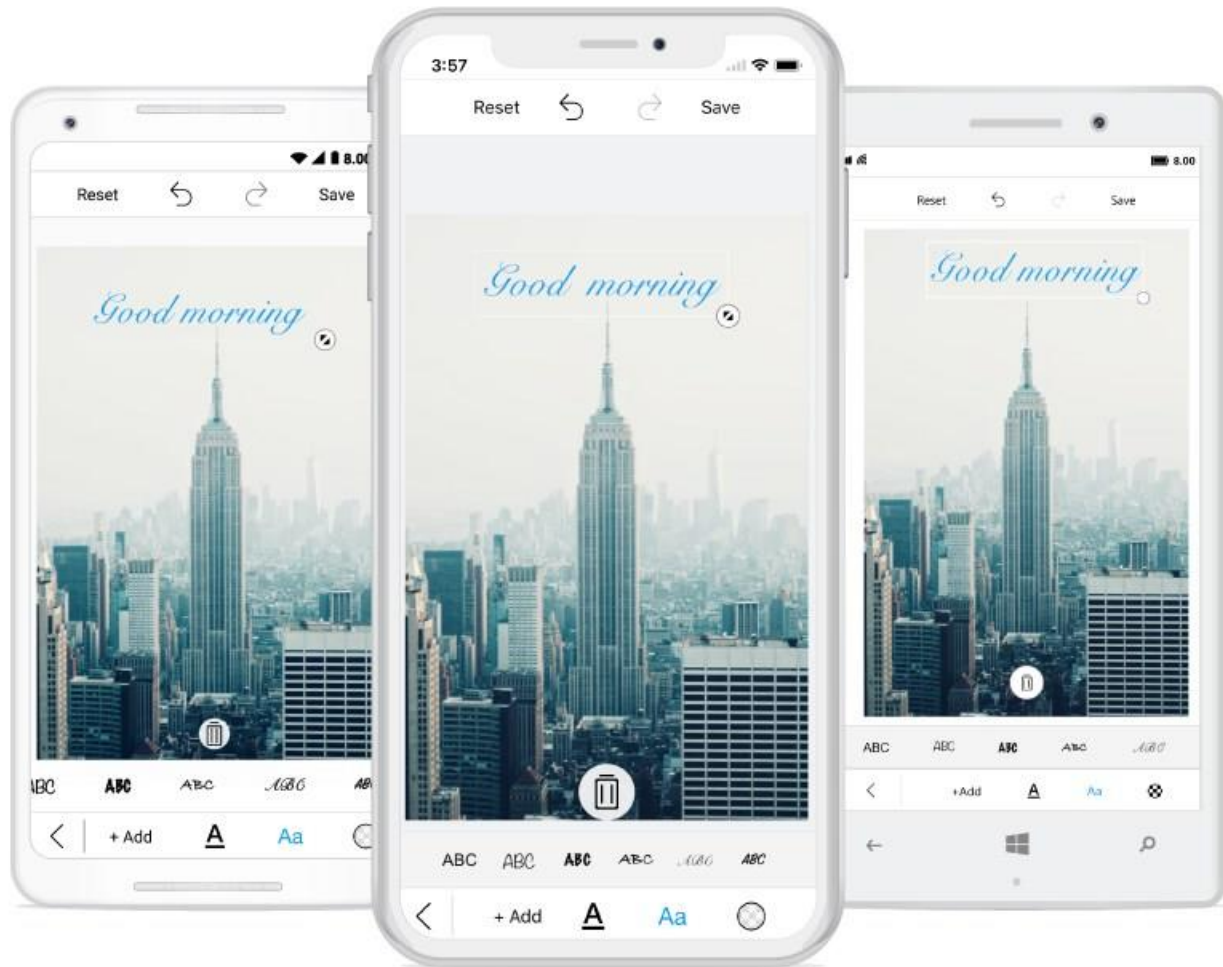

The following code snippet shows applying custom font family. In forms, Android, and iOS, give the font family name, but in UWP, you should mention font file name with .ttf extension and "#" symbol with font family name.

### C#

```
if ((Device.OS == TargetPlatform.Android) || (Device.OS == TargetPlatform.iOS))
    editor.AddText("New Text", new TextSettings() { FontFamily="Pacifico" });
else
    editor.AddText("New Text", new
TextSettings() { FontFamily="Assets/Pacifico.ttf#Pacifico" });
```

## Multiline text and text alignment

### Multiline text

You can annotate multiple line text over an image with the help of text preview window.

### Text alignment

**TextAlignment** is an enum type and text can be aligned with the help of text alignment enum values such as left, right and center.

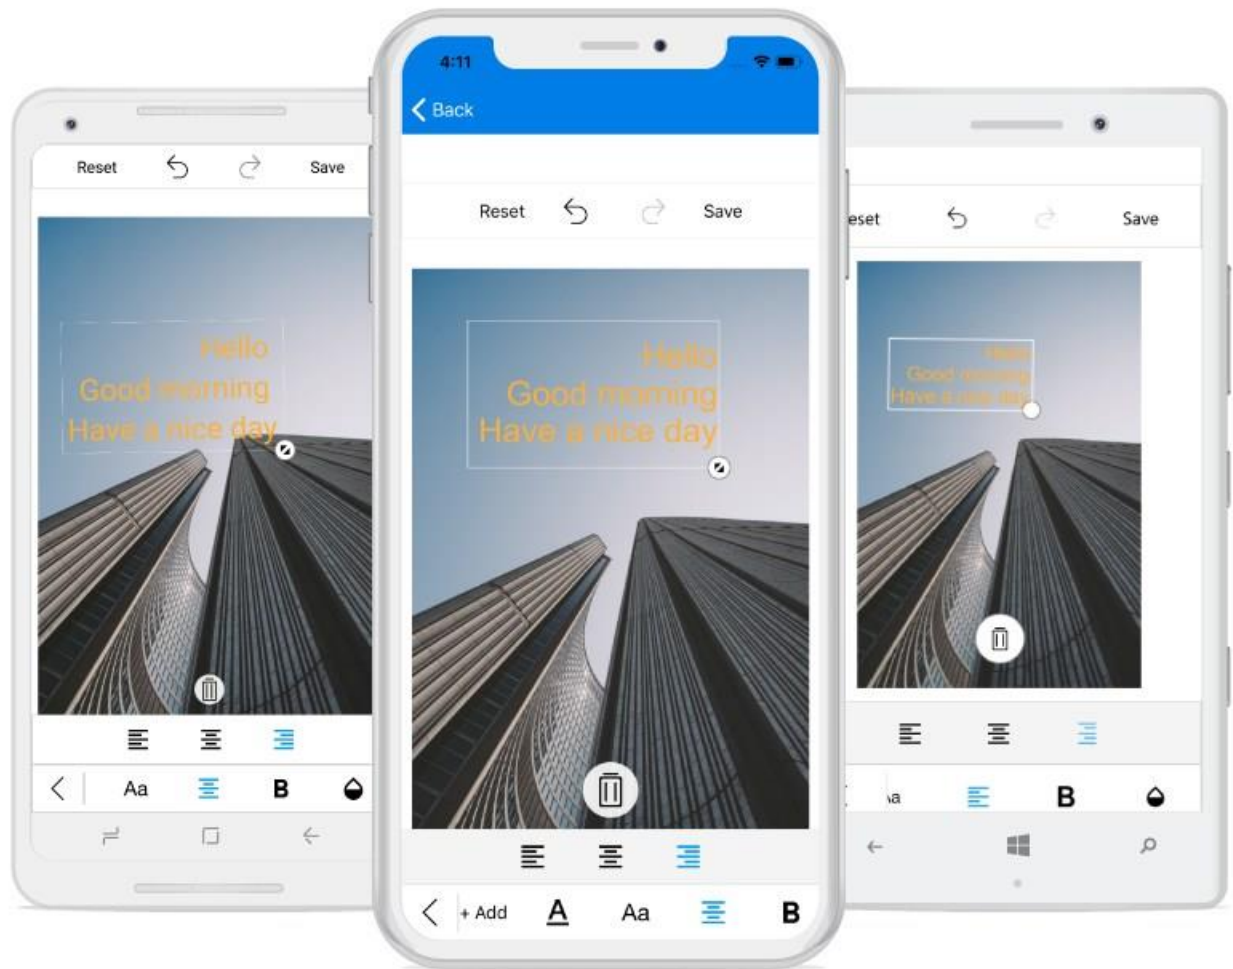

---

**Note:** The default text alignment is **Left** and text alignment is not applicable for single line text.

---

### C#

```
editor.AddText("Hello\nGood morning\nHave a nice day", new TextSettings()  
{TextAlignment = TextAlignment.Right });
```

### Text Rotation

You can rotate and resize the text by enabling the `RotatableElements` property of image editor. `ImageEditorElements` is an enum type with values `Text`, `CustomView` and `None` as shown in the following code snippet.

#### C#

```
editor.RotatableElements = ImageEditorElements.Text;
```

---

**Note:** The default value for `RotatableElements` is `None`.

---

You can rotate the text based on a particular angle using `Angle` property in `TextSettings` as shown in the following code snippet.

#### C#

```
editor.AddText("Good morning", new TextSettings() {Angle = 45});
```

### Restricting the edit text box pop-up window

You can restrict the edit text box pop-up window using the `IsEditable` property. By Default, the value of the `IsEditable` property is true, so you can edit the text in edit text box pop-up window. When setting the `IsEditable` property to false, the edit text box pop-up window will not be displayed, and you are restricted to edit the text in the edit text box.

#### C#

```
editor.AddText("text", new TextSettings { IsEditable=false });
```

### Shapes

You can annotate any shapes over an image using the `AddShape` method. The following shapes are available in image editor:

- Circle
- Rectangle
- Arrow
- Path

### Selecting a shape type

The `ShapeType` is an enum property with values `Rectangle`, `Circle`, `Arrow`, and `Path`. You can give the desired shape type as an argument to the `AddShape` method.

#### C#

```
editor.AddShape(ShapeType.Circle);
```

### Customizing a shape with pen settings

You can customize the appearance of each shape using the `PenSettings` property:

#### PenSettings

The `PenSettings` property consists of the following properties:

- [Color](#): Specifies the desired stroke color to a shape.
- [FillColor](#): Specifies the desired fill color to a shape.
- [StrokeWidth](#): Allows to denote the stroke width for the desired shape.
- [Mode](#): Determines whether the shape color mode is `Fill` or `Stroke`. It is an enum value.
- [Opacity](#): Denotes opacity for the desired shapes.
- [Bounds](#): Allows to set frame for the newly added shapes (rectangle and circle). You can position the shapes wherever you want on the image. In percentage, the value of the shape frame should fall between 0 and 100.

---

**Note:** The `FillColor` property is applicable only if the `ShapeType` is `Rectangle` or `Circle`.

---

- To add a rectangle, circle, or arrow over an image, specify the `ShapeType` and the desired `PenSettings` as shown in the following code snippet.

#### C#

```
editor.AddShape(ShapeType.Circle, new PenSettings() {Color = Color.Red,  
Mode= Mode.Stroke, Opacity=1f, Bounds = new Rectangle(20,20,35,35)});
```

- You can annotate any path on an image using free hand drawing as shown in the following code snippet.

**C#**

```
editor.AddShape(ShapeType.Path, new PenSettings() { StrokeWidth = 10 });
```

### Deleting a shape or text from view

You can delete the selected shape by using the `Delete` method as shown in the following code snippet.

#### C#

```
editor.Delete();
```

---

**Note:** You cannot delete the path.

---

### Transformation

The image editor control is capable of performing the image transformations such as `rotation` and `flip`.

#### Rotation

You can use the `Rotate` method of the image editor to rotate a image. For each rotation, image will be rotated to 90 degrees towards clockwise direction.

---

**Note:** Angle cannot be specified in code to alter the rotation angle of the image.

---

#### C#

```
editor.Rotate();
```

## Flip

The image editor control is capable of showing the mirror image. The `Flip` method flips the image horizontally or vertically based on the `FlipDirection` specified as argument of the flip method.

**Note:** The default flip direction is horizontal.

### C#

```
editor.Flip(FlipDirection.Horizontal);
```

## Crop

You can crop the desired portion of an image using the cropping tool.

### Image cropping ratio

You can crop the image with various aspect ratios. The following cropping ratios are available in built-in toolbar: "Free, Original, Square, 3:1, 1:3, 3:2, 2:3, 4:3, 3:4, 5:4, 4:5, 16:9, 9:16".

Cropping operation can be done in the following two ways:

- Enabling cropping and selecting the crop region visually.
- Entering the cropping area manually.

### *Handling the cropping tool*

The `ToggleCropping` method in the image editor control allows users to enable or disable the cropping region placed over the image to visually choose the area for cropping.

- The following code shows cropping the image to any desired size.

#### **C#**

```
// For free hand cropping.  
editor.ToggleCropping();
```

- The following code shows cropping an image based on its original width and height.

#### **C#**

```
// For cropping a image with its original width and height.  
editor.ToggleCropping(float.NaN, float.NaN);
```

- The following code shows cropping an image based on specific ratio.

#### **C#**

```
// For cropping the image with ratio, x value as 9, and y value as 17.  
editor.ToggleCropping(9, 17);
```

- To position the cropping window with custom location, pass the desired rectangle in `ToggleCropping` method. Each value in the rectangle should be in offset value(0 to 100).

#### **C#**

```
Rectangle rect = new Rectangle(20, 20, 50, 50);  
editor.ToggleCropping(rect);
```

After the cropping area has been selected, the `Crop` method is called, which in turn crops the selected region and displays the cropped image on the image editor.

#### **C#**

```
editor.Crop();
```

### *Entering the cropping area manually*

To manually enter the cropping area without enabling the cropping functionality, use the overloaded `Crop(Rectangle rect)` method. It can be done by defining a rectangle and passing it to the `Crop(rect)` method.

#### **C#**

```
editor.Crop(new Rectangle(100, 100, 150, 200));
```

### Save

You can save the image along with the current edits to the device using the **Save** method.

The saved image will be added to device for each platform in the following locations:

UWP :

The saved image will be added in default pictures library “C:\Users\your name\Pictures\Saved Pictures”.

Android:

The saved image will be added in default pictures library “Internal storage/Pictures/”.

### C#

```
editor.Save();
```

### Save events

The SfImageEditor has events when performing save operation namely **ImageSaving** and **ImageSaved**.

#### ImageSaving

This event occurs before saving the image. You can control the save functionality using the **Cancel** argument.

- Cancel:

It restricts saving image to the default location when set `Cancel` value to `true`.

#### **C#**

```
public MainPage()
{
    . . .
    editor.ImageSaving += editor_ImageSaving;
    . . .
}
private void editor_ImageSaving(object sender, ImageSavingEventArgs args)
{
    args.Cancel = true;
}
```

- Stream

You can get current image edits as stream using this argument.

#### **C#**

```
private void editor_ImageSaving(object sender, ImageSavingEventArgs args)
{
    var stream = args.Stream;
}
```

#### *ImageSaved*

This event occurs after the image has been saved. To get the location of the saved image, use the location argument as shown in the following code.

#### **C#**

```
public MainPage()
{
    . . .
    editor.ImageSaved += editor_ImageSaved;
    . . .
}
private void editor_ImageSaved(object sender, ImageSavedEventArgs args)
{
    string savedLocation = args.Location; // You can get the saved image
location with the help of this argument
}
```

#### *Saving Image with Custom Size and Format*

The `Save` method in the `SfImageEditor` control allows user to save an image in different format such as `png`, `jpg` and `bmp`.

To choose the format while Saving the image.

#### **C#**

```
editor.Save(".png");
```

To choose the format and size while Saving the image as like below,

### C#

```
editor.Save(".png", new Size(913, 764));
```

**Note:** Supported formats are .png, .jpg and .bmp.

### Reset

The **Reset** method resets the complete set of changes made in image and resets the image to original loaded image.

### C#

```
editor.Reset();
```

### Reset events

The SfImageEditor has events when performing reset operation namely **BeginReset** and **EndReset**.

#### BeginReset

This event occurs before resetting the changes made in an image. You can control the reset functionality using the Cancel argument.

### C#

```
public MainPage()
{
    . . .
    editor.BeginReset += editor_BeginReset;
    . . .
}
private void editor_BeginReset(object sender, BeginResetEventArgs args)
{
    args.Cancel = true; //It restricts resetting image to initial loaded image.
}
```

#### EndReset

This event occurs when reset has been completed.

### C#

```
public MainPage()
{
    . . .
    editor.EndReset += editor_EndReset;
    . . .
}
private void editor_EndReset(object sender, EndResetEventArgs args)
{
    Navigation.PushModalAsync(new NewImageEditorPage()); //Navigates to new page after completing the reset action.
}
```

### ImageLoaded Event

This event will be triggered after the image has been loaded. By using this event, you can add any shapes or text over an image or crop an image while initially loading the image.

#### C#

```
public MainPage()
{
    . . .
    editor.ImageLoaded += Editor_ImageLoaded;
    . . .
}
private void Editor_ImageLoaded(object sender, ImageLoadedEventArgs args)
{
    editor.AddShape(ShapeType.Circle, new PenSettings() {Color =
    Color.Green,Mode = Mode.Stroke });
}
```

### ItemSelected Event

This event will be triggered whenever you tap the selected shapes (rectangle, circle, and arrow) and text. You can get the settings of each selected shapes and text using the ItemSelected argument. You can also change the settings that will affect the selected shape.

#### C#

```
public MainPage()
{
    . . .
    editor.ImageLoaded += Editor_ImageLoaded;
    editor.ItemSelected += Editor_ItemSelected;
    . . .
}
private void Editor_ImageLoaded(object sender, ImageLoadedEventArgs args)
{
    editor.AddShape(ShapeType.Circle, new PenSettings() {Color =
    Color.Green,Mode = Mode.Stroke });
}
private void Editor_ItemSelected(object sender, ItemSelectedEventArgs args)
{
    var Settings = args.Settings;
    if (Settings is PenSettings)
    {
        (Settings as PenSettings).Color = color;
    }
    else
    {
        (Settings as TextSettings).Color = color;
    }
}
```

### ItemUnselected Event

This event will be triggered whenever you change the shape selections from one shape to another shape (rectangle, circle, arrow and text). You can get the settings of previous selected shape and text using the ItemUnselected event. You can also change the settings of previous selected shape.

#### C#

```
public MainPage()
{
    editor.ItemUnselected += Editor_ItemUnselected;
}
private void Editor_ItemUnselected(object sender, ItemUnselectedEventArgs e)
{
    var Settings = e.Settings;
    if (Settings is PenSettings)
    {
        (Settings as PenSettings).Color = Color.Green;
    }
    else
    {
        (Settings as TextSettings).Color = Color.Green;
    }
}
```

### ImageEdited Event

This event occurs whenever you start to edit an image. You can know whether the current image is edited or not by using the IsImageEdited argument.

#### C#

```
public MainPage()
{
    . . .
    editor.ImageEdited += ImageEditor_ImageEdited;
    . . .
}
private void ImageEditor_ImageEdited(object sender, ImageEditedEventArgs e)
{
    If (args.IsImageEdited)
    {
    }
}
```

### Undo and Redo

One of the important features of the image editor control is to perform **Undo** and **Redo** operations for adding shapes, text, and drawing paths.

#### Undo

The **Undo** method is used to revert the changes done previously over an image.

Undo can be performed for the following operations:

- Add/delete shapes or text.
- Change positions.

- Color/fill changes.
- Path drawings.

### C#

```
editor.Undo();
```

### Redo

The **Redo** method is used to redo the changes that are reverted by undo operation.

### C#

```
editor.Redo();
```

**Note:** Undo and redo cannot be applied for cropping and transformations.

### Toolbar customization

You can customize the color palette, visibility, and appearance of each toolbar item.

### Customize toolbar items

The image editor control provides support to customize and configure the appearance of toolbar menu. You can customize the toolbar by adding respective `FooterToolBarItem` and `HeaderToolBarItem`.

#### Toolbar item

You can customize each toolbar item using the `Text` and `Icon` properties.

#### Name

You can get or set the names of built-in toolbar and dynamically added toolbar items using the `Name` property.

#### C#

```
public MainPage()
{
    InitializeComponent();
    SfImageEditor editor = new SfImageEditor();
    var itemName = editor.ToolbarSettings.ToolbarItems[2].Name;
}
```

**Note:** The following built-in toolbar item names are available in image editor: Back, Text, Add, TextColor, FontFamily, Arial, Noteworthy, Marker Felt, Bradley Hand, SignPainter, Opacity, Path, StrokeThickness, Colors, Opacity, Shape, Rectangle, StrokeThickness, Circle, Arrow, Transform, Crop, free, original, square, 3:1, 3:2, 4:3, 5:4, 16:9, Rotate, Flip, Reset, Undo, Redo, and Save.

**Note:** You cannot modify the names of existing built-in toolbar items and cannot create toolbar item with these list.

The toolbar menu contains a set of header and footer menu items that help to perform editing actions. This can be categorized into the following types:

1. `HeaderToolBarItem`
2. `FooterToolBarItem`
3. SubItems

#### Adding HeaderToolBarItem

The `HeaderToolBarItem` is placed on the top of the image editor, and you can customize the header toolbar item using the `Icon` and `Text` properties:

#### C#

```
editor.ToolbarSettings.ToolbarItems.Add(new HeaderToolBarItem() { Icon =  
    ImageSource.FromResource("ImageEditor.share.png"), Text="Share" });
```

#### Adding FooterToolBarItem

The `FooterToolBarItem` is placed on the bottom of the image editor, and you can customize the footer toolbar item using the `Icon` and `Text` properties.

Refer to the following code snippet to customize footer toolbar item.

#### C#

```
editor.ToolbarSettings.ToolbarItems.Add(new FooterToolbarItem() { Icon =
ImageSource.FromResource("ImageEditor.delete.png"), Text="Delete" });
editor.ToolbarSettings.ToolbarItems.Add(new FooterToolbarItem() { Icon =
ImageSource.FromResource("ImageEditor.more.png"), Text="More" });
```

### Adding SubItems to the FooterToolbarItem

The **SubItems** is only applicable for **FooterToolbarItem**, and it represents grouped action of respective footer toolbar item. The SubItems will be placed above the footer toolbar item layout, and you can also customize the appearance of sub items as main toolbar items.

Refer to the following code snippet to customize sub items of footer toolbar item.

#### C#

```
editor.ToolbarSettings.ToolbarItems.Add(new FooterToolbarItem()
{
    Text = "More",
    Icon = ImageSource.FromResource("ImageEditor.Image.more.png"),
    SubItems = new ObservableCollection<ToolbarItem>()
    {
        new ToolbarItem() {
            Icon = ImageSource.FromResource("ImageEditor.Image.download.png")
        },
        new ToolbarItem() {
            Icon = ImageSource.FromResource("ImageEditor.Image.share.png")
        }
    }
});
```

**Note:** You can remove the existing toolbar items [names](#) from image editor toolbarItems collection based on the index value and change the icon and text values dynamically for any of the already added toolbar item based on the index as shown in the following code snippet.

#### C#

```
editor.ToolbarSettings.ToolbarItems[5].Text = "new item";
editor.ToolbarSettings.ToolbarItems[3].Icon =
ImageSource.FromResource("ImageEditor.Image.jpg");
```

### ToolbarItemSelected event

Whenever you tap the toolbar menu item, the **ToolbarItemSelected** event will be triggered, and you can get the respective tapped toolbar item as an argument as shown in the following code snippet.

#### C#

```
public MainPage()
{
    editor.ToolbarSettings.ToolbarItemSelected +=
    ToolbarSettings_ToolbarItemSelected;
}
private void ToolbarSettings_ToolbarItemSelected(object sender,
ToolbarItemSelectedEventArgs e)
{
    DisplayAlert("Selected ToolbarItem is " + e.ToolbarItem.Text, "Ok",
"Cancel");
}
```

```
}

```

### *MoveSubItemsToFooterToolbar*

The `MoveSubItemsToFooterToolbar` is boolean property of the `ToolbarItemSelected` event argument; it decides the placement of each sub items of respective footer toolbar item.

If you set the value to `true`, the respective sub items of footer item will be placed on footer toolbar layout. If you set `false`, then the sub items will be placed above the footer toolbar layout.

### **C#**

```
public MainPage()
{
    . . .
    SfImageEditor edit = new SfImageEditor();
    edit.ToolbarSettings.ToolbarItems.Add(new FooterToolbarItem()
    {
        Text = "NewFooterItem",
        SubItems = new ObservableCollection<ToolbarItem>()
        {
            new ToolbarItem() { Text= "Subitem1"},
            new ToolbarItem() { Text= "Subitem2"},
            new ToolbarItem() { Text= "Subitem3"},
        }
    });
    edit.ToolbarSettings.ToolbarItemSelected +=
    ToolbarSettings_ToolbarItemSelected;
    . . .
}

private void ToolbarSettings_ToolbarItemSelected(object sender,
ToolbarItemSelectedEventArgs e)
{
    if(e.ToolbarItem != null && e.ToolbarItem is FooterToolbarItem)
    {
        if(e.ToolbarItem.Text == "NewFooterItem")
        {
            e.MoveSubItemsToFooterToolbar = false;
        }
    }
}
```

---

**Note:** This is not applicable for built-in footer toolbar items.

---

### To hide/show toolbar

To show or hide the toolbar, set the `IsVisible` property of toolbar to either true or false. By default, the `IsVisible` property is set to true.

### **XML**

```
<imageeditor:SfImageEditor.ToolbarSettings>
<imageeditor:ToolbarSettings IsVisible="false" />
</imageeditor:SfImageEditor.ToolbarSettings>
```

### **C#**

```
editor.ToolbarSettings.IsVisible = false;
```

#### To hide/show the toolbar item

You can hide or show the toolbar items by specifying their icon names and setting the boolean values to true or false.

**Note:** You can customize an icon by specifying its [names](#).

#### C#

```
editor.SetToolbarItemVisibility("text,save", false);
```

### To customize the ColorPalette

You can change the default colors of the ColorPalette in toolbar.

#### XML

```
<imageeditor:SfImageEditor.ColorPalette>
  <Color>Yellow</Color>
  <Color>Pink</Color>
  <Color>Violet</Color>
</imageeditor:SfImageEditor.ColorPalette>
```

#### C#

```
ObservableCollection<Color> CustomColorPalette = new
ObservableCollection<Color>()
{
  Color.Yellow,
  Color.Pink,
  Color.Violet
};
editor.ColorPalette = CustomColorPalette;
```

### Default Color Selected Index

You can change the default index of the color palette in toolbar. By default, color palette index value is 2.

#### XML

```
<imageeditor:SfImageEditor x:Name="editor" DefaultSelectedColorIndex="0"/>
```

#### C#

```
editor.DefaultSelectedColorIndex = 0;
```

### ToolbarHeight Customization

You can customize **height of the toolbar** and toolbar items **icon** and **text**.

#### *Customize toolbar height*

The image editor control supports to customize the default height of the **Header**, **Footer**, and **Sub item** using the following properties:

1. HeaderToolbarHeight
2. FooterToolbarHeight
3. SubItemToolbarHeight

The toolbar items will be resized based on the height. To change the height of the toolbar, refer to the following code snippet.

#### XML

```
<imageeditor:SfImageEditor.ToolbarSettings>  
<imageeditor:ToolbarSettings  
HeaderToolbarHeight="70"  
FooterToolbarHeight="70"  
SubItemToolbarHeight="70"/>  
</imageeditor:SfImageEditor.ToolbarSettings>
```

#### C#

```
editor.ToolbarSettings.HeaderToolbarHeight = 70;  
editor.ToolbarSettings.FooterToolbarHeight = 70;  
editor.ToolbarSettings.SubItemToolbarHeight = 70;
```

#### Individual toolbar item height customization

You can arrange the toolbar items based on the toolbar height using the following properties:

1. TextHeight
2. IconHeight

To change the toolbar item Text and Icon height, refer to the following code snippet.

#### C#

```
FooterToolbarItem footerItem = new FooterToolbarItem()  
{  
    IconHeight=40,  
    TextHeight=20,  
    Icon = ImageSource.FromResource("ImageEditor.share.png"),  
    Text = "Share"  
};  
editor.ToolbarSettings.ToolbarItems.Add(footerItem);
```

## Zooming

The image editor control provides support to zoom and pan actions over an image.

The following properties are used for zooming feature of the image editor control:

- EnableZooming
- Maximum ZoomLevel
- PanningMode

### Enable zooming

You can enable or disable the zooming functionality by setting the **EnableZooming** value to true or false. By default, the **EnableZooming** value is set to true.

#### XML

```
<imageeditor:SfImageEditor EnableZooming="false"/>
```

#### C#

```
editor.EnableZooming = false;
```

### Maximum zoom level

You can set the maximum zoom level to image using the **MaximumZoomLevel** property.

#### XML

```
<imageeditor:SfImageEditor EnableZooming="true" MaximumZoomLevel="8"/>
```

#### C#

```
editor.EnableZooming = true;  
editor.MaximumZoomLevel = 8;
```

### Panning mode

The image editor control provides support for panning and allows to pan the image with two fingers or single finger by setting the **PanningMode**.

The following properties are used for panning:

- **SingleFinger**: Zooms or pans the image with single finger, but shapes and text selection cannot be performed with this mode.
- **TwoFinger**: Zooms or pans the image with two finger. The shapes and text selection can be performed with this mode.

By default, the **PanningMode** value is set to **TwoFinger**.

#### XML

```
<imageeditor:SfImageEditor EnableZooming="true" PanningMode="TwoFinger"/>
```

**C#**

```
editor.PanningMode = PanningMode.TwoFinger;
```

**Serialization and Deserialization**

The image editor control provides support to serialize and deserialize the shapes (circle, arrow, and rectangle), free hand drawing, text and toolbar settings. You can save the current state of the image editor and load it back when it is needed.

**Serialization**

The SaveEdits() method is used to serialize the current edits of shapes. The serialized object will be returned in the form of JSON stream.

**C#**

```
SfImageEditor editor;  
public MainPage()  
{  
    InitializeComponent();  
    Grid grid = new Grid();  
    editor = new SfImageEditor();  
    Button saveEdits = new Button();
```

```
saveEdits.Text = "Serialize";
saveEdits.Clicked += SaveEdits_Clicked;
grid.RowDefinitions.Add(new RowDefinition() { Height = 100 });
grid.RowDefinitions.Add(new RowDefinition() { Height = GridLength.Star });
grid.Children.Add(saveEdits, 0, 0);
grid.Children.Add(editor, 0, 1);
this.Content = grid;
}
void SaveEdits_Clicked(object sender, EventArgs e)
{
    Stream stream = editor.SaveEdits();
}
```

You can save stream into .txt format file. If you save stream as .txt format file to deserialize the shapes, then set the Build action to **Embedded resource** in project.

Sample text file: [ImageEditor.txt](#).

### Deserialization

The LoadEdits() method is used to deserialize the edits over an image.

### C#

```
SfImageEditor editor;
public MainPage()
{
    InitializeComponent();
    Grid grid = new Grid();
    editor = new SfImageEditor();
    Button LoadEdits = new Button();
    LoadEdits.Text = "Deserialize";
    LoadEdits.Clicked += LoadEdits_Clicked;
    grid.RowDefinitions.Add(new RowDefinition() { Height = 100 });
    grid.RowDefinitions.Add(new RowDefinition() { Height = GridLength.Star });
    grid.Children.Add(LoadEdits, 0, 0);
    grid.Children.Add(editor, 0, 1);
    this.Content = grid;
}
void LoadEdits_Clicked(object sender, EventArgs e)
{
    var assembly = typeof(App).GetTypeInfo().Assembly;
    Stream stream = new MemoryStream();
    var fileName = "namespace_name.Chart.txt";
    stream = assembly.GetManifestResourceStream(fileName);
    if (stream != null)
        editor.LoadEdits(stream);
}
```

### Moving shapes to front and back

The image editor control allows to change the position of shapes/edits that are arranged over the editor. This can be achieved using the following methods:

1. BringToFront
2. SendToBack
3. BringForward
4. SendBackward

#### BringToFront

The BringToFront method is used to bring the selected shapes/text to the front of a group of elements over an image.

#### C#

```
editor.BringToFront();
```

### SendToBack

The SendToBack method is used to send the selected shapes/text to the back of a group of elements over an image.

#### **C#**

```
editor.SendToBack();
```

### BringForward

The BringForward method is used to bring the selected shapes/text to one step front of a group of elements over an image.

#### **C#**

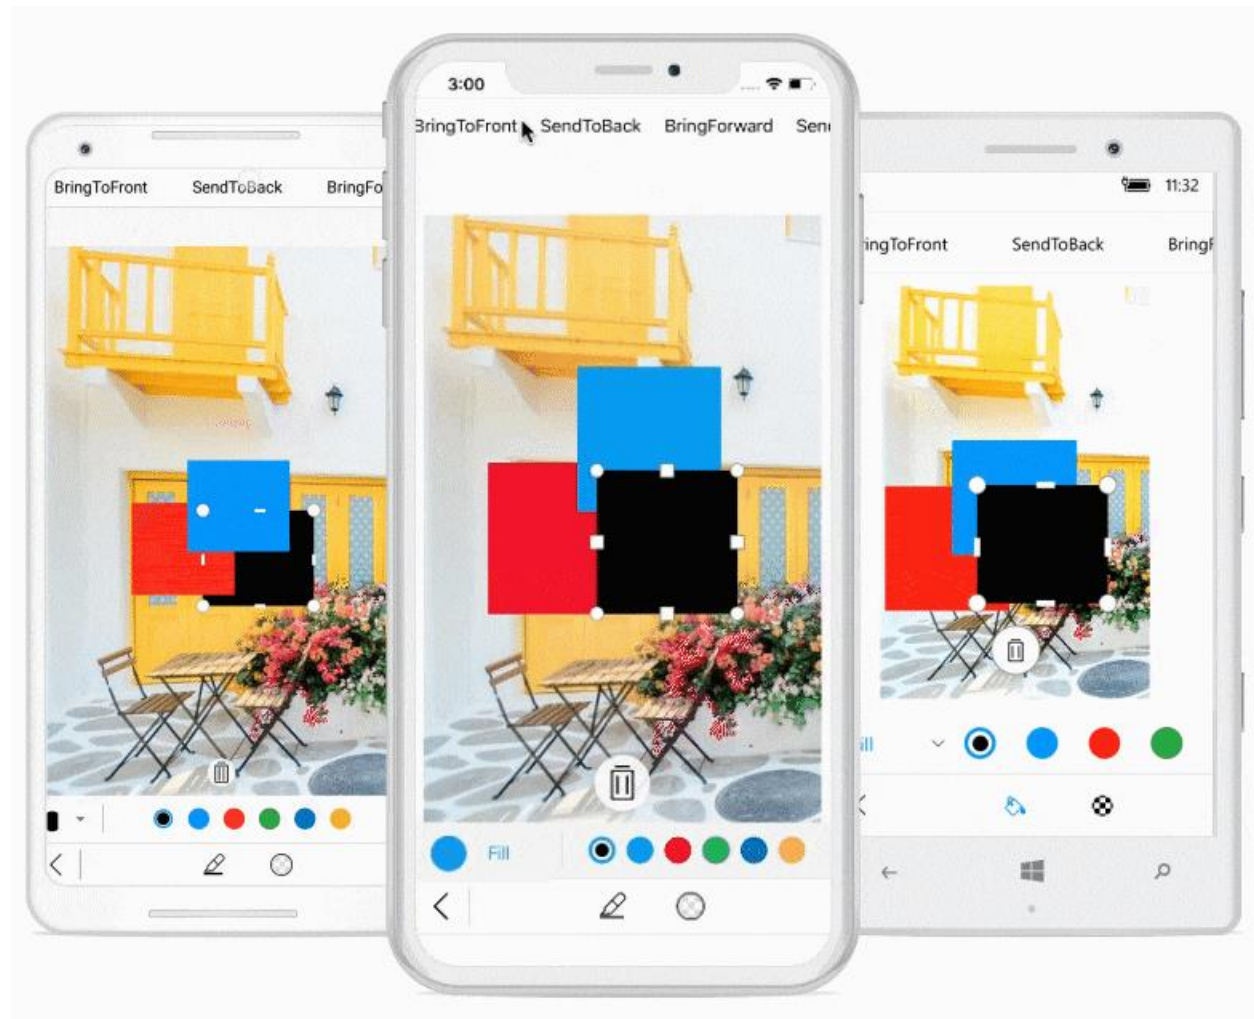

```
editor.BringForward();
```

### SendBackward

The SendBackward method is used to send the selected shapes/text to one step backward of a group of elements over an image.

#### **C#**

```
editor.SendBackward();
```

## Localization

The image editor control supports localization. You can localize the contents of image editor by adding equivalent localized strings.

### Change default language

Based on resource strings in the project, the contents are localized. By default, the image editor control is available in English.

You can localize image editor contents in the following two ways:

- Using Resx file from PCL.
- From platform-specific projects.

### Using Resx file from PCL

You can localize the text from PCL by adding equivalent localized strings in the resource file. Add the required resx files with **Build Action** -> **EmbeddedResource** (File name should contains culture code) under the **Resources** folder.

E.g., For Japanese, filename should be **Syncfusion.SfImageEditor.XForms.ja-JP.resx**.

Initializes a new instance of the `ResourceManager` class that looks up resources with the specified root name in the given assembly.

### C#

```
ImageEditorResourceManager.Manager = new ResourceManager (ResXPath,  
Assembly);
```

Here,

ResXPath => Full path of the resx file

Assembly => Application assembly (PCL)

The `CurrentCulture` must be set in the platform projects.

Convert the platform-specific format to a .NET format, and set it to `Thread.CurrentThread.CurrentCulture`.

You can use the value set to this static property from our source to read the values in PCL project's `Syncfusion.SfImageEditor.XForms.ja-JP.resx` files.

### C#

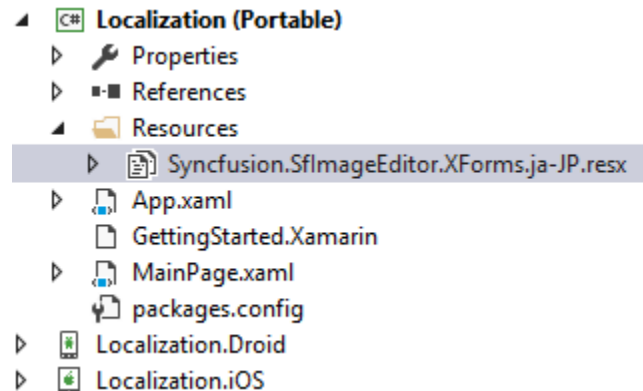

```
public void SetLocale(CultureInfo culture)  
{  
    Thread.CurrentThread.CurrentCulture = culture;  
    Thread.CurrentThread.CurrentUICulture = culture;  
}  
public CultureInfo GetCurrentCultureInfo()  
{  
    var netLanguage = "en";  
    var androidLocale = Java.Util.Locale.Default;  
    netLanguage =  
        AndroidToLanguage(androidLocale.ToString().Replace("_", "-"));  
    CultureInfo culture = null;  
    try  
    {  
        culture = new CultureInfo(netLanguage);  
    }  
    catch  
    {  
        try  
        {  
            var fallback = ToFallbackLanguage(new  
                PlatformCulture(netLanguage));  
            culture = new CultureInfo(fallback);  
        }  
        catch  
        {  
            culture = new CultureInfo("en");  
        }  
    }  
    return culture;  
}
```

The following code snippet shows converting Japanese language to `CultureInfo` equivalent.

**C#**

```
var netLanguage = platCulture.LanguageCode;
case "ja":
netLanguage = "ja-JP"; //equivalent to Japanese for this app
break;
```

Change the language preference in device.

The following screenshot shows localizing the text to Japanese language.

Name	Value
Add	追加する
Cancel	キャンセル
Crop	作物
Done	完了
EditText	テキストの編集
EnterText	テキストを入力
Fill	塗りつぶす
Free	無料
OK	完了
Original	元の
Outline	アウトライン
Reset	リセット
Save	セーブ
Saving	保存する
Square	平方

#### From platform-specific projects

You can localize the text from different platforms by adding equivalent localized strings in resource file. For localizing text, configure it to each platform separately.

- Localizing the text in Android renderer.
- Localizing the text in iOS renderer.
- Localizing the text in UWP renderer.

### Android

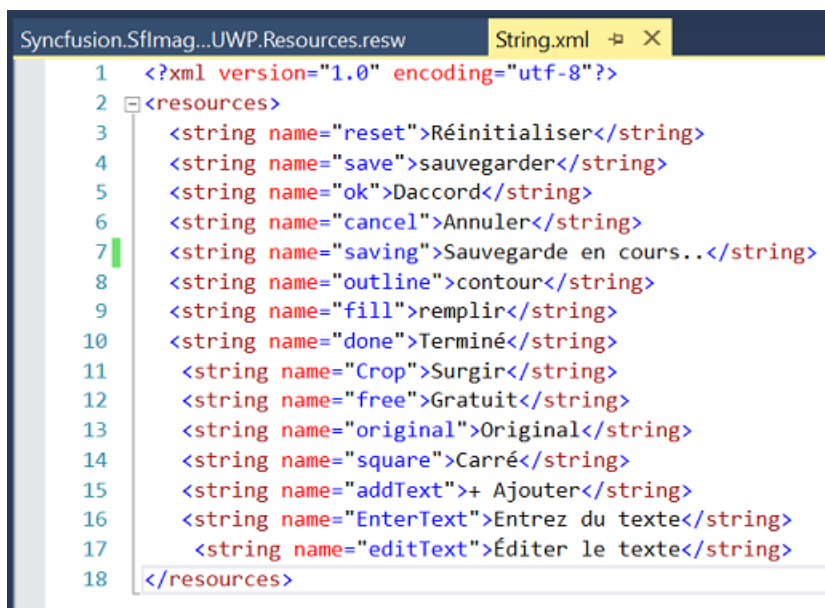

You can localize the text available in the control by adding equivalent localized strings in resource file.

Create String.xml in resource file in Android

Location- ProjectName.Android/Resources/values/Strings.Xml

The following screenshot shows localizing the text to French language.

### iOS

You can localize custom text available in the control by adding equivalent localized strings in resource file.

Create Localizable.strings in resource file in iOS.

Location- ProjectName.iOS/Resources/Localizable.strings

The following screenshot shows localizing the text to French language.

```

Localizable.strings
1  "Reset"="Réinitialiser";
2  "Save"="sauvegarder";
3  "Ok"="D'accord";
4  "Cancel"="Annuler";
5  "Outline"="contour";
6  "Fill"="remplir";
7  "EnterText"="Entrez du texte";
8  "Crop"="Surgir";
9  "Free"="Gratuit";
10 "Original"="Original";
11 "Square"="Carré";
12 "Add" = "+ Ajouter";

```

### UWP

You can localize custom text available in the control by adding equivalent localized strings in resource file.

Create Syncfusion.SfImageEditor.UWP.Resources file in UWP.

Location- ProjectName.UWP/Resources/Syncfusion.SfImageEditor.UWP.Resources

The following screenshot shows localizing the text to French language.

Syncfusion.SfImage...UWP.Resources.resw String.xml		
Add Resource Remove Resource		
	Name	Value
▶	Add	Ajouter
	Cancel	Annuler
	CropText	Surgir
	Enter Text	Entrez du texte
	EnterText	Entrez du texte
	Fill	Remplir
	Free	Free
	Ok	D'accord
	Original	Original
	Outline	Contour
	Reset	Réinitialiser
	Save	Sauvegarder
	Square	Carré
*		

The following screenshot shows localizing the text to French language in image editor.

### CustomView

You can add any custom shapes or views to an image using the `AddCustomView` method in the image editor control. To add a custom view, specify the view and its desired `CustomViewSettings` as shown in the following code snippet.

#### C#

```
Image customImage = new Image() { HeightRequest = 200, WidthRequest = 200 };
Assembly assembly = Assembly.GetAssembly(typeof(Sample));
customImage.Source =
    ImageSource.FromResource("sample_namespace.CustomImage.png", assembly);
imageEditor.AddCustomView(customImage, new CustomViewSettings());
```

### CustomViewSettings

The `CustomViewSettings` is defined to set the values for `CanMaintainAspectRatio`, `Bounds` and `Angle`.

- The `CanMaintainAspectRatio` property is used to decide whether the aspect ratio value needs to be maintained when resizing the custom view.

- Bounds property is used to set the bounds of the custom view. Using this property, you can position the custom view wherever you want on the image. In percentage, the value should fall between 0 and 100.
- Angle property is used to set the angle of the custom view. Using this property, you can rotate the custom view at desired angle.

**C#**

```
CustomViewSettings customViewSettings = new CustomViewSettings()  
{  
    CanMaintainAspectRatio = false,  
    Bounds = new Rectangle(0, 0, 100, 100),  
    Angle=45  
};
```

### CustomView Rotation

You can rotate and resize the custom view by enabling the `RotatableElements` property of image editor. `ImageEditorElements` is an enum type with values `Text`, `CustomView` and `None` as shown in the following code snippet.

**C#**

```
editor.RotatableElements = ImageEditorElements.CustomView;
```

**Note:** The default value for RotatableElements is **None**.

You can rotate the custom view based on a particular angle using **Angle** property in **CustomViewSettings** as shown in the following code snippet.

**C#**

```
imageEditor.AddCustomView(customImage, new CustomViewSettings() {Angle = 45});
```

![SfImageEditor](ImageEditor\_images/rotation.png)

### Image Filter

Using the image editor control, you can add effects such as Hue, Saturation, Brightness, Contrast, Blur, and Sharpen to the image. These effects can be applied from toolbar or using the **ApplyImageEffect** method. The **ApplyImageEffect** method contains two arguments: **ImageEffect** and **EffectValue**. The **ImageEffect** is an Enum, which contains the following effects:

- Hue
- Saturation
- Brightness
- Contrast
- Blur
- Sharpen
- None

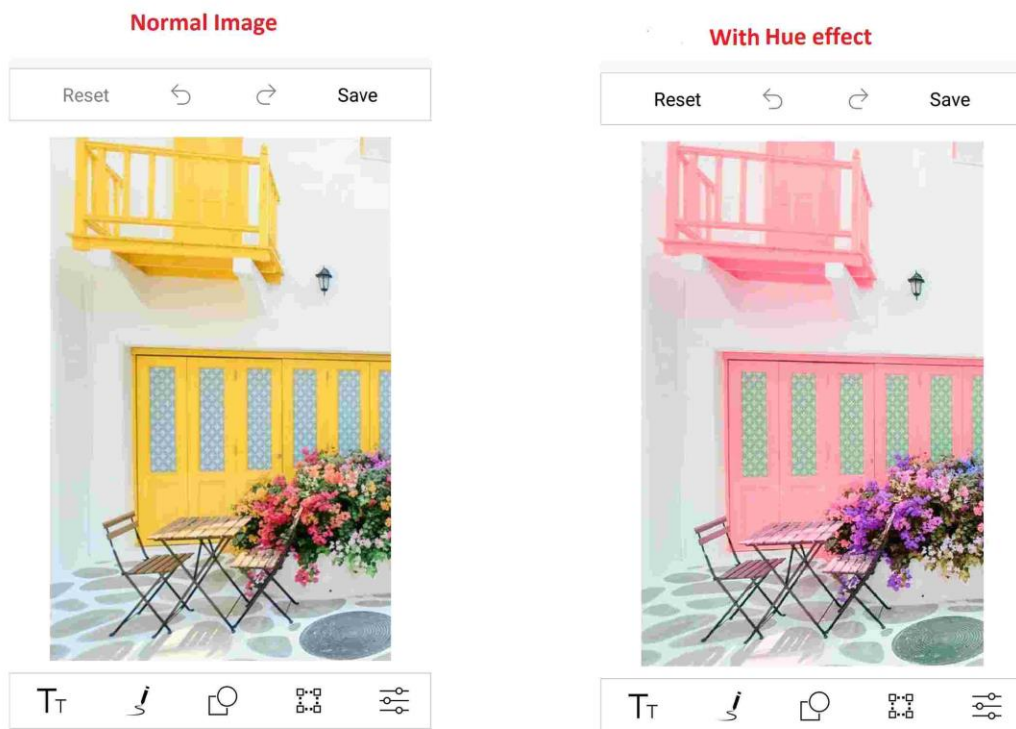

The **EffectValue** are the corresponding **ImageEffect** values, which varies for each effect, and they are explained as follows.

### Hue

The Hue represents the dominant wavelength of the color. The value of hue effect ranges from -180 to 180.

**C#**

```
public MainPage()  
{  
    . . .  
    editor.ApplyImageEffect(ImageEffect.Hue, 120);  
    . . .  
}
```

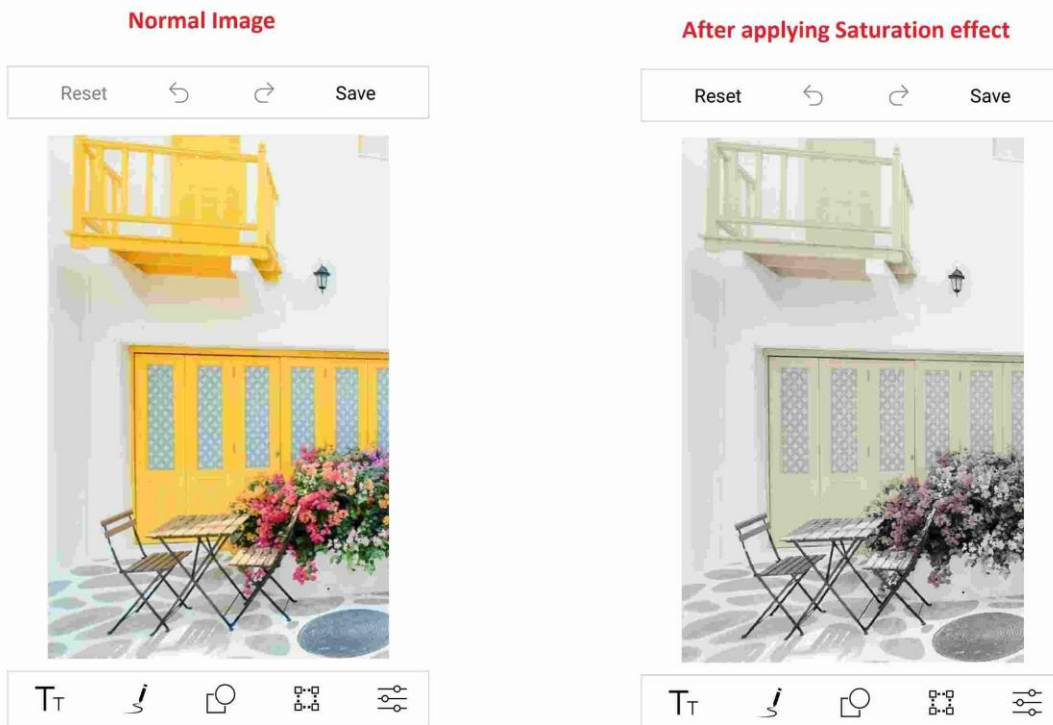

### Saturation

The Saturation represents the intensity of the color. The value of the saturation effect ranges from -100 to 100.

### C#

```
public MainPage()
{
    . . .
    editor.ApplyImageEffect(ImageEffect.Saturation, 20);
    . . .
}
```

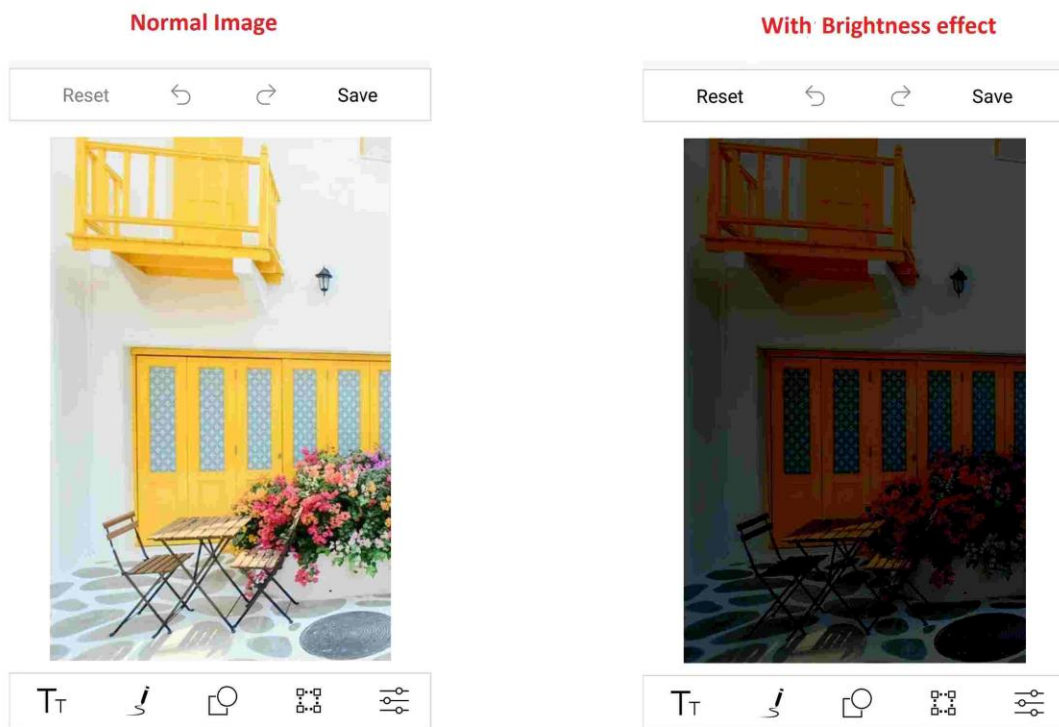

## Brightness

The brightness represents how bright the color is. The value of brightness effect ranges from -100 to 100.

### C#

```
public MainPage()  
{  
    . . .  
    editor.ApplyImageEffect(ImageEffect.Brightness, 80);  
    . . .  
}
```

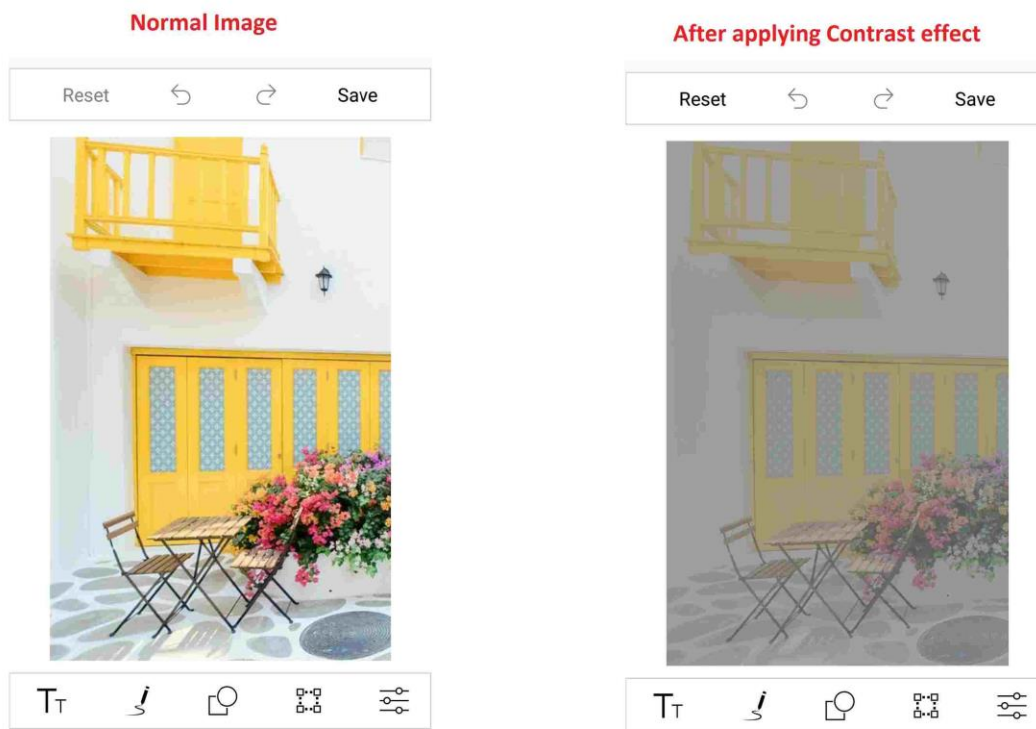

### Contrast

The contrast represents the color contrast of an image. The value of contrast effect ranges from -100 to 100.

### C#

```
public MainPage()
{
    . . .
    editor.ApplyImageEffect(ImageEffect. Contrast, 30);
    . . .
}
```

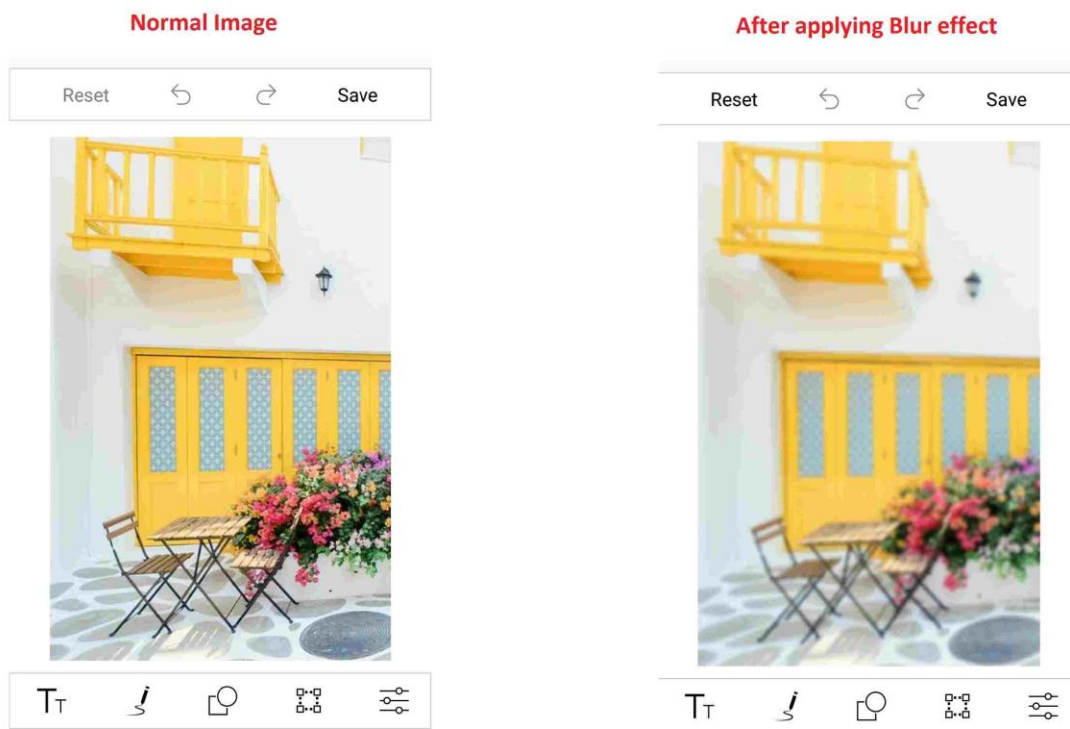

## Blur

The Blur represents the clearness of the image. The value of blur effect ranges from 0 to 6.

### C#

```
public MainPage()
{
    . . .
    editor.ApplyImageEffect(ImageEffect.Blur, 4);
    . . .
}
```

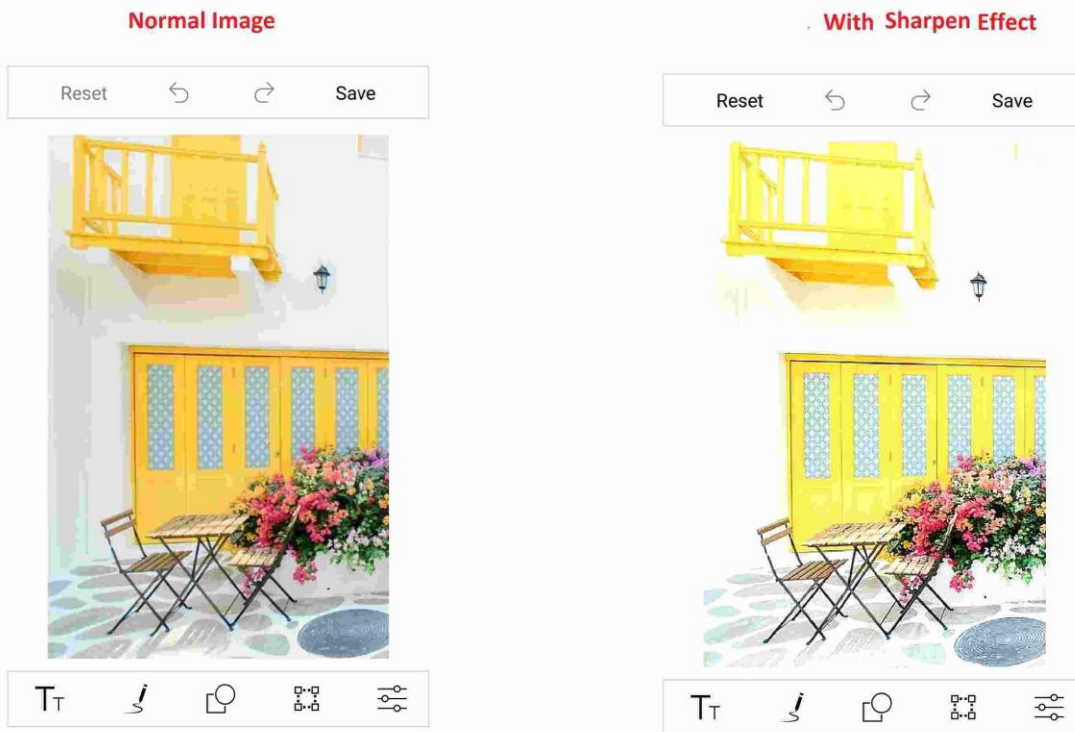

### Sharpen

Sharpen is used to highlight edges and fine details in an image. The value of sharpen effect ranges from 0 to 6.

#### C#

```
public MainPage()  
{  
    . . .  
    editor.ApplyImageEffect(ImageEffect.Sharpen, 2);  
    . . .  
}
```

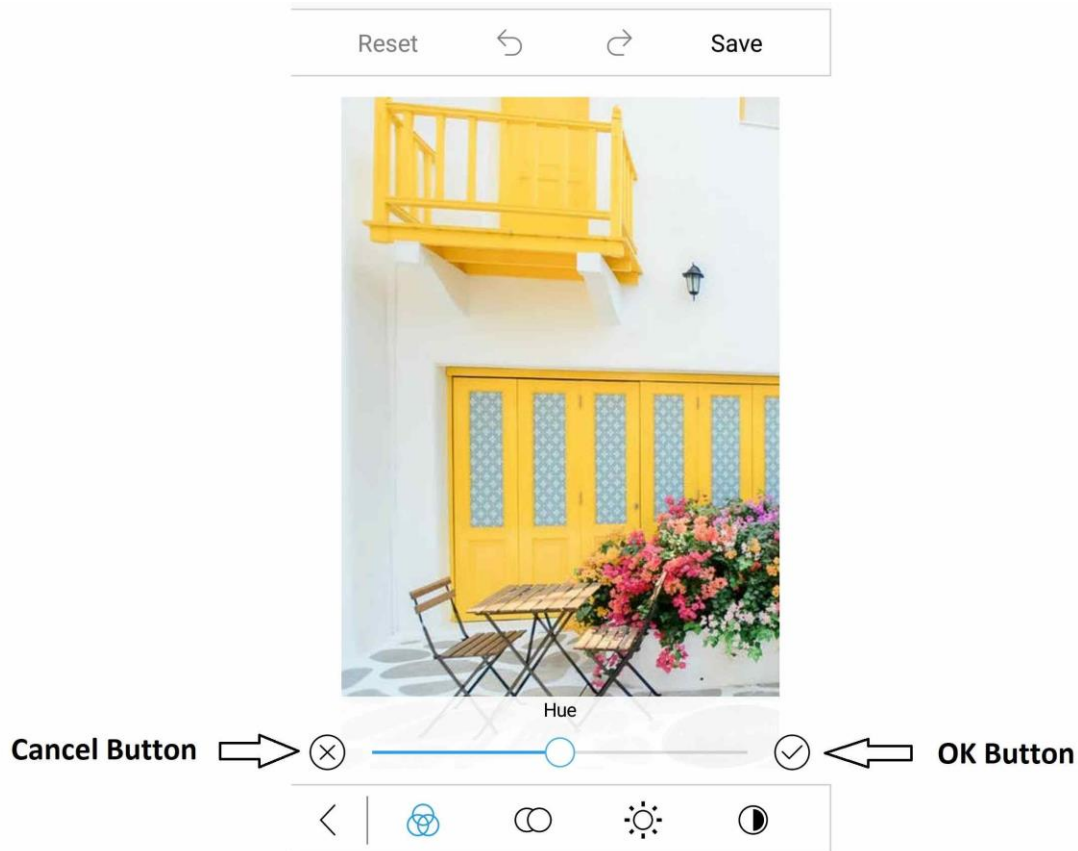

---

**Note:** The Image Effect enum also contains “None” option, which removes all the previously applied effects, which are not saved displays the original image. When applying effect through the Apply Image effect method, the effects will be saved automatically. But, if you apply effect from toolbar, each effect will be saved only when clicking the OK button, else all the applied effects will not be saved.

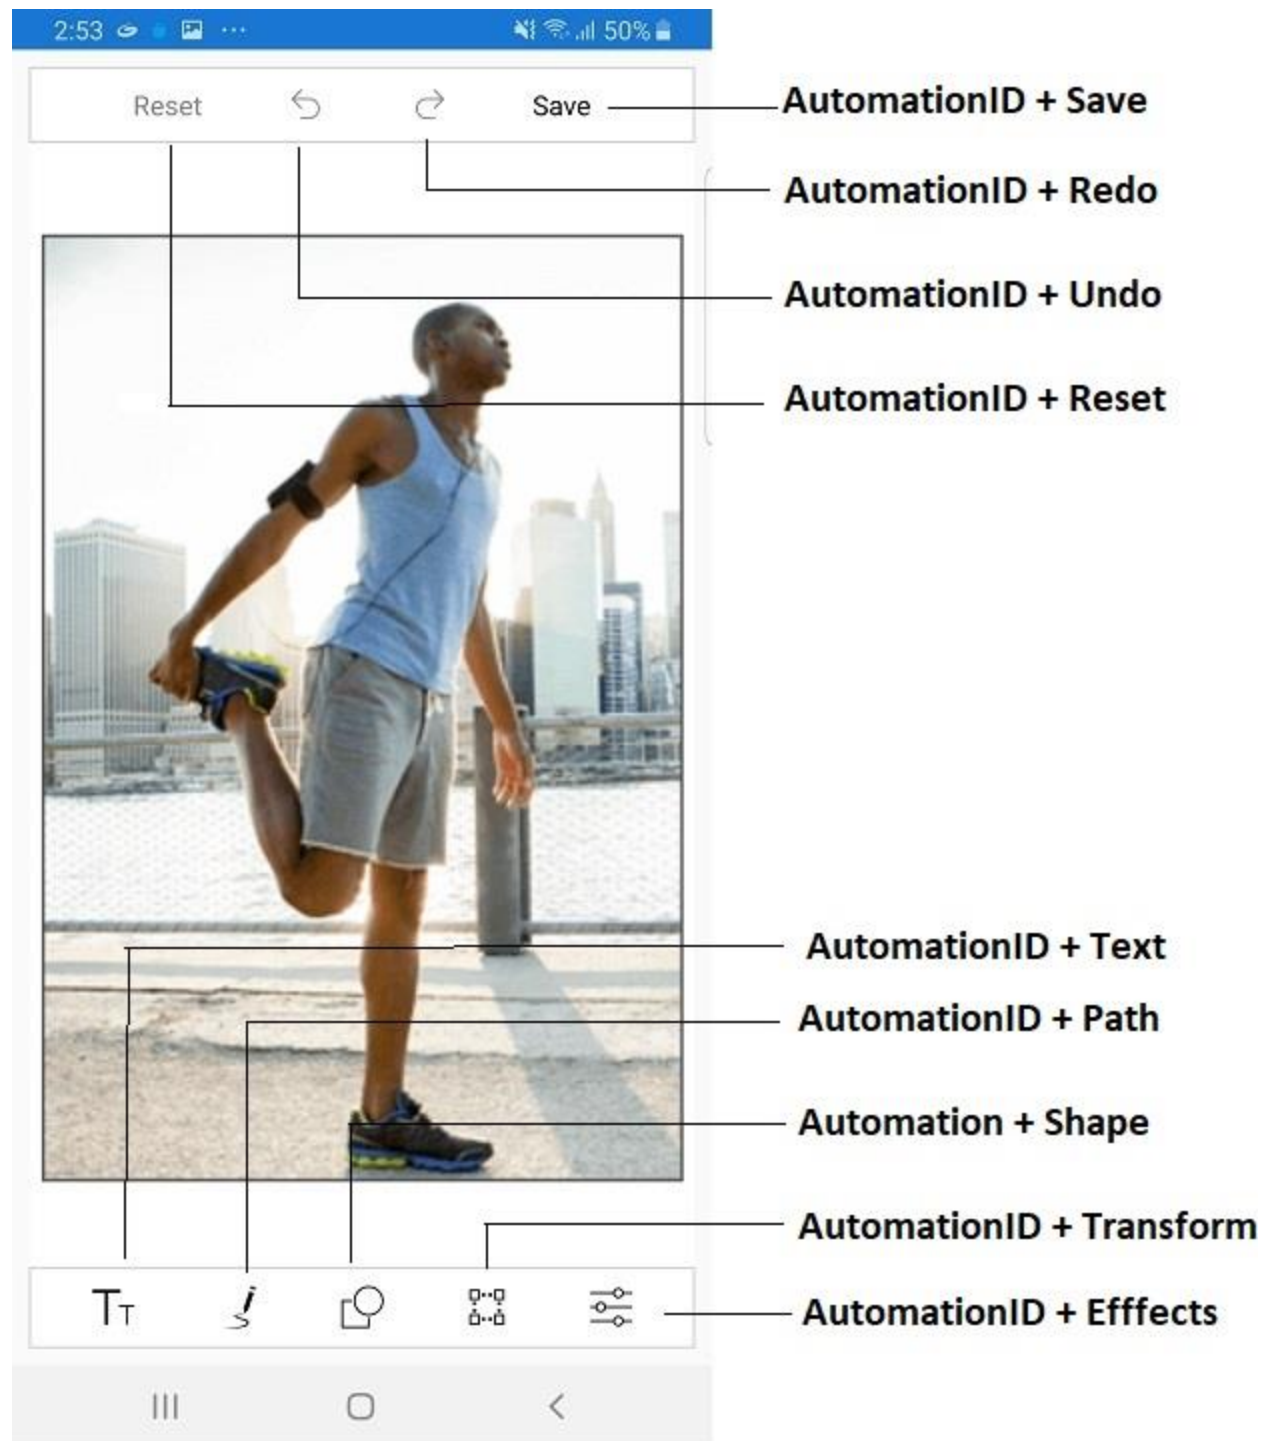

---

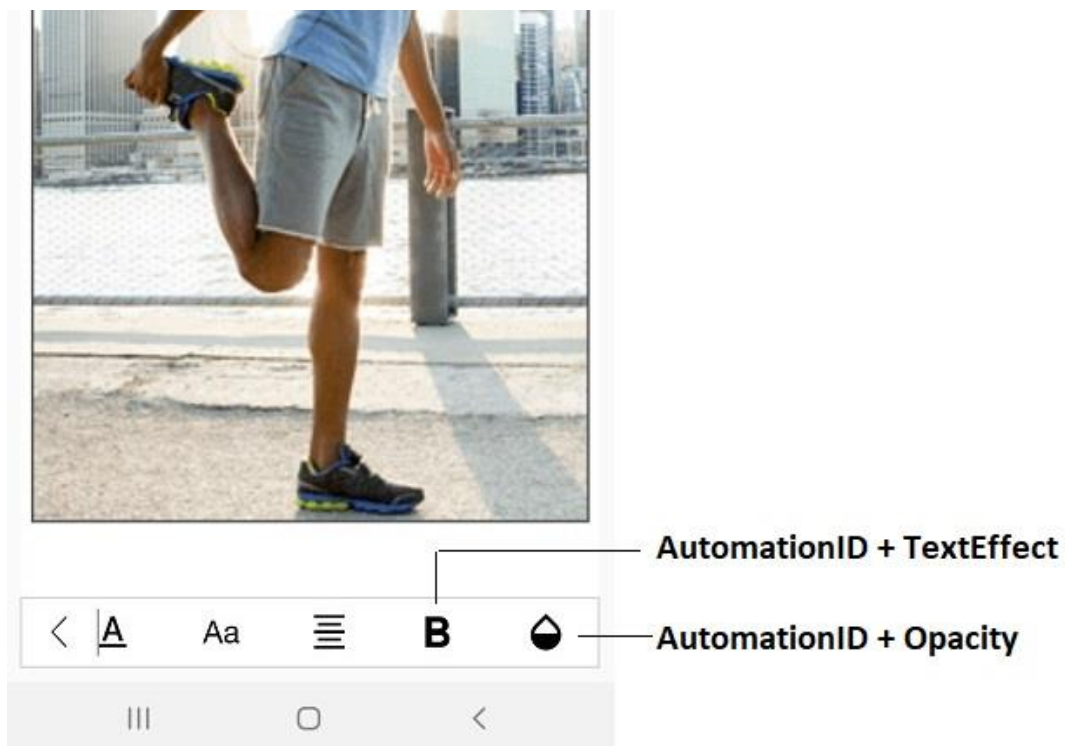

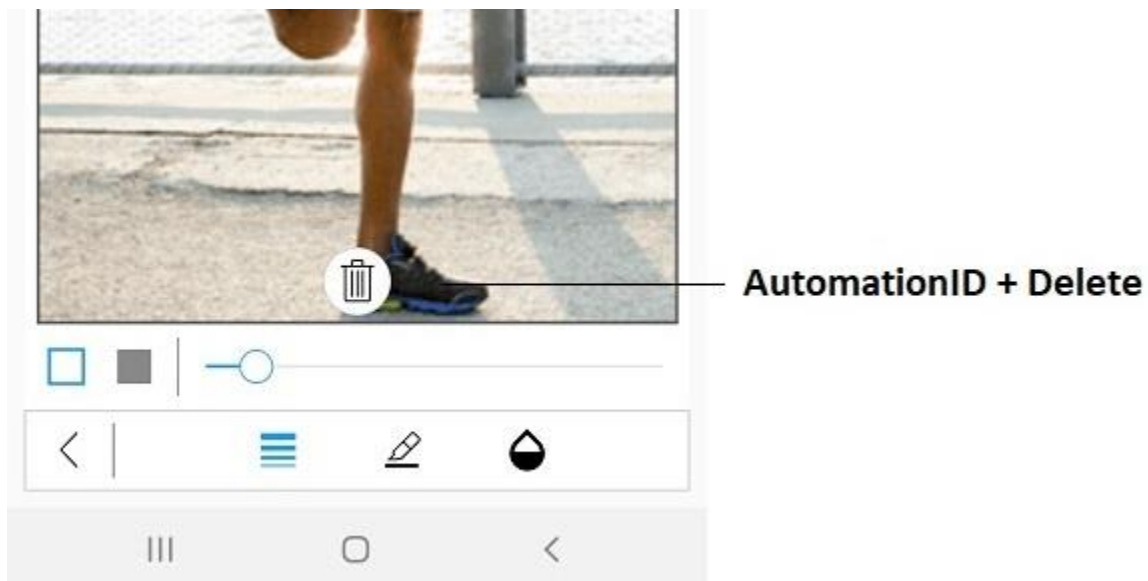

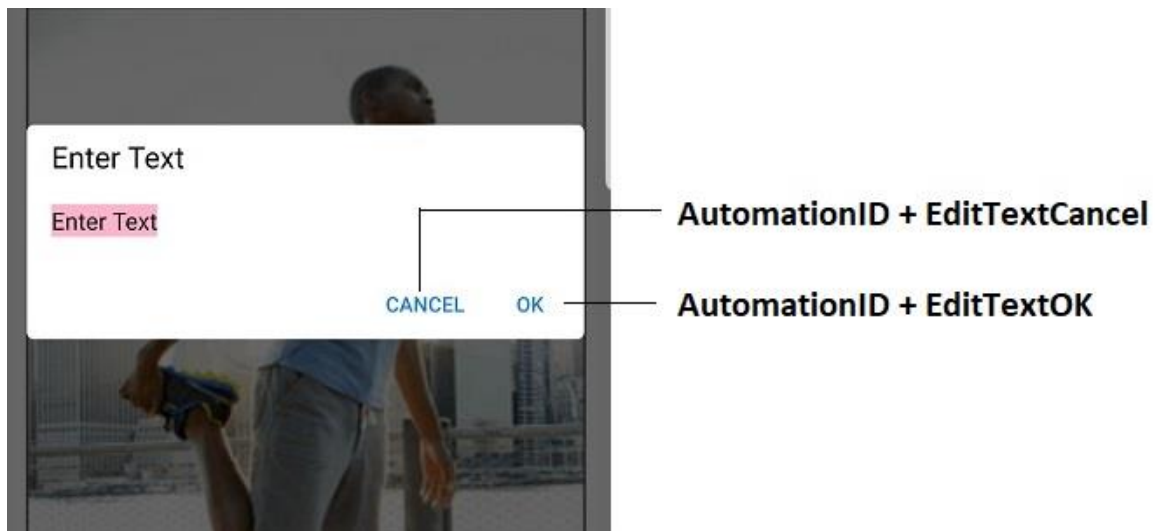

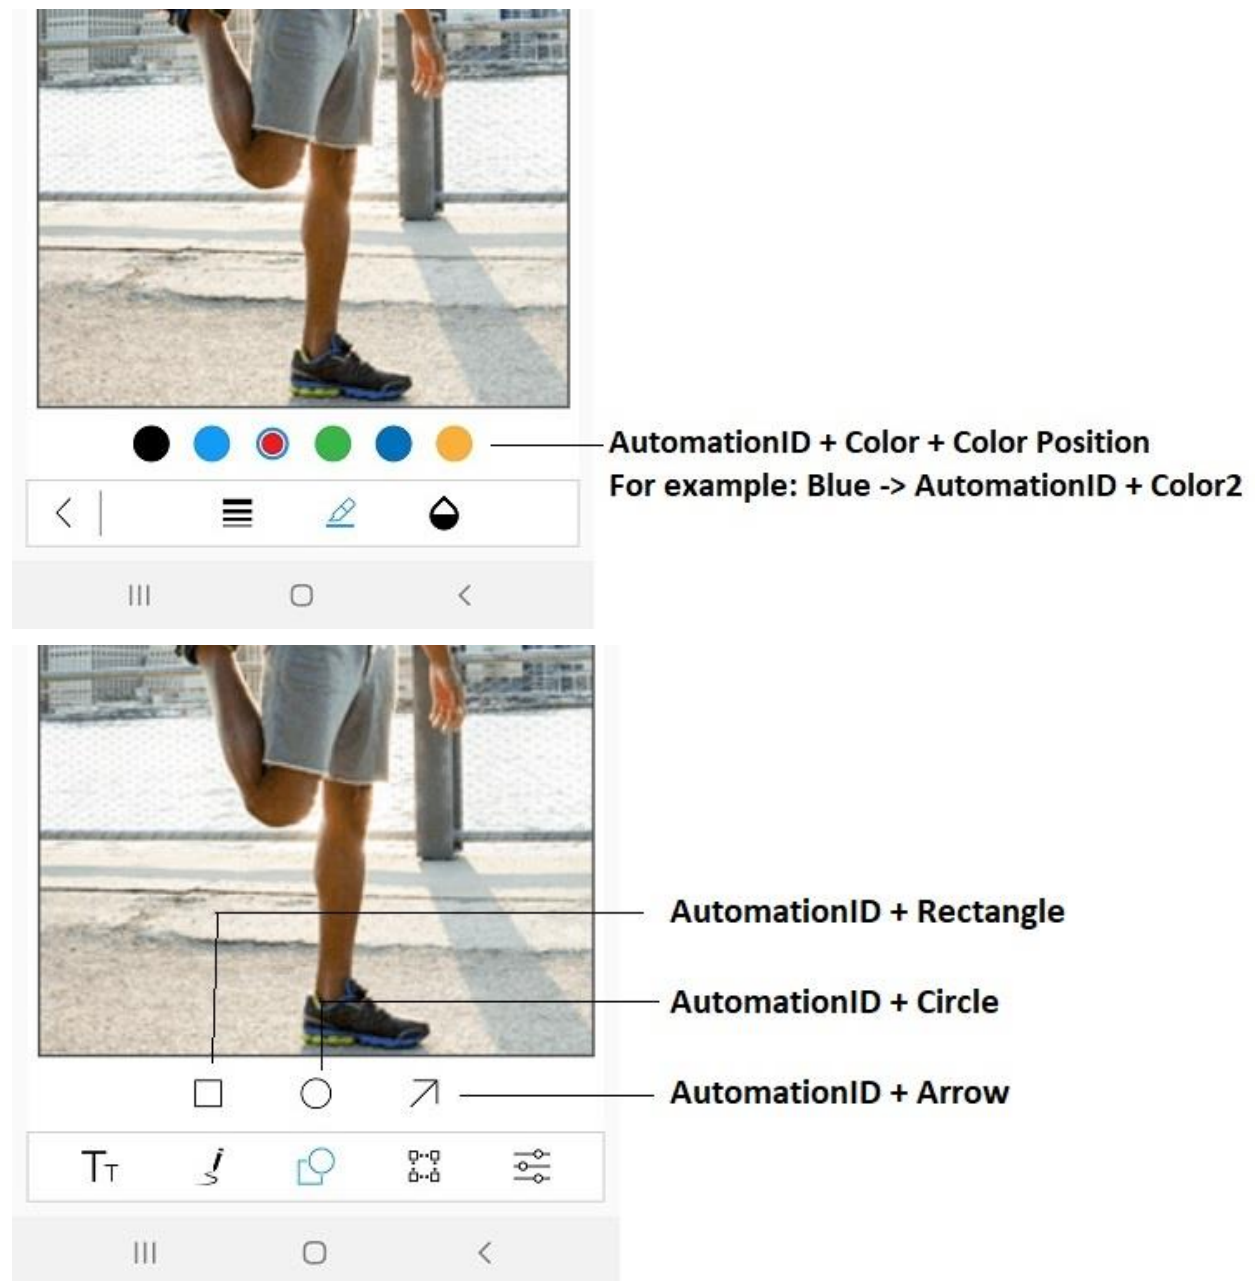

### Automation ID

The SfImageEditor control has built-in automation Id for inner elements. The `AutomationId` API allows the automation framework to find and interact with the inner elements of the SfImageEditor control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's `AutomationId`. For example, if you set automationId as `ImageEditor`, then the automation framework will interact with the Undo button as `ImageEditorUndo`. The following screenshot illustrates the AutomationIds for toolbar elements.

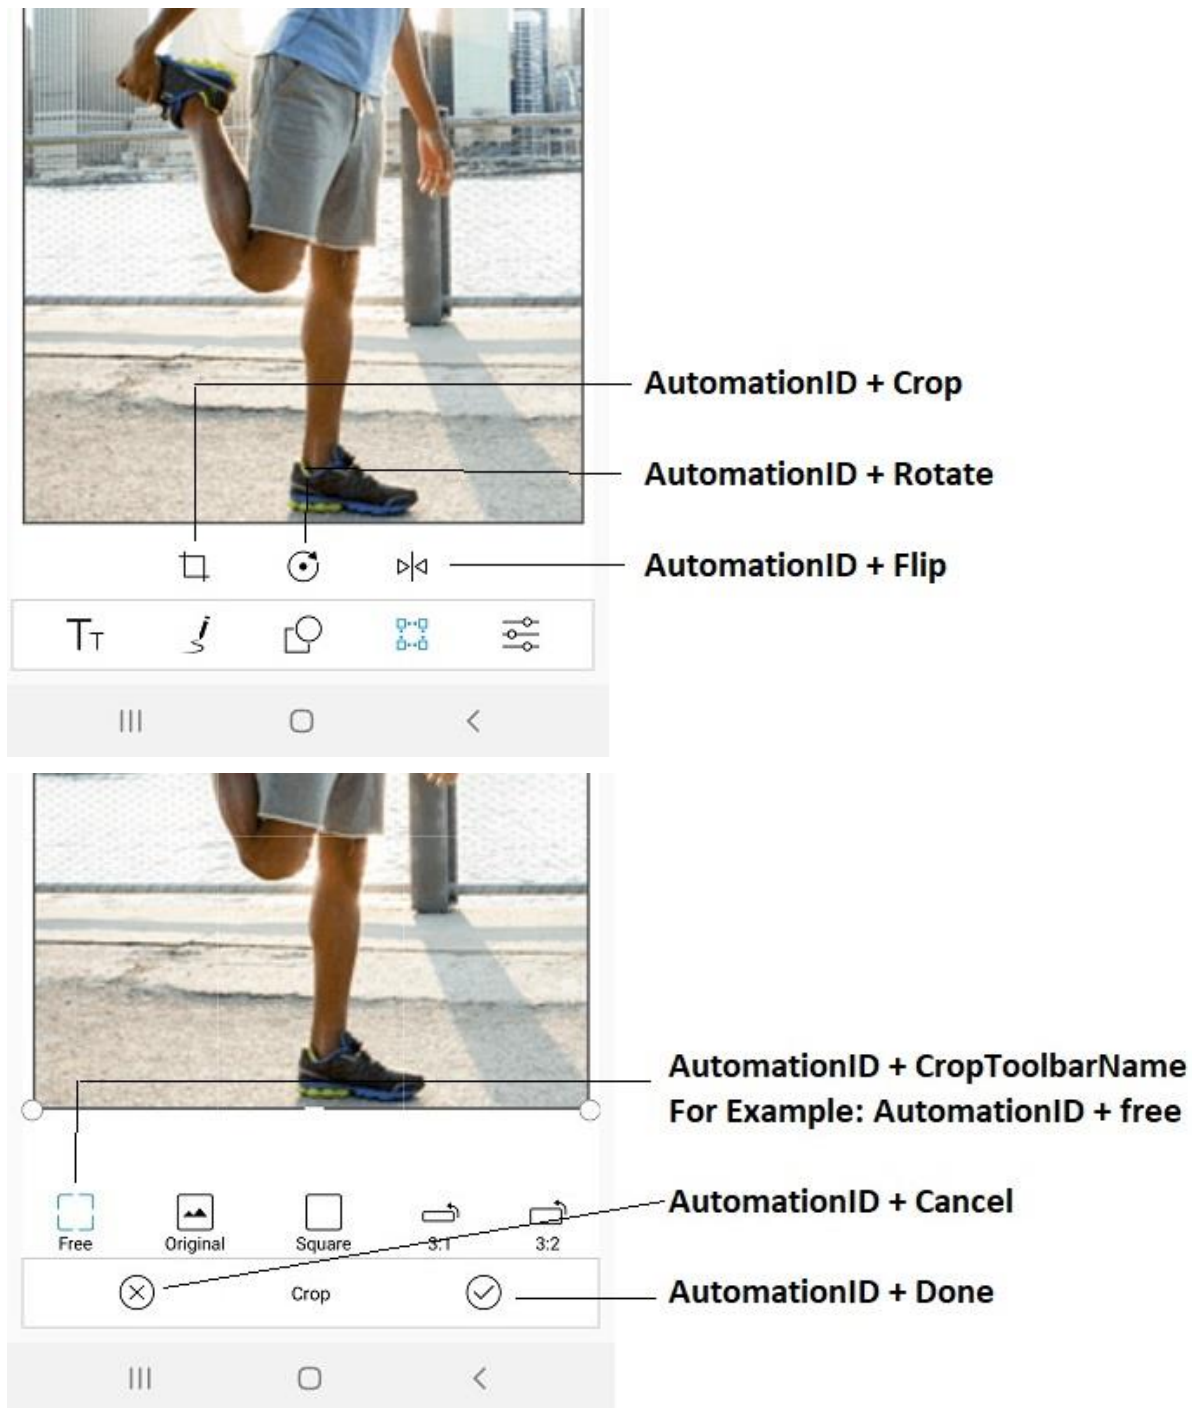

## SfKanban

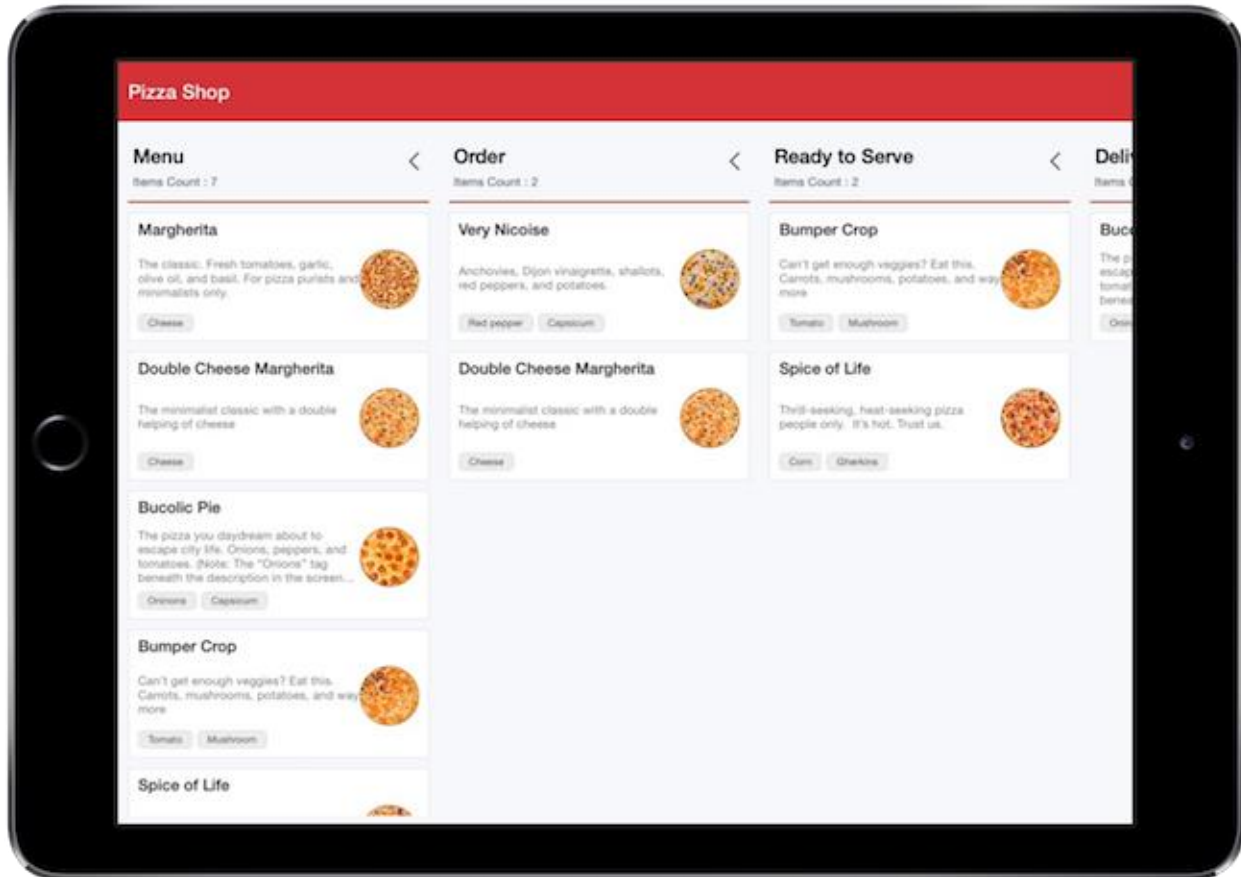

### Overview

The Kanban control is an efficient way to visualize a workflow at each stage of completion.

### Key features

- Visualize the workflow of any process.

- Limit a work in progress (WIP).
- Manage workflow transitions.
- Customize at a high level.
- Transition smoothly within processes.

## Getting Started

This section provides a quick overview for working with Essential Kanban for Xamarin.Forms. It is an efficient way to visualize the workflow at each stage along its path to completion.

### Adding SfKanban reference

You can add SfKanban reference in one of the following methods:

#### Method 1: Adding SfKanban reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfKanban). To add kanban to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfKanban](https://www.nuget.org/packages/Syncfusion.Xamarin.SfKanban), and then install it.

![Adding SfKanban reference from NuGet](SfKanban\_images/Adding SfKanban reference.png)

---

**Note:** Install the same version of kanban NuGet in all the projects.

---

#### Method 2: Adding SfKanban reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfKanban control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfKanban assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfKanban.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfKanban.Android.dll Syncfusion.SfKanban.XForms.Android.dll Syncfusion.SfKanban.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfKanban.iOS.dll Syncfusion.SfKanban.XForms.iOS.dll Syncfusion.SfKanban.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfKanban.UWP.dll Syncfusion.SfKanban.XForms.UWP.dll Syncfusion.SfKanban.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching an application on each platform with kanban

To use the kanban inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and are discussed in the following sections:

**Note:** If you are adding the references from toolbox, below steps are not needed.

*iOS*

To launch the kanban in iOS, call the `SfKanbanRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

**C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    SfKanbanRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

*Universal Windows Platform (UWP)*

To deploy the kanban in `Release` mode, initialize the kanban assemblies in the `App.xaml.cs` file in the UWP project as demonstrated in the following code samples.

**C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        assembliesToInclude.Add(typeof(SfKanbanRenderer).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
    ...
}
```

*Android*

Android platform does not require any additional configuration to render the kanban control.

## Initialize Kanban

Import '[SfKanban](#)' namespace as shown below in your respective page,

**XML**

```
xmlns:kanban="clr-namespace:Syncfusion.SfKanban.XForms;assembly=Syncfusion.SfKanban.XForms"
```

**C#**

```
using Syncfusion.SfKanban.XForms;
```

Create an instance of '[SfKanban](#)' control and set to Content property of a Page.

**XML**

```
<kanban:SfKanban>
```

```
</kanban:SfKanban>
```

### C#

```
SfKanban kanban = new SfKanban();  
this.Content = kanban;
```

### Initialize view model

Create a ViewModel class with a collection property to hold a collection of [KanbanModel](#) instances as shown below. Each [KanbanModel](#) instance represent a card in Kanban control.

### C#

```
public class ViewModel  
{  
    public ObservableCollection<KanbanModel> Cards { get; set; }  
    public ViewModel()  
    {  
        Cards = new ObservableCollection<KanbanModel>();  
        Cards.Add(new KanbanModel()  
        {  
            ID = 1,  
            Title = "iOS - 1002",  
            ImageURL = "Image1.png",  
            Category = "Open",  
            Description = "Analyze customer requirements",  
            ColorKey = "Red",  
            Tags = new string[] { "Incident", "Customer" }  
        });  
        Cards.Add(new KanbanModel()  
        {  
            ID = 6,  
            Title = "Xamarin - 4576",  
            ImageURL = "Image2.png",  
            Category = "Open",  
            Description = "Show the retrieved data from the server in grid control",  
            ColorKey = "Green",  
            Tags = new string[] { "Story", "Customer" }  
        });  
        Cards.Add(new KanbanModel()  
        {  
            ID = 13,  
            Title = "UWP - 13",  
            ImageURL = "Image4.png",  
            Category = "In Progress",  
            Description = "Add responsive support to application",  
            ColorKey = "Brown",  
            Tags = new string[] { "Story", "Customer" }  
        });  
        Cards.Add(new KanbanModel()  
        {  
            ID = 2543,  
            Title = "Xamarin_iOS - 2543",  
            Category = "Code Review",  
            ImageURL = "Image3.png",
```

```

Description = "Check login page validation",
ColorKey = "Brown",
Tags = new string[] { "Story", "Customer" }
});
}
}

```

Set the `ViewModel` instance as the `BindingContext` of your Page; this is done to bind properties of `ViewModel` to [SfKanban](#).

**Note:** Add namespace of `ViewModel` class in your XAML page if you prefer to set `BindingContext` in XAML.

### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="GettingStartedKanban.MainPage"
xmlns:kanban="clr-
namespace:Syncfusion.SfKanban.XForms;assembly=Syncfusion.SfKanban.XForms"
xmlns:local="clr-namespace:GettingStartedKanban">
<ContentPage.BindingContext>
<local:ViewModel>
</local:ViewModel>
</ContentPage.BindingContext>
</ContentPage>

```

### C#

```
this.BindingContext = new ViewModel();
```

Binding data to SfKanban

Bind the above data to [SfKanban](#) using [ItemsSource](#) property.

### XML

```

<kanban:SfKanban ItemsSource="{Binding Cards}">
</kanban:SfKanban>

```

### C#

```
kanban.SetBinding(SfKanban.ItemsSourceProperty, "Cards");
```

Defining columns

The columns are generated automatically based on the distinct values of '[KanbanModel.Category](#)' from '[ItemsSource](#)'. But, you can also define the columns by setting '[AutoGenerateColumns](#)' property to false and adding '[KanbanColumn](#)' instance to '[Columns](#)' property of '[SfKanban](#)'.

### XML

```

<kanban:SfKanban x:Name="kanban" AutoGenerateColumns="False">
<kanban:SfKanban.Columns>
<kanban:KanbanColumn x:Name="openColumn" Title="To Do" >
</kanban:KanbanColumn>

```

```
<kanban:KanbanColumn x:Name="progressColumn" Title="In Progress">
</kanban:KanbanColumn>
<kanban:KanbanColumn x:Name="codeColumn" Title="Code Review" >
</kanban:KanbanColumn>
<kanban:KanbanColumn x:Name="doneColumn" Title="Done" >
</kanban:KanbanColumn>
</kanban:SfKanban.Columns>
</kanban:SfKanban>
```

## C#

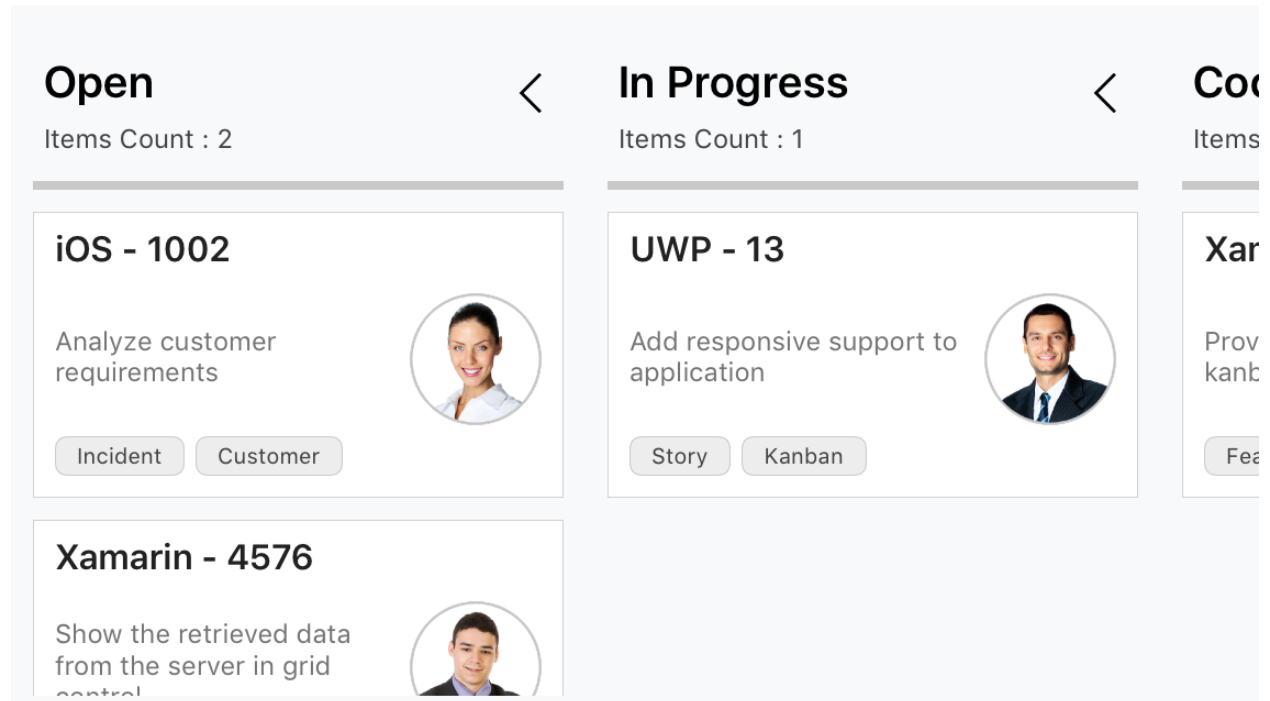

```
kanban.AutoGenerateColumns = false;
KanbanColumn openColumn = new KanbanColumn();
openColumn.Title = "To Do";
kanban.Columns.Add(openColumn);
KanbanColumn progressColumn = new KanbanColumn();
progressColumn.Title = "In Progress";
kanban.Columns.Add(progressColumn);
KanbanColumn codeColumn = new KanbanColumn();
codeColumn.Title = "Code Review";
kanban.Columns.Add(codeColumn);
KanbanColumn doneColumn = new KanbanColumn();
doneColumn.Title = "Done";
kanban.Columns.Add(doneColumn);
```

Define the categories of column using [Categories](#) property of [KanbanColumn](#) and cards will be added to the respective columns.

## C#

```
openColumn.Categories = new List<object>() { "Open" };
progressColumn.Categories = new List<object>() { "In Progress" };
codeColumn.Categories = new List<object>() { "Code Review" };
doneColumn.Categories = new List<object>() { "Done" };
```

This is how the final output will look like on iOS, Android and Windows devices. You can download the entire source code of this demo from [here](#).

## Column

### Customizing Column Size

By default, columns are sized smartly to arrange the default elements of the cards with better readability. However, you can define the minimum and maximum width for the columns in [SfKanban](#) using [SfKanban.MinimumColumnWidth](#) and [SfKanban.MaximumColumnWidth](#) properties respectively.

#### XML

```
<kanban:SfKanban MinimumColumnWidth ="300" MaximumColumnWidth ="340">
</kanban:SfKanban>
```

#### C#

```
kanban.MinimumColumnWidth = 300;
kanban.MaximumColumnWidth = 340;
```

You can also define the exact column width using [SfKanban.ColumnWidth](#) property.

#### XML

```
<kanban:SfKanban ColumnWidth ="250">
</kanban:SfKanban>
```

#### C#

```
kanban.ColumnWidth = 250;
```

### Categorizing Columns

If [ItemsSource](#) contains custom objects, the path of the property which can be used to categorize the card should be explicitly defined using [ColumnMappingPath](#) property. By default, [SfKanban](#) will automatically categorize the items using [KanbanModel.Category](#) property.

#### XML

```
<kanban:SfKanban ColumnMappingPath="Group">
</kanban:SfKanban>
```

#### C#

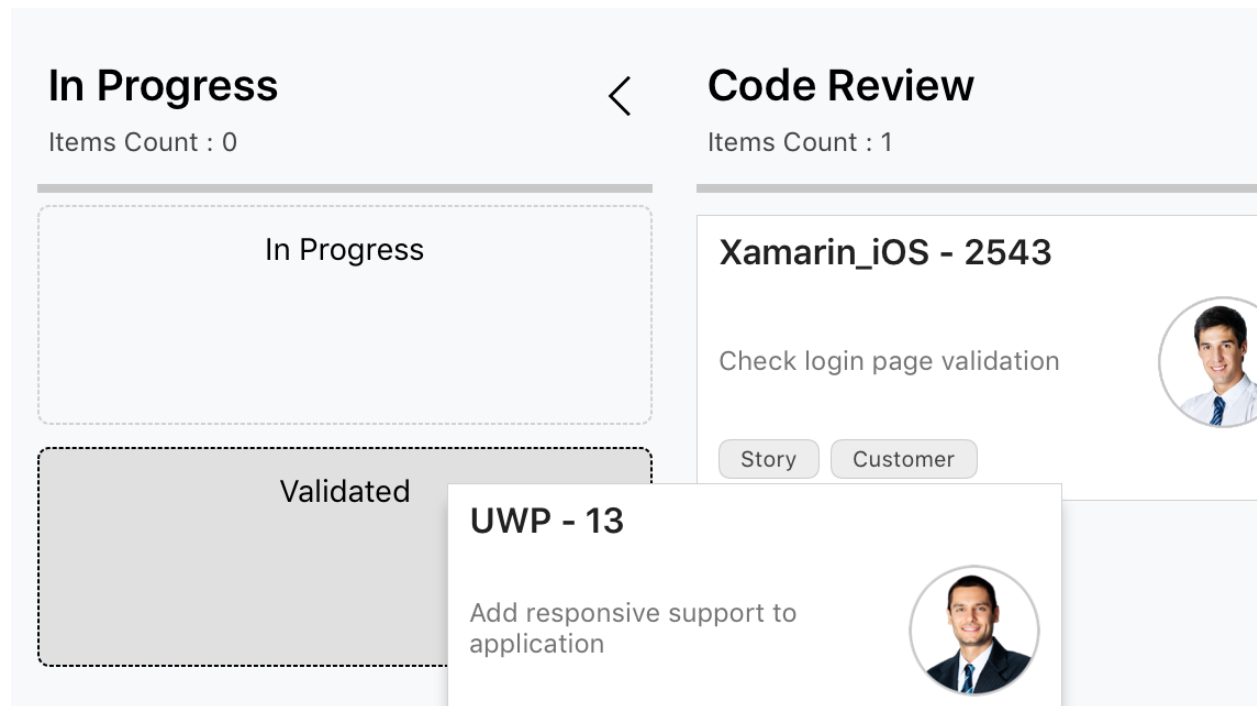

```
kanban.ColumnMappingPath = "Group";
```

### Multiple category for a column

More than one category can be mapped to a column by assigning multiple values to Categories collection of [KanbanColumn](#). For e.g., you can map “In progress, Validate types under “In progress” column.

#### C#

```
progressColumn.Categories = new List<object>() { "In Progress", "Validated"
};
```

### Headers

Header shows the category [Title](#), items count, min and max informations of a column. The UI of the header can be replaced entirely using [SfKanban.HeaderTemplate](#) property. The following code snippet and screenshot illustrates this.

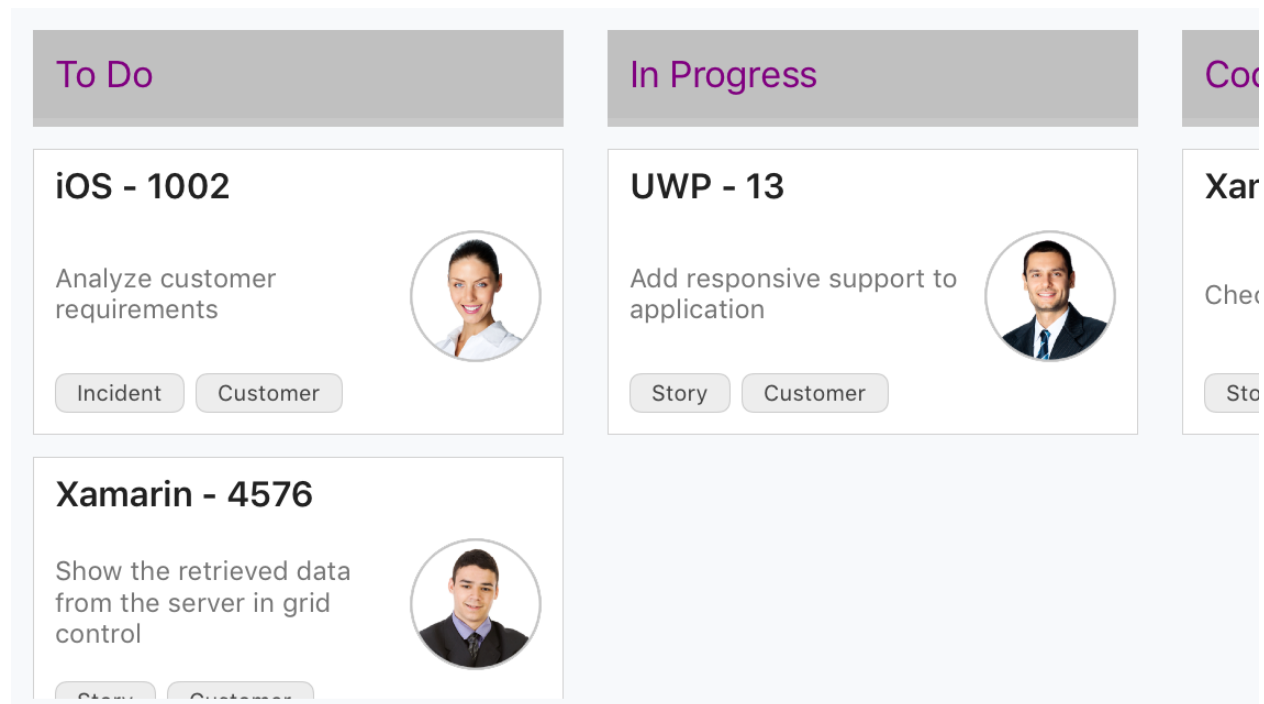

#### XML

```
<kanban:SfKanban.HeaderTemplate >
<DataTemplate>
<StackLayout WidthRequest="300" HeightRequest="40"
BackgroundColor="Silver">
<Label Margin="10" Text="{Binding Path=Title}" TextColor="Purple"
HorizontalOptions="Start" />
</StackLayout>
</DataTemplate>
</kanban:SfKanban.HeaderTemplate>
```

**C#**

```
var headerTemplate = new DataTemplate(() => {
    StackLayout root = new StackLayout() {
        WidthRequest = 300,
        HeightRequest = 40,
        BackgroundColor = Color.Silver
    };
    Label label = new Label();
    label.Margin = new Thickness(10);
    label.SetBinding(Label.TextProperty, new Binding("Title") );
    label.TextColor = Color.Purple;
    label.HorizontalOptions = LayoutOptions.Start;
    root.Children.Add(label);
    return root;
});
kanban.HeaderTemplate = headerTemplate;
```

The following output is displayed as a result of the above code example.

### Expand/Collapse Column

Columns can be expanded/collapsed by tapping the toggle button which is placed at top right corner of the Kanban header. [KanbanColumn.IsExpanded](#) ' property is used to programmatically expand/collapse the Kanban column. The following code example describes the above behavior.

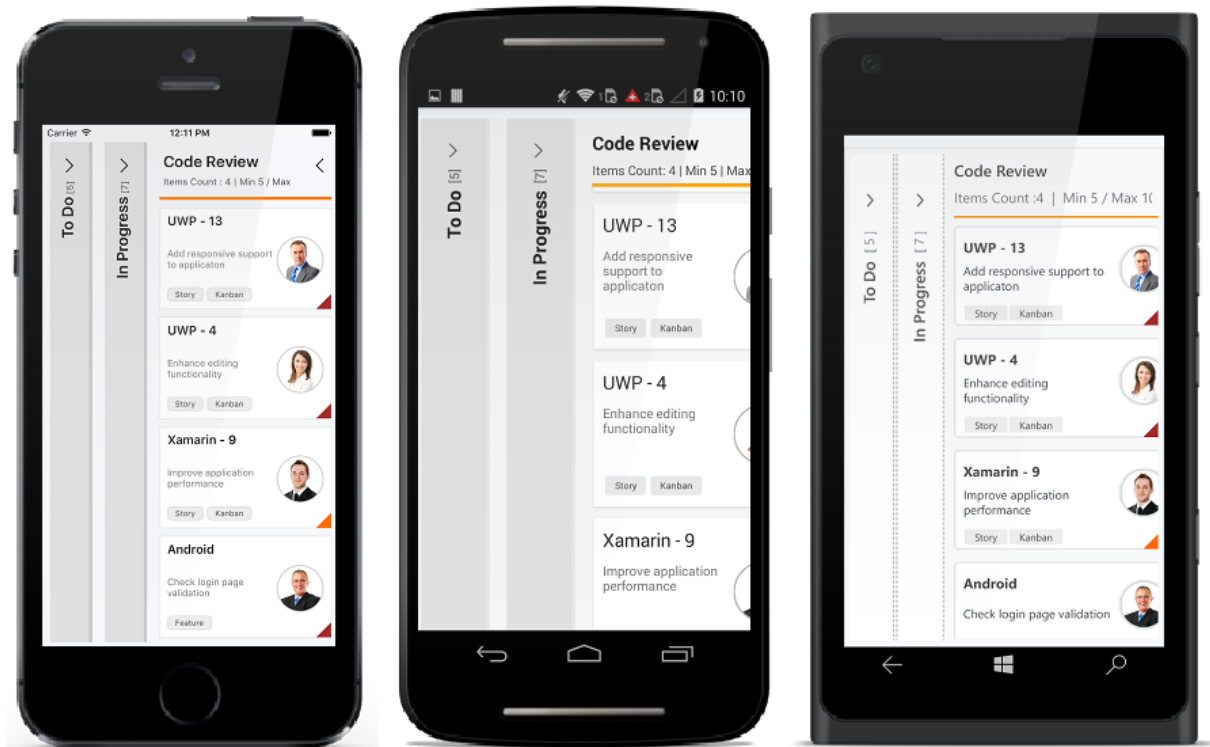

#### XML

```
<kanban:SfKanban.Columns>
<kanban:KanbanColumn x:Name="column1" Title="To Do" IsExpanded="false" />
<kanban:KanbanColumn x:Name="column2" Title="In Progress" IsExpanded="false" />
</kanban:SfKanban.Columns>
```

#### C#

```
KanbanColumn column1 = new KanbanColumn();
column1.IsExpanded = false;
KanbanColumn column2 = new KanbanColumn();
column2.IsExpanded = false;
kanban.Columns.Add(column1);
kanban.Columns.Add(column2);
```

The following output is displayed as a result of the above code example.

### Enable/Disable Drag & Drop

You can enable and disable the drag and drop operation of the cards for particular column using [KanbanColumn.AllowDrag](#) and [KanbanColumn.AllowDrop](#) properties.

The following code is used to disable the drag operation from progress column.

#### XML

```
<kanban:SfKanban.Columns>
<kanban:KanbanColumn AllowDrag="false"/>
</kanban:SfKanban.Columns>
```

#### C#

```
KanbanColumn progressColumn = new KanbanColumn();
progressColumn.AllowDrag = false;
```

The following code is used to disable the drop operation of the cards into the progress column.

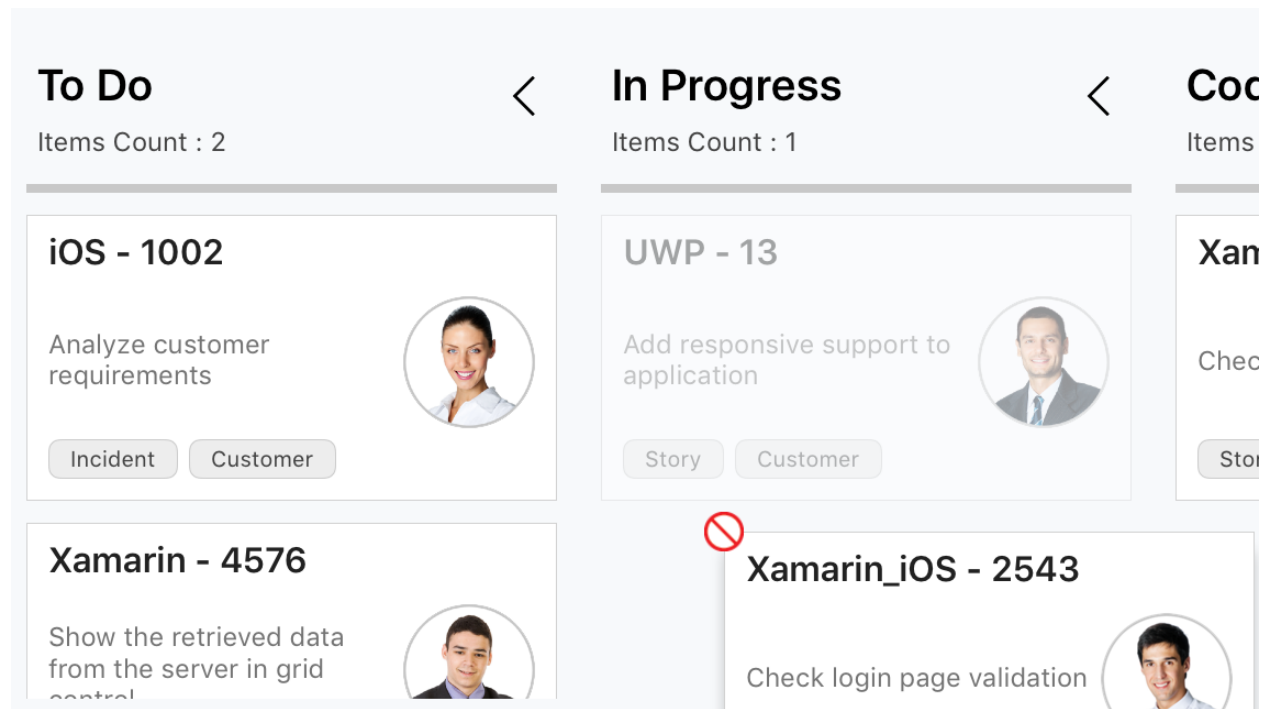

#### XML

```
<kanban:SfKanban.Columns>
<kanban:KanbanColumn AllowDrop="false"/>
</kanban:SfKanban.Columns>
```

#### C#

```
KanbanColumn progressColumn = new KanbanColumn();
progressColumn.AllowDrop = false;
```

The following output demonstrates the above example code.

Items Count

[ItemsCount](#) property is used to get the total cards count in each column.

**C#**

```
int count = todoColumn.ItemsCount;
```

## Work In-Progress Limit

[MinimumLimit](#) and [MaximumLimit](#) properties are used to define the minimum and maximum number of items in a column. If the actual items count is exceeded or lesser than the specified limits, the error bars are used to indicate this violation. Following properties of [ErrorbarSettings](#) are used to customize the appearance of error bar.

- [Color](#) - used to change the default color of the error bar.
- [MaxValidationColor](#) - used to change the maximum validation color of the error bar.
- [MinValidationColor](#) - used to change the minimum validation color of the error bar.
- [Height](#) - used to change the height of the error bar.

**XML**

```
<kanban:KanbanColumn x:Name="todoColumn" Title="To Do" MinimumLimit="2"
MaximumLimit="1">
</kanban:KanbanColumn>
```

**C#**

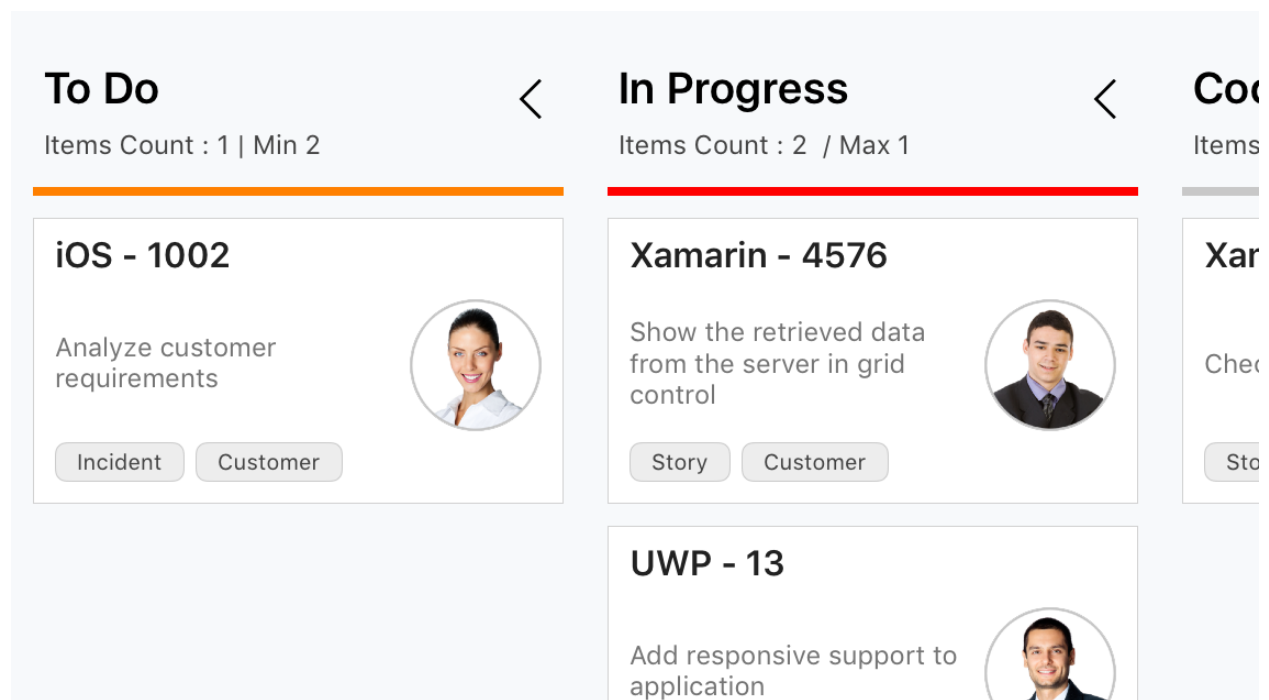

```
todoColumn.MinimumLimit = 2;
todoColumn.MaximumLimit = 1;
```

**XML**

```
<kanban:KanbanColumn x:Name="todoColumn" Title="To Do" MinimumLimit="3"
MaximumLimit="5">
<kanban:KanbanColumn.ErrorbarSettings>
<kanban:KanbanErrorBarSettings Color="Green" MinValidationColor="Orange"
MaxValidationColor="Red" Height="4"/>
</kanban:KanbanColumn.ErrorbarSettings>
</kanban:KanbanColumn>
```

**C#**

```
todoColumn.ErrorbarSettings.Color = Color.Green;
todoColumn.ErrorbarSettings.MinValidationColor = Color.Orange;
todoColumn.ErrorbarSettings.MaxValidationColor = Color.Red;
todoColumn.ErrorbarSettings.Height = 4;
```

## Workflows

This feature is used to define the flow of the card transitions from one state to another state. You need to create an instance of [KanbanWorkflow](#) class and add it to [SfKanban.Workflows](#) property to define the workflow for each column. The [KanbanWorkflow](#) contains the following properties to define the source category and target categories.

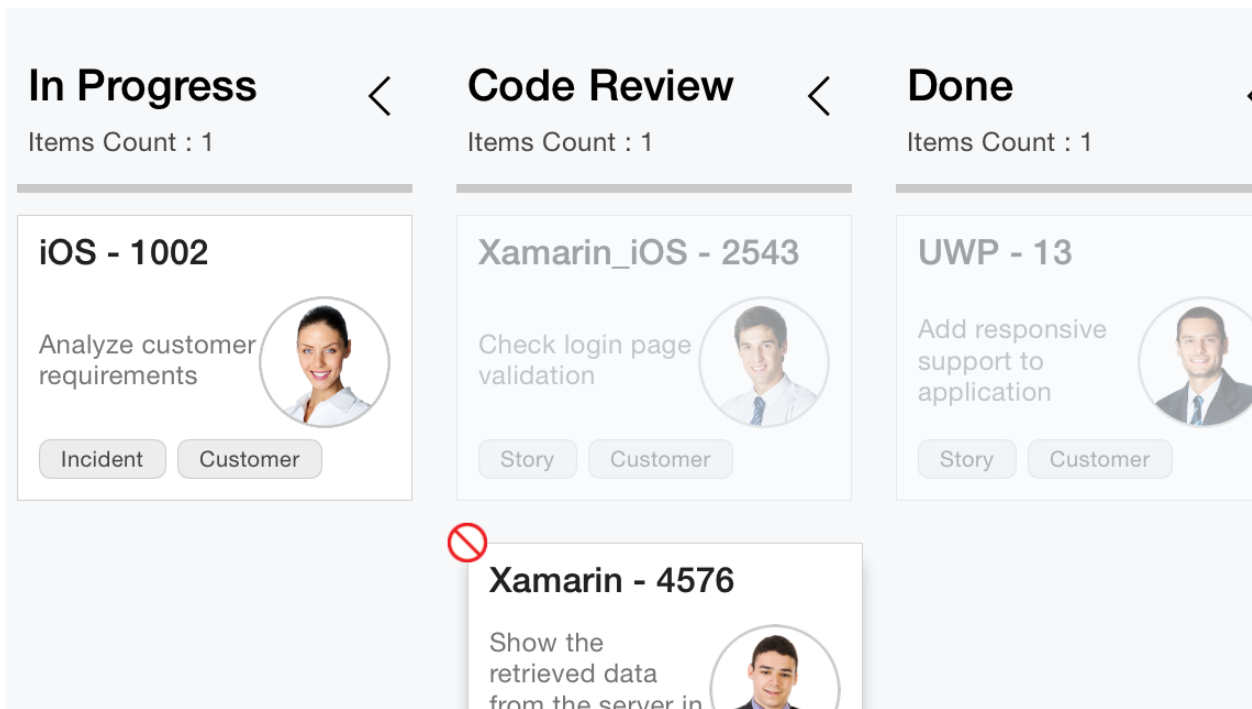

- [Category](#) - Used to define the source category/state.
- [AllowedTransitions](#) - Used to define the list of categories/states, the card with the state specified in [KanbanWorkflow.Category](#) is allowed to transit.

The following code example describes the workflow functionality.

### C#

```
var workflows = new List<KanbanWorkflow>();
var openWorkflow = new KanbanWorkflow();
openWorkflow.Category = "Open";
//Define the list of categories which accepts the cards from Open state.
openWorkflow.AllowedTransitions = new List<object> { "In Progress" };
workflows.Add(openWorkflow);
var progressWorkflow = new KanbanWorkflow();
progressWorkflow.Category = "In Progress";
//Define the list of categories which accepts the cards from "In Progress"
state.
progressWorkflow.AllowedTransitions = new List<object> { "Open", "Code
Review", "Closed-No Code Changes" };
workflows.Add(progressWorkflow);
kanban.Workflows = workflows;
```

In the below output, you can see the card which was picked from Open state is not allowed to drop on "Code Review" and "Done" state, because we have defined to move the card from Open to "In Progress" state only and not to any other states.

## Cards

The default elements of a card can be customized using the below properties of [KanbanModel](#).

- [Title](#) - Used to set the title of a card.
- [ImageURL](#) - Used to set the image URL of a card. The image will be displayed at right side in default card template.
- [Category](#) - Used to set the category of a card. Based on the category the cards will be added to the respective columns.
- [Description](#) - Used to set the description text of a card.
- [ColorKey](#) - Used to specify the indicator color key. The [Color](#) value of the corresponding [Key](#) should be added in [ColorModel](#) collection of [SfKanban](#).
- [Tags](#) - Used to specify the tags of a card. The tags will be displayed at bottom in default card template.
- [ID](#) - Used to set the ID of a card.

## C#

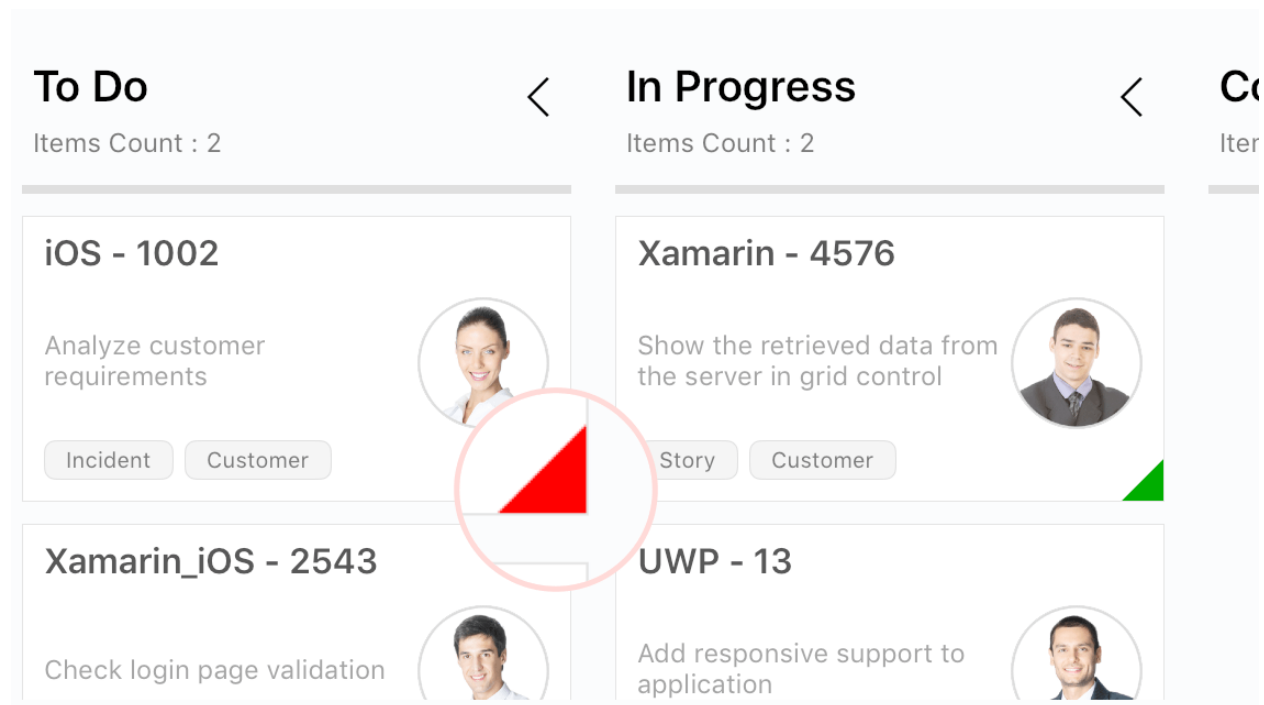

```
new KanbanModel ()
{
    ID = 1,
    Title = "iOS - 1002",
    ImageURL = "Image1.png",
    Category = "Open",
    Description = "Analyze customer requirements",
    ColorKey = "Red",
    Tags = new string[] { "Incident", "Customer" }
```

```
});
```

Following code snippet is used to define the colors for each key.

### C#

```
List<KanbanColorMapping> colorModels = new List<KanbanColorMapping>();
colorModels.Add(new KanbanColorMapping("Green", Color.Green));
colorModels.Add(new KanbanColorMapping("Red", Color.Red));
colorModels.Add(new KanbanColorMapping("Aqua", Color.Aqua));
colorModels.Add(new KanbanColorMapping("Blue", Color.Blue));
kanban.ColorModel = colorModels;
```

### Template

You can replace the entire card template with your own design using [SfKanban.CardTemplate](#) property. The following code snippet and screenshot illustrates this.

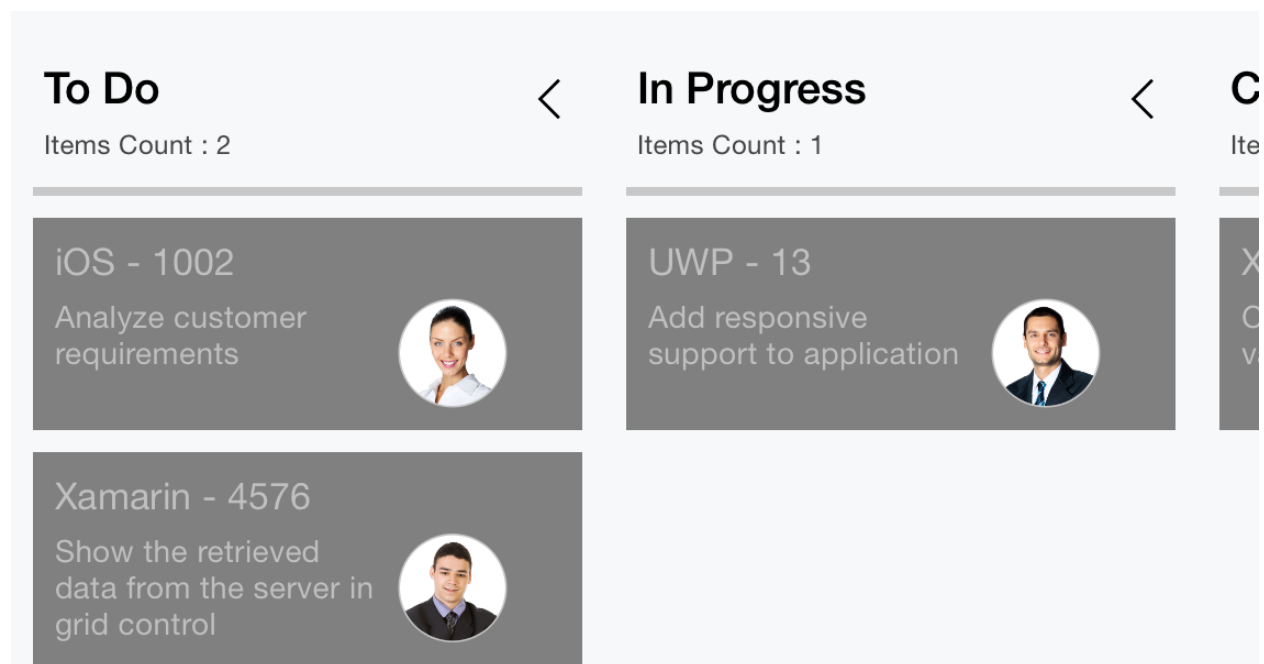

### XML

```
<kanban:SfKanban.CardTemplate >
<DataTemplate>
<StackLayout WidthRequest="250" Orientation="Vertical"
BackgroundColor="Gray" Padding="10,10,10,10">
<StackLayout Orientation="Horizontal">
<Label Text="{Binding Path=Title}" TextColor="Silver"
HorizontalOptions="StartAndExpand" >
</Label>
</StackLayout>
<StackLayout Orientation="Horizontal">
<Label Text="{Binding Description}" WidthRequest="150" FontSize="14"
TextColor="Silver" LineBreakMode="WordWrap" ></Label>
```

```
<Image Source="{Binding ImageURL}" HeightRequest="50" WidthRequest="50"
></Image>
</StackLayout>
</StackLayout>
</DataTemplate>
</kanban:SfKanban.CardTemplate>
```

## C#

```
var cardTemplate = new DataTemplate(() =>
{
    StackLayout root = new StackLayout()
    {
        WidthRequest = 250,
        Orientation = StackOrientation.Vertical,
        Padding = new Thickness(10),
        BackgroundColor = Color.Gray
    };
    StackLayout titleLayout = new StackLayout();
    Label title = new Label()
    {
        TextColor = Color.Silver,
        HorizontalOptions = LayoutOptions.StartAndExpand
    };
    title.SetBinding(Label.TextProperty, new Binding("Title"));
    titleLayout.Children.Add(title);
    StackLayout contentLayout = new StackLayout()
    {
        Orientation = StackOrientation.Horizontal
    };
    Label desc = new Label()
    {
        WidthRequest = 150,
        FontSize = 14,
        TextColor = Color.Silver,
        LineBreakMode = LineBreakMode.WordWrap
    };
    desc.SetBinding(Label.TextProperty, new Binding("Description"));
    Image image = new Image()
    {
        HeightRequest = 50,
        WidthRequest = 50
    };
    image.SetBinding(Image.SourceProperty, new Binding("ImageURL"));
    contentLayout.Children.Add(desc);
    contentLayout.Children.Add(image);
    root.Children.Add(titleLayout);
    root.Children.Add(contentLayout);
    return root;
});
kanban.CardTemplate = cardTemplate;
```

### Data template selector

You can customize the appearance of each card with different templates based on specific constraints using [DataTemplateSelector](#).

#### Create a data template selector

Create a custom class by inheriting `DataTemplateSelector`, and override the `OnSelectTemplate` method to return the `DataTemplate` for that item. At runtime, the SfKanban invokes the `OnSelectTemplate` method for each item and passes the data object as parameter.

#### C#

```
public class KanbanTemplateSelector : DataTemplateSelector
{
    private readonly DataTemplate menuTemplate;
    private readonly DataTemplate orderTemplate;
    private readonly DataTemplate readyToServeTemplate;
    private readonly DataTemplate deliveryTemplate;
    public KanbanTemplateSelector()
    {
        menuTemplate = new DataTemplate(typeof(MenuTemplate));
        orderTemplate = new DataTemplate(typeof(OrderTemplate));
        readyToServeTemplate = new DataTemplate(typeof(ReadyToServeTemplate));
        deliveryTemplate = new DataTemplate(typeof(DeliveryTemplate));
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject container)
    {
        var data = item as CustomKanbanModel;
        if (data == null)
            return null;
        string category = data.Category?.ToString();
        return category.Equals("Menu") ? menuTemplate :
```

```
category.Equals("Dining") || category.Equals("Delivery") ? orderTemplate :
category.Equals("Ready to Serve") ? readyToServeTemplate : deliveryTemplate;
}
}
```

### Applying the data template selector

Assign custom **DataTemplateSelector** to the [CardTemplate](#) of the SfKanban in either XAML or C#.

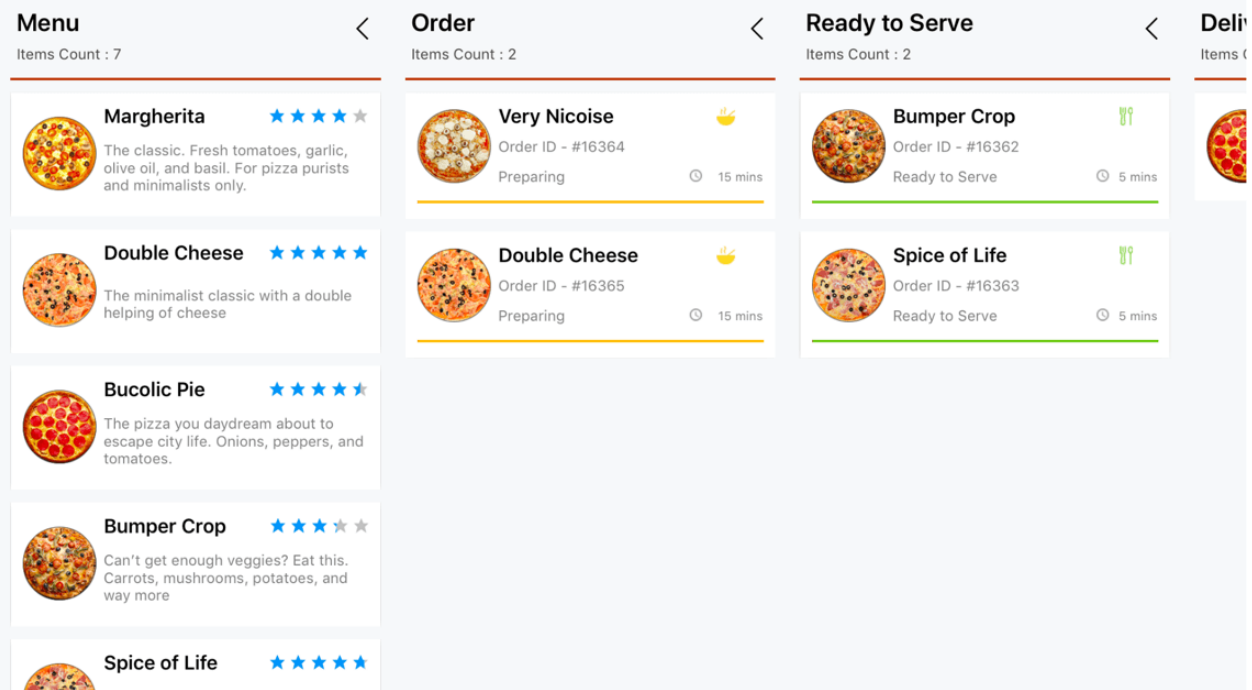

#### **XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="SimpleSample.MainPage"
xmlns:kanban="clr-
namespace:Syncfusion.SfKanban.XForms;assembly=Syncfusion.SfKanban.XForms"
xmlns:local="clr-namespace:SimpleSample;assembly=SimpleSample">
<ContentPage.Resources>
<ResourceDictionary>
<local:KanbanTemplateSelector x:Key="kanbanTemplateSelector" />
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.BindingContext>
<local:KanbanCustomViewModel />
</ContentPage.BindingContext>
<kanban:SfKanban x:Name="kanban" HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand" ItemsSource="{Binding Cards}"
CardTemplate="{StaticResource kanbanTemplateSelector}" >
...
</kanban:SfKanban>
</ContentPage>
```

#### **C#**

```
SfKanban kanban = new SfKanban();
kanban.ItemsSource = viewModel.Cards;
kanban.CardTemplate = new KanbanTemplateSelector();
```

## Placeholder

The placeholder is to denote a card's new position in the [KanbanColumn](#). It will appear while dragging a card over the column.

### Placeholder style

[PlaceholderStyle](#) property is used to customize the placeholder. Following [KanbanPlaceholderStyle](#) properties are used to customize its appearance.

- [BackgroundColor](#) - This property is used to change the background color of the placeholder.
- [BorderColor](#) - This property is used to change the border color of the placeholder.
- [BorderThickness](#) - This property is used to change the border width of the placeholder.
- [StrokeDashArray](#) - This property is used to change the dashes of the placeholder border.
- [FontSize](#) - This is used to change the text size of the placeholder.
- [TextColor](#) - This property is used to change the text color of the placeholder.

Following properties are used to customize the selected category when you have more than one category in a column.

- [SelectedBackgroundColor](#) - This property is used to change the background color of the selected placeholder.
- [SelectedBorderColor](#) - This property is used to change the border color of the selected placeholder.
- [SelectedBorderThickness](#) - This property is used to change the border width of the selected placeholder.
- [SelectedStrokeDashArray](#) - This property is used to change the dashes of the selected placeholder.
- [SelectedFontSize](#) - This is used to change the font size of the text in selected placeholder.
- [SelectedTextColor](#) - This property is used to change the color of the text in selected placeholder.

The following code example describes the above behavior.

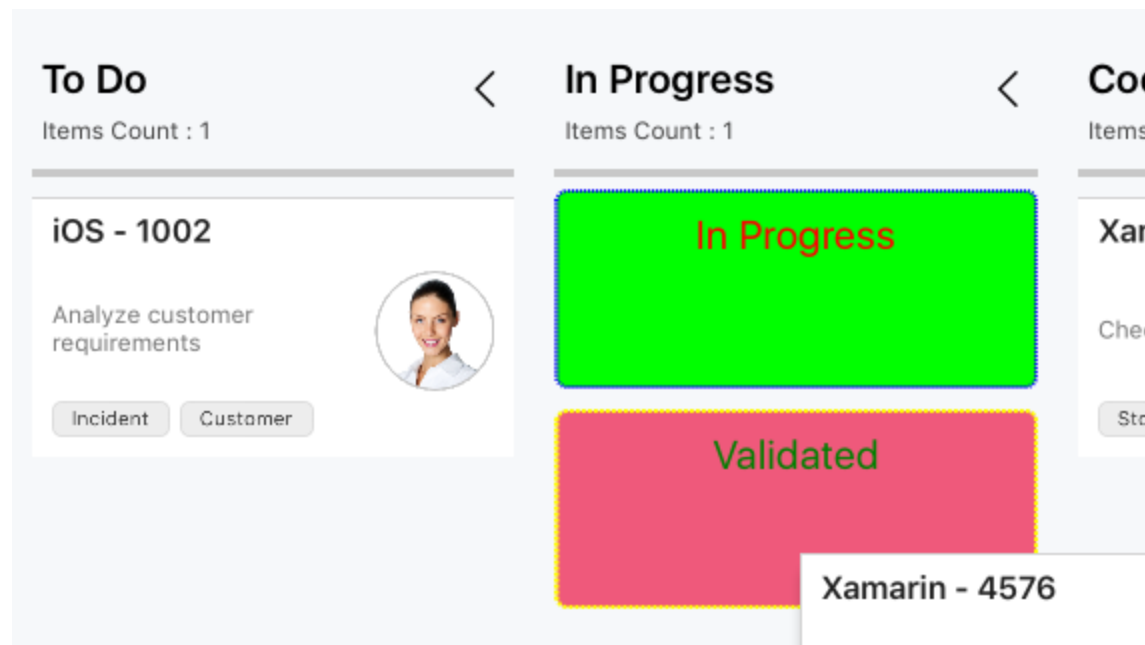

### XML

```
<kanban:SfKanban.PlaceholderStyle >  
<kanban:KanbanPlaceholderStyle FontSize="16"  
TextColor="Green"  
BackgroundColor="Fuchsia"  
BorderColor="Fuchsia"  
BorderThickness="2"  
SelectedFontSize="16"  
SelectedTextColor="Red"  
SelectedBorderColor="Yellow"  
SelectedBorderThickness="2"  
SelectedBackgroundColor="Green">  
</kanban:KanbanPlaceholderStyle>  
</kanban:SfKanban.PlaceholderStyle>
```

### C#

```
KanbanPlaceholderStyle style = new KanbanPlaceholderStyle();  
style.FontSize = 20;  
style.TextColor = Color.Green;  
style.BackgroundColor = Color.FromRgb(239, 89, 123);  
style.BorderColor = Color.Blue;  
style.BorderThickness = 2;  
style.StrokeDashArray = new double[] { 1, 1 };  
style.SelectedFontSize = 20;  
style.SelectedTextColor = Color.Red;  
style.SelectedBorderColor = Color.Yellow;  
style.SelectedBackgroundColor = Color.FromRgb(0, 255, 0);  
style.SelectedBorderThickness = 2;  
style.SelectedStrokeDashArray = new double[] { 2, 1 };  
kanban.PlaceholderStyle = style;
```

The following output demonstrates the above code example.

## Localization

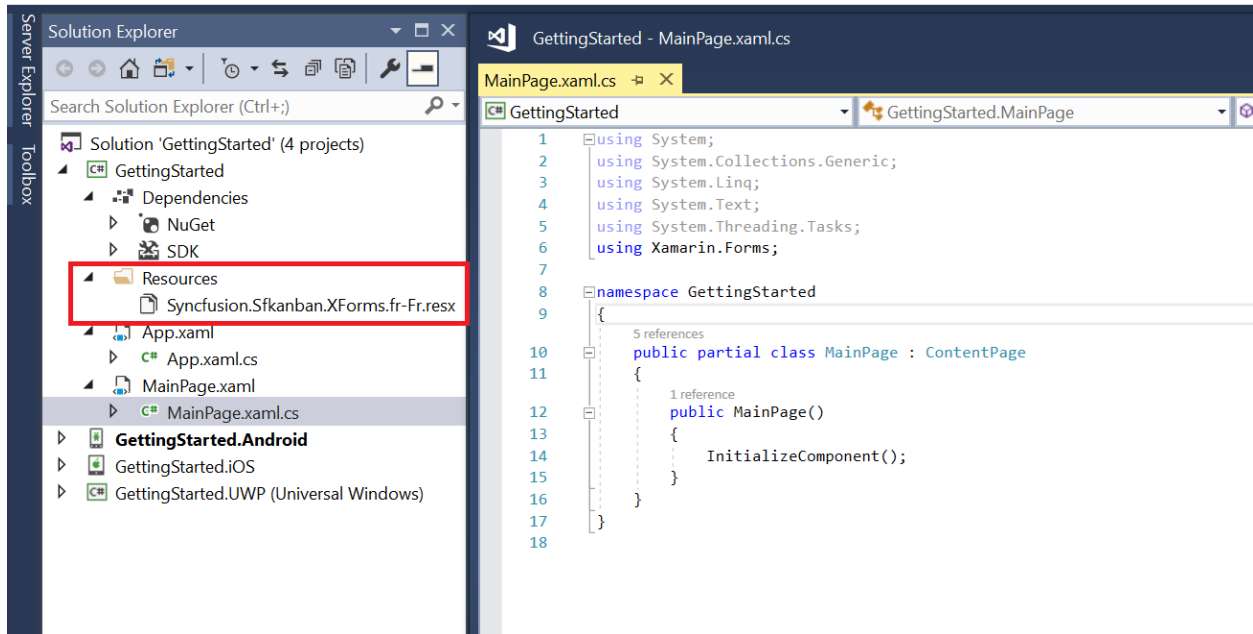

You can localize [SfKanban](#) in all the platforms by adding a .resx file in a .NET Standard project alone. The following steps describe how to localize SfKanban in a project and you can download the complete sample from this [link](#).

---

**Note:** Here, the resources have been already created for some cultures and shared them on [Syncfusion GitHub](#) for your convenience.

---

1. Add a new folder in the .NET Standard project named Resources.
2. Add resource files for the languages you wish to support, and set their Build Action to EmbeddedResource. The name of the resource file should be \$name of the Syncfusion component\$+\$language code\$.resx. For example, if you add a resource file for the French culture, add the Syncfusion.SfKanban.XForms.fr-FR.resx file to Resources folder as illustrated in the following screenshot.

Provide the French values for each key in the respective .resx files. Here, “ItemCount” and “Max” are the keys, and “Fritems” and “frmax” are their respective French values.

### XML

```
<data name="ItemCount" xml:space="preserve">
  <value>Fritems</value>
</data>
<data name="Max" xml:space="preserve">
  <value>frmax</value>
</data>
```

4. Set the resource manager to [‘KanbanResourceManager.Manager’](#) as demonstrated in the following code to get the resource manager from the users. For more details, refer [Localization](#).

### C#

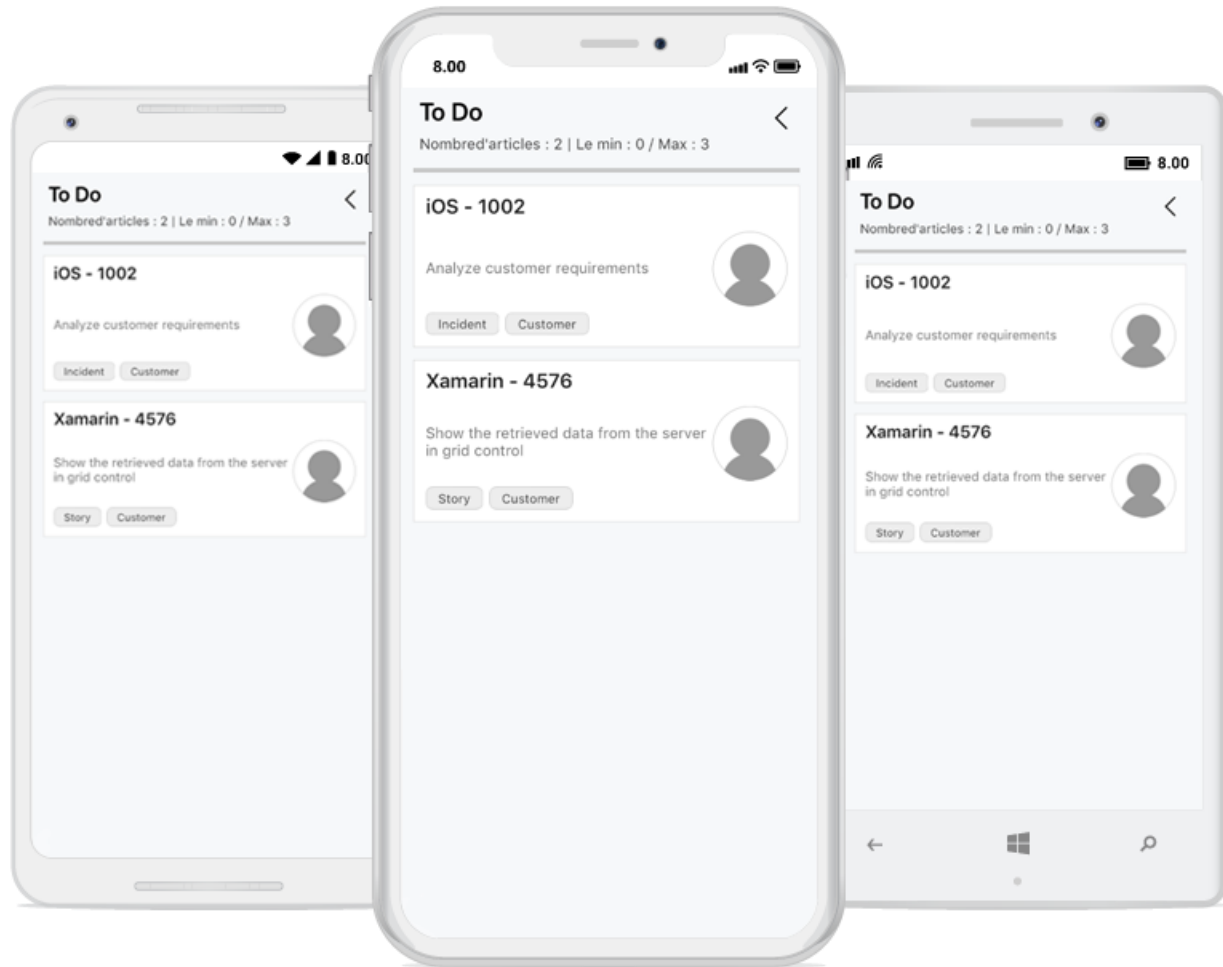

```
KanbanResourceManager.Manager = new
ResourceManager("GettingStarted.Resources.Syncfusion.SfKanban.XForms",
Application.Current.GetType().Assembly);
```

### Localize at application level

You can also localize the text at application-level regardless of the language selected on the device. The following platform-specific codes are needed to localize the text at application-level. Use the [DependencyServices](#) to set this from .NET Standard project.

### C#

```
//For Android and iOS,
Thread.CurrentThread.CurrentUICulture = new CultureInfo("fr-FR");
//For UWP,
CultureInfo.CurrentUICulture = new CultureInfo("fr-FR");
```

## Events

### ItemTapped

[ItemTapped](#) event is triggered when you tap on any card. The argument contains the following information.

- [Column](#) - Used to get the column of the card.
- [Data](#) - Used to get the underlying model of the card.
- [Index](#) - Used to get the index of the card in a column.

### Command

The `CardTappedCommand` property is used to associate a command with an instance of SfKanban. This property is most often set with MVVM pattern to bind callbacks back into the ViewModel.

### CommandParameter

The `CardTappedCommandParameter` property is used to set the parameter reference, based on which the event argument is shown.

---

## NOTE

The default value of the `CardTappedCommandParameter` is `null`.

## XML

```
<kanban:SfKanban CardTappedCommand="{Binding CardTappedCommand}"
CardTappedCommandParameter="1">
  <!--Initialize the column-->
</kanban:SfKanban >
```

## C#

```
public class ViewModel
{
    public ViewModel()
    {
        CardTappedCommand = new Command<object>(CardTappedEvent);
        public ICommand CardTappedCommand { get; set; }
    }
    private void CardTappedEvent(object args)
    {
        // handle event action.
    }
}
```

### DragStart

[DragStart](#) event is triggered when you start to drag a card. The argument contains the following information.

- [Cancel](#) - Used to cancel the drag action.
- [Data](#) - Used to get the underlying model of the card.
- [KeepItem](#) - Determines whether to keep the dragged card in the source location itself, until it is dropped in a new location. When it is true, the preview of the card will be created for dragging.
- [SourceColumn](#) - Used to get the source column of card.
- [SourceIndex](#) - Used to get the index of the card in source column.

### DragEnd

[DragEnd](#) event is triggered whenever the card is dropped or dragging action is canceled. The argument contains the following information.

- [Cancel](#) - Used to cancel the drag action.
- [Data](#) - Used to get the underlying model of the card.
- [SourceColumn](#) - Used to get the source column of the card.
- [SourceIndex](#) - Used to get the index of the card in source column.
- [TargetCategory](#) - Used to get the category of the column where the card is going to be dropped.
- [TargetColumn](#) - Used to get the current column which is the drop target for the card.
- [TargetIndex](#) - Used to get the index of the card in target column.

### DragEnter

[DragEnter](#) event is triggered when a card enters into a column while dragging. The argument contains the following information.

- [Cancel](#) - Used to cancel the drag action.

- [Data](#) - Used to get the underlying model of the card.
- [IsAboveMaximumLimit](#) - Used to know whether the total cards count of the target column will be above the maximum limit if you drop the card in target column. You can define the maximum limit of the cards using `KanbanColumn.MaximumLimit`.
- [SourceColumn](#) - Used to get the source column of the card.
- [SourceIndex](#) - Used to get the index of the card in source column.
- [TargetColumn](#) - Used to get the column upon which the card enters.
- [TargetIndex](#) - Used to get the index of the card in target column.

### DragLeave

[DragLeave](#) event is triggered when a card leaves a column while dragging. The argument contains the following information.

- [Data](#) - Used to get the underlying model of the card.
- [IsBelowMinimumLimit](#) - Used to know whether the total cards count of the target column will be below the minimum limit if you remove the card from target column. You can define the minimum limit of the cards using `KanbanColumn.MinimumLimit`.
- [SourceColumn](#) - Used to get the source column of the card.
- [SourceIndex](#) - Used to get the index of the card in source column.
- [TargetColumn](#) - Used to get the column from which the card leaves.

### DragOver

[DragOver](#) event is triggered when a card is dragged to a new index within a column. The argument contains the following information.

- [Cancel](#) - Used to cancel the drag action.
- [Data](#) - Used to get the underlying model of the card.
- [SourceColumn](#) - Used to get the source column of the card.
- [SourceIndex](#) - Used to get the index of the card in source column.
- [TargetColumn](#) - Used to get the current column which is the drop target for the card.
- [TargetIndex](#) - Used to get the new index of the card in target column.

### ColumnsGenerated

[ColumnsGenerated](#) event will be fired after the columns are generated automatically. You can access the auto-generated columns using [SfKanban.ActualColumns](#) property.

## SfLinearGauge

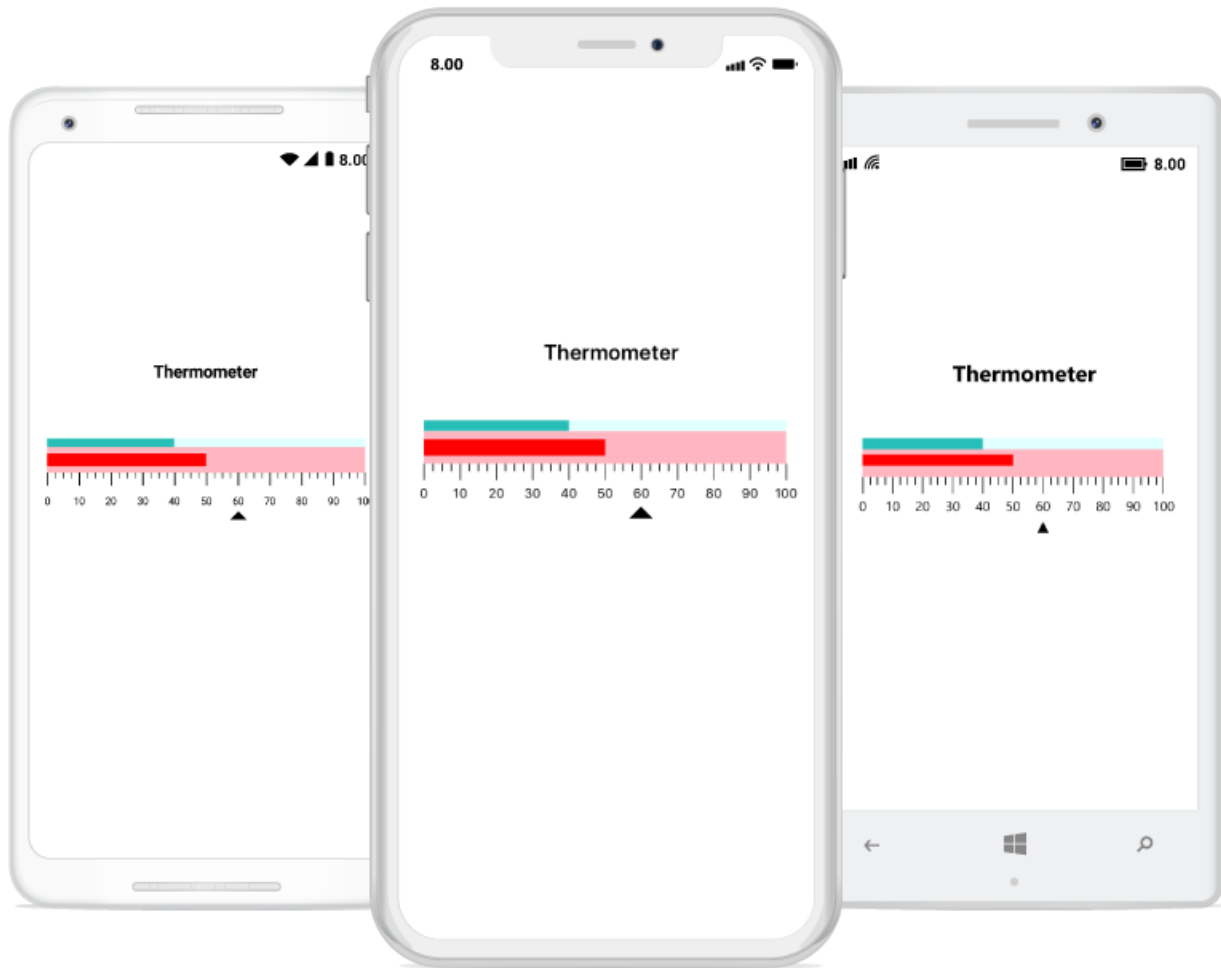

### Overview

[SfLinearGauge](#) displays a range of values graphically along the linear scale, which is considered as the linear form of the linear gauge. It measures the values of the scale and it is present in the horizontal, vertical sliding, or meter.

[SfLinearGauge](#) is used to visualize the numerical values of a scale in linear manner. By using the [SfLinearGauge](#) control, it is possible to render the thermometer.

## Key Features

- [Scales](#): Supports to adding multiple scales on linear gauge by horizontal and vertical orientations.
- [Pointers](#): Supports to add multiple pointers (bar and symbol) on the linear scale.
- [Range](#): Highlights the desired range of values in the gauge scale.
- [Annotations](#): Annotations are used to mark the specific area of interest in the gauge area with texts, shapes, or images. You can add any number of annotations to the gauge.

## Getting Started

This section explains the steps required to configure a [SfLinearGauge](#) control in a real-time scenario and also provides a walk-through on some of the customization features available in [SfLinearGauge](#) control.

### Adding SfLinearGauge reference

You can add SfLinearGauge reference using one of the following methods:

#### Method 1: Adding SfLinearGauge reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfLinearGauge to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfGauge](#), and then install it.

![[Adding SfLinearGauge reference from NuGet]](getting-started\_images/Adding SfLinearGauge reference.png)

---

**Note:** Install the same version of SfLinearGauge NuGet in all the projects.

---

### Method 2: Adding SfLinearGauge reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfLinearGauge control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfLinearGauge assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfGauge.Android.dll Syncfusion.SfGauge.XForms.Android.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfGauge.iOS.dll Syncfusion.SfGauge.XForms.iOS.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfGauge.UWP.dll Syncfusion.SfGauge.XForms.UWP.dll Syncfusion.SfGauge.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching an application on each platform with SfLinearGauge.

To use the SfLinearGauge control inside an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

#### iOS

To launch the SfLinearGauge in iOS, call the `SfLinearGaugeRenderer.Init()` in the `FinishedLaunching` overridden method of the AppDelegate class after the Xamarin.Forms Framework has been initialized and before the LoadApplication is called, as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.SfGauge.XForms.iOS.SfGaugeRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### Universal Windows Platform (UWP)

You need to initialize the linear gauge view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with linear gauge in Release mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    // Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfGauge.XForms.UWP.SfGaugeRenderer)
        .GetTypeInfo().Assembly);
    // Replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

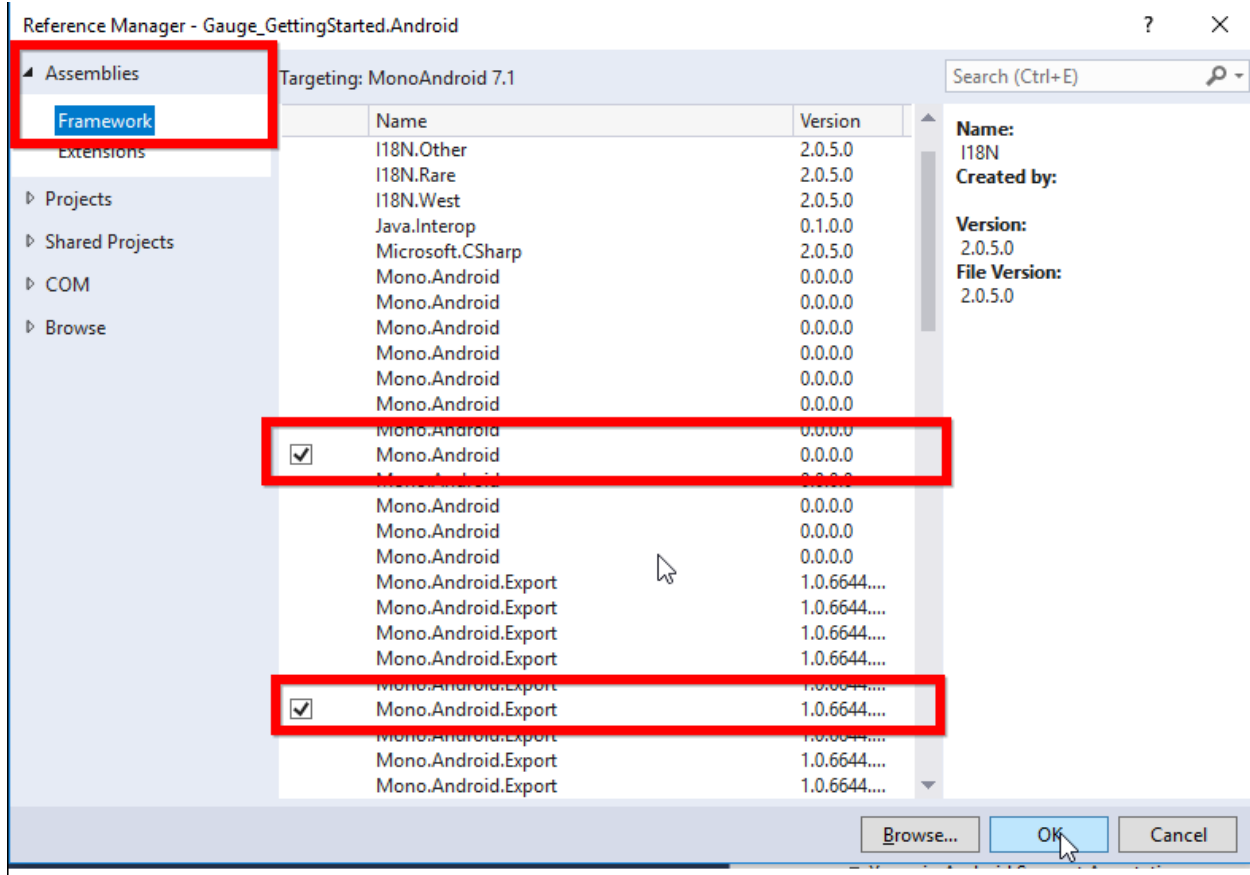

#### Android

The Android platform does not require any additional configuration to render the linear gauge.

#### Reference Mono.Android.Export

1. In the Solution Explorer in the Android project, right-click on References and choose Add Reference.
2. In the Add Reference window, select the Assemblies tab and choose the Framework.

3. In the Framework tab, ensure Mono.Android and Mono.Android.Export is checked and click ok.

## Adding namespace for the added assemblies

## XML

```
xmlns:linear="clr-
namespace:Syncfusion.SfGauge.XForms;assembly=Syncfusion.SfGauge.XForms"
```

## C#

```
using Syncfusion.SfGauge.XForms;
```

Initialize gauge

You can initialize the [SfLinearGauge](#) control with a required optimal name by using the included namespace.

**XML**

<gauge:SfLinearGauge/>

## C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
this.Content = linearGauge;
```

### Adding header

You can assign a unique header to [SfLinearGauge](#) by using the [LinearHeader](#) property and position it wherever as you desired by using the [Offset](#) property.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Header>
    <gauge:LinearHeader Text="Thermometer" TextSize="20" FontAttributes="Bold"
      Offset="0.35,0.35"/>
  </gauge:SfLinearGauge.Header>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge=new SfLinearGauge();
LinearHeader linearHeader = new LinearHeader();
linearHeader.Text = "Thermometer";
linearHeader.TextSize = 20;
linearHeader.FontAttributes = FontAttributes.Bold;
linearHeader.Offset = new Point(0.35, 0.35);
linearGauge.Header = linearHeader;
```

### Configuring scales

Scales is a collection of [LinearScale](#), which is used to indicate the numeric values. Scale bar, ticks, labels, ranges, and pointers are the sub elements of a scale.

The [MinimumValue](#) and [MaximumValue](#) properties allow you to set the scale range.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
```

```
linearScale.MinorTickSettings.Thickness = 1;  
linearGauge.Scales.Add(linearScale);  
this.Content = linearGauge;
```

Adding a symbol pointer

[SymbolPointer](#) is a shape that can be placed to mark the pointer value in gauge.

#### XML

```
<gauge:LinearScale.Pointers>  
<gauge:SymbolPointer Value="60" Offset="45" Color="#757575"/>  
</gauge:LinearScale.Pointers>
```

#### C#

```
SymbolPointer symbolPointer = new SymbolPointer();  
symbolPointer.Value = 60;  
symbolPointer.Offset = 45;  
symbolPointer.Color = Color.FromHex("#757575");  
linearScale.Pointers.Add(symbolPointer);
```

Adding a bar pointer

[BarPointer](#) is used to mark the scale values. It starts at the beginning of gauge and ends at the pointer value.

#### XML

```
<gauge:LinearScale.Pointers>  
<gauge:BarPointer Value="50" Color="#757575" />  
</gauge:LinearScale.Pointers>
```

#### C#

```
BarPointer barPointer = new BarPointer();  
barPointer.Value = 50;  
barPointer.Color = Color.FromHex("#757575");  
linearScale.Pointers.Add(barPointer);
```

Adding ranges

You can categorize the scale values using the start and end values properties in [LinearRange](#). You can add multiple ranges for a scale using the `ranges` property.

#### XML

```
<gauge:LinearScale.Ranges>  
<gauge:LinearRange StartValue="0" EndValue="40" Color="#27beb7" Offset="-20"/>  
<gauge:LinearRange StartValue="40" EndValue="100" Color="LightCyan" Offset="-20"/>  
</gauge:LinearScale.Ranges>
```

#### C#

```

LinearRange linearRange = new LinearRange();
linearRange.StartValue = 0;
linearRange.EndValue = 40;
linearRange.Color = Color.FromHex("#27beb7");
linearRange.Offset = -20;
linearScale.Ranges.Add(linearRange);
LinearRange linearRange1 = new LinearRange();
linearRange1.StartValue = 40;
linearRange1.EndValue = 100;
linearRange1.Color = Color.LightCyan;
linearRange1.Offset = -20;
linearScale.Ranges.Add(linearRange1);
linearGauge.Scales.Add(linearScale);

```

The following code example gives you the complete code of above configurations.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

```

## C#

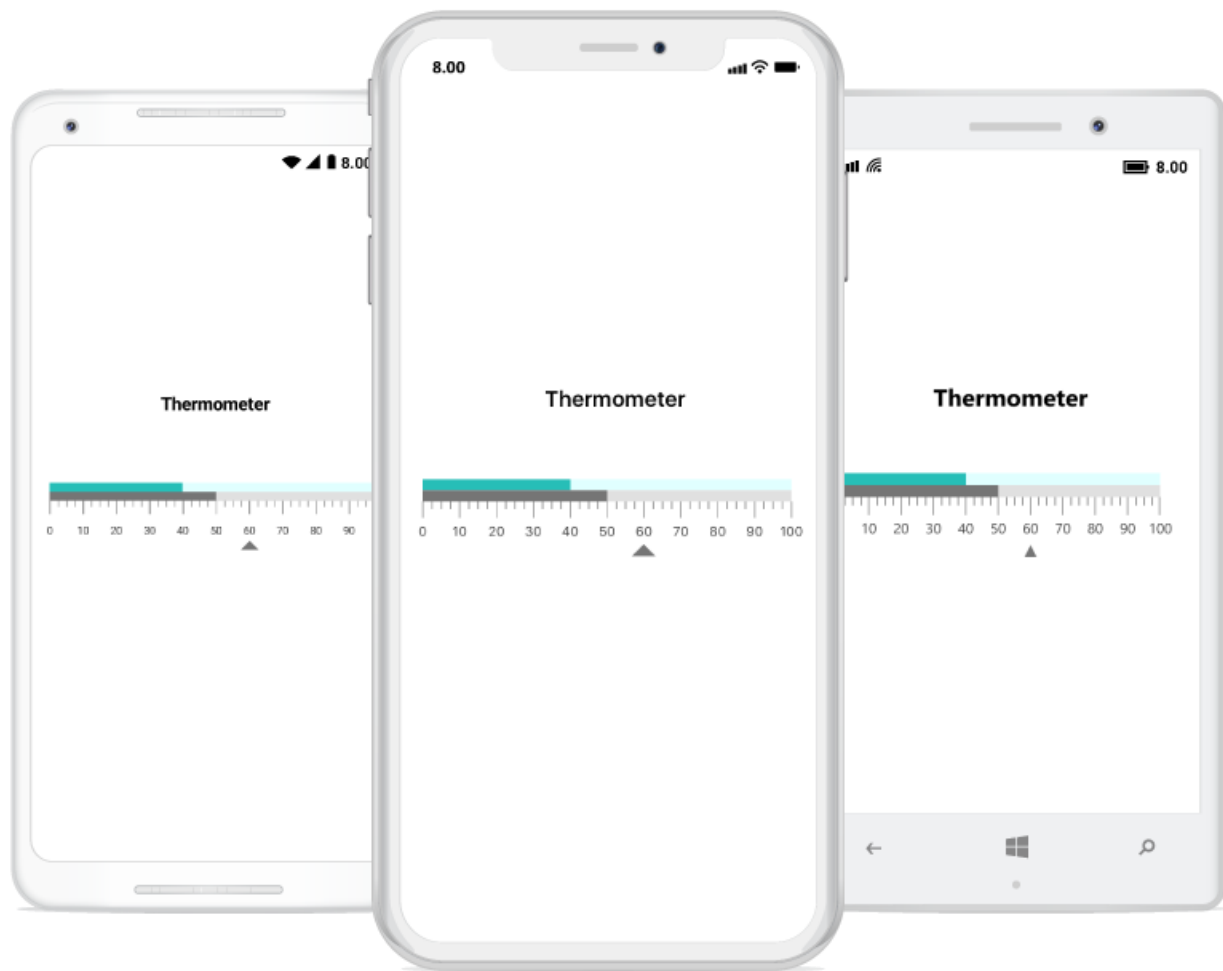

```

using Syncfusion.SfGauge.XForms;
using Xamarin.Forms;
namespace Gauge_GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            //Initializing linear gauge
            SfLinearGauge linearGauge = new SfLinearGauge();
            //Adding header
            LinearHeader linearHeader = new LinearHeader();
            linearHeader.Text = "Thermometer";
            linearHeader.TextSize = 20;
            linearHeader.FontAttributes = FontAttributes.Bold;
            linearHeader.Offset = new Point(0.35, 0.35);
            linearGauge.Header = linearHeader;
            //Initializing scale for linear gauge
            LinearScale linearScale = new LinearScale();
            linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
            linearScale.LabelColor = Color.FromHex("#424242");
            linearScale.MajorTickSettings.Thickness = 1;
            linearScale.MajorTickSettings.Length = 15;
            linearScale.MajorTickSettings.Color = Color.Gray;
            linearScale.MinorTickSettings.Color = Color.Gray;
            linearScale.MinorTickSettings.Length = 7;
            linearScale.MinorTickSettings.Thickness = 1;
            linearGauge.Scales.Add(linearScale);
            //Adding symbol pointer
            SymbolPointer symbolPointer = new SymbolPointer();
            symbolPointer.Value = 60;
            symbolPointer.Offset = 45;
            symbolPointer.Color = Color.FromHex("#757575");
            linearScale.Pointers.Add(symbolPointer);
            //Adding bar pointer
            BarPointer barPointer = new BarPointer();
            barPointer.Value = 50;
            barPointer.Color = Color.FromHex("#757575");
            linearScale.Pointers.Add(barPointer);
            //Adding linear ranges
            LinearRange linearRange = new LinearRange();
            linearRange.StartValue = 0;
            linearRange.EndValue = 40;
            linearRange.Color = Color.FromHex("#27beb7");
            linearRange.Offset = Device.RuntimePlatform == Device.iOS ? -20 :
            Device.RuntimePlatform == Device.Android ? -20 : -40;
            linearScale.Ranges.Add(linearRange);
            LinearRange linearRange1 = new LinearRange();

```

```
linearRange1.StartValue = 40;  
linearRange1.EndValue = 100;  
linearRange1.Color = Color.LightCyan;  
linearRange1.Offset = Device.RuntimePlatform == Device.iOS ? -20 :  
Device.RuntimePlatform == Device.Android ? -20 : -40;  
linearScale.Ranges.Add(linearRange1);  
linearGauge.Scales.Add(linearScale);  
this.Content = linearGauge;  
}  
}  
}
```

The following screenshot illustrates the result of the above codes.

You can find the complete getting started sample from this [link](#).

## Scales

Scales is a collection of [LinearScale](#), which integrates labels, tick marks, ranges, and pointers to customize the basic look and feel of the [SfLinearGauge](#).

### Linear scale

[LinearScale](#) contains sub elements such as ticks, labels, [Ranges](#), and [Pointers](#).

**XML**

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242">
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearGauge.Scales.Add(linearScale);
```

## Setting minimum and maximum values for scale

To change minimum and maximum values of linear scale, use the [MinimumValue](#) and [MaximumValue](#) properties as shown in the following code snippet.

**XML**

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale MinimumValue="20" MaximumValue="200"
      ScaleBarColor="#e0e0e0" LabelColor="#424242">
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MinimumValue = 20;
linearScale.MaximumValue = 200;
linearGauge.Scales.Add(linearScale);
```

### Setting interval for scale

The [Interval](#) property allows you to set the intervals for scale. The default [Interval](#) property of scale is auto interval. Auto interval defines the count of the scale labels as 3 for 100 pixels.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale MinimumValue="0" MaximumValue="500" Interval="100"
      ScaleBarColor="#e0e0e0" LabelColor="#424242">
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MinimumValue = 0;
linearScale.MaximumValue = 500;
linearScale.Interval = 100;
linearGauge.Scales.Add(linearScale);
```

### Setting maximum labels

The [MaximumLabels](#) property defines the count of the scale labels in the 100 pixels. By default, the maximum labels for 100 pixels is 3.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale MaximumLabels="4" ScaleBarColor="#e0e0e0"
      LabelColor="#424242" MinorTicksPerInterval="1">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
```

```
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearScale.MaximumLabels = 4;
linearGauge.Scales.Add(linearScale);
```

### Scale customization

You can customize the color, length, size, and position of the [LinearScale](#) by using the [ScaleBarColor](#), [ScaleBarLength](#), [ScaleBarSize](#), and [Offset](#) properties, respectively.

### XML

```
<gauge:SfLinearGauge Orientation="OrientationVertical">
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#4c88dc" LabelOffset="-5"
      MinorTicksPerInterval="1" Offset="10" ScaleBarLength="300" ScaleBarSize="5"
      LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Length="25" Color="Gray"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Length="10" Color="Gray"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
linearGauge.Orientation = Orientation.OrientationVertical;
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromRgb(76, 136, 220);
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MinorTicksPerInterval = 1;
linearScale.MajorTickSettings.Length = 25;
linearScale.MinorTickSettings.Length = 10;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.LabelOffset = -5;
linearScale.Offset = 10;
linearScale.ScaleBarLength = 300;
linearScale.ScaleBarSize = 5;
linearGauge.Scales.Add(linearScale);
```

### Scale Offset

The space between the control and linear scale can be customized using the `ScaleOffset` property.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleOffset="40" ScaleBarSize="20"
      CornerRadiusType="Start" CornerRadius="10" ScaleBarColor="#e0e0e0"
      LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
public MainPage()
{
    SfLinearGauge linearGauge = new SfLinearGauge();
    LinearScale linearScale = new LinearScale();
    linearScale.ScaleBarSize = 20;
    linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
    linearScale.CornerRadiusType = CornerRadiusType.Start;
    linearScale.CornerRadius = 10;
    linearScale.ScaleOffset = 40;
    linearScale.MajorTickSettings.Thickness = 1;
    linearScale.MajorTickSettings.Length = 15;
    linearScale.MajorTickSettings.Color = Color.Gray;
    linearScale.MinorTickSettings.Color = Color.Gray;
    linearScale.MinorTickSettings.Length = 7;
    linearScale.MinorTickSettings.Thickness = 1;
    linearScale.LabelColor = Color.FromHex("#424242");
}
```

```
linearGauge.Scales.Add(linearScale);
}
}
```

### Setting opposite position

To place the scale at opposite to its original position, set the [OpposedPosition](#) property to true in the scale.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale OpposedPosition="True" ScaleBarColor="#e0e0e0"
      LabelColor="#424242" MinorTicksPerInterval="1">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearScale.OpposedPosition = true;
linearGauge.Scales.Add(linearScale);
```

### Setting scale direction

You can set the scale position to its forward and backward using the [ScalePosition](#) property.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval="1" ScalePosition="BackWard">
      <gauge:LinearScale.MajorTickSettings>
```

```
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearScale.ScalePosition = ScalePosition.BackWard;
linearGauge.Scales.Add(linearScale);
```

**Setting corner radius type for scale**

Corners of the [LinearScale](#) can be customized by setting the value to the [CornerRadiusType](#) property. All corners of linear scale can be customized using the **Start**, **End**, **Both**, and **None** options.

[CornerRadius](#) property used to reduce the radius of the corners.

**XML**

```
<gauge:SfLinearGauge>
<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarSize="20" CornerRadiusType="Start"
CornerRadius="10" ScaleBarColor="#e0e0e0" LabelColor="#424242">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarSize = 20;
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.CornerRadiusType = CornerRadiusType.Start;
linearScale.CornerRadius = 10;
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.LabelColor = Color.FromHex("#424242");
linearGauge.Scales.Add(linearScale);
```

Start

End

Both

## Multiple scales

It helps you to add multiple scales to the same linear gauge and customize all the scales in a [Scales](#) collection.

## XML

```
<gauge:SfLinearGauge Orientation="OrientationVertical">
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarLength="500" MinimumValue="0" Interval="10"
      MaximumValue="100" Offset="9"
      ScaleBarColor="Gray" ScaleBarSize="5" LabelColor="Gray"
      MinorTicksPerInterval="1"
      LabelPostfix="°F" LabelOffset="-6">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Color="Gray" Thickness="1"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Color="Gray"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
    <gauge:LinearScale MinimumValue="0" ScaleBarLength="500" Interval="10"
      MaximumValue="100">
```

```

ShowTicks="False" ShowLabels="False" ScaleBarSize="5"
ScaleBarColor="Transparent"

linearScale1.MajorTickSettings.Thickness = 1;
linearScale1.LabelOffset = -5;
linearScale1.LabelPostfix = "°C";
linearGauge.Scales.Add(linearScale1);

```

### Setting gradient color for scale

You can give smooth color transition to scale to specifying the different colors based on scale value by using [GradientStops](#) property.

### XML

```

<gauge:SfLinearGauge>
<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarSize="15" MinorTicksPerInterval="1"
LabelColor="Black">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Black" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Black" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
<gauge:LinearScale.GradientStops>
<gauge:GaugeGradientStop Value="10" Color="#51c9e1"/>
<gauge:GaugeGradientStop Value="40" Color="#93e9e1"/>
<gauge:GaugeGradientStop Value="50" Color="#c5e692"/>
<gauge:GaugeGradientStop Value="60" Color="#fedd2b"/>
<gauge:GaugeGradientStop Value="100" Color="#e87813"/>
</gauge:LinearScale.GradientStops>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

**C#**

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
GaugeGradientStop gaugeGradientStop = new GaugeGradientStop();
gaugeGradientStop.Value = 10;
gaugeGradientStop.Color = Color.FromRgb(81, 201, 225);
linearScale.GradientStops.Add(gaugeGradientStop);
GaugeGradientStop gaugeGradientStop1 = new GaugeGradientStop();
gaugeGradientStop1.Value = 40;
gaugeGradientStop1.Color = Color.FromRgb(147, 233, 225);
linearScale.GradientStops.Add(gaugeGradientStop1);
GaugeGradientStop gaugeGradientStop2 = new GaugeGradientStop();
gaugeGradientStop2.Value = 50;
gaugeGradientStop2.Color = Color.FromRgb(197, 230, 146);
linearScale.GradientStops.Add(gaugeGradientStop2);
GaugeGradientStop gaugeGradientStop3 = new GaugeGradientStop();
gaugeGradientStop3.Value = 60;
gaugeGradientStop3.Color = Color.FromRgb(254, 221, 43);
linearScale.GradientStops.Add(gaugeGradientStop3);
GaugeGradientStop gaugeGradientStop4 = new GaugeGradientStop();
gaugeGradientStop4.Value = 100;
gaugeGradientStop4.Color = Color.FromRgb(232, 120, 19);
linearScale.GradientStops.Add(gaugeGradientStop4);
linearScale.ScaleBarSize = 15;
linearScale.MajorTickSettings.Color = Color.Black;
linearScale.MinorTickSettings.Color = Color.Black;
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearScale.LabelColor = Color.Black;
linearGauge.Scales.Add(linearScale);

```

### Tick Setting

The [TickSetting](#) property is used to identify the gauge's data value by marking the gauge scale in regular increments.

### Ticks visibility

Ticks visibility can be customized using the [ShowTicks](#) property of linear scale.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242" LabelOffset
    ="-10" ShowTicks ="False">
  </gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.LabelOffset = -10;
linearScale.ShowTicks = false;
linearGauge.Scales.Add(linearScale);
```

### Tick customization

You can customize the color and thickness of ticks by using the [Color](#) and [Thickness](#) properties. The ticks length also can be customized using the [Length](#) property as demonstrated below.

### Major tick customization

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Length ="25" Color = "DeepSkyBlue"/>
      </gauge:LinearScale.MajorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
LinearTickSettings majorTickSettings = new LinearTickSettings();
majorTickSettings.Thickness = 1;
majorTickSettings.Length = 25;
majorTickSettings.Color = Color.DeepSkyBlue;
linearScale.MajorTickSettings = majorTickSettings;
linearGauge.Scales.Add(linearScale);
```

*Minor tick customization***XML**

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval="3">
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="2" Length="7" Color="RosyBrown"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 3;
LinearTickSettings minorTickSettings = new LinearTickSettings();
minorTickSettings.Thickness = 2;
minorTickSettings.Length = 7;
minorTickSettings.Color = Color.RosyBrown;
linearScale.MinorTickSettings = minorTickSettings;
linearGauge.Scales.Add(linearScale);
```

### Setting minor ticks per interval

The [Interval](#) property is used to calculate the tick counts for a scale. Similar to ticks, minor ticks are also calculated by using the [MinorTicksPerInterval](#) property.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval = "4">
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MinorTicksPerInterval = 4;
linearGauge.Scales.Add(linearScale);
```

### Setting position for ticks

The major and minor ticks can be positioned far away from the scale by using the [Offset](#) property.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="Black" ScaleBarSize
      = "40" LabelOffset = "-9">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color = "Black" Length = "40" Offset
          = "-40" />
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Color = "Black" Length = "20" Offset = "-20" />
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarSize = 40;
linearScale.ScaleBarColor= Color.FromHex("#e0e0e0");
```

```
linearScale.MajorTickSettings.Color = Color.Black;
linearScale.MinorTickSettings.Color = Color.Black;
linearScale.MajorTickSettings.Length = 40;
linearScale.MinorTickSettings.Offset = -20;
linearScale.MajorTickSettings.Offset = -40;
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MinorTickSettings.Length = 20;
linearScale.LabelOffset = -9;
linearScale.MinorTicksPerInterval = 4;
linearScale.LabelColor = Color.Black;
linearGauge.Scales.Add(linearScale);
```

## Labels

[LinearScale](#) labels associate a numeric value with major scale tick marks.

### Label color customization

The label color can be changed using the [LabelColor](#) property.

## XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="Purple">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

## C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.LabelColor = Color.Purple;
linearGauge.Scales.Add(linearScale);
```

### Label font customization

The label font can be customized by using the [LabelFontSize](#), [FontAttribute](#), and [FontFamily](#) properties.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      LabelFontSize="15" FontAttributes="Bold">
      <gauge:LinearScale.FontFamily>
        <OnPlatform x:TypeArguments="x:String" iOS="Chalkduster"
          Android="algerian.ttf" WinPhone="Chiller" />
      </gauge:LinearScale.FontFamily>
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.LabelFontSize = 15;
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.FontAttributes = FontAttributes.Bold;
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.FontFamily = Device.RuntimePlatform == Device.iOS ?
"Chalkduster" : Device.RuntimePlatform == Device.Android ? "algerian.ttf" :
"Chiller";
linearGauge.Scales.Add(linearScale);
```

### Setting position for labels

The labels can be positioned far away from the ticks by using the [LabelOffset](#) property in pixel.

#### XML

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242" LabelOffset
    ="5">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

#### C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.LabelOffset = 5;
linearGauge.Scales.Add(linearScale);

```

### Setting postfix and prefix for labels

You can postfix/prefix values to the scale labels using the [LabelPostfix](#) and [LabelPrefix](#) properties, respectively.

#### Setting label postfix

The [LabelPostfix](#) property allows you to postfix the values to scale labels.

#### XML

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale MinimumValue = "0" MaximumValue = "1000" Interval = "200"
    LabelPostfix = "K" ScaleBarColor="#e0e0e0" LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

```
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.MinimumValue = 0;
linearScale.MaximumValue = 1000;
linearScale.Interval = 200;
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.LabelPostfix = "K";
linearGauge.Scales.Add(linearScale);
```

*Setting label prefix*

The [LabelPrefix](#) property allows you to prefix the values to scale labels.

**XML**

```
<gauge:SfLinearGauge>
<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242" LabelPrefix
="$">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
```

```
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.LabelPrefix = "$";
linearGauge.Scales.Add(linearScale);
```

### Custom labels

Linear scale supports custom label format using the [CustomLabels](#) property.

You can give labels in an array that you want to place in scale.

### XML

```
Namespace:
xmlns:sys="clr-namespace:System;assembly=mscorlib"
...
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242" >
      <gauge:LinearScale.CustomLabels>
        <x:Array Type="{x:Type x:Double}">
          <sys:Double>0</sys:Double>
          <sys:Double>23</sys:Double>
          <sys:Double>45</sys:Double>
          <sys:Double>67</sys:Double>
          <sys:Double>85</sys:Double>
          <sys:Double>100</sys:Double>
        </x:Array>
      </gauge:LinearScale.CustomLabels>
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.MajorTickSettings.Thickness = 1;
```

```
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.CustomLabels = new double[] { 0, 23, 45, 67, 85, 100 };
linearGauge.Scales.Add(linearScale);
Content = linearGauge;
```

### Labels visibility

Labels visibility can be customized using the [ShowLabels](#) property of linear scale.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" ShowLabels = "False" ScaleBarSize
    ="40">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color ="Black" Length ="40" Offset
        ="-40" />
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Color ="Black" Length = "20" Offset ="-20" />
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarSize = 40;
linearScale.ScaleBarColor= Color.FromHex("#e0e0e0");
linearScale.MajorTickSettings.Color = Color.Black;
linearScale.MinorTickSettings.Color = Color.Black;
linearScale.MajorTickSettings.Length = 40;
linearScale.MinorTickSettings.Offset = -20;
linearScale.MajorTickSettings.Offset = -40;
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MinorTickSettings.Length = 20;
linearScale.MinorTicksPerInterval = 4;
linearScale.ShowLabels = false;
linearGauge.Scales.Add(linearScale);
```

## Ranges

Range is a visual element, which begins and ends at specified values within a scale. You can add any number of range for a scale by using the array of range objects.

### Setting start and end values for range

Start and end values of ranges are set by using the [StartValue](#) and [EndValue](#) properties.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
      <gauge:LinearScale.Ranges>
        <gauge:LinearRange StartValue="0" EndValue="60" Color="#27beb7" Offset = "-20"/>
      </gauge:LinearScale.Ranges>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
LinearRange linearRange = new LinearRange();
linearRange.StartValue = 0;
linearRange.EndValue = 60;
linearRange.Color = Color.FromHex("#27beb7");
linearRange.Offset = -20;
linearScale.Ranges.Add(linearRange);
linearGauge.Scales.Add(linearScale);
```

### Range customization

To change the range's background color, use the [Color](#) property of linear range. The thickness of the range can be changed using the [StartWidth](#) and [EndWidth](#) properties.

### XML

```
<gauge:SfLinearGauge>
<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
<gauge:LinearScale.Ranges>
<gauge:LinearRange StartValue="0" EndValue="50" Color="#f95c85" Offset = "-30" StartWidth = "-5" EndWidth = "-20"/>
</gauge:LinearScale.Ranges>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearGauge.Scales.Add(linearScale);
LinearRange linearRange = new LinearRange();
linearRange.StartValue = 0;
linearRange.Color = Color.FromRgb(249, 92, 133);
linearRange.EndValue = 50;
linearRange.StartWidth = -5;
linearRange.EndWidth = -20;
linearRange.Offset = -30;
linearScale.Ranges.Add(linearRange);
linearGauge.Scales.Add(linearScale);
```

### Setting position for range

The range can be adjusted above or below the scale by using the [Offset](#) value in pixels.

### XML

```
<gauge:SfLinearGauge Orientation = "OrientationVertical">
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      OpposedPosition = "True" Interval = "10" ScaleBarLength="350"
      MinorTicksPerInterval = "1">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
      <gauge:LinearScale.Ranges>
        <gauge:LinearRange StartValue="0" EndValue="50" Color="#27beb7" Offset =
          "30"/>
      </gauge:LinearScale.Ranges>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
linearGauge.Orientation = Orientation.OrientationVertical;
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearScale.OpposedPosition = true;
linearScale.Interval = 10;
linearScale.ScaleBarLength = 350;
linearScale.LabelColor = Color.FromHex("#424242");
LinearRange linearRange = new LinearRange();
linearRange.StartValue = 0;
linearRange.EndValue = 50;
linearRange.Color = Color.FromHex("#27beb7");
linearRange.Offset = 30;
linearScale.Ranges.Add(linearRange);
linearGauge.Scales.Add(linearScale);
```

### Setting multiple ranges

You can add n number of ranges to a scale by using the [LinearRange](#) property of range as demonstrated below.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="Transparent" ShowTicks="False"
      LabelColor="#424242" Interval="25" LabelFontSize="14" LabelOffset="-10"
      MinorTicksPerInterval="0">
      <gauge:LinearScale.Ranges>
        <gauge:LinearRange StartValue="0" EndValue="25" Color="#6de500" StartWidth
          ="-10" EndWidth="-15"/>
        <gauge:LinearRange StartValue="25" EndValue="50" Color="#53ad00" StartWidth
          ="-15" EndWidth="-20"/>
        <gauge:LinearRange StartValue="50" EndValue="75" Color="#009148" StartWidth
          ="-20" EndWidth="-25"/>
        <gauge:LinearRange StartValue="75" EndValue="100" Color="#026623" StartWidth
          ="-25" EndWidth="-30"/>
      </gauge:LinearScale.Ranges>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.Transparent;
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.LabelFontSize = 14;
linearScale.LabelOffset = -10;
linearScale.Interval = 25;
linearScale.MinorTicksPerInterval = 0;
linearScale.ShowTicks = false;
LinearRange linearRange = new LinearRange();
linearRange.StartValue = 0;
```

```

linearRange.EndValue = 25;
linearRange.Color = Color.FromHex("#6de500");
linearRange.StartWidth = -10;
linearRange.EndWidth = -15;
linearScale.Ranges.Add(linearRange);
LinearRange linearRange1 = new LinearRange();
linearRange1.StartValue = 25;
linearRange1.EndValue = 50;
linearRange1.Color = Color.FromHex("#53ad00");
linearRange1.StartWidth = -15;
linearRange1.EndWidth = -20;
linearScale.Ranges.Add(linearRange1);
LinearRange linearRange2 = new LinearRange();
linearRange2.StartValue = 50;
linearRange2.EndValue = 75;
linearRange2.Color = Color.FromHex("#009148");
linearRange2.StartWidth = -20;
linearRange2.EndWidth = -25;
linearScale.Ranges.Add(linearRange2);
LinearRange linearRange3 = new LinearRange();
linearRange3.StartValue = 75;
linearRange3.EndValue = 100;
linearRange3.Color = Color.FromHex("#026623");
linearRange3.StartWidth = -25;
linearRange3.EndWidth = -30;
linearScale.Ranges.Add(linearRange3);
linearGauge.Scales.Add(linearScale);

```

### Setting gradient color for range

You can give smooth color transition to range to specifying the different colors based on range value by using [GradientStops](#) property.

### XML

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="Transparent" ScaleBarSize ="20"
      ShowTicks="False" LabelColor="#424242" Interval="25" LabelFontSize ="14"
      LabelOffset="10" MinorTicksPerInterval ="0">
      <gauge:LinearScale.Ranges>
        <gauge:LinearRange StartWidth="20" EndWidth="20" StartValue="0"
          EndValue="100">
          <gauge:LinearRange.GradientStops>
            <gauge:GaugeGradientStop Value="0" Color="#FFF9C2C3"/>
            <gauge:GaugeGradientStop Value="100" Color="#FFD91D71"/>
          </gauge:LinearRange.GradientStops>
        </gauge:LinearRange>
      </gauge:LinearScale.Ranges>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>

```

```
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.Transparent;
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.LabelFontSize = 14;
linearScale.LabelOffset = 10;
linearScale.Interval = 25;
linearScale.MinorTicksPerInterval = 0;
linearScale.ShowTicks = false;
linearScale.ScaleBarSize = 20;
LinearRange linearRange = new LinearRange();
linearRange.StartValue = 0;
linearRange.EndValue = 100;
linearRange.StartWidth = 20;
linearRange.EndWidth = 20;
ObservableCollection<GaugeGradientStop> gradientColor = new
ObservableCollection<GaugeGradientStop>()
{
    new GaugeGradientStop() {Value = 0, Color = Color.FromHex("#FFF9C2C3") },
    new GaugeGradientStop() {Value = 100, Color = Color.FromHex("#FFD91D71") }
};
linearRange.GradientStops = gradientColor;
linearScale.Ranges.Add(linearRange);
linearGauge.Scales.Add(linearScale);
```

**Pointers**

[SfLinearGauge](#) provides support to mark the values using [BarPointer](#) and [SymbolPointer](#).

Adding bar pointer to scale

[BarPointer](#) is used to mark the scale values. It starts at the beginning of gauge and ends at the pointer value.

**XML**

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
    = "20" LabelFontSize="14" MinorTicksPerInterval="0">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.Pointers>
        <gauge:BarPointer Value="75" EnableAnimation="false" Color="#36d1dc" />
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
```

```
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 20;
linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
linearGauge.Scales.Add(linearScale);
```

### Bar pointer customization

The bar pointer's UI is customized by using the [Color](#) and [Thickness](#) properties.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
      = "40" LabelFontSize="14" MinorTicksPerInterval="0">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.Pointers>
        <gauge:BarPointer Value="75" EnableAnimation="false" Color="#36d1dc"
          Thickness="20"/>
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
```

```

linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.Thickness = 20;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
linearGauge.Scales.Add(linearScale);

```

#### Setting corner radius type for bar pointer

Corners of the [BarPointer](#) can be customized by setting the value to the [CornerRadiusType](#) property. All corners of bar pointer can be customized using the [Start](#), [End](#), [Both](#), and [None](#) options.

[CornerRadius](#) property used to reduce the radius of the corners.

#### XML

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
    = "40" LabelFontSize="14" MinorTicksPerInterval="0">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.Pointers>
        <gauge:BarPointer Value="75" EnableAnimation="false" Color="#36d1dc"
        Thickness="20" CornerRadiusType="Start" CornerRadius="10"/>
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

#### C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;

```

```
linearScale.MajorTickSettings.Length = 10;

barPointer.Value = 75;
barPointer.Thickness = 20;
barPointer.CornerRadiusType = CornerRadiusType.Start;
barPointer.CornerRadius = 10;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
linearGauge.Scales.Add(linearScale);
```

### Setting gradient color for bar pointer

You can give smooth color transition to bar pointer to specifying the different colors based on bar pointer's value by using [GradientStops](#) property.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#F7EDED" LabelColor="Black"
      ScaleBarSize="40" CornerRadius="20" CornerRadiusType="Both"
      LabelFontSize="14" MinimumValue="0" MaximumValue="100" Interval="25"
      LabelOffset="-10" ShowTicks="False">
      <gauge:LinearScale.Pointers>
        <gauge:BarPointer Value="75" CornerRadiusType="Both" CornerRadius="15"
          Thickness="30" EnableAnimation="False">
          <gauge:BarPointer.GradientStops>
            <gauge:GaugeGradientStop Value="10" Color="#f8babf"/>
            <gauge:GaugeGradientStop Value="40" Color="#ee89a7"/>
            <gauge:GaugeGradientStop Value="50" Color="#e4548c"/>
            <gauge:GaugeGradientStop Value="60" Color="#db2575"/>
          </gauge:BarPointer.GradientStops>
        </gauge:BarPointer>
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

**C#**

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromRgb(247, 237, 237);
linearScale.LabelColor = Color.Black;
linearScale.ScaleBarSize = 40;
linearScale.CornerRadius = 20;
linearScale.CornerRadiusType = CornerRadiusType.Both;
linearScale.LabelFontSize = 14;
linearScale.MinimumValue = 0;
linearScale.MaximumValue = 100;
linearScale.Interval = 25;
linearScale.LabelOffset = -10;
linearScale.ShowTicks = false;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.CornerRadiusType = CornerRadiusType.Both;
barPointer.CornerRadius = 15;
barPointer.Thickness = 30;
barPointer.EnableAnimation = false;
GaugeGradientStop gaugeGradientStop = new GaugeGradientStop();
gaugeGradientStop.Value = 10;
gaugeGradientStop.Color = Color.FromRgb(248, 186, 191);
barPointer.GradientStops.Add(gaugeGradientStop);
GaugeGradientStop gaugeGradientStop1 = new GaugeGradientStop();
gaugeGradientStop1.Value = 40;
gaugeGradientStop1.Color = Color.FromRgb(238, 137, 167);
barPointer.GradientStops.Add(gaugeGradientStop1);
GaugeGradientStop gaugeGradientStop2 = new GaugeGradientStop();
gaugeGradientStop2.Value = 50;
gaugeGradientStop2.Color = Color.FromRgb(228, 84, 140);
barPointer.GradientStops.Add(gaugeGradientStop2);
GaugeGradientStop gaugeGradientStop3 = new GaugeGradientStop();
gaugeGradientStop3.Value = 60;
gaugeGradientStop3.Color = Color.FromRgb(219, 37, 117);
barPointer.GradientStops.Add(gaugeGradientStop3);
linearScale.Pointers.Add(barPointer);
linearGauge.Scales.Add(linearScale);

```

Adding symbol pointer to scale

In [SymbolPointer](#), the value is pointed by a symbol on the scale.

**XML**

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
= "40" LabelFontSize ="14" MinorTicksPerInterval ="0">

```

```

<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.Pointers>
<gauge:BarPointer Value="75" CornerRadiusType="End" CornerRadius="10"
EnableAnimation="false" Color="#36d1dc" Thickness="20"/>
<gauge:SymbolPointer Value="30" EnableAnimation="False" Color="#5b86e5"/>
</gauge:LinearScale.Pointers>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
linearScale.LabelFontSize = 14;
linearScale.MinimumValue = 0;
linearScale.MaximumValue = 100;
linearScale.Interval = 10;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.Thickness = 20;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.CornerRadius = 10;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
SymbolPointer symbolPointer = new SymbolPointer();
symbolPointer.Value = 30;
symbolPointer.EnableAnimation = false;
symbolPointer.Color = Color.FromHex("#5b86e5");
linearScale.Pointers.Add(symbolPointer);
linearGauge.Scales.Add(linearScale);

```

### Symbol pointer customization

You can modify the symbol pointer's size using the [Thickness](#) property. The color of the symbol pointer is changed using the [Color](#) property.

### XML

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
      <gauge:LinearScale.Pointers>
        <gauge:SymbolPointer Value="70" Color="DeepSkyBlue" Thickness="15"/>
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
SymbolPointer symbolPointer = new SymbolPointer();
symbolPointer.Value = 70;
symbolPointer.Color = Color.DeepSkyBlue;
symbolPointer.Thickness = 15;
linearScale.Pointers.Add(symbolPointer);
linearGauge.Scales.Add(linearScale);

```

### Positioning symbol pointer

You can position the [SymbolPointer](#) by using the following two ways:

#### Setting symbol pointer position

You can customize the position of the [SymbolPointer](#) by using the [SymbolPointerPosition](#). The default symbol pointer position is **Far**.

## XML

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
      = "40" LabelFontSize="14" MinorTicksPerInterval="0">
      <gauge:LinearScale.MajorTickSettings>

```

```
<gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.Pointers>
<gauge:BarPointer Value="75" CornerRadiusType="End" CornerRadius="10"
EnableAnimation="false" Color="#36d1dc" Thickness="20"/>
<gauge:SymbolPointer Value="30" EnableAnimation="False" Color="#5b86e5"
SymbolPointerPosition="Away"/>
</gauge:LinearScale.Pointers>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

## C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.Thickness = 20;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.CornerRadius = 10;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
SymbolPointer symbolPointer = new SymbolPointer();
symbolPointer.Value = 30;
symbolPointer.EnableAnimation = false;
symbolPointer.SymbolPointerPosition = SymbolPointerPosition.Away;
symbolPointer.Color = Color.FromHex("#5b86e5");
linearScale.Pointers.Add(symbolPointer);
linearGauge.Scales.Add(linearScale);
```

### Setting offset for symbol pointer

You can move the [SymbolPointer](#) by using the [Offset](#) property.

## XML

```
<gauge:SfLinearGauge>
<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
="40" LabelFontSize="14" MinorTicksPerInterval="0">
```

```

<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.Pointers>
<gauge:BarPointer Value="75" CornerRadiusType="End" CornerRadius="10"
EnableAnimation="false" Color="#36d1dc" Thickness="20"/>
<gauge:SymbolPointer Value="30" EnableAnimation="False" Color="#5b86e5"
Offset="40"/>
</gauge:LinearScale.Pointers>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.Thickness = 20;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.CornerRadius = 10;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
SymbolPointer symbolPointer = new SymbolPointer();
symbolPointer.Value = 30;
symbolPointer.EnableAnimation = false;
symbolPointer.Offset = 40;
symbolPointer.Color = Color.FromHex("#5b86e5");
linearScale.Pointers.Add(symbolPointer);
linearGauge.Scales.Add(linearScale);

```

## Change symbol pointer shapes

Different types of shapes are used in [SymbolPointer](#) to mark the pointer value in scale. You can change the shape of [SymbolPointer](#) by using the [MarkerShape](#) property in pointer.

## XML

```

<gauge:SfLinearGauge>

```

```

<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
= "40" LabelFontSize="14" MinorTicksPerInterval="0">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.Pointers>
<gauge:BarPointer Value="75" CornerRadiusType="End" CornerRadius="10"
EnableAnimation="false" Color="#36d1dc" Thickness="20"/>
<gauge:SymbolPointer Value="30" EnableAnimation="False" Color="#5b86e5"
SymbolPointerPosition="Away" MarkerShape="Circle"/>
</gauge:LinearScale.Pointers>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

**C#**

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.Thickness = 20;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.CornerRadius = 10;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
SymbolPointer symbolPointer = new SymbolPointer();
symbolPointer.Value = 30;
symbolPointer.EnableAnimation = false;
symbolPointer.Thickness = 12;
symbolPointer.MarkerShape = MarkerShape.Circle;
symbolPointer.SymbolPointerPosition = SymbolPointerPosition.Away;
symbolPointer.Color = Color.FromHex("#5b86e5");
linearScale.Pointers.Add(symbolPointer);
linearGauge.Scales.Add(linearScale);

```

### Setting image shape for symbol pointer

You can achieve the image shape by setting the [MarkerShape](#) property to `Image` and setting image path to [ImageSource](#) property in [SymbolPointer](#).

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242" ScaleBarSize
    = "40" LabelFontSize="14" MinorTicksPerInterval="0">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="#9E9E9E" Length="10"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.Pointers>
        <gauge:BarPointer Value="75" CornerRadiusType="End" CornerRadius="10"
        EnableAnimation="false" Color="#36d1dc" Thickness="20"/>
        <gauge:SymbolPointer Value="30" EnableAnimation="False" Color="#5b86e5"
        Offset="40" MarkerShape="Image" ImageSource="location.png"/>
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

```
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.Thickness = 20;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.CornerRadius = 10;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
SymbolPointer symbolPointer = new SymbolPointer();
symbolPointer.Value = 30;
symbolPointer.EnableAnimation = false;
symbolPointer.Thickness = 12;
symbolPointer.MarkerShape = MarkerShape.Image;
symbolPointer.ImageSource = "location.png";
symbolPointer.Offset = 40;
symbolPointer.Color = Color.FromHex("#5b86e5");
linearScale.Pointers.Add(symbolPointer);
linearGauge.Scales.Add(linearScale);
```

### Adding multiple pointers

In addition to the default pointer, you can add n number of pointers to a linear scale by using the [Pointers](#) property.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e9f9" LabelColor="#424242"
      CornerRadiusType="End" CornerRadius="20" ScaleBarSize = "40" LabelFontSize
      ="14" MinorTicksPerInterval ="0">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color ="#9E9E9E" Length = "10"/>
      </gauge:LinearScale.MajorTickSettings>
```

```

<gauge:LinearScale.Pointers>
<gauge:BarPointer Value="75" CornerRadiusType="End" EnableAnimation =
"false" Color = "#36d1dc" Thickness = "30"/>
<gauge:SymbolPointer Value="30" EnableAnimation="False" Color= "#5b86e5"
SymbolPointerPosition="Away" MarkerShape="Triangle"/>
</gauge:LinearScale.Pointers>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e9f9");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.ScaleBarSize = 40;
linearScale.CornerRadius = 20;
linearScale.CornerRadiusType = CornerRadiusType.End;
linearScale.LabelFontSize = 14;
linearScale.MinorTicksPerInterval = 0;
linearScale.MajorTickSettings.Color = Color.FromHex("#9E9E9E");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 10;
BarPointer barPointer = new BarPointer();
barPointer.Value = 75;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.Thickness = 30;
barPointer.EnableAnimation = false;
barPointer.Color = Color.FromHex("#36d1dc");
linearScale.Pointers.Add(barPointer);
SymbolPointer symbolPointer = new SymbolPointer();
symbolPointer.Value = 30;
symbolPointer.Thickness = 12;
symbolPointer.EnableAnimation = false;
symbolPointer.Color = Color.FromHex("#5b86e5");
symbolPointer.MarkerShape = MarkerShape.Triangle;
symbolPointer.SymbolPointerPosition = SymbolPointerPosition.Away;
linearScale.Pointers.Add(symbolPointer);
linearGauge.Scales.Add(linearScale);

```

## Change Orientation

[SfLinearGauge](#) supports horizontal and vertical orientations. By default, [SfLinearGauge](#) is rendered with horizontal orientation. You can change the orientation by using the [Orientation](#) property.

## XML

```
<gauge:SfLinearGauge Orientation="OrientationVertical">
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale Interval="10" ScaleBarLength="350"
      ScaleBarColor="#e0e0e0" LabelColor="#424242">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" />
      </gauge:LinearScale.MajorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

## C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
linearGauge.Orientation = Orientation.OrientationVertical;
LinearScale linearScale = new LinearScale();
linearScale.Interval = 10;
linearScale.ScaleBarLength = 350;
linearScale.MajorTickSettings.Thickness = 1;
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearGauge.Scales.Add(linearScale);
```

## Header

You can add a title to gauge using the [LinearHeader](#) option to provide information to users about the data that is being plotted in the linear gauge.

Adding header to linear gauge

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Header >
    <gauge:LinearHeader Text="Thermometer"/>
  </gauge:SfLinearGauge.Header>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      ScaleBarLength="350">
```

```

<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
linearGauge.Orientation = Orientation.OrientationVertical;
LinearHeader linearHeader = new LinearHeader();
linearHeader.Text = "Thermometer";
linearGauge.Header = linearHeader;
LinearScale linearScale = new LinearScale();
linearScale.Interval = 10;
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.ScaleBarLength = 350;
linearScale.LabelColor = Color.FromHex("#424242");
linearGauge.Scales.Add(linearScale);

```

Thermometer

## Positioning the header

To change the position of header, use the [Offset](#) property in the linear header. It ranges from 0 to 1. By default, the header will be positioned on the top of linear gauge.

## XML

```

<gauge:SfLinearGauge>

```

```

<gauge:SfLinearGauge.Header >
<gauge:LinearHeader Text="Thermometer" Offset="0.4,0.4"/>
</gauge:SfLinearGauge.Header>
<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
ScaleBarLength ="350">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearHeader linearHeader = new LinearHeader();
linearHeader.Text = "Thermometer";
linearHeader.Offset = new Point(0.4, 0.4);
linearGauge.Header = linearHeader;
LinearScale linearScale = new LinearScale();
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearGauge.Scales.Add(linearScale);

```

## Customizing header text

You can customize the text of [LinearHeader](#) by using the [FontFamily](#), [FontAttribute](#), [TextSize](#), and [ForegroundColor](#) properties as shown in the following code snippet.

## XML

```

linearScale.LabelColor = Color.FromHex("#424242");
linearGauge.Scales.Add(linearScale);

```

### THERMOMETER

## Annotations

[SfLinearGauge](#) supports [Annotations](#), which is used to mark the specific area of interest in the gauge area with texts, shapes, or images. You can add any number of annotations to the gauge.

### Annotation

By using the [View](#) property of annotation object, you can specify the new element that needs to be displayed in the gauge area.

## XML

```

<gauge:SfLinearGauge>
<gauge:SfLinearGauge.Annotations>
<gauge:LinearGaugeAnnotation OffsetX = "0.5" OffsetY = "0.45">
<gauge:LinearGaugeAnnotation.View>
<Label Text="CPU Utilization" TextColor="Black" FontSize = "20"/>
</gauge:LinearGaugeAnnotation.View>
</gauge:LinearGaugeAnnotation>
</gauge:SfLinearGauge.Annotations>
<gauge:SfLinearGauge.Scales>

```

```
<gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
MinorTicksPerInterval = "1">
  <gauge:LinearScale.MajorTickSettings>
    <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
  </gauge:LinearScale.MajorTickSettings>
  <gauge:LinearScale.MinorTickSettings>
    <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
  </gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

## C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearGaugeAnnotation linearGaugeAnnotation = new LinearGaugeAnnotation();
linearGaugeAnnotation.OffsetX = 0.5;
linearGaugeAnnotation.OffsetY = 0.45;
linearGaugeAnnotation.View = new Label() { Text = "CPU Utilization",
TextColor = Color.Black, FontSize = 20 };
linearGauge.Annotations.Add(linearGaugeAnnotation);
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale);
```

## CPU Utilization

## Positioning the annotation

You can place the annotation anywhere in gauge area by using the `Offset` or `ScaleValue` property.

### Change annotation position by using offset

You can position the annotation anywhere in the linear gauge by using the `OffsetX` and `OffsetY` properties. It ranges from 0 to 1.

## XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Annotations>
    <gauge:LinearGaugeAnnotation OffsetX = "0.5" OffsetY = "0.6">
      <gauge:LinearGaugeAnnotation.View>
        <Label Text="CPU Utilization" TextColor="Black" FontSize = "20"/>
      </gauge:LinearGaugeAnnotation.View>
    </gauge:LinearGaugeAnnotation>

<gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
MinorTicksPerInterval = "1">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearGaugeAnnotation linearGaugeAnnotation = new LinearGaugeAnnotation();
linearGaugeAnnotation.OffsetX = 0.5;
linearGaugeAnnotation.OffsetY = 0.6;
linearGaugeAnnotation.View = new Label() { Text = "CPU Utilization",
TextColor = Color.Black, FontSize = 20 };
linearGauge.Annotations.Add(linearGaugeAnnotation);
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale);

```

CPU Utilization

*Change annotation position by using scale value*

You can also place the annotation by specifying the [ScaleValue](#) property.

## XML

```

<gauge:SfLinearGauge>
<gauge:SfLinearGauge.Annotations>
<gauge:LinearGaugeAnnotation ScaleValue = "60">
<gauge:LinearGaugeAnnotation.View>
<Label Text="60%" FontAttributes = "Bold" TextColor="Black" FontSize = "15"/>
</gauge:LinearGaugeAnnotation.View>

```

```

</gauge:LinearGaugeAnnotation>
</gauge:SfLinearGauge.Annotations>
<gauge:SfLinearGauge.Scales>
<gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
MinorTicksPerInterval = "1" ScaleBarSize = "40">
<gauge:LinearScale.MajorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
<gauge:LinearScale.Pointers>
<gauge:BarPointer Value="60" Color = "#f95c85" Thickness = "20"
CornerRadius = "10" CornerRadiusType = "End"/>
</gauge:LinearScale.Pointers>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearGaugeAnnotation linearGaugeAnnotation = new LinearGaugeAnnotation();
linearGaugeAnnotation.ScaleValue = 60;
linearGaugeAnnotation.View = new Label() { Text = "60%", FontAttributes =
FontAttributes.Bold, TextColor = Color.Black, FontSize = 15 };
linearGauge.Annotations.Add(linearGaugeAnnotation);
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.ScaleBarSize = 40;
linearScale.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale);
BarPointer barPointer = new BarPointer();
barPointer.Value = 60;
barPointer.Thickness = 20;
barPointer.CornerRadius = 10;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.Color = Color.FromRgb(249, 92, 133);
linearScale.Pointers.Add(barPointer);

```

### Set margin to the annotation

You can adjust the annotation by specifying the [ViewMargin](#) property in pixel, which adjusts the annotation element from its current position.

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Annotations>
    <gauge:LinearGaugeAnnotation ScaleValue = "60" ViewMargin = "10,60">
      <gauge:LinearGaugeAnnotation.View>
        <Label Text="60%" FontAttributes = "Bold" TextColor= "#F95C85" FontSize
          ="15"/>
      </gauge:LinearGaugeAnnotation.View>
    </gauge:LinearGaugeAnnotation>
  </gauge:SfLinearGauge.Annotations>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval = "1" ScaleBarSize = "40">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
      <gauge:LinearScale.Pointers>
        <gauge:BarPointer Value="60" Color = "#F95C85" Thickness = "20"
          CornerRadius = "10" CornerRadiusType = "End"/>
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

#### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearGaugeAnnotation linearGaugeAnnotation = new LinearGaugeAnnotation();
linearGaugeAnnotation.ScaleValue = 60;
linearGaugeAnnotation.ViewMargin = new Point(10, 60);
linearGaugeAnnotation.View = Label() { Text = "60%", FontAttributes =
FontAttributes.Bold, TextColor = Color.FromHex("#F95C85"), FontSize = 15 };
linearGauge.Annotations.Add(linearGaugeAnnotation);
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.ScaleBarSize = 40;
linearScale.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale);
BarPointer barPointer = new BarPointer();
barPointer.Value = 60;
barPointer.Thickness = 20;
```

```
barPointer.CornerRadius = 10;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.Color = Color.FromRgb(249, 92, 133);
linearScale.Pointers.Add(barPointer);
```

### Alignment of annotation

You can align the annotation using the [HorizontalViewAlignment](#) and [VerticalViewAlignment](#) properties.

#### Setting horizontal view alignment

##### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Annotations>
    <gauge:LinearGaugeAnnotation ScaleValue="60" HorizontalViewAlignment="Start">
      <gauge:LinearGaugeAnnotation.View>
        <Label Text="60%" FontAttributes="Bold" TextColor="Black" FontSize="15"/>
      </gauge:LinearGaugeAnnotation.View>
    </gauge:LinearGaugeAnnotation>
  </gauge:SfLinearGauge.Annotations>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval="1" ScaleBarSize="40">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
      <gauge:LinearScale.Pointers>
        <gauge:BarPointer Value="60" Color="#f95c85" Thickness="20"
          CornerRadius="10" CornerRadiusType="End"/>
      </gauge:LinearScale.Pointers>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

##### C#

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearGaugeAnnotation linearGaugeAnnotation = new LinearGaugeAnnotation();
linearGaugeAnnotation.ScaleValue = 60;
linearGaugeAnnotation.HorizontalViewAlignment = ViewAlignment.Start;
linearGaugeAnnotation.View = new Label() { Text = "60%", FontAttributes =
  FontAttributes.Bold, TextColor = Color.Black, FontSize = 15 };
linearGauge.Annotations.Add(linearGaugeAnnotation);
```

```

LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.ScaleBarSize = 40;
linearScale.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale);
BarPointer barPointer = new BarPointer();
barPointer.Value = 60;
barPointer.Thickness = 20;
barPointer.CornerRadius = 10;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.Color = Color.FromRgb(249, 92, 133);
linearScale.Pointers.Add(barPointer);

```

### Setting vertical view alignment

#### XML

```

<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Annotations>
    <gauge:LinearGaugeAnnotation ScaleValue="60" VerticalViewAlignment="Start">
      <gauge:LinearGaugeAnnotation.View>
        <Label Text="60%" FontAttributes="Bold" TextColor="Black" FontSize="15"/>
      </gauge:LinearGaugeAnnotation.View>
    </gauge:LinearGaugeAnnotation>
  </gauge:SfLinearGauge.Annotations>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval="1" ScaleBarSize="40">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>

```

```

</gauge:LinearScale.MajorTickSettings>
<gauge:LinearScale.MinorTickSettings>
<gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
</gauge:LinearScale.MinorTickSettings>
<gauge:LinearScale.Pointers>
<gauge:BarPointer Value="60" Color = "#f95c85" Thickness = "20"
CornerRadius ="10" CornerRadiusType ="End"/>
</gauge:LinearScale.Pointers>
</gauge:LinearScale>
</gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>

```

## C#

```

SfLinearGauge linearGauge = new SfLinearGauge();
LinearGaugeAnnotation linearGaugeAnnotation = new LinearGaugeAnnotation();
linearGaugeAnnotation.ScaleValue = 60;
linearGaugeAnnotation.VerticalViewAlignment = ViewAlignment.Start;
linearGaugeAnnotation.View = new Label() { Text = "60%", FontAttributes =
FontAttributes.Bold, TextColor = Color.Black, FontSize = 15 };
linearGauge.Annotations.Add(linearGaugeAnnotation);
LinearScale linearScale = new LinearScale();
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.ScaleBarSize = 40;
linearScale.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale);
BarPointer barPointer = new BarPointer();
barPointer.Value = 60;
barPointer.Thickness = 20;
barPointer.CornerRadius = 10;
barPointer.CornerRadiusType = CornerRadiusType.End;
barPointer.Color = Color.FromRgb(249, 92, 133);
linearScale.Pointers.Add(barPointer);

```

Setting scale index for annotation

You can set the index for the scale by using [ScaleIndex](#)

#### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Annotations>
    <gauge:LinearGaugeAnnotation OffsetX = "0.5" OffsetY ="0.45" ScaleIndex =
      "0">
      <gauge:LinearGaugeAnnotation.View>
        <Label Text="CPU Utilization" TextColor="Black" FontSize ="20"/>
      </gauge:LinearGaugeAnnotation.View>
    </gauge:LinearGaugeAnnotation>
    <gauge:LinearGaugeAnnotation OffsetX = "0.5" OffsetY ="0.6" ScaleIndex ="1">
      <gauge:LinearGaugeAnnotation.View>
        <Label Text="Thermometer" TextColor="Black" FontSize ="20"/>
      </gauge:LinearGaugeAnnotation.View>
    </gauge:LinearGaugeAnnotation>
  </gauge:SfLinearGauge.Annotations>
  <gauge:SfLinearGauge.Scales>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval ="1">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
    <gauge:LinearScale ScaleBarColor="#e0e0e0" LabelColor="#424242"
      MinorTicksPerInterval ="1" Offset ="100">
      <gauge:LinearScale.MajorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="15"/>
      </gauge:LinearScale.MajorTickSettings>
      <gauge:LinearScale.MinorTickSettings>
        <gauge:LinearTickSettings Thickness="1" Color="Gray" Length="7"/>
      </gauge:LinearScale.MinorTickSettings>
    </gauge:LinearScale>
  </gauge:SfLinearGauge.Scales>
</gauge:SfLinearGauge>
```

```
</gauge:SfLinearGauge>
```

**C#**

```
SfLinearGauge linearGauge = new SfLinearGauge();
LinearGaugeAnnotation linearGaugeAnnotation = new LinearGaugeAnnotation();
linearGaugeAnnotation.OffsetX = 0.5;
linearGaugeAnnotation.OffsetY = 0.45;
linearGaugeAnnotation.ScaleIndex = 0;
linearGaugeAnnotation.View = new Label() { Text = "CPU Utilization",
TextColor = Color.Black, FontSize = 18 };
linearGauge.Annotations.Add(linearGaugeAnnotation);
LinearGaugeAnnotation linearGaugeAnnotation1 = new LinearGaugeAnnotation();
linearGaugeAnnotation1.OffsetX = 0.5;
linearGaugeAnnotation1.OffsetY = 0.6;
linearGaugeAnnotation1.ScaleIndex = 1;
linearGaugeAnnotation1.View = new Label() { Text = "Thermometer", TextColor
= Color.Black, FontSize = 18 };
linearGauge.Annotations.Add(linearGaugeAnnotation1);
LinearScale linearScale = new LinearScale();
linearScale.MinimumValue = 0;
linearScale.MaximumValue = 100;
linearScale.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale.LabelColor = Color.FromHex("#424242");
linearScale.MajorTickSettings.Thickness = 1;
linearScale.MajorTickSettings.Length = 15;
linearScale.MajorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Color = Color.Gray;
linearScale.MinorTickSettings.Length = 7;
linearScale.MinorTickSettings.Thickness = 1;
linearScale.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale);
LinearScale linearScale1 = new LinearScale();
linearScale1.MinimumValue = 0;
linearScale1.MaximumValue = 100;
linearScale1.ScaleBarColor = Color.FromHex("#e0e0e0");
linearScale1.LabelColor = Color.FromHex("#424242");
linearScale1.MajorTickSettings.Thickness = 1;
linearScale1.MajorTickSettings.Length = 15;
linearScale1.MajorTickSettings.Color = Color.Gray;
linearScale1.MinorTickSettings.Color = Color.Gray;
linearScale1.MinorTickSettings.Length = 7;
linearScale1.MinorTickSettings.Thickness = 1;
linearScale1.Offset = 100;
linearScale1.MinorTicksPerInterval = 1;
linearGauge.Scales.Add(linearScale1);
```

### Multiple annotations

You can add multiple annotations to the gauge as demonstrated below.

### XML

```
<gauge:SfLinearGauge>
  <gauge:SfLinearGauge.Annotations>
    <gauge:LinearGaugeAnnotation ScaleValue="15" ViewMargin ="0,30" >
      <gauge:LinearGaugeAnnotation.View>
        <Image Source="Low.png" WidthRequest="30" HeightRequest="30"/>
      </gauge:LinearGaugeAnnotation.View>
    </gauge:LinearGaugeAnnotation>
    <gauge:LinearGaugeAnnotation ScaleValue="45" ViewMargin ="0,30">

linearGauge.Annotations.Add(linearGaugeAnnotation4);
LinearGaugeAnnotation linearGaugeAnnotation5 = new LinearGaugeAnnotation();
linearGaugeAnnotation5.ScaleValue = 15;
linearGaugeAnnotation5.ViewMargin = new Point(0, 80);
linearGaugeAnnotation5.View = new Label() { Text = "Low", TextColor =
Color.Green, FontSize = 18 };
linearGauge.Annotations.Add(linearGaugeAnnotation5);
LinearScale linearScale = new LinearScale();
linearScale.MinimumValue = 0;
linearScale.MaximumValue = 90;
linearScale.ShowLabels = false;
linearScale.ScaleBarColor = Color.Transparent;
linearScale.MinorTicksPerInterval = 1;
linearScale.ShowTicks = false;
linearScale.ScalePosition = ScalePosition.BackWard;
linearGauge.Scales.Add(linearScale);
LinearRange linearRange = new LinearRange();
linearRange.StartValue = 0;
linearRange.Color = Color.FromHex("#30b32d");
linearRange.EndValue = 30;
linearRange.StartWidth = 60;
linearRange.EndWidth = 60;
linearScale.Ranges.Add(linearRange);
LinearRange linearRange1 = new LinearRange();
linearRange1.StartValue = 30;
linearRange1.Color = Color.FromHex("#fdd00");
linearRange1.EndValue = 60;
linearRange1.StartWidth = 60;
linearRange1.EndWidth = 60;
linearScale.Ranges.Add(linearRange1);
LinearRange linearRange2 = new LinearRange();
linearRange2.StartValue = 60;
linearRange2.Color = Color.FromHex("#f03e3e");
linearRange2.EndValue = 90;
linearRange2.StartWidth = 60;
linearRange2.EndWidth = 60;
linearScale.Ranges.Add(linearRange2);

```

## SfListView

### SfListView

The SfListView for Xamarin.Forms renders set of data items with Xamarin.Forms views or custom templates. Data can be grouped, sorted, and filtered with ease.

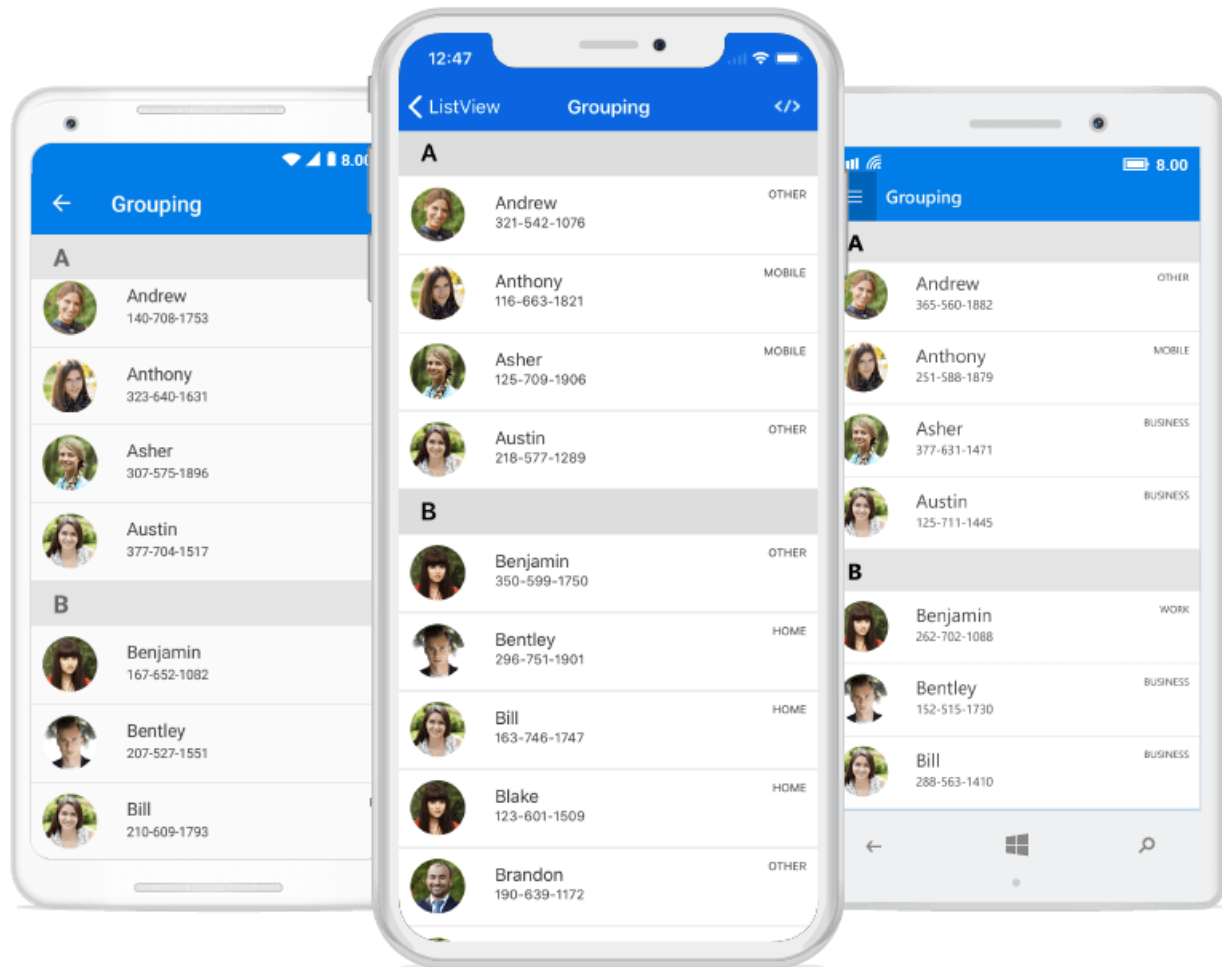

#### Key features

- Optimized view reusing strategy for enhanced performance.

- Item templating for rich UI(User Interface).
- Supports dynamic selection of UI for each item using the `DataTemplateSelector`.
- AutoFit items based on the content of 'ItemTemplate'.
- Supports linear layout and grid layout.
- Reordering items by dragging and dropping them in a linear layout with displaying custom UI in a template.
- Orientation support.
- Data operations such as sorting, grouping, and filtering.
- Customizable group header with option to stick in view.
- Selection with different selection modes and gestures.
- Swiping template for loading views with custom actions.
- Header and footer with sticky options.
- Supports to load more data either automatically or manually at bottom when end of the list is reached and manually at top.
- Supports for macOS with existing features along with key navigation.

#### Advantages of the SfListView over Xamarin.Forms ListView

- Horizontal orientation support.
- Support for different layouts such as linear layout and grid layout.
- Supports for item swiping.
- Supports for reordering items by drag and drop in linear layout.
- Supports to load more items when reached scroll end.
- Supports for sorting and filtering the data items.
- Supports to stick the header, group header, and footer in view.
- Supports to customize selection background color.
- Supports to notify the scroll state changes.

## Getting Started

This section provides a quick overview for getting started with the SfListView for Xamarin.Forms. Walk through the entire process of creating the real world SfListView.

### Assembly Deployment

After installing Essential Studio for Xamarin, you can find all the required assemblies in the {Syncfusion Essential Studio Installed location}\Essential Studio\{{ site.releaseversion }}\Xamarin\lib installation folder.

Eg: C:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Xamarin\lib

Refer [control dependencies](#) section to get the list of assemblies or NuGet package needs to be added as reference to use the SfListView control in any application.

---

**Note:** Assemblies can be found in an unzipped package location in Mac.

---

### Adding SfListView reference

You can add SfListView reference using one of the following methods:

#### Method 1: Adding SfListView reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfListView). To add SfListView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfListView](https://www.nuget.org/packages/Syncfusion.Xamarin.SfListView), and then install it.

![Adding SfListView reference from NuGet](SfListView\_images/Adding SfListView reference.png)

**Note:** Install the same version of SfListView NuGet in all the projects.

### Method 2: Adding SfListView reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfListView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfListView assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.DataSource.Portable.dll Syncfusion.Core.XForms.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfListView.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.DataSource.Portable.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfListView.XForms.Android.dll Syncfusion.SfListView.XForms.dll Syncfusion.Licensing.dll
iOS	Syncfusion.DataSource.Portable.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfListView.XForms.iOS.dll Syncfusion.SfListView.XForms.dll Syncfusion.Licensing.dll
UWP	Syncfusion.DataSource.Portable.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.GridCommon.Portable.dll Syncfusion.SfListView.XForms.UWP.dll Syncfusion.SfListView.XForms.dll Syncfusion.Licensing.dll
macOS	pcl\Syncfusion.DataSource.Portable.dll pcl\Syncfusion.Core.XForms.dll pcl\Syncfusion.GridCommon.Portable.dll

	pcl\Syncfusion.SfListView.XForms.dll macOS\Syncfusion.Core.XForms.macOS.dll macOS\Syncfusion.SfListView.XForms.macOS Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** After adding the reference, an additional step is required for [iOS](#) and [UWP](#) projects. For UWP alone, one more additional step is required if the project is built-in release mode with .NET Native tool chain is enabled. You can refer to this [KB article](#) for more details. If you are adding the references from toolbox, this step is not needed.

### System Requirements

In the SfListView, current supported Xamarin.Forms version is 3.5.0.129452 and later.

The following table lists the platforms supported versions:

Platform	Supported versions
Android	API level 19 and later versions
iOS	iOS 9.0 and later versions
UWP	Windows 10 devices
macOS	10.11

### Launching the SfListView on Each Platform

To use this control inside an application, each platform application must initialize the SfListView renderer. This initialization step varies from platform to platform, and is discussed in the following sections:

#### Android

The Android launches the SfListView without any initialization, and is enough to only initialize the Xamarin.Forms Framework to launch the application.

#### iOS

To launch the SfListView in iOS, call the `SfListViewRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework initialization, and before the `LoadApplication` is called as demonstrated in the following code example:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
```

```
{
...
global::Xamarin.Forms.Forms.Init ();
SfListViewRenderer.Init();
LoadApplication (new App ());
...
}
```

### Universal Windows Platform (UWP)

To launch the SfListView in UWP, call the `SfListViewRenderer.Init()` in the `MainPage` constructor before the `LoadApplication` is called as demonstrated in the following code example:

#### C#

```
public MainPage ()
{
...
SfListViewRenderer.Init();
LoadApplication (new App ());
...
}
```

### macOS

To launch SfListView in macOS, call the `SfListViewRenderer.Init()` in the `DidFinishLaunching` override method of `AppDelegate` class, after calling the Xamarin.Forms Framework and `LoadApplication` initialization.

#### C#

```
public override void DidFinishLaunching(NSNotification notification)
{
Forms.Init();
LoadApplication(new App());
SfListViewRenderer.Init();
...
}
```

### ReleaseMode Issue in UWP Platform

The known Framework issue in UWP platform is the custom controls will not render when deployed the application in `Release Mode`.

The above problem can be resolved by initializing the SfListView assemblies in `App.xaml.cs` in UWP project as in the following code snippet:

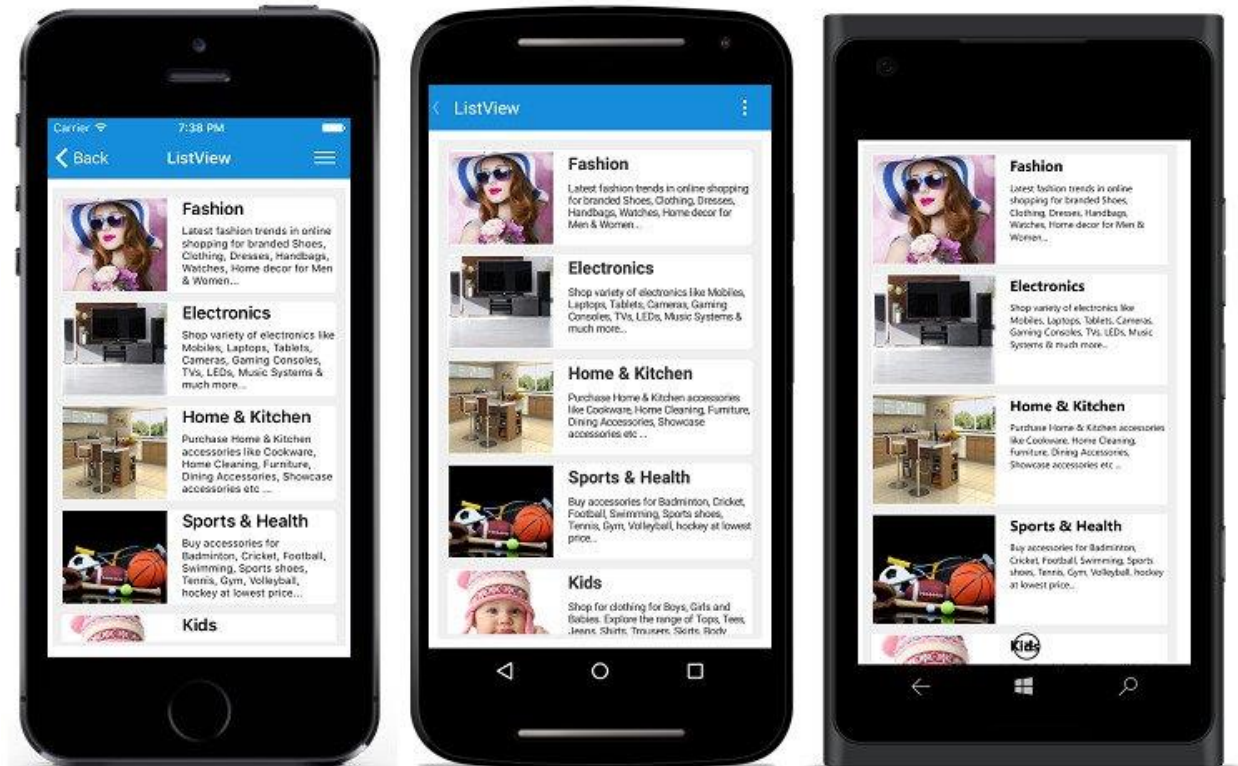

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
...
rootFrame.NavigationFailed += OnNavigationFailed;
// you'll need to add `using System.Reflection;`
List<Assembly> assembliesToInclude = new List<Assembly>();
//Now, add all the assemblies your app uses
```

```
assembliesToInclude.Add(typeof(SfListViewRenderer).GetTypeInfo().Assembly);  
// replaces Xamarin.Forms.Forms.Init(e);  
Xamarin.Forms.Forms.Init(e, assembliesToInclude);  
...  
}
```

## Create a Simple SfListView

This section explains how to create a SfListView, and configure it. The SfListView control can be configured entirely in C# code, or by using XAML markup. This is how the control will look like on iOS, Android, and Windows devices.

In this walk through, you will create a new application with the SfListView that includes the following topics:

- [Creating the project](#)
- [Adding SfListView in Xamarin.Forms](#)
- [Creating Data Model](#)
- [Binding data](#)
- [Defining an ItemTemplate](#)
- [Layouts](#)
- [Sorting](#)
- [Filtering](#)
- [Grouping](#)
- [Selection](#)
- [Header and Footer](#)

### Creating the Project

Create a new blank [\(Xamarin.Forms.NET Standard\) application](#) in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding the SfListView in Xamarin.Forms

1. Add the required assembly references to the corresponding projects as discussed in the [Assembly deployment](#) section.
2. Import the SfListView control namespace Syncfusion.ListView.XForms.
3. Set the SfListView control to the ContentPage.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<syncfusion:SfListView x:Name="listView" />
</ContentPage>
```

### C#

```
using Syncfusion.ListView.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfListView listView;
        public App()
        {
            listView = new SfListView();
            MainPage = new ContentPage { Content = listView };
        }
    }
}
```

### Creating Data Model for the SfListView

Create a data model to bind it to the control.

Create a simple data source as shown in the following code example in a new class file, and save it as BookInfo.cs file:

### C#

```
public class BookInfo : INotifyPropertyChanged
{
    private string bookName;
    private string bookDesc;
    public string BookName
    {
```

```
get { return bookName; }
set
{
    bookName = value;
    OnPropertyChanged("BookName");
}
}
public string BookDescription
{
    get { return bookDesc; }
    set
    {
        bookDesc = value;
        OnPropertyChanged("BookDescription");
    }
}
public event PropertyChangedEventHandler PropertyChanged;
public void OnPropertyChanged(string name)
{
    if (this.PropertyChanged != null)
        this.PropertyChanged(this, new PropertyChangedEventArgs(name));
}
}
```

**Note:** If you want your data model to respond to property changes, then implement `INotifyPropertyChanged` interface in your model class.

Create a model repository class with `BookInfo` collection property initialized with required number of data objects in a new class file as shown in the following code example, and save it as `BookInfoRepository.cs` file:

### C#

```
public class BookInfoRepository
{
    private ObservableCollection<BookInfo> bookInfo;
    public ObservableCollection<BookInfo> BookInfo
    {
        get { return bookInfo; }
        set { this.bookInfo = value; }
    }
    public BookInfoRepository()
    {
        GenerateBookInfo();
    }
    internal void GenerateBookInfo()
    {
        bookInfo = new ObservableCollection<BookInfo>();
        bookInfo.Add(new BookInfo() { BookName = "Object-Oriented Programming in C#", BookDescription = "Object-oriented programming is a programming paradigm based on the concept of objects" });
        bookInfo.Add(new BookInfo() { BookName = "C# Code Contracts", BookDescription = "Code Contracts provide a way to convey code assumptions" });
    }
}
```

```
bookInfo.Add(new BookInfo() { BookName = "Machine Learning Using C#",  
BookDescription = "You'll learn several different approaches to applying  
machine learning" });  
bookInfo.Add(new BookInfo() { BookName = "Neural Networks Using C#",  
BookDescription = "Neural networks are an exciting field of software  
development" });  
bookInfo.Add(new BookInfo() { BookName = "Visual Studio Code",  
BookDescription = "It is a powerful tool for editing code and serves for  
end-to-end programming" });  
bookInfo.Add(new BookInfo() { BookName = "Android Programming",  
BookDescription = "It is provides a useful overview of the Android  
application life cycle" });  
bookInfo.Add(new BookInfo() { BookName = "iOS Succinctly", BookDescription =  
"It is for developers looking to step into frightening world of iPhone" });  
bookInfo.Add(new BookInfo() { BookName = "Visual Studio 2015",  
BookDescription = "The new version of the widely-used integrated development  
environment" });  
bookInfo.Add(new BookInfo() { BookName = "Xamarin.Forms", BookDescription =  
"Its creates mappings from its C# classes and controls directly" });  
bookInfo.Add(new BookInfo() { BookName = "Windows Store Apps",  
BookDescription = "Windows Store apps present a radical shift in Windows  
development" });  
}  
}
```

### Binding Data to the SfListView

To bind the data source of the SfListView, set the [SfListView.ItemsSource](#) property as shown as follows. You can bind the data source of the SfListView either from XAML or in code.

The following code example binds the collection created in previous step to the `SfListView.ItemsSource` property:

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:syncfusion="clr-  
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"  
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"  
x:Class="GettingStarted.MainPage">  
  <ContentPage.BindingContext>  
    <local:BookInfoRepository />  
  </ContentPage.BindingContext>  
  <syncfusion:SfListView x:Name="listView"  
    ItemsSource="{Binding BookInfo}" />  
</ContentPage>
```

#### C#

```
BookInfoRepository viewModel = new BookInfoRepository ();  
listView.ItemsSource = viewModel.BookInfo;
```

### Defining an ItemTemplate

By defining the [SfListView.ItemTemplate](#) of the SfListView, a custom user interface(UI) can be achieved to display the data items.

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding BookInfo}"
ItemSize="100">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Grid Padding="10">
<Grid.RowDefinitions>
<RowDefinition Height="0.4*" />
<RowDefinition Height="0.6*" />
</Grid.RowDefinitions>
<Label Text="{Binding BookName}" FontAttributes="Bold" TextColor="Teal"
FontSize="21" />
<Label Grid.Row="1" Text="{Binding BookDescription}" TextColor="Teal"
FontSize="15"/>
</Grid>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</ContentPage>
```

#### C#

```
using Syncfusion.ListView.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfListView listView;
        public App()
        {
            BookInfoRepository viewModel = new BookInfoRepository ();
            listView = new SfListView();
            listView.ItemSize = 100;
            listView.ItemsSource = viewModel.BookInfo;
            listView.ItemTemplate = new DataTemplate(() => {
                var grid = new Grid();
                var bookName = new Label { FontAttributes = FontAttributes.Bold,
                    BackgroundColor = Color.Teal, FontSize = 21 };
                bookName.SetBinding(Label.TextProperty, new Binding("BookName"));
                var bookDescription = new Label { BackgroundColor = Color.Teal, FontSize =
                    15 };
                bookDescription.SetBinding(Label.TextProperty, new
                    Binding("BookDescription"));
                grid.Children.Add(bookName);
                grid.Children.Add(bookDescription, 1, 0);
                return grid;
            });
        }
    }
}
```

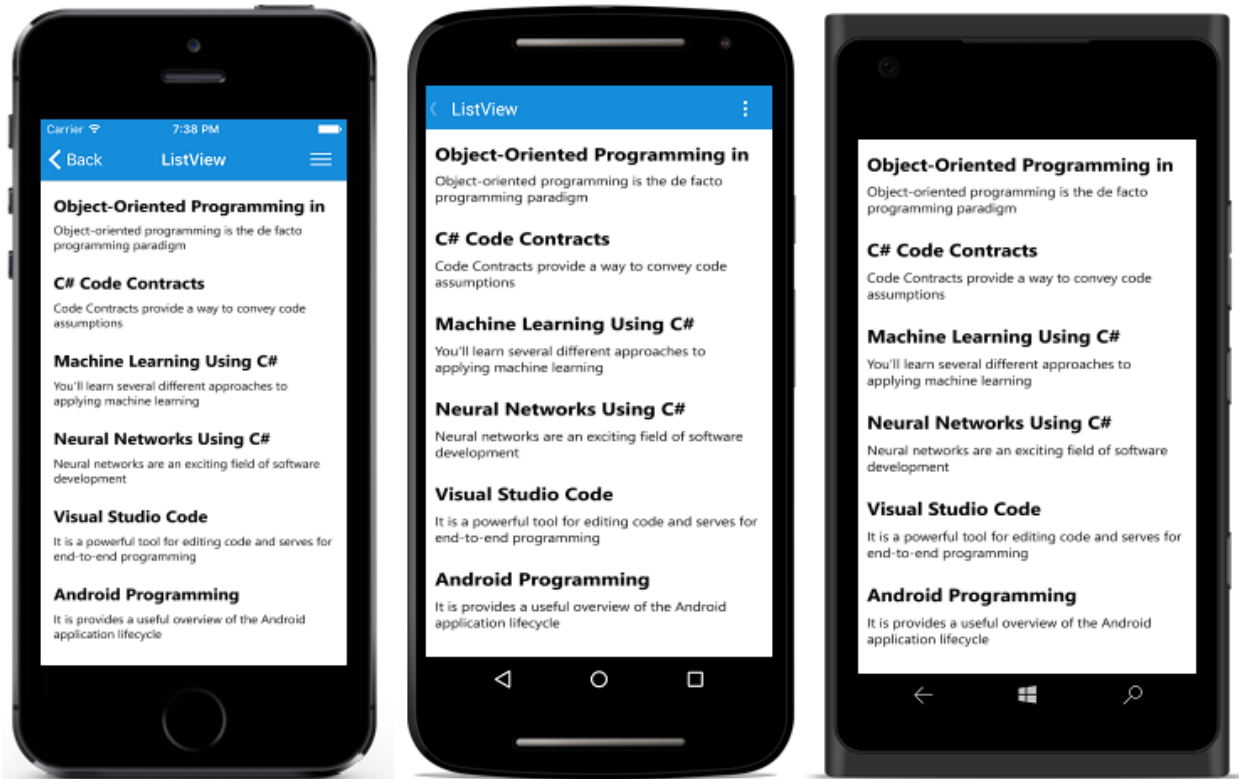

```

MainPage = new ContentPage { Content = listView };
}
}
}

```

Now, run the application to render the below output:

You can also download the entire source code of this demo [here](#).

## Layouts

SfListView supports different layouts such as linear layout and grid layout. The linear layout arranges the items in a single column, whereas the grid layout arranges the items in a predefined number of columns defined by the [SpanCount](#) property of [GridLayout](#).

The [SfListView.LayoutManager](#) property is used to define the layout of the SfListView. [LinearLayout](#) is default layout of this control.

## XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView"
    ItemsSource="{Binding BookInfo}"
    ItemSize="100">
    <syncfusion:SfListView.LayoutManager>
      <syncfusion:GridLayout SpanCount="3" />
    </syncfusion:SfListView.LayoutManager>
  </syncfusion:SfListView>
</ContentPage>

```

## C#

```
listView.LayoutManager = new GridLayout() { SpanCount = 3 };
```

## Sorting

The SfListView allows sorting on its data by using the [SfListView.DataSource.SortDescriptors](#) property. Create [SortDescriptor](#) for the property to be sorted, and add it into the [DataSource.SortDescriptors](#) collection.

Refresh the view by calling [SfListView.RefreshView](#) method.

SortDescriptor object holds the following three properties:

- [PropertyName](#): Describes name of the sorted property.
- [Direction](#): Describes an object of type [ListSortDirection](#) defines the sorting direction.
- [Comparer](#): Describes a comparer to be applied when sorting takes place.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<syncfusion:SfListView x:Name="listView">
<syncfusion:SfListView.DataSource>
<data:DataSource>
<data:DataSource.SortDescriptors>
<data:SortDescriptor PropertyName="BookName" Direction="Ascending"/>
</data:DataSource.SortDescriptors>
</data:DataSource>
</syncfusion:SfListView.DataSource>
</syncfusion:SfListView>
</ContentPage>
```

## C#

```
listView.DataSource.SortDescriptors.Add(new SortDescriptor()
{
    PropertyName = "BookName",
    Direction = ListSortDirection.Ascending,
});
listView.RefreshView();
```

## Filtering

The SfListView supports to filter the records in view by setting predicate to the [SfListView.DataSource.Filter](#) property. Call the [DataSource.RefreshFilter](#) method after assigning the Filter property for refreshing the view.

To filter the items based on the Title property of the underlying data by using `FilterContacts` method, follow the code example:

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition Height="Auto"/>
</Grid.RowDefinitions>
<SearchBar x:Name="filterText" HeightRequest="40"
Placeholder="Search here to filter"
TextChanged="OnFilterTextChanged" Grid.Row="0"/>
<syncfusion:SfListView x:Name="listView" Grid.Row="1" ItemsSource="{Binding
BookInfo}"/>
</Grid>
</ContentPage>
```

### C#

```
var grid = new Grid();
var viewModel = new BookInfoRepository ();
var searchBar = new SearchBar() { Placeholder = "Search here to filter" };
searchBar.TextChanged += OnFilterTextChanged;
listView = new SfListView();
listView.ItemsSource = viewModel.BookInfo;
grid.Children.Add(searchBar);
grid.Children.Add(listView, 0, 1);
...
private void OnFilterTextChanged(object sender, TextChangedEventArgs e)
{
searchBar = (sender as SearchBar);
if (listView.DataSource != null)
{
this.listView.DataSource.Filter = FilterContacts;
this.listView.DataSource.RefreshFilter();
}
}
private bool FilterContacts(object obj)
{
if (searchBar == null || searchBar.Text == null)
return true;
var bookInfo = obj as BookInfo;
if (bookInfo.BookName.ToLower().Contains(searchBar.Text.ToLower())
|| bookInfo.BookDescription.ToLower().Contains(searchBar.Text.ToLower()))
return true;
else
return false;
}
```

## Grouping

The SfListView allows displaying the items in a group using the [SfListView.DataSource.GroupDescriptors](#) property. Create [GroupDescriptor](#) for the property to be grouped, and add it in the [DataSource.GroupDescriptors](#) collection.

[GroupDescriptor](#) object holds the following properties:

- [PropertyName](#): Describes name of the property to be grouped.
- [KeySelector](#): Describes selector to return the group key.
- [Comparer](#): Describes comparer to be applied when sorting takes place.

It also supports to stick the group header by enabling the [SfListView.IsStickyGroupHeader](#) property.

## XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">
  <syncfusion:SfListView x:Name="listView">
    <syncfusion:SfListView.DataSource>
      <data:DataSource>
        <data:DataSource.GroupDescriptors>
          <data:GroupDescriptor PropertyName="BookName"/>
        </data:DataSource.GroupDescriptors>
      </data:DataSource>
    </syncfusion:SfListView.DataSource>
  </syncfusion:SfListView>
</ContentPage>
```

## C#

```
listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()
{
    PropertyName = "BookName",
});
```

## Selection

The SfListView allows selecting the item by setting the [SfListView.SelectionMode](#) property. Set the [SfListView.SelectionMode](#) property to single, multiple, and none based on the requirements. Informations about the selected item can be tracked using the [SfListView.SelectedItem](#) and [SfListView.SelectedItems](#) properties. It also allows changing the selection highlight color by using the [SfListView.SelectionBackgroundColor](#).

The gesture type can be changed to select the item by setting the [SfListView.SelectionGesture](#) property. Set the [SfListView.SelectionGesture](#) property to Tap, DoubleTap, and Hold based on the requirements.

The selection operations can be handled with the help of [SelectionChanging](#) and [SelectionChanged](#) events of the SfListView.

## XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
SelectionMode="Single"
SelectionGesture="Tap"
SelectionBackgroundColor="#E4E4E4"/>
</ContentPage>
```

## C#

```
listView.SelectionMode = SelectionMode.Single;
listView.SelectionGesture = TouchGesture.Tap;
listView.SelectionBackgroundColor = Color.FromHex("#E4E4E4");
```

## Header and Footer

The SfListView allows setting the header and footer to the user interface(UI) view by setting the DataTemplate to the [HeaderTemplate](#) and [FooterTemplate](#).

The header and footer can be handled either by scrollable, or sticky to the view by enabling or disabling the [IsStickyHeader](#) and [IsStickyFooter](#) properties.

## XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding InboxInfo}"
IsStickyHeader="true"
IsStickyFooter="true">
<syncfusion:SfListView.HeaderTemplate>
<DataTemplate>
<Grid BackgroundColor="#4CA1FE" HeightRequest="45">
<Label Text="Inbox" FontAttributes="Bold" FontSize="18" TextColor="White" />
</Grid>
</DataTemplate>
</syncfusion:SfListView.HeaderTemplate>
<syncfusion:SfListView.FooterTemplate>
<DataTemplate>
<Grid BackgroundColor="#DC595F">
<Grid.ColumnDefinitions>
<ColumnDefinition />
<ColumnDefinition />
</Grid.ColumnDefinitions>
<Image Grid.Column="0" Source="Edit.png" />
<Image Grid.Column="1" Source="Delete.png" />
</Grid>
</DataTemplate>
</syncfusion:SfListView.FooterTemplate>
</syncfusion:SfListView>
</ContentPage>
```

## C#

```
ViewModel viewModel = new ViewModel ();
listView.ItemsSource = viewModel.InboxInfo;
listView.IsStickyHeader = true;
listView.IsStickyFooter = true;
listView.HeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    grid.BackgroundColor = Color.FromHex("#4CA1FE");
    var headerLabel = new Label { BackgroundColor = Color.White, FontSize = 18,
    FontAttributes = FontAttributes.Bold };
    headerLabel.Text = "Inbox";
    grid.Children.Add(headerLabel);
    return grid;
});
listView.FooterTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    grid.BackgroundColor = Color.FromHex("#DC595F");
    var editImage = new Image();
    editImage.Source = "Edit.png";
    var deleteImage = new Image();
    deleteImage.Source = "Delete.png";
    grid.Children.Add(editImage);
    grid.Children.Add(deleteImage, 0, 1);
    return grid;
});
```

## Working with SfListView

### Interacting with ListView Items

#### *Loaded event*

The [Loaded](#) event is raised when the SfListView is loading in view for the first time.

#### **C#**

```
listView.Loaded += ListView_Loaded;
private void ListView_Loaded(object sender, ListViewLoadedEventArgs e)
{
    listView.SelectedItems.Add(viewModel.Customers[2]);
}
```

The **Loaded** event used for the following use cases:

- To scroll the desired position or index by using the [ScrollTo](#) or [ScrollToRowIndex](#).
- To collapse all the groups.
- To find the sorted or grouped [DataSource.DisplayItems](#) of underlying bound data to SfListView.

#### *Tapped event*

The [ItemTapped](#) event will be triggered whenever tapping the item. Here, [TapCommandParameter](#) property sets the parameter for [SfListView.TapCommand](#) and its default value is [ItemTappedEventArgs](#). [ItemTappedEventArgs](#) has the following members which provides the information for [ItemTapped](#) event:

- [ItemType](#): It gets the type of the tapped item.
- [ItemData](#): The underlying data associated with the tapped item as its arguments.
- [Position](#): Gets the touch position in the tapped item.

### C#

```
listView.ItemTapped += ListView_ItemTapped;
private void ListView_ItemTapped(object sender,
Syncfusion.ListView.XForms.ItemTappedEventArgs e)
{
    if (e.ItemData == viewModel.InboxInfo[0])
        viewModel.InboxInfo.Remove(e.ItemData as ListViewInboxInfo);
}
```

The [ItemTapped](#) event is used for the following use cases:

- To show the context menu.
- To navigate to another page.
- To delete the item in the list view at runtime.
- To display the item details into another view.
- To expand the view like, accordion.
- To change the underlying bound data.
- To skip other events like selection events if the `Handled` property set to true.

### *ItemDoubleTapped event*

The [ItemDoubleTapped](#) event will be triggered whenever double tapping the item. The [ItemDoubleTappedEventArgs](#) has the following members providing information for the `ItemDoubleTapped` event:

- [ItemType](#): It gets the type of double tapped item.
- [ItemData](#): The underlying data associated with the double tapped item as its arguments.
- [Position](#): Gets the touch position in the double tapped item.

### C#

```
listView.ItemDoubleTapped += ListView_ItemDoubleTapped;
private void ListView_ItemDoubleTapped(object sender,
ItemDoubleTappedEventArgs e)
{
    var listViewInboxInfo = new ListViewInboxInfo();
    listViewInboxInfo.Title = "Bryce Thomas";
    listViewInboxInfo.Subject = "Congratulations on the move!";
    viewModel.InboxInfo.Add(listViewInboxInfo);
}
```

The [ItemDoubleTapped](#) event is used for the following use cases:

- To show the context menu.
- To delete the item in the list view at runtime.
- To change the underlying bound data.

### *ItemHolding event*

The [ItemHolding](#) event will be triggered whenever long pressing the item. Here, [HoldCommandParameter](#) sets the parameter for [SfListView.HoldCommand](#) and its default value is [ItemHoldingEventArgs](#). [ItemHoldingEventArgs](#) has the following members which provides the information for [ItemHolding](#) event:

- [ItemType](#): It gets the type of the long pressed item.
- [ItemData](#): The underlying data associated with the holding item as its arguments.
- [Position](#): Gets the touch position in the holding item.

### **C#**

```
listView.ItemHolding += ListView_ItemHolding;
private void ListView_ItemHolding(object sender, ItemHoldingEventArgs e)
{
    if (e.ItemData == viewModel.InboxInfo[3])
        viewModel.InboxInfo.Remove(e.ItemData as ListViewInboxInfo);
}
```

{% endtabs%}

The [ItemHolding](#) event is used for the following use cases:

- To show the context menu.

### *ItemAppearing*

The [ItemAppearing](#) event is raised when the items are appearing in the view on scrolling, loading, and navigating from one page to another page. The [ItemAppearingEventArgs](#) has the following member which provides the information of appearing Items.

- [ItemData](#): The underlying data associated with the appearing item.

### **C#**

```
listView.ItemAppearing += listView_ItemAppearing;
private void listView_ItemAppearing(object sender,
Syncfusion.ListView.XForms.ItemAppearingEventArgs e)
{
    if (e.ItemData == viewModel.BookInfo[0])
        Debug.WriteLine((e.ItemData as BookInfo).BookName);
    // If the ItemData value is "Header", then it's a header item.
    if (e.ItemData == "Header")
        Debug.WriteLine("Header is Appeared");
}
```

The [ItemAppearing](#) event used for the following use cases:

- To find the item appears in the view.
- To customize the appearing item to change the background color using converter.

### ItemDisappearing

The [ItemDisappearing](#) event is raised when the items disappearing in the view on scrolling, disposing, and navigating from one page to another page. The [ItemDisappearingEventArgs](#) has the following member which provides the information on disappearing Items:

- [ItemData](#): The underlying data associated with the disappearing item.

### C#

```
listView.ItemDisappearing += listView_ItemDisappearing;
private void listView_ItemDisappearing(object sender,
Syncfusion.ListView.XForms.ItemDisappearingEventArgs e)
{
    if (e.ItemData == viewModel.BookInfo[0])
        Debug.WriteLine((e.ItemData as BookInfo).BookName);
    // If the ItemData value is "Footer" then it's a Footer item.
    if (e.ItemData == "Footer")
        Debug.WriteLine("Footer is Disappeared");
}
```

The [ItemDisappearing](#) event used for the following use cases:

- To find the item disappears in the view.

### Improving ListView performance

The SfListView has been built from the ground up with an optimized view reuse strategy for the best possible performance on the Xamarin platform even when loading large data sets. Following techniques are used to improve performance of the SfListView:

- Bind the ItemsSource property to an IList collection instead of an IEnumerable collection because IEnumerable collection do not support random access.
- The SfListView gets refreshed each and every time a new item added into the underlying collection. Because, when adding items at runtime, the DataSource gets refreshed. To avoid this behavior, use [BeginInit\(\)](#) to stop the RefreshView() calling in each time, and use [EndInit\(\)](#) to start the RefreshView() calling when adding number of finished items.
- Avoid loading complex layout in template of listview. For example, loading large-size images or nested containers degrades the scrolling performance. This practice commonly degrades performance in all platforms, and particularly more in Android version API level 19. So, use fewer elements and images with small size and resolution to achieve the maximum performance.
- Avoid placing the SfListView inside ScrollView for the following reasons:
  - The SfListView implement its own scrolling.
  - The SfListView will not receive any gestures as it will be handled by the parent ScrollView.
  - Should define size to the SfListView if it loads inside ScrollView.
  - Avoid changing the cell layout based on the BindingContext. This incurs large layout and initialization costs.
- Implement a model class inherited with [INotifyPropertyChanged](#) interface to notify the property changes at runtime.

### Loading ListView inside ScrollView

When the **SfListView** is loaded inside the **ScrollView** with the height of total items, scrolling will not occur in the SfListView only when [AllowSwiping](#) is set to **true**. The SfListView does not pass touch to the parent ScrollView in UWP, because swiping is handled in it.

When the SfListView is loaded inside the ScrollView the following scenarios, the height of the total items is set to **HeightRequest** of the SfListView.

- If the position of the SfListView is not in view when loading inside the StackLayout with more than one children, the SfListView will not be loaded. Because, the StackLayout passes the height for the **SfListView** as 1.
- When loading the SfListView inside the **Grid** with row definition as **Auto** in UWP, Grid passes the height for the SfListView to be **1**.

When the SfListView is loaded inside the ScrollView with sticky header and sticky group header, it changed to scrollable. The empty space remains after the **SfListView** items, when the device orientation is changed to horizontal. Because, the total extend is set to the ScrollView in horizontal orientation.

### XML

```
<local:ExtScrollView x:Name="scrollView" >
<sync:SfListView x:Name="listView" ItemsSource="{Binding BookInfo}"/>
</local:ExtScrollView>
```

### C#

```
public class ExtScrollView: ScrollView
{
    protected override void LayoutChildren(double x, double y, double width,
    double height)
    {
        this.Content.HeightRequest = height;
        base.LayoutChildren(x, y, width, height);
    }
}
```

Download the entire source code from GitHub [here](#).

### Loading ListView inside CarouselPage/Master detail page

When the SfListView is loaded in CarouselView with [SfListView.AllowSwiping](#) as false, it behaves in UWP platform as follows:

- When performing first swipe on the view, it will be handled by ScrollView to ensure whether scrolling is happened or not. If not means the manipulation to parent cannot be passed immediately due to UWP platform behavior. The second swipe will be listened by CarouselView, and the view gets swiped. This is the behavior of the SfListView.

When the SfListView is loaded in CarouselView with **SfListView.AllowSwiping** as true, it behaves as follows:

- When swiping in iOS, suddenly carousel swipe happened even if gesture is added to the carousel view. To swipe ListViewItem, touch and hold the item for some fraction of seconds (0.25 - 0.5 seconds) and then swipe.
- When swiping any Item, the SfListView handles the touch and swipe the ListViewItem.
- After swiping on ListViewItem, SwipeView will load along with it. If you swipe SwipeView element, Carousel view is swiped. Or else swipe on ListViewItem, control handles touching and swiping the item as usual.
- If you swipe header, footer or group header elements, Carousel view will swipe in Android platform. But in UWP, first swipe on those elements will be handled by SfListView itself, because manipulation to parent cannot be passed immediately. The second swipe will be listened by CarouselView.

### Context menu on items

The SfListView allows displaying a pop-up menu with different menu items to an item when it is long pressed by customizing the SfListView and by using custom view in it. For UWP platform, you can also display the pop-up menu when pressing right click button over the item. Display the pop-up menu by accessed the touch position in the item based on [Position](#) property from [ItemHolding](#) event.

### Defining SfPopUpView

#### C#

```
namespace SfListViewSample
{
    public class Behavior : Behavior<SfListView>
    {
        SfListView ListView;
        int sortOrder = 0;
        Contacts item;
        SfPopupLayout popupLayout;
        protected override void OnAttachedTo(SfListView listView)
        {
            ListView = listView;
            ListView.ItemHolding += ListView_ItemHolding;
            ListView.ScrollStateChanged += ListView_ScrollStateChanged;
            ListView.ItemTapped += ListView_ItemTapped;
            base.OnAttachedTo(listView);
        }
        private void ListView_ItemTapped(object sender,
            Syncfusion.ListView.XForms.ItemTappedEventArgs e)
        {
            popupLayout.Dismiss();
        }
        private void ListView_ScrollStateChanged(object sender,
            ScrollStateChangedEventArgs e)
        {
            popupLayout.Dismiss();
        }
        private void ListView_ItemHolding(object sender, ItemHoldingEventArgs e)
        {
            item = e.ItemData as Contacts;
            popupLayout = new SfPopupLayout();
            popupLayout.PopupView.HeightRequest = 100;
            popupLayout.PopupView.WidthRequest = 100;
        }
    }
}
```

```

popupLayout.PopupView.ContentTemplate = new DataTemplate(() =>
{
    var mainStack = new StackLayout();
    mainStack.BackgroundColor = Color.Teal;
    var deletedButton = new Button()
    {
        Text = "Delete",
        HeightRequest=50,
        BackgroundColor=Color.Teal,
        TextColor = Color.White
    };
    deletedButton.Clicked += DeletedButton_Clicked;
    var sortButton = new Button()
    {
        Text = "Sort",
        HeightRequest = 50,
        BackgroundColor = Color.Teal,
        TextColor=Color.White
    };
    sortButton.Clicked += SortButton_Clicked;
    mainStack.Children.Add(deletedButton);
    mainStack.Children.Add(sortButton);
    return mainStack;
});
popupLayout.PopupView.ShowHeader = false;
popupLayout.PopupView.ShowFooter = false;
if (e.Position.Y + 100 <= ListView.Height && e.Position.X + 100 >
    ListView.Width)
    popupLayout.Show((double)(e.Position.X - 100), (double)(e.Position.Y));
else if (e.Position.Y + 100 > ListView.Height && e.Position.X + 100 <
    ListView.Width)
    popupLayout.Show((double)e.Position.X, (double)(e.Position.Y - 100));
else if (e.Position.Y + 100 > ListView.Height && e.Position.X + 100 >
    ListView.Width)
    popupLayout.Show((double)(e.Position.X - 100), (double)(e.Position.Y -
    100));
else
    popupLayout.Show((double)e.Position.X, (double)(e.Position.Y));
}
private void SortButton_Clicked(object sender, EventArgs e)
{
    if (ListView == null)
        return;
    ListView.DataSource.SortDescriptors.Clear();
    popupLayout.Dismiss();
    ListView.DataSource.LiveDataUpdateMode =
    LiveDataUpdateMode.AllowDataShaping;
    if (sortOrder == 0)
    {
        ListView.DataSource.SortDescriptors.Add(new SortDescriptor { PropertyName =
        "ContactName", Direction = ListSortDirection.Descending });
        sortOrder = 1;
    }
    else
    {
        ListView.DataSource.SortDescriptors.Add(new SortDescriptor { PropertyName =
        "ContactName", Direction = ListSortDirection.Ascending });
    }
}

```

```

sortOrder = 0;
}
}
private void Dismiss()
{
popupLayout.IsVisible = false;
}
private void DeletedButton_Clicked(object sender, EventArgs e)
{
if (ListView == null)
return;
var source = ListView.ItemsSource as IList;
if (source != null && source.Contains(item))
source.Remove(item);
else
App.Current.MainPage.DisplayAlert("Alert", "Unable to delete the item",
"OK");
item = null;
source = null;
}
}
}

```

## Defining the SfListView

### XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:ContactsViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<ContentPage.Content>
<Grid>
<listView:SfListView x:Name="listView" ItemsSource="{Binding Items}" >
<listView:SfListView.ItemTemplate>
<DataTemplate>
<Grid>
<Image Source="{Binding ContactImage}"/>
<Label Text="{Binding ContactName}" />
<Label Text="{Binding ContactNumber}" />
</Grid>
</DataTemplate>
</listView:SfListView.ItemTemplate>
<listView:SfListView>
</Grid>
</ContentPage.Content>
</ContentPage>

```

You can download the entire source code of this demo [here](#).

## Paging

The SfListView allows displaying paging using the [SfDataPager](#) control. It can be performed through loading data dynamically into ItemsSource of the SfListView using OnDemandLoading event for the current page by setting the [SfDataPager.UseOnDemandPaging](#) to 'True'. By using the [SfDataPager.PageSize](#) property, you can define the number of list items to be displayed in each page.

**Note:** For more details about paging refer to [here](#).

## XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:sfPager="clr-
namespace:Syncfusion.SfDataGrid.XForms.DataPager;assembly=Syncfusion.SfDataG
rid.XForms">
<ContentPage.Behaviors>
<local:SfListViewPagingBehavior/>
</ContentPage.Behaviors>

= "PreviousNextNumeric" NumericButtonCount = "4" PageSize = "6">
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

## C#

```
using Syncfusion.ListView.XForms;
using Syncfusion.SfDataGrid.XForms.DataPager;
namespace Paging
{
    public class Paging : ContentPage
    {
        SfDataPager sfPager = new SfDataPager();
        SfListView listView = new SfListView();
        public Paging()
        {
        }
    }
}
```

```

{
    var stackLayout = new StackLayout();
    sfPager.DisplayMode = PagerDisplayMode.PreviousNextNumeric;
    sfPager.UseOnDemandPaging = true;
    sfPager.NumericButtonCount = 4;
    sfPager.PageSize = 6;
    listView = new SfListView();
    listView.LayoutManager = new GridLayout() { SpanCount = 2 };
    listView.ItemTemplate = new DataTemplate(() =>
    {
        var grid = new Grid();
        var image = new Image();
        image.SetBinding(Image.SourceProperty, new Binding("Image"));
        var label = new Label();
        label.SetBinding(Label.TextProperty, new Binding("Name"));
        var label1 = new Label();
        label1.SetBinding(Label.TextProperty, new Binding("Weight"));
        grid.Children.Add(image);
        grid.Children.Add(label);
        grid.Children.Add(label1);
        return grid;
    });
    stackLayout.Children.Add(listView);
    stackLayout.Children.Add(sfPager);
}
}
}

```

## C#

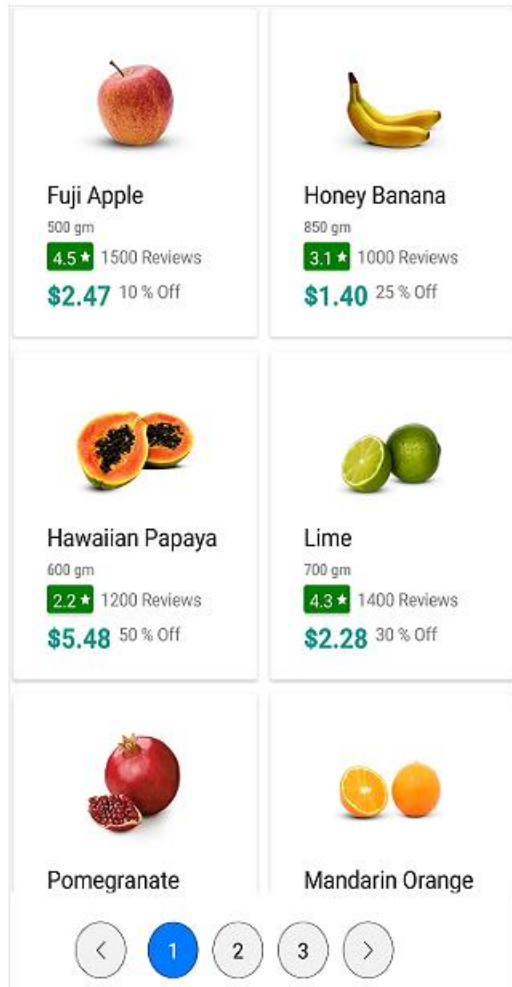

```

public class SfListViewPagingBehavior : Behavior<ContentPage>
{
    private Syncfusion.ListView.XForms.SfListView listView;
    private PagingViewModel PagingViewModel;
    private SfDataPager dataPager;
    protected override void OnAttachedTo(ContentPage bindable)
    {
        listView =
        bindable.FindByName<Syncfusion.ListView.XForms.SfListView>("listView");
        dataPager = bindable.FindByName<SfDataPager>("dataPager");
        PagingViewModel = new PagingViewModel();
        listView.BindingContext = PagingViewModel;
        dataPager.Source = PagingViewModel.pagingProducts;
        dataPager.OnDemandLoading += DataPager_OnDemandLoading;
        base.OnAttachedTo(bindable);
    }
    private void DataPager_OnDemandLoading(object sender,
    OnDemandLoadingEventArgs e)
    {
        var source =
        PagingViewModel.pagingProducts.Skip(e.StartIndex).Take(e.PageSize);
        listView.ItemsSource = source.AsEnumerable();
    }
    protected override void OnDetachingFrom(ContentPage bindable)
    {
        listView = null;
    }
}

```

```
PagingViewModel = null;  
dataPager = null;  
base.OnDetachingFrom(bindable);  
}  
}
```

Download the entire source code form GitHub [here](#).

#### Loading data from SQLite online database

The SfListView allows binding the data from online database with the help of **Azure App Service**. To perform this, follow the steps:

Step 1: Get URL to store the data online.

Step 2: Create table using **AppServiceHelpers**.

Step 3: Populate the data into the table using the ObservableCollection **Items**.

Step 4: Bind it to SfListView using [SfListView.ItemsSource](#) property.

Step 5: Refer to the following link to know more about working with **Azure App Service**.

<https://blog.xamarin.com/add-a-backend-to-your-app-in-10-minutes/>

---

**Note:** Install the following NuGet packages to successfully run the application:

---

- Microsoft.Azure.Mobile.Client(v.2.1.1)
- Microsoft.Azure.Mobile.Client.SQLiteStore(v.2.1.1)
- AppService.Helpers (Does not support UWP platform)
- AppService.Helpers.Forms (Does not support UWP platform)

Refer to the following code which illustrates, how to initialize the library with the URL of the Azure Mobile App and registering the Model with the client to create a table.

#### **C#**

```
public App()
{
    InitializeComponent();
    IEasyMobileServiceClient client = new EasyMobileServiceClient();
    client.Initialize("http://xamarin-todo-sample.azurewebsites.net");
    client.RegisterTable<ToDo>();
    client.FinalizeSchema();
    MainPage = new NavigationPage(new Pages.ToDoListPage(client));
}
```

Refer to the following code which illustrates, how to create a table using AppServiceHelpers and insert items in it.

#### **C#**

```
using AppServiceHelpers.Abstractions;
using AppServiceHelpers.Models;
public class BaseAzureViewModel<T> : INotifyPropertyChanged where T :
    EntityData
{
    IEasyMobileServiceClient client;
    ITableDataStore<T> table;
    public BaseAzureViewModel(IEasyMobileServiceClient client)
    {
        this.client = client;
        table = client.Table<T>();
    }
    // Returns an ObservableCollection of all the items in the table
    ObservableCollection<T> items = new ObservableCollection<T>();
    public ObservableCollection<T> Items
    {
        get { return items; }
        set
        {
            items = value;
            OnPropertyChanged("items");
        }
    }
    // Adds an item to the table.
    public async Task AddItemAsync(T item)
    {
        await table.AddAsync(item);
    }
}
```

```

// Deletes an item from the table.
public async Task DeleteItemAsync(T item)
{
    await table.DeleteAsync(item);
}
// Updates an item in the table.
public async Task UpdateItemAsync(T item)
{
    await table.UpdateAsync(item);
}
// Refresh the table and synchronize data with Azure.
Command refreshCommand;
public Command RefreshCommand
{
    get { return refreshCommand ?? (refreshCommand = new Command(async () =>
        await ExecuteRefreshCommand())); }
}
async Task ExecuteRefreshCommand()
{
    if (IsBusy)
        return;
    IsBusy = true;
    try
    {
        var _items = await table.GetItemsAsync();
        Items.Clear();
        foreach (var item in _items)
        {
            Items.Add(item);
        }
        IsBusy = false;
    }
    catch (Exception ex)
    {
        await Application.Current.MainPage.DisplayAlert("Error", ex.Message, "OK");
    }
}
public event PropertyChangedEventHandler PropertyChanged;
public void OnPropertyChanged(string propertyName)
{
    if (PropertyChanged == null)
        return;
    PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
}
}

```

Refer to the following code which illustrates, how to bind the table contents into the SfListView.

#### C#

```

public partial class ToDoListPage : ContentPage
{
    public ToDoListPage(IEasyMobileServiceClient client)
    {
        InitializeComponent();
        var viewModel = new ViewModels.ToDosViewModel(client);
    }
}

```

```

BindingContext = viewModel;
listView.ItemsSource = viewModel.Items;
}
private void FetchButton_Clicked(object sender, EventArgs e)
{
    var viewModel1 = (TodosViewModel)BindingContext;
    viewModel1.RefreshCommand.Execute(null);
}
}

```

## XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.Content>
<StackLayout>
<syncfusion:SfListView x:Name="listView" SelectedItem="{Binding
SelectedToDoItem, Mode=TwoWay}" ItemSize="50">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<StackLayout Orientation="Horizontal" HorizontalOptions="FillAndExpand"
VerticalOptions="CenterAndExpand">
<Label Text="{Binding Text}" />
<Switch IsToggled="{Binding Completed}" />
</StackLayout>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
<Button Text="Add New" Command="{Binding AddNewItemCommand}" />
<Button Text="Fetch" Command="{Binding FetchItemCommand}" />
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

Download the entire source code from GitHub [here](#).

### Loading data from SQLite offline database

The SfListView allows binding the data from local database by using SQLite. To perform this, follow the steps: SQLiteConnection

Step 1: Create a **SQLite database table**

Step 2: Populate the data into the table

Step 3: Store them as an **IEnumerable** collection

Step 4: Bind it to SfListView using [SfListView.ItemsSource](#) property.

Step 5: Refer to the following link to know how to create SQLite connection,

<http://developer.xamarin.com/guides/xamarin-forms/working-with/databases/>

**Note:** To run this sample in UWP, install [SQLite.Net.Pcl](#), version v1.0.10 (Only this version of SQLite supports UWP platform, later versions don't support UWP).

**C#**

```
using SQLite;
public class OrderItem
{
    public int ID { get; set; }
    public string Name { get; set; }
}
```

**C#**

```
using SQLite;
public class ViewModel
{
    SQLiteConnection database;
    IEnumerable<OrderItem> orderItemCollection;
    public IEnumerable<OrderItem> OrderItemCollection
    {
        get
        {
            if (orderItemCollection == null)
                orderItemCollection = GetItems();
            return orderItemCollection;
        }
    }
    public ViewModel()
    {
        database = DependencyService.Get<ISQLite>().GetConnection();
        // Create the table
        database.CreateTable<OrderItem>();
        // Insert items into table
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1001,'Antony')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1002,'Blake')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1003,'Catherine')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1004,'Jude')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1005,'Mark')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1006,'Anderson')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1007,'Wilson')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1008,'Jade')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1009,'Zachery')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1010,'Dhotis')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1011,'Trunks')");
        database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name) values (1012,'Kevin')");
    }
}
```

```

database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name)values
(1013,'Mathew')");
database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name)values
(1014,'Watson')");
database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name)values
(1015,'Chris')");
database.Query<OrderItem>("INSERT INTO OrderItem (ID,Name)values
(1016,'Phantom')");
}
public IEnumerable<OrderItem> GetItems()
{
    // Changing the database table items as ObservableCollection
    var table = (from i in database.Table<OrderItem>() select i);
    ObservableCollection<OrderItem> OrderList = new
    ObservableCollection<OrderItem>();
    foreach (var order in table)
    {
        OrderList.Add(new OrderItem()
        {
            ID = order.ID,
            Name = order.Name
        });
    }
    return OrderList;
}
}

```

Refer to the following code which illustrates, how to bind the data from the SQLite database to SfListView.

### XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:ViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<Grid>
<listView:SfListView x:Name="listView" ItemSize="70"
BackgroundColor="Teal"
ItemsSource="{Binding OrderItemCollection}">
<listView:SfListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="*" />
<RowDefinition Height="1" />
</Grid.RowDefinitions>
<Grid>
<Grid.ColumnDefinitions>
<ColumnDefinition Width="*" />
<ColumnDefinition Width="*" />
</Grid.ColumnDefinitions>

```

```

<Label LineBreakMode="NoWrap" Text="{Binding ID}" VerticalOptions="Center"/>
<Label LineBreakMode="NoWrap" Text="{Binding Name}" Grid.Column="1"
VerticalOptions="Center" />
</Grid>
<StackLayout Grid.Row="1" BackgroundColor="Gray" HeightRequest="1"/>
</Grid>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</listView:SfListView.ItemTemplate>
</listView:SfListView>
</Grid>
</ContentPage.Content>
</ContentPage>

```

Download the entire source code from GitHub [here](#).

### ListView with Prism Framework

The SfListView allows the user to work with prism for MVVM Framework. Steps to be followed:

1. Replace your application to prism application in App.xaml file.
2. Inherit App.xaml.cs from prism application instead of your application.
3. Create a prism namespace library reference in xaml file of the ContentPage.
4. Connect view and view model instead of binding context by registering them.

### C#

```

public partial class App : PrismApplication
{
    public App(IPlatformInitializer initializer = null) : base(initializer) { }
    protected override void OnInitialized()
    {
        InitializeComponent();
    }
    protected override void RegisterTypes()
    {
        Container.RegisterTypeForNavigation<MainPage, MainPageViewModel>();
    }
}

```

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<prism:PrismApplication xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:prism="clr-namespace:Prism.Unity;assembly=Prism.Unity.Forms"
x:Class="ListViewPrism.App">
</prism:PrismApplication>

```

### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:prism="clr-namespace:Prism.Mvvm;assembly=Prism.Forms"

```

```
xmlns:local="clr-namespace:ListViewPrism;assembly=ListViewPrism"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
x:Class="ListViewPrism.Views.MainPage"
Title="MainPage">
<StackLayout HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
<syncfusion:SfListView x:Name="listView" ItemSize="70" ItemSpacing="0,0,5,0"
AutoFitMode="Height"
ItemsSource="{Binding ContactsInfo,}" IsStickyHeader="True"
AllowSwiping="True" IsStickyGroupHeader="True" GroupHeaderSize="50">
</syncfusion:SfListView>
</StackLayout>
</ContentPage>
```

For more details, refer to <https://xamgirl.com/prism-in-xamarin-forms-step-by-step-part-1>.

Download the entire source code from GitHub [here](#).

### Scrolling ListView without virtualization

ListView allows you to scroll by loading the entire collection of items inside the ScrollView and defining the total extend of its container to `HeightRequest` in the `Loaded` event.

#### XML

```
<ScrollView>
<sync:SfListView x:Name="listView" ItemsSource="{Binding BookInfo}"
Loaded="listView_Loaded"/>
</ScrollView>
```

#### C#

```
using Syncfusion.ListView.XForms.Control.Helpers;
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
    private void listView_Loaded(object sender, ListViewLoadedEventArgs e)
    {
        var container = listView.GetVisualContainer();
        var extent =
            (double)container.GetType().GetRuntimeProperties().FirstOrDefault(x =>
            x.Name == "TotalExtent").GetValue(container);
        listView.HeightRequest = extent;
    }
}
```

Download the entire source code from GitHub [here](#).

When ListView is in `AutoFitMode` as 'Height', the extend of the ListView will be updated only while scrolling. So you can resize the ListView in `VisualContainer` `PropertyChanged` method as like below.

#### XML

```
<ScrollView>
<sync:SfListView x:Name="listView" AutoFitMode="Height"
ItemsSource="{Binding BookInfo}" Loaded="listView_Loaded"/>
</ScrollView>
```

## C#

```
using Syncfusion.ListView.XForms.Control.Helpers;
public partial class MainPage : ContentPage
{
    VisualContainer visualContainer;
    bool loaded;
    public MainPage()
    {
        InitializeComponent();
        visualContainer = listView.GetVisualContainer();
        visualContainer.PropertyChanged += VisualContainer_PropertyChanged;
    }
    private void VisualContainer_PropertyChanged(object sender,
        System.ComponentModel.PropertyChangedEventArgs e)
    {
        if (e.PropertyName == "Height" && listView.HeightRequest !=
            visualContainer.Height && loaded)
        {
            listView.HeightRequest = visualContainer.Height;
        }
    }
    private void listView_Loaded(object sender, ListViewLoadedEventArgs e)
    {
        var extent =
            (double)visualContainer.GetType().GetRuntimeProperties().FirstOrDefault(x =>
                x.Name == "TotalExtent").GetValue(visualContainer);
        listView.HeightRequest = extent;
        loaded = true;
    }
}
```

You can download the entire source code of this demo [here](#).

**Note:** While loading in `AutoFitMode` make sure that the `ItemSize` property value is not specified, to avoid extra space below the list. Update the size of the container after ListView loaded to render all the list items in the view.

The following limitations should be noted when using the previous approaches:

- As the entire list items are loaded inside the parent `ScrollView` element, the `ItemAppearing` and `ItemDisappearing` events will not be fired when scrolling.
- When performing keyboard navigation, the view cannot be scrolled automatically while navigating out of view.
- Scrolling through the touch action will be handled in all platforms and ListView scrolling will be handled by the parent ScrollView.

### Working with nested ListView

ListView allows you to load another ListView inside its [ItemTemplate](#). When the [AutoFitMode](#) of the outer ListView is height, the size of the inner ListView will be allocated from the maximum screen size. Since the exact size for the inner list cannot not be obtained before loading the view.

To get a fixed height for the inner ListView, define a value in its [HeightRequest](#). If the items inside the inner ListView are less, allocate the total extend of the inner list to its [HeightRequest](#).

Follow the steps to set the size for the outer ListView based on the extend of inner ListView:

1. Define a property in the Model class and bind it to the [HeightRequest](#) of inner ListView, as the height for various inner ListView has to be identified while scrolling.
2. Hook the container's [PropertyChanged](#) event. When the height of the container changes, set the value of [TotalExtent](#) to the property bound to the [HeightRequest](#).
3. Call the [RefreshView](#) method asynchronously with few seconds delay in the [Loaded](#) event of the outer SfListView. The height requested for each inner SfListView will be set but the outer SfListView will not get any notification regarding the size change. So, call the [RefreshView](#) method asynchronously after loading the view.

### XML

```
<listView:SfListView x:Name="listView" ItemsSource="{Binding ContactInfo}"
AutoFitMode="Height" Loaded="listView_Loaded"
AllowGroupExpandCollapse="True">
<listView:SfListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<Grid>
<local:ExtendedListView x:Name="list1" HeightRequest="{Binding
InnerListHeight}" ItemsSource="{Binding ContactDetails}" ItemSize="75">
<local:ExtendedListView.ItemTemplate>
<DataTemplate>
<StackLayout>
<Image Source="{Binding Image}" />
<Label Text="{Binding Name}" />
<Label Text="{Binding Number}" />
</StackLayout>
</DataTemplate>
</local:ExtendedListView.ItemTemplate>
</local:ExtendedListView>
</Grid>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</listView:SfListView.ItemTemplate>
</listView:SfListView>
```

### C#

```
public partial class NestedListView : ContentPage
{
public NestedListView ()
```

```
{
InitializeComponent();
}
private async void listView_Loaded(object sender,
Syncfusion.ListView.XForms.ListViewLoadedEventArgs e)
{
await Task.Delay(2000);
listView.RefreshView();
}
}
```

## C#

```
using Syncfusion.ListView.XForms.Control.Helpers;
public class ExtendedListView : SfListView
{
VisualContainer container;
public ExtendedListView()
{
container = this.GetVisualContainer();
container.PropertyChanged += Container_PropertyChanged;
}
private void Container_PropertyChanged(object sender,
System.ComponentModel.PropertyChangedEventArgs e)
{
Device.BeginInvokeOnMainThread(async () =>
{
var extent =
(double)container.GetType().GetRuntimeProperties().FirstOrDefault(container
=> container.Name == "TotalExtent").GetValue(container);
if (e.PropertyName == "Height")
(this.BindingContext as ContactInfo_NestedListView).InnerListHeight =
extent;
});
}
}
```

Download the entire source code from GitHub [here](#).

### Rendering ListView when loading in different layouts

The options are as follows:

- Creates the measurement and layout similar to Xamarin.Forms ListView, when the ListView is loaded inside the layouts such as StackLayout, ScrollView, and Grid, in which the RowDefinition or ColumnDefinition is set to 'Auto'. In all other layouts, the ListView size will be allocated from the framework.
- Sets the value of total extend to the HeightRequest of ListView, since the scrolling will be handled by the parent ScrollView, when ListView is loaded inside the StackLayout with base parent as ScrollView having multiple elements inside the StackLayout.

### How to

#### *Swipe and move an item to another listview on swipe item tapped action*

By using swipe view action, you can move an item from one listview to another listview.

**C#**

```
private void FavoriteTapped(object obj)
{
    var departureInfo = obj as DepartureInfo;
    var pinnedInfo = FirstLVCollection.Any(o => o.Name == departureInfo.Name) ?
    FirstLVCollection.First(o => o.Name == departureInfo.Name) : null;
    if (pinnedInfo == null)
    {
        FirstLVCollection.Add(new PinnedInfo() { Name = departureInfo.Name,
        RouteName = departureInfo.Name, Icon = departureInfo.Icon, IsFavorite = true
    });
    }
}
```

*Filter listview items based on another listview selection*

To filter the listview items based on the item selection in another listview, use the SfListView.DataSource.Filter property.

**C#**

```
private void ItemTapped(Syncfusion.ListView.XForms.ItemTappedEventArgs e)
{
    tappedPinnedInfo = e.ItemData as PinnedInfo;
    if (tappedPinnedInfo.IsFavorite)
    {
        secondLV.DataSource.Filter = FilterDepartures;
        tappedPinnedInfo.IsFavorite = false;
    }
    else
    {
        secondLV.DataSource.Filter = null;
        tappedPinnedInfo.IsFavorite = true;
    }
    secondLV.DataSource.RefreshFilter();
}

private bool FilterDepartures(object obj)
{
    var departureInfo = obj as DepartureInfo;
    if (tappedPinnedInfo == null)
        return true;
    if (departureInfo.Name.ToLower().Contains(tappedPinnedInfo.Name.ToLower())
    ||
    departureInfo.RouteName.ToLower().Contains(tappedPinnedInfo.RouteName.ToLower()
    ()))
        return true;
    else
        return false;
}
```

Download the entire source code from GitHub [here](#).

*Dispose listview*

You can dispose and release resources used by ListView by calling the [ListView.Dispose](#) method.

**C#**

```
protected override void OnDisappearing()  
{  
    listview.Dispose();  
    base.OnDisappearing();  
}
```

## View Appearance

The SfListView allows customizing appearance of the underlying data, and provides different functionalities to the end-user.

### Item template

A template can be used to present the data in a way that makes sense for the application by using different controls. SfListView allows customizing appearance of view by setting the [ItemTemplate](#) property.

### Data template selector

The SfListView allows customizing appearance of each item with different templates based on specific constraints by using the [DataTemplateSelector](#). You can choose a [DataTemplate](#) for each item at runtime based on the value of data-bound property using [DataTemplateSelector](#).

Here, an [ItemsCacheLimit](#) property maintains number of items reusing in the view. This cache limit is used to create and reuse the [ListViewItem](#) if different templates are used in [DataTemplateSelector](#) for better scrolling performance. Based on this value, [SfListView](#) creates number of [ListViewItem](#) for different templates in the view if new template is created while scrolling, and reuses it if same template is used for improving the scrolling performance.

### Create a data template selector

Create custom class that inherits from [DataTemplateSelector](#), and override the [OnSelectTemplate](#) method to return the [DataTemplate](#) for that item. At runtime, the SfListView invokes the [OnSelectTemplate](#) method for each item and passes the data object as parameter.

### C#

```
class MyDataTemplateSelector : Xamarin.Forms.DataTemplateSelector  
{  
    private readonly DataTemplate incomingDataTemplate;  
    private readonly DataTemplate outgoingDataTemplate;  
    public MyDataTemplateSelector()  
    {  
        this.incomingDataTemplate = new DataTemplate(typeof(IncomingViewCell));  
        this.outgoingDataTemplate = new DataTemplate(typeof(OutgoingViewCell));  
    }  
    protected override DataTemplate OnSelectTemplate(object item, BindableObject container)  
    {  
        var message = item as Message;  
        if (message == null)  
            return null;  
        return message.IsIncoming ? this.incomingDataTemplate :  
            this.outgoingDataTemplate;  
    }  
}
```

*Applying the data template selector*

Assign custom `DataTemplateSelector` to the [ItemTemplate](#) of the SfListView either in XAML or C#.

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="DataTemplateSelector.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:local="clr-
namespace:DataTemplateSelector;assembly=DataTemplateSelector">
<ContentPage.Resources>
<ResourceDictionary>
<local:MyDataTemplateSelector x:Key="MessageTemplateSelector" />
</ResourceDictionary>
</ContentPage.Resources>
<Grid>
<syncfusion:SfListView x:Name="ListView"
ItemTemplate="{StaticResource MessageTemplateSelector}"
ItemsSource="{Binding Messages}"
ItemSize="100">
</syncfusion:SfListView>
</Grid>
</ContentPage>
```

**C#**

```
public class MainPageCs : ContentPage
{
    public MainPageCs()
    {
        var viewModel = new MainPageViewModel();
        BindingContext = viewModel;
        Content = new SfListView()
        {
            ItemSize = 100,
            ItemsSource = viewModel.Messages,
            ItemTemplate = new MyDataTemplateSelector()
        };
    }
}
```

You can also download the entire source code of this demo [here](#).

Hi Jack. What are you doing?

04/12/2018 04:22 PM

Hi Mary. I'm filling out a job application.

04/12/2018 04:23 PM

Are you finished with school already?

04/12/2018 04:24 PM

No. I have one more semester, but it would be great to have a job lined up.

04/12/2018 04:25 PM

How is your day going?

04/12/2018 04:26 PM

Quite busy. I'm preparing for my exam tomorrow.

04/12/2018 04:27 PM

Good luck !.. for your exam.

04/12/2018 04:28 PM

Thank you buddy...Have a nice day

### Horizontal ListView

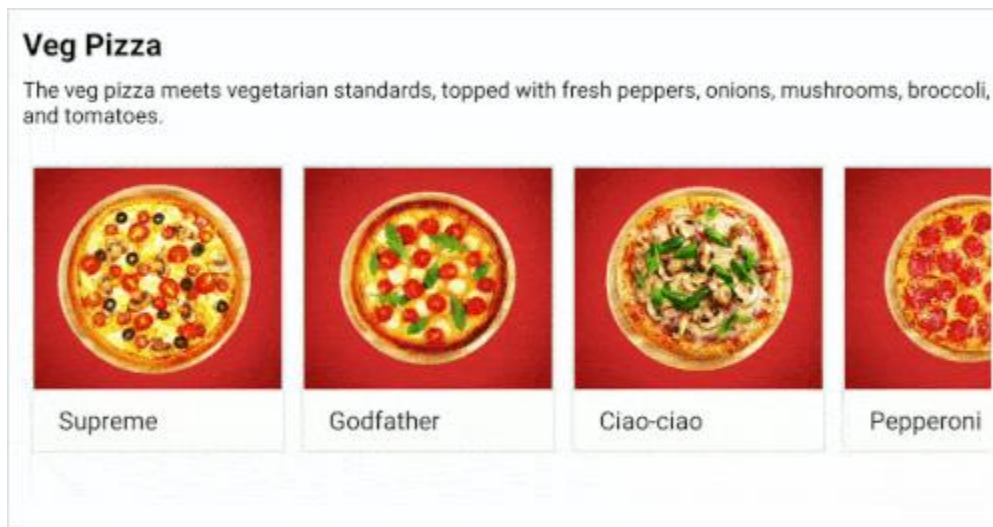

The SfListView allows you to layout every item in the [SfListView.ItemsSource](#) property either in vertical or horizontal orientation by setting the [SfListView.Orientation](#). The default orientation is **Vertical**.

#### XML

```
<syncfusion:SfListView x:Name="listView" Orientation="Horizontal" />
```

#### C#

```
listView.Orientation = Orientation.Horizontal;
```

### Navigate across views (like TabView)

The SfListView allows you to layout the items like **TabView** in the horizontal direction by setting the [Orientation](#) property as **Horizontal** using the [ItemTapped](#) event. It brings any desired view above the horizontal list as follows.

#### XML

```
<ContentPage xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <ContentPage.Content>
    <Grid x:Name="GridView">
      <Label Text="Tap image to expand"/>
      <Grid>
        <Image Source="{Binding ContactImage}" />
        <Label Text="{Binding ContactName}" />
        <Label Text="{Binding ContactNumber}" />
      </Grid>
      <syncfusion:SfListView x:Name="listView" ItemTapped="list_ItemTapped"
        ItemSize="70" ItemsSource="{Binding ContactsInfo}">
        <syncfusion:SfListView.ItemTemplate>
          <DataTemplate x:Name="ItemTemplate" x:Key="ItemTemplate">
            <ViewCell>
              <ViewCell.View>
                <Image Source="{Binding ContactImage}" />
              </ViewCell.View>
            </DataTemplate>
          </syncfusion:SfListView.ItemTemplate>
        </syncfusion:SfListView>
      </Grid>
    </ContentPage.Content>
  </ContentPage>
```

```

</ViewCell>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</Grid>
</ContentPage.Content>
</ContentPage>

```

## C#

```

public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        list.BindingContext = new ContactsViewModel();
        var grid = new Grid();
        var label = new Label();
        label.Text = "Tap image to expand";
        var grid1 = new Grid();
        var image = new Image();
        image.SetBinding(Image.SourceProperty, new Binding("ContactImage"));
        var label1 = new Label();
        label.SetBinding(Label.TextProperty, new Binding("ContactName"));
        var label2 = new Label();
        label1.SetBinding(Label.TextProperty, new Binding("ContactNumber"));
        grid1.Children.Add(image);
        grid1.Children.Add(label1);
        grid1.Children.Add(label2);
        var listView = new SfListView();
        ContactsViewModel contactsViewModel = new ContactsViewModel();
        listView.ItemsSource = contactsViewModel.ContactsInfo;
        listView.ItemSize = 70;
        listView.ItemTapped += ListView_ItemTapped;
        listView.ItemTemplate = new DataTemplate(() =>
        {
            var viewCell = new ViewCell();
            var image1 = new Image();
            image1.SetBinding(Image.SourceProperty, new Binding("ContactImage"));
            viewCell.View = image1;
            return viewCell;
        });
        grid.Children.Add(label);
        grid.Children.Add(grid1);
        grid.Children.Add(listView);
    }
    private void list_ItemTapped(object sender,
        Syncfusion.ListView.XForms.ItemTappedEventArgs e)
    {
        GridView.BindingContext = e.ItemData;
    }
}

```

Download the entire source code from GitHub [here](#).

### Horizontal list inside vertical list

The SfListView allows you to layout the items in horizontal list inside the vertical list. You can load the nested SfListView by customizing the [ItemTemplate](#) of outer SfListView.

You should define the size for each inner SfListView or set the [AutoFitMode](#) of inner SfListView as **Height**, and define the [ItemSize](#) for outer SfListView.

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:ListViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<Grid>
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding OuterList}"
ItemSize="100">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Grid>
<Label Text="{Binding Label}" />
<syncfusion:SfListView ItemsSource="{Binding InnerList}" ItemSize="100"
Orientation="Horizontal">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Grid>
<Image Source="{Binding Image}"/>
</Grid>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</Grid>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</Grid>
</ContentPage>
```

#### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        var grid = new Grid();
        var label1 = new Label();
        label.SetBinding(Label.TextProperty, new Binding("Label"));
        var listView = new SfListView();
        listView.ItemsSource = OuterList;
        listView.ItemSize = 100;
        listView.ItemTemplate = new DataTemplate(() =>
        {
            var InnerListView = new SfListView();
            InnerListView.ItemSize = 100;
            InnerListView.ItemsSource = InnerList;
        });
    }
}
```

```
InnerListView.Orientation = Orientation.Horizontal;
listView.ItemTemplate = new DataTemplate(() =>
{
    var grid1 = new Grid();
    var image = new Image();
    image.SetBinding(Image.SourceProperty, new Binding("Image"));
    grid1.Children.Add(image);
}
return InnerListView;
});
grid.Children.Add(label1);
grid.Children.Add(listView);
}
```

### Item size

The SfListView allows customizing the size of items by setting the [ItemSize](#) property. The default value of this property is 40. This property can be customized at runtime.

#### XML

```
<syncfusion:SfListView x:Name="listView" ItemSize="60" />
```

#### C#

```
listView.ItemSize = 60;
```

---

**Note:** For vertical orientation, the item size is considered as height. For horizontal orientation, it will be considered as width.

---

### Item spacing

The SfListView allows specifying space between each item in the list by setting the [ItemSpacing](#) property. Generate the space around the item. The default value of this property is 0. This property can be customized at runtime.

#### XML

```
<syncfusion:SfListView x:Name="listView" ItemSpacing="5,0,0,0" />
```

#### C#

```
listView.ItemSpacing = new Thickness(5, 0, 0, 0)
```

### Rounded corner on items

The SfListView allows customizing the item appearance like rounded corner by using the [Frame](#) layout in the [ItemTemplate](#) property. By defining the CornerRadius property of frame layout, you can perform the rounded corner for items.

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.Content>
<syncfusion:SfListView x:Name="listView" ItemSize="60" ItemsSource="{Binding
customerDetails}">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Frame x:Name="frame" CornerRadius="10" >
<StackLayout>
<Label Text="{Binding ContactName}" />
<Label Text="{Binding ContactNumber}" />
<Label Text="{Binding ContactType}" />
</StackLayout>
</Frame>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        var listView = new SfListView();
        listView.ItemsSource = customerDetails;
        listView.ItemSize = 60;
        listView.ItemTemplate = new DataTemplate(() =>
        {
            var frame = new Frame();
            frame.CornerRadius = 10;
            var stackLayout = new StackLayout();
            var label1 = new Label();
            label1.SetBinding(Label.TextProperty, new Binding("ContactName"));
            var label2 = new Label();
            label2.SetBinding(Label.TextProperty, new Binding("ContactName"));
            var label3 = new Label();
            label3.SetBinding(Label.TextProperty, new Binding("ContactType"));
            stackLayout.Children.Add(label1);
            stackLayout.Children.Add(label2);
            stackLayout.Children.Add(label3);
            frame.Children.Add(stackLayout);
            return frame;
        });
    }
}
```

### Drop shadow effect on items

The SfListView allows customizing the item appearance like shadow effect for items by setting the shadow property of frame as true in [ItemTemplate](#) property.

**Note:** Define the frame within any view inside ItemTemplate with around some margin.

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.Content>
<syncfusion:SfListView x:Name="listView" ItemSize="60" ItemsSource="{Binding
customerDetails}">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Grid Padding="2" Margin="2" >
<Frame x:Name="frame" HasShadow="True" Padding="2" Margin="2">
<StackLayout>
<Label Text="{Binding ContactName}" />
<Label Text="{Binding ContactNumber}" />
<Label Text="{Binding ContactType}" />
</StackLayout>
</Frame>
</Grid>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        var listView = new SfListView();
        listView.ItemsSource = customerDetails;
        listView.ItemSize = 60;
        listView.ItemTemplate = new DataTemplate(() =>
        {
            var grid = new Grid();
            grid.Padding = 2;
            grid.Margin = 2;
            var frame = new Frame();
            frame.Padding = 2;
            frame.Margin = 2;
            frame.HasShadow = "True";
            var stackLayout = new StackLayout();
            var label1 = new Label();
            label.SetBinding(Label.TextProperty, new Binding("ContactName"));
            var label2 = new Label();
            label.SetBinding(Label.TextProperty, new Binding("ContactName"));
            var label3 = new Label();
            label1.SetBinding(Label.TextProperty, new Binding("ContactType"));
```

```
stackLayout.Children.Add(label1);  
stackLayout.Children.Add(label2);  
stackLayout.Children.Add(label3);  
frame.Children.Add(stackLayout);  
grid.Children.Add(frame);  
return grid;  
});  
}  
}

### ListViewItem customization

The SfListView allows customizing the [ListViewItem](#) based on the [ItemType](#). To customize the Header, Footer, GroupHeader, LoadMore, and ListViewItem follow the code example.

#### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        this.listView.ItemGenerator = new ItemGeneratorExt(this.listView);
    }
}
```

### Extension class for ItemGenerator

#### C#

```
public class ItemGeneratorExt : ItemGenerator
{
    public SfListView listView;
    public ItemGeneratorExt(SfListView listView) : base(listView)
    {
        this.listView = listView;
    }
    protected override ListViewItem OnCreateListViewItem(int itemIndex, ItemType type, object data = null)
    {
        if (type == ItemType.Header)
            return new HeaderItemExt(this.listView);
        else if (type == ItemType.Footer)
            return new FooterItemExt(this.listView);
        else if (type == ItemType.GroupHeader)
            return new GroupHeaderItemExt(this.listView);
        else if (type == ItemType.LoadMore)
            return new LoadMoreItemExt(this.listView);
        else if (type == ItemType.Record)
            return new ListViewItemExt(this.listView);
        return base.OnCreateListViewItem(itemIndex, type, data);
    }
}
```

### Extension class for HeaderItem

#### C#

```
public class HeaderItemExt : HeaderItem
{
    private SfListView listView;
    public HeaderItemExt(SfListView listView)
    {
        this.listView = listView
    }
    protected override void OnItemAppearing()
    {
        base.OnItemAppearing();
    }
}
```

```
this.BackgroundColor = Color.Yellow;
}
}
```

*Extension class for FooterItem***C#**

```
public class FooterItemExt : FooterItem
{
    private SfListView listView;
    public FooterItemExt(SfListView listView)
    {
        this.listView = listView
    }
    protected override void OnItemAppearing()
    {
        base.OnItemAppearing();
        this.BackgroundColor = Color.Yellow;
    }
}
```

*Extension class for GroupHeaderItem***C#**

```
public class GroupHeaderItemExt : GroupHeaderItem
{
    private SfListView listView;
    public GroupHeaderItemExt(SfListView listView)
    {
        this.listView = listView
    }
    protected override void OnItemAppearing()
    {
        base.OnItemAppearing();
        this.BackgroundColor = Color.Yellow;
    }
}
```

*Extension class for LoadMoreItem***C#**

```
public class LoadMoreItemExt : LoadMoreItem
{
    private SfListView listView;
    public LoadMoreItemExt(SfListView listView)
    {
        this.listView = listView
    }
    protected override void OnItemAppearing()
    {
        base.OnItemAppearing();
        this.BackgroundColor = Color.Yellow;
    }
}
```

*Extension class for ListViewItem***C#**

```

public class ListViewItemExt : ListViewItem
{
    private SfListView listView;
    public ListViewItemExt(SfListView listView)
    {
        this.listView = listView
    }
    protected override void OnItemAppearing()
    {
        base.OnItemAppearing();
        this.BackgroundColor = Color.Yellow;
    }
}

```

*Accordion view*

The SfListView supports accordion view to display a list of items. Each item can be expanded or stretched to reveal the content associated with that item. There can be zero expanded items, exactly one item, or more than one item can be expanded at a time depending on the configuration.

**XML**

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
    <ContentPage.Behaviors>
        <local:SfListViewAccordionBehavior />
    </ContentPage.Behaviors>
    <ContentPage.Content>
        <Grid x:Name="mainGrid" BackgroundColor="#F0F0F0" Padding="4">
            <syncfusion:SfListView x:Name="listView" AutoFitMode="Height" SelectionMode
            ="None" IsScrollBarVisible="False" ItemSpacing="0">
                <syncfusion:SfListView.ItemTemplate>
                    <DataTemplate>
                        <ViewCell>
                            <ViewCell.View>

    });
}
#endregion
protected override void OnDetachingFrom(ContentPage bindable)
{
    listView.ItemTapped -= ListView_ItemTapped;
}
}
```

The `IsVisible` model property which is bound to the second template will be enabled when tapping the item and disabled when tapping again the same item.

Download the entire source code from GitHub [here](#).

### show busy indicator on list view

The SfListView allows displaying the [SfBusyIndicator](#) when loading the bounded items. The busy indicator can be enabled and disabled by using [IsBusy](#) property.

Create a IsLoading boolean property in view model and bind it to the IsBusy property. By setting the value to IsLoading property, the busy indicator will be enabled and disabled into the view till the items loaded in the SfListView.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:busyIndicator="clr-
namespace:Syncfusion.SfBusyIndicator.XForms;assembly=Syncfusion.SfBusyIndica

ItemSize="110">
</syncfusion:SfListView>
<busyIndicator:SfBusyIndicator x:Name="busyIndicator"
InputTransparent="True"
AnimationType="SingleCircle"
IsBusy="{Binding IsLoading, Mode=TwoWay}"
TextColor="Magenta"
ViewBoxWidth="50"
ViewBoxHeight="50"/>
</Grid>
</ContentPage>
```

### C#

```
public class ViewModel : INotifyPropertyChanged
{
    private bool isLoading = false;
    public bool IsLoading
    {
        get { return isLoading; }
        set
        {
            this.isLoading = value;
            OnPropertyChanged("IsLoading");
        }
    }
    private async void GenerateItems()
    {
        IsLoading = true;
        await Task.Delay(5000);
        for (int i = 0; i < 30; i++)
        {
            var contact = new Model(CustomerNames[i], ContactNumber[i]);
            ContactInfo.Add(contact);
        }
        IsLoading = false;
    }
}
```

**Note:** When both SfBusyIndicator and ListView loaded with same row and column, you need to set InputTransparent as True to SfBusyindicator in order to pass touch interaction to listview in iOS platform.

### show busy indicator on list view items

The SfListView allows displaying an activity indicator for an item when its data is being loaded in the background. To perform this, load both `ActivityIndicator` and a `Button` in the same row of a `Grid` element inside the [ItemTemplate](#) of the SfListView. The busy indicator and button can be enabled and disabled by using properties `IsButtonVisible` and `IsIndicatorVisible` respectively in the model class.

#### C#

```
public class BookInfo : INotifyPropertyChanged
{
    private string bookName;
    private string bookDescription;
    public bool isDescriptionVisible;
    public bool isButtonVisible;
    public bool isIndicatorVisible;
    public BookInfo()
    {
    }
    public string BookName
    {
        get { return bookName; }
        set
        {
            bookName = value;
            OnPropertyChanged("BookName");
        }
    }
    public bool IsDescriptionVisible
    {
        get { return isDescriptionVisible; }
        set
        {
            isDescriptionVisible = value;
            OnPropertyChanged("IsDescriptionVisible");
        }
    }
    public string BookDescription
    {
        get { return bookDescription; }
        set
        {
            bookDescription = value;
            OnPropertyChanged("BookDescription");
        }
    }
    public bool IsButtonVisible
    {
        get { return isButtonVisible; }
        set
        {
            isButtonVisible = value;
            OnPropertyChanged("IsButtonVisible");
        }
    }
    public bool IsIndicatorVisible
    {

```

```

get { return isIndicatorVisible; }
set
{
    isIndicatorVisible = value;
    OnPropertyChanged("IsIndicatorVisible");
}
}
public event PropertyChangedEventHandler PropertyChanged;
public void OnPropertyChanged(string name)
{
    if (this.PropertyChanged != null)
        this.PropertyChanged(this, new PropertyChangedEventArgs(name));
}
}

```

Disable the visibility of Description and ActivityIndicator initially while adding items into collection.

### C#

```

public class BookInfoRepository : INotifyPropertyChanged
{
    private ObservableCollection<BookInfo> newBookInfo;
    public event PropertyChangedEventHandler PropertyChanged;
    public ObservableCollection<BookInfo> NewBookInfo
    {
        get { return newBookInfo; }
        set { this.newBookInfo = value; }
    }
    public void OnPropertyChanged(string name)
    {
        if (this.PropertyChanged != null)
            this.PropertyChanged(this, new PropertyChangedEventArgs(name));
    }
    public BookInfoRepository()
    {
        GenerateNewBookInfo();
    }
    private void GenerateNewBookInfo()
    {
        NewBookInfo = new ObservableCollection<BookInfo>();
        NewBookInfo.Add(new BookInfo() { BookName = "Machine Learning Using C#",
            BookDescription = "You'll learn several different approaches to applying
            machine learning", IsIndicatorVisible = false, IsButtonVisible = true,
            IsDescriptionVisible = false });
        NewBookInfo.Add(new BookInfo() { BookName = "Object-Oriented Programming in
            C#", BookDescription = "Object-oriented programming is the de facto
            programming paradigm", IsIndicatorVisible = false, IsButtonVisible = true,
            IsDescriptionVisible = false });
        NewBookInfo.Add(new BookInfo() { BookName = "C# Code Contracts",
            BookDescription = "Code Contracts provide a way to convey code assumptions",
            IsIndicatorVisible = false, IsButtonVisible = true, IsDescriptionVisible =
            false });
    }
}

```

Bind the bool values for the IsVisible properties to switch between indicator and button while loading the description.

### XML

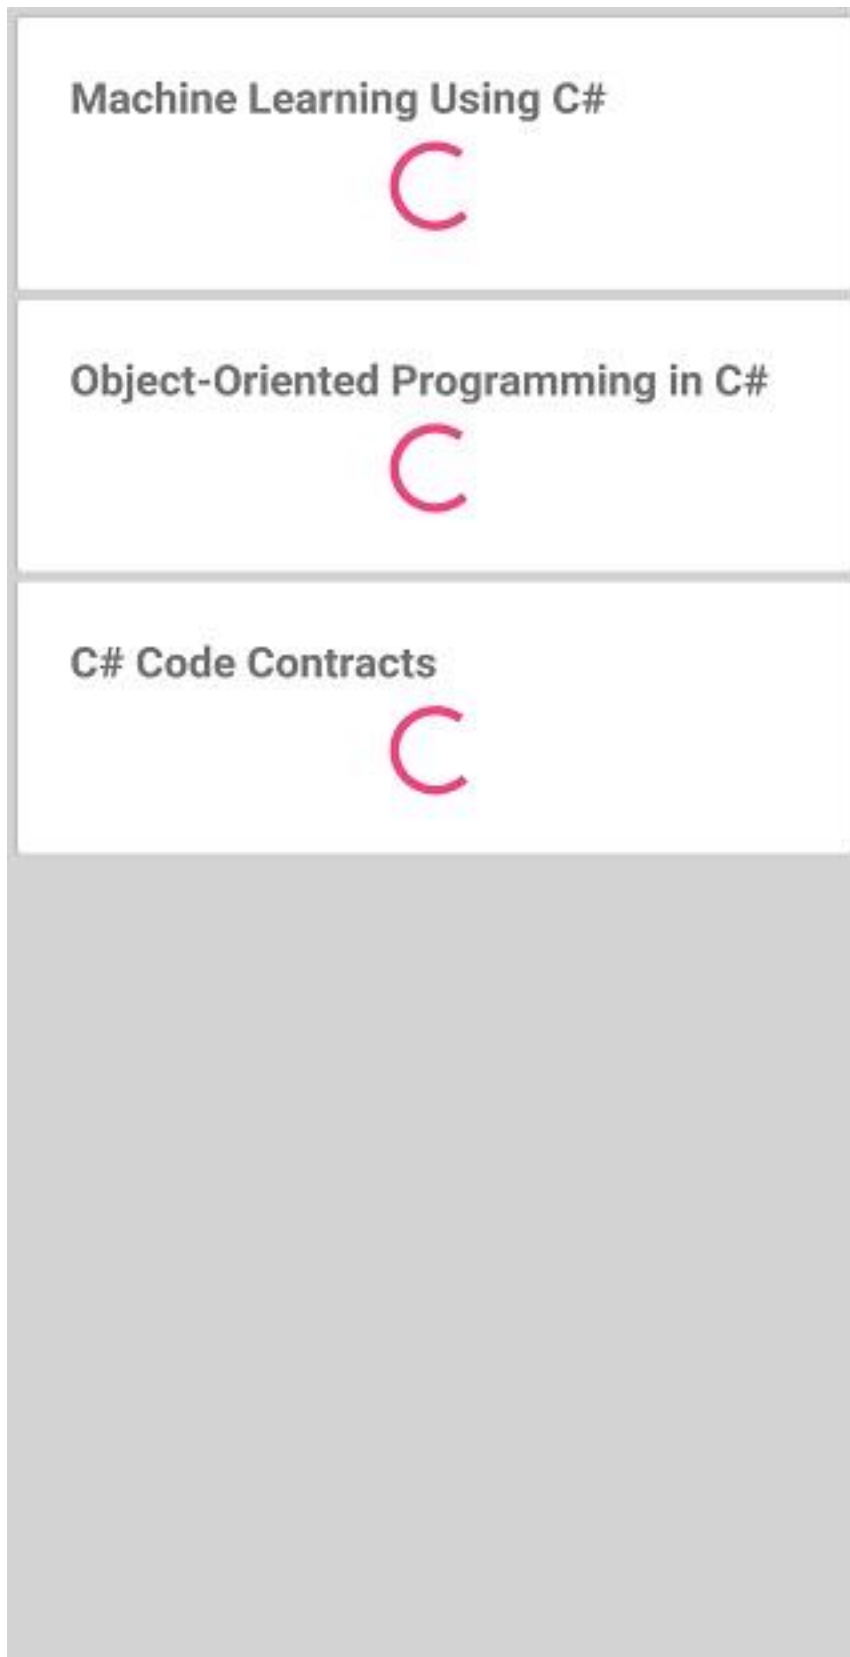

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:BookInfoRepository x:Name="ViewModel" />
</ContentPage.BindingContext>
<sync:SfListView x:Name="listView" AutoFitMode="Height"
BackgroundColor="#d3d3d3" SelectionMode="None" ItemsSource="{Binding
NewBookInfo}">
<sync:SfListView.ItemTemplate>
<DataTemplate>
<Frame HasShadow="True" Margin="5,5,5,0">
<Grid Padding="5">
<Grid.RowDefinitions>
<RowDefinition Height="*" />
<RowDefinition Height="2*" />
</Grid.RowDefinitions>
<Label Text="{Binding BookName}" FontAttributes="Bold" FontSize="19" />
<Button Grid.Row="1" Clicked="Button_Clicked" Text="Load Description"
IsVisible="{Binding IsButtonVisible}" HorizontalOptions="Center"
VerticalOptions="Center"/>
<Label Grid.Row="1" Text="{Binding BookDescription}" FontSize="15"
IsVisible="{Binding IsDescriptionVisible}" />
<ActivityIndicator Grid.Row="1" IsEnabled="True" IsRunning="True"
IsVisible="{Binding IsIndicatorVisible}" />
</Grid>
</Frame>
</DataTemplate>
</sync:SfListView.ItemTemplate>
</sync:SfListView>
</ContentPage>
```

In the Clicked event of the Button, get the row data from its BindingContext and alter the bool values accordingly.

### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
    private async void Button_Clicked(object sender, EventArgs e)
    {
        var model = ((sender as Button).BindingContext as BookInfo);
        model.IsIndicatorVisible = true;
        model.IsButtonVisible = false;
        await Task.Delay(2000);
        model.IsDescriptionVisible = true;
        model.IsIndicatorVisible = false;
    }
}
```

### Show busy indicator on list view items using toggle switch

The SfListView allows to display **ActivityIndicator** for an item when loading its data in the background. To do this, load both **ActivityIndicator** and a toggle switch in the same row of a **Grid** element inside the **ItemTemplate** of SfListView. The busy indicator and toggle switch can be enabled and disabled by using the **IsButtonVisible** and **IsIndicatorVisible** properties respectively in the model class. The **ActivityIndicator** remains visible when the toggle switch is enabled.

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:ContactInfoRepository x:Name="ViewModel" />
</ContentPage.BindingContext>
<syncfusion:SfListView x:Name="listView" AutoFitMode="Height"
BackgroundColor="#d3d3d3" SelectionMode="None" ItemsSource="{Binding
NewContactInfo}">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Frame HasShadow="True" Margin="5,5,5,0">
<Grid Padding="5">
<Grid.RowDefinitions>
<RowDefinition Height="*" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Label Text="{Binding ContactName}" FontAttributes="Bold" FontSize="19" />
<Switch Grid.Row="1" Grid.Column="1" IsVisible="{Binding IsButtonVisible}"
IsToggled="{Binding IsChecked}" Toggled="Switch_Toggled"/>
<Label Grid.Row="1" Text="{Binding ContactNo}" FontSize="15"
IsVisible="{Binding IsDescriptionVisible}" />
<ActivityIndicator Grid.Row="1" IsEnabled="True" IsRunning="True"
IsVisible="{Binding IsIndicatorVisible}" />
</Grid>
</Frame>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</ContentPage>
```

In the Toggled event of the switch, get the row data from its BindingContext and alter the Bool values accordingly.

#### C#

```
public partial class MainPage : ContentPage
{
    private Random random = new Random();
    public MainPage()
    {
        InitializeComponent();
    }
    private async void Switch_Toggled(object sender, ToggledEventArgs e)
    {
        var model = ((sender as Switch).BindingContext as ContactInfo);
        if (model.IsChecked == true)
```

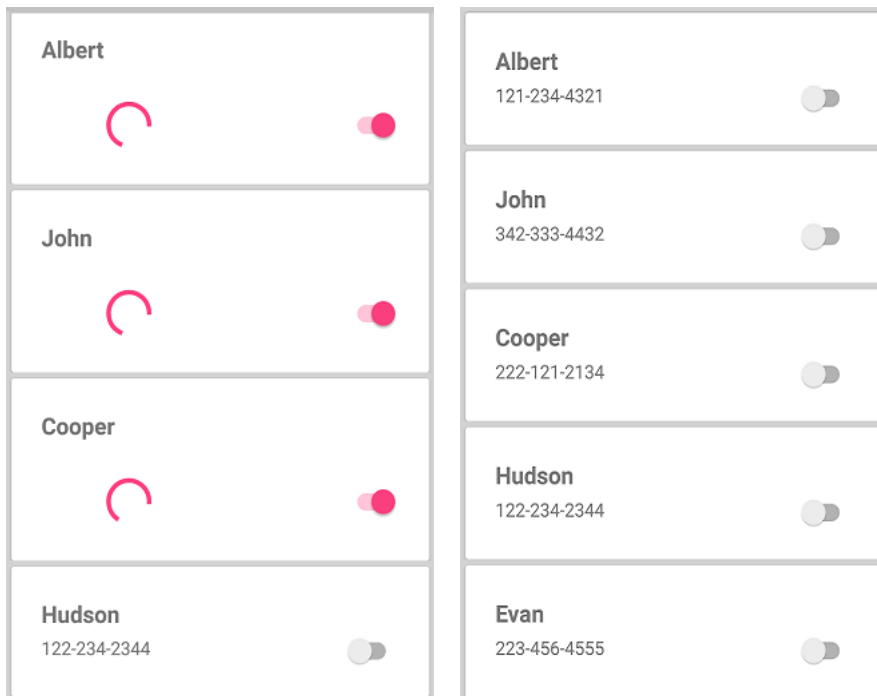

```

{
    model.ContactNo = random.Next(100, 400).ToString() + "-" + random.Next(500,
800).ToString() + "-" + random.Next(1000, 2000).ToString();
    model.IsDescriptionVisible = false;
    model.IsIndicatorVisible = true;
    await Task.Delay(2000);
    model.IsDescriptionVisible = true;
    model.IsIndicatorVisible = false;
    model.IsChecked = false;
}
else
{
    model.IsIndicatorVisible = false;
}
}
}

```

Download the entire source code from GitHub [here](#).

#### Item animation on appearing

The SfListView supports animating the items by using an [OnItemAppearing](#) virtual method. It is raised when the items appearing in the view on scrolling, loading, and navigating from one page to another page. To apply the animation effect for items, follow the steps:

#### Extension of ItemGenerator

##### C#

```

public class ItemGeneratorExt : ItemGenerator
{
    public SfListView listView;
    public ItemGeneratorExt(SfListView listView) : base(listView)
    {
    }
}

```

```

this.listView = listView;
}
protected override ListViewItem OnCreateListViewItem(int itemIndex, ItemType
type, object data = null)
{
if (type == ItemType.Record)
return new ListViewItemExt(this.listView);
return base.OnCreateListViewItem(itemIndex, type, data);
}
}

```

Initialize and assign ItemGenerator extension to ListView

**C#**

```

public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
this.listView.ItemGenerator = new ItemGeneratorExt(this.listView);
}
}

```

#### *Extension of ListViewItem*

To apply the animation for items while appearing, override the [OnItemAppearing](#) method.

**C#**

```

public class ListViewItemExt : ListViewItem
{
private SfListView listView;
public ListViewItemExt(SfListView listView)
{
this.listView = listView;
this.PropertyChanged += ListViewItemExt_PropertyChanged;
}
private void ListViewItemExt_PropertyChanged(object sender,
System.ComponentModel.PropertyChangedEventArgs e)
{
if (e.PropertyName == "Visibility")
{
if (!this.Visibility)
this.AbortAnimation("FadeTo");
}
}
protected override void OnItemAppearing()
{
this.Opacity = 0;
this.FadeTo(1, 400, Easing.SinInOut);
base.OnItemAppearing();
}
}

```

Here **FadeTo** animation is applied for [ListViewItem](#), when comes in the view.

### *Right to left(RTL)*

ListView supports to change the flow of text to the right-to-left direction by setting the [FlowDirection](#) property. ListView supports RTL in Xamarin.Forms version 3.0 and above.

### XML

```
<ContentPage xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView"
    ItemsSource="{Binding Products}"
    FlowDirection="RightToLeft"/>
</ContentPage>
```

### C#

```
this.FlowDirection = FlowDirection.RightToLeft;
```

In UWP platform, the ScrollView is not changed when RTL is enabled (framework issue). To overcome this issue, set the `FlowDirection` property in constructor of `MainPage` in UWP renderer as demonstrated in the following code example.

### C#

```
public MainPage()
{
    ...
    SfListViewRenderer.Init();
    this.FlowDirection = FlowDirection.RightToLeft;
    LoadApplication (new App ());
    ...
}
```

**Note:** When a label is loaded in the `ItemTemplate`, the right-to-left direction is not applied due to the framework issue. It has been reported to the Xamarin team; for more details about this, refer to this [link](#). To overcome this issue, set the `HorizontalOptions` to `StartAndExpand` in Label.

A		
MOBILE	Anthony 100-693-1167	
HOME	Asher 301-649-1747	
WORK	Austin 182-605-1921	
B		
C		
MOBILE	Caden 210-684-1734	
BUSINESS	Caleb 327-750-1357	

### Limitations

- ListView does not support the right-to-left(RTL) direction when [SfListView.Orientation](#) is `Horizontal`.

## Scrolling

### Programmatic scrolling

#### Scrolling to row index

The SfListView allows programmatically scrolling based on the index by using the [ScrollToRowIndex](#) method for both linear and grid layouts. It also enables and disables the scrolling animation when changing the view. By default, the scrolling will be animated.

You can set position of item in view while scrolling by passing [ScrollToPosition](#) to [ScrollToRowIndex](#) method. Below are four different types of positions:

- **MakeVisible**: Scrolls a specific item to make visible in the view. If the item is already in view, scrolling will not occur.
- **Start**: Scrolls a specific item to be positioned at the begin of the view.
- **End**: Scrolls a specific item to be positioned at the end of the view.
- **Center**: Scrolls a specific item to be positioned at the center of the view.

You can also scroll to specified data in [SfListView](#) using the [ScrollTo](#) method.

#### C#

```
int index =  
listView.DataSource.DisplayItems.IndexOf(viewModel.Customers[2]);  
// Programmatic scrolling based on the item index.  
listView.LayoutManager.ScrollToRowIndex(index,  
Syncfusion.ListView.XForms.ScrollToPosition.Center, true);  
// Programmatic scrolling based on the item data.  
listView.ScrollTo(viewModel.Customers[index],  
Syncfusion.ListView.XForms.ScrollToPosition.Center, true);
```

**Note:** If grouping is enabled, get the desired row index by passing the underlying data in the [DisplayItems.IndexOf](#) method.

#### C#

```
int index =  
listView.DataSource.DisplayItems.IndexOf(viewModel.Customers[2]);  
listView.LayoutManager.ScrollToRowIndex(index, true);
```

### Limitations

- When [AutoFitMode](#) is [Height](#) or grouping is enabled, the scroll animation will be disabled by default in Android and iOS platforms.
- If [ScrollToRowIndex](#) method is called when loading the [SfListView](#), set [disableAnimation](#) to [true](#) to scroll to the appropriate row index, or else view does not scrolled in Android.
- If the [ScrollToRowIndex](#) method is applied to a particular item index while the item is in Grouping or AutoFit mode, the particular item will get displayed in view but not in the exact position when the [ScrollToPosition](#) property is set as [MakeVisible](#) or [Center](#) for first time.
- In UWP platform, when you hover and scroll the inner listview, the outer listview will not be scrolled by default. To overcome this, set the [InputTransparent](#) to [True](#) for the parent element

loaded in the `ItemTemplate`. If you set `InputTransparent`, then the inner listview scroll will not work. This is the default behavior of the listview.

### Scrollbar visibility

The SfListView provides an option to enable or disable the `Scrollbar` visibility by using the [IsScrollBarVisible](#) property. By default, the value will be `true`.

**Note:** Due to some restrictions in native ScrollView renderer in Xamarin.Forms, you cannot change the `IsScrollBarVisible` value at runtime. It can be defined only when initializing the SfListView.

### XML

```
<syncfusion:SfListView x:Name="listView" IsScrollBarVisible="False" />
```

### C#

```
listView.IsScrollBarVisible = false;
```

### Identifying scroll state changes

The SfListView will notify the scrolling state changes by using the [ScrollStateChanged](#) event.

Following states will be notified via [ScrollState](#) property in the event argument.

- Dragging: Specifies that SfListView is currently being dragged in the view.
- Flung: Specifies that fling action is performed on the SfListView.
- Idle: Specifies that SfListView is not currently scrolling.
- Programmatic: Specifies that scrolling is performed by using [ScrollTo](#) or [ScrollToRowIndex](#) method.

### C#

```
listView.ScrollStateChanged += ListView_ScrollStateChanged;
private void ListView_ScrollStateChanged(object sender,
ScrollStateChangedEventArgs e)
{
    if (e.ScrollState == ScrollState.Idle)
    {
        DisplayAlert("ScrollState", "Scrolling has stopped", "OK");
    }
}
```

### Identify when end of the list is reached on scrolling

The SfListView allows notifying when scrolling using [Changed](#) event of [ScrollAxisBase](#) in [VisualContainer](#) of the SfListView. By using this event, you can find whether reached the last item in the list in the SfListView based on [LastBodyVisibleLineIndex](#) property and underlying collection count.

### C#

```
using Syncfusion.ListView.XForms.Control.Helpers;
public partial class MainPage : ContentPage
{
    VisualContainer visualContainer;
```

```

bool showAlertShown = false;
public MainPage()
{
    InitializeComponent();
    visualContainer = listView.GetVisualContainer();
    visualContainer.ScrollRows.Changed += ScrollRows_Changed;
}
///<summary>
///To notify when end reached
///</summary>
private void ScrollRows_Changed(object sender, ScrollChangedEventArgs e)
{
    var lastIndex = visualContainer.ScrollRows.LastBodyVisibleLineIndex;
    //To include header if used
    var header = (listView.HeaderTemplate != null && !listView.IsStickyHeader) ?
    1 : 0;
    //To include footer if used
    var footer = (listView.FooterTemplate != null && !listView.IsStickyFooter) ?
    1 : 0;
    var totalItems = listView.DataSource.DisplayItems.Count + header + footer;
    if ((lastIndex == totalItems - 1))
    {
        if (!isAlertShown)
        {
            DisplayAlert("Alert", "End of list reached...", "Ok");
            showAlertShown = true;
        }
    }
    else
    {
        showAlertShown = false;
    }
}
}

```

Download the entire source code from GitHub [here](#).

Maintain the scroll position while updating ItemsSource at runtime

The SfListView have scrolled to top automatically when changing the ItemsSource at runtime. However, you can maintain the same scrolled position by using the **SCROLLY** value of ExtendedScrollView from the [VisualContainer](#). After changing the ItemsSource, you can pass the SCROLLY value to [ScrollTo](#) method of SfListView and scroll back to the same position.

For horizontal orientation, use the **SCROLLX** value of ExtendedScrollView.

By using [Reflection](#), get the value of **ScrollOwner** from **VisualContainer** and use it.

## C#

```

using Syncfusion.ListView.XForms.Control.Helpers;
public partial class MainPage : ContentPage
{
    ExtendedScrollView scrollView;
    public MainPage()
    {
        InitializeComponent();
        scrollView = listView.GetScrollView();
    }
}

```

```
private void ChangeItemsSource_Clicked(object sender, EventArgs e)
{
    var viewModel = new ContactsViewModel();
    listView.ItemsSource = viewModel.EmployeeInfo;
    listView.ScrollTo(scrollView.ScrollY);
}
}
```

Download the entire source code from GitHub [here](#).

### Item Size Customization

This section explains how to customize the item size in the SfListView.

#### Customize item size of a particular item on-demand

The SfListView allows customizing the size of the item on-demand by the [SfListView.QueryItemSize](#) event using the item index. This event is raised whenever items come to view and triggered with [QueryItemSizeEventArgs](#).

The [SfListView.QueryItemSize](#) event provides the following properties in their arguments:

- [ItemIndex](#): Identifies a particular item in the SfListView.
- [ItemData](#): Identifies the underlying data bound to that item.
- [ItemSize](#): Identifies size of the queried item. For vertical orientation, it will be considered as the item height. For horizontal orientation, it will be considered as the item width.
- [ItemType](#): Identifies the item type of the queried item.
- [Handled](#): Decides whether the specified size can be set to the item or not. The default value is false. When this property is not set, the decided size will not set to the item.

### C#

```
this.listView.QueryItemSize += ListView_QueryItemSize;
private void ListView_QueryItemSize(object sender,
Syncfusion.ListView.XForms.QueryItemSizeEventArgs e)
{
    if(e.ItemIndex == 1)
    {
        e.ItemSize = 300;
        e.Handled = true;
    }
}
```

### AutoFit the items based on the content

The SfListView allows dynamically adjusting size of items based on the content loaded in the [SfListView.ItemTemplate](#) by defining the [SfListView.AutoFitMode](#) property.

The control contains the following three types of [AutoFitMode](#):

- Height: AutoFit the items based on the content.
- DynamicHeight: AutoFit the items based on the content if size of the content is changed at run time.
- None: The [SfListView](#) items are layout by [SfListView.ItemSize](#).

---

**Note:** If you define any size manually to the view loaded in [SfListView.ItemTemplate](#), the [SfListView](#) will return that size as the item size for each item.

---

### *AutoFitMode as Height*

AutoFit considers height of the item when [SfListView.Orientation](#) is vertical. When [SfListView.Orientation](#) is horizontal, it considers width of the item. The [SfListView.GridLayout](#) AutoFit all the items in a row and takes the maximum item height of the row and applies to all other items in the row.

### **XML**

```
<ContentPage xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView"
    ItemSize="200"
    AutoFitMode="Height"
    ItemsSource="{Binding BookInfo}" />
</ContentPage>
```

### **C#**

```
listView.AutoFitMode = AutoFitMode.Height;
```

### *AutoFitMode as DynamicHeight*

AutoFit considers height of the item when `SfListView.Orientation` is vertical. When `SfListView.Orientation` is horizontal, it considers width of the item. The `SfListView.GridLayout` AutoFit all the items in a row and takes the maximum item height of the row and applies to all other items in the row.

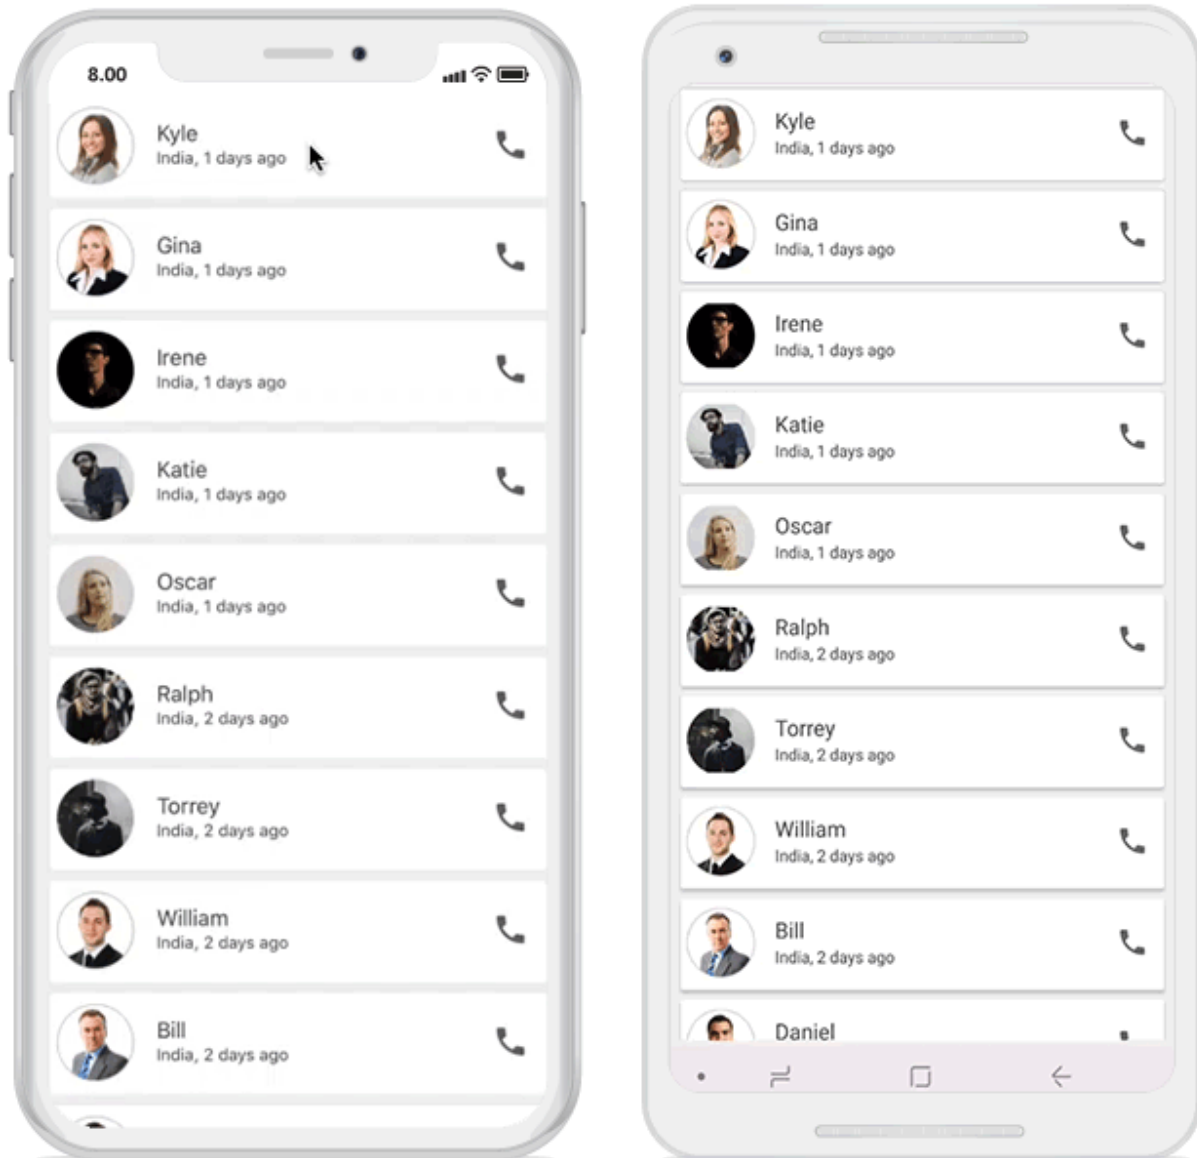

#### **XML**

```
<ContentPage xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView"
    ItemSize="200"
    AutoFitMode="DynamicHeight"
    ItemsSource="{Binding BookInfo}" />
</ContentPage>
```

#### **C#**

```
listView.AutoFitMode = AutoFitMode.DynamicHeight;
```

You can download the entire source code of this demo [here](#).

Updating the listview item size based on font at runtime

ListView allows you to resize the item size based on the change in font size of the label element at runtime when `SfListView.AutoFitMode` is [DynamicHeight](#).

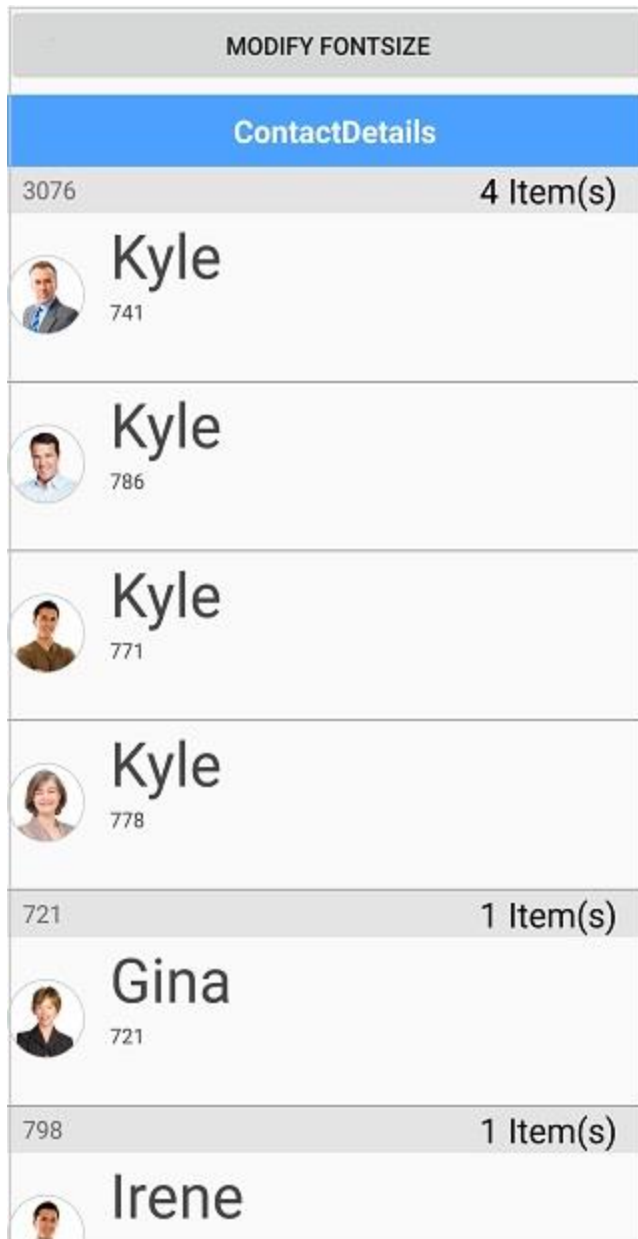

#### **XML**

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <Grid>
    <Grid.RowDefinitions>
      <RowDefinition Height="50"/>
      <RowDefinition Height="*" />
    </Grid.RowDefinitions>
    <Button Text="Modify FontSize" Clicked="Button_Clicked"/>
    <syncfusion:SfListView x:Name="listView"
      ItemsSource="{Binding Items}"
```

```
BackgroundColor="#FFE8E8EC"
AutoFitMode="DynamicHeight"
ItemSize="60">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Grid x:Name="grid" RowSpacing="1">
<Label LineBreakMode="NoWrap"
TextColor="#474747"
FontSize="{Binding BindingContext.FontSize, Source={x:Reference
Name=listView}}"
Text="{Binding ContactName}">
</Label>
</Grid>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</ContentPage>
```

### C#

```
private void Button_Clicked(object sender, EventArgs e)
{
    ViewModel.FontSize += 25;
}
```

Updating the Header and Footer height based on font at runtime

ListView allows you to resize the header and footer item size based on the change in font size of the label element at runtime by calling [RefreshListViewItem](#) method asynchronously when [SfListView.AutoFitMode](#) is Height.

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <Grid>
    <Grid.RowDefinitions>
      <RowDefinition Height="50"/>
      <RowDefinition Height="*" />
    </Grid.RowDefinitions>
```

```

<Button Text="Change FontSize" Command="{Binding ResizeHeaderFooterCommand}"
CommandParameter="{x:Reference listView}"/>
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding Contacts}"
BackgroundColor="#FFE8E8EC"
AutoFitMode="Height">
<syncfusion:SfListView.HeaderTemplate>
<DataTemplate>
<ViewCell>
<Grid>
<Label Text="Contact Details"
FontSize="{Binding BindingContext.FontSize, Source={x:Reference
listView}}"/>
</Grid>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.HeaderTemplate>
<syncfusion:SfListView.FooterTemplate>
<DataTemplate>
<ViewCell>
<Grid >
<Label Text="Contacts Count" FontSize="{Binding BindingContext.FontSize,
Source={x:Reference listView}}"/>
<Label Text="{Binding Contacts.Count}" FontSize="{Binding
BindingContext.FontSize, Source={x:Reference listView}}"/>
</Grid>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.FooterTemplate>
</syncfusion:SfListView>
</ContentPage>

```

## C#

```

namespace SfListViewSample
{
    public class ContactsViewModel : INotifyPropertyChanged
    {
        public Command ResizeHeaderFooterCommand { get; set; }
        private double MaxPhone = 70;
        private double MinPhone = 20;
        private double MaxTablet = 100;
        private double MinTablet = 30;
        public ContactsViewModel()
        {
            ResizeHeaderFooterCommand = new Command(ResizeHeaderFooter);
        }
        private void ResizeHeaderFooter(object obj)
        {
            list = obj as SfListView;
            var maxFont = Device.Idiom == TargetIdiom.Phone ? MaxPhone : MaxTablet;
            var minFont = (Device.Idiom == TargetIdiom.Phone) ? MinPhone : MinTablet;
            if (FontSize >= maxFont)
            {
                FontSize = minFont;
            }
        }
    }
}

```

```
else
{
    FontSize += 10;
}
list.RefreshListViewItem(-1, -1, true);
}
}
```

You can download entire source code from [GitHub](#).

#### Load images with autofit mode

By default, the image is not loaded with the actual size in autofit mode, as it measures the size before the layout. So, the size of the child view changes cannot be found from the parent view. It is a known issue in listview, but this can be overcome by calling the `RefreshListViewItem` method in the loaded event of listview.

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <ContentPage.Content>
    <Grid>
      <syncfusion:SfListView x:Name="listView"
        AutoFitMode="Height"
        ItemsSource="{Binding ContactsInfo}"
        Loaded="ListView_Loaded">
        <syncfusion:SfListView.ItemTemplate>
```

```

<DataTemplate>
<StackLayout>
<StackLayout>
<Label Text="{Binding ContactName}" />
<Label Text="{Binding ContactNumber}" />
</StackLayout>
<Image Source="{Binding ContactImage}" />
</StackLayout>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</Grid>
</ContentPage.Content>
</ContentPage>

```

## C#

```

private void ListView_Loaded(object sender,
Syncfusion.ListView.XForms.ListViewLoadedEventArgs e)
{
Device.BeginInvokeOnMainThread(async () =>
{
await Task.Delay(100);
listView.RefreshListViewItem();
});
}

```

## Limitations

- Defines the size of the image when loading image in the [SfListView.ItemTemplate](#). Because, it does not return actual measured size when measuring before layout the item.
- Avoids SfListView inside the SfListView if SfListView.AutoFitMode is Height or DynamicHeight. Because, the inner SfListView does not return actual measured size when measuring before layout the item.

## Layouts

The SfListView supports different layouts such as linear layout and grid layout. The [SfListView.LayoutManager](#) property is used to define the layout.

### Linear Layout

Linear layout arrange items in a single column. Initialize the [LinearLayout](#), and assign it to the [SfListView.LayoutManager](#) property to load the SfListView in linear layout. It is the default layout.

## XML

```

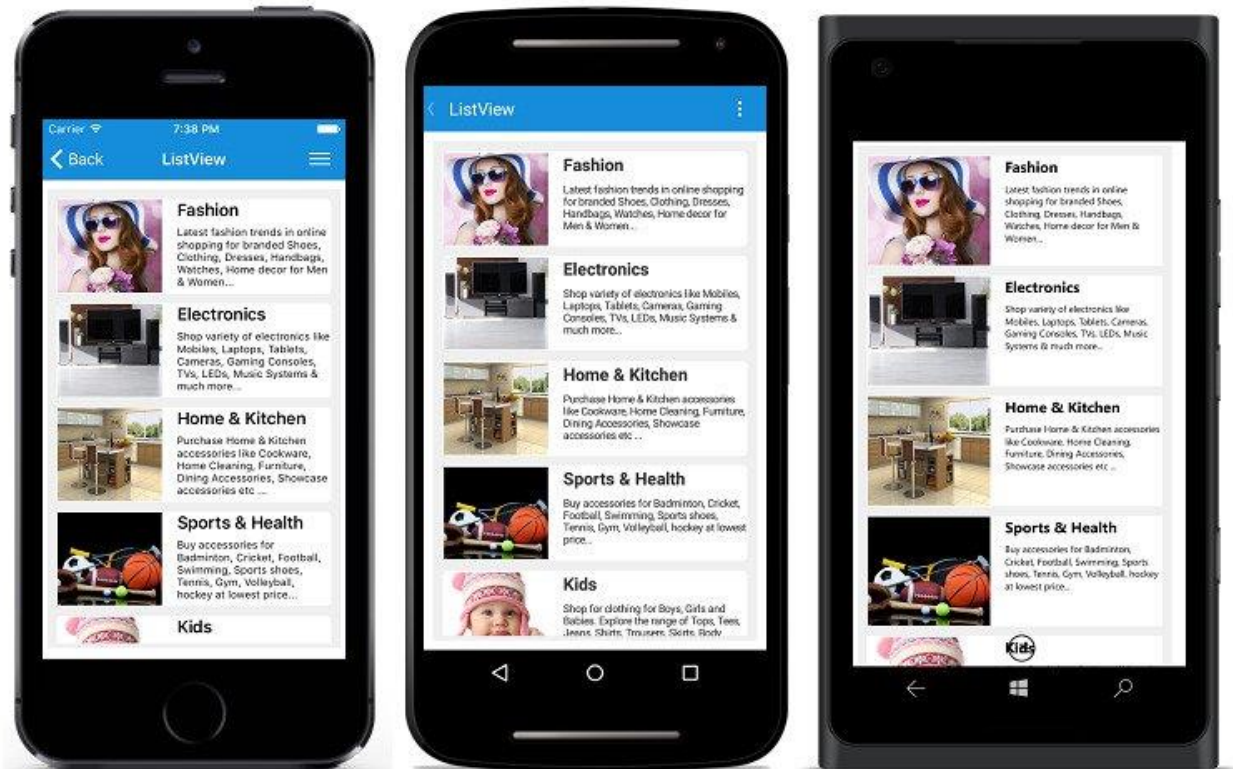

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding GalleryInfo}"
ItemSize="100">
<syncfusion:SfListView.LayoutManager>
<syncfusion:LinearLayout />
</syncfusion:SfListView.LayoutManager>

```

```
</syncfusion:SfListView>
</ContentPage>
```

## C#

```
listView.LayoutManager = new LinearLayout();
```

## Grid Layout

Grid layout arrange items in a predefined number of columns. Initialize the [GridLayout](#), and assign it to the [SfListView.LayoutManager](#) property to load the SfListView in grid layout.

The number of columns can be defined by using the [SpanCount](#) property of [GridLayout](#). Default [SpanCount](#) is 2.

In horizontal orientation, [SpanCount](#) defines the number of rows.

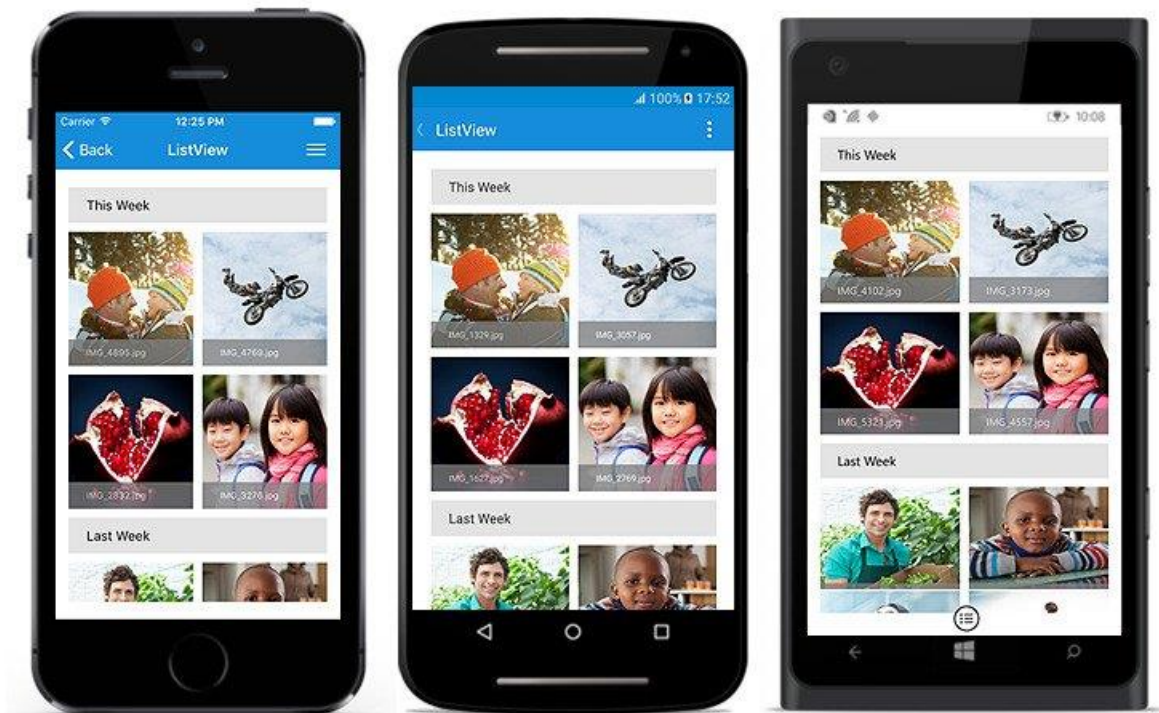

## XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding GalleryInfo}"
ItemSize="100">
<syncfusion:SfListView.LayoutManager>
<syncfusion:GridLayout SpanCount="2" />
</syncfusion:SfListView.LayoutManager>
</syncfusion:SfListView>
</ContentPage>
```

**C#**

```
listView.LayoutManager = new GridLayout() { SpanCount = 2 };
```

Download the entire source code from GitHub [here](#).

### Customize span count based on platform

The [SpanCount](#) property of the [GridLayout](#) can be customized based on the specified platform to avoid squeezed problem of listview item in phone and tablet devices or windows desktop.

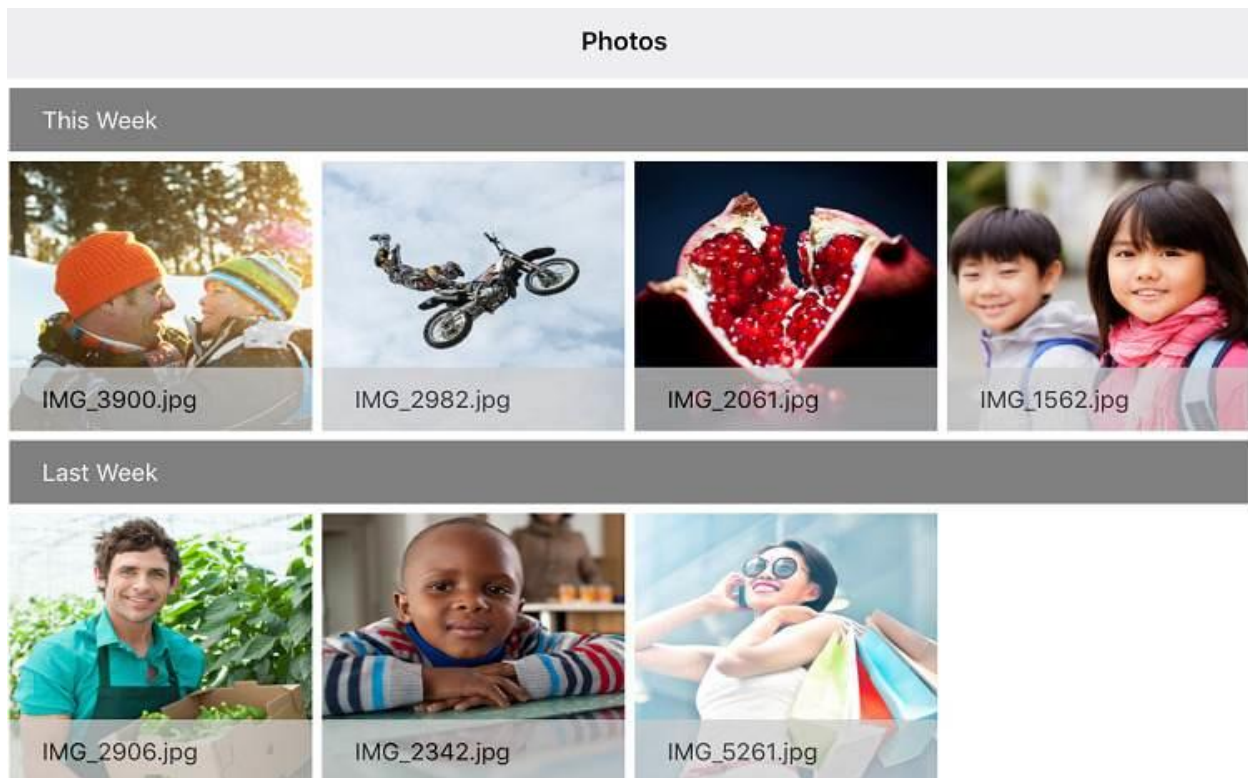

**XML**

```
<ContentPage xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView.LayoutManager>
    <syncfusion:GridLayout>
      <syncfusion:GridLayout.SpanCount>
        <OnPlatform x:TypeArguments="x:Int32">
          <OnPlatform.WinPhone>
            <OnIdiom x:TypeArguments="x:Int32" Phone="2" Tablet="4" Desktop="4"/>
          </OnPlatform.WinPhone>
          <OnPlatform.Android>
            <OnIdiom x:TypeArguments="x:Int32" Phone="2" Tablet="4" />
          </OnPlatform.Android>
          <OnPlatform.iOS>
            <OnIdiom x:TypeArguments="x:Int32" Phone="2" Tablet="4" />
          </OnPlatform.iOS>
        </OnPlatform>
      </syncfusion:GridLayout.SpanCount>
    </syncfusion:GridLayout>
  </syncfusion:SfListView.LayoutManager>
```

```
</syncfusion:SfListView>
</ContentPage>
```

**C#**

```
GridLayout gridLayout = new GridLayout();
if (Device.OS == TargetPlatform.Android || Device.OS == TargetPlatform.iOS)
gridLayout.SpanCount = Device.Idiom == TargetIdiom.Phone ? 2 : 4;
else if (Device.OS == TargetPlatform.Windows)
gridLayout.SpanCount = Device.Idiom == TargetIdiom.Desktop || Device.Idiom
== TargetIdiom.Tablet ? 4 : 2;
listView.LayoutManager = gridLayout;
```

Change span count based on screen size

In the SfListView, the [GridLayout](#) allows changing the span count based on the view size of application with orientation in either portrait or landscape mode.

**C#**

```
public partial class GridLayoutPage : ContentPage
{
    protected override void OnSizeAllocated(double width, double height)
    {
        base.OnSizeAllocated(width, height);
        if (width > 0 && pageWidth != width)
        {
            var size = Application.Current.MainPage.Width / listView.ItemSize;
            gridLayout.SpanCount = (int)size;
            listView.LayoutManager = gridLayout;
        }
    }
}
```

```
}
}
}
```

You can download the entire sample code [here](#).

## Item Drag and Drop

The SfListView allows reordering by dragging and dropping items. It supports displaying the customized view in a template while dragging the item. It can be enabled by setting the [SfListView.DragStartMode](#) property to **OnHold**. The drag and drop options are listed as follows:

- None: Disables drag and drop. This is the default value.
- OnHold: Allows dragging and dropping by holding the item.
- OnDragIndicator: Allows dragging and dropping by loading the [DragIndicatorView](#) within [SfListView.ItemTemplate](#).

---

**Note:** The [GridLayout](#) does not support drag and drop.

---

The drag and drop scenarios are as follows:

- Items can be reordered to any position by auto-scrolling.
- Items can be reordered in same group or in other groups but, no groups can be added to other groups.
- Groups, header, and footer cannot be reordered.

To enable drag and drop using 'OnHold', follow the code example:

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding ToDoList}"
DragStartMode="OnHold"
BackgroundColor="#FFE8E8EC"
ItemSize="60" />
</ContentPage>
```

### C#

```
listView.DragStartMode = DragStartMode.OnHold;
```

To enable drag and drop using both 'OnHold' and 'OnDragIndicator', follow the code example:

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding ToDoList}"
DragStartMode="OnHold, OnDragIndicator"
BackgroundColor="#FFE8E8EC"
```

```
ItemSize="60" />
</ContentPage>
```

## C#

```
listView.DragStartMode = DragStartMode.OnHold |
DragStartMode.OnDragIndicator;
```

**Note:** Reordering changes made only in view, and not in underlying collection. Thus, the changes will be reverted when performing sorting, grouping, or any other operation that refreshes view. You can update underlying collection by setting UpdateSource to true.

### Drag indicator view

To drag and drop the items by [DragIndicatorView](#), set the [SfListView.DragStartMode](#) property to OnDragIndicator. To display the dragging item, define any custom user interface(UI) in DragIndicatorView.

**Note:** You must set the SfListView instance as reference to the [ListView](#) property in DragIndicatorView.

## XML

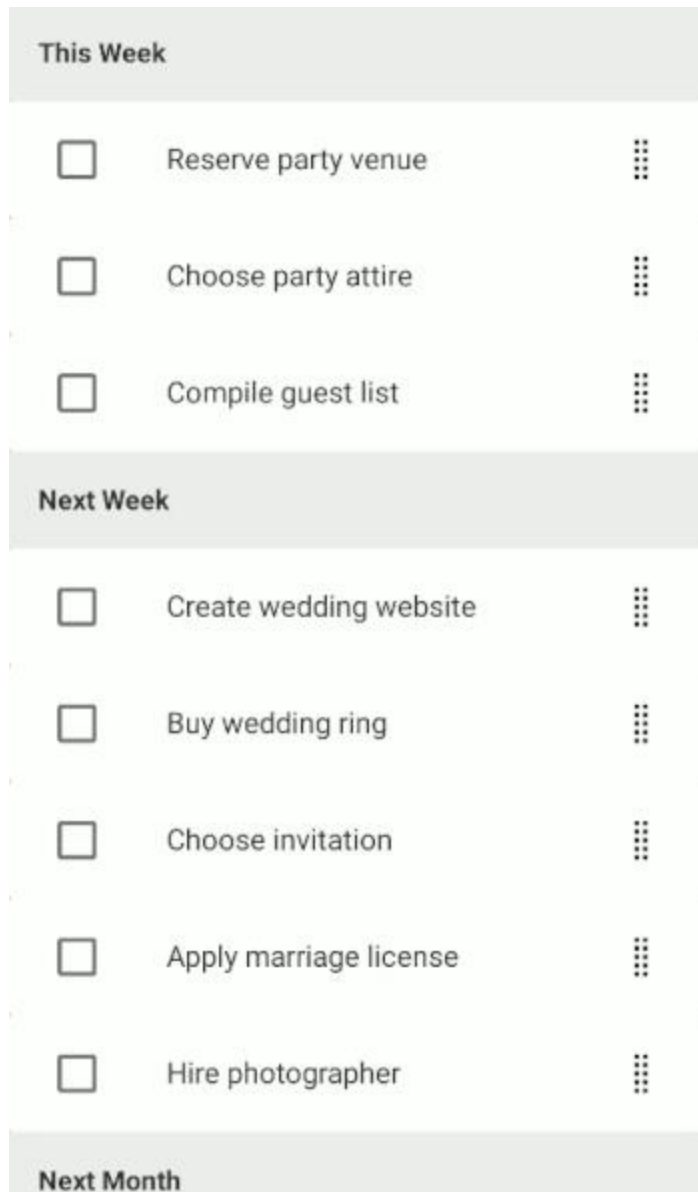

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding ToDoList}"
DragStartMode="OnDragIndicator"
BackgroundColor="#FFE8E8EC"
ItemSize="60">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Grid Padding="10">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="*" />
<ColumnDefinition Width="60" />
</Grid.ColumnDefinitions>
<Label x:Name="textLabel" Text="{Binding Name}" Grid.Column="1"
FontSize="15" TextColor="#333333" />
<syncfusion:DragIndicatorView Grid.Column="2" ListView="{x:Reference
listView}"
HorizontalOptions="Center"
VerticalOptions="Center">
<Grid Padding="10, 20, 20, 20">
<Image Source="DragIndicator.png" />
</Grid>
</syncfusion:DragIndicatorView>
</Grid>
</Grid>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</ContentPage>
```

## C#

```
listView.ItemTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var name = new Label
    {
        FontSize = 15,
        VerticalOptions = LayoutOptions.Center
    };
    name.SetBinding(Label.TextProperty, new Binding("Name"));
    var indicatorGrid = new Grid()
    {
        Padding = new Thickness(10, 20, 20, 20),
        HorizontalOptions = LayoutOptions.End,
        VerticalOptions = LayoutOptions.Center
    };
    var dragIndicatorView = new DragIndicatorView() { ListView = this.listView };
    var indicator = new Image() { Source = "DragIndicator.png" };
    indicatorGrid.Children.Add(indicator);
    dragIndicatorView.Content = indicatorGrid;
    grid.Children.Add(name);
    grid.Children.Add(dragIndicatorView, 1, 0);
    return grid;
});
```

The screenshot shows the output of the reordering items by drag and drop. Download the entire source code from GitHub [here](#).

### Drag item customization

By defining the [SfListView.DragItemTemplate](#) of the SfListView, displays the custom User Interface(UI) when performing drag and drop operations. The template can be defined either in code or XAML.

**Note:** If BackgroundColor is set to DragItemTemplate or [DragIndicatorView](#), set InputTransparent to true. Since, dragging does not happen when performing by DragIndicatorView in UWP.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView"
    ItemsSource="{Binding ToDoList}"
    DragStartMode="OnHold"
    BackgroundColor="#FFE8E8EC"
    ItemSize="60">
    <syncfusion:SfListView.DragItemTemplate>
```

```
<DataTemplate>
<Grid Padding="10">
<Label x:Name="textLabel" Text="{Binding Name}" FontSize="15" />
</Grid>
</DataTemplate>
</syncfusion:SfListView.DragItemTemplate>
</syncfusion:SfListView>
</ContentPage>
```

## C#

```
listView.ItemTemplate = new DataTemplate(() => {
var grid = new Grid();
var name = new Label { FontSize = 15 };
name.SetBinding(Label.TextProperty, new Binding("Name"));
grid.Children.Add(name);
return grid;
});
```

## Event

The [ItemDragging](#) event is raised while dragging and dropping the item in the [SfListView](#). The [ItemDraggingEventArgs](#) has the following members which provides the information for the [ItemDragging](#) event:

- [Action](#): Returns the drag [Action](#) such as start, dragging, and drop.
- [Bounds](#): Return bounds of drag item when dragging and dropping.
- [Handled](#): If this member is set to true, dragging can be handled. It is applicable only if [Action](#) is [Dragging](#).
- [ItemData](#): Returns the underlying data of the dragging item.
- [NewIndex](#): Returns the item index of the [DataSource.DisplayItems](#) where dragging item is going to be dropped.
- [OldIndex](#): Returns the item index of the [DataSource.DisplayItems](#) where dragging item started. The OldIndex and NewIndex will be same if [Action](#) is [Start](#).
- [Position](#): Returns the touch position of the drag item from screen coordinates.

## Auto scroll options

### Auto scroll margin

To adjust auto scroll margin, set a value to the [ScrollMargin](#) property of [AutoScroller](#) to enable auto-scrolling while dragging. The default value is 15. Auto-scrolling will be enabled when reaching [ScrollMargin](#) from view bounds while dragging.

To disable auto-scrolling, set the value to 0 for [ScrollMargin](#).

## C#

```
this.listView.AutoScroller.ScrollMargin = 20;
```

### Auto scroll interval

To adjust auto-scroll interval while dragging, set the [Interval](#) property of [AutoScroller](#). The default value is 150 milliseconds.

**C#**

```
this.listView.AutoScroller.Interval = new TimeSpan(0, 0, 0, 0, 200);
```

*Disable outside scroll*

To disable auto-scroll when dragging item moves outside the SfListView while dragging, set the [AllowOutsideScroll](#) property of [AutoScroller](#) to true. The default value is true.

**C#**

```
this.listView.AutoScroller.AllowOutsideScroll = false;
```

*Disable dragging for particular item*

To disable dragging for a particular item, handle the [ItemDragging](#) event based on the conditions of [Action](#) event argument.

**C#**

```
private void ListView_ItemDragging(object sender, ItemDraggingEventArgs e)
{
    // Disable the dragging for 4th item.
    if (e.Action == DragAction.Start && e.NewIndex == 3)
        e.Cancel = true;
}
```

*Cancel dropping for the dragged item*

To cancel dropping for the dragged item, handle the [ItemDragging](#) event based on the conditions of [Action](#) event argument.

**C#**

```
using Syncfusion.ListView.XForms.Control.Helpers;
private void ListView_ItemDragging(object sender, ItemDraggingEventArgs e)
{
    // Cancel the dropping if drop the drag item into out of view.
    var listView = sender as ListView;
    var totalExtent = listView.GetVisualContainer().Bounds.Bottom;
    if (e.Action == DragAction.Drop && (e.Bounds.Y < -30 || e.Bounds.Bottom >
        totalExtent + 40))
        e.Cancel = true;
}
```

*Reorder the underlying collection*

The underlying collection can be reordered directly by setting the [UpdateSource](#) property to true. The default value is false.

**C#**

```
this.listView.DragDropController.UpdateSource = true;
```

We can able to update collection even when [UpdateSource](#) is false. Like, user can decide where dragged item should be dropped actually by handling the [ItemDragging](#) event with [DragAction.Drop](#).

**C#**

```
private void ListView_ItemDragging(object sender, ItemDraggingEventArgs e)
{
    if (e.Action == DragAction.Drop)
    {
        ViewModel.ToDoList.MoveTo(1, 5);
    }
}
```

**Note:** Underlying collection will not be updated when any data operation like sorting or grouping is performed. The order will be maintained only in DisplayItems of data source. When drag and drop an item between groups, the value of the property in which grouping is performed is updated in data object.

Delete item when dropping in particular view

To delete the dragged item when dropping into a particular view, handle the [ItemDragging](#) event based on the conditions of [Action](#) and [Bounds](#) event arguments.

To delete the dragged item from the underlying collection when dropping into delete icon, follow the code example. It will enable or disable whenever drag started, and dropped by `IsVisible` property in `ViewModel`.

**XML**

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Grid BackgroundColor="#2196F3">
<Label Text="To Do Items" x:Name="headerLabel" TextColor="White"
FontAttributes="Bold" VerticalOptions="Center" HorizontalOptions="Center" />
<StackLayout x:Name="stackLayout" IsVisible="{Binding IsVisible}"
Orientation="Horizontal" VerticalOptions="Center"
HorizontalOptions="Center">
<Image Source="Delete.png" HeightRequest="30" WidthRequest="30" />
<Label x:Name="deleteLabel" Text="Delete Item" FontAttributes="Bold"
TextColor="White" />
</StackLayout>
</Grid>
<syncfusion:SfListView x:Name="listView" Grid.Row="1"
ItemsSource="{Binding ToDoList}"
DragStartMode="OnHold"
BackgroundColor="#FFE8E8EC"
ItemSize="60" />
</Grid>
</ContentPage>
```

**C#**

```
public partial class MainPage : ContentPage
{
```

```
public MainPage()
{
    InitializeComponent();
    var grid = new Grid();
    grid.RowDefinitions.Add(new RowDefinition { Height = new GridLength(40) });
    grid.RowDefinitions.Add(new RowDefinition { Height = new GridLength(1,
        GridUnitType.Star) });
    var grid1 = new Grid();
    var headerLabel = new Label()
    {
        Text = "To Do Items"
    };
    var stackLayout = new StackLayout();
    stackLayout.SetBinding(StackLayout.IsVisibleProperty, new
        Binding("IsVisible"));
    var image = new Image() { Source = "Delete.png" };
    var deleteLabel = new Label() { Text = "DeleteItem" };
    stackLayout.Children.Add(image);
    stackLayout.Children.Add(deleteLabel);
    grid1.Children.Add(headerLabel);
    grid1.Children.Add(stackLayout);
    var listView = new SfListView()
    {
        DragStartMode = DragStartMode.OnHold,
        ItemSize = 60,
        SelectionMode = SelectionMode.None,
        BackgroundColor = Color.FromHex("#FFE8E8EC")
    };
    listView.SetBinding(ListView.ItemsSourceProperty, new Binding("ToDoList"));
    grid.Children.Add(grid1);
    grid.Children.Add(listView, 0, 1);
}
```

## C#

```
private async void ListView_ItemDragging(object sender,
    ItemDraggingEventArgs e)
{
    var viewModel = this.listView.BindingContext as ViewModel;
    if (e.Action == DragAction.Start)
    {
        viewModel.IsVisible = true;
        this.stackLayout.Opacity = 0.25;
    }
    if (e.Action == DragAction.Dragging)
    {
        var position = new Point(e.Position.X - this.listView.Bounds.X, e.Position.Y
            - this.listView.Bounds.Y);
        if (this.stackLayout.Bounds.Contains(position))
            this.deleteLabel.TextColor = Color.Red;
        else
            this.deleteLabel.TextColor = Color.White;
    }
    if (e.Action == DragAction.Drop)
    {

```

```
var position = new Point(e.Position.X - this.listView.Bounds.X, e.Position.Y - this.listView.Bounds.Y);  
if (this.stackLayout.Bounds.Contains(position))  
{  
    await Task.Delay(100);  
    viewModel.ToDoList.Remove(e.ItemData as ToDoItem);  
}  
viewModel.IsVisible = false;  
this.deleteLabel.TextColor = Color.White;  
this.headerLabel.IsVisible = true;  
}  
}
```

### Skip dragging item into another group

To skip dragging from one group to another group, handle the [ItemDragging](#) event based on the conditions of [Action](#) and [Bounds](#) event arguments.

---

**Note:** While auto-scrolling, dragging item cannot be skipped.

---

Skip the dragging item by bounds of dragging item, and bounds of current and next group item.

### C#

```
using Syncfusion.ListView.XForms.Control.Helpers;
private async void ListView_ItemDragging(object sender,
ItemDraggingEventArgs e)
{
    if (e.Action == DragAction.Dragging)
    {
        var currentGroup = this.GetGroup(e.ItemData);
        var container = this.ListView.GetVisualContainer();
        var groupIndex = this.ListView.DataSource.Groups.IndexOf(currentGroup);
        var nextGroup = (groupIndex + 1 < this.ListView.DataSource.Groups.Count) ?
this.ListView.DataSource.Groups[groupIndex + 1] : null;
        ListViewItem groupItem = null;
        ListViewItem nextGroupItem = null;
        foreach (ListViewItem item in container.Children)
        {
            if (item.BindingContext == null || !item.Visibility)
                continue;
            if (item.BindingContext.Equals(currentGroup))
                groupItem = item;
            if (nextGroup != null && item.BindingContext.Equals(nextGroup))
                nextGroupItem = item;
        }
        if (groupItem != null && e.Bounds.Y <= groupItem.Y + groupItem.Height ||
nextGroupItem != null && (e.Bounds.Y + e.Bounds.Height >= nextGroupItem.Y))
            e.Handled = true;
    }
}

private GroupResult GetGroup(object itemData)
{
    GroupResult itemGroup = null;
    foreach (var item in this.listView.DataSource.DisplayItems)
    {
        if (item is GroupResult)
            itemGroup = item as GroupResult;
        if (item == itemData)
            break;
    }
    return itemGroup;
}
```

Download sample from GitHub [here](#)

## Drag and drop customization

### Adjust drag item axis

To adjust drag item coordinates (X and Y) while dragging, returns true from virtual method [CanAdjustDragItemAxis](#) of [DragDropController](#). By default, Y coordinates can be adjusted if [SfListView.Orientation](#) is [Vertical](#), and X coordinates can be adjusted if [Orientation](#) is [Horizontal](#).

#### C#

```
this.listView.DragDropController = new DragDropControllerExt(this.listView);
public class DragDropControllerExt : DragDropController
{
    public DragDropControllerExt(SfListView listView) : base(listView)
    {
    }
    protected override bool CanAdjustDragItemAxis()
    {
        return true;
    }
}
```

### Layout item on dragging

In the SfListView, layout the [ListViewItem](#) with different animations, and time on dragging by virtual method [OnLayoutItem](#).

#### C#

```
this.listView.DragDropController = new DragDropControllerExt(this.listView);
public class DragDropControllerExt : DragDropController
{
    public DragDropControllerExt(SfListView listView) : base(listView)
    {
    }
    protected override Task<bool> OnLayoutItem(View element, Rectangle rect)
    {
        return element.LayoutTo(rect, 250, Easing.BounceIn);
    }
}
```

## Sorting

The SfListView supports sorting the data either in ascending or descending order by using [DataSource.SortDescriptors](#) property and by using the custom logic.

---

**Note:** When ItemsSource changed for ListView, [DataSource.SortDescriptors](#) will be cleared by default. You need to add [DataSource.SortDescriptors](#) again after changing ItemsSource if you want to retain sorting in listview.

---

### Programmatic sorting

Sorting the data by creating the [SortDescriptor](#) with required property name and direction and adding it into the [DataSource.SortDescriptors](#) property.

[SortDescriptor](#) object holds the following three properties:

- [PropertyName](#): Describes the name of the sorted property.

- [Direction](#): Describes an object of type [ListSortDirection](#) that defines the sorting direction.
- [Comparer](#): Describes the comparer to be applied when sorting take place.

### XML

```
<ContentPage xmlns:syncfusion="clr-  
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"  
xmlns:data="clr-  
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">  
  <syncfusion:SfListView x:Name="listView">  
    <syncfusion:SfListView.DataSource>  
      <data:DataSource>  
        <data:DataSource.SortDescriptors>  
          <data:SortDescriptor PropertyName="ContactName" Direction="Ascending"/>  
        </data:DataSource.SortDescriptors>  
      </data:DataSource>  
    </syncfusion:SfListView.DataSource>  
  </syncfusion:SfListView>  
</ContentPage>
```

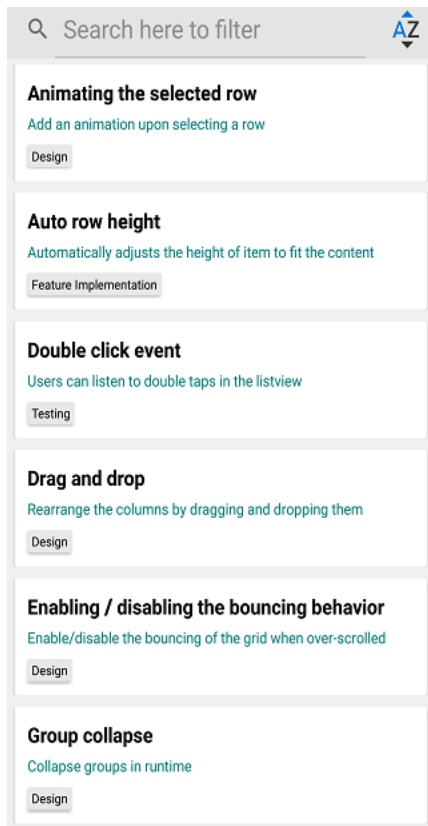

### C#

```
listView.DataSource.SortDescriptors.Add(new SortDescriptor()  
{  
    PropertyName = "ContactName",  
    Direction = ListSortDirection.Ascending,  
});  
listView.RefreshView();
```

---

**Note:** It is mandatory to specify the `PropertyName` of `SortDescriptor`.

---

### Custom sorting

Sort the items based on the custom logic and it can be applied to either [SfListView.DataSource.SortComparer](#) property or [SortDescriptor.Comparer](#) which is added into the [DataSource.SortDescriptors](#) collection.

You can download the entire sample code from the [github](#).

**Note:** If the `PropertyName` in the [SortDescriptor](#) and `GroupDescriptor` are same then, [GroupResult](#) will be passed as parameters for the `SortDescriptor.Comparer`. Otherwise data objects are passed. To sort the data items alone, set the different `PropertyName` in both `SortDescriptor` and `GroupDescriptor` properties.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">

    <ResourceDictionary>
      <local:CustomSortComparer x:Key="CustomSortComparer" />
    </ResourceDictionary>
  </ContentPage.Resources>
  <syncfusion:SfListView x:Name="listView"
  <syncfusion:SfListView.DataSource>
    <data:DataSource>
      <data:DataSource.SortDescriptors>
        <data:SortDescriptor Comparer="{StaticResource CustomSortComparer}"/>
      </data:SortDescriptors>
    </data:DataSource>
  </syncfusion:SfListView>
</ContentPage>
```

```

</data:DataSource.SortDescriptors>
</data:DataSource>
</syncfusion:SfListView.DataSource>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

```

listView.DataSource.SortDescriptors.Add(new SortDescriptor()
{
    Comparer = new CustomSortComparer()
});

```

**C#**

```

public class CustomSortComparer : IComparer<object>
{
    public int Compare(object x, object y)
    {
        if (x.GetType() == typeof(ListViewContactsInfo))
        {
            var xitem = (x as ListViewContactsInfo).ContactName;
            var yitem = (y as ListViewContactsInfo).ContactName;
            if (xitem.Length > yitem.Length)
            {
                return 1;
            }
            else if (xitem.Length < yitem.Length)
            {
                return -1;
            }
            else
            {
                if (string.Compare(xitem, yitem) == -1)
                {
                    return -1;
                }
                else if (string.Compare(xitem, yitem) == 1)
                {
                    return 1;
                }
            }
            return 0;
        }
    }
}

```

For more information about custom sorting of groups, please refer the documentation [here](#).

Sort the items on header tapped

To apply the sorting when tapping the header, handle the [ItemTapped](#) event of the SfListView.

**XML**

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">
<syncfusion:SfListView x:Name="listView" ItemSize="60"

```

```

ItemsSource="{Binding customerDetails}"
ItemTapped="ListView_ItemTapped"
IsStickyHeader="True">
<syncfusion:SfListView.HeaderTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<StackLayout BackgroundColor="Teal">
<Label TextColor="White" FontSize="20" FontAttributes="Bold"
Text="CustomerDetails" />
</StackLayout>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.HeaderTemplate>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

```

listView = new SfListView();
listView.ItemsSource = viewModel.customerDetails;
listView.ItemSize = 60;
listView.ItemTapped += ListView_ItemTapped;
listView.IsStickyHeader = true;
listView.HeaderTemplate = new DataTemplate(() =>
{
    var stackLayout = new StackLayout { BackgroundColor = Color.Teal };
    var label = new Label { Text = "CustomerDetails", TextColor = Color.White,
        FontAttributes = FontAttributes.Bold, FontSize = 20 };
    stackLayout.Children.Add(label);
    return stackLayout;
});

```

When the `ItemTapped` event is raised for the Header, add the [SortDescriptor](#) and refresh the view.

**C#**

```

private void ListView_ItemTapped(object sender,
Syncfusion.ListView.XForms.ItemTappedEventArgs e)
{
    //Applying sorting to the underlying data when the header item is tapped.
    if (e.ItemType == ItemType.Header && listView.IsStickyHeader)
    {
        listView.DataSource.SortDescriptors.Clear();
        listView.DataSource.SortDescriptors.Add(new SortDescriptor()
        {
            PropertyName = "ContactName",
            Direction = ListSortDirection.Ascending
        });
    }
}

```

Sort the items along with grouping

The SfListView allows sorting the items along with grouping by adding the [DataSource.GroupDescriptors](#) and the [DataSource.SortDescriptors](#) with required property name.

Sorting with grouping by year

Sorting the items along with grouping by using [KeySelector](#) based on returning the year value of the data-time property.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">
  <ContentPage.Content>
    <syncfusion:SfListView x:Name="listView" ItemsSource="{Binding Items}"
    ItemSize="50">
      <syncfusion:SfListView.GroupHeaderTemplate>
        <DataTemplate>
          <Grid>
            <Label Text= "{Binding Key}" BackgroundColor="Teal" FontAttributes="Bold"
            TextColor="White"/>
          </Grid>
        </DataTemplate>
      </syncfusion:SfListView.GroupHeaderTemplate>
    </syncfusion:SfListView>
  </ContentPage.Content>
</ContentPage>
```

### C#

```
var listView = new SfListView();
listView.ItemSize = 50;
listView.ItemsSource = viewModel.Items;
listView.GroupHeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var headerLabel = new Label
    {
        TextColor = Color.White,
        FontAttributes = FontAttributes.Bold,
        BackgroundColor=Color.Teal
    };
    headerLabel.SetBinding(Label.TextProperty, new Binding("key"));
    grid.Children.Add(headerLabel);
    return grid;
});
listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()
{
    PropertyName = "DateOfBirth",
    KeySelector = (object obj1) =>
    {
        var item = (obj1 as Contacts);
        return item.DateOfBirth.Year;
    },
});
```

```
this.listView.DataSource.SortDescriptors.Add(new SortDescriptor()
{
    PropertyName = "DateOfBirth",
    Direction = ListSortDirection.Ascending
});
```

The following screenshot shows the output when items are sorted by year. Download the entire source code from GitHub [here](#)

## Filtering

This section explains how to filter the data and its related operations in the SfListView.

### Programmatic filtering

The [SfListView](#) supports to filter the data by setting the [SfListView.DataSource.Filter](#) property. You have to call the [SfListView.DataSource.RefreshFilter\(\)](#) method after assigning the [Filter](#) property for refreshing the view.

The [FilterChanged](#) event is raised once filtering is applied to the SfListView.

The [FilterContacts](#) method filters the data contains the filter text value. Assign [FilterContacts](#) method to [SfListView.DataSource.Filter](#) predicate to filter the [ContactName](#). To apply filtering in the SfListView, follow the code example:

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <Grid>
    <Grid.RowDefinitions>
      <RowDefinition Height="Auto"/>
      <RowDefinition Height="Auto"/>
    </Grid.RowDefinitions>
    <SearchBar x:Name="filterText" HeightRequest="40"
      Placeholder="Search here to filter"
      TextChanged="OnFilterTextChanged" Grid.Row="0"/>
    <syncfusion:SfListView x:Name="listView" Grid.Row="1" ItemSize="60"
      ItemsSource="{Binding customerDetails}"/>
  </Grid>
</ContentPage>
```

```
</Grid>
</ContentPage>
```

### C#

```
var grid = new Grid();
var searchBar = new SearchBar() { Placeholder = "Search here to filter" };
searchBar.TextChanged += OnFilterTextChanged;
var listView = new SfListView();
listView.ItemsSource = viewModel.customerDetails;
listView.ItemSize = 60;
grid.Children.Add(searchBar);
grid.Children.Add(listView, 0, 1);
```

The following code example illustrates code for filtering the data using `FilterContacts` method in the ViewModel:

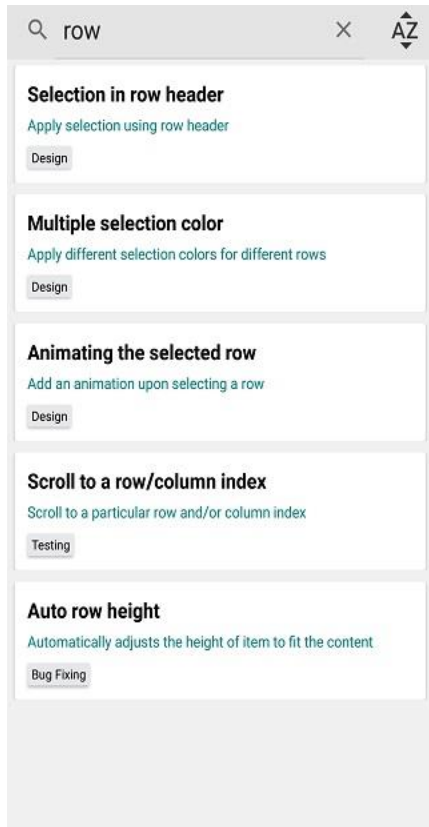

### C#

```
SearchBar searchBar = null;
private void OnFilterTextChanged(object sender, TextChangedEventArgs e)
{
    searchBar = (sender as SearchBar);
    if (listView.DataSource != null)
    {
        this.listView.DataSource.Filter = FilterContacts;
        this.listView.DataSource.RefreshFilter();
    }
}

private bool FilterContacts(object obj)
{
    if (searchBar == null || searchBar.Text == null)
        return true;
    var contacts = obj as Contacts;
    if (contacts.ContactName.ToLower().Contains(searchBar.Text.ToLower())
        || contacts.ContactName.ToLower().Contains(searchBar.Text.ToLower()))
        return true;
    else
        return false;
}
```

Download the entire source code from GitHub [here](#)

The following screenshot shows the output rendered when the items are filtered:

### *Filter based on multiple criteria*

The [SfListView](#) allows filtering the items based on multiple criteria. To filter the data using multiple properties, follow the code example:

#### **C#**

```
private bool FilterContacts(object obj)
{
    if (searchBar == null || searchBar.Text == null)
        return true;
    var contacts = obj as Contacts;
    if (contacts.ContactName.ToLower().Contains(searchBar.Text.ToLower())
        || contacts.ContactNumber.ToLower().Contains(searchBar.Text.ToLower()))
        return true;
    else
        return false;
}
```

### Getting the filtered data

You can get filtered items from the view and modify it in the [SfListView.DataSource.FilterChanged](#) event. When filter is applied, the filtered items are available in the [SfListView.DataSource.DisplayItems](#).

#### **C#**

```
listView.DataSource.FilterChanged += DataSource_FilterChanged;
...
private void DataSource_FilterChanged(object sender,
    NotifyCollectionChangedEventArgs e)
```

```
{  
    //Contacts is model class  
    ObservableCollection<Contacts> contacts = new  
    ObservableCollection<Contacts>();  
    // Get the filtered items  
    var items = (sender as DataSource).DisplayItems;  
    foreach (var item in items)  
        contacts.Add(item as Contacts);  
}
```

### Clear filtering

The SfListView allows clearing the filters by setting the [DataSource.Filter](#) to null, and call the [DataSource.RefreshFilter](#) method.

#### C#

```
listView.DataSource.Filter = null;  
listView.DataSource.RefreshFilter();
```

### Sort the filtered items

The order of the filtered items can be rearranged in the [FilterChanged](#) event by adding [SortDescriptor](#). To sort the filtered items, follow the code example:

#### C#

```
private void DataSource_FilterChanged(object sender,  
    NotifyCollectionChangedEventArgs e)  
{  
    listView.DataSource.SortDescriptors.Add(new SortDescriptor { PropertyName =  
        "ContactName",  
        Direction = ListSortDirection.Ascending });  
    listView.RefreshView();  
}
```

## Grouping

A group represents a collection of items belongs to a category. When grouping is applied, the data is organized into different groups based on key values. Each group is identified by its [Key](#), by which you can get the underlying data in the group.

---

**Note:** When ItemsSource changed for ListView, [DataSource.GroupDescriptors](#) will be cleared by default. You need to add `DataSource.GroupDescriptors` again after changing ItemsSource if you want to retain grouping in listview.

---

### Programmatic grouping

The SfListView allows programmatic grouping by defining the [GroupDescriptor](#) object, and adding it into the [DataSource.GroupDescriptors](#) collection. The `GroupDescriptor` object holds the following properties:

- [PropertyName](#): Describes the name of the property to be grouped.
- [KeySelector](#): Describes selector to return the group key.
- [Comparer](#): Describes comparer to be applied in when sorting take place.

## XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">
  <syncfusion:SfListView x:Name="listView">
    <syncfusion:SfListView.DataSource>
      <data:DataSource>
        <data:DataSource.GroupDescriptors>
          <data:GroupDescriptor PropertyName="BookName"/>
        </data:DataSource.GroupDescriptors>
      </data:DataSource>
    </syncfusion:SfListView.DataSource>
  </syncfusion:SfListView>
</ContentPage>
```

## C#

```
listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()
{
    PropertyName = "ContactName",
});
```

### Custom grouping

ListView supports grouping the items based on custom logic for each [GroupDescriptor](#) by using [KeySelector](#). Below topics explains how to achieve different custom grouping use cases with code examples,

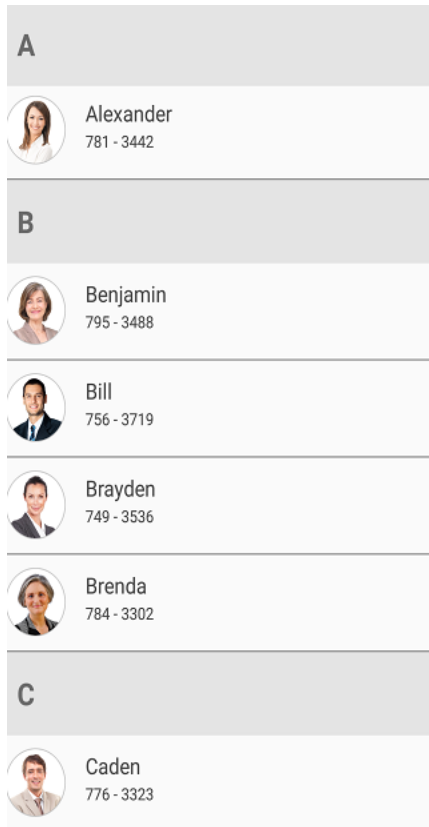

#### Grouping based on first character

The SfListView supports grouping the items based on first character of the value assigned to the property name in [GroupDescriptor](#) by using [KeySelector](#).

## C#

```
listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()
{
    PropertyName = "ContactName",
    KeySelector = (object obj1) =>
    {
        var item = (obj1 as Contacts);
        return item.ContactName[0].ToString();
    }
    Comparer = new CustomGroupComparer()
});
```

The following screenshot shows the output when grouping based on first character.

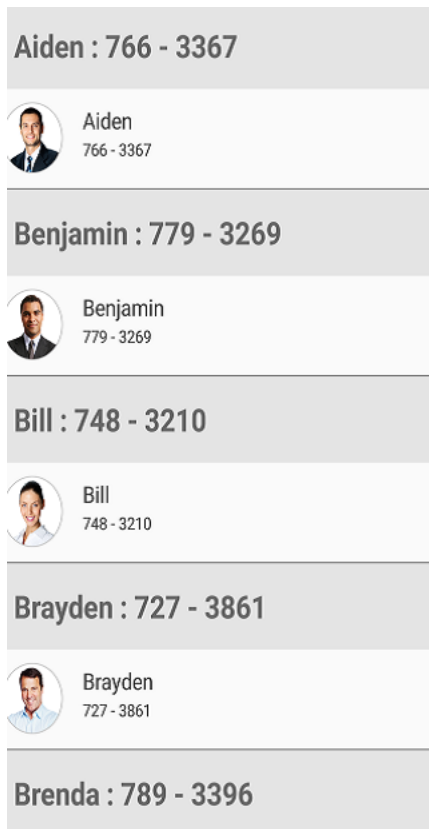

*Grouping based on more than one property in the data object*

Group the items by binding multiple properties to the property name of [GroupDescriptor](#) by using [KeySelector](#) in which the group header items can be created with multiple data model object effectively.

### C#

```
listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()  
{  
    PropertyName = "Designation",  
    KeySelector = (object obj1) =>  
    {  
        var item = (obj1 as Employee);  
        return item.Designation + item.Level;  
    }  
});
```

The following screenshot shows the output when grouping based on more than one property .

#### *Grouping by ignoring case sensitivity*

Grouping the items by ignoring case sensitive by using the [KeySelector](#) property in the [GroupDescriptor](#). While returning the [KeySelector](#), convert the required property name in the data model to group either as Upper or Lower case. The items will be grouped based on the [KeySelector](#) with returned case sensitive.

#### **C#**

```
listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()  
{  
    PropertyName = "ContactName",  
    KeySelector = (object obj) =>  
    {  
        return (obj as Contacts).ContactName.ToUpper()[0];  
    }  
});
```

The following screenshot shows grouping by ignoring case sensitivity.

### Sorting the groups

ListView sorts the groups using default sorting logic of List.

#### *Custom sorting of groups*

The SfListView supports sorting the groups based on custom logic applied to either [SfListView.DataSource.GroupComparer](#) property or [GroupDescriptor.Comparer](#) added to the `DataSource.GroupDescriptors` collection.

In custom group comparer, all the items present in a group compares each other based on the items count to each group sorted accordingly. You can download the entire sample code [here](#)

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable"
xmlns:local="clr-namespace:CustomGrouping">
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding
ContactsInfo}">
<syncfusion:SfListView.DataSource>
<dataSource:DataSource>
<dataSource:DataSource.GroupDescriptors>
<dataSource:GroupDescriptor PropertyName="ContactType">
<dataSource:GroupDescriptor.Comparer>
<local:CustomGroupComparer/>
</dataSource:GroupDescriptor.Comparer>
</dataSource:GroupDescriptor>
</dataSource:DataSource.GroupDescriptors>
```

```

</dataSource:DataSource>
</syncfusion:SfListView.DataSource>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

```

public class CustomGroupComparer : IComparer<GroupResult>
{
    public int Compare(GroupResult x, GroupResult y)
    {
        if (x.Count > y.Count)
        {
            //GroupResult y is stacked into top of the group i.e., Ascending.
            //GroupResult x is stacked at the bottom of the group i.e., Descending.
            return 1;
        }
        else if (x.Count < y.Count)
        {
            //GroupResult x is stacked into top of the group i.e., Ascending.
            //GroupResult y is stacked at the bottom of the group i.e., Descending.
            return -1;
        }
        return 0;
    }
}

```

*Sorting the items within group*

Group the items of underlying collection along with sorting by adding the [DataSource.GroupDescriptors](#) and the [DataSource.SortDescriptors](#) with required properties.

**C#**

```

public GroupingPage()
{
    InitializeComponent();
    listView.DataSource.SortDescriptors.Add(new SortDescriptor { PropertyName =
"ContactName", Direction = ListSortDirection.Ascending });
    //Applying custom grouping
    listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()
    {
        PropertyName = "ContactName",
        KeySelector = (object obj1) =>
        {
            var item = (obj1 as Contacts);
            return item.ContactName[0].ToString();
        },
    });
}

```

*Group header summary**Aggregate summary*

For each group, display the sum of values of the property from model object in the [SfListView.GroupHeaderTemplate](#) by using converter.

**XML**

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">
<syncfusion:SfListView x:Name="listView">
<syncfusion:SfListView.GroupHeaderTemplate>
<DataTemplate x:Name="GroupHeaderTemplate" x:Key="GroupHeaderTemplate">
<ViewCell>
<ViewCell.View>
<Grid BackgroundColor="#E4E4E4">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="*" />
</Grid.ColumnDefinitions>
<Label Text="{Binding Key}" />
<Label Text="{Binding Items,Converter={StaticResource Converter}}"
Grid.Column="1" />
</Grid>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.GroupHeaderTemplate>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

```

listView.GroupHeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var label1 = new Label();
    label1.SetBinding(Label.TextProperty, new Binding("Key"));
    var label2 = new Label();
    Binding binding = new Binding("Items");
    binding.Converter = new Converter();
    label2.SetBinding(Label.TextProperty, binding);
    grid.Children.Add(label1);
    grid.Children.Add(label2, 1, 0);
    return grid;
});
public object Convert(object value, Type targetType, object parameter,
CultureInfo culture)
{
    int result = 0;
    var items = value as IEnumerable;
    if(items != null)
    {
        var items = items.ToList<object>().ToList<object>();
        if (items != null)
        {
            for (int i = 0; i < items.Count; i++)
            {
                var contact = items[i] as Contacts;
                result += contact.ContactNumber;
            }
        }
    }
}

```

```

}
}
return result
}

```

The following screenshot shows grouping by sum of property value.

Download the entire sample code [here](#).

A Sum of salary: 38391	
	Adam 10,913
	Adrian 14,659
	Aiden 12,819
B Sum of salary: 34377	
	Bill 12,989
	Brenda 10,234
	Bryson 11,154

#### Displaying items count

The total number of items in each group will be displayed in the group header by binding the [Count](#) property in the [SfListView.GroupHeaderTemplate](#).

#### XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">

    <syncfusion:SfListView.GroupHeaderTemplate>
      <DataTemplate>
        <Grid BackgroundColor="#E4E4E4">
          <Grid.ColumnDefinitions>
            <ColumnDefinition Width="*" />
            <ColumnDefinition Width="*" />
          </Grid.ColumnDefinitions>
          <StackLayout Orientation="Horizontal" HorizontalOptions="Start"
            VerticalOptions="Center" >

```

```

<Label Text="{Binding Key}" TextColor="Black" />
<Label Text="Year" TextColor="Black" />
</StackLayout>
<StackLayout Orientation="Horizontal" Grid.Column="1"
HorizontalOptions="EndAndExpand" VerticalOptions="Center">
<Label Text="{Binding Count}" TextColor="Black" />
<Label Text="Item(s)" TextColor="Black" />
</StackLayout>
</Grid>
</DataTemplate>
</syncfusion:SfListView.GroupHeaderTemplate>
</syncfusion:SfListView>
</ContentPage>

```

## C#

```

listView.GroupHeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var stack1 = new StackLayout()
    {
        VerticalOptions = LayoutOptions.Center,
        HorizontalOptions = LayoutOptions.Start,
        Orientation = StackOrientation.Horizontal
    };
    var yearLabel = new Label
    {
        TextColor = Color.Black,
    };
    var yearlabel2 = new Label() { Text="Year", TextColor=Color.Black};
    yearLabel.SetBinding(Label.TextProperty, new Binding("key"));
    var stack2 = new StackLayout()
    {
        VerticalOptions = LayoutOptions.Center,
        HorizontalOptions = LayoutOptions.EndAndExpand,
        Orientation = StackOrientation.Horizontal
    };
    var countLabel = new Label
    {
        TextColor = Color.Black,
    };
    countLabel.SetBinding(Label.TextProperty, new Binding("Count"));
    var countlabel2 = new Label() { Text="Item's" , TextColor=Color.Black};
    grid.Children.Add(stack1);
    grid.Children.Add(stack2, 1, 0);
    return grid;
});

```

The following screenshot shows the output when displaying items count at group header.

 Jackson 789 - 3789	
 Jayden 736 - 3781	
 Joseph 795 - 3086	

### Multi-level grouping

The SfListView supports multiple level grouping by adding multiple [GroupDescriptor](#) objects into the [DataSource.GroupDescriptors](#) collection. The grouped items will be displayed in hierarchical structure by customizing the [SfListView.GroupHeaderTemplate](#) property. In the [GroupHeaderTemplate](#), set the [Padding](#) property to the custom view to arrange the group header items and sub-group header items in the hierarchical structure.

**Note:** Multi-level grouping is only applicable for [LinearLayout](#) in the SfListView.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">

}
}

```

The following screenshot shows the output for multi-level grouping.

Download the entire source code from GitHub [here](#).

### Group expand and collapse

By default, the groups will be in expanded state in the SfListView. You can expand or collapse the group at runtime by setting the [SfListView.AllowGroupExpandCollapse](#) to true. So, when tapping the group header, the group gets collapse if the group is in expand state and vice-versa.

### XML

```

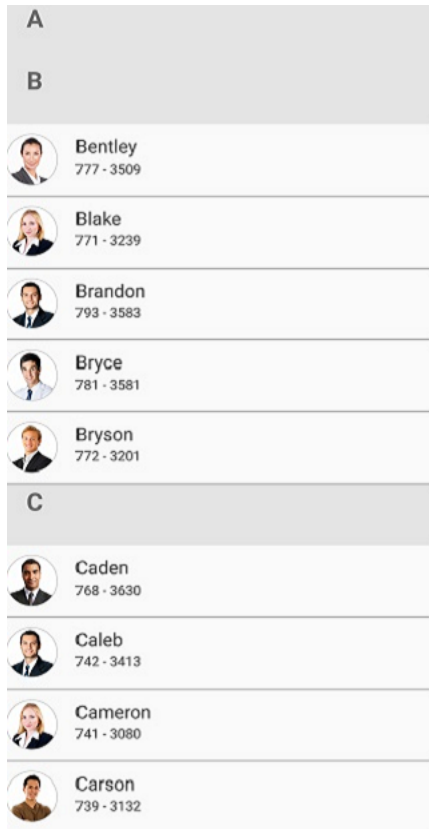

<syncfusion:SfListView x:Name="listView" ItemSize="70"
AllowGroupExpandCollapse="True"
ItemsSource="{Binding contactsInfo}" />

```

**C#**

```
listView.AllowGroupExpandCollapse = true;
```

The following screenshot shows the output when the groups are collapsed.

*Programmatic expand and collapse**Expand or collapse all the groups*

Expand or collapse all the groups programmatically at runtime by using the [SfListView.ExpandAll](#) method and [SfListView.CollapseAll](#) method.

**C#**

```
listView.ExpandAll();  
listView.CollapseAll();
```

*Expand or collapse a specific group*

Expand or collapse a specific group by using the [SfListView.ExpandGroup](#) method and [SfListView.CollapseGroup](#) method.

**C#**

```
var group = listView.DataSource.Groups[0];  
listView.ExpandGroup(group);  
listView.CollapseGroup(group);
```

### Expand or collapse all groups by default

Expand or collapse all the groups by default using the [SfListView.Loaded](#) event.

#### C#

```
listView.Loaded += ListView_Loaded;
private void ListView_Loaded(object sender, ListViewLoadedEventArgs e)
{
    listView.CollapseAll();
    listView.ExpandAll();
}
```

### Keeping only one group in expanded state

To keep any one specific group alone in the expanded state, use the [SfListView.GroupExpanding](#) event. The particular selected group can be get from [GroupExpandCollapseChangingEventArgs](#), by which you can compare and collapse all other groups, and expand the particular selected group.

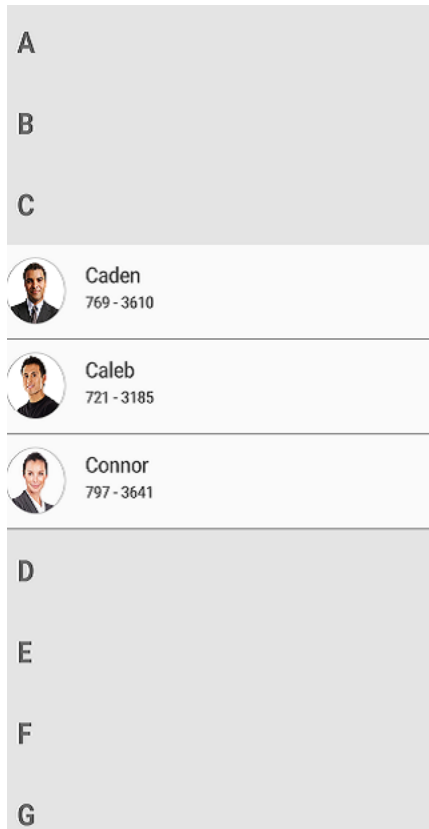

#### C#

```
private void ListView_GroupExpanding(object sender,
GroupExpandCollapseChangingEventArgs e)
{
    if (e.Groups.Count > 0)
    {
        var group = e.Groups[0];
        if (expandedGroup == null || group.Key != expandedGroup.Key)
        {
            foreach (var otherGroup in listView.DataSource.Groups)
            {
                if (group.Key != otherGroup.Key)
                {
                    listView.CollapseGroup(otherGroup);
                }
            }
            expandedGroup = group;
            listView.ExpandGroup(expandedGroup);
        }
    }
}
```

The following screenshot shows the output when one group in expanded state.

Download the entire source code from GitHub [here](#).

### Events

#### GroupExpanding Event

The [SfListView.GroupExpanding](#) event occurs when the group is being expanded.

The [GroupExpandCollapseChangingEventArgs](#) of the [GroupExpanding](#) event provides the information about the expanding group and it has the following members:

[Groups](#): Gets a list of groups being expanded.

[Cancel](#): Decides whether to cancel the group expansion or not.

The [GroupExpanding](#) event used for the following use case.

- Keeps any one specific group in the expanded state by comparing and collapsing all other groups.

You can cancel the group expansion by setting [GroupExpandCollapseChangingEventArgs.Cancel](#) to true.

### XML

```
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding contactsInfo}"
    GroupExpanding="ListView_GroupExpanding" />
```

### C#

```
listView.GroupExpanding += ListView_GroupExpanding;
```

**C#**

```
private void ListView_GroupExpanding(object sender,
GroupExpandCollapseChangingEventArgs e)
{
    if (e.Groups[0] == listView.DataSource.Groups[0])
        e.Cancel = true;
}
```

*GroupExpanded Event*

The [SfListView.GroupExpanded](#) event occurs after expanding the group.

The [GroupExpandCollapseChangedEventArgs](#) of the [GroupExpanded](#) event provides the information about the expanded group and it has the following member:

[Groups](#): Gets a list of expanded groups.

*GroupCollapsing Event*

The [SfListView.GroupCollapsing](#) event occurs when the group is being collapsed.

The [GroupExpandCollapseChangingEventArgs](#) of the [GroupCollapsing](#) event provides the information about the collapsing group and it contains the following members:

[Groups](#): Gets a list of groups being collapsed.

[Cancel](#): Decides whether to cancel the group collapsing or not.

You can cancel the group is being collapsed by using the [GroupExpandCollapseChangingEventArgs.Cancel](#) of [GroupCollapsing](#) event.

**XML**

```
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding
contactsInfo}"
GroupCollapsing="ListView_GroupCollapsing" />
```

**C#**

```
listView.GroupCollapsing += ListView_GroupCollapsing;
```

**C#**

```
private void ListView_GroupCollapsing(object sender,
GroupExpandCollapseChangingEventArgs e)
{
    if (e.Groups[0] == listView.DataSource.Groups[0])
        e.Cancel = true;
}
```

*GroupCollapsed Event*

The [SfListView.GroupCollapsed](#) event occurs after the group is collapsed.

The [GroupExpandCollapseChangedEventArgs](#) of the [GroupCollapsed](#) event provides the information about collapsed group and it contains the following member.

[Groups](#): Gets a list of collapsed groups.

#### Stick group header

To stick the group header to view, enable the property [SfListView.IsStickyGroupHeader](#). If [IsStickyGroupHeader](#) is true, the corresponding group header will be in view until the last item of the group goes out of view, and sticky group header will move when another group header leads while scrolling.

**Information:** If sticky group header is enabled and [AutoFitMode](#) is [Height](#), the panning experience will not be smooth or item's layout will not work as expected. To make the panning experience smooth, set the same size for all group header items by handling the [QueryItemSize](#) event.

**Note:** When the [IsStickyGroupHeader](#) is set to true, the [IsStickyHeader](#) property will be changed to true because the header item can not be scrolled. When the [IsStickyHeader](#) is set to false, if [IsStickyGroupHeader](#) is true then it will be changed to false because the group header item cannot be sticky.

#### XML

```
<syncfusion:SfListView x:Name="listView" ItemSize="70"
IsStickyGroupHeader="True"
ItemsSource="{Binding contactsInfo}" />
```

#### C#

```
listView.IsStickyGroupHeader = true;
```

The following screenshot illustrates the output when the group headers are sticky.

## Group header customization

### *Appearance customization*

The User Interface (UI) for the group header items can be customized by using the [SfListView.GroupHeaderTemplate](#) property.

To customize the view for group header items and binding the [Key](#) to it, follow the code example.

### **XML**

```
<ContentPage xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView">
    <syncfusion:SfListView.GroupHeaderTemplate>
      <DataTemplate>
        <ViewCell>
```

```
<ViewCell.View>
<StackLayout BackgroundColor="#E4E4E4">
<Label Text="{Binding Key}"
FontSize="22"
FontAttributes="Bold"
VerticalOptions="Center"
HorizontalOptions="Start"
Margin="20,0,0,0" />
</StackLayout>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.GroupHeaderTemplate>
</syncfusion:SfListView>
</ContentPage>
```

## C#

```
listView.GroupHeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid { BackgroundColor = Color.FromHex("#E4E4E4") };
    var label = new Label
    {
        VerticalOptions = LayoutOptions.Center,
        HorizontalOptions = LayoutOptions.Start,
        Margin = new Thickness(20, 0, 0, 0),
    };
    label.SetBinding(Label.TextProperty, new Binding("Key"));
    grid.Children.Add(label);
    return grid;
});
```

The following screenshot shows the output when the groups header appearance customized by key.

#### *Expand and collapse icon in group header*

Expand and collapse the group when tapping icon in the group header item by customizing the [SfListView.GroupHeaderTemplate](#) with the help of converter.

#### **XML**

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <ContentPage.Resources>
    <ResourceDictionary>
      <local:BoolToImageConverter x:Key="BoolToImageConverter"/>
      <DataTemplate x:Name="GroupHeaderTemplate" x:Key="GroupHeaderTemplate">
        <ViewCell>
          <ViewCell.View>
            <Grid>
              <Grid.ColumnDefinitions>
                <ColumnDefinition Width="30" />
                <ColumnDefinition Width="*" />
              </Grid.ColumnDefinitions>
              <Image x:Name="NormalImage" Grid.Column="0" HorizontalOptions="Center"
                Source="{Binding IsExpand, Converter={StaticResource BoolToImageConverter}}"
                VerticalOptions="Center"/>
              <Label Text="{Binding Key}" Grid.Column="1"/>
            </Grid>
          </ViewCell.View>
        </ViewCell>
      </DataTemplate>
    </ResourceDictionary>
  </ContentPage.Resources>
```

```

<ContentPage.Content>
<Grid>
<syncfusion:SfListView x:Name="listView" ItemSize="70"
GroupHeaderSize="60"
GroupHeaderTemplate="{StaticResource GroupHeaderTemplate}"
ItemsSource="{Binding contactsInfo}"
AllowGroupExpandCollapse="True">
</syncfusion:SfListView>
</Grid>
</ContentPage.Content>
</ContentPage>

```

## C#

```

listView = new SfListView();
viewModel = new ContactsViewModel();
listView.ItemsSource = viewModel.contactsInfo;
listView.GroupHeaderTemplate = new DataTemplate(() =>
{
var grid = new Grid { BackgroundColor = Color.FromHex("#E4E4E4") };
var column0 = new ColumnDefinition { Width = 30 };
var column1 = new ColumnDefinition { Width = new GridLength(1,
GridUnitType.Star) };
grid.ColumnDefinitions.Add(column0);
grid.ColumnDefinitions.Add(column1);
var image = new Image();
Binding binding = new Binding("IsExpand");
binding.Converter = new BoolToImageConverter();
image.SetBinding(Image.SourceProperty, binding);
image.HeightRequest = 30;
image.WidthRequest = 30;
image.VerticalOptions = LayoutOptions.Center;
image.HorizontalOptions = LayoutOptions.Center;
var label = new Label
{
FontAttributes = FontAttributes.Bold,
FontSize = 22,
VerticalOptions = LayoutOptions.Center,
HorizontalOptions = LayoutOptions.Start,
Margin = new Thickness(20, 0, 0, 0),
};
label.SetBinding(Label.TextProperty, new Binding("Key"));
grid.Children.Add(image, 0, 0);
grid.Children.Add(label, 1, 0);
return grid;
});

```

You can switch the expand or collapse group icon based on `IsExpand` property using the converter.

## C#

```

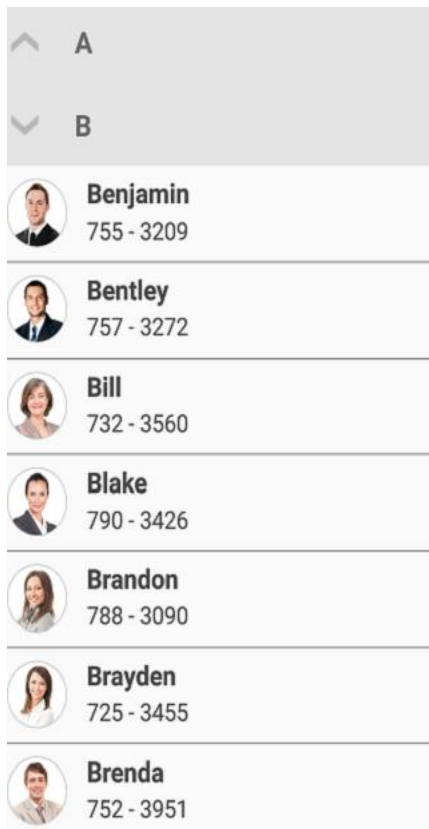

public class BoolToImageConverter : IValueConverter
{
public object Convert(object value, Type targetType, object parameter,
CultureInfo culture)
{

```

```
if ((bool) value)
return ImageSource.FromResource("ListViewSample.Images. GroupExpand.png");
else
return ImageSource.FromResource("ListViewSample.Images. GroupCollapse.png");
}
public object ConvertBack(object value, Type targetType, object parameter,
CultureInfo culture)
{
throw new NotImplementedException();
}
}
```

The following screenshot shows the output when grouping with expand collapse icon in group header.

Download entire source code from GitHub [here](#).

#### *Height customization*

The size of the group header items can be customized by setting the [SfListView.GroupHeaderSize](#) property. The default value of this property is 40. This property responds to runtime changes.

#### **XML**

```
<syncfusion:SfListView x:Name="listView" GroupHeaderSize="60" />
```

#### **C#**

```
listView.GroupHeaderSize = 60;
```

**Note:** For Vertical orientation, the group header size is considered as height and for Horizontal orientation, it will be considered as width.

#### *CheckBox in group header*

ListView supports selecting each group and items in the group like a checkBox selection by customizing the [SfListView.GroupHeaderTemplate](#) and the [ItemTemplate](#) respectively. The checkbox state will be update by using converter.

#### **XML**

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView>
<syncfusion:SfListView.GroupHeaderTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<Grid BackgroundColor="#d3d3d3">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="30" />
<ColumnDefinition Width="*" />
<ColumnDefinition Width="Auto" />
</Grid.ColumnDefinitions>
<Label Text="{Binding Key}" Grid.Column="1" VerticalTextAlignment="Center"/>
<Image Grid.Column="2" IsVisible="{Binding SelectionMode,
Source={x:Reference listView}}"
HorizontalOptions="Center" VerticalOptions="Center"
Source="{Binding ., Converter={StaticResource GroupingSelectionConverter},
ConverterParameter={x:Reference listView}}">
<Image.GestureRecognizers>
<TapGestureRecognizer Tapped="TapGestureRecognizer_Tapped"/>
</Image.GestureRecognizers>
</Image>
</Grid>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.GroupHeaderTemplate>
</syncfusion:SfListView>
</ContentPage>
```

#### **C#**

```
listView.GroupHeaderTemplate = new DataTemplate(() =>
{
var grid = new Grid();
var label = new Label() { VerticalTextAlignment=TextAlignment.Center};
label.SetBinding(Label.TextProperty, new Binding("Key"));
var image = new Image() { VerticalOptions=LayoutOptions.Center,
HorizontalOptions=LayoutOptions.Center};
Binding binding = new Binding(".");
binding.Converter = new GroupingSelectionConverter();
binding.ConverterParameter = listView;
image.SetBinding(Image.SourceProperty, binding);
Binding bind = new Binding("SelectionMode");
bind.Source = listView;
```

```

image.SetBinding(Image.IsVisibleProperty, bind);
var tapped = new TapGestureRecognizer();
tapped.Tapped += Image_Tapped;
image.GestureRecognizers.Add(tapped);
grid.Children.Add(label);
grid.Children.Add(image, 2, 0);
return grid;
});

```

The checkBox state in the `GroupHeaderTemplate` will be updated whenever items select and deselect by using converter.

### C#

```

public object Convert(object value, Type targetType, object parameter,
CultureInfo culture)
{
    if (value == null)
        return value;
    GroupResult groupResult = value as GroupResult;
    SfListView list = parameter as SfListView;
    var items = new List<MusicInfo>(groupResult.Items.ToList<MusicInfo>());
    if ((items.All(item => item.IsSelected == false)))
    {
        for (int i = 0; i < items.Count(); i++)
        {
            var item = items[i];
            (item as MusicInfo).IsSelected = false;
            list.SelectedItems.Remove(item);
        }
        return ImageSource.FromResource("CustomSelection.Images.NotSelected.png");
    }
    else if ((items.All(item => item.IsSelected == true)))
    {
        for (int i = 0; i < items.Count(); i++)
        {
            var item = items[i];
            (item as MusicInfo).IsSelected = true;
            list.SelectedItems.Add(item);
        }
        return ImageSource.FromResource("CustomSelection.Images.Selected.png");
    }
    else
        return ImageSource.FromResource("CustomSelection.Images.Intermediate.png");
}

```

To select and deselect all the items of group by tap the checkbox in the group header, follow the code example.

### C#

```

using Syncfusion.ListView.XForms.Control.Helpers;
private void TapGestureRecognizer_Tapped(object sender, EventArgs e)
{
    var image = (sender as Image);
    var groupResult = image.BindingContext as GroupResult;
}

```

```
if (groupResult == null)
return;
var items = groupResult.Items.ToList<MusicInfo>().ToList();
if ((items.All(listItem => listItem.IsSelected == true)))
{
for (int i = 0; i < items.Count(); i++)
{
var item = items[i];
(item as MusicInfo).IsSelected = false;
}
}
else if ((items.All(listItem => listItem.IsSelected == false)))
{
for (int i = 0; i < items.Count(); i++)
{
var item = items[i];
(item as MusicInfo).IsSelected = true;
}
}
this.RefreshGroupHeader(groupResult);
listView.RefreshView();
}
private void RefreshGroupHeader(GroupResult group)
{
foreach (var item in this.listView.GetVisualContainer().Children)
{
if (item.BindingContext == group)
{
item.BindingContext = null;
(item as GroupHeaderItem).Content.BindingContext = null;
}
}
}
```

The following screenshot shows the output when checking items in group header.

*Changing group header appearance when expanding*

Change the [SfListView.GroupHeaderTemplate](#) appearance like `BackgroundColor` of view while expanding the particular group with the help of Converter.

#### **XML**

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:data="clr-
namespace:Syncfusion.DataSource;assembly=Syncfusion.DataSource.Portable">
<ContentPage.Resources>
<ResourceDictionary>
<local:SelectionBoolToBackgroundColorConverter
x:Key="BoolToColorConverter"/>
</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfListView x:Name="listView" ItemSize="90"
AllowGroupExpandCollapse="True"
ItemSpacing="2" ItemsSource="{Binding Items}">
<syncfusion:SfListView.DataSource>
<data:DataSource>
<data:DataSource.GroupDescriptors>
<data:GroupDescriptor PropertyName="DisplayString"/>
</data:DataSource.GroupDescriptors>
</data:DataSource>
</syncfusion:SfListView.DataSource>
<syncfusion:SfListView.GroupHeaderTemplate>
<DataTemplate>
<StackLayout BackgroundColor="{Binding Path=IsExpand,
```

```

Converter={StaticResource BoolToColorConverter}}">
<Label Text="{Binding Key}"
VerticalOptions="Center" HorizontalOptions="Start" />
</StackLayout>
</DataTemplate>
</syncfusion:SfListView.GroupHeaderTemplate>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

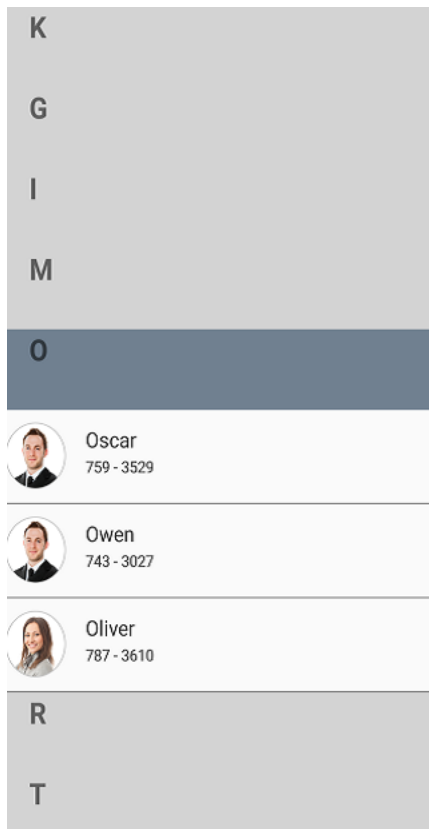

```

listView.DataSource.GroupDescriptors.Add(new GroupDescriptor()
{
    PropertyName = "BookName",
});
listView.GroupHeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var stack = new StackLayout();
    Binding binding = new Binding("IsExpand");
    binding.Converter = new BoolToColorConverter();
    stack.SetBinding(StackLayout.BackgroundColorProperty, binding);
    var label = new Label() {
        VerticalOptions=LayoutOptions.Center,HorizontalOptions=LayoutOptions.Start};
    label.SetBinding(Label.TextProperty, new Binding("Key"));
    stack.Children.Add(label);
    grid.Children.Add(stack);
    return grid;
});
public class SelectionBoolToBackgroundColorConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        return (bool)value == true ? Color.FromHex("#E4E4E4") :
            Color.FromHex("#ADD8E6");
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        throw new NotImplementedException();
    }
}

```

The following screenshot shows the output when group header appearance changed by expanding.

Download entire source code from GitHub [here](#)

#### *Providing Indentation for GroupHeader items*

ListView allows you to provide space between the group header items by using the [Margin](#) property of parent view in the [GroupHeaderTemplate](#) property. For example, in the following code snippet, StackLayout is considered as parent view and spacing is provided by setting its margin.

#### **XML**

```
<syncfusion:SfListView x:Name="listView" ItemSize="90"
AllowGroupExpandCollapse="True"
ItemSpacing="2" ItemsSource="{Binding Items}">
  <syncfusion:SfListView.GroupHeaderTemplate>
    <DataTemplate>
      <StackLayout BackgroundColor="#E4E4E4" Margin="2,0,0,0">
        <Label Text="{Binding Key}" FontSize="22" />
      </StackLayout>
    </DataTemplate>
  </syncfusion:SfListView.GroupHeaderTemplate>
</syncfusion:SfListView>
```

#### How To

##### *Allow to select only one item in a group at a time*

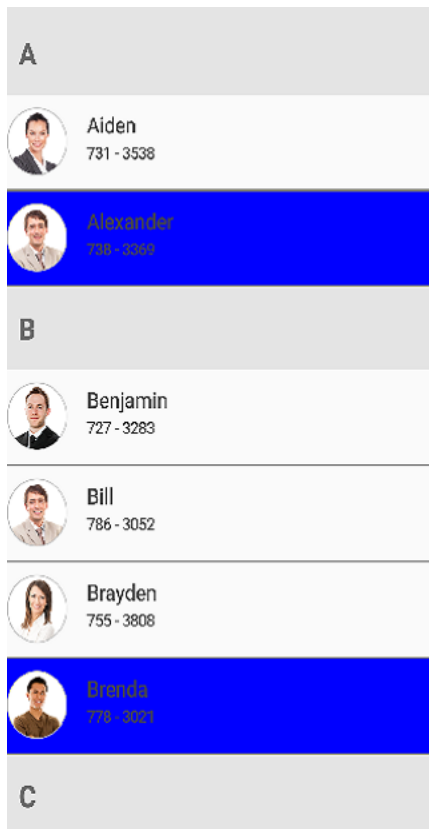

To select only one item in a group at a time, use the [ItemSelectionChangingEventArgs](#) event. If more than one item in the same group gets selected, already selected item will be removed from ListView's SelectedItems.

#### **C#**

```
private void ListView_SelectionChanging(object sender,
ItemSelectionChangingEventArgs e)
{
    GroupResult actualGroup = null;
    object key = null;
    var selectedItems = listView.SelectedItems;
    //To Cancel the Deselection
    if (e.RemovedItems.Count > 0 && selectedItems.Contains(e.RemovedItems[0]))
    {
        e.Cancel = true;
        return;
    }
    //To return when SelectedItems is zero
    if (e.AddedItems.Count <= 0)
        return;
    var itemData = (e.AddedItems[0] as Contacts);
    var descriptor = listView.DataSource.GroupDescriptors[0];
    if (descriptor.KeySelector == null)
    {
        var Collection = new PropertyInfoCollection(itemData.GetType());
        key = Collection.GetValue(itemData, descriptor.PropertyName);
    }
    else
        key = descriptor.KeySelector(itemData);
    for (int i = 0; i < listView.DataSource.Groups.Count; i++)
    {
        var group = listView.DataSource.Groups[i];
        if ((group.Key != null && group.Key.Equals(key)) || group.Key == key)
        {
            actualGroup = group;
            break;
        }
    }
    if (selectedItems.Count > 0)
    {
        foreach (var item in actualGroup.Items)
        {
            var groupItem = item;
            if (selectedItems.Contains(groupItem))
            {
                listView.SelectedItems.Remove(groupItem);
                break;
            }
        }
    }
}
```

The following screenshot shows the output when only one item in a group gets selected.

Download entire source code from GitHub [here](#).

#### *Add an item at the specific index in a group*

The SfListView allows adding an item at the specific index in a group by finding the group with the help of [Key](#) value of the group.

#### **C#**

```
internal void GetGroupResult(object ItemData)
{
    var descriptor = listView.DataSource.GroupDescriptors[0];
    object key;
    if (descriptor.KeySelector == null)
    {
        var propertyInfoCollection = new PropertyInfoCollection(ItemData.GetType());
        key = propertyInfoCollection.GetValue(ItemData, descriptor.PropertyName);
    }
    else
    {
        key = descriptor.KeySelector(ItemData);
        for (int i = 0; i < this.listView.DataSource.Groups.Count; i++)
        {
            var group = this.listView.DataSource.Groups[i];
            if ((group.Key != null && group.Key.Equals(key)) || group.Key == key)
            {
                itemGroup = group;
                break;
            }
            group = null;
        }
        itemGroup = this.listView.DataSource.Groups.FirstOrDefault(x => x.Key == key);
    }
}
```

```
descriptor = null;  
key = null;  
}
```

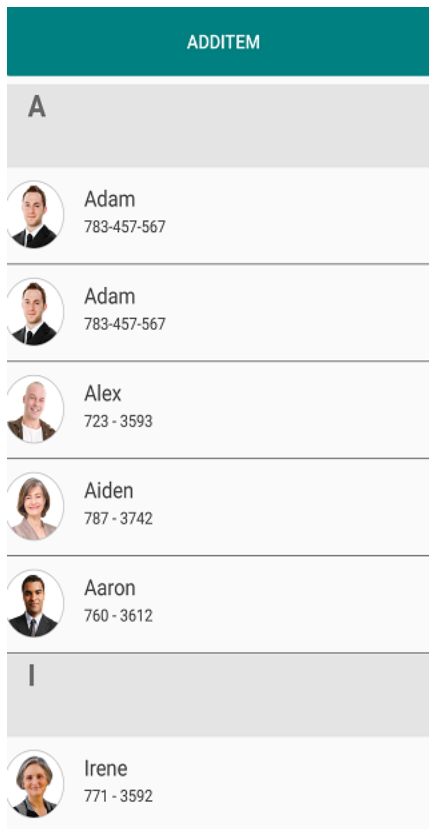

To add item at specific index in a group, follow the code example

### C#

```
using Syncfusion.ListView.XForms.Control.Helpers;  
private void AddItem_Clicked(object sender, EventArgs e)  
{  
    var contact = new Contacts();  
    contact.ContactName = "Adam";  
    contact.ContactNumber = "783-457-567";  
    contact.DisplayString = "A";  
    contact.ContactImage = ImageSource.FromResource("Grouping.Images.Image" + 25  
    + ".png");  
    ViewModel.ContactItems.Add(contact);  
    GetGroupResult(contact);  
    if (itemGroup == null)  
        return;  
    var items = itemGroup.GetType().GetRuntimeProperties().FirstOrDefault(x =>  
    x.Name == "ItemList").GetValue(itemGroup) as List<object>;  
    InsertItemInGroup(items, contact, 0);  
}  
internal void InsertItemInGroup(List<object> items, object Item, int  
InsertAt)  
{  
    visualContainer = listView.GetVisualContainer();  
    items.Remove(Item);  
    items.Insert(InsertAt, Item);  
    visualContainer.ForceLayout();  
}
```

The following screenshot shows the output when item added at specified index.

Download entire source code from GitHub [here](#).

## Header and Footer

This section explains how to define and customize the header and footer in the SfListView.

### Header and footer customization

The [SfListView](#) allows adding and customizing appearance of the header and footer by setting the [SfListView.HeaderTemplate](#) and [SfListView.FooterTemplate](#) properties.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView"
    ItemsSource="{Binding InboxInfo}"
    ItemSize="100">
    <syncfusion:SfListView.HeaderTemplate>
      <DataTemplate>
        <Grid BackgroundColor="#4CA1FE" HeightRequest="45">
          <Label LineBreakMode="NoWrap"
            Margin="10,0,0,0" Text="Inbox" FontAttributes="Bold"
            FontSize="18" TextColor="White" HorizontalOptions="Center"
            VerticalOptions="Center"/>
        </Grid>
      </DataTemplate>
    </syncfusion:SfListView.HeaderTemplate>
  </syncfusion:SfListView>
</ContentPage>
```

### C#

```
viewModel = new ViewModel ();
listView = new SfListView();
listView.ItemsSource = viewModel.InboxInfo;
listView.HeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    grid.BackgroundColor = Color.FromHex("#4CA1FE");
    var headerLabel = new Label
    {
        BackgroundColor = Color.White,
        FontSize = 18,
        FontAttributes = FontAttributes.Bold,
        Text = "Inbox"
    };
    grid.Children.Add(headerLabel);
    return grid;
});
```

### Header and footer items appearance

The [SfListView](#) allows customizing size of the header and footer items by setting the [SfListView.HeaderSize](#) and [SfListView.FooterSize](#) properties. The default value is 40. These properties can be customized at runtime.

#### XML

```
<syncfusion:SfListView x:Name="listView" HeaderSize="70" FooterSize="60" />
```

#### C#

```
listView.HeaderSize = 70;
listView.FooterSize = 60;
```

**Note:** For vertical orientation, the header and footer size are considered as height. For horizontal orientation, that will be considered as width.

### Sticky header and footer

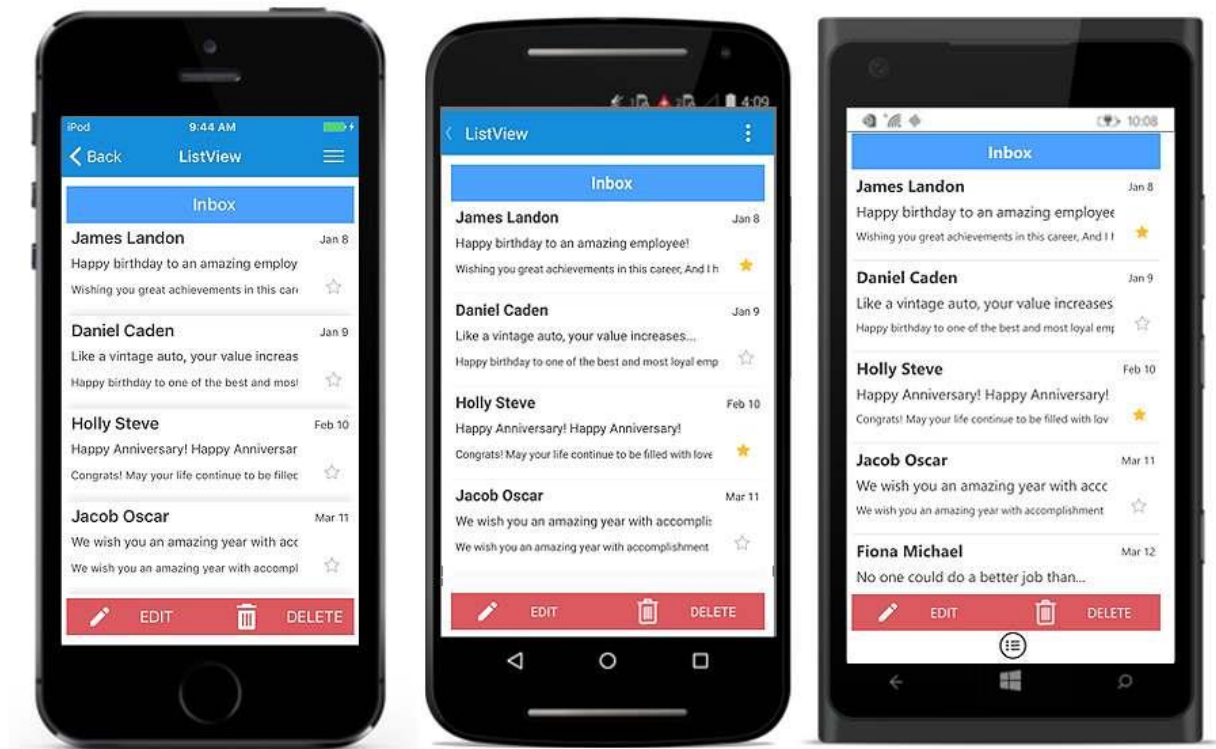

The [SfListView](#) allows sticking the header and footer items to view by enabling the [SfListView.IsStickyHeader](#) and [SfListView.IsStickyFooter](#) properties. If the [SfListView.IsStickyHeader](#) is **true**, the header item will stick to the top of the view. If the [SfListView.IsStickyFooter](#) is **true**, the footer item will stick to the bottom of the view.

#### XML

```
<syncfusion:SfListView x:Name="listView" IsStickyHeader="True"
IsStickyFooter="True" />
```

#### C#

```
listView.IsStickyHeader = true;
listView.IsStickyFooter = true;
```

### Sticky footer position

The [SfListView](#) allows to position the footer item by using the [StickyFooterPosition](#) property.

The [StickyFooterPosition](#) property has two options:

- **Body:** The footer item will be positioned inside the body of the ListView when the items are less than the view size.
- **Default:** The footer item will be positioned at the bottom of the ListView.

### XML

```
<syncfusion:SfListView x:Name="listView" StickyFooterPosition="Body"/>
```

### C#

```
listView.StickyFooterPosition = FooterPosition.Body;
```

How to

*TabView appearance using listview header*

The [SfListView](#) allows performing tab view structure by customizing the [HeaderTemplate](#) to load any view.

#### **XML**

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <ContentPage.BindingContext>
    <local:BookInfoRepository />
  </ContentPage.BindingContext>
  <ContentPage.Resources>
    <ResourceDictionary>
      <DataTemplate x:Key="template">

## Selection

This section explains how to perform selection and its related operations in the SfListView.

### UI selection

The SfListView allows selecting items either programmatically or touch interactions by setting the [SfListView.SelectionMode](#) property value to other than **None**. The control has different selection modes to perform selection operations as listed as follows:

- **None**: Allows disabling selection.
- **Single**: Allows selecting single item only. When clicking on the selected item, selection not will not be cleared. This is the default value for [SfListView.SelectionMode](#).
- **SingleDeselect**: Allows selecting single item only. When clicking on the selected item, selection gets cleared.
- **Multiple**: Allows selecting more than one item. Selection is not cleared when selecting more than one items. When clicking on the selected item, selection gets cleared.

The SfListView allows selecting items on different gestures such as tap, double tap, and hold by setting the [SfListView.SelectionGesture](#). The default value for the [SfListView.SelectionGesture](#) is [TouchGesture.Tap](#).

### XML

```
<syncfusion:SfListView x:Name="listView"
    SelectionMode="Multiple"
    SelectionGesture="Hold"/>
```

### C#

```
listView.SelectionMode = SelectionMode.Multiple;
listView.SelectionGesture = TouchGesture.Hold;
```

	Adventure of a lifetime Coldplay	50.3KB

### Programmatic selection

When the [SfListView.SelectionMode](#) is other than `None`, the item or items in the SfListView can be selected from the code by setting the [SfListView.SelectedItem](#), or adding items to the [SfListView.SelectedItems](#) property based on the `SfListView.SelectionMode`.

When the selection mode is `Single`, programmatically select an item by setting the underlying object to the [SfListView.SelectedItem](#) property.

#### C#

```
//Perform selection using selected item  
listView.SelectedItem = viewModel.Items[5];
```

When the selection mode is `Multiple`, programmatically select more than one item by adding the underlying object to the [SfListView.SelectedItems](#) property.

#### C#

```
//Perform multiple selection using selected items  
listView.SelectedItems.Add (viewModel.Items [4]);  
listView.SelectedItems.Add (viewModel.Items [5]);
```

All items of the SfListView can be selected using the [SelectAll](#) method.

#### C#

```
listView.SelectAll();
```

---

**Note:** When programmatically select an item then the selection related [events](#) will not be triggered. It triggers only on UI interactions.

---

However, get the notification from the SelectedItems collection changed event which will be triggered when add an item at runtime.

### Selected items

#### *Get selected items*

The SfListView gets all the selected items through the [SfListView.SelectedItems](#) property and gets the single item by using the [SfListView.SelectedItem](#) property.

#### *Clear selected items*

The selected items can be cleared by calling the [SelectedItem.Clear\(\)](#) method.

### C#

```
listView.SelectedItems.Clear();
```

#### *CurrentItem vs SelectedItem*

The SfListView gets the selected item by using the [SfListView.SelectedItem](#) and [SfListView.CurrentItem](#) properties. Both [SfListView.SelectedItem](#) and [SfListView.CurrentItem](#) returns the same data object when selecting single item. When selecting more than one item, the [SfListView.SelectedItem](#) property returns the first selected item, and the [SfListView.CurrentItem](#) property returns the last selected item.

---

**Warning:** If you select an item when [SfListView.SelectionMode](#) is none or if you select multiple items when [SfListView.SelectionMode](#) is single, exception will be thrown.

---

### Selected item customization

The SfListView supports customizing the selection background color for the selected items by using the [SfListView.SelectedItemTemplate](#) if the background color is set to view loaded in the [SfListView.ItemTemplate](#).

### XML

```
<ContentPage xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView">
    <syncfusion:SfListView.SelectedItemTemplate>
      <DataTemplate>
        <Grid x:Name="grid" BackgroundColor="RoyalBlue">
          <Grid.RowDefinitions>
            <RowDefinition Height="*" />
            <RowDefinition Height="*" />
            <RowDefinition Height="1" />
          </Grid.RowDefinitions>
          <Label Text="{Binding SongTitle}" />
          <Label Text="{Binding SongAuthor}" Grid.Row="1"/>
          <Frame Grid.Row="2" HasShadow="True" HeightRequest="1"/>
        </Grid>
      </DataTemplate>
    </syncfusion:SfListView.SelectedItemTemplate>
  </syncfusion:SfListView>
</ContentPage>
```

**C#**

```
listView.SelectedItemTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    grid.RowDefinitions.Add(new RowDefinition { Height = new GridLength(1,
        GridUnitType.Star) });
    grid.RowDefinitions.Add(new RowDefinition { Height = new GridLength(1,
        GridUnitType.Star) });
    grid.RowDefinitions.Add(new RowDefinition { Height = new GridLength(1) });
    grid.BackgroundColor = Color.RoyalBlue;
    var songTitle = new Label();
    songTitle.SetBinding(Label.TextProperty, new Binding("SongTitle"));
    var songAuthor = new Label();
    songAuthor.SetBinding(Label.TextProperty, new Binding("songAuthor"));
    var frame = new Frame()
    {
        HeightRequest = 1,
        HasShadow = true,
    };
    grid.Children.Add(songTitle);
    grid.Children.Add(songAuthor, 0, 1);
    grid.Children.Add(frame, 0, 2);
    return grid;
});
```

Download the entire sample from GitHub [here](#).

*Show checked circle on selected items*

To customize the appearance of the selected item or items by using the appearance of [SfListView.SelectedItemTemplate](#). The following customizations should give an idea to customize the appearance of selected items in the control.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView">
<syncfusion:SfListView.SelectedItemTemplate>
<DataTemplate>
<Grid x:Name="grid">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="40" />
<ColumnDefinition Width="*" />
<ColumnDefinition Width="Auto" />
</Grid.ColumnDefinitions>
<Image Source="{Binding SongThumbnail}" />
<Grid Grid.Column="1">
<Grid.RowDefinitions>
<RowDefinition Height="*" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Label Text="{Binding SongTitle}" />
<Grid Grid.Row="1">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="*" />
<ColumnDefinition Width="*" />
```

```

</Grid.ColumnDefinitions>
<Label Text="{Binding SongAuthor}" />
<Label Grid.Column="1" Text="{Binding SongSize}"/>
</Grid>
</Grid>
<Image Grid.Column="2" x:Name="selectionImage" IsVisible="True"
Source="Selected.png"/>
</Grid>
</DataTemplate>
</syncfusion:SfListView.SelectedItemTemplate>
</syncfusion:SfListView>
</ContentPage>

```

## C#

```

listView.SelectedItemTemplate = new DataTemplate(() =>
{
    var grid1 = new Grid();
    grid1.ColumnDefinitions.Add(new ColumnDefinition { Width = new
    GridLength(40) });
    grid1.ColumnDefinitions.Add(new ColumnDefinition { Width = new GridLength(1,
    GridUnitType.Star) });
    grid1.ColumnDefinitions.Add(new ColumnDefinition { Width = new GridLength(1,
    GridUnitType.Auto) });
    var songThumbnail = new Image();
    songThumbnail.SetBinding(Image.SourceProperty, new
    Binding("SongThumbnail"));
    var grid2 = new Grid();
    grid2.RowDefinitions.Add(new RowDefinition { Height = new GridLength(1,
    GridUnitType.Star) });
    grid2.RowDefinitions.Add(new RowDefinition { Height = new GridLength(1,
    GridUnitType.Star) });
    grid2.Padding = new Thickness(15, 0, 0, 0);
    var songTitle = new Label();
    songTitle.SetBinding(Label.TextProperty, new Binding("SongTitle"));
    var grid3 = new Grid();
    grid3.ColumnDefinitions.Add(new ColumnDefinition { Width = new GridLength(1,
    GridUnitType.Star) });
    grid3.ColumnDefinitions.Add(new ColumnDefinition { Width = new GridLength(1,
    GridUnitType.Star) });
    var songAuthor = new Label();
    songAuthor.SetBinding(Label.TextProperty, new Binding("songAuthor"));
    var songSize = new Label();
    songSize.SetBinding(Label.TextProperty, new Binding("SongSize"));
    grid3.Children.Add(songAuthor);
    grid3.Children.Add(songSize, 1, 0);
    grid2.Children.Add(songTitle);
    grid2.Children.Add(grid3, 0, 1);
    var selectionImage = new Image()
    {
        IsVisible = true,
        Source = "Selected.png"
    };
    grid1.Children.Add(songThumbnail);
    grid1.Children.Add(grid2, 1, 0);
    grid1.Children.Add(selectionImage, 2, 0);
}

```

```
return grid1;
});
```

### Selected item style

#### *Selection background*

The SfListView allows changing the selection background color for the selected items by using the [SfListView.SelectionBackgroundColor](#) property. You can also change the selection background color at runtime.

#### **C#**

```
<syncfusion:SfListView x:Name="listView"
SelectionBackgroundColor="Khaki"/>
```

#### **C#**

```
listView.SelectionBackgroundColor = Color.Khaki;
```

### *Programmatic animation*

The SfListView allows programmatic animation in selection at runtime by using the virtual method [AnimateSelectedItem](#) of [SelectionController](#) class.

### **C#**

```
listView.SelectionController = new SelectionControllerExt(listView);  
public class SelectionControllerExt : SelectionController  
{  
    public SelectionControllerExt(SfListView listView) : base(listView)  
    {  
    }  
    protected override void AnimateSelectedItem(ListViewItem  
selectedListViewItem)  
    {  
        base.AnimateSelectedItem(selectedListViewItem);  
        selectedListViewItem.Opacity = 0;  
        selectedListViewItem.FadeTo(1, 3000, Easing.SinInOut);  
    }  
}
```

Download the entire source code from GitHub [here](#).

## Events

### *SelectionChanging event*

The [SelectionChanging](#) event is raised while selecting an item at the execution time.

[ItemSelectionChangingEventArgs](#) has the following members which provides the information for SelectionChanging event:

- [AddedItems](#): Gets collection of the underlying data objects where the selection is going to process.
- [RemovedItems](#): Gets collection of the underlying data objects where the selection is going to remove.

You can cancel the selection process within this event by setting the `ItemSelectionChangingEventArgs.Cancel` property to true.

The `SelectionChanging` event is used for the following use case:

- Disable the selection of the particular item based on the underlying data.

### C#

```
listView.SelectionChanging += ListView_SelectionChanging;  
private void ListView_SelectionChanging(object sender,  
ItemSelectionChangingEventArgs e)  
{  
if (e.AddedItems.Count > 0 && e.AddedItems[0] == ViewModel.Items[0])  
e.Cancel = true;  
}
```

### SelectionChanged event

The [SelectionChanged](#) event will occur once selection process has been completed for the selected item in the SfListView. [ItemSelectionChangedEventArgs](#) has the following members which provides information for [SelectionChanged](#) event:

- [AddedItems](#): Gets collection of the underlying data objects where the selection has been processed.
- [RemovedItems](#): Gets collection of the underlying data objects where the selection has been removed.

The [SelectionChanged](#) event used for the following use cases:

- Clears all the selected item.
- Removes the particular selected item.
- Gets the index of the selected item.

### C#

```
listView.SelectionChanged += ListView_OnSelectionChanged;  
private void ListView_OnSelectionChanged(object sender,  
ItemSelectionChangedEventArgs e)  
{  
listView.SelectedItems.Clear();  
}
```

---

**Note:** [SelectionChanging](#) and [SelectionChanged](#) events will be triggered only on UI interactions.

---

### Key navigation

The [AllowKeyNavigation](#) property enables navigation through keyboard buttons. When the [AllowKeyNavigation](#) property is [true](#), navigation gets enabled. Otherwise, set to [false](#). Behavior of key navigation in UWP and macOS are explained as follows :

- When the [SfListView.SelectionMode](#) is [Single](#), the selected item is highlighted with [FocusBorderColor](#) around the item while key navigation.
- When the [SelectionMode](#) is [SingleDeSelect](#) or [Multiple](#), the [FocusBorderColor](#) will set to the [CurrentItem](#) only on key navigation.

- If focusable elements i.e. `Entry`, `SearchBar`, etc. are loaded in the page, the `Focus` will not be changed either to other elements in the view or to the next `ListViewItem` when `Tab` or `Shift+Tab` key is pressed in the `LinearLayout`.
- In the `GridLayout` with span count greater than 1, the `FocusBorderColor` will navigate to the next or previous `ListViewItem` when pressing `Tab` or `Shift+Tab` key.
- In macOS, need to move the focus manually to perform key navigation.

#### *FocusBorderColor*

`FocusBorderColor` used to set the border color for the current focused item. For Android and iOS platform, the default color is `Color.Transparent` and for macOS and UWP platform, the default color is `Color.FromRgb(76, 161, 254)`.

#### *FocusBorderThickness*

`FocusBorderThickness` used to set the border thickness for the current focused item. For Android and iOS platform, the default thickness is 0 and for macOS and UWP platform, the default thickness is 1.

#### MacOS support

##### *Known issues*

- If `SfListView` flings with more `inertia` or the scrollbar reaches either the bottom or top of the view, the listview items will not layout properly. Since, it occurs in simple custom control and `Xamarin.Forms.ListView`. So, a defect report is logged to `Bugzilla` team. Find the bug report: <https://github.com/xamarin/Xamarin.Forms/issues/2403>
- When `Grouping` is enabled, the listview items and group header items will not layout properly while scrolling the `SfListView`.
- Application will get crash when `Linker` option is set as `Link All`.
- If an `Image` is loaded in the `ItemTemplate` property, it is necessary to define a definite size for the `Image`.

#### *Not yet implemented*

The following features are not yet implemented due to some limitations in the `Xamarin.Forms.macOS` platform:

- `ScrollStateChanged` event
- `Pull-To-Refresh`

#### How to

##### *Disable selection on particular item*

The selection of a particular set of items can be disabled based on the `SfListView.SelectedItems` of the underlying collections.

#### **C#**

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
}
```

```
private void listView_SelectionChanging(object sender,
Syncfusion.ListView.XForms.ItemSelectionChangingEventArgs e)
{
    if (e.AddedItems.Count > 0 && (e.AddedItems[0] as Contacts).Category ==
        "Non-Selectable items")
        e.Cancel = true;
}
```

Download the entire sample from GitHub [here](#).

*Automatically scroll to bring a selected item into the view*

To bring the [SfListView.SelectedItem](#) automatically into the view when it changed at runtime by calling the [ScrollToRowIndex](#) method.

In linear layout, you can get the row index of [SfListView.SelectedItem](#) and resolve if header and group header are used.

### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        listView.PropertyChanged += listView_PropertyChanged;
    }
    private void listView_PropertyChanged(object sender,
        System.ComponentModel.PropertyChangedEventArgs e)
    {
        if (e.PropertyName == "SelectedItem")
        {
            var selectedItemIndex =
                listView.DataSource.DisplayItems.IndexOf(listView.SelectedItem);
            selectedItemIndex += (listView.HeaderTemplate != null &&
                !listView.IsStickyHeader || !listView.IsStickyGroupHeader) ? 1 : 0;
            selectedItemIndex -= (listView.GroupHeaderTemplate != null &&
                listView.IsStickyGroupHeader) ? 1 : 0;
            (listView.LayoutManager as
                LinearLayout).ScrollToRowIndex(selectedItemIndex);
        }
    }
}
```

Download the entire sample from GitHub [here](#).

*Gets the index of selected item*

When performing selection, you can get the index of the selected item by using the [SelectionChanged](#) event from the [DataSource.DisplayItems](#).

### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
```

```
InitializeComponent();
listView.SelectionChanged += ListView_SelectionChanged;
}
private void ListView_SelectionChanged(object sender,
ItemSelectionChangedEventArgs e)
{
var items = e.AddedItems;
var index = listView.DataSource.DisplayItems.IndexOf(items[0]);
entry.Text = index.ToString();
}
}
```

Download the entire sample from GitHub [here](#).

#### *Display selection when ItemTemplate contains image*

When [ItemTemplate](#) contains only image, then the selection color will not be visible in the view when select an image. To see selection, add any layout such as Grid or StackLayout above the image, and set margin or padding to it.

#### **XML**

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView
ItemsSource="{Binding BookInfo}"
ItemSize="100">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Grid Margin="10">
<Image Source="{Binding Image}" Aspect="Fill"/>
</Grid>
</DataTemplate>
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
</ContentPage>
```

#### **C#**

```
public partial class MainPage : ContentPage
{
SfListView listView;
public MainPage()
{
InitializeComponent();
listView = new SfListView();
listView.ItemSize = 100;
listView.ItemsSource = viewModel.BookInfo;
listView.ItemTemplate = new DataTemplate(() =>
{
var grid = new Grid() { Margin = 10 };
var image = new Image() { Aspect = Aspect.Fill};
image.SetBinding(Image.SourceProperty, new Binding("Image"));
grid.Children.Add(image);
return grid;
});
this.Content = listView;
}
```

```
}
}
```

## Limitation

- When a grid is loaded inside the [ItemTemplate](#) with background color, the [SelectionBackgroundColor](#) will not display. Because, it overlaps the [SelectionBackgroundColor](#). In this case, set the background color for the ListView instead of [ItemTemplate](#).
- When the ListView contains duplicated items in the collection, only the first item whose instance was created initially will be selected or deselected.

## Swiping

### Overview

The SfListView allows swiping items to do custom actions such as deleting the data, adding the data, editing the data, etc. To enable swiping, set the [SfListView.AllowSwiping](#) property to `true`. Swipe views are displayed when swiping from left to right or right to left (for horizontal orientation, top to bottom or bottom to top) on the item.

It provides customizable swipe templates for swiping on left and right sides. You can restrict the layout of swipe view up to a certain position when swiping the item by setting the [SfListView.SwipeThreshold](#) property. You can set size of the swipe views by setting the [SfListView.SwipeOffset](#) property.

**Note:** When [SfListView.AutoFitMode](#) is `AutoFitMode.Height` for main listview, the height of inner listview will change while scrolling the view and items will be refreshed.

**Note:** When tap a swiped item, the [SelectionChanging](#) and [SelectionChanged](#) events will not occur since the swiped item is reset at this time.

### Assigning left and right swipe templates

The User Interface (UI) for swiping can be customized by using swipe templates [SfListView.LeftSwipeTemplate](#) when swiping towards right and [SfListView.RightSwipeTemplate](#) when swiping towards left. The contents inside the swipe template are arranged based on the offset values when swiping an item. You can reset the swiping item or swiped item by calling the [SfListView.ResetSwipe](#) method.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView" AllowSwiping="True">
    <syncfusion:SfListView.LeftSwipeTemplate>
      <DataTemplate x:Name="LeftSwipeTemplate">
        <Grid>
          <Grid BackgroundColor="#009EDA" HorizontalOptions="Fill"
            VerticalOptions="Fill" Grid.Column="0">
            <Grid VerticalOptions="Center" HorizontalOptions="Center">
              <Image Grid.Column="0"
                Grid.Row="0"
                BackgroundColor="Transparent"
                HeightRequest="35"
                WidthRequest="35"/>
```

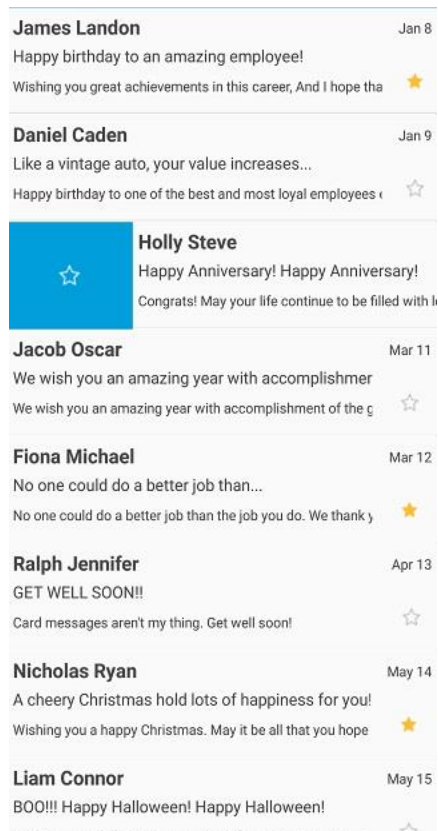

```
Source="Favorites.png" />
</Grid>
</Grid>
</Grid>
</DataTemplate>
</syncfusion:SfListView.LeftSwipeTemplate>
</syncfusion:SfListView>
</ContentPage>
```

## C#

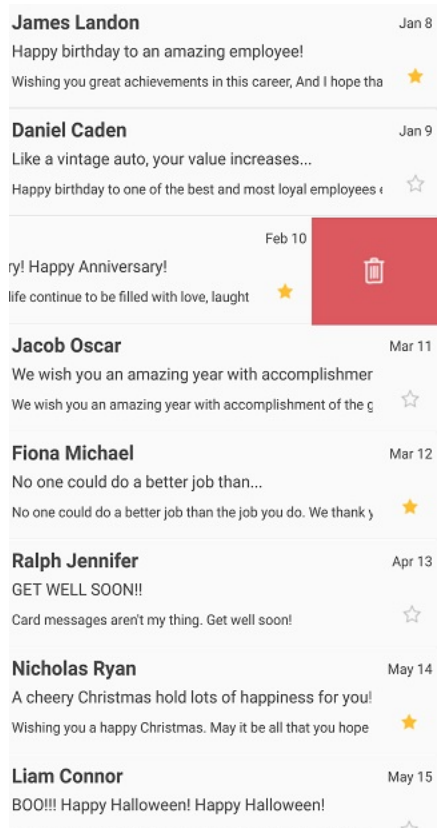

```
//Defining left swipe template
listView.LeftSwipeTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var grid1 = new Grid() { BackgroundColor = Color.FromHex("#009EDA"),
        HorizontalOptions = LayoutOptions.Fill,
        VerticalOptions = LayoutOptions.Fill };
    var favoriteGrid = new Grid() { HorizontalOptions = LayoutOptions.Center,
        VerticalOptions = LayoutOptions.Center };
    var favoriteImage = new Image() { BackgroundColor = Color.Transparent,
        HeightRequest = 35, WidthRequest = 35 };
    favoriteImage.Source =
        ImageSource.FromResource("Swiping.Images.Favorites.png");
    favoriteGrid.Children.Add(favoriteImage);
    grid1.Children.Add(favoriteGrid);
    grid.Children.Add(grid1);
    return grid;
});
```

**Note:** Similarly, the UI for swiping towards left can be customized by using the [SfListView.RightSwipeTemplate](#).

**Note:** Swipe Template is mandatory to perform swiping in the SfListView.

Download the entire source code from GitHub [here](#).

**Note:** To customize the appearance of each swipe item with different templates based on specific constraints by using the [DataTemplateSelector](#).

### Working with multiple views in swipe template

The swipe templates allows customizing with custom actions such as deleting the data, adding the data, editing the data, etc. by loading multiple views.

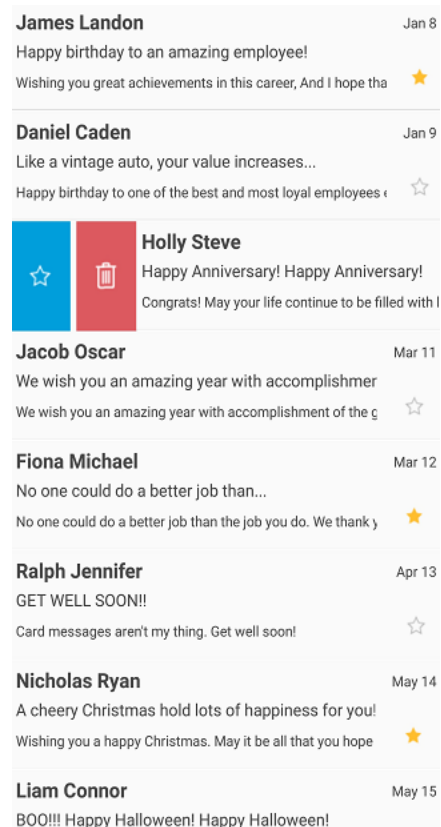

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView x:Name="listView">
    <syncfusion:SfListView.LeftSwipeTemplate>
      <DataTemplate x:Name="LeftSwipeTemplate">
        <Grid>
          <Grid.ColumnDefinitions>
            <ColumnDefinition Width="*" />
            <ColumnDefinition Width="*" />
          </Grid.ColumnDefinitions>
          <Grid BackgroundColor="#009EDA" HorizontalOptions="Fill"
VerticalOptions="Fill" Grid.Column="0">
            <Grid VerticalOptions="Center" HorizontalOptions="Center">
              <Image Grid.Column="0"
Grid.Row="0"
BackgroundColor="Transparent"
HeightRequest="35"
WidthRequest="35"
BindingContextChanged="leftImage_BindingContextChanged"
Source="Favorites.png" />
            </Grid>
          </Grid>
          <Grid BackgroundColor="#DC595F" HorizontalOptions="Fill"
VerticalOptions="Fill" Grid.Column="1">
            <Grid VerticalOptions="Center" HorizontalOptions="Center">
              <Image Grid.Column="0"
Grid.Row="0"
HeightRequest="35"
WidthRequest="35"
BackgroundColor="Transparent"
BindingContextChanged="rightImage_BindingContextChanged"
Source="Delete.png" />
            </Grid>
          </Grid>
        </Grid>
      </DataTemplate>
    </syncfusion:SfListView.LeftSwipeTemplate>
  </syncfusion:SfListView>
</ContentPage>
```

#### C#

```
listView.LeftSwipeTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var grid1 = new Grid()
    {
```

```
BackgroundColor = Color.FromHex("#009EDA"),
HorizontalOptions = LayoutOptions.Fill,
VerticalOptions = LayoutOptions.Fill
};
var favoriteGrid = new Grid() { HorizontalOptions = LayoutOptions.Center,
VerticalOptions = LayoutOptions.Center };
var favoriteImage = new Image() { BackgroundColor = Color.Transparent,
HeightRequest = 35, WidthRequest = 35 };
favoriteImage.Source =
ImageSource.FromResource("Swiping.Images.Favorites.png");
favoriteImage.BindingContextChanged += FavoriteImage_BindingContextChanged;
favoriteGrid.Children.Add(favoriteImage);
grid1.Children.Add(favoriteGrid);
var grid2 = new Grid()
{
BackgroundColor = Color.FromHex("#DC595F"),
HorizontalOptions = LayoutOptions.Fill,
VerticalOptions = LayoutOptions.Fill
};
var deleteGrid = new Grid() { HorizontalOptions = LayoutOptions.Center,
VerticalOptions = LayoutOptions.Center };
var deleteImage = new Image() { BackgroundColor = Color.Transparent,
HeightRequest = 35, WidthRequest = 35 };
deleteImage.Source = ImageSource.FromResource("Swiping.Images.Delete.png");
deleteImage.BindingContextChanged += DeleteImage_BindingContextChanged;
deleteGrid.Children.Add(deleteImage);
grid1.Children.Add(deleteGrid);
grid.Children.Add(grid1);
grid.Children.Add(grid2, 1, 0);
return grid;
});
```

To delete the item when **Delete** image is tapped and setting favorites to item when **Favorites** image is tapped, follow the code example.

### C#

```
Image leftImage;
Image rightImage;
int itemIndex = -1;
private void SetFavorites()
{
    if (itemIndex >= 0)
    {
        var item = viewModel.InboxInfo[itemIndex];
        item.IsFavorite = !item.IsFavorite;
    }
    this.listView.ResetSwipe();
}
private void Delete()
{
    if (itemIndex >= 0)
    {
        viewModel.InboxInfo.RemoveAt(itemIndex);
        this.listView.ResetSwipe();
    }
}
private void ListView_SwipeStarted(object sender, SwipeStartedEventArgs e)
{
    itemIndex = -1;
}
private void ListView_SwipeEnded(object sender, SwipeEndedEventArgs e)
{
}
```

```

itemIndex = e.ItemIndex;
}
private void leftImage_BindingContextChanged(object sender, EventArgs e)
{
    if (leftImage == null)
    {
        leftImage = sender as Image;
        (leftImage.Parent as View).GestureRecognizers.Add(new TapGestureRecognizer()
        { Command = new Command(SetFavorites) });
        leftImage.Source = ImageSource.FromResource("Swiping.Images.Favorites.png");
    }
}
private void rightImage_BindingContextChanged(object sender, EventArgs e)
{
    if (rightImage == null)
    {
        rightImage = sender as Image;
        (rightImage.Parent as View).GestureRecognizers.Add(new
        TapGestureRecognizer() { Command = new Command>Delete) });
        rightImage.Source = ImageSource.FromResource("Swiping.Images.Delete.png");
    }
}

```

### Performing swipe delete operation

To delete an item in view while swiping the item from one extent to other by using [SfListView.SwipeEnded](#) event. By setting the [SfListView.SwipeOffset](#) value to the view size to swipe the item upto end of the item.

### XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
AllowSwiping="True" SelectionMode="None"
SwipeOffset="360" SwipeThreshold="30"
SwipeStarted="ListView_SwipeStarted"
SwipeEnded="ListView_SwipeEnded"
Swiping="ListView_Swiping">
<syncfusion:SfListView.RightSwipeTemplate>
<DataTemplate x:Name="RightSwipeTemplate">
<Grid BackgroundColor="#DC595F" HorizontalOptions="Fill"
VerticalOptions="Fill">
<Grid VerticalOptions="Center" HorizontalOptions="Center">
<Image Grid.Column="0"
Grid.Row="0"
HeightRequest="35"
WidthRequest="35"
BackgroundColor="Transparent"
Source="Delete.png" />
</Grid>
</Grid>
</DataTemplate>
</syncfusion:SfListView.RightSwipeTemplate>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

```

listView.AllowSwiping = true;
listView.SelectionMode = SelectionMode.None;
listView.SwipeOffset = 360;
listView.SwipeThreshold = 30;
listView.SwipeStarted += ListView_SwipeStarted;
listView.SwipeEnded += ListView_SwipeEnded;
listView.Swiping += ListView_Swiping;
listView.RightSwipeTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var grid1 = new Grid()
    {
        BackgroundColor = Color.FromHex("#DC595F"),
        HorizontalOptions = LayoutOptions.Fill,
        VerticalOptions = LayoutOptions.Fill
    };
    var deleteGrid = new Grid() { HorizontalOptions = LayoutOptions.Center,
        VerticalOptions = LayoutOptions.Center };
    var deleteImage = new Image() { BackgroundColor = Color.Transparent,
        HeightRequest = 35, WidthRequest = 35 };
    deleteImage.Source = ImageSource.FromResource("Swiping.Images.Delete.png");
    deleteGrid.Children.Add(deleteImage);
    grid1.Children.Add(deleteGrid);
    grid.Children.Add(grid1);
    return grid;
});
private void ListView_SwipeEnded(object sender, SwipeEndedEventArgs e)
{
    if (e.SwipeOffset >= 360)
    {
        viewModel.InboxInfo.RemoveAt(e.ItemIndex);
        listView.ResetSwipe();
    }
}

```

## Events

*SwipeStarted Event*

The [SfListView.SwipeStarted](#) event is raised when the swipe offset changes from its initial value.

The **SwipeStarted** event provides the following properties in their arguments:

- [ItemIndex](#): Defines the swiping item index.
- [ItemData](#): Defines the underlying data associated with the swiped item. as its arguments.
- [SwipeDirection](#): Defines the swipe direction of the swiped item.

The **SwipeStarted** event is used for the following use case:

- To cancel the swipe action for a particular item by setting the Cancel property of the [SwipeStartedEventArgs](#).

**XML**

```
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding InboxInfo}"  
SwipeStarted="ListView_SwipeStarted" />
```

### C#

```
listView.SwipeStarted += ListView_SwipeStarted;
```

### C#

```
private void ListView_SwipeStarted(object sender, SwipeStartedEventArgs e)  
{  
    if (e.ItemIndex == 1)  
        e.Cancel = true;  
}
```

### Swiping Event

The [SfListView.Swiping](#) event is raised while swiping an item is in progress. This event is triggered with [SwipingEventArgs](#).

The [Swiping](#) event provides the following properties in their arguments:

- [ItemIndex](#): Defines the swiping item index.
- [ItemData](#): Defines the underlying data associated with the swiped item as its arguments.
- [SwipeDirection](#): Defines the swipe direction of the swiped item.
- [SwipeOffset](#): Defines the current swipe offset of the item being swiped.
- [Handled](#): Defines that if it is true, current swipe offset value remains same for the swiped item until the [SwipeEnded](#) event is raised.

The [Swiping](#) event used for the following use cases:

- To maintain the current offset value for the swiped item till the [SwipeEnded](#) event gets called.
- To hold the swipe view being swiping by setting the [Handled](#) property if swipe offset meet certain position.

### XML

```
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding InboxInfo}"  
Swiping="ListView_Swiping" />
```

### C#

```
listView.Swiping += ListView_Swiping;
```

### C#

```
private void ListView_Swiping(object sender, SwipingEventArgs e)  
{  
    if (e.ItemIndex == 1 && e.SwipeOffset > 70)  
        e.Handled = true;  
}
```

### SwipeEnded Event

The [SfListView.SwipeEnded](#) event is fired when completing the swipe action. This event is triggered with [SwipeEndedEventArgs](#).

The **SwipeEnded** event provides the following properties in their arguments:

- [ItemIndex](#): Defines the swiping item index.
- [ItemData](#): Defines the underlying data associated with the swiped item as its arguments.
- [SwipeDirection](#): Defines the swipe direction of the swiped item.
- [SwipeOffset](#): Defines the current swipe offset of the item being swiped.

The **SwipeEnded** event is used for the following use cases:

- To insert the data or edit the data after swiped.
- To delete the item from view after swiping it to certain extent.
- To reset the swipe view automatically for the swiped item.

### XML

```
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding InboxInfo}"  
SwipeEnded="ListView_SwipeEnded" />
```

### C#

```
listView.SwipeEnded += ListView_SwipeEnded;
```

### C#

```
private void ListView_SwipeEnded(object sender, SwipeEndedEventArgs e)  
{  
    if (e.SwipeOffset > 70)  
        listView.ResetSwipe();  
}
```

### SwipeReset Event

The [SfListView.SwipeReset](#) event is fired when swiping gets reset. The SwipeReset action can be canceled by setting the Cancel property of the ResetSwipeEventArgs to true. This event is triggered with [ResetSwipeEventArgs](#).

**SwipeReset** event provides the following properties in their arguments:

- [ItemIndex](#): Defines the swiping item index.
- [ItemData](#): Defines the underlying data associated with the swiped item as its arguments.
- [SwipeOffset](#): Defines the current swipe offset of the item being swiped.

The **SwipeReset** event used for the following use case:

- To skip the reset operation for a swiped item.

### XML

```
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding InboxInfo}"  
SwipeReset="ListView_SwipeReset" />
```

### C#

```
listView.SwipeReset += ListView_SwipeReset;
```

### C#

```
private void ListView_SwipeReset(object sender, ResetSwipeEventArgs e)  
{  
    if (e.ItemIndex == 1)  
        e.Cancel = true;  
}
```

### Limitations

When ListView is loaded in CarouselView with [SfListView.AllowSwiping](#) as false, it behaves in UWP platform as follows:

- While performing first swipe on the view, it will be handled by ScrollView to ensure whether scrolling is happened or not. If not means the manipulation to parent cannot be passed immediately due to UWP platform behavior. The second swipe will be listened by CarouselView, and the view gets swiped. This is the behavior of the SfListView.

When ListView is loaded in CarouselView with [AllowSwiping](#) as true, it behaves as follows:

- When swiping in iOS, suddenly carousel swipe happened. To swipe ListViewItem, touch and hold the item for some fraction of seconds (0.25 - 0.5 seconds) and then swipe.
- When swiping any Item, the SfListView handles the touch and swipe the ListViewItem.
- After swiping on ListViewItem, SwipeView will load along with it. If you swipe SwipeView element, Carousel view is swiped. Or else swipe on ListViewItem, control handles touching and swiping the item as usual.
- If you swipe header, footer, or group header elements, Carousel view will swipe in Android platform. But in UWP, first swipe on those elements will be handled by SfListView itself, because manipulation to parent cannot be passed immediately. The second swipe will be listened by CarouselView.

When ListView is loaded in MasterDetailPage with [AllowSwiping](#) as true, it behaves as follows:

- In iOS platform, when swiping a ListViewItem, touch and hold the item for some fraction of seconds (0.25 - 0.5 seconds) and then swipe.

When ListView [ItemTemplate](#) contains button with [AllowSwiping](#) as true, it behaves as follows:

- While swiping in Android and UWP, button click event executes after swiping.
- While swiping in iOS, swipe action does not happened when clicking and swiping a button.

- Swiping will be reset whenever the listview is refreshed like scrolling or any size change is made.

How to reset swipe view automatically?

Swiped item can be reset by defining the [SfListView.SwipeOffset](#) argument of [SfListView.SwipeEnded](#) event to 0 when the swiping action is completed.

**C#**

```
private void ListView_SwipeEnded(object sender, SwipeEndedEventArgs e)
{
    if (e.SwipeOffset > 70)
        e.SwipeOffset = 0;
}
```

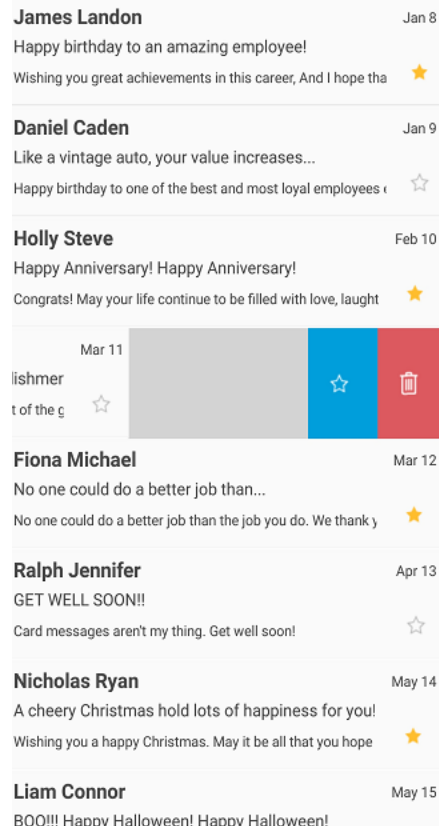

How to swipe an item indefinitely?

To swipe an item indefinitely, set the [SfListView.SwipeOffset](#) property by considering the width or height of the SfListView with [SfListView.Orientation](#) accordingly.

**C#**

```
ListView.PropertyChanged += ListView_PropertyChanged;
private void ListView_PropertyChanged(object sender,
PropertyChangedEventArgs e)
{
    if (e.PropertyName == "Width" && ListView.Orientation ==
Orientation.Vertical && ListView.SwipeOffset != ListView.Width)
        ListView.SwipeOffset = ListView.Width;
    else if (e.PropertyName == "Height" && ListView.Orientation ==
Orientation.Horizontal && ListView.SwipeOffset != ListView.Height)
        ListView.SwipeOffset = ListView.Height;
}
```

Download the entire source code from GitHub [here](#)

### How to edit data by swiping?

The SfListView allows editing the item data using either [SfListView.RightSwipeTemplate](#) or [SfListView.LeftSwipeTemplate](#) by loading edit view into the respective template after swiping the item.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
  <syncfusion:SfListView >
    <syncfusion:SfListView.RightSwipeTemplate>
      <DataTemplate x:Name="RightSwipeTemplate">
        <Grid BackgroundColor="#DC595F" HorizontalOptions="Fill"
          VerticalOptions="Fill">
          <Grid>
            <Label Grid.Row="0"
              HeightRequest="50"
              WidthRequest="50"
              BackgroundColor="Transparent"
              Text="EditItem">
            <Grid.GestureRecognizers>
              <TapGestureRecognizer Tapped="TapGestureRecognizer_Tapped"/>
            </Grid.GestureRecognizers>
          </Label>
        </Grid>
      </DataTemplate>
    </syncfusion:SfListView.RightSwipeTemplate>
  </syncfusion:SfListView>
</ContentPage>
```

**C#**

```
listView.RightSwipeTemplate = new DataTemplate(() =>
{
    var grid = new Grid()
    {
        BackgroundColor = Color.FromHex("#009EDA"),
        HorizontalOptions = LayoutOptions.Fill,
        VerticalOptions = LayoutOptions.Fill
    };
    var grid1 = new Grid();
    TapGestureRecognizer tapped = new TapGestureRecognizer();
    grid1.GestureRecognizers.Add(tapped);
    tapped.Tapped += Grid_Tapped;
    var label = new Label()
    {
        HeightRequest = 50,
        WidthRequest = 50,
        BackgroundColor = Color.Transparent,
        Text = "EditItem"
    };
    grid1.Children.Add(label);
    grid.Children.Add(grid1);
    return grid;
});
```

To set tapped items binding context for pop-up page, follow the code example.

**C#**

```
private void TapGestureRecognizer_Tapped(object sender, EventArgs e)
{
    var popupPage = new SfPopUpView();
    popupPage.BindingContext = (sender as Grid).BindingContext;
    Navigation.PushAsync(popupPage);
}
```

Download entire source code from GitHub [here](#).

**PullToRefresh**

The [SfPullToRefresh](#) refreshing control allows interacting and refreshing the loaded view. When the SfListView is loaded inside the [SfPullToRefresh](#), it refreshes the item when performing the pull-to-refresh action.

Refer [control dependencies](#) section to get the list of assemblies or NuGet package needs to be added as reference to use the SfPullToRefresh control.

Refer [initializing pull-to-refresh](#) to launch pull-to-refresh on each platform.

**SfListView inside the SfPullToRefresh**

The SfListView supports refreshing the data in view when performing the pull-to-refresh action at runtime by loading it directly into the [SfPullToRefresh.PullableContent](#) of the [SfPullToRefresh](#).

---

**Note:** You should load the SfListView as first children of [PullableContent](#) for the SfPullToRefresh.

---

## XML

```
<ContentPage xmlns:pulltoRefresh="clr-
namespace:Syncfusion.SfPullToRefresh.XForms;assembly=Syncfusion.SfPullToRefr
esh.XForms"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
>
<pulltoRefresh:SfPullToRefresh x:Name="pullToRefresh"
ProgressBackgroundColor="#428BCA" RefreshContentHeight="50"
RefreshContentWidth="50" TransitionMode="Push" IsRefreshing="False">
<pulltoRefresh:SfPullToRefresh.PullableContent>
<syncfusion:SfListView x:Name="listView" ItemSize="120"
SelectionMode="None">
</syncfusion:SfListView>
</pulltoRefresh:SfPullToRefresh.PullableContent>
</pulltoRefresh:SfPullToRefresh>
</ContentPage>
```

## C#

```
public ListViewPullToRefresh()
{
InitializeComponent();
//Initializing the PullToRefresh control.
SfPullToRefresh pullToRefresh = new SfPullToRefresh();
pullToRefresh.RefreshContentHeight = 50;
pullToRefresh.RefreshContentWidth = 50;
pullToRefresh.TransitionMode = TransitionType.Push;
pullToRefresh.IsRefreshing = false;
//Initializing the SfListView control.
var listView = new SfListView();
listView.ItemSize = 120;
listView.SelectionMode = SelectionMode.None;
//loading listview into pulltoRefresh
pullToRefresh.PullableContent = listView;
}
```

### Loading data when refreshing

To refresh the data in view at runtime, use the [SfPullToRefresh.Refreshing](#) event. The **Refreshing** event gets triggered once the progress bar meets 100 %. The data can be added into the underlying collection, and the data gets updated in view once the **Refreshing** event gets completed.

## C#

```
pullToRefresh.Refreshing += PullToRefresh_Refreshing;
private async void PullToRefresh_Refreshing(object sender, EventArgs args)
{
pullToRefresh.IsRefreshing = true;
await Task.Delay(2000);
for (int i = 0; i < 3; i++)
{
var blogsCount = pullToRefreshViewModel.BlogsInfo.Count;
var item = new ListViewBlogsInfo()
{
```

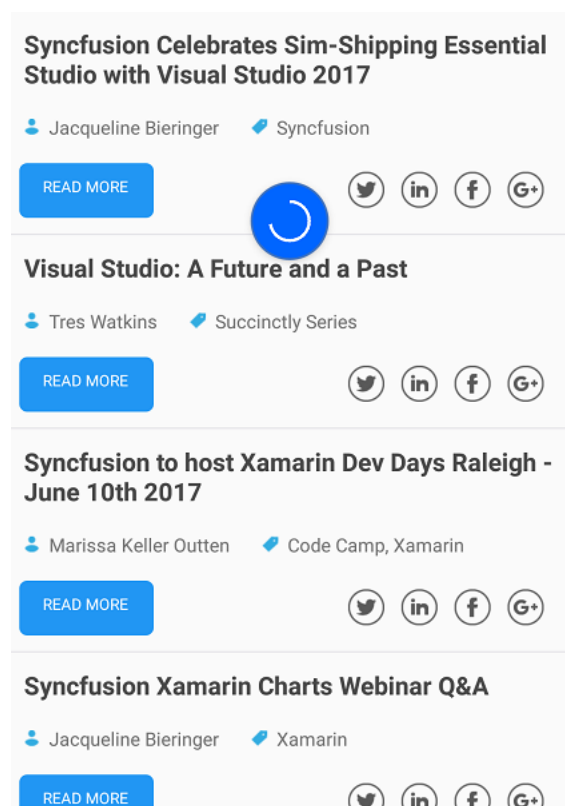

```

BlogTitle = pullToRefreshViewModel.BlogsTitle[blogsTitleCount - blogsCount],
BlogAuthor = pullToRefreshViewModel.BlogsAuthors[blogsAuthorCount -
blogsCount],
BlogCategory = pullToRefreshViewModel.BlogsCategory[blogsCategoryCount -
blogsCount],
ReadMoreContent =
pullToRefreshViewModel.BlogsReadMoreInfo[blogsReadMoreCount - blogsCount],
};
pullToRefreshViewModel.BlogsInfo.Insert(0, item);
}
pullToRefresh.IsRefreshing = false;
}

```

Run the application to render the following output.

Download the entire source code from GitHub [here](#).

SfListView inside the SfPullToRefresh with ScrollView

The SfListView allows loading as a [SfPullToRefresh.PullableContent](#) of the [SfPullToRefresh](#) with ScrollView and refresh the data in view at runtime.

### XML

```

<ContentPage xmlns:pulltoRefresh="clr-
namespace:Syncfusion.SfPullToRefresh.XForms;assembly=Syncfusion.SfPullToRefr
esh.XForms"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
>
<ScrollView>

```

```

<pulltoRefresh:SfPullToRefresh x:Name="pullToRefresh"
ProgressBackgroundColor="#428BCA"
TransitionMode="SlideOnTop"
IsRefreshing="False">
<pulltoRefresh:SfPullToRefresh.PullableContent>
<syncfusion:SfListView x:Name="listView"
ItemSize="120"
AutoFitMode="Height"
SelectionMode="None">
</syncfusion:SfListView>
</pulltoRefresh:SfPullToRefresh.PullableContent>
</pulltoRefresh:SfPullToRefresh>
</ScrollView>
</ContentPage>

```

## C#

```

public ListViewPullToRefresh()
{
InitializeComponent();
//Initializing the PullToRefresh control.
SfPullToRefresh pullToRefresh = new SfPullToRefresh();
pullToRefresh.RefreshContentHeight = 50;
pullToRefresh.RefreshContentWidth = 50;
pullToRefresh.TransitionMode = TransitionType.Push;
pullToRefresh.IsRefreshing = false;
//Initializing the SfListView control.
var listView = new SfListView();
listView.ItemSize = 120;
listView.SelectionMode = SelectionMode.None;
//loading listView into pulltorefresh
pullToRefresh.PullableContent = listView;
}

public App()
{
InitializeComponent();
SfPullToRefresh pullToRefresh = new SfPullToRefresh();
MainPage = new ContentPage { Content = new ScrollView { Content =
pullToRefresh.PullableContent } };
}

```

## Limitation

The horizontal ListView does not support the [SfPullToRefresh](#).

## How To

### *Pull-to-refresh with SearchBar at Top*

When the SearchBar or any view placed above the [SfPullToRefresh](#) control, pulling action does not work on the SfListView because touches directly passed to the SfListView instead of SfPullToRefresh control. You can overcome this problem by placing the SfListView inside the Grid and place that Grid as [SfPullToRefresh.PullableContent](#).

## XML

```

<ContentPage xmlns:pulltoRefresh="clr-
namespace:Syncfusion.SfPullToRefresh.XForms;assembly=Syncfusion.SfPullToRefr
esh.XForms"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
>
<ContentPage.Content>
<Grid RowSpacing="0" ColumnSpacing="0" Padding="0" Margin="0">
<Grid.RowDefinitions>
<RowDefinition Height="50" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Grid.Behaviors>
<local:SfListViewPullToRefreshBehavior />
</Grid.Behaviors>
<SearchBar x:Name="filterText" Placeholder="Search" FontSize="14" />
<pulltoRefresh:SfPullToRefresh x:Name="pullToRefresh" Grid.Row="1"
ProgressBackgroundColor="#428BCA" RefreshContentHeight="50"
RefreshContentWidth="50" TransitionMode="Push" IsRefreshing="False">
<pulltoRefresh:SfPullToRefresh.PullableContent>
<Grid>
<syncfusion:SfListView x:Name="listView" AllowSwiping="True"
AutoFitMode="Height">
</syncfusion:SfListView>
</Grid>
</pulltoRefresh:SfPullToRefresh.PullableContent>
</pulltoRefresh:SfPullToRefresh>
</Grid>
</ContentPage.Content>
</ContentPage>

```

## C#

```

public ListViewPullToRefresh()
{
    InitializeComponent();
    //Initializing the PullToRefresh control.
    SfPullToRefresh pullToRefresh = new SfPullToRefresh();
    pullToRefresh.RefreshContentHeight = 50;
    pullToRefresh.RefreshContentWidth = 50;
    pullToRefresh.TransitionMode = TransitionType.Push;
    pullToRefresh.IsRefreshing = false;
    //Initializing the SfListView control.
    var listView = new SfListView();
    listView.ItemSize = 120;
    listView.SelectionMode = SelectionMode.None;
    //loading listview into pulltorefresh
    pullToRefresh.PullableContent = listView;
    var grid = new Grid();
    var searchBar = new SearchBar() { Placeholder = "Search here to filter" };
    grid.Children.Add(searchBar);
    grid.Children.Add(pullToRefresh, 0, 1);
}

```

Download entire source code from GitHub [here](#).

*Pull-to-refresh with Grouping*

The [SfPullToRefresh](#) has its pullable content as SfListView along with [SfListView.GroupHeaderTemplate](#). When refreshing the items in the listview, the newly added item loads directly into respective groups.

**XML**

```
<ContentPage xmlns:pulltoRefresh="clr-
namespace:Syncfusion.SfPullToRefresh.XForms;assembly=Syncfusion.SfPullToRefr
esh.XForms"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
>
<ContentPage.Content>
<Grid RowSpacing="0" ColumnSpacing="0" Padding="0" Margin="0">
<Grid.Behaviors>
<local:SfListViewPullToRefreshBehavior />
</Grid.Behaviors>
<Grid.RowDefinitions>
<RowDefinition Height="60"/>
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<SearchBar x:Name="filterText" Placeholder="Search" FontSize="14" />
<pulltoRefresh:SfPullToRefresh x:Name="pullToRefresh"
ProgressBackgroundColor="#0065FF"
RefreshContentHeight="50"
PullingThreshold="150"
RefreshContentWidth="50"
TransitionMode="Push"
IsRefreshing="False"
Grid.Row="1">
<pulltoRefresh:SfPullToRefresh.PullableContent>
<syncfusion:SfListView x:Name="listView" ItemSize="120"
AutoFitMode="Height" SelectionMode="None" AllowGroupExpandCollapse="True">
<syncfusion:SfListView.GroupHeaderTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<Grid HeightRequest="150">
<Label Text="{Binding Key}" TextColor="Red" BackgroundColor="#d3d3d3"/>
</Grid>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.GroupHeaderTemplate>
</syncfusion:SfListView>
</pulltoRefresh:SfPullToRefresh.PullableContent>
</pulltoRefresh:SfPullToRefresh>
</Grid>
</ContentPage.Content>
</ContentPage>
```

**C#**

```
public ListViewPullToRefresh ()
{
InitializeComponent();
```

```
//Initializing the PullToRefresh control.
SfPullToRefresh pullToRefresh = new SfPullToRefresh();
pullToRefresh.RefreshContentHeight = 50;
pullToRefresh.RefreshContentWidth = 50;
pullToRefresh.TransitionMode = TransitionType.Push;
pullToRefresh.IsRefreshing = false;
//Initializing the SfListView control.
var listView = new SfListView();
listView.ItemSize = 120;
listView.SelectionMode = SelectionMode.None;
listView.GroupHeaderTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    grid.HeightRequest = 150;
    var headerLabel = new Label
    {
        TextColor = Color.Red,
        BackgroundColor=Color.White
    };
    headerLabel.SetBinding(Label.TextProperty, new Binding("key"));
    grid.Children.Add(headerLabel);
    return grid;
});
//loading listview into pulltorefresh
pullToRefresh.PullableContent = listView;
var grid = new Grid();
var searchBar = new SearchBar() { Placeholder = "Search here to filter" };
grid.Children.Add(searchBar);
grid.Children.Add(pullToRefresh, 0, 1);
}
```

## Load More

The **ListView** enables **Load More** view by setting the [SfListView.LoadMoreOption](#) and [SfListView.LoadMoreCommand](#) properties. This can be displayed either on the top or bottom of the view by setting the [SfListView.LoadMorePosition](#) property. This view will be displayed when reaching the end of the list when the **LoadMorePosition** is bottom. This provides an option to add the items at runtime. If the **SfListView.LoadMorePosition** property is set as top, the items will be loaded only by using the **LoadMoreOption.Manual** mode.

The **SfListView.LoadMoreOption** property contains the following four different modes of operations:

- **None**: Disables the load more button. This is the default value.
- **Manual**: Displays the load more button when reaching the end of the list and execute **SfListView.LoadMoreCommand** when tapping the button.
- **Auto**: Automatically execute the **SfListView.LoadMoreCommand** when reaching end of the list.
- **AutoOnScroll**: Executes **SfListView.LoadMoreCommand** when users interact with listview and reach to the end of list.

The **SfListView.LoadMorePosition** property has two positions:

- Top: Positioned on the top of list.
- Bottom: Positioned on the bottom of list when reaching the end of the list. This is the default value.

`SfListView.LoadMoreCommand` executes when the listview is empty. This is the default behavior of Manual and Auto.

Load more automatically

To automatically load more items using the [SfListView.LoadMoreCommand](#) and [SfListView.LoadMoreCommandParameter](#) when reaching end of the list, set the [SfListView.LoadMoreOption](#) property as `Auto`.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
    ItemSize="120"
    LoadMoreOption="Auto"
    LoadMoreCommand="{Binding LoadMoreItemsCommand}"
    LoadMoreCommandParameter="{Binding Source={x:Reference listView}}}"
    ItemsSource="{Binding Products}"/>
</ContentPage>
```

### C#

```
listView.LoadMoreOption = LoadMoreOption.Auto;
listView.LoadMoreCommand = viewModel.LoadMoreItemsCommand;
//ViewModel.cs
LoadMoreItemsCommand = new Command<object>(LoadMoreItems, CanLoadMoreItems);
private bool CanLoadMoreItems(object obj)
{
    if (Products.Count >= totalItems)
        return false;
    return true;
}
private async void LoadMoreItems(object obj)
{
    var listView = obj as Syncfusion.ListView.XForms.SfListView;
    listView.IsBusy = true;
    await Task.Delay(2500);
    var index = Products.Count;
    var count = index + 3 >= totalItems ? totalItems - index : 3;
    AddProducts(index, count);
    listView.IsBusy = false;
}
private void AddProducts(int index, int count)
{
    for (int i = index; i < index + count; i++)
    {
        var name = Names[i];
        var p = new Product()
        {
            Name = name,
            Weight = Weights[i],
        }
    }
}
```

```

Price = Prices[i],
Image = ImageSource.FromResource("LoadMoreUG.LoadMore." + name.Replace(" ",
string.Empty) + ".jpg")
};
Products.Add(p);
}
}

```

### Load more manually

To load more items manually using the [SfListView.LoadMoreCommand](#) and [SfListView.LoadMoreCommandParameter](#) when tapping the load more button at end of the list, set the [SfListView.LoadMoreOption](#) property as **Manual**.

### XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemSize="120"
LoadMoreOption="Manual"
LoadMoreCommand="{Binding LoadMoreItemsCommand}"
LoadMoreCommandParameter="{Binding Source={x:Reference listView}}}"
ItemsSource="{Binding Products}"/>
</ContentPage>

```

### C#

```

listView.LoadMoreOption = LoadMoreOption.Manual;
listView.LoadMoreCommand = viewModel.LoadMoreItemsCommand;
//ViewModel.cs
LoadMoreItemsCommand = new Command<object>(LoadMoreItems, CanLoadMoreItems);
private bool CanLoadMoreItems(object obj)
{
    if (Products.Count >= totalItems)
        return false;
    return true;
}
private async void LoadMoreItems(object obj)
{
    var listView = obj as Syncfusion.ListView.XForms.SfListView;
    listView.IsBusy = true;
    await Task.Delay(2500);
    var index = Products.Count;
    var count = index + 3 >= totalItems ? totalItems - index : 3;
    AddProducts(index, count);
    listView.IsBusy = false;
}
private void AddProducts(int index, int count)
{
    for (int i = index; i < index + count; i++)
    {
        var name = Names[i];
        var p = new Product()
        {
            Name = name,

```

```

Weight = Weights[i],
Price = Prices[i],
Image = ImageSource.FromResource("LoadMoreUG.LoadMore." + name.Replace(" ",
string.Empty) + ".jpg")
};
Products.Add(p);
}
}

```

### Load more when user interacts

To load more items only when users interact with the listview and reach to the end of list using `SfListView.LoadMoreCommand` and `SfListView.LoadMoreCommandParameter`, set the `SfListView.LoadMoreOption` property to [AutoOnScroll](#).

The `SfListView.LoadMoreCommand` will not execute when the listview is initially loaded. The `SfListView.LoadMoreCommand` will execute only when users interact and reach to the end of list.

The `SfListView.LoadMoreTemplate` is not displayed when the listview is initially loaded. When users interact, the `SfListView.LoadMoreTemplate` is displayed for the initially loaded items. Then, the visibility of `SfListView.LoadMoreTemplate` will be handled by the `CanExecute` method.

### XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="listView"
ItemSize="120"
LoadMoreOption="AutoOnScroll"
LoadMoreCommand="{Binding LoadMoreItemsCommand}"
LoadMoreCommandParameter="{Binding Source={x:Reference listView}}}"
ItemsSource="{Binding Products}"/>
</ContentPage>

```

### C#

```

listView.LoadMoreOption = LoadMoreOption.AutoOnScroll;
listView.LoadMoreCommand = viewModel.LoadMoreItemsCommand;
//ViewModel.cs
LoadMoreItemsCommand = new Command<object>(LoadMoreItems, CanLoadMoreItems);
/// <summary>
/// When AutoOnScroll load more is enabled, the CanExecute method will be
called only when the user interacts and reach to the end of list.
/// Based on return value, the visibility of the LoadMoreTemplate is handled
and the Execute method is called.
/// </summary>
/// <param name="obj">ListView is passed as default parameter.</param>
/// <returns>Returns true if the list has items to load, else returns
false.</returns>
private bool CanLoadMoreItems(object obj)
{
if (Products.Count >= totalItems)
return false;
return true;
}

```

```

/// <summary>
/// The Execute method is called based on the return value of the CanExecute
/// method. If CanExecute returns false, the Execute method will not be
/// executed.
/// </summary>
/// <param name="obj">ListView is passed as default parameter.</param>
private async void LoadMoreItems(object obj)
{
    var listView = obj as Syncfusion.ListView.XForms.SfListView;
    //Enables LoadMoreIndicator to the LoadMoreTemplate.
    listView.IsBusy = true;
    await Task.Delay(2500);
    var index = Products.Count;
    var count = index + 3 >= totalItems ? totalItems - index : 3;
    //Adding the items to the list.
    AddProducts(index, count);
    //Disables LoadMoreIndicator after adding the items.
    listView.IsBusy = false;
}

private void AddProducts(int index, int count)
{
    for (int i = index; i < index + count; i++)
    {
        var name = Names[i];
        var p = new Product()
        {
            Name = name,
            Weight = Weights[i],
            Price = Prices[i],
            Image = ImageSource.FromResource("LoadMoreUG.LoadMore." + name.Replace(" ",
            string.Empty) + ".jpg")
        };
        Products.Add(p);
    }
}

```

### Show loading indicator

The [SfListView.LoadMoreIndicator](#) will be displayed when loading more items in the list.

By using the [SfListView.IsBusy](#) property, you can interchange the visibility of the button and busy indicator when creating the load more view. You can set the value of the [SfListView.IsBusy](#) property to true before adding items to the list and set it to false, after adding the items. You can also bind the [IsBusy](#) property through ViewModel.

### C#

```

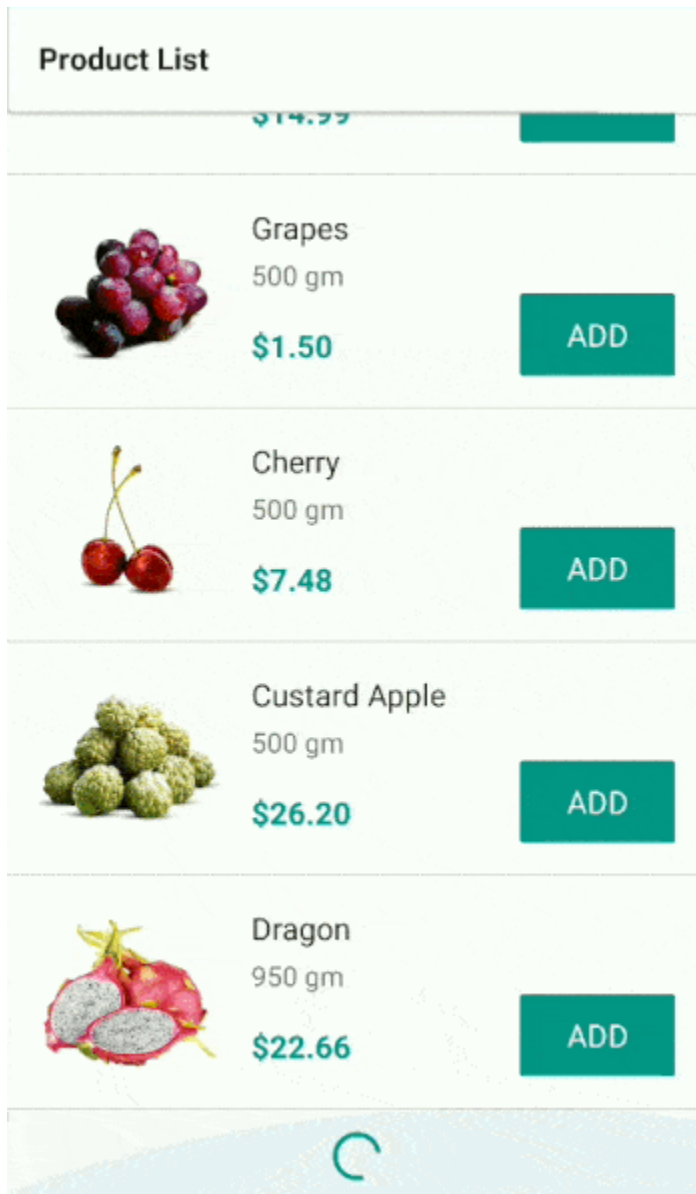

private async void LoadMoreItems(object obj)
{
    var listView = obj as Syncfusion.ListView.XForms.SfListView;
    listView.IsBusy = true;
    await Task.Delay(2500);
    var index = Products.Count;
    var count = index + 3 >= totalItems ? totalItems - index : 3;
    AddProducts(index, count);
    listView.IsBusy = false;
}

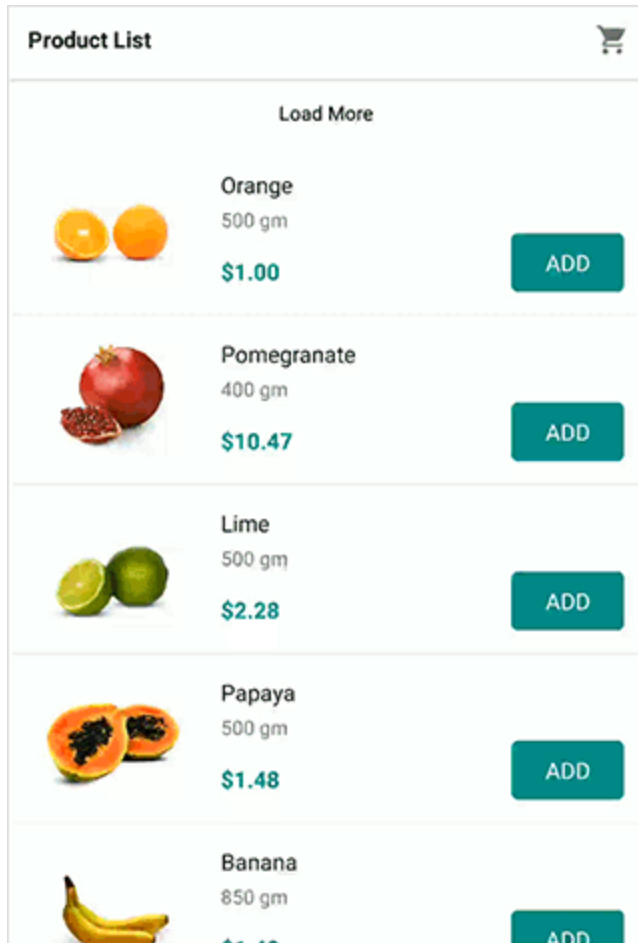

```

```
}
```

Download the entire source code from GitHub [here](#).

Items can be loaded either on the top or bottom of the view.

### Load more view customization

The SfListView allows customizing User Interface(UI) of **Load More** view.

#### *Load more button*

To customize the load more button, add the custom UI in the [SfListView.LoadMoreTemplate](#) property.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="Sample.MainPage"
xmlns:helper="clr-
namespace:Syncfusion.ListView.XForms.Helpers;assembly=Syncfusion.SfListView.
XForms"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:LoadMoreViewModel/>
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<helper:InverseBoolConverter x:Key="inverseBoolConverter"/>
</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfListView x:Name="listView"
```

```

ItemSize="120"
LoadMoreOption="Manual"
LoadMoreCommand="{Binding LoadMoreItemsCommand}"
LoadMoreCommandParameter="{Binding Source={x:Reference listView}}"
ItemsSource="{Binding Products}">
<syncfusion:SfListView.LoadMoreTemplate>
<DataTemplate>
<Grid>
<Label Text="Load More Items..." TextColor="Black"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center"
IsVisible="{Binding IsBusy, Converter={StaticResource inverseBoolConverter},
Source={x:Reference Name=listView}}" />
</Grid>
</DataTemplate>
</syncfusion:SfListView.LoadMoreTemplate>
</syncfusion:SfListView>
</ContentPage>

```

## C#

```

listView.LoadMoreTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var label = new Label
    {
        Text = "Load More Items...",
        FontSize = 20,
        BackgroundColor = Color.AliceBlue,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center
    };
    label.SetBinding(Label.IsVisibleProperty, new Binding("IsBusy",
        BindingMode.Default, new InverseBoolConverter(), null, null, listView));
    grid.Children.Add(label);
    return grid;
});

```

## Loading Indicator

To customize the loading indicator, add the custom UI in the [SfListView.LoadMoreTemplate](#) property.

## XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="Sample.MainPage"
xmlns:helper="clr-
namespace:Syncfusion.ListView.XForms.Helpers;assembly=Syncfusion.SfListView.
XForms"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:LoadMoreViewModel/>
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<helper:InverseBoolConverter x:Key="inverseBoolConverter"/>

```

```

</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfListView x:Name="listView"
    ItemSize="120"
    LoadMoreOption="Manual"
    LoadMoreCommand="{Binding LoadMoreItemsCommand}"
    LoadMoreCommandParameter="{Binding Source={x:Reference listView}}}"
    ItemsSource="{Binding Products}">
    <syncfusion:SfListView.LoadMoreTemplate>
    <DataTemplate>
    <Grid>
    <Label Text="Load More Items" TextColor="Black"
        HorizontalTextAlignment="Center" VerticalTextAlignment="Center"
        IsVisible="{Binding IsBusy, Converter={StaticResource inverseBoolConverter},
        Source={x:Reference Name=listView}}" />
    <syncfusion:LoadMoreIndicator IsRunning="{Binding IsBusy,
        Source={x:Reference Name=listView}}" IsVisible="{Binding IsBusy,
        Source={x:Reference Name=listView}}" Color="Red" VerticalOptions="Center"/>
    </Grid>
    </DataTemplate>
    </syncfusion:SfListView.LoadMoreTemplate>
    </syncfusion:SfListView>
</ContentPage>

```

## C#

```

listView.LoadMoreTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var label = new Label
    {
        Text = "Load More Items...",
        FontSize = 20,
        BackgroundColor = Color.AliceBlue,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center
    };
    label.SetBinding(Label.IsVisibleProperty, new Binding("IsBusy",
        BindingMode.Default, new InverseBoolConverter(), null, null, listView));
    var loadMoreIndicator = new LoadMoreIndicator();
    loadMoreIndicator.Color = Color.Red;
    loadMoreIndicator.VerticalOptions = LayoutOptions.Center;
    loadMoreIndicator.SetBinding(LoadMoreIndicator.IsRunningProperty, new
        Binding("IsBusy", BindingMode.Default, null, null, null, listView));
    loadMoreIndicator.SetBinding(LoadMoreIndicator.IsVisibleProperty, new
        Binding("IsBusy", BindingMode.Default, null, null, null, listView));
    grid.Children.Add(label);
    grid.Children.Add(loadMoreIndicator);
    return grid;
});

```

### *Customize the size of load more view and indicator*

Listview allows customizing the size of the load more item by the [SfListView.QueryItemSize](#) event using the item type.

**C#**

```

this.listView.QueryItemSize += ListView_QueryItemSize;
private void ListView_QueryItemSize(object sender,
Syncfusion.ListView.XForms.QueryItemSizeEventArgs e)
{
    if(e.ItemType == ItemType.LoadMore)
    {
        e.ItemSize = 300;
        e.Handled = true;
    }
}

```

To customize the size of the loading indicator, add the custom UI to the [SfListView.LoadMoreTemplate](#) property and assign the height and width for the grid and loading indicator.

**XML**

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="Sample.MainPage"
xmlns:helper="clr-
namespace:Syncfusion.ListView.XForms.Helpers;assembly=Syncfusion.SfListView.
XForms"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.BindingContext>
<local:LoadMoreViewModel/>
</ContentPage.BindingContext>
<ContentPage.Resources>
<ResourceDictionary>
<helper:InverseBoolConverter x:Key="inverseBoolConverter"/>
</ResourceDictionary>
</ContentPage.Resources>
<syncfusion:SfListView x:Name="listView"
ItemSize="120"
LoadMoreOption="Manual"
LoadMoreCommand="{Binding LoadMoreItemsCommand}"
LoadMoreCommandParameter="{Binding Source={x:Reference listView}}}"
ItemsSource="{Binding Products}">
<syncfusion:SfListView.LoadMoreTemplate>
<DataTemplate>
<Grid HeightRequest="100" WidthRequest="100">
<Label Text="Load More Items" TextColor="Black"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center"
IsVisible="{Binding IsBusy, Converter={StaticResource inverseBoolConverter},
Source={x:Reference Name=listView}}" />
<syncfusion:LoadMoreIndicator IsRunning="{Binding IsBusy,
Source={x:Reference Name=listView}}" IsVisible="{Binding IsBusy,
Source={x:Reference Name=listView}}" Color="Red" VerticalOptions="Center"
HeightRequest="100" WidthRequest="100"/>
</Grid>
</DataTemplate>
</syncfusion:SfListView.LoadMoreTemplate>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

```
listView.LoadMoreTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    grid.HeightRequest = 100;
    grid.WidthRequest = 100;
    var label = new Label
    {
        Text = "Load More Items...",
        FontSize = 20,
        BackgroundColor = Color.AliceBlue,
        HorizontalTextAlignment = TextAlignment.Center,
        VerticalTextAlignment = TextAlignment.Center
    };
    label.SetBinding(Label.IsVisibleProperty, new Binding("IsBusy",
        BindingMode.Default, new InverseBoolConverter(), null, null, listView));
    var loadMoreIndicator = new LoadMoreIndicator();
    loadMoreIndicator.Color = Color.Red;
    loadMoreIndicator.VerticalOptions = LayoutOptions.Center;
    loadMoreIndicator.SetBinding(LoadMoreIndicator.IsRunningProperty, new
        Binding("IsBusy", BindingMode.Default, null, null, null, listView));
    loadMoreIndicator.SetBinding(LoadMoreIndicator.IsVisibleProperty, new
        Binding("IsBusy", BindingMode.Default, null, null, null, listView));
    loadMoreIndicator.HeightRequest = 100;
    loadMoreIndicator.WidthRequest = 100;
    grid.Children.Add(label);
    grid.Children.Add(loadMoreIndicator);
    return grid;
});
```

## Disable load more at runtime

To disable the **Load More** view, return the 'CanExecute' method of the [SfListView.LoadMoreCommand](#) to false.

If you reach maximum count (for example, totalItems = 22) in the list, follow the code example to disable the **Load More** view.

**C#**

```
LoadMoreItemsCommand = new Command<object>(LoadMoreItems, CanLoadMoreItems);
private async void LoadMoreItems(object obj)
{
    var listView = obj as Syncfusion.ListView.XForms.SfListView;
    listView.IsBusy = true;
    await Task.Delay(2500);
    var index = Products.Count;
    var count = index + 3 >= totalItems ? totalItems - index : 3;
    AddProducts(index, count);
    listView.IsBusy = false;
}
private bool CanLoadMoreItems(object obj)
{
    if (Products.Count >= totalItems)
```

```
return false;
return true;
}
```

## Limitations

- SfListView does not support to set Manual in [SfListView.LoadMoreOption](#) when [SfListView.Orientation](#) is Horizontal.
- SfListView supports to set Auto and AutoOnScroll in [SfListView.LoadMoreOption](#) only when [SfListView.LoadMorePosition](#) is set to Bottom.
- Handle [LoadMoreCommand](#) execution by implementing [CanExecute](#) predicate of command.

## How to

### *Load more on infinite scroll*

The SfListView allows adding more items infinite times either manually or automatically.

## C#

```
public class LoadMoreViewModel:INotifyPropertyChanged
{
    public ObservableCollection<Product> Products { get; set; }
    public Command<object> LoadMoreItemsCommand { get; set; }
    public LoadMoreViewModel()
    {
        Products = new ObservableCollection<Product>();
        AddProducts(0, 10);
        LoadMoreItemsCommand = new Command<object>(LoadMoreItems);
    }
    private async void LoadMoreItems(object obj)
    {
        var listview = obj as Syncfusion.ListView.XForms.SfListView;
        listview.IsBusy = true;
        await Task.Delay(2500);
        AddProducts(11, 21);
        listview.IsBusy = false;
    }
    private void AddProducts(int value, int count)
    {
        Random rand= new Random();
        for (int i = value; i < count; i++)
        {
            var name = Names[rand.Next(1,22)];
            var p = new Product()
            {
                Name = name,
                Weight = Weights[i],
                Price = Prices[i],
                Image = ImageSource.FromResource("LoadMoreUG.LoadMore." + name.Replace(" ",
                    string.Empty) + ".jpg")
            };
            Products.Add(p);
        }
    }
}
```

```
}
```

Download the entire sample from GitHub [here](#).

*Load more items automatically from up direction*

The SfListView allows loading more items automatically when reaching top of the list by showing the busy indicator by loading in the [HeaderTemplate](#).

#### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="ListView" IsBusy="True"
ItemsSource="{Binding Messages}"
AutoFitMode="Height">
<syncfusion:SfListView.HeaderTemplate>
<DataTemplate>
<ViewCell>
<Grid>
<syncfusion:LoadMoreIndicator Color="Red" IsRunning="True"
IsVisible="{Binding IndicatorIsVisible}"/>
</Grid>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.HeaderTemplate>
</syncfusion:SfListView>
</ContentPage>
```

#### C#

```
public partial class MainPage : ContentPage
{
    MainPageViewModel ViewModel;
    public MainPage()
    {
        InitializeComponent();
        ViewModel = new MainPageViewModel();
        ListView.IsBusy = true;
        ListView.ItemsSource = ViewModel.Messages;
        ListView.AutoFitMode = AutoFitMode.Height;
        ListView.HeaderTemplate = new DataTemplate(() =>
        {
            var grid = new Grid();
            var loadMoreIndicator = new LoadMoreIndicator()
            {
                Color = Color.Red,
                IsRunning = true
            };
            loadMoreIndicator.SetBinding(LoadMoreIndicator.IsVisibleProperty, new
            Binding("IndicatorIsVisible"));
            grid.Children.Add(loadMoreIndicator);
            return grid;
        });
    }
}
```

Insert each new item in the 0th position of the underlying collection bound to the SfListView.ItemsSource property.

### C#

```
using Syncfusion.ListView.XForms.Control.Helpers;
public partial class MainPage : ContentPage
{
    MainPageViewModel ViewModel;
    VisualContainer visualContainer;
    public bool isScrolled;
    HeaderItem headerItem;
    public MainPage()
    {
        InitializeComponent();
        ViewModel = new MainPageViewModel();
        BindingContext = ViewModel;
        ViewModel.ListView = this.ListView;
        ListView.Loaded += ListView_Loaded;
        visualContainer = ListView.GetVisualContainer();
    }
    private void HeaderItem_PropertyChanged(object sender,
        System.ComponentModel.PropertyChangedEventArgs e)
    {
        if(e.PropertyName=="Visibility")
        {
            if (headerItem.Visibility && isScrolled)
                LoadMoreOnTop();
        }
    }
    private async void LoadMoreOnTop()
    {
        //To get the current first item which is visible in the View.
        var firstItem = ListView.DataSource.DisplayItems[0];
        ViewModel.IndicatorIsVisible = true;
        await Task.Delay(4000);
        var r = new Random();
        //To avoid layout calls for arranging each and every items to be added in the View.
        ListView.DataSource.BeginInit();
        for (int i = 0; i < 5; i++)
        {
            var collection = new Message();
            collection.Text = ViewModel.MessageText[r.Next(0,
                ViewModel.MessageText.Count() - 1)];
            collection.IsIncoming = i % 2 == 0 ? true : false;
            collection.MessageDateTime = DateTime.Now.ToString();
            ViewModel.Messages.Insert(0, collection);
        }
        ListView.DataSource.EndInit();
        var firstItemIndex = ListView.DataSource.DisplayItems.IndexOf(firstItem);
        var header = (ListView.HeaderTemplate != null && !ListView.IsStickyHeader) ?
            1 : 0;
        var totalItems = firstItemIndex + header;
        //Need to scroll back to previous position else the ScrollViewer moves to top of the list.
        ListView.LayoutManager.ScrollToRowIndex(totalItems, true);
    }
}
```

```

ViewModel.IndicatorIsVisible = false;
}
private void ListView_Loaded(object sender,
Syncfusion.ListView.XForms.ListViewLoadedEventArgs e)
{
    //To avoid loading items initially when page loaded.
    if (!isScrolled)
    (ListView.LayoutManager as
LinearLayout).ScrollToRowIndex(ViewModel.Messages.Count - 1, true);
    headerItem = visualContainer.Children[0] as HeaderItem;
    headerItem.PropertyChanged += HeaderItem_PropertyChanged;
    isScrolled = true;
}
}

```

Download the entire source code from GitHub [here](#).

*Load more items manually from up direction*

The SfListView allows loading more items when tapping the button loaded in the [HeaderTemplate](#) when reaching top of the list and shows the busy indicator till the items are added into the collection.

#### XML

```

<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<syncfusion:SfListView x:Name="ListView" IsBusy="True"
ItemTemplate="{StaticResource MessageTemplateSelector}"
ItemsSource="{Binding Messages}"

```

```

ItemSize="100">
<syncfusion:SfListView.HeaderTemplate>
<DataTemplate>
<ViewCell>
<Grid>
<Grid BackgroundColor="#d3d3d3" IsVisible="{Binding GridIsVisible}">
<Button Text="Load More" Clicked="Button_Clicked"
HorizontalOptions="CenterAndExpand" VerticalOptions="CenterAndExpand"/>
</Grid>
<syncfusion:LoadMoreIndicator Color="Red" IsRunning="True"
IsVisible="{Binding IndicatorIsVisible}"/>
</Grid>
</ViewCell>
</DataTemplate>
</syncfusion:SfListView.HeaderTemplate>
</syncfusion:SfListView>
</ContentPage>

```

**C#**

```

public partial class MainPage : ContentPage
{
    MainPageViewModel ViewModel;
    public MainPage()
    {
        InitializeComponent();
        ViewModel = new MainPageViewModel();
        ListView.IsBusy = true;
        ListView.ItemsSource = ViewModel.Messages;
        ListView.AutoFitMode = AutoFitMode.Height;
        ListView.HeaderTemplate = new DataTemplate(() =>
        {
            var grid = new Grid();
            grid.BackgroundColor = Color.FromHex("#d3d3d3");
            grid.SetBinding(Grid.IsVisibleProperty, new Binding("GridIsVisible"));
            var loadMore = new Button()
            {
                HorizontalOptions = LayoutOptions.CenterAndExpand,
                VerticalOptions = LayoutOptions.CenterAndExpand,
                Text = "LoadMore",
            };
            loadMore.Clicked += Button_Clicked;
            grid.Children.Add(loadMore);
            var grid1 = new Grid();
            var loadMoreIndicator = new LoadMoreIndicator()
            {
                Color = Color.Red,
                IsRunning = true
            };
            loadMoreIndicator.SetBinding(LoadMoreIndicator.IsVisibleProperty, new
            Binding("IndicatorIsVisible"));
            grid1.Children.Add(loadMoreIndicator);
            grid1.Children.Add(grid);
            return grid1;
        });
    }
}

```

```
}

```

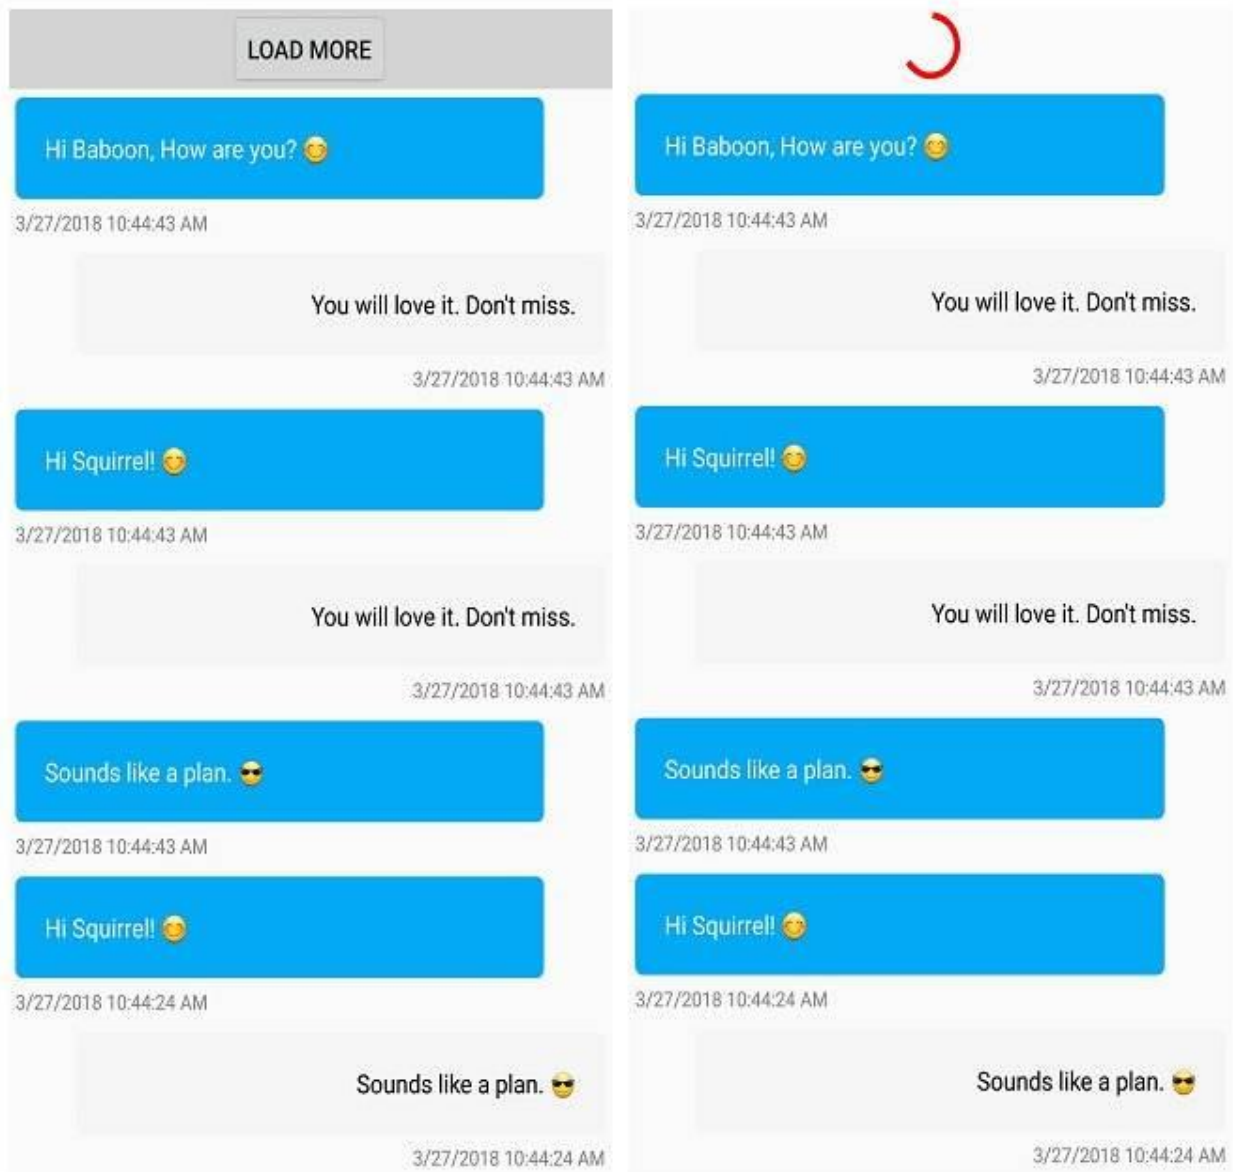

Insert each new item in the 0th position of the underlying collection bound to the SfListView.ItemsSource property.

### C#

```
public partial class MainPage : ContentPage
{
    MainPageViewModel ViewModel;
    VisualContainer visualContainer;
    public MainPage()
    {
        InitializeComponent();
        ViewModel = new MainPageViewModel();
        BindingContext = ViewModel;
        ViewModel.ListView = this.ListView;
        ListView.Loaded += ListView_Loaded;
    }
    private void ListView_Loaded(object sender,
        Syncfusion.ListView.XForms.ListViewLoadedEventArgs e)
    {
        (ListView.LayoutManager as
        LinearLayout).ScrollToRowIndex(ViewModel.Messages.Count - 1, true);
    }
    private async void Button_Clicked(object sender, EventArgs e)
    {
        //To get the current first item which is visible in the View.
        var firstItem = ListView.DataSource.DisplayItems[0];
        ViewModel.GridIsVisible = false;
        ViewModel.IndicatorIsVisible = true;
        await Task.Delay(2000);
        var r = new Random();
        //To avoid layout calls for arranging each and every items to be added in the View.
        ListView.DataSource.BeginInit();
        for (int i = 0; i < 5; i++)
        {
            var collection = new Message();
            collection.Text = ViewModel.MessageText[r.Next(0,
            ViewModel.MessageText.Count() - 1)];
            collection.IsIncoming = i % 2 == 0 ? true : false;
            collection.MessageDateTime = DateTime.Now.ToString();
            ViewModel.Messages.Insert(0, collection);
        }
        ListView.DataSource.EndInit();
        var firstItemIndex = ListView.DataSource.DisplayItems.IndexOf(firstItem);
        var header = (ListView.HeaderTemplate != null && !ListView.IsStickyHeader) ?
        1 : 0;
        var totalItems = firstItemIndex + header;
        //Need to scroll back to previous position else the ScrollViewer moves to top of the list.
        ListView.LayoutManager.ScrollToRowIndex(totalItems, true);
        ViewModel.GridIsVisible = true;
        ViewModel.IndicatorIsVisible = false;
    }
}
```

}

Download the entire source code from GitHub [here](#).

*How to disable LoadMoreCommand execution when ListView is Empty?*

You can skip the load more action by checking the underlying collection count in the execute method.

**C#**

```
//ViewModel.cs
LoadMoreItemsCommand = new Command<object>(LoadMoreItems, CanLoadMoreItems);
private bool CanLoadMoreItems(object obj)
{
    if (Products.Count >= totalItems)
        return false;
    return true;
}
```

```
private async void LoadMoreItems(object obj)
{
    if (Products.Count == 0)
        return;
    var listView = obj as Syncfusion.ListView.XForms.SfListView;
    listView.IsBusy = true;
    await Task.Delay(2500);
    var index = Products.Count;
    var count = index + 3 >= totalItems ? totalItems - index : 3;
    AddProducts(index, count);
    listView.IsBusy = false;
}

private void AddProducts(int index, int count)
{
    for (int i = index; i < index + count; i++)
    {
        var name = Names[i];
        var p = new Product()
        {
            Name = name,
            Weight = Weights[i],
            Price = Prices[i],
            Image = ImageSource.FromResource("LoadMoreUG.LoadMore." + name.Replace(" ",
                string.Empty) + ".jpg")
        };
        Products.Add(p);
    }
}
```

Download the GitHub sample from GitHub [here](#)

### Right to left(RTL)

ListView supports to change the flow of text to the right-to-left direction by setting the [FlowDirection](#) to [RightToLeft](#) in both [Vertical](#) and [Horizontal](#) orientations. ListView supports RTL in Xamarin.Forms version 3.0 and above. It also supports RTL when device's flow direction is changed.

**Note:** Specific platform setup is required to enable right-to-left localization. For platform settings you can refer [here](#).

### XML

```
<ContentPage xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms">
<ContentPage.Content>
<syncfusion:SfListView x:Name="listView" FlowDirection="RightToLeft"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
listView.FlowDirection = FlowDirection.RightToLeft;
```

You can download the entire source code of this demo from [here](#).

**Note:** When a label is loaded in the `ItemTemplate`, the right-to-left direction is not applied due to the framework issue. It has been reported to the Xamarin team; for more details about this, refer to this [link](#). To overcome this issue, set the `HorizontalOptions` to `StartAndExpand` in Label.

#### Limitation

- ListView item does not arrange from right to left direction in `Horizontal` orientation, when the `AutoFitMode` is `Height`.

## MVVM

### Commands

#### Tap command

The [TapCommand](#) will be triggered whenever tapping the item and passing the [ItemTappedEventArgs](#) as parameter.

#### C#

```
listView.TapCommand = viewModel.TappedCommand;
public class CommandViewModel
{
    private Command<Object> tappedCommand;
    public Command<object> TappedCommand
    {
        get { return tappedCommand; }
        set { tappedCommand = value; }
    }
    public CommandViewModel()
    {
        TappedCommand = new Command<object>(TappedCommandMethod);
    }
    private void TappedCommandMethod(object obj)
    {
        if ((obj as Syncfusion.ListView.XForms.ItemTappedEventArgs).ItemData ==
            viewModel.InboxInfo[0])
            viewModel.InboxInfo.Remove(e.ItemData as ListViewInboxInfo)
    }
}
```

#### Hold command

The [HoldCommand](#) will be triggered whenever long pressing the item and passing the [ItemHoldingEventArgs](#) as parameter.

#### C#

```
listView.HoldCommand = viewModel.HoldCommand;
public class CommandViewModel
{
    private Command<Object> holdingCommand;
    public Command<object> HoldingCommand
    {
        get { return holdingCommand; }
        set { holdingCommand = value; }
    }
    public CommandViewModel()
    {
        HoldingCommand = new Command<object>(HoldingCommandMethod);
    }
    private void HoldingCommandMethod(object obj)
    {
        if ((obj as Syncfusion.ListView.XForms.ItemHoldingEventArgs).ItemData ==
            viewModel.InboxInfo[3])
            viewModel.InboxInfo.Remove(e.ItemData as ListViewInboxInfo);
    }
}
```

---

**Note:** When Command is bound to ItemTemplate, it must also define **Source** property with its root element as reference. Only then it executes the property in the ViewModel of type Command.

---

### Event to command

The ListView event can be converted into commands using [Behaviors](#). To achieve this, create a command in the ViewModel class and associate it to the ListView event using **Behaviors**.

### XML

```
<listView:SfListView x:Name="listView" ItemsSource="{Binding contactsinfo}">
<listView:SfListView.Behaviors>
<local:EventToCommandBehavior EventName="SelectionChanged" Command="{Binding
SelectionChangedCommand}" />
</listView:SfListView.Behaviors>
</listView:SfListView>
```

### C#

```
public class ContactsViewModel
{
    public Command<ItemSelectionChangedEventArgs> selectionChangedCommand;
    public Command<ItemSelectionChangedEventArgs> SelectionChangedCommand
    {
        get { return selectionChangedCommand; }
        set { selectionChangedCommand = value; }
    }
    public ContactsViewModel()
    {
        SelectionChangedCommand = new
        Command<Syncfusion.ListView.XForms.ItemSelectionChangedEventArgs>(OnSelection
        Changed);
    }
    private void OnSelectionChanged(ItemSelectionChangedEventArgs obj)
    {
        App.Current.MainPage.DisplayAlert("Alert", (obj.AddedItems[0] as
        Contacts).ContactName + " is selected", "OK");
    }
}
```

Download the entire source code from GitHub [here](#).

For more information regarding the event to command behavior in Xamarin.Forms, you can refer [this](#) link.

### Binding command of inner ListView to Model Command?

You can bind command of Button inside ItemTemplate to the command in Model by specifying Source property with its root element as reference to execute the binded property of type command.

### XML

```
<listView:SfListView x:Name="listView" ItemsSource="{Binding ContactInfo}">
<listView:SfListView.ItemTemplate>
<DataTemplate>
<ViewCell>
```

```

<ViewCell.View>
<StackLayout>
<listView:SfListView x:Name="list1" ItemsSource="{Binding ContactDetails}"
TapCommand="{Binding NavigateToSelectModelsCommand}"
TapCommandParameter="{Binding}">
<listView:SfListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<StackLayout BackgroundColor="Teal" >
<Label Text="{Binding ContactName}" />
<Label Text="{Binding ContactNumber}" />
<StackLayout HeightRequest="1" BackgroundColor="Gray"/>
</StackLayout>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</listView:SfListView.ItemTemplate>
</listView:SfListView>
</StackLayout>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</listView:SfListView.ItemTemplate>
</listView:SfListView>

```

## C#

```

public class ContactInfo_NestedListView
{
    public Command<Object> NavigateToSelectModelsCommand { get; private set; }
    public ContactInfo_NestedListView()
    {
        NavigateToSelectModelsCommand = new Command<Object>(NavigateToSelectModels,
        CanNavigate);
    }
    private bool CanNavigate(object argument)
    {
        return true;
    }
    private void NavigateToSelectModels(object model)
    {
        var customer = model as ContactInfo_NestedListView;
        App.Current.MainPage.DisplayAlert("Message", "Tapped customer group value : "
        + customer.location, "OK");
    }
}

```

Binding command of Button inside the ItemTemplate of Xamarin.Forms ListView to ViewModel Command?

You can bind command of Button inside ItemTemplate to the command in ViewModel by specifying Source property with its root element as reference to execute the binded property of type command.

## XML

```
<Syncfusion:SfListView x:Name="listView" ItemsSource="{Binding
contactsinfo}" >
<Syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<Grid >
<Button Text="Delete" Command="{Binding Path=BindingContext.DeleteCommand,
Source={x:Reference listView}}" CommandParameter="{x:Reference listView}"/>
</Grid>
</ViewCell>
</DataTemplate>
</Syncfusion:SfListView.ItemTemplate>
</Syncfusion:SfListView>
```

## C#

```
namespace ListViewSample
{
    public class ContactsViewModel : INotifyPropertyChanged
    {
        public Command<object> DeleteCommand { get; set; }
        public ContactsViewModel()
        {
            DeleteCommand = new Command<object>(OnTapped);
        }
        private void OnTapped(object obj)
        {
            var contact = obj as Contacts;
            contactsInfo.Remove(contact);
            App.Current.MainPage.DisplayAlert("Message", "Item Deleted :",
            +contact.ContactName, "Ok");
        }
    }
}
```

You can download the sample from GitHub [here](#).

## ListView with Prism Framework

The SfListView allows the user to work with prism for MVVM Framework. Steps to be followed:

1. Replace your application to prism application in App.xaml file.
2. Inherit App.xaml.cs from prism application instead of your application.
3. Create a prism namespace library reference in xaml file of the ContentPage.
4. Connect view and view model instead of binding context by registering them.

## C#

```
public partial class App : PrismApplication
{
    public App(IPlatformInitializer initializer = null) : base(initializer) { }
    protected override void OnInitialized()
    {
        InitializeComponent();
    }
}
```

```
protected override void RegisterTypes ()
{
    Container.RegisterTypeForNavigation<MainPage, MainPageViewModel>();
}
}
```

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<prism:PrismApplication xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:prism="clr-namespace:Prism.Unity;assembly=Prism.Unity.Forms"
x:Class="ListViewPrism.App">
</prism:PrismApplication>
```

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:prism="clr-namespace:Prism.Mvvm;assembly=Prism.Forms"
xmlns:local="clr-namespace:ListViewPrism;assembly=ListViewPrism"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
x:Class="ListViewPrism.Views.MainPage"
Title="MainPage">
<StackLayout HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand">
<syncfusion:SfListView x:Name="listView" ItemSize="70" ItemSpacing="0,0,5,0"
AutoFitMode="Height"
ItemsSource="{Binding ContactsInfo}" IsStickyHeader="True"
AllowSwiping="True" IsStickyGroupHeader="True" GroupHeaderSize="50">
</syncfusion:SfListView>
</StackLayout>
</ContentPage>
```

For more details, refer to <https://xamgirl.com/prism-in-xamarin-forms-step-by-step-part-1>.

Download the entire source code from GitHub [here](#).

### ListView with MVVMCross

The SfListView allows users work with MVVMCross Framework. Follow the below steps to work with MVVMCross Framework:

1. Inherit App.cs from MvxApplication instead of your application.

**C#**

```
public class CoreApp : MvvmCross.Core.ViewModels.MvxApplication
{
    public override void Initialize ()
    {
    }
}
```

2. Inherit ViewModel from the MvxViewModel.

**C#**

```
public class MvxFormsViewModel : MvxViewModel
{
    public MvxFormsViewModel()
    {
    }
}
```

3. Connect view and view model instead of binding context by registering them.

**C#**

```
public class CoreApp : MvvmCross.Core.ViewModels.MvxApplication
{
    public override void Initialize()
    {
        CreatableTypes()
        .EndingWith("Service")
        .AsInterfaces()
        .RegisterAsLazySingleton();
        RegisterNavigationServiceAppStart<ViewModels.MvxFormsViewModel>();
    }
}
```

4. Derive MainActivity and AppDelegate from MvxFormsAppCompatActivity and MvxFormsApplicationDelegate for initializing renderer.

**C#**

```
public class MainActivity : MvxFormsAppCompatActivity
{
    protected override void OnCreate(Bundle bundle)
    {
        base.OnCreate(bundle);
        TabLayoutResource = Resource.Layout.Tabbar;
        ToolbarResource = Resource.Layout.Toolbar;
    }
}

public partial class AppDelegate : MvxFormsApplicationDelegate
{
    public override UIWindow Window { get; set; }
    public override bool FinishedLaunching(UIApplication app, NSDictionary options)
    {
        SfListViewRenderer.Init();
    }
}
```

For more details, refer to this [documentation](#).

You can download the entire source code of this demo in the following link: [Source code](#).

Binding properties in MVVM pattern

*Binding ItemsSource*

ListView support to bind the [ItemsSource](#) property to populate the list view items from view model.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:MVVM"
xmlns:syncfusion="clr-
namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
x:Class="MVVM.MainPage">
<ContentPage.BindingContext>
<local:BookInfoRepository/>
</ContentPage.BindingContext>
</ContentPage>
<syncfusion:SfListView x:Name="listView" ItemsSource="{Binding
BookInfoCollection}"/>
```

### C#

```
listView.SetBinding(SfListView.ItemsSourceProperty, new
Binding("BookInfoCollection", BindingMode.OneWay));
```

### C#

```
//ViewModel.cs
public class BookInfoRepository : INotifyPropertyChanged
{
    private ObservableCollection<BookInfo> bookInfoCollection;
    public event PropertyChangedEventHandler PropertyChanged;
    public ObservableCollection<BookInfo> BookInfoCollection
    {
        get { return bookInfoCollection; }
        set
        {
            this.bookInfoCollection = value;
            this.OnPropertyChanged("BookInfoCollection");
        }
    }
    public void OnPropertyChanged(string name)
    {
        if (this.PropertyChanged != null)
            this.PropertyChanged(this, new PropertyChangedEventArgs(name));
    }
    public BookInfoRepository()
    {
        GenerateNewBookInfo();
    }
    private void GenerateNewBookInfo()
    {
        BookInfoCollection = new ObservableCollection<BookInfo>();
    }
}
```

```
BookInfoCollection.Add(new BookInfo() { BookName = "Machine Learning Using C#", BookDescription = "You'll learn several different approaches to applying machine learning" });
BookInfoCollection.Add(new BookInfo() { BookName = "Object-Oriented Programming in C#", BookDescription = "Object-oriented programming is the de facto programming paradigm" });
BookInfoCollection.Add(new BookInfo() { BookName = "C# Code Contracts", BookDescription = "Code Contracts provide a way to convey code assumptions" });
}
```

### Binding SelectedItem

ListView support to select the items through binding the [SelectedItem](#) property from view model by implementing the [INotifyPropertyChanged](#) interface that gives the call back notification to UI.

### XML

```
<syncfusion:SfListView x:Name="listView"
SelectedItem="{Binding SelectedItem}"
ItemsSource="{Binding BookInfoCollection}"/>
```

### C#

```
listView.SetBinding(SfListView.SelectedItemProperty, new
Binding("SelectedItem", BindingMode.TwoWay));
```

### C#

```
//ViewModel.cs
public class BookInfoRepository : INotifyPropertyChanged
{
    private object selectedItem;
    public object SelectedItem
    {
        get { return this.selectedItem; }
        set
        {
            this.selectedItem = value;
            this.OnPropertyChanged("SelectedItem");
        }
    }
    public BookInfoRepository()
    {
        SelectedItem = BookInfoCollection[2];
    }
}
```

Download the entire sample from GitHub [here](#).

### Binding SelectedItems

ListView support to select multiple items through binding the [SelectedItems](#) property from view model with [ObservableCollection<object>](#) type. Set the [SelectionMode](#) property as [Multiple](#).

**XML**

```
<syncfusion:SfListView x:Name="listView"
SelectionMode="Multiple"
SelectedItems="{Binding SelectedItems}"
ItemsSource="{Binding BookInfoCollection}"/>
```

**C#**

```
listView.SelectionMode = SelectionMode.Multiple;
listView.SetBinding(SfListView.SelectedItemsProperty, new
Binding("SelectedItems", BindingMode.TwoWay));
```

**C#**

```
//ViewModel.cs
public class BookInfoRepository : INotifyPropertyChanged
{
    public event PropertyChangedEventHandler PropertyChanged;
    private ObservableCollection<object> selectedItems;
    public ObservableCollection<object> SelectedItems
    {
        get { return this.selectedItems; }
        set
        {
            this.selectedItems = value;
            this.OnPropertyChanged("SelectedItems");
        }
    }
    public void OnPropertyChanged(string name)
    {
        if (this.PropertyChanged != null)
            this.PropertyChanged(this, new PropertyChangedEventArgs(name));
    }
    public BookInfoRepository()
    {
        SelectedItems = new ObservableCollection<object>();
        SelectedItems.Add(BookInfoCollection[1]);
        SelectedItems.Add(BookInfoCollection[2]);
    }
}
```

Download the entire sample from GitHub [here](#).

*Binding SelectionChanged event*

In ListView, the [SelectionChanged](#) event is raised once the selection process has been completed. MVVM for the [SelectionChanged](#) event can be achieved by binding through the event to command converter.

Refer [event to command](#) knowledge base to create the command for event using behavior.

**XML**

```
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding BookInfoCollection}">
<syncfusion:SfListView.Behaviors>
```

```
<local:EventToCommandBehavior EventName="SelectionChanged" Command="{Binding
SelectedItem}"
Converter="{StaticResource EventArgs}"/>
</syncfusion:SfListView.Behaviors>
</syncfusion:SfListView>
```

## C#

```
//ViewModel.cs
public class BookInfoRepository : INotifyPropertyChanged
{
    private Command<ItemSelectionChangedEventArgs> selectedItem
    public Command<ItemSelectionChangedEventArgs> SelectedItem
    {
        get { return this.selectedItem; }
        set
        {
            this.selectedItem = value;
            this.OnPropertyChanged("SelectedItem");
        }
    }
    public BookInfoRepository()
    {
        selectedItem = new
        Command<ItemSelectionChangedEventArgs>(OnSelectionChanged);
    }
    ///<summary>
    ///Remove the selected item
    ///</summary>
    public void OnSelectionChanged(ItemSelectionChangedEventArgs obj)
    {
        var eventArgs = obj as ItemSelectionChangedEventArgs;
        var item= eventArgs.AddedItems[0];
        this.bookInfoCollection.Remove(this.BookInfoCollection.FirstOrDefault(x => x
        == item));
    }
}
```

Download the entire sample from GitHub [here](#).

### Binding SelectionChanging event

In ListView, the [SelectionChanging](#) event will be raised when selecting an item at the execution time. MVVM for the [SelectionChanging](#) event can be achieved by binding through the event to command converter.

Refer [event to command](#) knowledge base to create the command for event using behavior.

## XML

```
<syncfusion:SfListView x:Name="listView"
ItemsSource="{Binding BookInfoCollection}">
<syncfusion:SfListView.Behaviors>
<local:EventToCommandBehavior EventName="SelectionChanging"
Command="{Binding SelectedItem}"
Converter="{StaticResource EventArgs}"/>
</syncfusion:SfListView.Behaviors>
```

---

```
</syncfusion:SfListView>
```

---

**C#**

```
//ViewModel.cs
public class BookInfoRepository : INotifyPropertyChanged
{
    private Command<ItemSelectionChangingEventArgs> selectedItem
    public Command<ItemSelectionChangingEventArgs> SelectedItem
    {
        get { return this.selectedItem; }
        set
        {
            this.selectedItem = value;
            this.OnPropertyChanged("SelectedItem");
        }
    }
    public BookInfoRepository()
    {
        selectedItem = new
        Command<ItemSelectionChangingEventArgs>(OnSelectionChanging);
    }
    ///<summary>
    ///To disable the selection for particular item
    ///</summary>
    public void OnSelectionChanging(ItemSelectionChangingEventArgs obj)
    {
        var eventArgs = obj as ItemSelectionChangingEventArgs;
        if (eventArgs.AddedItems.Count > 0 && eventArgs.AddedItems[0] ==
        this.BookInfoCollection[0])
            eventArgs.Cancel = true;
    }
}
```

Download the entire sample from GitHub [here](#).

---

**Note:** Similarly, you can bind the [ItemTapped](#), [ItemDoubleTapped](#), and [ItemHolding](#) event.

---

*Handling ItemTapped action*

ListView supports binding the [TapCommand](#) property with the item tapped action from view model, where you can write navigation or any other action code in the execution. When defining the command, [ItemTappedEventArgs](#) will be passed as command parameter which has item information in execution.

You can define the command parameter for `TapCommand` using [TappedCommandParameter](#), where you can get the element reference passed in view model.

**XML**

```
<syncfusion:SfListView x:Name="listView"
    TapCommand="{Binding TapCommand}"
    ItemsSource="{Binding BookInfoCollection}"/>
```

**C#**

```
listView.SetBinding(SfListView.TapCommandProperty, new Binding("TapCommand",
BindingMode.OneWay));
```

**C#**

```
//ViewModel.cs
public class BookInfoRepository : INotifyPropertyChanged
{
    private Command tapCommand;
    public Command TapCommand
    {
        get { return tapCommand; }
        protected set { tapCommand = value; }
    }
    public BookInfoRepository()
    {
        tapCommand = new Command(OnItemTapped);
    }
    ///<summary>
    ///To display tapped item content
    ///</summary>
    public void OnItemTapped(object obj)
    {
        var eventArgs = obj as Syncfusion.ListView.XForms.ItemTappedEventArgs;
        var bookName = (eventArgs.ItemData as BookInfo).BookName;
        var bookDescription = (eventArgs.ItemData as BookInfo).BookDescription;
        var display = Application.Current.MainPage.DisplayAlert(bookName,
        "Description:" + bookDescription, "Ok");
    }
}
```

Download the entire sample from GitHub [here]<https://github.com/SyncfusionExamples/xamarin-forms-listview-itemtapped-mvvm>).

*Handling ItemHolding action*

ListView supports binding the [HoldCommand](#) property with the item holding action from view model, where you can write navigation or any other action code in the execution. When defining the command, [ItemHoldingEventArgs](#) will be passed as command parameter which has item information in execution.

You can define the command parameter for the [HoldCommand](#) using [HoldCommandParameter](#), where you can get the element reference passed in view model.

**XML**

```
<syncfusion:SfListView x:Name="listView"
HoldCommand="{Binding HoldCommand}"
ItemsSource="{Binding BookInfoCollection}"/>
```

**C#**

```
listView.SetBinding(SfListView.HoldCommandProperty, new
Binding("HoldCommand", BindingMode.OneWay));
```

**C#**

```
//ViewModel.cs
public class BookInfoRepository : INotifyPropertyChanged
{
    private Command holdCommand;
    public Command HoldCommand
    {
        get { return holdCommand; }
        protected set { holdCommand = value; }
    }
    public BookInfoRepository()
    {
        holdCommand = new Command(OnHold);
    }
    ///<summary>
    /// Displays the item holding content
    ///</summary>
    public void OnHold(object obj)
    {
        var eventArgs = obj as Syncfusion.ListView.XForms.ItemHoldingEventArgs;
        Application.Current.MainPage.DisplayAlert("Type Of Item :" +
        eventArgs.ItemType, "Item Tapped Position : + " +eventArgs.Position , "Ok");
    }
}
```

Download the entire sample from GitHub [here](#).

#### *Binding button command*

The contents loaded in the [ItemTemplate](#) can be bound from the view model using their commands or gestures, where you can customize the loaded content or any other action code needed in the call back. You will get the BindingContext of [ListViewItem](#) as the parameter in execution when defining the command button.

You can also get the reference of element bound as parameter by using command parameter of loaded elements.

#### **XML**

```
<syncfusion:SfListView x:Name="listView" AutoFitMode="Height"
SelectedItem="{Binding SelectedItem}"
ItemsSource="{Binding BookInfoCollection}">
<syncfusion:SfListView.ItemTemplate>
<DataTemplate>
<Frame HasShadow="True" Margin="5,5,5,5" >
<Grid Padding="5">
<Grid.RowDefinitions>
<RowDefinition Height="*" />
<RowDefinition Height="2*" />
</Grid.RowDefinitions>
<Button x:Name="bookName" Text="{Binding BookName}" Command="{Binding
Path=BindingContext.BackgroundColorCommand, Source={x:Reference listView}}"
CommandParameter="{x:Reference bookName}" BackgroundColor="Transparent"
FontAttributes="Bold" FontSize="19"/>
<Label Grid.Row="1" Text="{Binding BookDescription}" FontSize="15" />
</Grid>
</Frame>
</DataTemplate>
```

```
</syncfusion:SfListView.ItemTemplate>
</syncfusion:SfListView>
```

**C#**

```
listView.ItemTemplate = new DataTemplate(() =>
{
    var frame = new Frame();
    frame.HasShadow = true;
    frame.Margin = 5;
    var grid = new Grid();
    grid.Padding = 5;
    var button = new Button();
    Binding binding = new Binding();
    binding.Path = "BookName";
    button.SetBinding(Button.TextProperty, binding);
    button.Command = this.viewModel.BackgroundColorCommand;
    button.BackgroundColor = Color.Transparent;
    button.FontAttributes = FontAttributes.Bold;
    button.FontSize = 19;
    var label = new Label();
    Binding bind = new Binding();
    bind.Path = "BookDescription";
    label.SetBinding(Label.TextProperty, bind);
    label.FontSize = 15;
    grid.Children.Add(button);
    grid.Children.Add(label, 0, 1);
    frame.Content = grid;
    return frame;
});
```

**C#**

```
public class BookInfoRepository : INotifyPropertyChanged
{
    private Command backgroundColorCommand;
    public Command BackgroundColorCommand
    {
        get { return backgroundColorCommand; }
        protected set { backgroundColorCommand = value; }
    }
    public BookInfoRepository()
    {
        backgroundColorCommand = new Command(OnButtonTapped);
    }
    ///<summary>
    ///To display tapped item content
    ///</summary>
    public void OnButtonTapped(object obj)
    {
        var firstButton = obj as Button;
        firstButton.BackgroundColor = Color.AliceBlue;
    }
}
```

Download the entire sample from GitHub [here](#).

#### *Processing LoadMore*

ListView supports binding the [LoadMoreOption](#), [LoadMoreCommand](#), and [IsBusy](#) properties from view model to load more number of items at runtime. [LoadMoreOption](#) enables load more manually or automatically the items when loading the items at runtime. [LoadMoreCommand](#) executes to load the items form view model. The [IsBusy](#) property notifies that the items are populating from view model to show or hide the load more view.

The [IsBusy](#) property in view model shows the busy indicator when populating the [ItemsSource](#).

#### **XML**

```
<syncfusion:SfListView x:Name="listView"
    LoadMoreOption="Auto"
    LoadMoreCommand="{Binding LoadMoreItemsCommand}"
    LoadMoreCommandParameter="{Binding Source={x:Reference Name=listView}}"
    IsBusy="{Binding IsBusy}"
    ItemsSource="{Binding BookInfoCollection}">
```

#### **C#**

```
listView.LoadMoreOption = LoadMoreOption.Auto;
listView.SetBinding(SfListView.LoadMoreCommandProperty, new
Binding("LoadMoreItemsCommand", BindingMode.OneWay));
listView.LoadMoreCommandParameter = listView;
listView.SetBinding(SfListView.IsBusyProperty, new Binding("IsBusy",
BindingMode.OneWay));
```

#### **C#**

```
public class ViewModel:INotifyPropertyChanged
{
    private bool isBusy;
    public bool IsBusy
    {
        get { return isBusy; }
        set
        {
            this.isBusy = value;
            RaisePropertyChanged("IsBusy");
        }
    }
    private int totalItems = 22;
    public Command<object> LoadMoreItemsCommand { get; set; }
    public ViewModel()
    {
        BookInfoCollection = new ObservableCollection<BookInfo>();
        AddBookInfos(0, 3);
        LoadMoreItemsCommand = new Command<object>(LoadMoreItems);
    }
    private bool CanLoadMoreItems(object obj)
    {
        if (BookInfoCollection.Count >= totalItems)
            return false;
    }
}
```

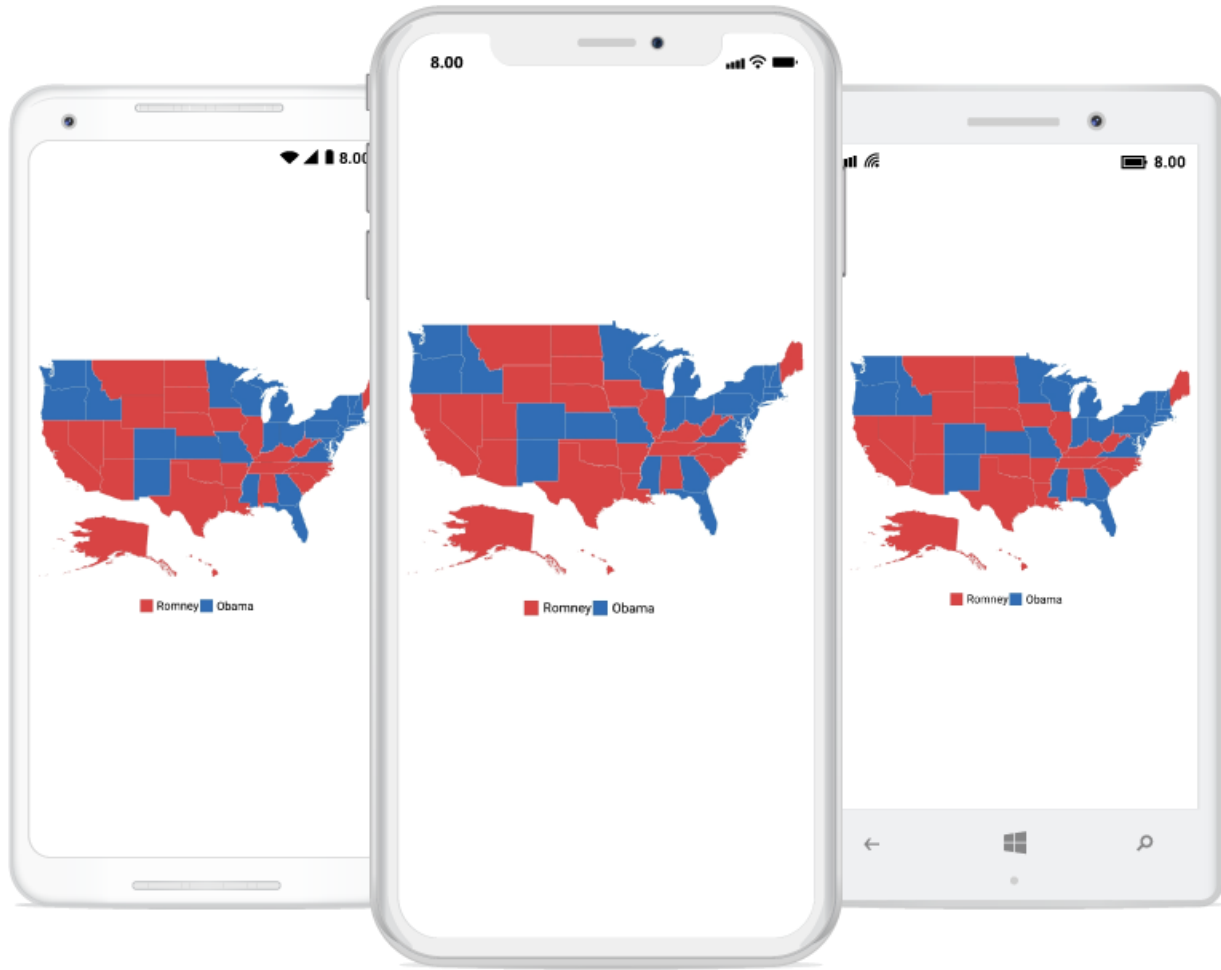

```
return true;
}
private async void LoadMoreItems(object obj)
{
    var listview = obj as Syncfusion.ListView.XForms.SfListView;
    try
    {
        IsBusy = true;
        await Task.Delay(1000);
        var index = BookInfoCollection.Count;
        var count = index + 3 >= totalItems ? totalItems - index : 3;
        AddBookInfos(index, 3);
    }
    catch
    {
    }
    finally
    {
        IsBusy = false;
    }
}
private void AddBookInfos(int index, int count)
{
    int bookNameCount = 0;
    int bookDescriptionCount = 0;
    for (int i = index; i < index + count; i++)
    {
        if (bookNameCount == 11)
            bookNameCount = 0;
        if (bookDescriptionCount == 11)
            bookDescriptionCount = 0;
        BookInfoCollection.Add(new BookInfo() { BookName = bookNames[bookNameCount]
            , BookDescription = bookDescription[bookDescriptionCount] });
        bookNameCount++;
        bookDescriptionCount++;
    }
}
}
```

You can download the entire sample from GitHub [here](#).

## SfMaps

### Overview

The maps control for Xamarin.Forms provides a graphical representation of geographical data. It is used to represent the statistical data of a particular geographical area on earth by panning and zooming. The maps control supports enhanced data visualization with bubbles and labels using data bound to map.

## Key features

- **Layers:** Visualize maps. A map can accommodate one or more layers.
- **Map elements:** Show additional information on map with customized appearance using various set of elements, shapes, bubbles, markers, legends, labels, and data items.
- **User interaction:** Enables options such as zooming, panning, and map selection to make the map elements more interactive.

## Getting Started

This section explains the steps required to configure the maps control and customize its elements.

### Adding SfMaps reference

You can add SfMaps reference using one of the following methods:

#### Method 1: Adding SfMaps reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfMaps to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfMaps](https://www.syncfusion.com/nuget/packages/syncfusion.xamarin.sfmmaps), and then install it.

![Adding SfMaps reference from NuGet](Images/Adding SfMaps reference.png)

---

**Note:** Install the same version of SfMaps NuGet in all the projects.

---

### Method 2: Adding SfMaps reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfMaps control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfMaps assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfMaps.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfMaps.Android.dll Syncfusion.SfMaps.XForms.Android.dll Syncfusion.SfMaps.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfMaps.iOS.dll Syncfusion.SfMaps.XForms.iOS.dll Syncfusion.SfMaps.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfMaps.UWP.dll Syncfusion.SfMaps.XForms.UWP.dll Syncfusion.SfMaps.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching an application on each platform with SfMaps.

To use the SfMaps control inside an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

### iOS

To launch the SfMaps in iOS, call the `SfMapsRenderer.Init()` in the `FinishedLaunching` overridden method of the AppDelegate class after the Xamarin.Forms Framework has been initialized and before the `LoadApplication` is called, as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.SfMaps.XForms.iOS.SfMapsRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

### Universal Windows Platform (UWP)

You need to initialize the maps view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with maps in Release mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    // Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfMaps.XForms.UWP.SfMapsRenderer).
        GetTypeInfo().Assembly);
    // Replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Android

The Android platform does not require any additional configuration to render the maps.

#### Adding namespace

Add the following namespace.

#### XML

```
xmlns:maps="clr-
namespace:Syncfusion.SfMaps.XForms;assembly=Syncfusion.SfMaps.XForms"
```

#### C#

```
using Syncfusion.SfMaps.XForms;
```

### Initializing maps

Create an instance for the maps control, and add it as content.

#### XML

```
<maps:SfMaps >  
</maps:SfMaps>
```

#### C#

```
SfMaps map = new SfMaps();  
this.Content = map;
```

### Adding layers

The maps control is maintained through [layers](#). It can accommodate one or more shape file layers.

#### XML

```
<maps:SfMaps>  
<maps:SfMaps.Layers>  
<maps:ShapeFileLayer/>  
</maps:SfMaps.Layers>  
</maps:SfMaps>
```

#### C#

```
SfMaps map = new SfMaps();  
ShapeFileLayer layer = new ShapeFileLayer();  
map.Layers.Add(layer);  
this.Content = map;
```

### Adding shape files

A shape file is a set of files that is stored in a non-topological geometry with the attribute information for the spatial features and records in a data set.

The maps control supports reading and loading the shape files. A shape file can be a set of files or a single file. Generally, a shape file contains the following files:

- Main file (.shp)
- dBase file (.dbf)

#### Android

- Add necessary shape files to the Assets folder of ProjectFileName.Droid.
- Right-click the added shape file, and navigate to properties.
- Choose the **AndroidAsset** option under BuildAction of respective shape file.

#### iOS

- Add necessary shape files to the Resources folder of ProjectFileName.iOS.
- Right-click the added shape file, and navigate to properties.

- Choose the **BundleResource** option under BuildAction of respective shape file.

#### UWP

- Add necessary shapes files in a folder, and name it as **ShapeFiles**. Add this **ShapeFiles** folder into the **Assets** folder of ProjectFileName.UWP.
- Right-click the added shape file, and navigate to properties.
- Choose the **EmbeddedResource** option under BuildAction of respective shape file.

The [Uri](#) property in shape file layer is used to retrieve the location of the shape file that is added.

#### XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White" >
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" >
  </maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

#### C#

```
SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
map.Layers.Add(layer);
this.Content = map;
```

The following screenshot illustrates the result of adding shape files.

#### GeoJSON support

The maps control supports reading and loading the GeoJSON files. The GeoJSON file contains attribute information for the spatial features and coordinates in a dataset.

#### XML

```
<maps:ShapeFileLayer Uri="usa_state.json">
</maps:ShapeFileLayer>
```

### C#

```
ShapeFileLayer layer = new ShapeFileLayer();  
layer.Uri = "usa_state.json";
```

#### Data binding

Data can be bound to the shape file layer using the [ItemsSource](#), [ShapeIDPath](#), and [ShapeIDTableField](#) properties.

The [Populate data](#) section gives the detailed explanation of data binding.

### XML

```
<maps:SfMaps.Layers >  
<maps:ShapeFileLayer Uri="usa_state.shp" ItemsSource="{Binding Data}"  
ShapeIDPath="State" ShapeIDTableField="STATE_NAME" >  
</maps:ShapeFileLayer>  
</maps:SfMaps.Layers>
```

### C#

```
ShapeFileLayer layer = new ShapeFileLayer();  
layer.Uri = "usa_state.shp";  
layer.ItemsSource =viewModel.Data;  
layer.ShapeIDTableField = "STATE_NAME";  
layer.ShapeIDPath = "State";  
map.Layers.Add(layer);
```

#### Adding markers

Markers are used to identify the shapes. They can be added to the shape file layers as demonstrated in the following code sample. Markers can be customized using the [MarkerSettings](#) property in the shape file layer.

The detailed explanation of marker and its customization are provided under [Markers](#) section.

### XML

```
<maps:ShapeFileLayer.Markers>  
<maps:MapMarker Label = "California" Latitude = "37" Longitude = "-120">  
</maps:MapMarker>  
</maps:ShapeFileLayer.Markers>
```

### C#

```
MapMarker marker = new MapMarker();  
marker.Label = "California";  
marker.Latitude = "37";  
marker.Longitude = "-120";  
layer.Markers.Add(marker);
```

## Color mapping

The color mapping support allows you customize the shape colors based on the underlying value of shape received from the bound data. Both the range color mapping and equal color mapping are supported in maps.

The detailed explanation of color mapping is provided in [colorMapping](#) section.

### XML

```
<maps:ShapeSetting.ColorMappings>
<maps:EqualColorMapping Color="#D84444" LegendLabel="Romney" Value =
"Romney"></maps:EqualColorMapping>
<maps:EqualColorMapping Color="#316DB5" LegendLabel="Obama"
Value="Obama"></maps:EqualColorMapping>
</maps:ShapeSetting.ColorMappings>
```

### C#

```
EqualColorMapping colorMapping = new EqualColorMapping();
colorMapping.Color = Color.FromHex("#D84444");
colorMapping.LegendLabel = "Romney";
colorMapping.Value = "Romney";
EqualColorMapping colorMapping1 = new EqualColorMapping();
colorMapping1.Color = Color.FromHex("#316DB5");
colorMapping1.LegendLabel = "Obama";
colorMapping1.Value = "Obama";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ColorMappings.Add(colorMapping);
shapeSetting.ColorMappings.Add(colorMapping1);
```

## Adding legends

Legends interpret what the map displays. They can be added to the shape file layer as demonstrated in the following code sample. Legends will be displayed based on the data bound to the layer, and color mapping plays a major role in enabling legends.

The detailed explanation of legend is provided under [Legend](#) section.

### XML

```
<maps:ShapeFileLayer.LegendSettings>
<maps:MapLegendSetting ShowLegend="true" LegendPosition="75,90"/>
</maps:ShapeFileLayer.LegendSettings>
```

### C#

```
MapLegendSetting setting = new MapLegendSetting();
setting.ShowLegend = true;
setting.LegendPosition = new Point(75, 90);
layer.LegendSettings = setting;
```

The following code sample gives you the complete code for map with markers and legends.

### XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White" >
```

```

<maps:SfMaps.Layers >
<maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
ShapeIDTableField="STATE_NAME"
ItemsSource="{Binding Data}"
>
<maps:ShapeFileLayer.Markers>
<maps:MapMarker Label = "California" Latitude = "37" Longitude = "-120">
</maps:MapMarker>
</maps:ShapeFileLayer.Markers>
<maps:ShapeFileLayer.MarkerSettings>
<maps:MapMarkerSetting IconColor="LimeGreen" IconSize="25"
LabelColor="White" LabelSize="20">
</maps:MapMarkerSetting>
</maps:ShapeFileLayer.MarkerSettings>
<maps:ShapeFileLayer.ShapeSettings>
<maps:ShapeSetting ShapeColorValuePath="Candidate"
ShapeValuePath="Candidate" >
<maps:ShapeSetting.ColorMappings>
<maps:EqualColorMapping Color="#D84444" LegendLabel="Romney" Value =
"Romney"></maps:EqualColorMapping>
<maps:EqualColorMapping Color="#316DB5" LegendLabel="Obama"
Value="Obama"></maps:EqualColorMapping>
</maps:ShapeSetting.ColorMappings>
</maps:ShapeSetting>
</maps:ShapeFileLayer.ShapeSettings>
<maps:ShapeFileLayer.LegendSettings>
<maps:MapLegendSetting ShowLegend="True"
LegendPosition="30,70">
<maps:MapLegendSetting.IconSize>
<Size Width="20" Height="20"></Size>
</maps:MapLegendSetting.IconSize>
</maps:MapLegendSetting>
</maps:ShapeFileLayer.LegendSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

## C#

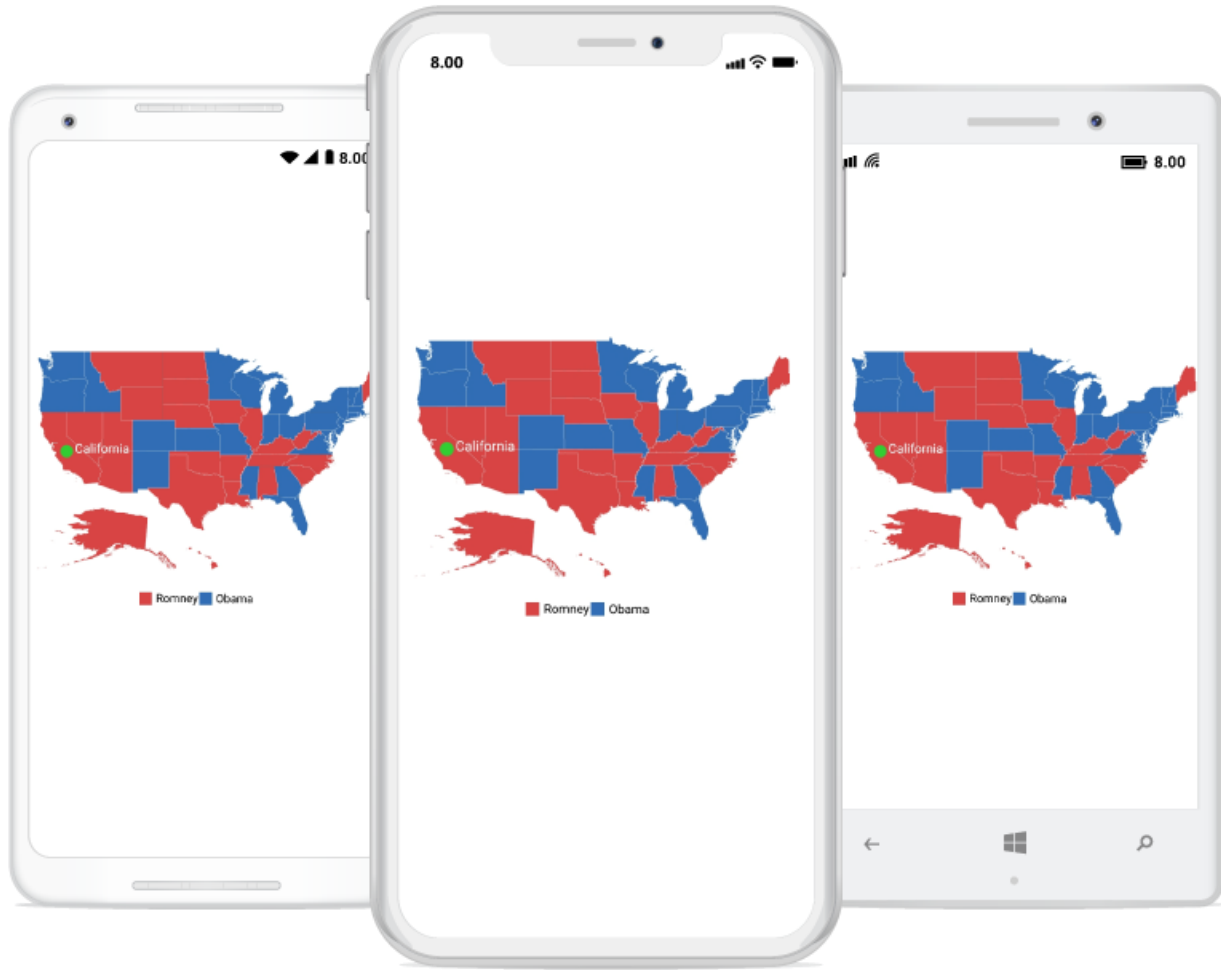

```

SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ItemsSource = viewModel.Data;
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeIDPath = "State";
map.Layers.Add(layer);
MapLegendSetting legendSetting = new MapLegendSetting();
legendSetting.ShowLegend = true;
legendSetting.LegendPosition = new Point(30, 70);
legendSetting.IconSize = new Size(20, 20);
layer.LegendSettings = legendSetting;
MapMarker marker = new MapMarker();
marker.Label = "California";
marker.Latitude = "37";
marker.Longitude = "-120";

```

```
layer.Markers.Add(marker);
MapMarkerSetting markerSetting = new MapMarkerSetting();
markerSetting.IconColor = Color.LimeGreen;
markerSetting.IconSize = 25;
markerSetting.LabelColor = Color.White;
markerSetting.LabelSize = 20;
layer.MarkerSettings = markerSetting;
EqualColorMapping colorMapping = new EqualColorMapping();
colorMapping.Color = Color.FromHex("#D84444");
colorMapping.LegendLabel = "Romney";
colorMapping.Value = "Romney";
EqualColorMapping colorMapping1 = new EqualColorMapping();
colorMapping1.Color = Color.FromHex("#316DB5");
colorMapping1.LegendLabel = "Obama";
colorMapping1.Value = "Obama";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeValuePath = "Candidate";
shapeSetting.ShapeColorValuePath = "Candidate";
shapeSetting.ColorMappings.Add(colorMapping);
shapeSetting.ColorMappings.Add(colorMapping1);
layer.ShapeSettings = shapeSetting;
this.Content = map;
```

The following screenshot illustrates the result of the above code sample.

You can download the complete [Getting started](#) sample.

## Populate Data

This section explains how to populate shape data for providing data input to the maps control and usage of the `ItemsSource` property.

### Data binding

The maps control supports data binding using the `ItemsSource` property in the shape layers.

The following properties in shape layers are used for binding data in the maps control:

- `ItemsSource`
- `ShapeIDPath`
- `ShapeIDTableField`

### *ItemsSource*

The [ItemsSource](#) property accepts the collection values as input.

### *ShapeIDPath*

The [ShapeIDPath](#) property refers the data ID in `ItemsSource`.

### ShapeIDTableField

The [ShapeIDTableField](#) property is similar to the [ShapeIDPath](#); it refers to the column name in the data property of shape layers to identify the shape. When the values of the [ShapeIDPath](#) property in the [ItemsSource](#) property and the values of [ShapeIDTableField](#) in the data property match, the associated object from the ItemsSource will be bound to the corresponding shape.

### XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White" >
  <maps:SfMaps.BindingContext>
  <local:ViewModel></local:ViewModel>
</maps:SfMaps.BindingContext>
<maps:SfMaps.Layers >
  <maps:ShapeFileLayer Uri="usa_state.shp" ItemsSource="{Binding Data}"
  ShapeIDPath="State" ShapeIDTableField="STATE_NAME" >
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ItemsSource =viewModel.Data;
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeIDPath = "State";
map.BackgroundColor = Color.White;
map.Layers.Add(layer);
```

The following code sample demonstrates referring the United States election data as items source.

### C#

```
public class ViewModel
{
  public ObservableCollection<ElectionData> Data { get; set; }
  public ViewModel()
  {
    Data = new ObservableCollection<ElectionData>();
    Data.Add(new ElectionData("Alabama", "Romney", 9));
    Data.Add(new ElectionData("Alaska", "Romney", 3));
    Data.Add(new ElectionData("Arizona", "Romney", 11));
    Data.Add(new ElectionData("Arkansas", "Romney", 6));

}
```

## Layers

The maps control is maintained through [Layers](#); a map can accommodate one or more layers.

The maps control consists the following two layers:

- Imagery layer
- Shape file layer

### Imagery layer

The [MapsProvider](#) section explains about the imagery layer.

### Shape file layer

Using shape file layer, custom shape files can be rendered and the shapes can be customized.

### Shape settings

This section defines how to customize the shapes in a map.

You can customize a shape's fill, stroke, and stroke thickness using the [ShapeFill](#), [ShapeStroke](#), [ShapeStrokeThickness](#) properties.

Refer to the following code sample for customizing shapes.

### XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" >
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="LightBlue" ShapeStroke="Black"
          ShapeStrokeThickness="2" >
        </maps:ShapeSetting>
      </maps:ShapeFileLayer.ShapeSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
SfMaps maps = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ItemsSource = GetDataSource();
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeIDPath = "State";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeFill = Color.LightBlue;
shapeSetting.ShapeStroke = Color.Black;
shapeSetting.ShapeStrokeThickness = 2;
layer.ShapeSettings = shapeSetting;
maps.Layers.Add(layer);
```

To customize the shapes based on the bound values, use the following properties:

[ShapeValuePath](#): Field value that has to be bound for each shape.

[ShapeColorValuePath](#): Field value that has to be bound to determine the color.

### XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp"
      ShapeIDPath="State" ShapeIDTableField="STATE_NAME" >
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeColorValuePath="Candidate"
          ShapeValuePath="Candidate">
          <maps:ShapeSetting.ColorMappings>
            <maps:EqualColorMapping Color="#D84444" Value="Romney"
              LegendLabel="Romney"></maps:EqualColorMapping>
            <maps:EqualColorMapping Color="#316DB5" Value="Obama"
              LegendLabel="Obama"></maps:EqualColorMapping>
          </maps:ShapeSetting.ColorMappings>
        </maps:ShapeSetting>
      </maps:ShapeFileLayer.ShapeSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ItemsSource = GetDataSource();
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeIDPath = "State";
map.Layers.Add(layer);
EqualColorMapping colorMapping = new EqualColorMapping();
colorMapping.Color = Color.FromHex("#D84444");
colorMapping.LegendLabel = "Romney";
colorMapping.Value = "Romney";
EqualColorMapping colorMapping1 = new EqualColorMapping();
colorMapping1.Color = Color.FromHex("#316DB5");
colorMapping1.LegendLabel = "Obama";
```

```
colorMapping1.Value = "Obama";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeValuePath = "Candidate";
shapeSetting.ShapeColorValuePath = "Candidate";
shapeSetting.ColorMappings.Add(colorMapping);
shapeSetting.ColorMappings.Add(colorMapping1);
layer.ShapeSettings = shapeSetting;
```

#### *Customize selected shapes*

To customize the selected shapes alone, use the following properties:

[SelectedShapeColor](#): Sets the color for selected shapes in a map.

[SelectedShapeStroke](#): Sets the border color for selected shapes in a map.

[SelectedShapeStrokeThickness](#): Sets the border thickness for selected shapes in a map.

#### **XML**

```
<maps:ShapeFileLayer.ShapeSettings>
  <maps:ShapeSetting ShapeFill="LightBlue" ShapeStroke="Black"
    ShapeStrokeThickness="1" >
  </maps:ShapeSetting>
</maps:ShapeFileLayer.ShapeSettings>
```

#### **C#**

```
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.SelectedShapeColor = Color.Green;
shapeSetting.SelectedShapeStroke = Color.Black;
shapeSetting.SelectedShapeStrokeThickness = 1;
layer.ShapeSettings = shapeSetting;
```

### Events

The [ShapeSelected](#) event will be triggered when a map shape is selected. A corresponding model data is passed as an argument. The ShapeSelected event has been deprecated.

The [ShapeSelectionChanged](#) event will be triggered when changing the the map shapes selection with corresponding argument as model [Data](#). Selection state of the shape will be changed using the [IsSelected](#) property

### XML

```
<maps:ShapeFileLayer ShapeSelectionChanged
="ShapeLayer_ShapeSelectionChanged" />
```

### C#

```
private void ShapeLayer_ShapeSelectionChanged(object sender,
ShapeSelectedEventArgs e)
{
    AgricultureData data = e.Data as AgricultureData;
    bool IsSelected = e.IsSelected;
}
```

### Sublayer

The shape layers are the core layers of the maps. Multiple layers can be added to the shape layers as sublayers within the shape layers.

### Adding multiple layers in the map

Multiple layers can be added to the maps using [Sublayer](#).

### Displaying layer in the view

The [BaseMapIndex](#) property allows drill-down from main layer to another layer.

In the ShapeSelected event, the *BaseMapIndex* property has been used to change the layer when Asia shape is selected.

### XML

```
<Grid>
  <Grid.BindingContext>
    <local:DrilldownViewModel/>
  </Grid.BindingContext>
  <maps:SfMaps x:Name="map">
    <maps:SfMaps.Layers>
      <maps:ShapeFileLayer EnableSelection="True" x:Name="layer1" Uri="world-
map.shp" ItemsSource="{Binding DataSource}" ShapeIDPath="Country"
ShapeIDTableField="admin"
ShapeSelectionChanged="ShapeFileLayer_ShapeSelected">
        <maps:ShapeFileLayer.ShapeSettings>
          <maps:ShapeSetting ShapeColorValuePath="Continent">
            <maps:ShapeSetting.ColorMappings>
              <maps:EqualColorMapping Color="#C13664" Value="North America"
            ></maps:EqualColorMapping>
              <maps:EqualColorMapping Color="#9C3367" Value="South
America"></maps:EqualColorMapping>
              <maps:EqualColorMapping Color="#80306A"
Value="Africa"></maps:EqualColorMapping>
              <maps:EqualColorMapping Color="#622D6C"

    public DrilldownViewModel()
    {
        DataSource = new ObservableCollection<DrilldownModel>();
        DataSource.Add(new DrilldownModel("Afghanistan", "Asia"));
        DataSource.Add(new DrilldownModel("Angola", "Africa"));
        DataSource.Add(new DrilldownModel("Albania", "Europe"));
        DataSource.Add(new DrilldownModel("United Arab Emirates", "Asia"));
        DataSource.Add(new DrilldownModel("Argentina", "South America"));
        DataSource.Add(new DrilldownModel("Armenia", "Asia"));
        DataSource.Add(new DrilldownModel("French Southern and Antarctic Lands",
            "Seven seas (open ocean)"));
        DataSource.Add(new DrilldownModel("Australia", "Australia"));
        //..
        //..
        DataSource.Add(new DrilldownModel("Zambia", "Africa"));
        DataSource.Add(new DrilldownModel("Zimbabwe", "Africa"));
    }
    public ObservableCollection<DrilldownModel> DataSource { get; set; }
}
public class DrilldownModel
{
    public DrilldownModel(string country, string con)
    {
        this.Country = country;
        this.Continent = con;
    }
    public string Continent
    {
        get;
        set;
    }
    public string Country
    {
        get;
        set;
    }
}
```

## Shape Type

[SfMaps](#) allows to provide various shape types in [ShapeFileLayer](#) such as Polygon, Polyline, and Points.

### Polygon

Polygon is a two-dimensional surface stored as a sequence of points defining its exterior bounding ring and 0 or more interior rings. Polygons are always simple. Mostly the polygon shape type defines a group of land, water bodies, and other features that have a spatial extent.

### Polyline

The polyline is a shape that has a dimension of 1. It is called a simple line if it does not intersect itself. The polylines are often used to define linear features such as roads, rivers, and power lines. Mostly the shape file layer with the polyline shape type is used as [sublayer](#).

The following code example demonstrates the sublayer with polyline shape type. The roads (sublayer) of Bahrain (base layer) is displayed using the shape file layer of maps.

### XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="Bahrain.shp">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="#bcbcbc"/>
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.Sublayers>
        <maps:ShapeFileLayer Uri="roads.shp">
          <maps:ShapeFileLayer.ShapeSettings>
            <maps:ShapeSetting ShapeFill="Black" ShapeStrokeThickness="2"/>
          </maps:ShapeFileLayer.ShapeSettings>
        </maps:ShapeFileLayer>
      </maps:ShapeFileLayer.Sublayers>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

```

</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

## C#

```

SfMaps maps = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "Bahrain.shp";
ShapeSetting layerSetting = new ShapeSetting();
layerSetting.ShapeFill = Color.FromHex("#bcbcbc");
layer.ShapeSettings = layerSetting;
ShapeFileLayer subLayer = new ShapeFileLayer();
subLayer.Uri = "roads.shp";
ShapeSetting subLayerSetting = new ShapeSetting();
subLayerSetting.ShapeFill = Color.Black;
subLayerSetting.ShapeStrokeThickness = 2;
subLayer.ShapeSettings = subLayerSetting;
layer.Sublayers.Add(subLayer);
maps.Layers.Add(layer);
this.Content = maps;

```

## Points

A point is shape with a dimension of 0 that occupies a single location in coordinate space. A point has a single x, y coordinate value. The points are often used to define features such as oil wells, landmarks, and elevations.

The following code example demonstrates the [sublayer](#) with the points shape type. The places (sublayer) of Australia (base layer) is displayed using the shape file layer of maps.

## XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="australia.shp">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="#bcbcbc"/>
      </maps:ShapeFileLayer.ShapeSettings>
    <maps:ShapeFileLayer.Sublayers>
      <maps:ShapeFileLayer Uri="points.shp">
        <maps:ShapeFileLayer.ShapeSettings>
          <maps:ShapeSetting ShapeFill="Black" />
        </maps:ShapeFileLayer.ShapeSettings>
      </maps:ShapeFileLayer>
    </maps:ShapeFileLayer.Sublayers>
  </maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

## C#

```
SfMaps maps = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "australia.shp";
ShapeSetting layerSetting = new ShapeSetting();
layerSetting.ShapeFill = Color.FromHex("#bcbcbc");
layer.ShapeSettings = layerSetting;
ShapeFileLayer subLayer = new ShapeFileLayer();
subLayer.Uri = "points.shp";
ShapeSetting subLayerSetting = new ShapeSetting();
subLayerSetting.ShapeFill = Color.Black;
subLayer.ShapeSettings = subLayerSetting;
layer.Sublayers.Add(subLayer);
maps.Layers.Add(layer);
this.Content = maps;
```

### Customization of Points

The size, shape, and position of the map points can be customized using the [MapPointIconSize], [MapPointIcon], [MapPointHorizontalAlignment] and [MapPointVerticalAlignment] properties of shape file layer.

### Map point icon

The shape of the map point is customized using the [MapPointIcon] property of ShapeFileLayer. SfMap supports the following map point icon types:

Circle, Rectangle, Square, Diamond, \* Star

### XML

```
<maps:SfMaps BackgroundColor="White">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="australia.shp">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="#bcbcbc"/>
      </maps:ShapeFileLayer.ShapeSettings>
    <maps:ShapeFileLayer.Sublayers>
      <maps:ShapeFileLayer Uri="points.shp" MapPointIcon="Circle"
MapPointIconSize="10">
        <maps:ShapeFileLayer.ShapeSettings>
          <maps:ShapeSetting ShapeFill="Green" />
        </maps:ShapeFileLayer.ShapeSettings>
      </maps:ShapeFileLayer>
    </maps:ShapeFileLayer.Sublayers>
  </maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

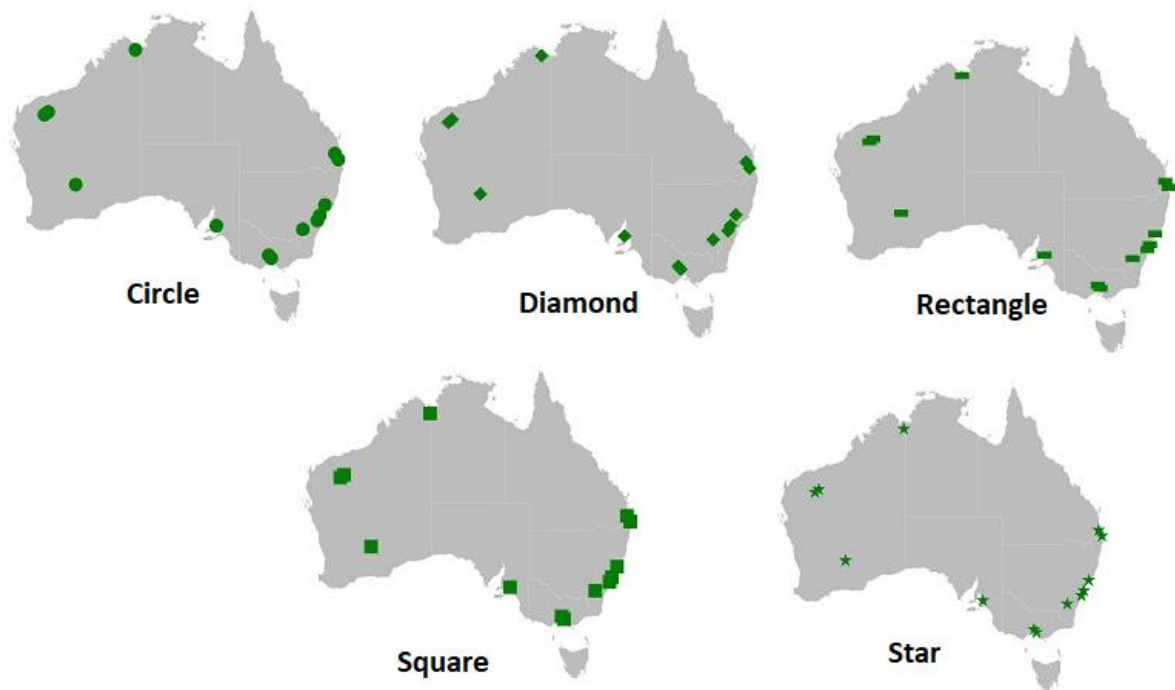

**C#**

```

SfMaps maps = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "australia.shp";
ShapeSetting layerSetting = new ShapeSetting();
layerSetting.ShapeFill = Color.FromHex("#bcbcbc");
layer.ShapeSettings = layerSetting;
ShapeFileLayer subLayer = new ShapeFileLayer();
subLayer.Uri = "points.shp";
subLayer.MapPointIcon = MapPointIcon.Circle;
subLayer.MapPointIconSize = 10;
ShapeSetting subLayerSetting = new ShapeSetting();
subLayerSetting.ShapeFill = Color.Green;
subLayer.ShapeSettings = subLayerSetting;
layer.Sublayers.Add(subLayer);
maps.Layers.Add(layer);

```

*Map point position*

The position of the map points can be customized using the `[MapPointHorizontalAlignment]` and `[MapPointVerticalAlignment]` properties of shape file layer. These properties allow to vary the position to Near, Far, and Center by considering the provided latitude, longitude, and the map point icon size.

**XML**

```

<maps:SfMaps BackgroundColor="White">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="australia.shp">
      <maps:ShapeFileLayer.ShapeSettings>

```

```

<maps:ShapeSetting ShapeFill="#bcbcbc"/>
</maps:ShapeFileLayer.ShapeSettings>
<maps:ShapeFileLayer.Sublayers>
<maps:ShapeFileLayer Uri="points.shp" MapPointIcon="Circle"
MapPointIconSize="10"
MapPointHorizontalAlignment="Near" MapPointVerticalAlignment="Near">
<maps:ShapeFileLayer.ShapeSettings>
<maps:ShapeSetting ShapeFill="Brown" />
</maps:ShapeFileLayer.ShapeSettings>
</maps:ShapeFileLayer>
</maps:ShapeFileLayer.Sublayers>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

### C#

```

SfMaps maps = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "australia.shp";
ShapeSetting layerSetting = new ShapeSetting();
layerSetting.ShapeFill = Color.FromHex("#bcbcbc");
layer.ShapeSettings = layerSetting;
ShapeFileLayer subLayer = new ShapeFileLayer();
subLayer.Uri = "points.shp";
subLayer.MapPointIcon = MapPointIcon.Circle;
subLayer.MapPointIconSize = 10;
subLayer.MapPointHorizontalAlignment = MarkerAlignment.Near;
subLayer.MapPointVerticalAlignment = MarkerAlignment.Near;
ShapeSetting subLayerSetting = new ShapeSetting();
subLayerSetting.ShapeFill = Color.Green;
subLayer.ShapeSettings = subLayerSetting;
layer.Sublayers.Add(subLayer);
maps.Layers.Add(layer);

```

### Map point size

The size of the map points can be customized using the [MapPointIconSize] property of ShapeFileLayer.

### XML

```
<maps:SfMaps BackgroundColor="White">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="australia.shp">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="#bcbcbc"/>
      </maps:ShapeFileLayer.ShapeSettings>
    <maps:ShapeFileLayer.Sublayers>
      <maps:ShapeFileLayer Uri="points.shp" MapPointIconSize="15">
        <maps:ShapeFileLayer.ShapeSettings>
          <maps:ShapeSetting ShapeFill="OrangeRed" />
        </maps:ShapeFileLayer.ShapeSettings>
      </maps:ShapeFileLayer>
    </maps:ShapeFileLayer.Sublayers>
  </maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
SfMaps maps = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "australia.shp";
ShapeSetting layerSetting = new ShapeSetting();
layerSetting.ShapeFill = Color.FromHex("#bcbcbc");
layer.ShapeSettings = layerSetting;
ShapeFileLayer subLayer = new ShapeFileLayer();
subLayer.Uri = "points.shp";
subLayer.MapPointIcon = MapPointIcon.Circle;
subLayer.MapPointIconSize = 15;
ShapeSetting subLayerSetting = new ShapeSetting();
subLayerSetting.ShapeFill = Color.OrangeRed;
subLayer.ShapeSettings = subLayerSetting;
layer.Sublayers.Add(subLayer);
maps.Layers.Add(layer);
```

## Markers

Markers are used to show some messages on maps.

Markers are set to the maps control using the following ways:

- Adding marker objects
- Defining custom markers

### Adding marker objects

Any number of markers can be added to the shape file layers using the [Markers](#) property. Each marker object contains the following properties:

[Label](#): Displays some messages on maps.

[Latitude](#): Specifies y-axis position of the marker.

[Longitude](#): Specifies x-axis position of the marker.

### XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp">
      <maps:ShapeFileLayer.Markers>
        <maps:MapMarker Label = "California" Latitude = "37" Longitude = "-120"/>
      </maps:ShapeFileLayer.Markers>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
map.Layers.Add(layer);
MapMarker marker = new MapMarker();
marker.Label = "California";
marker.Latitude = "37";
marker.Longitude = "-120";
layer.Markers.Add(marker);
this.Content = map;
```

### Customizing markers

Markers can be customized using the [MarkerSettings](#) property in shape file layer.

#### Customizing marker icons

The size and color of marker icons can be customized using the [IconSize](#) and [IconColor](#) properties.

#### Icon types

The shape of a marker icon can be customized using the [MarkerIcon](#) property. The maps control supports the following types of marker icons:

- Circle
- Diamond
- Image
- Rectangle
- Square

### XML

```
<maps:SfMaps x:Name="sfmap">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp">
      <maps:ShapeFileLayer.Markers>
        <maps:MapMarker Label = "California" Latitude = "37" Longitude = "-120"/>
      </maps:ShapeFileLayer.Markers>
      <maps:ShapeFileLayer.MarkerSettings>
        <maps:MapMarkerSetting MarkerIcon="Square"/>
      </maps:ShapeFileLayer.MarkerSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
```

```
</maps:SfMaps>
```

## C#

```
SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
map.Layers.Add(layer);
MapMarker marker = new MapMarker();
marker.Label = "California";
marker.Latitude = "37";
marker.Longitude = "-120";
layer.Markers.Add(marker);
MapMarkerSetting markerSetting = new MapMarkerSetting();
markerSetting.MarkerIcon = MapMarkerIcon.Square;
layer.MarkerSettings = markerSetting;
this.Content = map;
```

### Setting contrast color

Based on the background color of the shapes, contrast color will be applied to marker icon.

## XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White">
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer x:Name="layer" Uri="usa_state.shp" ShapeIDPath="State"
      ShowMapItems="False"
      ShapeIDTableField="STATE_NAME">
      <maps:ShapeFileLayer.Markers>
        <maps:MapMarker Latitude = "37" Longitude = "-120">
        </maps:MapMarker>
```

```

<maps:MapMarker Latitude = "31" Longitude = "-97">
</maps:MapMarker>
<maps:MapMarker Latitude = "41" Longitude = "-92">
</maps:MapMarker>
<maps:MapMarker Latitude = "38" Longitude = "-98">
</maps:MapMarker>
<maps:MapMarker Latitude = "41" Longitude = "-99">
</maps:MapMarker>
</maps:ShapeFileLayer.Markers>
<maps:ShapeFileLayer.ShapeSettings>
<maps:ShapeSetting ShapeColorValuePath="Candidate"
ShapeValuePath="Candidate">
<maps:ShapeSetting.ColorMappings>
<maps:EqualColorMapping Color="#FFD84F" LegendLabel="Romney"
Value = "Romney"></maps:EqualColorMapping>
<maps:EqualColorMapping Color="#316DB5" LegendLabel="Obama"
Value="Obama"></maps:EqualColorMapping>

<Size Width="20" Height="20"></Size>
</maps:MapLegendSetting.IconSize>
</maps:MapLegendSetting>
</maps:ShapeFileLayer.LegendSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

## C#

```

SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.ItemsSource = viewModel.Data;
layer.Uri = "usa_state.shp";
map.Layers.Add(layer);
MapMarker marker = new MapMarker();
marker.Label = "California";
marker.Latitude = "37";
marker.Longitude = "-120";
layer.Markers.Add(marker);
MapLegendSetting legendSetting = new MapLegendSetting();
legendSetting.ShowLegend = true;
legendSetting.LegendPosition = new Point(30, 70);
legendSetting.IconSize = new Size(20, 20);
layer.LegendSettings = legendSetting;
MapMarker marker1 = new MapMarker();
marker1.Label = "California";
marker1.Latitude = "31";
marker1.Longitude = "-97";
layer.Markers.Add(marker1);
MapMarker marker2 = new MapMarker();
marker2.Label = "California";

```

```
marker2.Latitude = "41";
marker2.Longitude = "-92";
layer.Markers.Add(marker2);
MapMarker marker3 = new MapMarker();
marker3.Label = "California";
marker3.Latitude = "38";
marker3.Longitude = "-98";
layer.Markers.Add(marker3);
MapMarker marker4 = new MapMarker();
marker4.Label = "California";
marker4.Latitude = "41";
marker4.Longitude = "-99";
layer.Markers.Add(marker4);
EqualColorMapping colorMapping = new EqualColorMapping();
colorMapping.Color = Color.FromHex("#FFD84F");
colorMapping.LegendLabel = "Romney";
colorMapping.Value = "Romney";
EqualColorMapping colorMapping1 = new EqualColorMapping();
colorMapping1.Color = Color.FromHex("#316DB5");
colorMapping1.LegendLabel = "Obama";
colorMapping1.Value = "Obama";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeValuePath = "Candidate";
shapeSetting.ShapeColorValuePath = "Candidate";
shapeSetting.ColorMappings.Add(colorMapping);
shapeSetting.ColorMappings.Add(colorMapping1);
layer.ShapeSettings = shapeSetting;
this.Content = map;
```

### Setting image marker icon

You can pin an image as marker icon by setting the icon type as `Image`. Set [ImageSource](#) to get the image from local path.

### XML

```
<maps:SfMaps x:Name="sfmap">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp">
      <maps:ShapeFileLayer.Markers>
        <maps:MapMarker Label = "Texas" Latitude = "31.267153" Longitude = "-97.7430608"/>
        <maps:MapMarker Label = "California" Latitude = "37" Longitude = "-120"/>
      </maps:ShapeFileLayer.Markers>
      <maps:ShapeFileLayer.MarkerSettings>
        <maps:MapMarkerSetting MarkerIcon="Image" ImageSource="pin.png"/>
      </maps:ShapeFileLayer.MarkerSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
map.Layers.Add(layer);
MapMarker marker = new MapMarker();
```

```

marker.Label = "Texas";
marker.Latitude = "31.267153";
marker.Longitude = "-97.7430608";
layer.Markers.Add(marker);
MapMarker marker1 = new MapMarker();
marker1.Label = "California";
marker1.Latitude = "37";
marker1.Longitude = "-120";
layer.Markers.Add(marker1);
MapMarkerSetting markerSetting = new MapMarkerSetting();
markerSetting.MarkerIcon = MapMarkerIcon.Image;
markerSetting.ImageSource = "pin.png";
layer.MarkerSettings = markerSetting;
this.Content = map;

```

### Customizing labels

The color and size of marker labels can be customized using the [LabelColor](#) and [LabelSize](#) properties.

The following code sample explains how to customize a marker.

### XML

```

<maps:SfMaps x:Name="sfmap" BackgroundColor="White">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp">
      <maps:ShapeFileLayer.Markers>
        <maps:MapMarker Label = "California" Latitude = "37" Longitude = "-120"/>
      </maps:ShapeFileLayer.Markers>
      <maps:ShapeFileLayer.MarkerSettings>
        <maps:MapMarkerSetting IconColor="Red" IconSize="25" MarkerIcon="Diamond"
          LabelColor="White" LabelSize="20"/>
      </maps:ShapeFileLayer.MarkerSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>

```

```

</maps:ShapeFileLayer.MarkerSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

## C#

```

SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
map.Layers.Add(layer);
MapMarker marker = new MapMarker();
marker.Label = "California";
marker.Latitude = "37";
marker.Longitude = "-120";
layer.Markers.Add(marker);
MapMarkerSetting markerSetting = new MapMarkerSetting();
markerSetting.IconColor = Color.Red;
markerSetting.IconSize = 25;
markerSetting.MarkerIcon = MapMarkerIcon.Diamond;
markerSetting.LabelColor = Color.White;
markerSetting.LabelSize = 20;
layer.MarkerSettings = markerSetting;
this.Content = map;

```

## Custom marker

The maps control provides support for defining custom markers using the [MarkerTemplate](#) property.

## XML

```

<maps:SfMaps x:Name="sfmap" BackgroundColor="White">
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="world1.shp" >
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="Gray" />
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.Markers>
        <local:CustomMarker Latitude="38.8833" Longitude= "-77.0167" />
        <local:CustomMarker Latitude="-15.7833" Longitude= "-47.8667" />
        <local:CustomMarker Latitude="21.0000" Longitude= "78.0000" />
        <local:CustomMarker Latitude="35.0000" Longitude= "103.0000" />
      </maps:ShapeFileLayer.Markers>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>

```

```

<local:CustomMarker Latitude="-6.1750" Longitude="106.8283" />
</maps:ShapeFileLayer.Markers>
<maps:ShapeFileLayer.MarkerTemplate>
<DataTemplate >
<StackLayout Padding="-12,-12,0,0" IsClippedToBounds="false"
HorizontalOptions="StartAndExpand" VerticalOptions="Center"
HeightRequest="60" WidthRequest="60" >
<Image Source="{Binding ImageName}" Scale="1" Aspect="AspectFit "
HorizontalOptions="StartAndExpand" VerticalOptions="Center"
HeightRequest="15" WidthRequest="23" />
</StackLayout>
</DataTemplate>
</maps:ShapeFileLayer.MarkerTemplate>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

## C#

```

SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "world1.shp";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeFill = Color.Gray;
layer.ShapeSettings = shapeSetting;
map.Layers.Add(layer);
CustomMarker marker1 = new CustomMarker();
marker1.Latitude = "38.8833";
marker1.Longitude = "-77.0167";
CustomMarker marker2 = new CustomMarker();
marker2.Latitude = "-15.7833";
marker2.Longitude = "-47.866";
CustomMarker marker3 = new CustomMarker();
marker3.Latitude = "21.0000";
marker3.Longitude = "78.0000";
CustomMarker marker4 = new CustomMarker();
marker4.Latitude = "35.0000";
marker4.Longitude = "103.0000";
CustomMarker marker5 = new CustomMarker();
marker5.Latitude = "-6.1750";
marker5.Longitude = "106.8283";
layer.Markers.Add(marker1);
layer.Markers.Add(marker2);
layer.Markers.Add(marker3);
layer.Markers.Add(marker4);
layer.Markers.Add(marker5);
DataTemplate dataTemplate = new DataTemplate(() =>
{
    StackLayout stackLayout = new StackLayout();
    stackLayout.Padding = new Thickness(-12, -12, 0, 0);
    stackLayout.IsClippedToBounds = false;
    stackLayout.HorizontalOptions = LayoutOptions.StartAndExpand;
    stackLayout.VerticalOptions = LayoutOptions.Center;
    stackLayout.HeightRequest = 60;
    stackLayout.WidthRequest = 60;

```

```
Image image = new Image();
image.Source = marker1.ImageName;
image.Scale = 1;
image.Aspect = Aspect.AspectFit;
image.HorizontalOptions = LayoutOptions.StartAndExpand;
image.VerticalOptions = LayoutOptions.Center;
image.HeightRequest = 15;
image.WidthRequest = 23;
stackLayout.Children.Add(image);
return stackLayout;
});
layer.MarkerTemplate = dataTemplate;
grid.Children.Add(map);
```

The following code sample explains how to define a custom marker with image support.

### C#

```
public class CustomMarker : MapMarker
{
    public ImageSource ImageName { get; set; }
    public CustomMarker()
    {
        ImageName = ImageSource.FromResource("MapsSample.pin.png");
    }
}
```

### Marker Alignment

You can align the maps marker horizontally and vertically using the [HorizontalAlignment](#) and [VerticalAlignment](#) properties.

#### Setting horizontal alignment

The [HorizontalAlignment](#) property is used to position the marker icon in x-axis. The marker icon can be positioned using the following ways in x-axis:

- Near: Specifies the near position of the marker icon for the given latitude and longitude values in x-axis position.
- Center: Specifies the center position of the marker icon for the given latitude and longitude values in x-axis position.

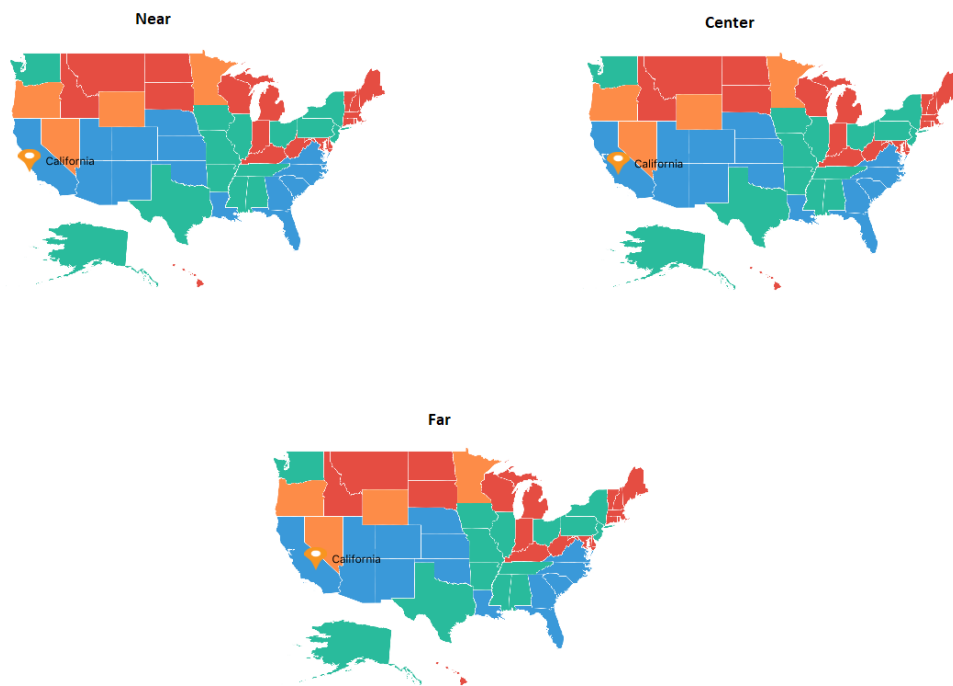

- Far: Specifies the far position of the marker icon for the given latitude and longitude values in x-axis position.

### XML

```
<maps:SfMaps Grid.Row="0" x:Name="Map" EnableZooming="False"
EnablePanning="False">
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="Name"
ShapeIDTableField="STATE_NAME"
ItemsSource="{Binding DataSource}">
      ....
    <maps:ShapeFileLayer.MarkerSettings>
      <maps:MapMarkerSetting x:Name="markerSetting" MarkerIcon="Image"
ImageSource="pin.png" HorizontalAlignment="Center" IconSize="25"/>
    </maps:ShapeFileLayer.MarkerSettings>
      ....
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
CustomMarker customMarker = new CustomMarker();
layer.ItemsSource = customMarker.DataSource;
layer.Uri = "usa_state.shp";
layer.ShapeIDPath = "Name";
layer.ShapeIDTableField = "STATE_NAME";
map.Layers.Add(layer);
....
MapMarkerSetting mapMarkerSetting = new MapMarkerSetting();
mapMarkerSetting.MarkerIcon = MapMarkerIcon.Image;
mapMarkerSetting.ImageSource = "pin.png";
mapMarkerSetting.IconSize = 25;
mapMarkerSetting.HorizontalAlignment = MarkerAlignment.Center;
layer.MarkerSettings = mapMarkerSetting;
....
this.Content = map;
```

### Setting vertical alignment

The VerticalAlignment property is used to position the marker icon in y-axis. The marker icon can be positioned using the following ways in y-axis:

- Near: Specifies the near position of the marker icon for the given latitude and longitude values in y-axis position.
- Center: Specifies the center position of the marker icon for the given latitude and longitude values in y-axis position.
- Far: Specifies the far position of the marker icon for the given latitude and longitude values in y-axis position.

### XML

```
<maps:SfMaps Grid.Row="0" x:Name="Map" EnableZooming="False"
EnablePanning="False">
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="Name"
ShapeIDTableField="STATE_NAME"
ItemsSource="{Binding DataSource}">
      ....
      <maps:ShapeFileLayer.MarkerSettings>
        <maps:MapMarkerSetting x:Name="markerSetting" MarkerIcon="Image"
ImageSource="pin.png" VerticalAlignment="Center" IconSize="25"/>
      </maps:ShapeFileLayer.MarkerSettings>
      ....
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

```

</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

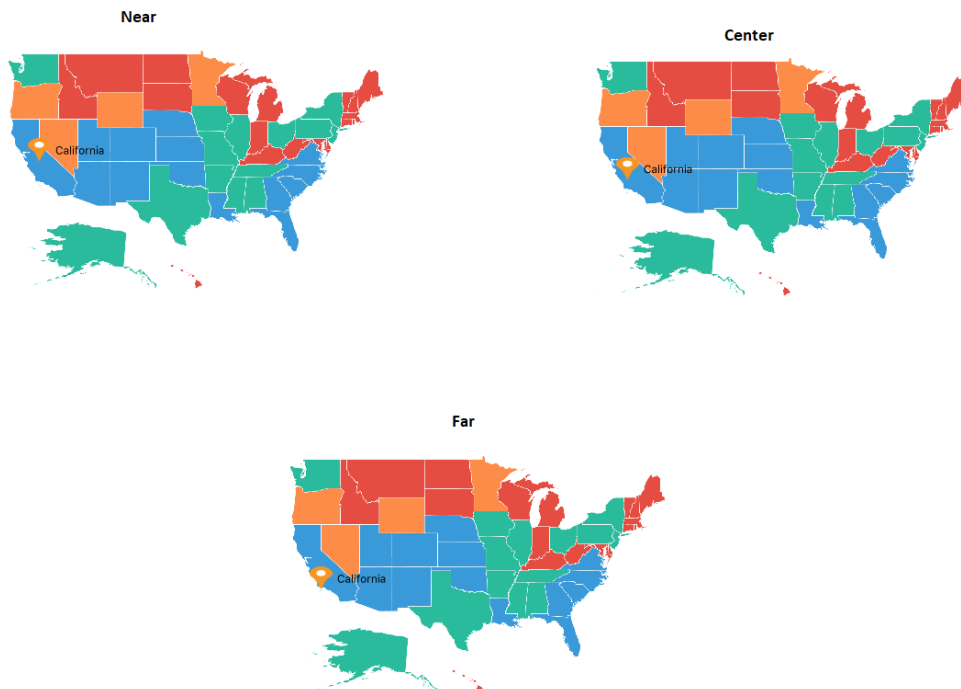

```

## C#

```

SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
CustomMarker customMarker = new CustomMarker();
layer.ItemsSource = customMarker.DataSource;
layer.Uri = "usa_state.shp";
layer.ShapeIDPath = "Name";
layer.ShapeIDTableField = "STATE_NAME";
map.Layers.Add(layer);
....
MapMarkerSetting mapMarkerSetting = new MapMarkerSetting();
mapMarkerSetting.MarkerIcon = MapMarkerIcon.Image;
mapMarkerSetting.ImageSource = "pin.png";
mapMarkerSetting.IconSize = 25;
mapMarkerSetting.VerticalAlignment = MarkerAlignment.Center;
layer.MarkerSettings = mapMarkerSetting;
....
this.Content = map;

```

**Note:** The default marker icon position for VerticalAlignment and HorizontalAlignment is Center.

## Events

The `MarkerSelected` event is fired when a marker is selected. The `CustomView` and `MapMarker` will be passed to `MarkerSelectedEventArgs`.

If you set any view for the `CustomView` property of `MarkerSelectedEventArgs`, then the corresponding view will be applied to the selected marker.

## XML

```
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="selectedMarker">
<StackLayout >
<Image Source="pin.png" Scale="1" Aspect="AspectFit "
HorizontalOptions="StartAndExpand" VerticalOptions="Center"
HeightRequest="15" WidthRequest="23" />
</StackLayout>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<maps:ImageryLayer MarkerSelected="Layer_MarkerSelected" >
<maps:ImageryLayer.MarkerSettings>
<maps:MapMarkerSetting IconColor="Red"
IconSize="13" MarkerIcon="Diamond"/>
</maps:ImageryLayer.MarkerSettings>
<maps:ImageryLayer.Markers>
<maps:MapMarker Label="United States"
Latitude="40" Longitude= "-101"/>
<maps:MapMarker Label="Brazil"
Latitude="-15.7833" Longitude= "-52" />
<maps:MapMarker Label="Congo"
Latitude="-1.6" Longitude= "24.4" />
<maps:MapMarker Label="Kazakhstan"
Latitude="49.9" Longitude= "72.23" />
<maps:MapMarker Label="Australia"
Latitude="-20.54" Longitude= "134.10" />
</maps:ImageryLayer.Markers>
</maps:ImageryLayer>
</maps:SfMaps.Layers>
```

## C#

```
private void Layer_MarkerSelected(object sender, MarkerSelectedEventArgs e)
{
    e.CustomView = this.Resources["selectedMarker"] as DataTemplate;
}
```

## Bubble Marker

Bubbles in the maps control represent the underlying data values of the maps. Bubbles are scattered throughout the map shapes that contain bound values.

### Bubble data

Bubbles are included when the data binding and [BubbleMarkerSettings](#) are set to the shape layers.

The following code sample explains data binding provided for bubble.

#### XML

```
<maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="Name"
ShapeIDTableField="STATE_NAME"
ItemsSource="{Binding DataSource}" />
```

#### C#

```
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ItemsSource = viewModel.DataSource;
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeIDPath = "Name";
map.Layers.Add(layer);
```

### Adding bubbles

To add bubbles to maps, the bubble marker setting should be added to the shape file layer. The [ShowBubbles](#) property should be enabled for making the bubbles visible.

The [ValuePath](#) represents the field value to be fetched from the data for each bubble.

#### XML

```
<maps:ShapeFileLayer.BubbleMarkerSettings>
<maps:BubbleMarkerSetting ShowBubbles="True" ValuePath="index" />
</maps:ShapeFileLayer.BubbleMarkerSettings>
```

#### C#

```
BubbleMarkerSetting bubbleSetting = new BubbleMarkerSetting();
bubbleSetting.ShowBubbles = true;
bubbleSetting.ValuePath = "index";
layer.BubbleMarkerSettings = bubbleSetting;
```

### *Range color mapping*

It is used to differentiate the bubble fill based on its under-bound value and color ranges.

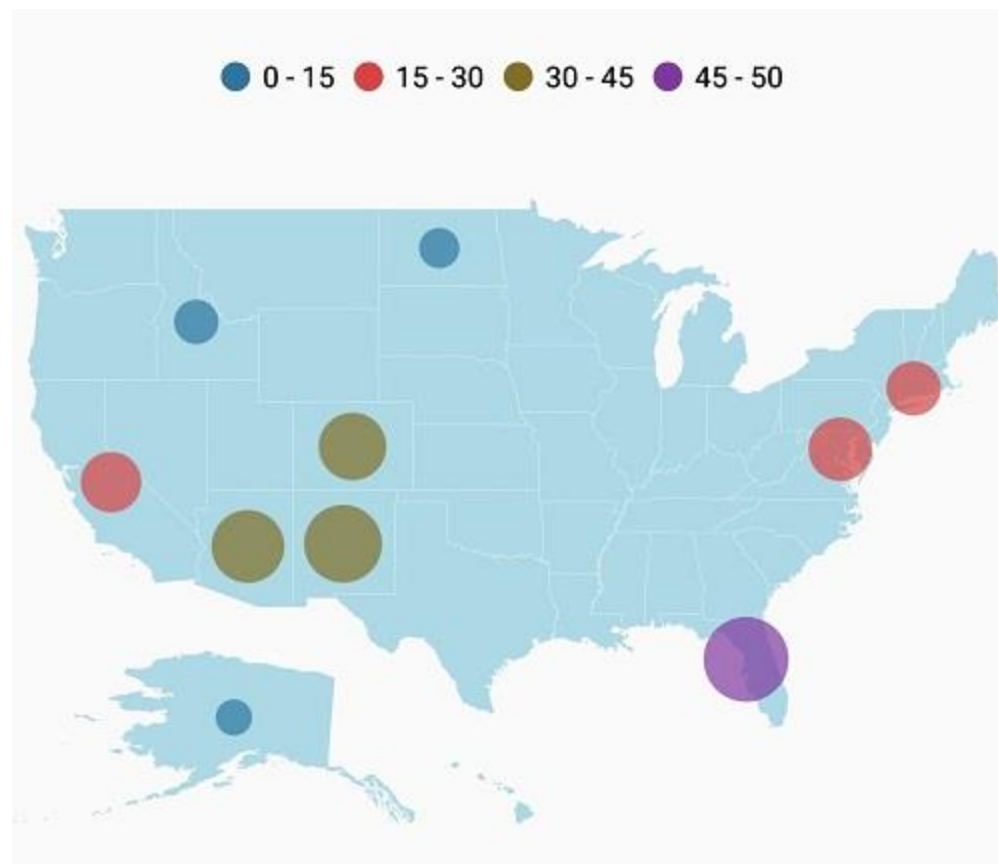

The [From](#) and [To](#) properties are used to define the color range and color for the range that can be specified using the Color property.

### **XML**

```
<maps:ShapeFileLayer.BubbleMarkerSettings>
  <maps:BubbleMarkerSetting ValuePath="index" ColorValuePath="index" >
    <maps:BubbleMarkerSetting.ColorMappings>
      <maps:RangeColorMapping Color="#2E769F" From="0" To="15" />
      <maps:RangeColorMapping Color="#D84444" To="30" From="15" />
      <maps:RangeColorMapping Color="#816F28" To="45" From="30" />
      <maps:RangeColorMapping Color="#7F38A0" To="50" From="45" />
    </maps:BubbleMarkerSetting.ColorMappings>
  </maps:BubbleMarkerSetting>
</maps:ShapeFileLayer.BubbleMarkerSettings>
```

### **C#**

```
BubbleMarkerSetting bubbleSetting = new BubbleMarkerSetting();
bubbleSetting.ValuePath = "index";
bubbleSetting.ColorValuePath = "index";
RangeColorMapping colorMapping1 = new RangeColorMapping() { Color =
Color.FromHex("#2E769F"), From = 0, To = 15 };
RangeColorMapping colorMapping2 = new RangeColorMapping() { Color =
Color.FromHex("#D84444"), From = 15, To = 30 };
RangeColorMapping colorMapping3 = new RangeColorMapping() { Color =
Color.FromHex("#816F28"), From = 30, To = 45 };
RangeColorMapping colorMapping4 = new RangeColorMapping() { Color =
Color.FromHex("#7F38A0"), From = 45, To = 50 };
bubbleSetting.ColorMappings.Add(colorMapping1);
bubbleSetting.ColorMappings.Add(colorMapping2);
bubbleSetting.ColorMappings.Add(colorMapping3);
bubbleSetting.ColorMappings.Add(colorMapping4);
layer.BubbleMarkerSettings = bubbleSetting;
```

### Equal color mapping

It is used to differentiate the bubble fill based on its underlying value and color using the [Value](#) and [Color](#) properties.

### XML

```
<maps:ShapeFileLayer.BubbleMarkerSettings>
  <maps:BubbleMarkerSetting ValuePath="index" ColorValuePath="Type" >
    <maps:BubbleMarkerSetting.ColorMappings>
      <maps:EqualColorMapping Color="#2E769F" Value="Vegetables" />
      <maps:EqualColorMapping Color="#D84444" Value="Rice" />
      <maps:EqualColorMapping Color="#816F28" Value="Wheat" />
      <maps:EqualColorMapping Color="#7F38A0" Value="Grains" />
    </maps:BubbleMarkerSetting.ColorMappings>
  </maps:BubbleMarkerSetting>
</maps:ShapeFileLayer.BubbleMarkerSettings>
```

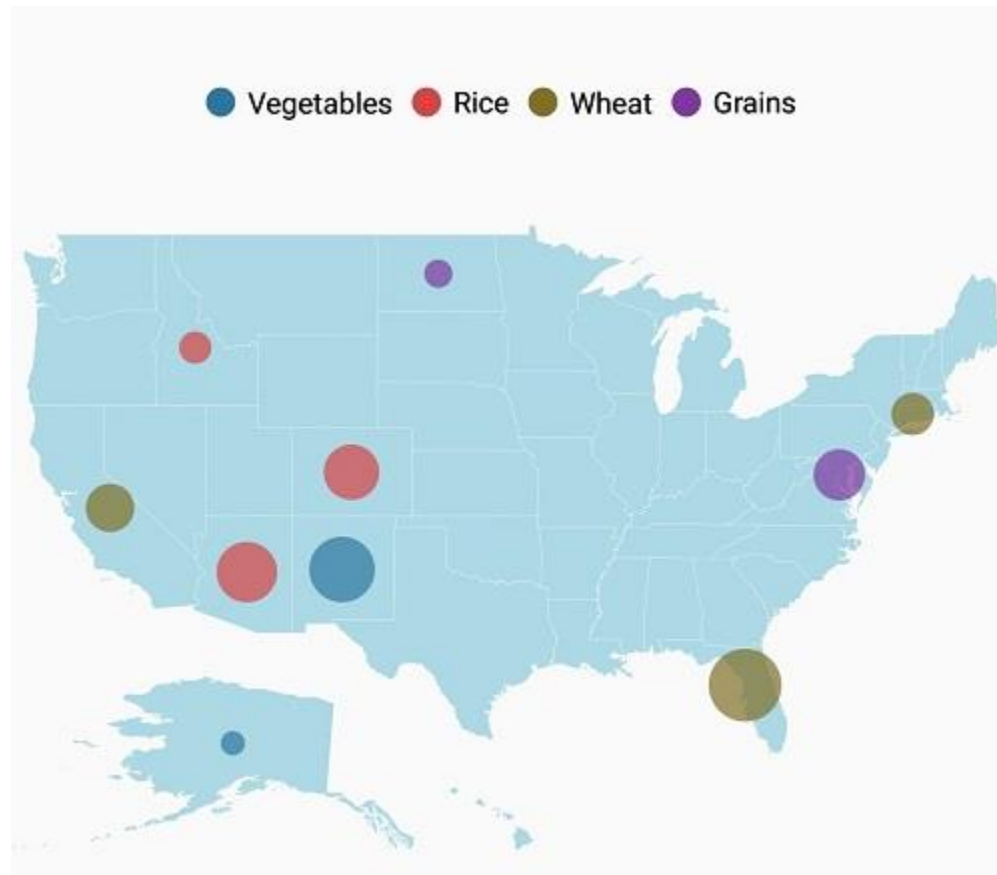

### C#

```
BubbleMarkerSetting bubbleSetting = new BubbleMarkerSetting();
bubbleSetting.ValuePath = "index";
bubbleSetting.ColorValuePath = "Type";
EqualColorMapping colorMapping1 = new EqualColorMapping() { Color =
Color.FromHex("#2E769F"), Value = "Vegetables" };
EqualColorMapping colorMapping2 = new EqualColorMapping() { Color =
Color.FromHex("#D84444"), Value = "Rice" };
```

```

EqualColorMapping colorMapping3 = new EqualColorMapping() { Color =
Color.FromHex("#816F28"), Value = "Wheat" };
EqualColorMapping colorMapping4 = new EqualColorMapping() { Color =
Color.FromHex("#7F38A0"), Value = "Grains" };
bubbleSetting.ColorMappings.Add(colorMapping1);
bubbleSetting.ColorMappings.Add(colorMapping2);
bubbleSetting.ColorMappings.Add(colorMapping3);
bubbleSetting.ColorMappings.Add(colorMapping4);
layer.BubbleMarkerSettings = bubbleSetting;

```

### Customizing bubble size

The size of the bubbles depends on the data bound to the [ValuePath](#). The maximum and minimum sizes of the bubbles can be customized using [MaxSize](#) and [MinSize](#) properties.

**Information:** The [ShowMapItems](#) should be enabled to display label on bubble marker.

### XML

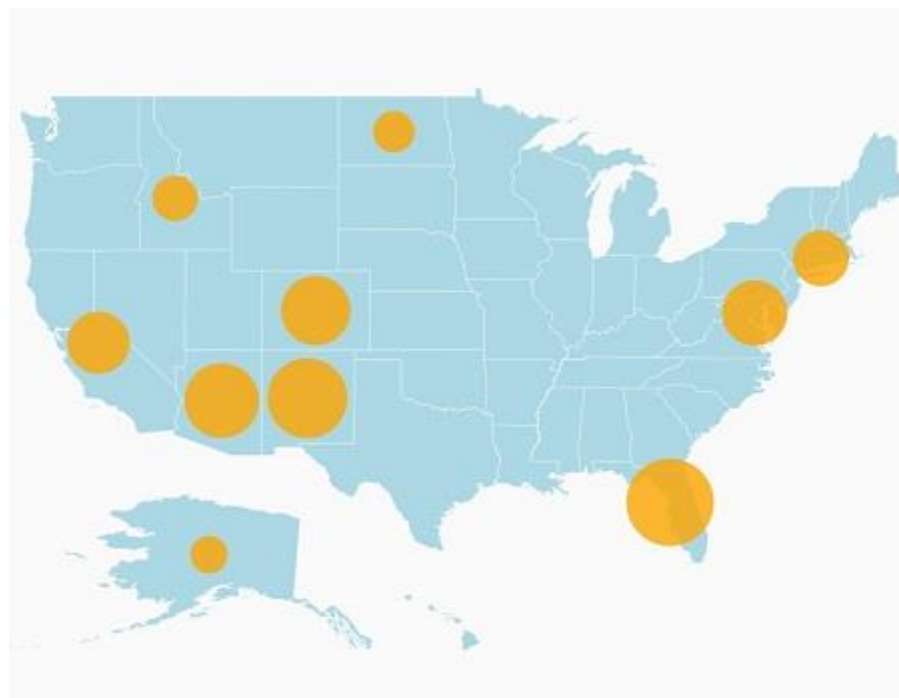

```

<maps:ShapeFileLayer.BubbleMarkerSettings>
  <maps:BubbleMarkerSetting ShowBubbles="True" ValuePath="Electors"
  Fill="Orange"
  MaxSize="25" MinSize="20" Opacity="0.8" />
</maps:ShapeFileLayer.BubbleMarkerSettings>

```

### C#

```
BubbleMarkerSetting bubbleSetting = new BubbleMarkerSetting();
bubbleSetting.ShowBubbles = true;
bubbleSetting.ValuePath = "Electors";
bubbleSetting.Fill = Color.Orange;
bubbleSetting.Opacity = 0.8;
bubbleSetting.MinSize = 20;
bubbleSetting.MaxSize = 25;
layer.BubbleMarkerSettings = bubbleSetting;
```

The following code sample demonstrates how to add bubbles to maps and customize them

#### XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer x:Name="layer" Uri="usa_state.shp" ShapeIDPath="Name"
      ShapeIDTableField="STATE_NAME"
      ShowMapItems="True" ItemsSource="{Binding DataSource}">
      <maps:ShapeFileLayer.BubbleMarkerSettings>
        <maps:BubbleMarkerSetting ValuePath="index" ColorValuePath="index" >
          <maps:BubbleMarkerSetting.ColorMappings>
            <maps:RangeColorMapping Color="#2E769F" From="0" To="15" />
            <maps:RangeColorMapping Color="#D84444" To="30" From="15" />
            <maps:RangeColorMapping Color="#816F28" To="45" From="30" />
            <maps:RangeColorMapping Color="#7F38A0" To="50" From="45" />
          </maps:BubbleMarkerSetting.ColorMappings>
        </maps:BubbleMarkerSetting>
      </maps:ShapeFileLayer.BubbleMarkerSettings>
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="LightBlue"/>
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.LegendSettings>
```

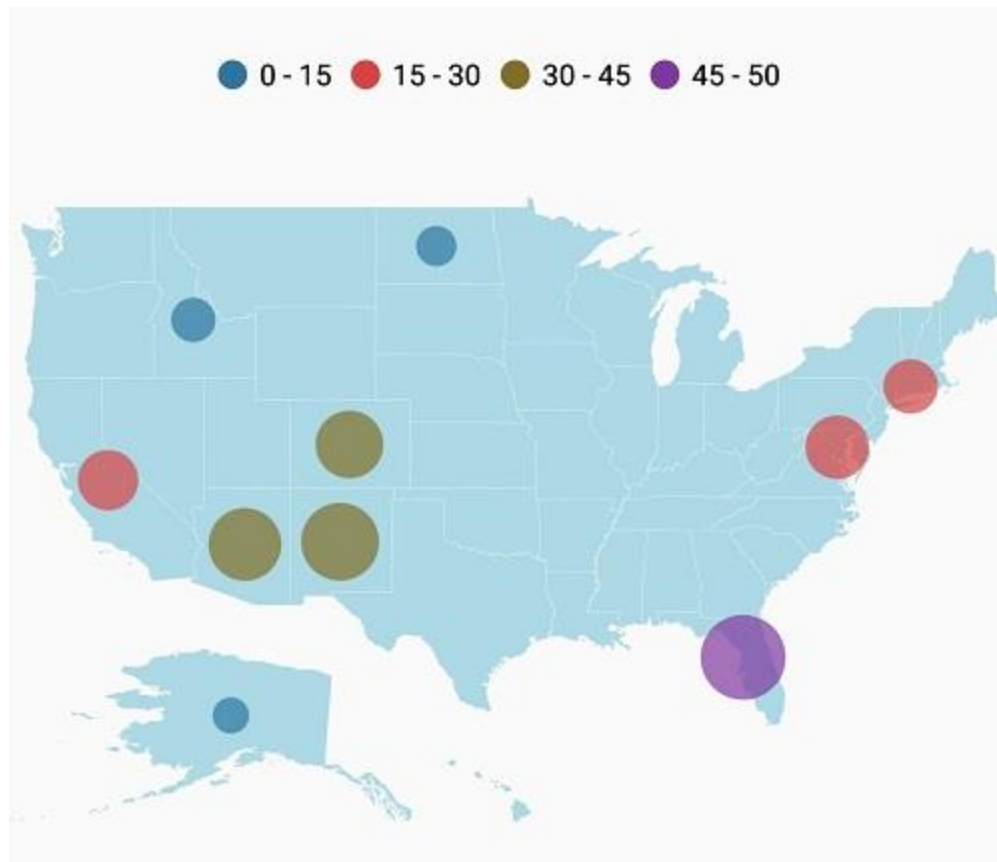

```
<maps:MapLegendSetting LegendType="Bubbles"
ShowLegend="True"></maps:MapLegendSetting>
</maps:ShapeFileLayer.LegendSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

**C#**

```
ViewModel viewModel = new ViewModel();

```

### Color mapping

The color mapping support allows you to customize the shape colors based on the underlying value of shapes received from the bound data.

The maps control provides two types of color mapping:

- Equal color mapping
- Range Color mapping

### Equal color mapping

It is used to differentiate the shape's fill based on its underlying value and color using the [Value](#) and [Color](#) properties.

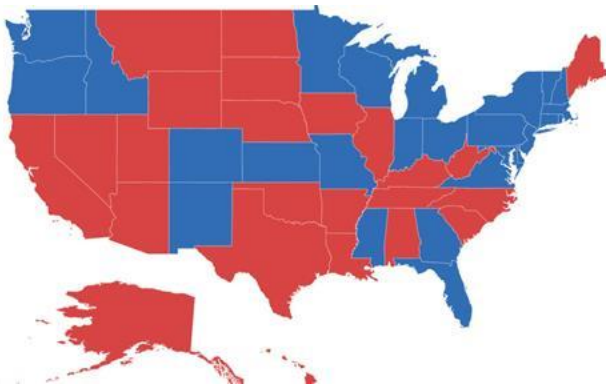

### XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeValuePath="Candidate"
          ShapeColorValuePath="Candidate" >
          <maps:ShapeSetting.ColorMappings>
            <maps:EqualColorMapping Color="#D84444" Value = "Romney"/>
            <maps:EqualColorMapping Color="#316DB5" Value="Obama"/>
          </maps:ShapeSetting.ColorMappings>
        </maps:ShapeSetting>
      </maps:ShapeFileLayer.ShapeSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

```
</maps:ShapeSetting>
</maps:ShapeFileLayer.ShapeSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

## C#

```
SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ItemsSource = viewModel.Data;
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeIDPath = "State";
map.Layers.Add(layer);
EqualColorMapping colorMapping = new EqualColorMapping();
colorMapping.Color = Color.FromHex("#D84444");
colorMapping.Value = "Romney";
EqualColorMapping colorMapping1 = new EqualColorMapping();
colorMapping1.Color = Color.FromHex("#316DB5");
colorMapping1.Value = "Obama";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeValuePath = "Candidate";
shapeSetting.ShapeColorValuePath = "Candidate";
shapeSetting.ColorMappings.Add(colorMapping);
shapeSetting.ColorMappings.Add(colorMapping1);
layer.ShapeSettings = shapeSetting;
this.Content = map;
```

## Range color mapping

It is used to differentiate the bubble's fill based on its under-bound value and color ranges.

The [From](#) and [To](#) properties are used to define the color range and color for the range that can be specified using the [Color](#) property.

## XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
    <maps:ShapeFileLayer.ShapeSettings>
```

```
<maps:ShapeSetting ShapeColorValuePath="Electors" >
<maps:ShapeSetting.ColorMappings>
<maps:RangeColorMapping From="30" To="70" Color="#397D02"/>
<maps:RangeColorMapping From="15" To="30" Color="#316DB5"/>
<maps:RangeColorMapping From="0" To="15" Color="#D84444"/>
</maps:ShapeSetting.ColorMappings>
</maps:ShapeSetting>
</maps:ShapeFileLayer.ShapeSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

## C#

```
SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ItemsSource = viewModel.Data;
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeIDPath = "State";
map.Layers.Add(layer);
RangeColorMapping rangeColorMapping = new RangeColorMapping();
rangeColorMapping.From = 30;
rangeColorMapping.To = 70;
rangeColorMapping.Color = Color.FromHex("#397D02");
RangeColorMapping rangeColorMapping1 = new RangeColorMapping();
rangeColorMapping1.From = 15;
rangeColorMapping1.To = 30;
rangeColorMapping1.Color = Color.FromHex("#316DB5");
RangeColorMapping rangeColorMapping2 = new RangeColorMapping();
rangeColorMapping2.From = 0;
rangeColorMapping2.To = 15;
rangeColorMapping2.Color = Color.FromHex("#D84444");
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeColorValuePath = "Electors";
shapeSetting.ColorMappings.Add(rangeColorMapping);
shapeSetting.ColorMappings.Add(rangeColorMapping1);
shapeSetting.ColorMappings.Add(rangeColorMapping2);
layer.ShapeSettings = shapeSetting;
this.Content = map;
```

## Data Labels

Data labels are used to display the values of shapes.

### Adding data labels

The [ShowMapItems](#) property, which is a boolean property, displays or hides the data labels in shapes.

Set the [ShapeValuePath](#) property to get the data labels bound to each shape.

### XML

```
<ContentPage.BindingContext>
<local:USAShapeViewModel/>
</ContentPage.BindingContext>
<maps:SfMaps x:Name="sfmap" >
<maps:SfMaps.Layers>
<maps:ShapeFileLayer Uri="usa_state.shp" ShowMapItems="True"
ItemsSource="{Binding DataSource}" ShapeIDPath="Name"
ShapeIDTableField="STATE_NAME">
<maps:ShapeFileLayer.ShapeSettings>
<maps:ShapeSetting ShapeValuePath="Type" ShapeFill="LightGray"/>
</maps:ShapeFileLayer.ShapeSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ShowMapItems = true;
layer.ShapeSettings.ShapeFill = Color.LightGray;
USAShapeViewModel usaShapeViewModel = new USAShapeViewModel();
layer.ItemsSource = usaShapeViewModel.DataSource;
layer.ShapeIDPath = "Name";
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeSettings.ShapeValuePath = "Type";
map.Layers.Add(layer);
this.Content = map;
```

### Setting contrast color

Based on the background color of the shapes, contrast color will be applied to data labels.

### XML

```
<maps:SfMaps x:Name="sfmap">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp" ShowMapItems="True"
      ItemsSource="{Binding DataSource}" ShapeIDPath="Name"
      ShapeIDTableField="STATE_NAME">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeFill="#A9D9F7" ShapeValuePath="Type"
          ShapeColorValuePath="index" >
          <maps:ShapeSetting.ColorMappings>
            <maps:RangeColorMapping To="25" From="0" Color="#FFD84F"/>
            <maps:RangeColorMapping To="50" From="25" Color="#316DB5"/>
          </maps:ShapeSetting.ColorMappings>
        </maps:ShapeSetting>
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.DataLabelSettings>
        <maps:DataLabelSetting SmartLabelMode="Trim"/>
      </maps:ShapeFileLayer.DataLabelSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

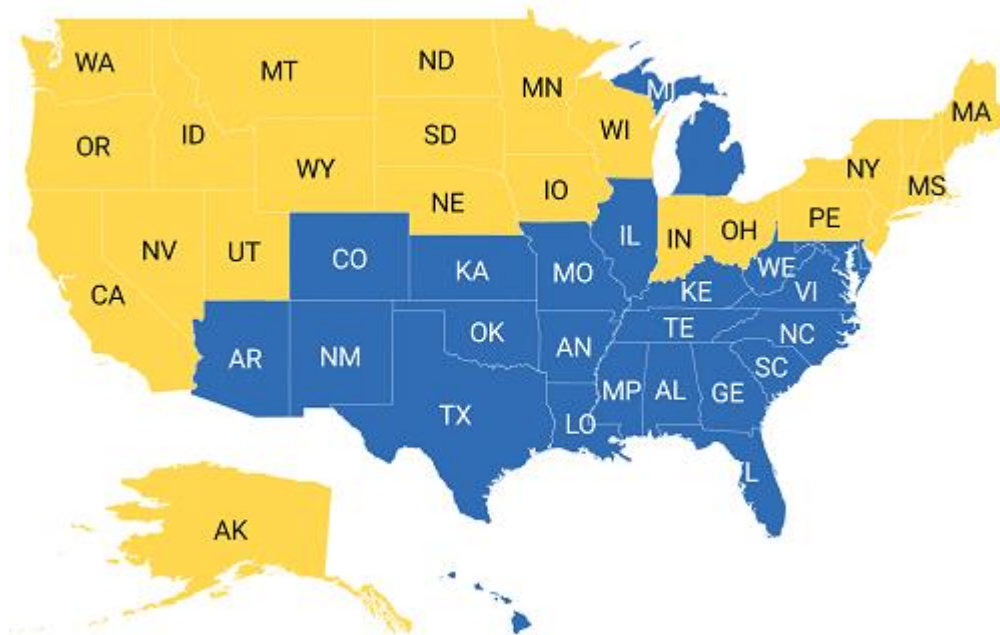

### C#

```
SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ShowMapItems = true;
layer.ShapeSettings.ShapeFill = Color.DarkBlue;
```

```

USAShapeViewModel usaShapeViewModel = new USAShapeViewModel();
layer.ItemsSource = usaShapeViewModel.DataSource;
layer.ShapeIDPath = "Name";
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeSettings.ShapeValuePath = "Type";
layer.ShapeSettings.ShapeColorValuePath = "index";
ObservableCollection<ColorMapping> colorMapping = new
ObservableCollection<ColorMapping>();
RangeColorMapping rangeColorMapping = new RangeColorMapping();
rangeColorMapping.From = 0;
rangeColorMapping.To = 25;
rangeColorMapping.Color = Color.FromHex("#FFD84F");
colorMapping.Add(rangeColorMapping);
RangeColorMapping rangeColorMapping1 = new RangeColorMapping();
rangeColorMapping1.From = 25;
rangeColorMapping1.To = 50;
rangeColorMapping1.Color = Color.FromHex("#316DB5");
colorMapping.Add(rangeColorMapping1);
layer.ShapeSettings.ColorMappings = colorMapping;
DataLabelSetting dataLabelSetting = new DataLabelSetting();
dataLabelSetting.SmartLabelMode = IntersectAction.Trim;
layer.DataLabelSettings = dataLabelSetting;
map.Layers.Add(layer);
this.Content = map;

```

### Customizing data labels

Data labels can be customized using the [DataLabelSetting](#) property in shape file layer. The font attribute, color, font size, and font family can be customized using the [FontAttributes](#), [TextColor](#), [FontSize](#), and [FontFamily](#) properties.

### XML

```

<maps:SfMaps x:Name="sfmap" >
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp" ShowMapItems="True"
      ItemsSource="{Binding DataSource}" ShapeIDPath="Name"
      ShapeIDTableField="STATE_NAME">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeValuePath="Type" ShapeFill="LightGray"/>
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.DataLabelSettings>
        <maps:DataLabelSetting TextColor="Blue" FontAttributes="Bold"
          FontFamily="cursive" FontSize="12" />
      </maps:ShapeFileLayer.DataLabelSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>

```

## C#

```

SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ShowMapItems = true;
USAStateViewModel usaStateViewModel = new USAStateViewModel();
layer.ItemsSource = usaStateViewModel.DataSource;
layer.ShapeIDPath = "Name";
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeSettings.ShapeValuePath = "Type";
layer.ShapeSettings.ShapeFill = Color.LightGray;
DataLabelSetting dataLabelSetting = new DataLabelSetting();
dataLabelSetting.TextColor = Color.Blue;
dataLabelSetting.FontAttributes = FontAttributes.Bold;
dataLabelSetting.FontFamily = "cursive";
dataLabelSetting.FontSize = 12;
layer.DataLabelSettings = dataLabelSetting;
map.Layers.Add(layer);
this.Content = map;

```

To smartly align data labels

The [SmartLabelMode](#) property aligns the labels smartly within shape boundaries and avoids labels overlapping. Labels can be customized using the `Hide`, `Trim`, and `None` options.

#### XML

```
<maps:SfMaps x:Name="sfmap">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp" ShowMapItems="True"
      ItemsSource="{Binding Data}" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeValuePath="State" ShapeFill="LightGray" />
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.DataLabelSettings>
        <maps:DataLabelSetting SmartLabelMode="Trim"/>
      </maps:ShapeFileLayer.DataLabelSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

#### C#

```
SfMaps map = new SfMaps();
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ShowMapItems = true;
USASateViewModel usaStateViewModel = new USASateViewModel();
layer.ItemsSource = usaStateViewModel.Data;
layer.ShapeIDPath = "State";
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeSettings.ShapeValuePath = "State";
```

```

layer.ShapeSettings.ShapeFill = Color.LightGray;
DataLabelSetting dataLabelSetting = new DataLabelSetting();
dataLabelSetting.SmartLabelMode = IntersectAction.Trim;
layer.DataLabelSettings = dataLabelSetting;
map.Layers.Add(layer);
this.Content = map;

```

To avoid overlap in data labels

The [IntersectionAction](#) property aligns labels that overlap. Labels can be customized using the `Hide`, `Trim`, and `None` options. First, set the [SmartLabelMode](#) property to `None`.

### XML

```

<maps:SfMaps x:Name="sfmap">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp" ShowMapItems="True"
      ItemsSource="{Binding Data}" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeValuePath="State" ShapeFill="LightGray" />
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.DataLabelSettings>
        <maps:DataLabelSetting IntersectionAction="Hide" SmartLabelMode="None"/>
      </maps:ShapeFileLayer.DataLabelSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>

```

### C#

```

SfMaps map = new SfMaps();

```

```

ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.ShowMapItems = true;
USAStateViewModel usaStateViewModel = new USAStateViewModel();
layer.ItemsSource = usaStateViewModel.Data;
layer.ShapeIDPath = "State";
layer.ShapeIDTableField = "STATE_NAME";
layer.ShapeSettings.ShapeValuePath = "State";
layer.ShapeSettings.ShapeFill = Color.LightGray;
DataLabelSetting dataLabelSetting = new DataLabelSetting();
dataLabelSetting.IntersectionAction = IntersectAction.Hide;
dataLabelSetting.SmartLabelMode = IntersectAction.None;
layer.DataLabelSettings = dataLabelSetting;
map.Layers.Add(layer);
this.Content = map;

```

## Legend

Legends are keys used on maps; they contain swatches of symbols with descriptions. A legend interprets what the map displays; it can be represented in various colors, shapes, or other identifiers based on the data. It gives a breakdown on what each symbol represents throughout the map.

Legends can be added using the [LegendSettings](#) in the shape file layer.

## Visibility

The legends can be made visible by setting the [ShowLegend](#) property in [MapLegendSetting](#) to true.

## XML

```

<maps:ShapeFileLayer.LegendSettings>
  <maps:MapLegendSetting ShowLegend="True"></maps:MapLegendSetting>
</maps:ShapeFileLayer.LegendSettings>

```

## C#

```
MapLegendSetting legendSetting = new MapLegendSetting();  
legendSetting.ShowLegend = true;  
layer.LegendSettings = legendSetting;
```

### Legend type

The [LegendType](#) property is used to display the shapes and bubble legends in maps.

- Layers
- Bubbles

### Legend position

Based on the values of x (in the range of 0 to 100) and y (in the range of 0 to 100), the legends can be positioned using the [LegendPosition](#) property of the [MapLegendSetting](#) class. Legends will be positioned in the range of 0 to 100 (screen size ratio). By default, the *LegendPosition* is (50,10).

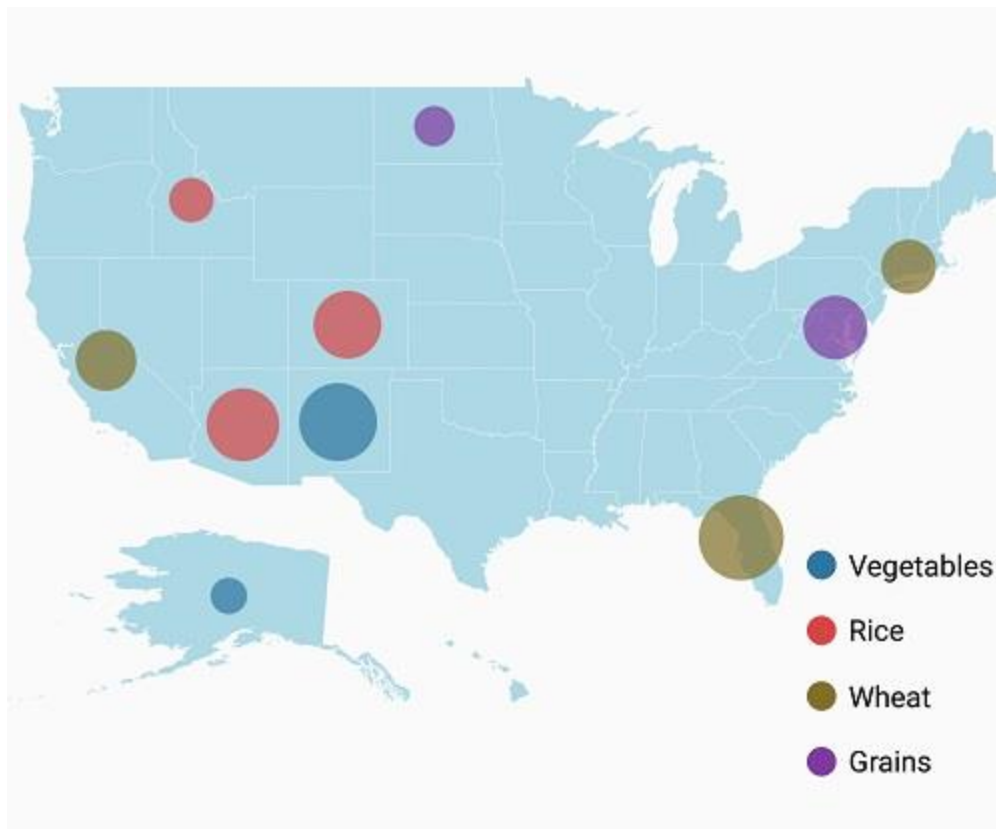

The legend items will be placed in multiple rows if size of the total legend exceeds the available size.

## XML

```
<maps:ShapeFileLayer.LegendSettings>  
  <maps:MapLegendSetting LegendType="Bubbles" HorizontalAlignment="Start"  
    LegendPosition="80,60" ShowLegend="True"></maps:MapLegendSetting>  
</maps:ShapeFileLayer.LegendSettings>
```

## C#

```
MapLegendSetting legendSetting = new MapLegendSetting();  
legendSetting.ShowLegend = true;  
legendSetting.LegendType = LegendType.Bubbles;  
legendSetting.LegendPosition = new Point(80, 60);  
legendSetting.HorizontalAlignment = HorizontalAlignment.Start;  
layer.LegendSettings = legendSetting;
```

### Legend alignment

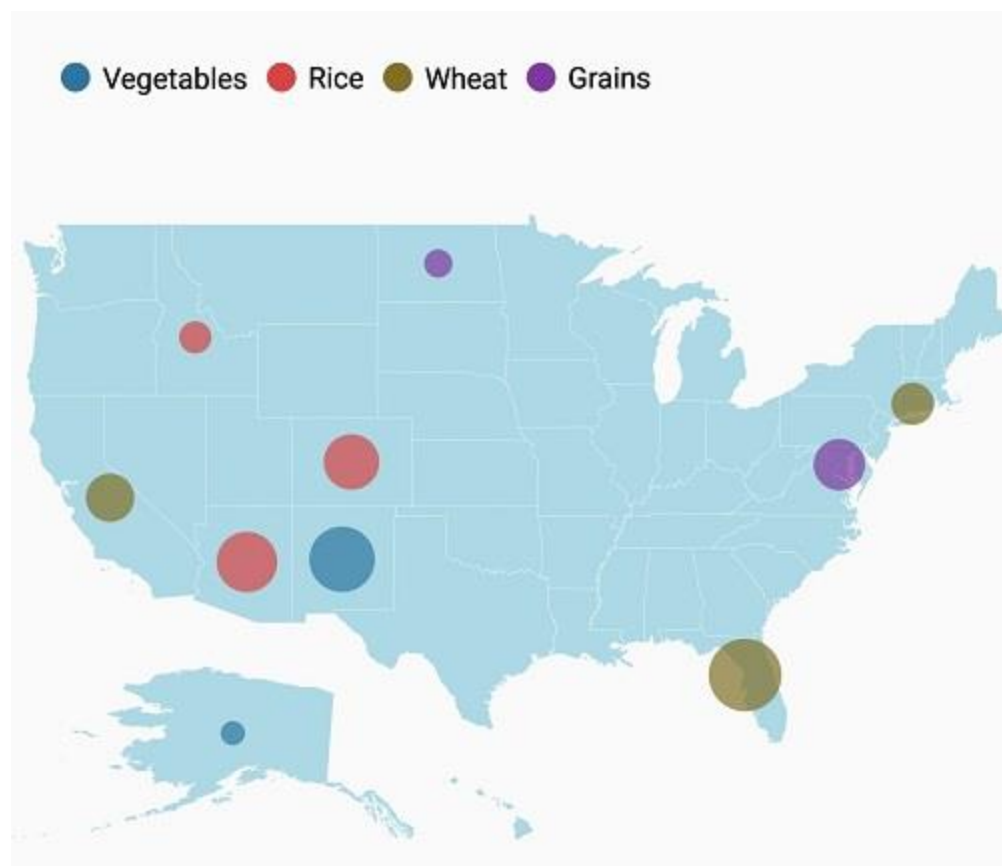

Legends can be aligned using the [HorizontalAlignment](#) and [VerticalAlignment](#) Properties. By default, the legends will be aligned to the center.

### XML

```
<maps:ShapeFileLayer.LegendSettings>  
<maps:MapLegendSetting LegendType="Bubbles" HorizontalAlignment="Start"  
LegendPosition="5,20" VerticalAlignment="Center"  
ShowLegend="True"></maps:MapLegendSetting>  
</maps:ShapeFileLayer.LegendSettings>
```

### C#

```
MapLegendSetting legendSetting = new MapLegendSetting();  
legendSetting.ShowLegend = true;  
legendSetting.LegendType = LegendType.Bubbles;  
legendSetting.LegendPosition = new Point(5, 20);  
legendSetting.HorizontalAlignment = HorizontalAlignment.Start;  
legendSetting.VerticalAlignment = VerticalAlignment.Center;  
layer.LegendSettings = legendSetting;
```

### Icon customization

The icon size of a legend can be customized using the [IconSize](#) property.

#### XML

```
<maps:ShapeFileLayer.LegendSettings>
  <maps:MapLegendSetting ShowLegend="True" LegendPosition="75,90">
    <maps:MapLegendSetting.IconSize>
      <Size Width="20" Height="20"/>
    </maps:MapLegendSetting.IconSize>
  </maps:MapLegendSetting>
</maps:ShapeFileLayer.LegendSettings>
```

#### C#

```
MapLegendSetting legendSetting = new MapLegendSetting();
legendSetting.ShowLegend = true;
legendSetting.LegendPosition = new Point(75, 90);
legendSetting.IconSize = new Size(20, 20);
layer.LegendSettings = legendSetting;
```

The icon shape can be customized using the [LegendIcon](#) property. By default, this property is set to circle for bubbles and rectangle for shapes.

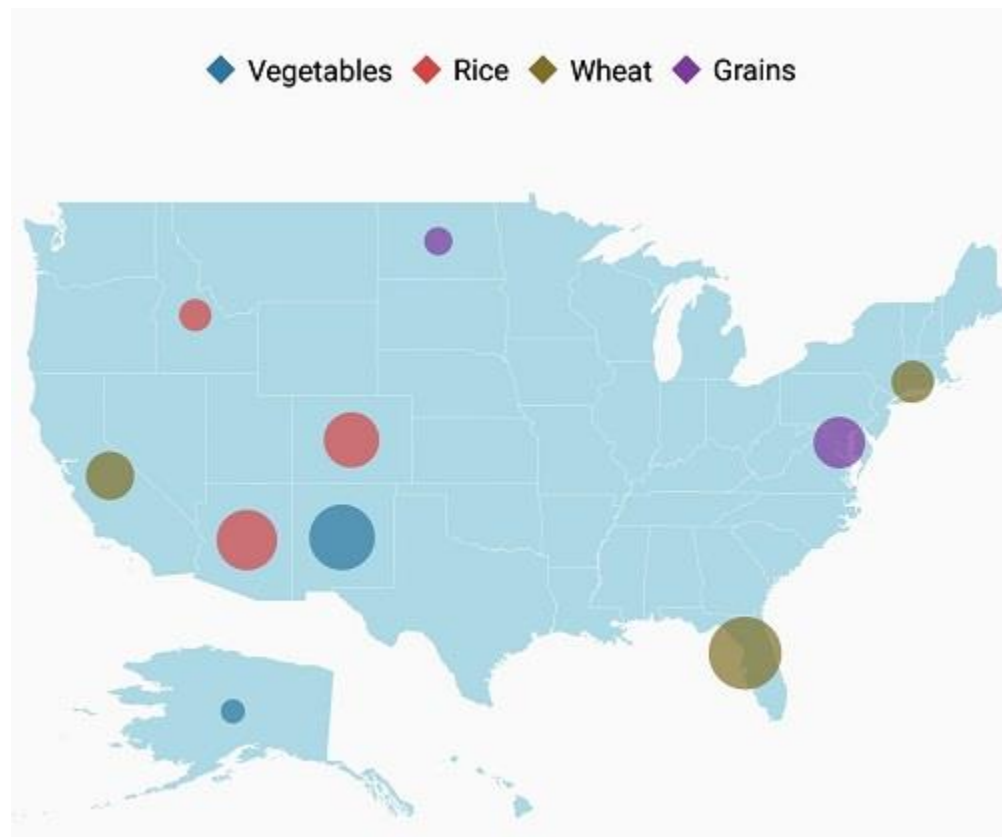

#### XML

```
<maps:ShapeFileLayer.LegendSettings>
```

```
<maps:MapLegendSetting ShowLegend="True" LegendType="Bubbles"
LegendIcon="Diamond">
</maps:MapLegendSetting>
</maps:ShapeFileLayer.LegendSettings>
```

**C#**

```
MapLegendSetting legendSetting = new MapLegendSetting();
legendSetting.ShowLegend = true;
legendSetting.LegendType = LegendType.Bubbles;
legendSetting.LegendIcon = LegendIcon.Diamond;
layer.LegendSettings = legendSetting;
```

Item margin

The [ItemMargin](#) property is used to set spacing between the legend items.

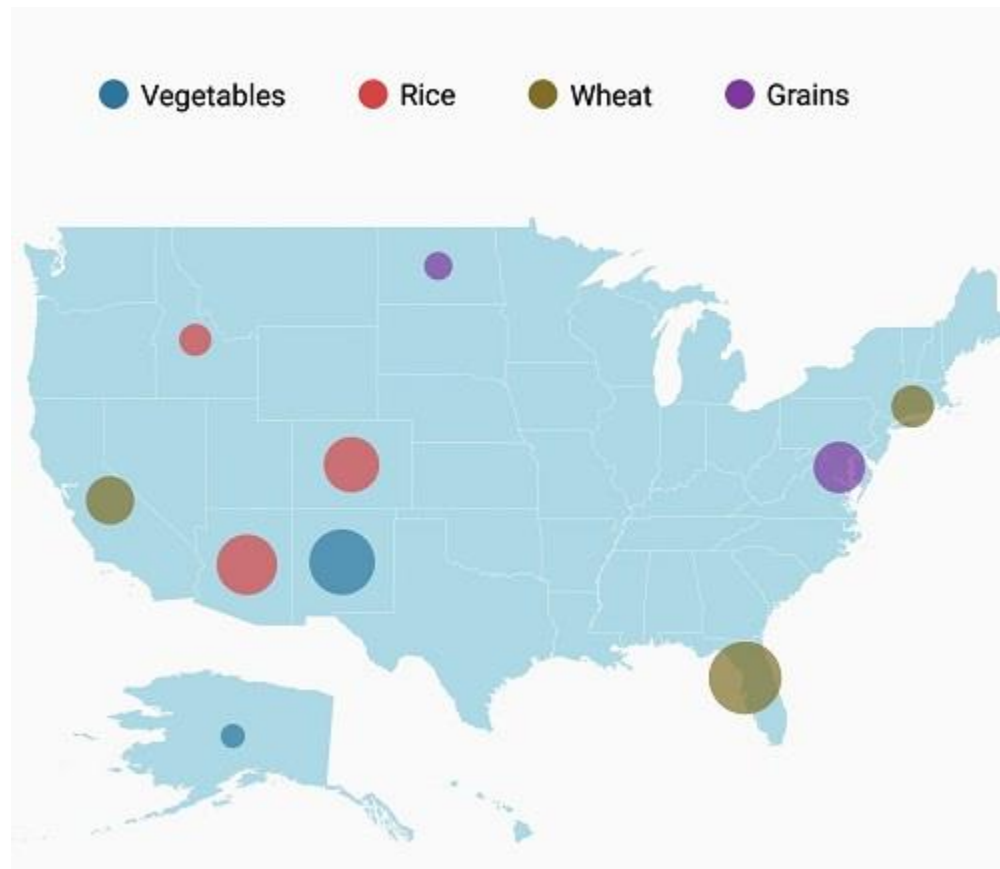

**XML**

```
<maps:ShapeFileLayer.LegendSettings>
<maps:MapLegendSetting LegendType="Bubbles" ShowLegend="True"
ItemMargin="30" />
</maps:ShapeFileLayer.LegendSettings>
```

**C#**

```
MapLegendSetting legendSetting = new MapLegendSetting();
legendSetting.ShowLegend = true;
```

```
legendSetting.LegendType = LegendType.Bubbles;
legendSetting.ItemMargin = 30;
layer.LegendSettings = legendSetting;
```

### Legend label

The [LegendLabel](#) provides information about the maps. It is specified under color mapping. If *LegendLabel* is not specified, ColorMapping values will be applied as legend label.

The following properties are used to customize the label of the legends:

- [TextColor](#) : Changes the color of the legend text.
- [FontAttributes](#) : Changes the font weight of the legend label.
- [FontFamily](#) : Changes the font family of the legend label.
- [FontSize](#) : Changes the text size of the legend label.

### XML

```
<maps:ShapeFileLayer.LegendSettings>
  <maps:MapLegendSetting LegendType="Bubbles" ShowLegend="True"
    FontFamily="algerian.ttf" TextColor="Maroon" />
</maps:ShapeFileLayer.LegendSettings>
```

### C#

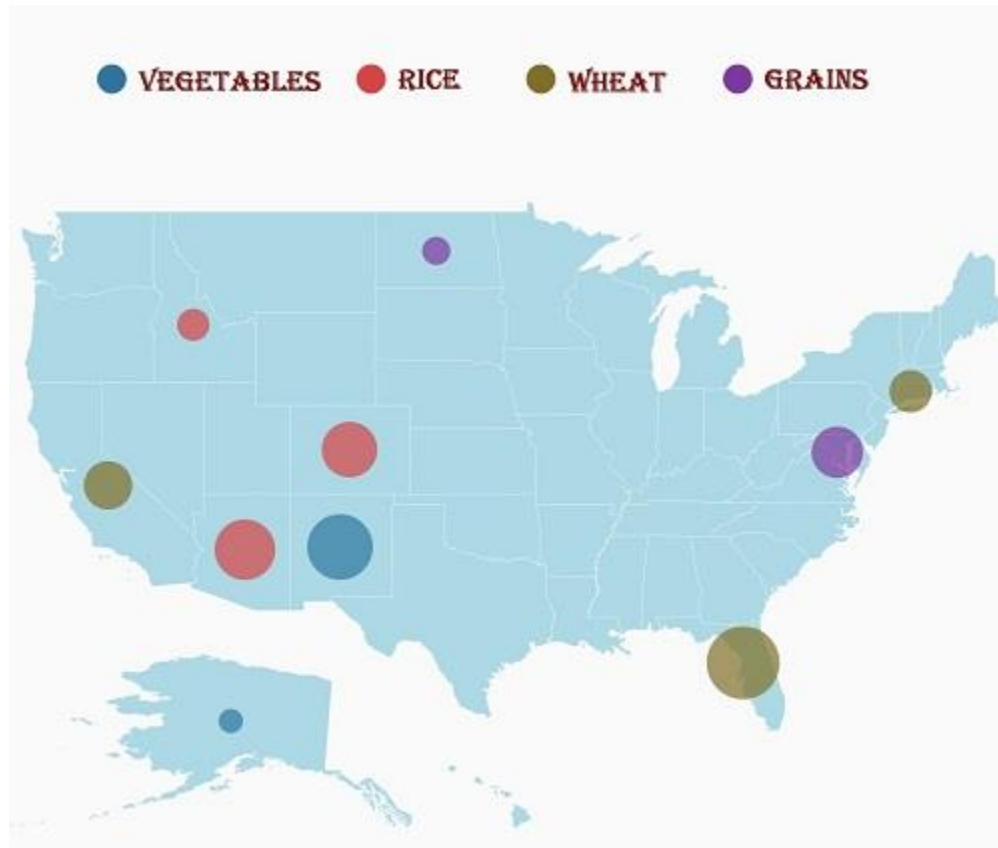

```
MapLegendSetting legendSetting = new MapLegendSetting();
```

```

legendSetting.ShowLegend = true;
legendSetting.LegendType = LegendType.Bubbles;
legendSetting.FontFamily = "algerian.ttf";
legendSetting.TextColor = Color.Maroon;
layer.LegendSettings = legendSetting;

```

The following code sample demonstrates how to add a legend to maps and customize it.

*Legend for bubbles*

**XML**

```

<Grid>
<Grid.BindingContext>

colorMapping1.Value = "Obama";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeValuePath = "Candidate";
shapeSetting.ShapeColorValuePath = "Candidate";
shapeSetting.ColorMappings.Add(colorMapping);
shapeSetting.ColorMappings.Add(colorMapping1);
layer.ShapeSettings = shapeSetting;
this.Content = map;

```

## Tooltip

Tooltip provides additional information about the shapes in the maps. To enable tooltip, set the [ShowTooltip](#) property to true, and set the [ValuePath](#) property of tooltip.

Tooltip is displayed by tapping the following elements:

- Shapes
- Bubbles
- Markers

The following code sample shows how to enable tooltip by tapping the shapes.

### XML

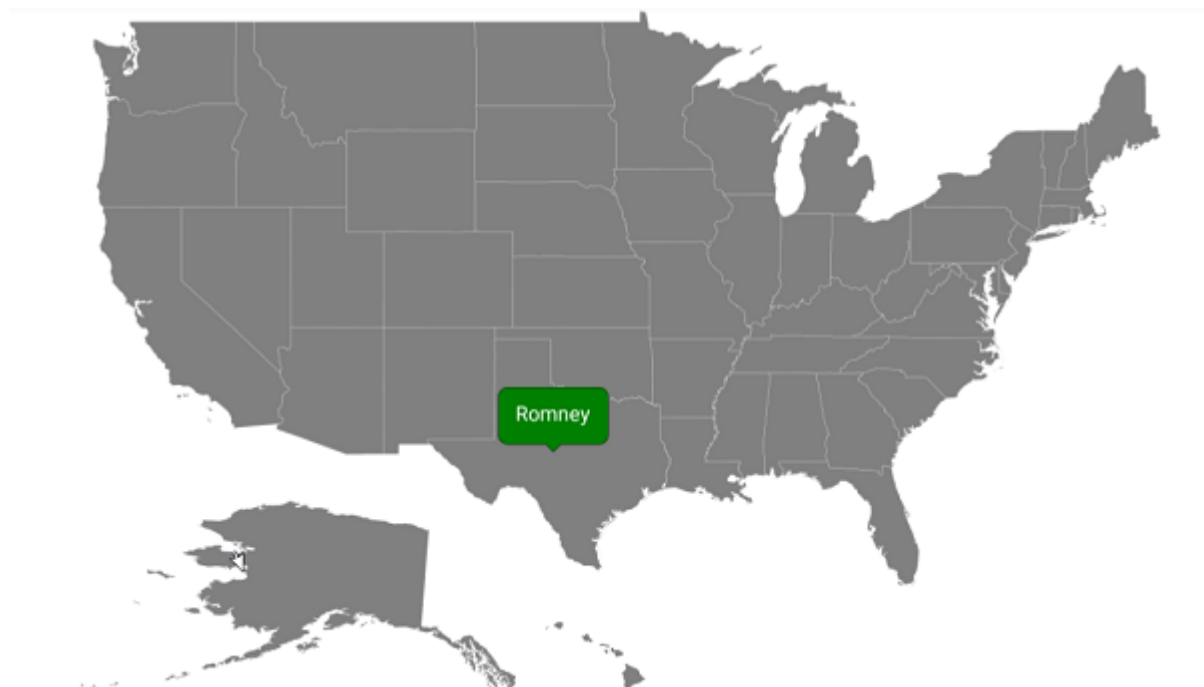

```
<maps:SfMaps>
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME"
      ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.TooltipSettings>
        <maps:TooltipSetting ShowTooltip="True" ValuePath="Candidate"/>
      </maps:ShapeFileLayer.TooltipSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

**C#**

```
SfMaps sfMaps = new SfMaps();  
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();  
shapeFileLayer.Uri = "usa_state.shp";  
ViewModel model = new ViewModel();  
shapeFileLayer.ItemsSource = model.Data;  
shapeFileLayer.ShapeIDTableField = "STATE_NAME";  
shapeFileLayer.ShapeIDPath = "State";  
shapeFileLayer.TooltipSettings.ShowTooltip = true;  
shapeFileLayer.TooltipSettings.ValuePath = "Candidate";  
sfMaps.Layers.Add(shapeFileLayer);  
Content = sfMaps;
```

[Tooltip customization](#)

The appearance of the tooltip can be customized using the following properties:

*[TextColor](#): Customizes the text color of tooltip. \* [BackgroundColor](#): Customizes the background color of tooltip. \* [StrokeColor](#): Customizes the stroke color of tooltip. \* [StrokeWidth](#): Customizes the stroke width of tooltip. \* [Duration](#): Specifies the duration of tooltip to be displayed. \* [Margin](#): Sets the margin for tooltip.*

The following code sample shows all the above customizations.

#### XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME"
      ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.TooltipSettings>
        <maps:TooltipSetting ShowTooltip="True" ValuePath="Candidate"
          TextColor="White" Margin="10"
          BackgroundColor="Green" StrokeColor="Black" StrokeWidth="2"
          Duration="2000"/>
      </maps:ShapeFileLayer.TooltipSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

#### C#

```
SfMaps sfMaps = new SfMaps();
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();
shapeFileLayer.Uri = "usa_state.shp";
ViewModel model = new ViewModel();
shapeFileLayer.ItemsSource = model.Data;
shapeFileLayer.ShapeIDTableField = "STATE_NAME";
shapeFileLayer.ShapeIDPath = "State";
shapeFileLayer.TooltipSettings.ShowTooltip = true;
```

```

shapeFileLayer.TooltipSettings.ValuePath = "Candidate";
shapeFileLayer.TooltipSettings.TextColor = Color.White;
shapeFileLayer.TooltipSettings.BackgroundColor = Color.Green;
shapeFileLayer.TooltipSettings.StrokeColor = Color.Black;
shapeFileLayer.TooltipSettings.StrokeWidth = 2;
shapeFileLayer.TooltipSettings.Margin = 10;
shapeFileLayer.TooltipSettings.Duration = 2000;
sfMaps.Layers.Add(shapeFileLayer);
Content = sfMaps;

```

![Xamarin Tooltip Customization Image](Images/tooltip\_customization.png)

### Tooltip font customization

The font can be customized using the [FontSize](#), [FontAttributes](#), and [FontFamily](#) properties of tooltip.

### XML

```

<maps:SfMaps>
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.TooltipSettings>
        <maps:TooltipSetting ShowTooltip="True" ValuePath="Candidate" FontSize="15"
          FontAttributes="Bold">
          <maps:TooltipSetting.FontFamily>
            <OnPlatform x:TypeArguments="x:String" iOS="Chalkduster" Android="monospace"
              WinPhone="Chiller" />
          </maps:TooltipSetting.FontFamily>
        </maps:TooltipSetting>
      </maps:ShapeFileLayer.TooltipSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>

```

### C#

```

SfMaps sfMaps = new SfMaps();
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();
shapeFileLayer.Uri = "usa_state.shp";
ViewModel model = new ViewModel();
shapeFileLayer.ItemsSource = model.Data;
shapeFileLayer.ShapeIDTableField = "STATE_NAME";
shapeFileLayer.ShapeIDPath = "State";
shapeFileLayer.TooltipSettings.ShowTooltip = true;
shapeFileLayer.TooltipSettings.ValuePath = "Candidate";
shapeFileLayer.TooltipSettings.FontSize = 15;
shapeFileLayer.TooltipSettings.FontAttributes = FontAttributes.Bold;
shapeFileLayer.TooltipSettings.FontFamily = Device.RuntimePlatform ==
Device.iOS ? "Chalkduster" : Device.RuntimePlatform == Device.Android ?
"monospace" : "Chiller";
sfMaps.Layers.Add(shapeFileLayer);
Content = sfMaps;

```

### Custom template for tooltip

The maps control provides options to design your own template for tooltip using the [TooltipTemplate](#) property.

### XML

```
<maps:SfMaps Margin="20" BackgroundColor="White">
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeValuePath="Candidate"
          ShapeColorValuePath="Candidate" >
          <maps:ShapeSetting.ColorMappings>
            <maps:EqualColorMapping Color="#D84444" Value = "Romney"/>
            <maps:EqualColorMapping Color="#316DB5" Value="Obama"/>
          </maps:ShapeSetting.ColorMappings>
        </maps:ShapeSetting>
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.TooltipSettings>
        <maps:TooltipSetting ShowTooltip="True" ValuePath="State" Duration="2000">
          <maps:TooltipSetting.TooltipTemplate>
            <DataTemplate>
              <StackLayout>
                <Label Text="{Binding State}" HorizontalTextAlignment="Center"
                  VerticalTextAlignment="Center" TextColor="#FFFFFF" FontAttributes="Bold"
                  FontFamily="Helvetica" Margin="0" FontSize="12" Grid.Row="0" />
                <BoxView Color="#888C91" HeightRequest="1" VerticalOptions="FillAndExpand"
                  HorizontalOptions="FillAndExpand" />
                <Label Text="{Binding Candidate}" VerticalTextAlignment="Center"
                  HorizontalOptions="Center" TextColor="#FFFFFF" FontAttributes="Bold"
                  FontFamily="Helvetica" FontSize="12" />
              </StackLayout>
            </DataTemplate>
          </maps:TooltipSetting.TooltipTemplate>
        </maps:TooltipSetting>
      </maps:ShapeFileLayer.TooltipSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

```

</maps:TooltipSetting>
</maps:ShapeFileLayer.TooltipSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

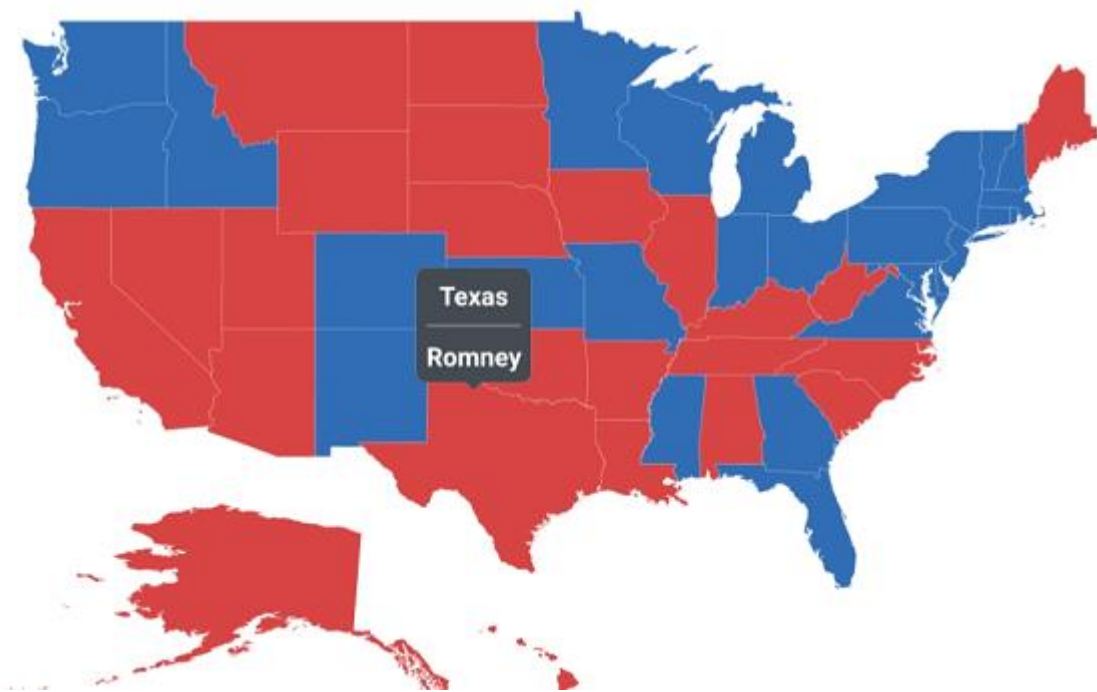

## C#

```

SfMaps sfMaps = new SfMaps();
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();
shapeFileLayer.Uri = "usa_state.shp";
ViewModel model = new ViewModel();
shapeFileLayer.ItemsSource = model.Data;
shapeFileLayer.ShapeIDTableField = "STATE_NAME";
shapeFileLayer.ShapeIDPath = "State";
EqualColorMapping colorMapping = new EqualColorMapping();
colorMapping.Color = Color.FromHex("#D84444");
colorMapping.Value = "Romney";
EqualColorMapping colorMapping1 = new EqualColorMapping();
colorMapping1.Color = Color.FromHex("#316DB5");
colorMapping1.Value = "Obama";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeValuePath = "Candidate";
shapeSetting.ShapeColorValuePath = "Candidate";
shapeSetting.ColorMappings.Add(colorMapping);
shapeSetting.ColorMappings.Add(colorMapping1);
shapeFileLayer.ShapeSettings = shapeSetting;
shapeFileLayer.TooltipSettings.ShowTooltip = true;
shapeFileLayer.TooltipSettings.ValuePath = "State";
DataTemplate template = new DataTemplate(() =>
{
    StackLayout categoryLayout = new StackLayout();
    Label category = new Label();
    category.HorizontalTextAlignment = TextAlignment.Center;
    category.VerticalTextAlignment = TextAlignment.Center;
    category.TextColor = Color.FromHex("#FFFFFF");
    category.FontAttributes = FontAttributes.Bold;
    category.FontFamily = "Helvetica";
    category.Margin = 0;
    category.FontSize = 12;
    category.SetBinding(Label.TextProperty, "State");
    categoryLayout.Children.Add(category);
    BoxView boxView = new BoxView();
    boxView.Color = Color.FromHex("#888C91");
    boxView.HeightRequest = 1;
    boxView.VerticalOptions = LayoutOptions.FillAndExpand;
    boxView.HorizontalOptions = LayoutOptions.FillAndExpand;
    categoryLayout.Children.Add(boxView);
    Label category1 = new Label();
    category1.HorizontalTextAlignment = TextAlignment.Center;
    category1.VerticalTextAlignment = TextAlignment.Center;
    category1.TextColor = Color.FromHex("#FFFFFF");
    category1.FontAttributes = FontAttributes.Bold;
    category1.FontFamily = "Helvetica";
    category1.Margin = 0;
    category1.FontSize = 12;

```

```
category1.SetBinding(Label.TextProperty, "Candidate");
categoryLayout.Children.Add(category1);
return categoryLayout;
});
shapeFileLayer.TooltipSettings.TooltipTemplate = template;
sfMaps.Layers.Add(shapeFileLayer);
Content = sfMaps;
```

### Setting animation for tooltip

You can enable or disable the animation of tooltip using the [EnableAnimation](#) property.

#### XML

```
<maps:ShapeFileLayer.TooltipSettings>
  <maps:TooltipSetting ShowTooltip="True" ValuePath="State"
  EnableAnimation="False"/>
</maps:ShapeFileLayer.TooltipSettings>
```

#### C#

```
shapeFileLayer.TooltipSettings.ShowTooltip = true;
shapeFileLayer.TooltipSettings.ValuePath = "State";
shapeFileLayer.TooltipSettings.EnableAnimation = false;
sfMaps.Layers.Add(shapeFileLayer);
```

### Setting pointer length for tooltip

You can customize the pointer length of the tooltip using the [PointerLength](#) property.

#### XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers >
```

```

<maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
  <maps:ShapeFileLayer.TooltipSettings>
    <maps:TooltipSetting ShowTooltip="True" ValuePath="Candidate"
    PointerLength="18"/>
  </maps:ShapeFileLayer.TooltipSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>

```

## C#

```

SfMaps sfMaps = new SfMaps();
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();
shapeFileLayer.Uri = "usa_state.shp";
ViewModel model = new ViewModel();
shapeFileLayer.ItemsSource = model.Data;
shapeFileLayer.ShapeIDTableField = "STATE_NAME";
shapeFileLayer.ShapeIDPath = "State";
shapeFileLayer.TooltipSettings.ShowTooltip = true;
shapeFileLayer.TooltipSettings.ValuePath = "Candidate";
shapeFileLayer.TooltipSettings.PointerLength = 18;
sfMaps.Layers.Add(shapeFileLayer);
Content = sfMaps;

```

## Events

### Tooltip opening event

This event occurs whenever you select a shape, bubble, or marker. You will get the [Data](#) and [TooltipType](#) properties as arguments from [TooltipOpeningEventArgs](#) handler, and you can cancel the event for a particular shape using the [Cancel](#) property.

**XML**

```
<maps:SfMaps TooltipOpening="SfMaps_TooltipOpening">
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.TooltipSettings>
        <maps:TooltipSetting ShowTooltip="True" ValuePath="State" />
      </maps:ShapeFileLayer.TooltipSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

**C#**

```
private void SfMaps_TooltipOpening(object sender, TooltipOpeningEventArgs e)
{
    if ((e.Data is ElectionData) && (e.Data as ElectionData).State == "Montana")
    {
        e.Cancel = true;
    }
}
```

## Tooltip for bubbles

You can get tooltip by tapping the bubbles in the shapes.

**XML**

```
<maps:SfMaps>
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.BubbleMarkerSettings>
        <maps:BubbleMarkerSetting ValuePath="Electors" ColorValuePath="Electors"
          Fill="#7F38A0">
          <maps:BubbleMarkerSetting.TooltipSettings>
            <maps:TooltipSetting ShowTooltip="True" ValuePath="Electors"/>
          </maps:BubbleMarkerSetting.TooltipSettings>
        </maps:BubbleMarkerSetting>
      </maps:ShapeFileLayer.BubbleMarkerSettings>
    <maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeSetting ShapeFill="LightGray"/>
    </maps:ShapeFileLayer.ShapeSettings>
  </maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

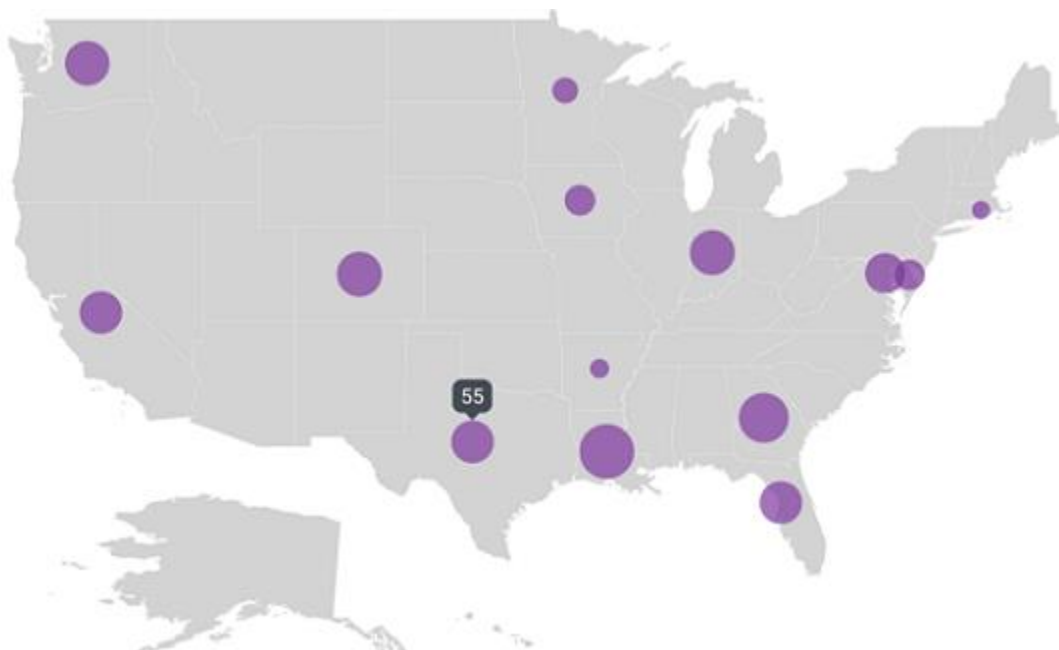

**C#**

```
SfMaps sfMaps = new SfMaps();
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();
shapeFileLayer.Uri = "usa_state.shp";
ViewModel model = new ViewModel();
shapeFileLayer.ItemsSource = model.Data;
shapeFileLayer.ShapeIDTableField = "STATE_NAME";
```

```

shapeFileLayer.ShapeIDPath = "State";
BubbleMarkerSetting bubbleMarkerSetting = new BubbleMarkerSetting();
bubbleMarkerSetting.ColorValuePath = "Electors";
bubbleMarkerSetting.ValuePath = "Electors";
bubbleMarkerSetting.Fill = Color.FromHex("#7F38A0");
bubbleMarkerSetting.TooltipSettings.ShowTooltip = true;
bubbleMarkerSetting.TooltipSettings.ValuePath = "Electors";
shapeFileLayer.BubbleMarkerSettings = bubbleMarkerSetting;
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeFill = Color.LightGray;
shapeFileLayer.ShapeSettings = shapeSetting;
sfMaps.Layers.Add(shapeFileLayer);
Content = sfMaps;

```

### Bubble tooltip customization

To customize the tooltip in the bubbles, refer to this link.

### XML

```

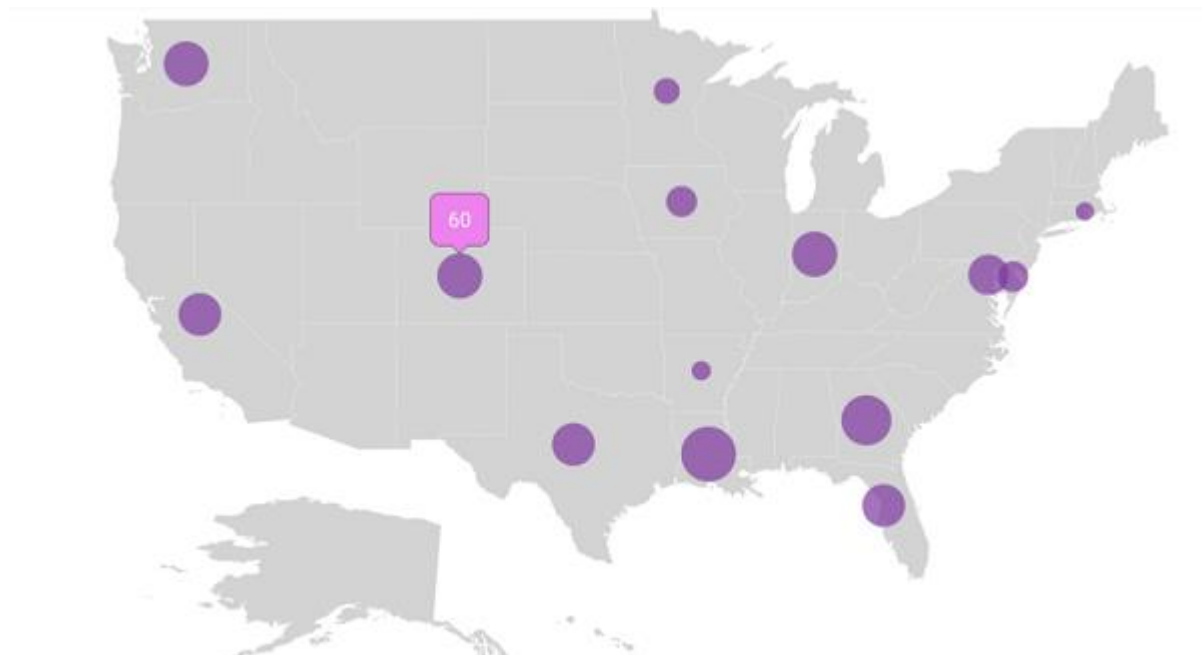

<maps:SfMaps>
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.BubbleMarkerSettings>
        <maps:BubbleMarkerSetting ValuePath="Electors" ColorValuePath="Electors"
          Fill="#7F38A0">
          <maps:BubbleMarkerSetting.TooltipSettings>
            <maps:TooltipSetting ShowTooltip="True" ValuePath="Electors"
              TextColor="White" Margin="10" BackgroundColor="Violet" StrokeColor="Black"
              StrokeWidth="2" Duration="2000"/>
          </maps:BubbleMarkerSetting.TooltipSettings>
        </maps:BubbleMarkerSetting>
      </maps:ShapeFileLayer.BubbleMarkerSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>

```

```
<maps:ShapeSetting ShapeFill="LightGray"/>
</maps:ShapeFileLayer.ShapeSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

## C#

```
SfMaps sfMaps = new SfMaps();
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();
shapeFileLayer.Uri = "usa_state.shp";
ViewModel model = new ViewModel();
shapeFileLayer.ItemsSource = model.Data;

Content = sfMaps;
```

### Marker tooltip customization

To customize the tooltip in the marker, refer to this link.

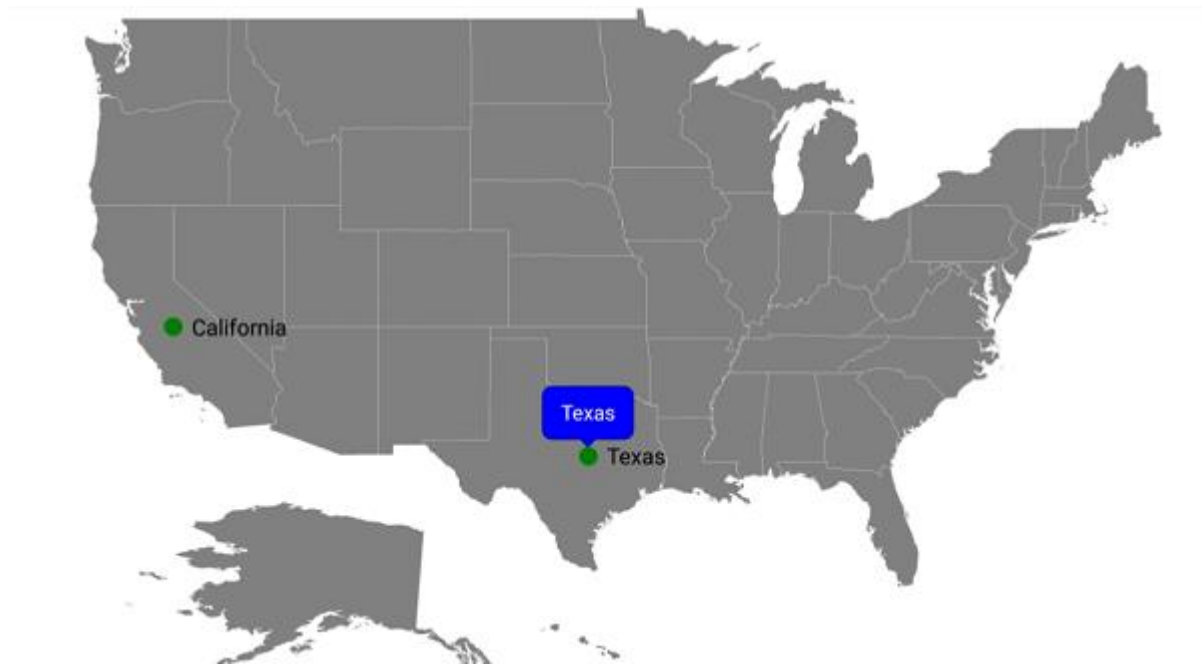

### XML

```
<maps:SfMaps BackgroundColor="White" Margin="10">
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" ShapeIDPath="State"
      ShapeIDTableField="STATE_NAME" ItemsSource="{Binding Data}">
      <maps:ShapeFileLayer.Markers>
        <maps:MapMarker Label="Texas" Latitude="31.267153" Longitude="-97.7430608"/>
        <maps:MapMarker Label="California" Latitude="37" Longitude="-120"/>
      </maps:ShapeFileLayer.Markers>
      <maps:ShapeFileLayer.MarkerSettings>
        <maps:MapMarkerSetting>
          <maps:MapMarkerSetting.TooltipSettings>
            <maps:TooltipSetting ShowTooltip="True" ValuePath="Label" TextColor="White"
```

```
Margin="10" BackgroundColor="Blue"
StrokeColor="Black" StrokeWidth="2" Duration="2000"/>
</maps:MapMarkerSetting.TooltipSettings>
</maps:MapMarkerSetting>
</maps:ShapeFileLayer.MarkerSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

## C#

```
SfMaps sfMaps = new SfMaps();
ShapeFileLayer shapeFileLayer = new ShapeFileLayer();
shapeFileLayer.Uri = "usa_state.shp";
ViewModel model = new ViewModel();
shapeFileLayer.ItemsSource = model.Data;
shapeFileLayer.ShapeIDTableField = "STATE_NAME";
shapeFileLayer.ShapeIDPath = "State";
MapMarker mapMarker = new MapMarker();
mapMarker.Label = "Texas";
mapMarker.Latitude = "31.267153";
mapMarker.Longitude = "-97.7430608";
shapeFileLayer.Markers.Add(mapMarker);
MapMarker mapMarker1 = new MapMarker();
mapMarker1.Label = "California";
mapMarker1.Latitude = "37";
mapMarker1.Longitude = "-120";
shapeFileLayer.Markers.Add(mapMarker1);
MapMarkerSetting mapMarkerSetting = new MapMarkerSetting();
mapMarkerSetting.TooltipSettings.ShowTooltip = true;
mapMarkerSetting.TooltipSettings.ValuePath = "Label";
mapMarkerSetting.TooltipSettings.TextColor = Color.White;
mapMarkerSetting.TooltipSettings.BackgroundColor = Color.Blue;
mapMarkerSetting.TooltipSettings.StrokeColor = Color.Black;
mapMarkerSetting.TooltipSettings.StrokeWidth = 2;
mapMarkerSetting.TooltipSettings.Margin = 10;
mapMarkerSetting.TooltipSettings.Duration = 2000;
shapeFileLayer.MarkerSettings = mapMarkerSetting;
sfMaps.Layers.Add(shapeFileLayer);
Content = sfMaps;
```

## Sublayer

Sublayer in the maps control allows to load multiple shape files in a single container and enables maps to display more information.

### Adding sublayers in ShapeFileLayer

You can add multiple shape files in the [ShapeFileLayer](#) using the [Sublayers](#) property.

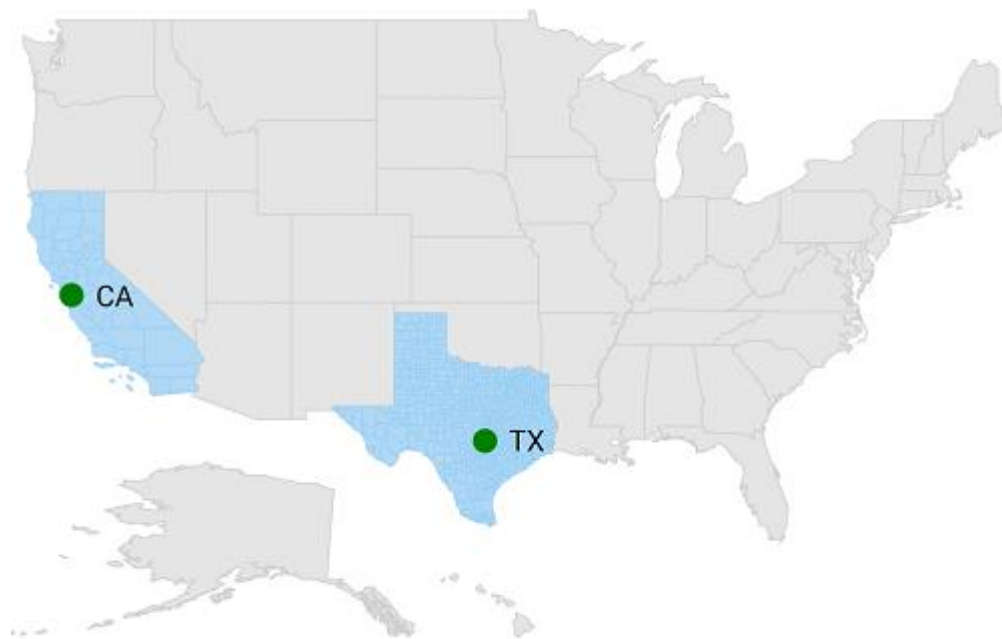

### XML

```
<maps:SfMaps x:Name="sfmap">
  <maps:SfMaps.Layers>
    <maps:ShapeFileLayer Uri="usa_state.shp">
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting ShapeStroke="#D0D0D0" ShapeStrokeThickness="2"
          ShapeFill="#E5E5E5" />
      </maps:ShapeFileLayer.ShapeSettings>
      <maps:ShapeFileLayer.Sublayers>
        <maps:ShapeFileLayer Uri="Texas.shp">
          <maps:ShapeFileLayer.ShapeSettings>
            <maps:ShapeSetting ShapeFill="#B1D8F5" ShapeStroke="#8DCCF4"
              ShapeStrokeThickness="1"/>
          </maps:ShapeFileLayer.ShapeSettings>
          <maps:ShapeFileLayer.Markers>
            <maps:MapMarker Label="TX" Latitude="30.267153" Longitude="-97.7430608"/>
          </maps:ShapeFileLayer.Markers>
        </maps:ShapeFileLayer>
        <maps:ShapeFileLayer Uri="California.shp">
          <maps:ShapeFileLayer.ShapeSettings>
            <maps:ShapeSetting ShapeFill="#B1D8F5" ShapeStroke="#8DCCF4"
              ShapeStrokeThickness="1"/>
          </maps:ShapeFileLayer.ShapeSettings>
          <maps:ShapeFileLayer.Markers>
            <maps:MapMarker Label="CA" Latitude="37.3382082" Longitude="-121.8863286"/>
          </maps:ShapeFileLayer.Markers>
        </maps:ShapeFileLayer>
      </maps:ShapeFileLayer.Sublayers>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

```
</maps:ShapeFileLayer>  
</maps:ShapeFileLayer.Sublayers>  
</maps:ShapeFileLayer>  
</maps:SfMaps.Layers>  
</maps:SfMaps>
```

## C#

```
SfMaps map = new SfMaps();  
ShapeFileLayer layer = new ShapeFileLayer();  
layer.Uri = "usa_state.shp";  
ShapeSetting shapeSetting = new ShapeSetting();  
shapeSetting.ShapeStroke = Color.FromHex("#D0D0D0");  
shapeSetting.ShapeStrokeThickness = 2;  
shapeSetting.ShapeFill = Color.FromHex("#E5E5E5");  
layer.ShapeSettings = shapeSetting;  
ShapeFileLayer subShapeLayer = new ShapeFileLayer();  
subShapeLayer.Uri = "Texas.shp";  
ShapeSetting shapeSetting1 = new ShapeSetting();  
shapeSetting1.ShapeFill = Color.FromHex("#B1D8F5");  
shapeSetting1.ShapeStrokeThickness = 1;  
shapeSetting1.ShapeStroke = Color.FromHex("#8DCCF4");  
subShapeLayer.ShapeSettings = shapeSetting1;  
MapMarker mapMarker = new MapMarker();  
mapMarker.Label = "TX";  
mapMarker.Latitude = "30.267153";  
mapMarker.Longitude = "-97.7430608";  
subShapeLayer.Markers.Add(mapMarker);  
layer.Sublayers.Add(subShapeLayer);  
ShapeFileLayer subShapeLayer1 = new ShapeFileLayer();  
subShapeLayer1.Uri = "California.shp";  
ShapeSetting shapeSetting2 = new ShapeSetting();  
shapeSetting2.ShapeFill = Color.FromHex("#B1D8F5");  
shapeSetting2.ShapeStrokeThickness = 1;  
shapeSetting2.ShapeStroke = Color.FromHex("#8DCCF4");  
subShapeLayer1.ShapeSettings = shapeSetting2;  
MapMarker mapMarker1 = new MapMarker();  
mapMarker1.Label = "CA";  
mapMarker1.Latitude = "37.3382082";  
mapMarker1.Longitude = "-121.8863286";  
subShapeLayer1.Markers.Add(mapMarker1);  
layer.Sublayers.Add(subShapeLayer1);  
map.Layers.Add(layer);  
this.Content = map;
```

### Adding sublayers in ImageryLayer

You can add multiple shape files in the `ImageryLayer` using the `Sublayers` property.

#### XML

```
<maps:SfMaps x:Name="sfmap">
  <maps:SfMaps.Layers>
    <maps:ImageryLayer>
      <maps:ImageryLayer.Sublayers>
        <maps:ShapeFileLayer Uri="africa.shp">
          <maps:ShapeFileLayer.ShapeSettings>
            <maps:ShapeSetting ShapeFill="#FD8C48" ShapeStrokeThickness="1"/>
          </maps:ShapeFileLayer.ShapeSettings>
        </maps:ShapeFileLayer>
      </maps:ImageryLayer.Sublayers>
    </maps:ImageryLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

#### C#

```
SfMaps map = new SfMaps();
ImageryLayer imageryLayer = new ImageryLayer();
ShapeFileLayer subShapeLayer = new ShapeFileLayer();
subShapeLayer.Uri = "africa.shp";
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.ShapeFill = Color.FromHex("#FD8C48");
shapeSetting.ShapeStrokeThickness = 1;
subShapeLayer.ShapeSettings = shapeSetting;
imageryLayer.Sublayers.Add(subShapeLayer);
map.Layers.Add(imageryLayer);
```

```
Content = map;
```

#### *Customizing sublayer*

Sublayer is a type of shapefile layer. You can add all the elements such as markers, bubbles, color mapping, and legends to sublayer. Please refer to the following links to add the sublayer properties.

- [Adding markers](#)
- [Color mapping](#)
- [Adding legend](#)
- [Adding bubbles](#)
- [Adding data labels](#)

#### User interaction

Options such as zooming, panning, and selection enable effective interaction on map elements.

##### Selection

Each shape in a map can be selected or deselected when interacting with shapes. Map shapes can be selected using the following ways:

- Single selection
- Multiple selection

The selected map shapes are differentiated by their fill. The [SelectedShapeColor](#) property of [ShapeSettings](#) gets or sets the selected shape color. The [SelectedShapeStroke](#) property is used to customize the selected shape border.

### Single selection

Single selection allows you select only one shape at a time. You can select a shape by tapping it. By default, the single selection is enabled when the [EnableSelection](#) property is set to true. You can also enable the single selection by setting the [SelectionMode](#) property of ShapeFileLayer to “Single”. When selecting or tapping the rest of the area, the selected shape will be deselected.

#### XML

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White" >
  <maps:SfMaps.Layers >
    <maps:ShapeFileLayer Uri="usa_state.shp" EnableSelection="True"
      SelectionMode="Single" >
      <maps:ShapeFileLayer.ShapeSettings>
        <maps:ShapeSetting SelectedShapeColor="Green" SelectedShapeStroke="Black"
          SelectedShapeStrokeThickness="1" />
      </maps:ShapeFileLayer.ShapeSettings>
    </maps:ShapeFileLayer>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

#### C#

```
SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.EnableSelection = true;
layer.SelectionMode = SelectionMode.Single;
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.SelectedShapeColor = Color.Green;
shapeSetting.SelectedShapeStroke = Color.Black;
shapeSetting.SelectedShapeStrokeThickness = 1;
layer.ShapeSettings = shapeSetting;
map.Layers.Add(layer);
this.Content = map;
```

### Multiple selection

Multiple selection allows you select multiple shapes at a time. You can select many shapes by tapping them. To enable this feature, set the [SelectionMode](#) property to “Multiple” along with the [EnableSelection](#) property.

---

**Information:** Shapes cannot be selected when the [EnableSelection](#) property is set to false.

---

**XML**

```
<maps:SfMaps x:Name="sfmap" BackgroundColor="White" >
<maps:SfMaps.Layers >
<maps:ShapeFileLayer Uri="usa_state.shp" EnableSelection="True"
SelectionMode="Multiple" >
<maps:ShapeFileLayer.ShapeSettings>
<maps:ShapeSetting SelectedShapeColor="Green" SelectedShapeStroke="Black"
SelectedShapeStrokeThickness="1" />
</maps:ShapeFileLayer.ShapeSettings>
</maps:ShapeFileLayer>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

**C#**

```
SfMaps map = new SfMaps();
map.BackgroundColor = Color.White;
ShapeFileLayer layer = new ShapeFileLayer();
layer.Uri = "usa_state.shp";
layer.EnableSelection = true;
layer.SelectionMode = SelectionMode.Multiple;
ShapeSetting shapeSetting = new ShapeSetting();
shapeSetting.SelectedShapeColor = Color.Green;
shapeSetting.SelectedShapeStroke = Color.Black;
shapeSetting.SelectedShapeStrokeThickness = 1;
layer.ShapeSettings = shapeSetting;
map.Layers.Add(layer);
this.Content = map;
```

*Selected items*

The **SelectedItems** property allows you select the shapes without tapping or touching them.

To select a shape and deselect it from the same collection without tapping or touching, just add the shape that is to be selected to the selected items collection.

The following code sample demonstrates how to select and deselect a shape.

**C#**

```
var model = GetDataSource();
ShapeFileLayer layer=new ShapeFileLayer();
layer.ItemsSource=model;
```

```
SelectedItemButton.Clicked += (sender, e) =>
{
    layer.SelectedItems.Add(model[4]);
};
RemoveItemButton.Clicked += (sender, e) =>
{
    layer.SelectedItems.Remove(model[4]);
};
```

### Zooming

The zooming feature enables you to zoom in and zoom out the maps to show the in-depth information. The following properties are used to zoom in and zoom out maps:

[EnableZooming](#): Controls whether to perform zooming or not.

[MinZoom](#): Sets the minimum level of zooming.

[MaxZoom](#): Sets the maximum level of zooming.

[ZoomLevel](#): Sets zooming level to shapes.

### XML

```
<maps:SfMaps EnableZooming="True" MinZoom="1"
MaxZoom="10" ZoomLevel="2"/>
```

### C#

```
SfMaps map = new SfMaps();
map.EnableZooming = true;
map.MinZoom = 1;
map.MaxZoom = 10;
map.ZoomLevel = 2;
```

### Panning

Panning feature allows you to move the visible area of the maps when it is zoomed in. To enable panning, set the [EnablePanning](#) property to true.

### XML

```
<maps:SfMaps x:Name="sfmap" EnablePanning="True" EnableZooming="True"
MinZoom="1"
MaxZoom="10" BackgroundColor="White" />
```

## C#

```
SfMaps map = new SfMaps();  
map.EnablePanning = true;  
map.EnableZooming = true;  
map.MinZoom = 1;  
map.MaxZoom = 10;
```

## Map Providers

The maps control supports map providers such as OpenStreetMap and Bing Maps that can be added to an imagery layer in maps.

### OpenStreetMap

The OpenStreetMap (OSM) is a world map; it was built by a community of mappers. It is free to use under an open license. This allows you view geographical data in a collaborative way from anywhere on the earth. The OSM provides small tile images based on your requests and combines them into a single image to display the map area in the maps control.

#### *Adding OSM in maps*

The maps control uses **imagery layer** to display the tile images from the OSM service. To use **OSM**, add an imagery layer in maps' layers collection.

## XML

```
<maps:SfMaps.Layers>  
<maps:ImageryLayer/>  
</maps:SfMaps.Layers>
```

## C#

```
SfMaps maps = new SfMaps();  
ImageryLayer layer = new ImageryLayer();  
maps.Layers.Add(layer);
```

**Note:** Both the [ShapeFileLayer](#) and **ImageryLayer** have been derived commonly from MapsLayer.

## Bing Maps

The Bing Maps is a world map owned by Microsoft. As OSM, Bing Maps also provides map tile images based on your requests and combines them into a single image to display the map area. To use Bing maps, set the `LayerType` property of `ImageryLayer` to "Bing". Then, set the Bing Maps key, which is obtained from [Bing Maps Key](#).

### XML

```
<maps:SfMaps.Layers>
  <maps:ImageryLayer LayerType="Bing" BingMapKey="Your bing map key"/>
</maps:SfMaps.Layers>
```

### C#

```
SfMaps maps = new SfMaps();
ImageryLayer layer = new ImageryLayer();
layer.LayerType = LayerType.Bing;
layer.BingMapKey = "Your bing map key";
maps.Layers.Add(layer);
```

**Note:** The `LayerType` property of `ImageryLayer` provides support to `OSM` and `Bing Maps`. The default value of the `LayerType` property is `OSM`.

### Set different bing map style

The `ImageryLayer` provides support to the following types of Bing Maps:

- `Road`
- `Aerial`
- `AerialWithLabels`

The desired style for the Bing Maps can be set using the `BingMapStyle` property of `ImageryLayer`. The default value of `BingMapStyle` is "Road".

### Road

The Road view displays the default map view of roads, buildings, and geography. The default value of the `BingMapStyle` property of imagery layer is "Road".

### Aerial

The Aerial view displays the satellite images to highlight the roads and major landmarks for easy identification. The aerial view can be applied to maps by setting the `BingMapStyle` to "Aerial".

#### XML

```
<maps:SfMaps.Layers>
  <maps:ImageryLayer LayerType="Bing"
    BingMapStyle="Aerial"
    BingMapKey=" Your bing map key "/>
</maps:SfMaps.Layers>
```

#### C#

```
SfMaps maps = new SfMaps();
ImageryLayer layer = new ImageryLayer();
layer.LayerType = LayerType.Bing;
layer.BingMapStyle = BingMapStyle.Aerial;
layer.BingMapKey = "Your bing map key ";
maps.Layers.Add(layer);
```

### AerialWithLabel

The AerialWithLabel view displays the Aerial map with labels for continent, country, ocean, etc. This view can be applied to maps by setting the `BingMapStyle` to "AerialWithLabel".

#### XML

```
<maps:SfMaps.Layers>
  <maps:ImageryLayer LayerType="Bing"
    BingMapStyle="AerialWithLabels"
    BingMapKey=" Your bing map key "/>
</maps:SfMaps.Layers>
```

#### C#

```
SfMaps maps = new SfMaps();  
ImageryLayer layer = new ImageryLayer();  
layer.LayerType = LayerType.Bing;  
layer.BingMapStyle = BingMapStyle.AerialWithLabels;  
layer.BingMapKey = "Your bing map key ";  
maps.Layers.Add(layer);
```

### Zooming and panning

The maps control provides interactive zooming and panning supports to OSM and Bing Maps.

Zooming helps you get a closer look of an area on maps for in-depth analysis. Panning helps you move a map around to focus the targeted area. You can perform zooming and panning with the pinching gesture in a map area.

### Reset zooming

The ImageryLayer provides support to reset the maps to the default view when you double tap the imagery layer by setting the `ResetOnDoubleTap` property to true. The default value of this property is true. This behavior can be restricted by setting the `ResetOnDoubleTap` property to false.

#### XML

```
<maps:SfMaps>
  <maps:SfMaps.Layers>
    <maps:ImageryLayer ResetOnDoubleTap="True"/>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

#### C#

```
SfMaps maps = new SfMaps();
ImageryLayer layer = new ImageryLayer();
layer.ResetOnDoubleTap = true;
maps.Layers.Add(layer);
```

### Set Geo coordinates points(center position)

The `GeoCoordinates` property allows you view the desired area at the center on loading. By default, the `GeoCoordinates` value is (0,0). So, the latitude value "0" and longitude value "0" are shown at the center.

#### XML

```
<maps:SfMaps ZoomLevel="2">
  <maps:SfMaps.Layers>
    <maps:ImageryLayer GeoCoordinates="69.07,-37.08"/>
  </maps:SfMaps.Layers>
</maps:SfMaps>
```

#### C#

```
SfMaps maps = new SfMaps();
maps.ZoomLevel = 2;
ImageryLayer layer = new ImageryLayer();
layer.GeoCoordinates = new Point(69.07, -37.08);
maps.Layers.Add(layer);
```

### XML

```
<maps:SfMaps ZoomLevel="2">  
  <maps:SfMaps.Layers>  
    <maps:ImageryLayer GeoCoordinates="0,0"/>  
  </maps:SfMaps.Layers>  
</maps:SfMaps>
```

### C#

```
SfMaps maps = new SfMaps();  
maps.ZoomLevel = 2;  
ImageryLayer layer = new ImageryLayer();  
layer.GeoCoordinates = new Point(0,0);  
maps.Layers.Add(layer);
```

Set markers in imagery layer

As [ShapeFileLayer](#), markers also can be added to imagery layer. Markers can be customized using the `MarkerSettings` property in imagery layer.

The detailed explanation of marker and its customization have been provided in Markers section.

### XML

```
<maps:ImageryLayer >
  <maps:ImageryLayer.MarkerSettings>
    <maps:MapMarkerSetting IconColor="Red"
      IconSize="13" MarkerIcon="Diamond"/>
  </maps:ImageryLayer.MarkerSettings>
  <maps:ImageryLayer.Markers>
    <maps:MapMarker Label="United States" Latitude="40"
      Longitude= "-101"/>
    <maps:MapMarker Label="Brazil" Latitude="-15.7833"
      Longitude= "-52" />
    <maps:MapMarker Label="Congo" Latitude="-1.6"
      Longitude= "24.4" />
    <maps:MapMarker Label="Kazakhstan" Latitude="49.9"
      Longitude= "72.23" />
    <maps:MapMarker Label="Australia" Latitude="-20.54"
      Longitude= "134.10" />
  </maps:ImageryLayer.Markers>
</maps:ImageryLayer>
```

### C#

```
ImageryLayer layer = new ImageryLayer();
layer.MarkerSettings = new MapMarkerSetting();
layer.MarkerSettings.IconColor = Color.Red;
layer.MarkerSettings.MarkerIcon = MapMarkerIcon.Diamond;
layer.MarkerSettings.IconSize = 13;
MapMarker marker1 = new MapMarker();
marker1.Label = "United States";
marker1.Latitude = "40";
marker1.Longitude = "-101";
layer.Markers.Add(marker1);
MapMarker marker2 = new MapMarker();
marker2.Label = "Brazil";
marker2.Latitude = "-15.7833";
marker2.Longitude = "-52";
layer.Markers.Add(marker2);
MapMarker marker3 = new MapMarker();
marker3.Label = "Congo";
marker3.Latitude = "-1.6";
marker3.Longitude = "24.4";
layer.Markers.Add(marker3);
MapMarker marker4 = new MapMarker();
marker4.Label = "Kazakhstan";
marker4.Latitude = "49.9";
marker4.Longitude = "72.23";
layer.Markers.Add(marker4);
MapMarker marker5 = new MapMarker();
marker5.Label = "Australia";
```

```
marker5.Latitude = "-20.54";
marker5.Longitude = "134.10";
layer.Markers.Add(marker5);
```

### Custom map providers

You can show the other map providers maps using imagery layer. First, initialize the map extension class, override the GetUri method of imagery layer extension class, and then pass the Map providers tile image Uri link like Google uri with corresponding x, y, and zoom level. Finally, add the imagery layer extension class to layers collection of native map control by overriding the OnElementChanged method of each platform's (Xamarin.Android, Xamarin.iOS, and UWP) custom map renderer. For more information to add custom map provider, refer to this [KB article](#).

### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        MapExt maps = new MapExt();
        ImageryLayer layer = new ImageryLayer();
        maps.Layers.Add(layer);
        this.Content = maps;
    }
}

public class MapExt : SfMaps
{
}

public class CustomMapRenderer : SfMapsRenderer
{
    protected override void OnElementChanged(ElementChangedEventArgs<SfMaps> e)
    {
        base.OnElementChanged(e);
        if (Control != null)
            AddLayer();
    }

    void AddLayer()
    {
        ImageryLayerExt layer = new ImageryLayerExt();
        (Control as NativeMap.SfMaps).Layers.Clear();
        (Control as NativeMap.SfMaps).Layers.Add(layer as NativeMap.ImageryLayer);
    }
}
```

```
}  
}  
public class ImageryLayerExt : NativeMap.ImageryLayer  
{  
    protected override string GetUri(int X, int Y, int Scale)  
    {  
        var link = "http://mt1.google.com/vt/lyrs=y&x=" + X.ToString()  
        + "&y=" + Y.ToString() + "&z=" + Scale.ToString();  
        return link;  
    }  
}
```

You can download the demo sample in this [link](#).

Cache tile images in application memory

The [CanCacheTiles](#) property used to decide whether the tile images should be cached in application memory or not.

### C#

```
ImageryLayer imageryLayer = new ImageryLayer();  
imageryLayer.CanCacheTiles = true;
```

Clear cached tile images from application memory

The [DeleteTilesFromCache](#) method used to clear the cached tile images from application cache memory.

### XML

```
<maps:SfMaps>  
  <maps:SfMaps.Layers>  
    <maps:ImageryLayer x:Name="imageryLayer" />  
  </maps:SfMaps.Layers>  
</maps:SfMaps>
```

```
</maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
imageryLayer.DeleteTilesFromCache();
```

### Events

The [ZoomLevelChanging](#) event triggers when zoom level changed. Following arguments can be get from the ZoomLevelChanging event .

- [Cancel](#) : Used to cancel the zooming.
- [PreviousLevel](#) : Returns the previous level after the zooming.
- [CurrentLevel](#) : Returns the current level to be zoomed.

### XML

```
<maps:SfMaps>
<maps:SfMaps.Layers>
<maps:ImageryLayer ZoomLevelChanging="Layer_ZoomLevelChanging" />
</maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
private void Layer_ZoomLevelChanging(object sender,
ZoomLevelChangingEventArgs e)
{
    if(e.PreviousLevel == 10) // Returns the previous zoom level
    {
        e.Cancel = true; // Cancels the zooming event
        var CurrentLevel = e.CurrentLevel; // Returns the current zoomed level
    }
}
```

The [GeoCoordinateChanged](#) event is triggered while zooming and panning the maps.

The following arguments can be gotten from the `ImageryLayer_GeoCoordinateChanged` event:

- [Center](#): Returns the center Geo coordinate point of the visual tiles while zooming and panning.
- [TopLeft](#): Returns the top-left Geo coordinate point of the visual tiles while zooming and panning.
- [TopRight](#): Returns the top-right Geo coordinate point of the visual tiles while zooming and panning.
- [BottomLeft](#): Returns the bottom-left Geo coordinate point of the visual tiles while zooming and panning.
- [BottomRight](#): Returns the bottom-right Geo coordinate point of the visual tiles while zooming and panning.

### XML

```
<maps:SfMaps >
```

```
<maps:SfMaps.Layers >
<maps:ImageryLayer
GeoCoordinateChanged="ImageryLayer_GeoCoordinateChanged"/>
</maps:SfMaps.Layers>
</maps:SfMaps>
```

### C#

```
private void ImageryLayer_GeoCoordinateChanged(object sender,
GeoCoordinateChangedEventArgs e)
{
var topLeft = e.TopLeft;
var topRight = e.TopRight;
var bottomLeft = e.BottomLeft;
var bottomRight = e.BottomRight;
var center = e.Center;
}
```

### How to

#### Transform latitude and longitude value to pixel value and vice-versa

SfMaps offers two utility methods to transform the pixel values to longitude and latitude values and vice-versa. This method is used for both ShapeFileLayer and ImageryLayer.

- **GeopointToViewPoint(double latitude, double longitude)** - Converts the latitude and longitude values to screen point. Here, pass the parameters as latitude and longitude values, from that values we can get screen points x and y.
- **GetLatLonFromPoint(Point point)** - Converts the screen point to longitude and latitude values. Here, pass the parameters as screen points x and y, from that points we can get longitude(Point.X) and latitude(Point.Y) values.

### C#

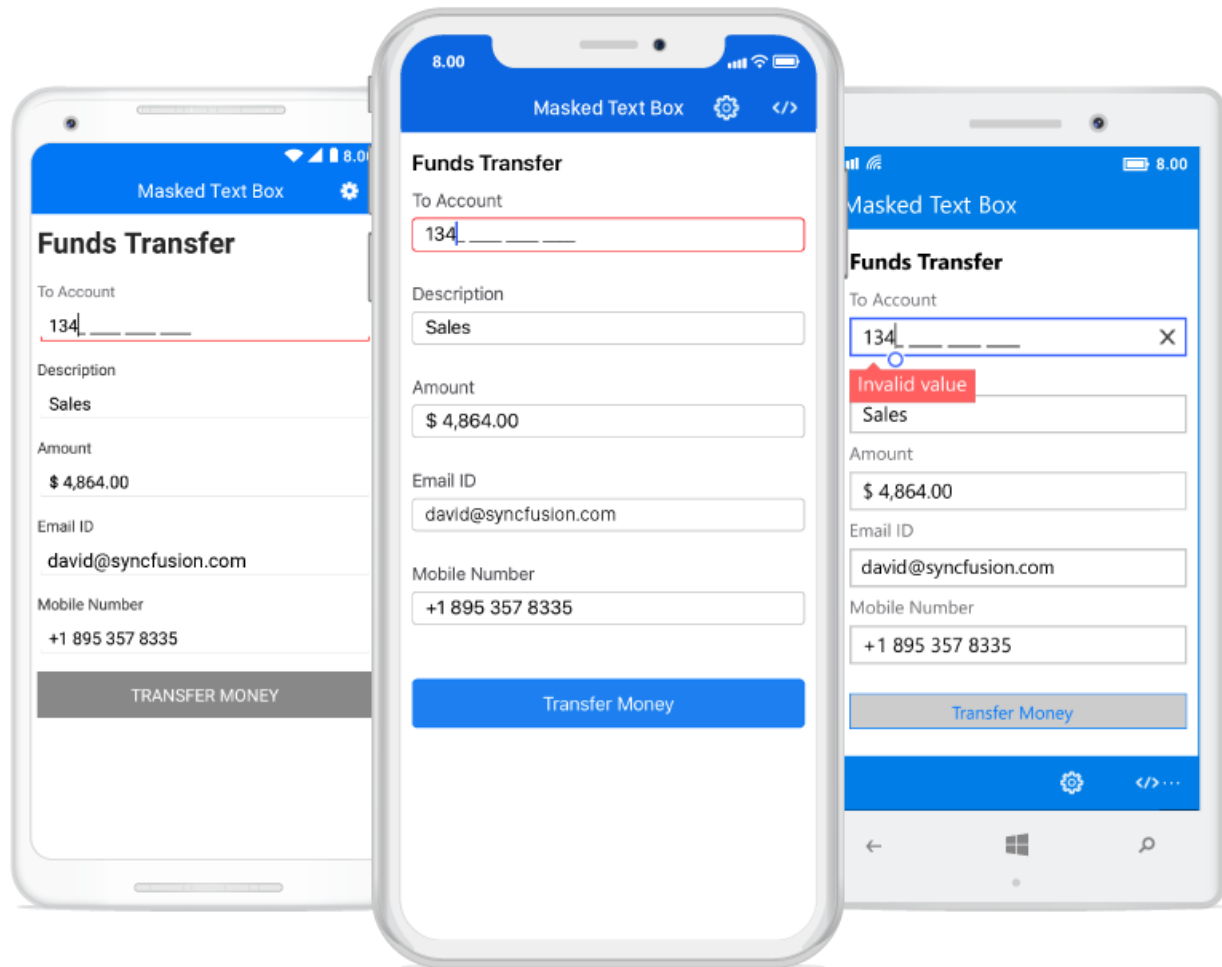

```
Point pixelPoint = layer.GeopointToViewPoint(21.00, 78.00);
Point longitudeLatitude = layer.GetLatLonFromPoint(pixelPoint);
marker.Latitude = longitudeLatitude.Y.ToString();
marker.Longitude = longitudeLatitude.X.ToString();
```

## SfMaskedEdit

### Overview

The Masked text box is an advanced version of the Entry control that restricts your input to certain types of characters, text, and numbers using a mask pattern. This control is used to create a template for providing information such as telephone numbers, IP addresses, product IDs, and so on.

## Key features

- The input can be masked with a fixed or variable length by setting the **MaskType** to **Text** or **Regex**, respectively.
- Custom prompt characters can be set.
- Special symbols such as currency symbol, date separator, decimal separator, etc., can be localized based on the culture.
- Input validation can be done either during each key press or when the control loses its focus.
- Values can be accessed with or without literal and prompt characters.
- Clipboard operations can be used with or without literal and prompt characters.
- Watermark text can be used to display an instruction or important information.
- The UI of the masked text box is completely customizable.

## Getting Started

This section explains you the steps required to configure a **SfMaskedEdit** control in a real-time scenario and provides a walk-through on some of the customization features available in **SfMaskedEdit** control.

### Adding SfMaskedEdit reference

You can add SfMaskedEdit reference using one of the following methods:

### Method 1: Adding SfMaskedEdit reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.syncfusion.com/nuget-packages). To add SfMaskedEdit to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfMaskedEdit](https://www.syncfusion.com/nuget-packages), and then install it.

!{Adding SfMaskedEdit reference from NuGet}(SfMaskedEditImages/Adding SfMaskedEdit reference.png)

---

**Note:** Install the same version of SfMaskedEdit NuGet in all the projects.

---

### Method 2: Adding SfMaskedEdit reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfMaskedEdit control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfMaskedEdit assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfMaskedEdit.XForms.Android.dll Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfMaskedEdit.XForms.iOS.dll Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfMaskedEdit.XForms.UWP.dll Syncfusion.SfMaskedEdit.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

**Note:** After adding the reference, an additional step is required for iOS and UWP projects. If you are adding the references from toolbox, this step is not needed.

#### *Additional step for iOS*

To launch SfMaskedEdit in iOS, call the `SfMaskedEditRenderer.Init()` in `FinishedLaunching` overridden method of `AppDelegate` class in iOS Project, as demonstrated in the following code example.

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    SfMaskedEditRenderer.Init();
    return base.FinishedLaunching(app, options);
}
```

#### *Additional step for UWP*

This step is required only if the application is deployed in Release mode with .NET native tool chain enabled and it is for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the SfMaskedEdit assembly at `OnLaunched` overridden method of the `App` class in UWP project is the suggested work around, as demonstrated in the following code example.

#### **C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    .....
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfMaskedEditRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    .....
}
```

#### Create a Simple SfMaskedEdit

The SfMaskedEdit control is configured entirely in C# code or by using XAML markup. The following steps explain how to create a SfMaskedEdit and configure its elements:

#### *Add namespace for referred assemblies*

#### **XML**

```
xmlns:syncfusion="clr-namespace:Syncfusion.XForms.MaskedEdit;assembly=Syncfusion.SfMaskedEdit.XForms"
```

**C#**

```
using Syncfusion.XForms.MaskedEdit;
```

Refer SfMaskedEdit control with declared suffix name for Namespace

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:syncmaskededit="clr-
namespace:Syncfusion.XForms.MaskedEdit;assembly=Syncfusion.SfMaskedEdit.XFor
ms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<StackLayout Margin="0,100,0,0">
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" />
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.MaskedEdit;
using Xamarin.Forms;
namespace GettingStarted
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout();
stackLayout.Margin = new Thickness(0, 100, 0, 0);
SfMaskedEdit maskedEdit = new SfMaskedEdit();
stackLayout.Children.Add(maskedEdit);
this.Content = stackLayout;
}
}
}
```

## Masking the input

To mask the input, set the **Mask** property as follows:

**XML**

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" Mask="00/00/0000"/>
```

**C#**

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.Mask = "00/00/0000";
```

This mask expression allows only numeric inputs in the places of 0.

Refer to this [link](#) to know more about the Mask characters and Mask Types available in SfMaskedEdit control.

Run the project and check if you get the following output to make sure that you have configured your project properly to add SfMaskedEdit.

You can find the complete getting started sample from this [link](#).

## Basic Features

### Setting Value

The SfMaskedEdit control displays the value that can be set using the **Value** property:

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" Mask="00/00/0000"
Value="14/11/2014"/>
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.Mask = "00/00/0000";
maskedEdit.Value =@"14/11/2014";
```

### Setting Prompt Character

Displays prompt character for the absence of your input in Mask and its default value is '\_'. You can set the custom prompt character using **PromptChar** property.

#### XML

```
< syncmaskededit:SfMaskedEdit x:Name="maskedEdit" Mask="000000"
MaskType="Text" PromptChar="*" />
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.Mask = "00/00/0000";
maskedEdit.PromptChar = '*';
```

### Setting Watermark

The watermark will prompt you with instructions or important information when it is not on focus and any valid characters are not entered. The `Watermark` property of `SfMaskedEdit` is used to set the watermark text for the control.

The following properties are used to customize its appearance:

- `WatermarkColor`: Sets text color for the watermark.
- `WatermarkFontFamily`: Represents the font to be used in the watermark.
- `WatermarkFontAttributes`: Sets font attributes(bold/italic/none) for the watermark.
- `WatermarkFontSize`: Sets font size for the watermark.

### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" Mask="00/00/0000"
Watermark="Type here" WatermarkColor="LightGray" WatermarkFontFamily="Arial"
WatermarkFontAttributes="Bold" WatermarkFontSize="20"/>
```

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.Mask = "00/00/0000";
maskedEdit.Watermark = "Type here";
maskedEdit.WatermarkColor = Color.LightGray;
maskedEdit.WatermarkFontFamily = "Arial";
maskedEdit.WatermarkFontAttributes = FontAttributes.Bold;
maskedEdit.WatermarkFontSize = 20;
```

You can find the complete basic features sample from this [link](#).

### MaskType

Each `MaskType` has different set of mask characters that are combined to form a mask expression. Based on the complexity and usage, mask types are classified as:

- Text
- RegEx

#### Text

The expressions that are generated with letters, digits, and special characters come under this group. This is mainly used for fixed length inputs. For example: phone number, zip code, and so on.

*Text Mask characters*

Characters	Description
A	Alphanumeric, required.
a	Alphanumeric, optional.
L	Letter, required. Restricts input to the ASCII letters a-z and A-Z.
l	Letter, optional. Restricts input to the ASCII letters a-z and A-Z.
0	Digit, required. This character accepts any single digit between 0 and 9
9	Digit or space, optional.
#	Digit or space, optional. Plus (+) and minus (-) signs are allowed.
C	Character, optional.
\	Escapes a mask character, turning it into a literal. "\" is the escape sequence for a backslash.
Any other characters	Considered as literals. Literals always occupy a static position in the mask at run time, and cannot be moved or deleted.

**XML**

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="+1 (000) 000000"/>
```

**C#**

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "+1 (000) 000000";
```

This mask expression allows only numeric inputs in the places of 0.

*Regex*

The expressions that are generated with regular expressions come under this group, preferable for variable length inputs and input in range. For example: hexadecimal values [0-9A-C].

The regular expressions provide significant advantages when creating masks as compared with other mask modes.

**Advantages**

- Allows you to enter the value of indeterminate length.
- Restricts with specific pattern. Example email, password, and more.
- Restricts you to enter specific range at specific position.

*Regex Mask Characters*

Characters	Description
\w	Accepts any alphabet, number, including the _(Underscore) character.
\d	Accepts any digit.
{n}	Accepts the input for $\hat{\sim}$ number of times.
{n,m}	Accepts the input for $\hat{\sim}$ minimum number of times and $\hat{\sim}$ maximum number of times.
?	Optional input.
+	Accepts the input for one or more times.
*	Accepts the input for zero or more times.
[aeiou]	Accepts any single character included in the specified set of characters.
[0-9a-fA-F]	Accepts any character between[A-F]/[a-f] and numbers between [0-9].

**XML**

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Regex"
Mask="+1(\d{3})\d{5}"/>
```

**C#**

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.RegEx;
maskedEdit.Mask = @"+1(\d{3})\d{5}";
```

This mask expression '\d{3}' and '\d{5}' allows only numeric, where {n} is the count that the input should be accepted.

You can find the complete mask type sample from this [link](#).

## Localization

The special symbols such as currency symbol, date separator, decimal separator etc., can be localized to any specific culture using the `Culture` property.

Characters	Description
.	Decimal separator determined by current culture.
,	Group separator determined by current culture.
/	Date separator determined by current culture.
:	Time separator determined by current culture.
\$	Currency symbol determined by current culture.

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.Mask = "$ 0,000.00";
maskedEdit.Culture = new CultureInfo("fr-FR");
```

Now the '\$' will be localized to '€'; '.' will be localized to ',' and ' ' will be localized to ' '(single white space).

You can find the runnable localization sample from this [link](#).

### Using Mask Characters as Literals

To use mask character as a literal, precede the mask character with a backslash (\\). For example, to display the dollar sign (\$), then set the mask as follows:

### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text" Mask="\$ 0000"/>
```

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = @"\$ 0000";
```

This will produce a mask that displays a dollar sign (\$) followed by the prompt characters for entering numbers.

This demo can be downloaded from this [link](#).

### Hiding Prompt Characters

When the `HidePromptOnLeave` property is set to true, prompt characters are ignored when control loses focus. Again, the prompt characters are restored when the control is focused.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" HidePromptOnLeave="True" />
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.HidePromptOnLeave = true;
```

This demo can be downloaded from this [link](#).

### Validation

#### Validation Mode

Input validation happens based on the value of the `ValidationMode` property. The enum values of this property are:

- KeyPress
- LostFocus

The default value for validation mode is `LostFocus`.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" ValidationMode="KeyPress" />
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
```

```
maskedEdit.ValidationMode = InputValidationMode.KeyPress;
```

When the ValidationMode is LostFocus, the validation takes place when the control lost its focus. For KeyPress, the validation triggers for each key press.

### HasError

This read only property is used to check whether the validation succeeds or not. It returns true once validation succeeds or else returns false. The following code example shows the usage of **HasError** property.

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.ValidationMode = InputValidationMode.LostFocus;
maskedEdit.ValueChanged += MaskedEdit_ValueChanged;
private void MaskedEdit_ValueChanged(object sender,
Syncfusion.XForms.MaskedEdit.ValueChangedEventArgs e)
{
    SfMaskedEdit maskedEdit = sender as SfMaskedEdit;
    if(maskedEdit.HasError)
    {
        DisplayAlert("Alert", "Please enter valid details", "OK");
    }
}
```

Refer this [link](#) to know more about the **ValueChanged** event of SfMaskedEdit control.

This demo can be downloaded from this [link](#).

## Events

The SfMaskedEdit exposes the following events:

- **ValueChanged**: Occurs when the value of **Value** property is changed.
- **MaskInputRejected**: Occurs when a character is rejected by the input mask.

### ValueChanged event

Occurs when the value of the **Value** property is changed by either entering the valid input character or setting the value to the **Value** property through XAML or C# code. The event arguments are of type **ValueChangedEventArgs** and expose the following property:

- **Value**: The read only property contains the updated value of the **Value** property of SfMaskedEdit.

---

Your valid input character is updated to **Value** property based on the **ValidationMode** property.

Refer to this [link](#) to know more about the **ValidationMode** property of SfMaskedEdit control.

---

## XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" Watermark="dd/MM/YYYY" ValidationMode="LostFocus"
ValueChanged="MaskedEdit_OnValueChanged" />
private void MaskedEdit_OnValueChanged(object sender,
Syncfusion.XForms.MaskedEdit.ValueChangedEventArgs e)
{
    string date= e.Value.ToString();
    if (!string.IsNullOrEmpty(date))
    {
        try
        {
            DateTime datetime =
            DateTime.ParseExact(date,CultureInfo.CurrentCulture.DateTimeFormat.ShortDate
            Pattern, CultureInfo.InvariantCulture);
        }
        catch (Exception exception)
        {
            DisplayAlert("Error", "Invalid Date format", "Ok");
        }
    }
}
```

## C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.Watermark = "dd/MM/YYYY";
maskedEdit.ValidationMode = InputValidationMode.LostFocus;
maskedEdit.ValueChanged += MaskedEdit_OnValueChanged;
private void MaskedEdit_OnValueChanged(object sender,
Syncfusion.XForms.MaskedEdit.ValueChangedEventArgs e)
{
    string date= e.Value.ToString();
    if (!string.IsNullOrEmpty(date))
    {
        try
        {
            DateTime datetime =
            DateTime.ParseExact(date,CultureInfo.CurrentCulture.DateTimeFormat.ShortDate
            Pattern, CultureInfo.InvariantCulture);
        }
        catch (Exception exception)
        {
            DisplayAlert("Error", "Invalid Date format", "Ok");
        }
    }
}
```

### [MaskInputRejected event](#)

Occurs when your input or assigned character does not match the corresponding format element of the input mask. The event arguments are type of `MaskInputRejectedEventArgs` and expose the following properties:

- **Position**: The position in the mask corresponding to the invalid input character.
- **RejectionHint**: The enumerated value that describes why the input character was rejected.

`MaskInputRejected` is raised in the following situations:

- An input character does not match the corresponding format element. For example, if you enter an alphabetic character when a digit is required. This is probably the most common reason why this event is raised.
- When you try to input extraneous characters beyond the end of the mask.
- A paste operation inserts a character that does not match with its associated format element.

### **XML**

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" Watermark="dd/MM/YYYY" ValidationMode="LostFocus"
MaskInputRejected="MaskedEdit_OnMaskInputRejected"/>
private void MaskedEdit_OnMaskInputRejected(object sender,
MaskInputRejectedEventArgs e)
{
if(e.RejectionHint!= MaskedTextResultHint.UnavailableEditPosition)
DisplayAlert("Error", "Please enter valid input", "Ok");
}
```

## C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.Watermark = "dd/MM/YYYY";
maskedEdit.ValidationMode = InputValidationMode.LostFocus;
maskedEdit.MaskInputRejected += MaskedEdit_OnMaskInputRejected;
private void MaskedEdit_OnMaskInputRejected(object sender,
MaskInputRejectedEventArgs e)
{
if(e.RejectionHint!= MaskedTextResultHint.UnavailableEditPosition)
DisplayAlert("Error", "Please enter valid input", "Ok");
}
```

This demo can be downloaded from this [link](#).

### Formatting Value

SfMaskedEdit allows you to format the characters in the `Value` property in a mask scenario (when the `Mask` property is set). By default, the `Value` property holds your input characters, prompt characters and the literals defined in the mask. You can modify this and allow the `Value` property to hold the characters without prompt and literals by setting the `ValueMaskFormat` property of the control. The `Value` in the `SfMaskedEdit` is formatted by any one of the following formatting enum values:

- `ExcludePromptAndLiterals`
- `IncludePrompt`
- `IncludeLiterals`
- `IncludePromptAndLiterals`

#### `ExcludePromptAndLiterals`

Value contains only the typed characters, the prompt characters and literals are excluded.

#### `IncludePrompt`

Value contains the typed characters and prompt characters, literals are excluded.

### IncludeLiterals

Value contains the typed characters and literals, prompt characters are excluded.

### IncludePromptAndLiterals

Value contains typed characters, prompt characters, and literals.

### XML

```

<syncmaskededit:SfMaskedEdit x:Name="maskedEdit1" MaskType="Text"
Mask="00/00/0000" ValueMaskFormat="ExcludePromptAndLiterals"/>
<Label BindingContext="{x:Reference maskedEdit1}" Text="{Binding Value}" />
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit2" MaskType="Text"
Mask="00/00/0000" ValueMaskFormat="IncludeLiterals"/>
<Label BindingContext="{x:Reference maskedEdit2}" Text="{Binding Value}" />
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit3" MaskType="Text"
Mask="00/00/0000" ValueMaskFormat="IncludePrompt"/>
<Label BindingContext="{x:Reference maskedEdit3}" Text="{Binding Value}" />
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit4" MaskType="Text"
Mask="00/00/0000" ValueMaskFormat="IncludePromptAndLiterals"/>
<Label BindingContext="{x:Reference maskedEdit4}" Text="{Binding Value}" />

```

### C#

```

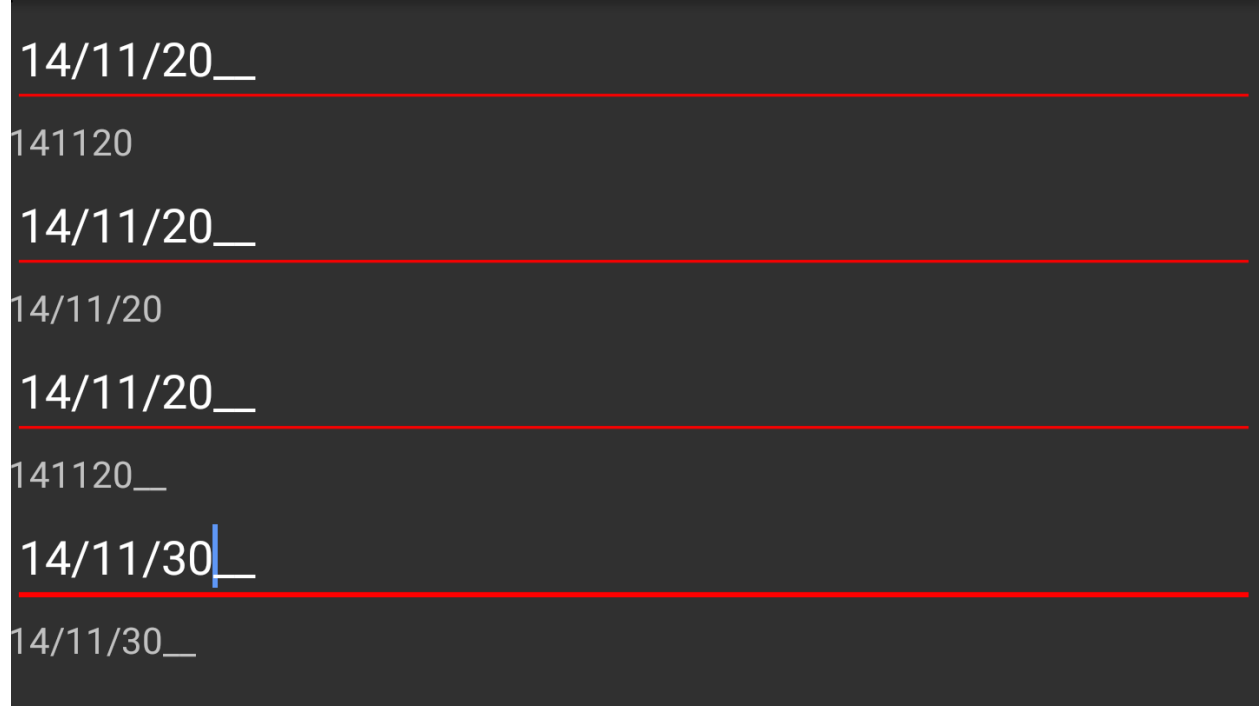

Label label1;
Label label2;
Label label3;
Label label4;
SfMaskedEdit maskedEdit1;
SfMaskedEdit maskedEdit2;
SfMaskedEdit maskedEdit3;
SfMaskedEdit maskedEdit4;
StackLayout stackLayout = new StackLayout();
maskedEdit1 = new SfMaskedEdit();
maskedEdit1.MaskType = MaskType.Text;
maskedEdit1.Mask = "00/00/0000";
maskedEdit1.ValueMaskFormat = MaskFormat.ExcludePromptAndLiterals;
maskedEdit1.ValueChanged += MaskedEdit1_ValueChanged;
label1 = new Label();
stackLayout.Children.Add(maskedEdit1);
stackLayout.Children.Add(label1);
maskedEdit2 = new SfMaskedEdit();
maskedEdit2.MaskType = MaskType.Text;
maskedEdit2.Mask = "00/00/0000";
maskedEdit2.ValueMaskFormat = MaskFormat.IncludeLiterals;
maskedEdit2.ValueChanged += MaskedEdit2_ValueChanged;
label2 = new Label();
stackLayout.Children.Add(maskedEdit2);
stackLayout.Children.Add(label2);
maskedEdit3 = new SfMaskedEdit();
maskedEdit3.MaskType = MaskType.Text;
maskedEdit3.Mask = "00/00/0000";
maskedEdit3.ValueMaskFormat = MaskFormat.IncludePrompt;
maskedEdit3.ValueChanged += MaskedEdit3_ValueChanged;
label3 = new Label();
stackLayout.Children.Add(maskedEdit3);
stackLayout.Children.Add(label3);

```

```
maskedEdit4 = new SfMaskedEdit();
maskedEdit4.MaskType = MaskType.Text;
maskedEdit4.Mask = "00/00/0000";
maskedEdit4.ValueMaskFormat = MaskFormat.IncludePromptAndLiterals;
maskedEdit4.ValueChanged += MaskedEdit4_ValueChanged;
label4 = new Label();
stackLayout.Children.Add(maskedEdit4);
stackLayout.Children.Add(label4);
private void MaskedEdit1_ValueChanged(object sender,
Syncfusion.XForms.MaskedEdit.ValueChangedEventArgs e)
{
    label1.Text = e.Value as string;
}
private void MaskedEdit2_ValueChanged(object sender,
Syncfusion.XForms.MaskedEdit.ValueChangedEventArgs e)
{
    label2.Text = e.Value as string;
}
private void MaskedEdit3_ValueChanged(object sender,
Syncfusion.XForms.MaskedEdit.ValueChangedEventArgs e)
{
    label3.Text = e.Value as string;
}
private void MaskedEdit4_ValueChanged(object sender,
Syncfusion.XForms.MaskedEdit.ValueChangedEventArgs e)
{
    label4.Text = e.Value as string;
}
```

Refer this [link](#) to know more about the `ValueChanged` event of SfMaskedEdit control.

## Formatting clipboard text

SfMaskedEdit allows you to format the clipboard text in a mask scenario (when the Mask property is set). When you perform the cut or copy operation, the clipboard text will be formatted with your input characters and the literals defined in the mask. You can modify this and allow the clipboard to hold the characters with or without prompt and literals by setting the `CutCopyMaskFormat` property of the control. The clipboard text is formatted by any one of the following formatting enum values:

- ExcludePromptAndLiterals
- IncludePrompt
- IncludeLiterals
- IncludePromptAndLiterals

### ExcludePromptAndLiterals

Clipboard text will contain only the typed characters, the prompt characters and literals are excluded.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" CutCopyMaskFormat ="ExcludePromptAndLiterals"/>
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.CutCopyMaskFormat = MaskFormat.ExcludePromptAndLiterals;
```

### IncludePrompt

Clipboard text contains the typed characters and prompt characters, literals are excluded.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" CutCopyMaskFormat ="IncludePrompt"/>
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.CutCopyMaskFormat = MaskFormat.IncludePrompt;
```

### IncludeLiterals

Clipboard text contains the typed characters and literals, prompt characters are excluded.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" CutCopyMaskFormat ="IncludeLiterals"/>
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.CutCopyMaskFormat = MaskFormat.IncludeLiterals;
```

### IncludePromptAndLiterals

Clipboard text contains typed characters, prompt characters, and literals.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" CutCopyMaskFormat="IncludePromptAndLiterals"/>
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.CutCopyMaskFormat = MaskFormat.IncludePromptAndLiterals;
```

### Visual Customization

The appearance of **SfMaskedEdit** can be customized using the following properties:

#### BorderColor

Sets the custom border color to SfMaskedEdit.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" BorderColor="Green"/>
```

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.BorderColor = Color.Green;
```

#### ErrorBorderColor

Sets the custom error border color to SfMaskedEdit. Error border color indicates the color to be used when the validation fails for your input with respect to the mask used.

Validation triggers based on **ValidationMode** property.

Refer this [link](#) to know more about the **ValidationMode** property of SfMaskedEdit control.

#### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" BorderColor="Green" ErrorBorderColor="Yellow"/>
```

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.ErrorBorderColor = Color.Yellow;
```

### Setting Appearance of Text

You can customize the display text appearance of SfMaskedEdit control using the following properties:

- **TextColor**: Changes the color of the text.
- **HorizontalTextAlignment**: Changes the horizontal alignment of the text.
- **FontFamily**: Changes the font family of the text.
- **FontAttributes**: Sets font attributes(bold/italic/none) of the text.
- **FontSize**: Sets font size of the text.

### XML

```
<syncmaskededit:SfMaskedEdit x:Name="maskedEdit" MaskType="Text"
Mask="00/00/0000" TextColor="Brown" HorizontalTextAlignment="Center"
FontFamily="Arial" FontAttributes="Bold" FontSize="20"/>
```

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.MaskType = MaskType.Text;
maskedEdit.Mask = "00/00/0000";
maskedEdit.TextColor = Color.Brown;
maskedEdit.HorizontalTextAlignment = TextAlignment.Center;
maskedEdit.FontFamily = "Arial";
maskedEdit.FontAttributes = FontAttributes.Bold;
maskedEdit.FontSize = 20;
```

This demo can be downloaded from this [link](#).

## Show password character

The SfMaskedEdit control supports to work as a password text box when setting a character to the PasswordChar property.

### XML

```
<syncfusion:SfMaskedEdit x:Name="maskedEdit" Mask="\w+" MaskType="Regex" PasswordChar="*" />
```

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();  
maskedEdit.Mask = @"\w+";  
maskedEdit.MaskType = MaskType.RegEx;  
maskedEdit.PasswordChar = '*';
```

### Password Character

## Password Delay

When providing password character, you can show the typed character with some delay using the EnablePasswordDelay property. When enabling the EnablePasswordDelay property, the typed character will be displayed for a few seconds before it is converted to the password character.

### XML

```
<syncfusion:SfMaskedEdit x:Name="maskedEdit" Mask="\w+" MaskType="Regex" PasswordChar="*" EnablePasswordDelay="True" />
```

### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();  
maskedEdit.Mask = @"\w+";  
maskedEdit.MaskType = MaskType.RegEx;  
maskedEdit.PasswordChar = '*';  
maskedEdit.EnablePasswordDelay = true;
```

## Password Character

---

**Note:** The default value of the EnablePasswordDelay property is false.

---

### Password Delay Duration

When “PasswordDelay” is enabled, you can handle the duration of the displaying typed character using the `PasswordDelayDuration` property.

#### XML

```
<syncfusion:SfMaskedEdit x:Name="maskedEdit" Mask="\w+" MaskType="Regex"
PasswordChar="*" EnablePasswordDelay="True" PasswordDelayDuration="2" />
```

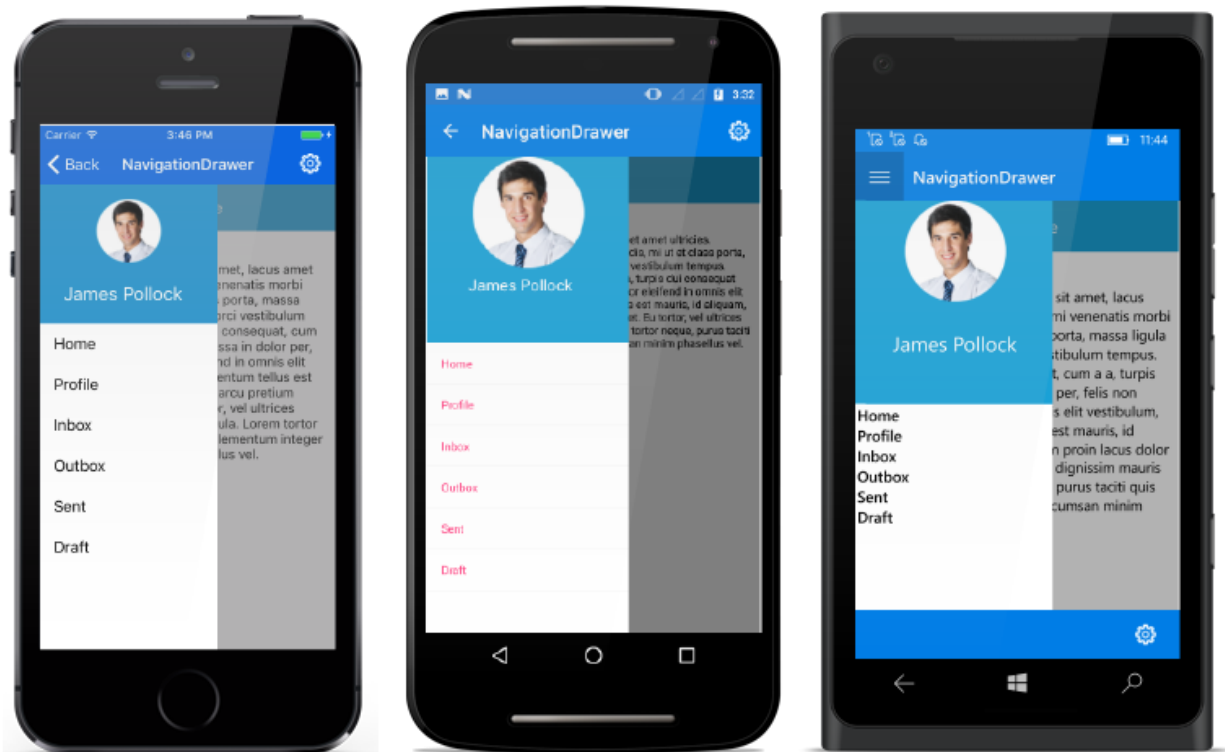

#### C#

```
SfMaskedEdit maskedEdit = new SfMaskedEdit();
maskedEdit.Mask = @"\w+";
maskedEdit.MaskType = MaskType.RegEx;
maskedEdit.PasswordChar = '*';
maskedEdit.EnablePasswordDelay = true;
maskedEdit.PasswordDelayDuration = 2;
```

## SfNavigationDrawer

### Overview

Essential NavigationDrawer for Xamarin.Forms is a simpler component to create navigation pane in application. It has a content area and a sliding pane that slides out from the edge of the page. The pane can be opened by swiping the edges of the screen or programmatically.

## Key Features

- Pane positions – Supports pane position in all four directions such as Left, Right, Top and Bottom.
- Animated transitions – Supports opening/closing of pane due to the transition SlideOnTop, Push and Reveal.
- Changeable swipe sensitivity – Flexible for the users to update touch threshold based on their device screen size.

## Getting Started

This section explains you the steps required to create a navigation DrawerPanel with content area and data filled drawer and it covers only the minimal features that you need to know to get started with the NavigationDrawer.

### Adding SfNavigationDrawer reference

You can add SfNavigationDrawer reference using one of the following methods:

#### Method 1: Adding SfNavigationDrawer reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfNavigationDrawer). To add SfNavigationDrawer to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfNavigationDrawer](https://www.nuget.org/packages/Syncfusion.Xamarin.SfNavigationDrawer), and then install it.

![[Adding SfNavigationDrawer reference from NuGet]](Images/Adding SfNavigationDrawer reference.png)

**Note:** Install the same version of SfNavigationDrawer NuGet in all the projects.

#### Method 2: Adding SfNavigationDrawer reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfNavigationDrawer control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfNavigationDrawer assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfNavigationDrawer.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfNavigationDrawer.Android.dll Syncfusion.SfNavigationDrawer.XForms.Android.dll Syncfusion.SfNavigationDrawer.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfNavigationDrawer.iOS.dll Syncfusion.SfNavigationDrawer.XForms.iOS.dll Syncfusion.SfNavigationDrawer.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfNavigationDrawer.UWP.dll Syncfusion.SfNavigationDrawer.XForms.UWP.dll Syncfusion.SfNavigationDrawer.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** After adding the reference, an additional step is required for iOS and UWP projects. If you are adding the references from toolbox, this step is not needed.

#### *Additional Step for iOS*

Currently an additional step is required for iOS project. We need to create an instance of the NavigationDrawer custom renderer as shown below.

Create an instance of SfNavigationDrawerRenderer in FinishedLaunching overridden method of AppDelegate class in iOS project as shown below:

**C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    new Syncfusion.SfNavigationDrawer.XForms.iOS.SfNavigationDrawerRenderer();
    global::Xamarin.Forms.Forms.Init(); LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

*Additional Step for UWP*

This step is required only if application is deployed in Release mode with .NET native tool chain enabled and it is for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the SfNavigationDrawer assembly at OnLaunched overridden method of App class in UWP project is the suggested workaround. And the code example is shown below:

**C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    #if DEBUG
    if (System.Diagnostics.Debugger.IsAttached)
    {
        this.DebugSettings.EnableFrameRateCounter = true;
    }
    #endif
    Frame rootFrame = Window.Current.Content as Frame;
    if (rootFrame == null)
    {
        rootFrame = new Frame();
        rootFrame.NavigationFailed += OnNavigationFailed;
        List<System.Reflection.Assembly> assembliesToInclude = new
        List<System.Reflection.Assembly>();
        // Add all the renderer assemblies your app uses
        assembliesToInclude.Add(typeof(Syncfusion.SfNavigationDrawer.XForms.UWP.SfNa
        vigationDrawerRenderer).GetTypeInfo().Assembly);
        // Replace the Xamarin.Forms.Forms.Init(e);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
        if (e.PreviousExecutionState == ApplicationExecutionState.Terminated)
        {
            //TODO: Load state from previously suspended application
        }
        // Place the frame in the current Window
        Window.Current.Content = rootFrame;
    }
    if (rootFrame.Content == null)
    {
        // When the navigation stack isn't restored navigate to the first page,
        // configuring the new page by passing required information as a navigation
        // parameter rootFrame.Navigate(typeof(MainPage), e.Arguments);
    }
    // Ensure the current window is active
    Window.Current.Activate();
}
```

## Initialize SfNavigationDrawer

Import the SfNavigationDrawer namespace in respective Page as shown below:

### XML

```
<xmlns:navigationdrawer="clr-  
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi  
gationDrawer.XForms"/>
```

### C#

```
using Syncfusion.SfNavigationDrawer.XForms;
```

Then initialize an empty navigation drawer as shown below,

### XML

```
<?xml version="1.0" encoding="utf-8"?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:local="clr-namespace:NaviSample"  
xmlns:navigationdrawer="clr-  
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi  
gationDrawer.XForms"  
x:Class="NaviSample.MainPage">  
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer">  
<navigationdrawer:SfNavigationDrawer.ContentView>  
<Grid/>  
</navigationdrawer:SfNavigationDrawer.ContentView>  
</navigationdrawer:SfNavigationDrawer>  
</ContentPage>
```

### C#

```
using Syncfusion.SfNavigationDrawer.XForms;  
using Xamarin.Forms;  
namespace NaviSample  
{  
    public partial class MainPage : ContentPage  
    {  
        public MainPage()  
        {  
            InitializeComponent();  
            SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();  
            Grid grid = new Grid();  
            navigationDrawer.ContentView = grid;  
            this.Content = navigationDrawer;  
        }  
    }  
}
```

**Note:** It is mandatory to set ContentView for SfNavigationDrawer on initializing.

## Adjust Drawer Size

The default position of navigation pane is left so let us change the drawer width to 200.

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
DrawerWidth="200">
<navigationdrawer:SfNavigationDrawer.ContentView>
<Grid/>
</navigationdrawer:SfNavigationDrawer.ContentView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

### C#

```
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfNavigationDrawer navigationDrawer = new SfNavigationDrawer()
            {
                DrawerWidth = 200
            };
            Grid grid = new Grid();
            navigationDrawer.ContentView = grid;
            this.Content = navigationDrawer;
        }
    }
}
```

**Note:** For changing the side of navigation pane use Position property. Use DrawerHeight property to change the drawer height in Top and Bottom positions.

### Add Hamburger Menu for Toggling Drawer

Create a button and set required image to the Image property of Button. Subscribe Clicked event of the button and invoke ToggleDrawer() method in it to toggle the drawer. Set this button as ContentView property of SfNavigationDrawer. Align the layout of ContentView properly to get the hamburger icon at top left as shown in following code:

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
```

```

xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
DrawerWidth ="200">
<navigationdrawer:SfNavigationDrawer.ContentView>
<Grid x:Name="mainContentView"
BackgroundColor="White">
<Grid.RowDefinitions>
<RowDefinition Height="auto"/>
<RowDefinition/>
</Grid.RowDefinitions>
<StackLayout BackgroundColor="#1aa1d6"
Orientation="Horizontal">
<Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1aa1d6"
Clicked="hamburgerButton_Clicked"/>
<Label x:Name="headerLabel"
HeightRequest="50"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center"
Text="Home" FontSize="16"
TextColor="White"
BackgroundColor="#1aa1d6"/>
</StackLayout>
<Label Grid.Row="1"
x:Name="contentLabel"
VerticalOptions="Center"
HorizontalOptions="Center"
Text="Content View"
FontSize="14"
TextColor="Black"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.ContentView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>

```

**C#**

```

using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage ()
        {
            InitializeComponent();
            hamburgerButton.Image =
            (FileImageSource) ImageSource.FromFile("hamburger_icon.png");

```

```

}
void hamburgerButton_Clicked(object sender, EventArgs e)
{
    navigationDrawer.ToggleDrawer();
}
}
}

```

**Note:** Add the required images in drawable folder of Android project, Assets folder of iOS project and add it directly to the UWP project.

### Set ListView as Drawer Content

Create a ListView with five items and set it as DrawerContentView.

### XML

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
DrawerWidth ="200"
DrawerHeaderHeight="160">
<navigationdrawer:SfNavigationDrawer.ContentView>
<Grid x:Name="mainContentView"
BackgroundColor="White">

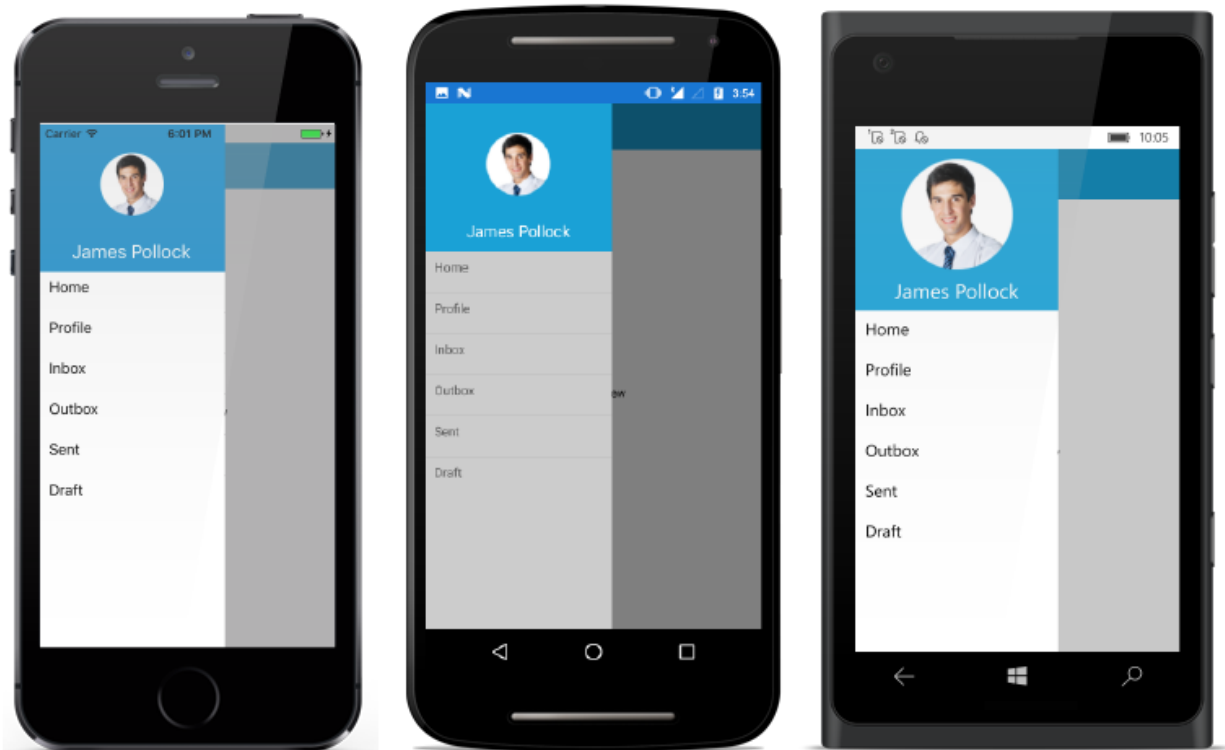

```

```
<Grid.RowDefinitions>
<RowDefinition Height="auto"/>
</Grid.RowDefinitions>
<StackLayout BackgroundColor="#1aa1d6"
Orientation="Horizontal">
<Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1aa1d6"
Clicked="hamburgerButton_Clicked"/>
<Label x:Name="headerLabel"
HeightRequest="50"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center"
Text="Home"
FontSize="16"
TextColor="White"
BackgroundColor="#1aa1d6"/>
</StackLayout>
<Label Grid.Row="1"
x:Name="contentLabel"
VerticalOptions="Center"
HorizontalOptions="Center"
Text="Content View"
FontSize="14"
TextColor="Black"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1aa1d6">
<Grid.RowDefinitions>
<RowDefinition Height="120"/>
<RowDefinition Height="40"/>
</Grid.RowDefinitions>
<Image Source="user.png"
HeightRequest="110"
Margin="0,10,0,0"
BackgroundColor="#1aa1d6"
VerticalOptions="Center"
HorizontalOptions="Center"/>
<Label Text="James Pollock"
Grid.Row="1"
HorizontalTextAlignment="Center"
HorizontalOptions="Center"
FontSize="20"
TextColor="White"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<navigationdrawer:SfNavigationDrawer.DrawerContentView>
<ListView x:Name="listView"
ItemSelected="listView_ItemSelected">
<ListView.ItemTemplate>
<DataTemplate>
<ViewCell>
```

```
<StackLayout HeightRequest="40">
<Label Margin="10,7,0,0"
Text="{Binding}"
FontSize="16"/>
</StackLayout>
</ViewCell>
</DataTemplate>
</ListView.ItemTemplate>
</ListView>
</navigationdrawer:SfNavigationDrawer.DrawerContentView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using System.Collections.Generic;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
hamburgerButton.Image =
(FileImageSource) ImageSource.FromFile("hamburger_icon.png");
List<string> list = new List<string>();
list.Add("Home");
list.Add("Profile");
list.Add("Inbox");
list.Add("Out box");
list.Add("Sent");
list.Add("Draft");
listView.ItemsSource = list;
}
void hamburgerButton_Clicked(object sender, EventArgs e)
{
navigationDrawer.ToggleDrawer();
}
private void listView_ItemSelected(object sender,
SelectedItemChangedEventArgs e)
{
// Your codes here
navigationDrawer.ToggleDrawer();
}
}
}
```

We have created knowledge base document by creating SfNavigationDrawer sample fully in code behind. Please refer the same in this [link](#).

You can find the Getting Started Sample from this [link](#).

## Main Content

Main content of NavigationDrawer is always visible and it can be set using **ContentView** property. In the following code example, ContentView is switched when selection changes in ListView.

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
DrawerHeaderHeight="160">
<navigationdrawer:SfNavigationDrawer.ContentView>
<Grid x:Name="mainContentView" BackgroundColor="White">
<Grid.RowDefinitions>
<RowDefinition Height="auto"/>
<RowDefinition/>
</Grid.RowDefinitions>
<StackLayout BackgroundColor="#1a1d6" Orientation="Horizontal">
<Button x:Name="hamburgerButton" HeightRequest="50" WidthRequest="50"
HorizontalOptions="Start" FontSize="20" BackgroundColor="#1a1d6"
Clicked="hamburgerButton_Clicked"/>
```

```

<Label x:Name="headerLabel" HeightRequest="50"
HorizontalTextAlignment="Center" VerticalTextAlignment="Center" Text="Home"
FontSize="16" TextColor="White" BackgroundColor="#1a1d6"/>
</StackLayout>
<Label Grid.Row="1" x:Name="contentLabel" VerticalOptions="Center"
HorizontalOptions="Center" Text="Content View" FontSize="14"
TextColor="Black"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1a1d6">
<Grid.RowDefinitions>
<RowDefinition Height="120"/>
<RowDefinition Height="40"/>
</Grid.RowDefinitions>
<Image Source="user.png" HeightRequest="110" Margin="0,10,0,0"
BackgroundColor="#1a1d6" VerticalOptions="Center"
HorizontalOptions="Center"/>
<Label Text="James Pollock" Grid.Row="1" HorizontalTextAlignment="Center"
HorizontalOptions="Center" FontSize="20" TextColor="White"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<navigationdrawer:SfNavigationDrawer.DrawerContentView>
<ListView x:Name="listView" ItemSelected="listView_ItemSelected">
<ListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<StackLayout HeightRequest="40">
<Label Margin="10,7,0,0" Text="{Binding}" FontSize="16"/>
</StackLayout>
</ViewCell>
</DataTemplate>
</ListView.ItemTemplate>
</ListView>
</navigationdrawer:SfNavigationDrawer.DrawerContentView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>

```

**C#**

```

using System;
using System.Collections.Generic;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
public partial class MainPage : ContentPage
{
SfNavigationDrawer navigationDrawer = new SfNavigationDrawer() {
DrawerHeaderHeight = 160 };
Label label1;
public MainPage()
{
InitializeComponent();
Grid grid = new Grid();
grid.BackgroundColor = Color.White;

```

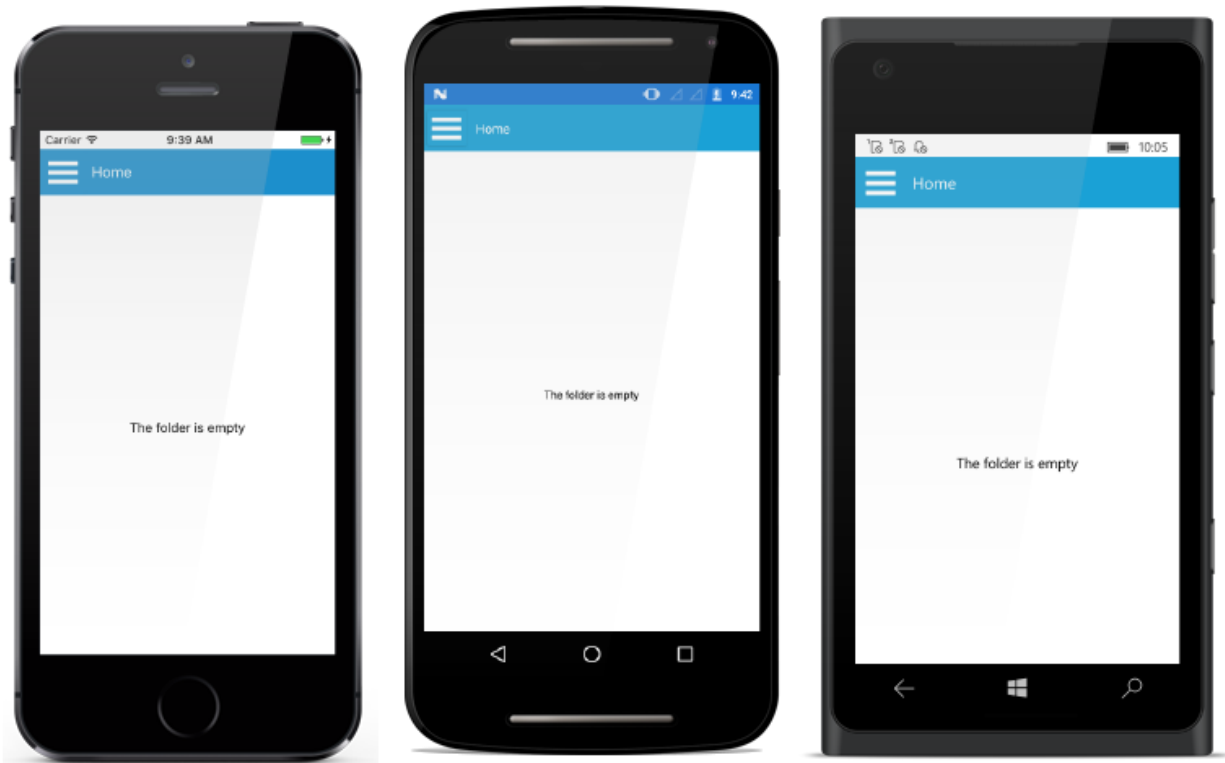

```
RowDefinition rowDef1 = new RowDefinition() { Height = GridLength.Auto };
RowDefinition rowDef2 = new RowDefinition() { Height = GridLength.Star };
grid.RowDefinitions.Add(rowDef1);
grid.RowDefinitions.Add(rowDef2);
StackLayout layout = new StackLayout() { BackgroundColor =
Color.FromHex("#1aa1d6"), Orientation = StackOrientation.Horizontal };
var hamburgerButton = new Button
{
    Text = "StackLayout",
    HeightRequest = 50,
    WidthRequest = 50,
    HorizontalOptions = LayoutOptions.Start,
    FontSize = 20,
    BackgroundColor = Color.FromHex("#1aa1d6")
};
hamburgerButton.Clicked += hamburgerButton_Clicked;
var label = new Label
{
    HeightRequest = 50,
    HorizontalTextAlignment = TextAlignment.Center,
    VerticalTextAlignment = TextAlignment.Center,
    Text = "Home",
    FontSize = 16,
    TextColor = Color.White,
    BackgroundColor = Color.FromHex("#1aa1d6")
};
layout.Children.Add(hamburgerButton);
layout.Children.Add(label);
labell = new Label
{
    HorizontalOptions = LayoutOptions.Center,
    VerticalOptions = LayoutOptions.Center,
    Text = "Content View",
    FontSize = 14,
    TextColor = Color.Black
};
grid.Children.Add(layout, 0, 0);
grid.Children.Add(labell, 0, 1);
navigationDrawer.ContentView = grid;
Grid grid1 = new Grid();
grid1.BackgroundColor = Color.FromHex("#1aa1d6");
RowDefinition rowDef3 = new RowDefinition() { Height = 120 };
RowDefinition rowDef4 = new RowDefinition() { Height = 40 };
grid1.RowDefinitions.Add(rowDef3);
grid1.RowDefinitions.Add(rowDef4);
var image = new Image
{
    Source = (FileImageSource)ImageSource.FromFile("user.png"),
    HeightRequest = 110,
    Margin = new Thickness(0, 10, 0, 0),
    BackgroundColor = Color.FromHex("#1aa1d6"),
    HorizontalOptions = LayoutOptions.Center,
    VerticalOptions = LayoutOptions.Center
};
var label2 = new Label
{
    Text = "James Pollock",
```

```
HorizontalTextAlignment = TextAlignment.Center,
HorizontalOptions = LayoutOptions.Center,
FontSize = 20,
TextColor = Color.White
};
grid1.Children.Add(image, 0, 0);
grid1.Children.Add(label2, 0, 1);
navigationDrawer.DrawerHeaderView = grid1;
ListView listView = new ListView();
listView.ItemSelected += listView_ItemSelected;
StackLayout layout1 = new StackLayout() { HeightRequest = 40 };
var label3 = new Label
{
    Margin = new Thickness(10, 7, 0, 0),
    TextColor = Color.Black,
    FontSize = 16,
};
label3.SetBinding(Label.TextProperty, "Text");
navigationDrawer.DrawerContentView = listView;
this.Content = navigationDrawer;
navigationDrawer.DrawerWidth = 200;
hamburgerButton.Image =
    (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
List<string> list = new List<string>();
list.Add("Home");
list.Add("Profile");
list.Add("Inbox");
list.Add("Out box");
list.Add("Sent");
list.Add("Draft");
listView.ItemsSource = list;
}
void hamburgerButton_Clicked(object sender, EventArgs e)
{
    navigationDrawer.ToggleDrawer();
}
private void listView_ItemSelected(object sender,
    SelectedItemChangedEventArgs e)
{
    if (e.SelectedItem.ToString() == "Home")
        label1.Text = "Home";
    else if (e.SelectedItem.ToString() == "Profile")
        label1.Text = "Profile";
    else if (e.SelectedItem.ToString() == "Inbox")
        label1.Text = "Inbox";
    else if (e.SelectedItem.ToString() == "Out box")
        label1.Text = "Out box";
    else if (e.SelectedItem.ToString() == "Sent")
        label1.Text = "Sent";
    else if (e.SelectedItem.ToString() == "Draft")
        label1.Text = "The folder is empty";
    navigationDrawer.ToggleDrawer();
}
}
```

---

**Note:** It is mandatory to set ContentView for SfNavigationDrawer on initializing.

---

## Multi Drawer

The navigation drawer allows users to open the drawer on multiple sides with different toggle methods. The DrawerSettings class and its properties need to be used when users need to provide multiple drawer. The multiple drawers can be implemented using the following drawer settings.

- Default drawer settings
- Secondary drawer settings

---

**Note:** The header and footer content are optional, but the drawer content is mandatory to allocate space for the drawer.

---

## Default drawer settings

Implement the default drawer using the default drawer settings class. The following code sample demonstrates how to set the default drawer settings's properties inside the DrawerSettings class.

## XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
  <navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings >
  <navigationdrawer:DrawerSettings
```

```

DrawerWidth="150"
DrawerHeight="150"
Transition ="SlideOnTop"
DrawerHeaderHeight="150"
DrawerFooterHeight="150"
ContentBackgroundColor ="Red"
Position="Left">
</navigationdrawer:DrawerSettings>
</navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings>
</ContentPage>

```

**C#**

```

using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
            DrawerSettings defaultDrawerSettings = new DrawerSettings();
            defaultDrawerSettings.DrawerHeight = 150;
            defaultDrawerSettings.Position = Position.Left;
            defaultDrawerSettings.Transition = Transition.SlideOnTop;
            defaultDrawerSettings.ContentBackgroundColor = Color.Red;
            defaultDrawerSettings.DrawerWidth = 150;
            navigationDrawer.DrawerHeaderHeight = 150;
            navigationDrawer.DrawerFooterHeight = 150;
            navigationDrawer.DefaultDrawerSettings = defaultDrawerSettings;
            this.Content = navigationDrawer;
        }
    }
}

```

**Note:** The navigation drawer works with the value given for the properties inside the DrawerSettings class when using the default drawer settings.

*Default drawer header view*

The header content can be provided to the default drawer using the `DrawerHeaderView` property inside the DrawerSettings class of DefaultDrawerSettings. The following code demonstrates how to set header content for the default drawer.

**XML**

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"

```

```

x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings>
<Grid BackgroundColor="#1aa1d6">
<Grid.RowDefinitions>
<RowDefinition Height="120"/>
</Grid.RowDefinitions>
<navigationdrawer:DrawerSettings.DrawerHeaderView>
<Label Text="Syncfusion Xamarin Products" HorizontalTextAlignment="Center"
HorizontalOptions="Center" FontSize="20" TextColor="White"/>
</navigationdrawer:DrawerSettings.DrawerHeaderView>
</Grid>
</navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings>
</ContentPage>

```

### C#

```

using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
DrawerSettings defaultDrawerSettings = new DrawerSettings();
Grid headerLayout = new Grid();
headerLayout.BackgroundColor = Color.FromHex("#1aa1d6");
Label header = new Label();
header.Text = "Syncfusion Xamarin Products";
header.FontSize = 20;
header.TextColor = Color.White;
header.HorizontalTextAlignment = TextAlignment.Center;
headerLayout.Children.Add(header);
defaultDrawerSettings.DrawerHeaderView = headerLayout;
this.Content = navigationDrawer;
}
}
}

```

#### Default drawer content view

The drawer content can be provided to the default drawer using the `DrawerContentView` property inside the `DrawerSettings` class. The following code demonstrates how to set drawer content to the default drawer.

### XML

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"

```

```

xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings>
<navigationdrawer:DrawerSettings>
<navigationdrawer:DrawerSettings.DrawerContentView>
<Label Text="DrawerContent "
HorizontalTextAlignment="Center"
HorizontalOptions="Center"
FontSize="20"
TextColor="White"/>
</navigationdrawer:DrawerSettings.DrawerContentView>
</navigationdrawer:DrawerSettings>
</navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings>
</ContentPage>

```

## C#

```

using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
DrawerSettings defaultDrawerSettings = new DrawerSettings();
Grid contentLayout = new Grid();
contentLayout.BackgroundColor = Color.FromHex("#1aa1d6");
Label content = new Label();
content.Text = "DrawerContent";
content.FontSize = 20;
content.TextColor = Color.White;
content.HorizontalTextAlignment = TextAlignment.Center;
contentLayout.Children.Add(content);
defaultDrawerSettings.DrawerContentView = contentLayout;
this.Content = navigationDrawer;
}
}
}

```

### Default drawer footer view

The footer content can be provided to the default drawer using the **DrawerFooterView** property inside the **DrawerSettings** class of **DefaultDrawerSettings**. The following code demonstrates how to set footer content to the default drawer.

## XML

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

```

```

xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings>
<navigationdrawer:DrawerSettings.DrawerFooterView>
<Grid BackgroundColor="#1aa1d6">
<Grid.RowDefinitions>
<RowDefinition Height="120"/>
</Grid.RowDefinitions>
<Label Text="Close"
Grid.Row="0"
HorizontalTextAlignment="Center"
HorizontalOptions="Center"
FontSize="20"
TextColor="White"/>
</Grid>
</navigationdrawer:DrawerSettings.DrawerFooterView>
</navigationdrawer:SfNavigationDrawer.DefaultDrawerSettings>
</ContentPage>

```

## C#

```

using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
            DrawerSettings defaultDrawerSettings = new DrawerSettings();
            Grid footerLayout = new Grid();
            footerLayout.BackgroundColor = Color.FromHex("#1aa1d6");
            Label footer = new Label();
            footer.Text = "Close";
            footer.FontSize = 20;
            footer.TextColor = Color.White;
            footer.HorizontalTextAlignment = TextAlignment.Center;
            footerLayout.Children.Add(footer);
            defaultDrawerSettings.DrawerFooterView = footerLayout;
            this.Content = navigationDrawer;
        }
    }
}

```

### Secondary drawer settings

Implement the secondary drawer using the secondary drawer settings class. Its properties and functionalities are same as the default drawer. The secondary drawer can be set to different positions

similar to the default drawer. The following code demonstrates how to set the secondary drawer settings's properties inside the DrawerSettings class.

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings >
<navigationdrawer:DrawerSettings x:Name="secondaryDrawer"
DrawerHeaderHeight="40"
DrawerFooterHeight="40"
ContentBackgroundColor="Blue"
DrawerHeight="300"
DrawerWidth="150"
Duration="400"
Position="Right"
Transition="SlideOnTop">
</navigationdrawer:DrawerSettings>
</navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings>
</ContentPage>
```

### C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
            DrawerSettings secondaryDrawer = new DrawerSettings();
            secondaryDrawer.DrawerHeight = 300;
            secondaryDrawer.Position = Position.Right;
            secondaryDrawer.Transition = Transition.SlideOnTop;
            secondaryDrawer.ContentBackgroundColor = Color.Blue;
            secondaryDrawer.DrawerWidth = 150;
            secondaryDrawer.DrawerHeaderHeight = 40;
            secondaryDrawer.DrawerFooterHeight = 40;
            navigationDrawer.SecondaryDrawerSettings = secondaryDrawer;
            this.Content = navigationDrawer;
        }
    }
}
```

**Note:** When the default drawer and the secondary drawer are set to the same position, the default drawer will open on swiping.

#### Secondary drawer header view

The header content can be provided to the secondary drawer using the `DrawerHeaderView` property inside the `DrawerSettings` class of `SecondaryDrawerSettings`. The following code demonstrates how to set the header content to the secondary drawer.

#### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  xmlns:local="clr-namespace:NaviSample"
  xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
  x:Class="NaviSample.MainPage">
  <navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings>
  <navigationdrawer:DrawerSettings.DrawerHeaderView>
  <Grid BackgroundColor="#1aald6">
  <Grid.RowDefinitions>
  <RowDefinition Height="120"/>
  </Grid.RowDefinitions>
  <Label Text="Syncfusion Enterprise solution"
  Grid.Row="0"
  HorizontalTextAlignment="Center"
  HorizontalOptions="Center"
  FontSize="20"
  TextColor="White"/>
  </Grid>
  </navigationdrawer:DrawerSettings.DrawerHeaderView>
  </navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings>
</ContentPage>
```

#### C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
  public partial class MainPage : ContentPage
  {
    public MainPage()
    {
      InitializeComponent();
      SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
      DrawerSettings secondaryDrawer = new DrawerSettings();
      Grid secondary = new Grid();
      secondary.BackgroundColor = Color.FromHex("#1aald6");
      Label header = new Label();
      header.Text = "Syncfusion Enterprise solution";
      header.FontSize = 20;
      header.TextColor = Color.White;
      header.HorizontalTextAlignment = TextAlignment.Center;
```

```

secondary.Children.Add(header);
secondaryDrawer.DrawerHeaderView = secondary;
this.Content = navigationDrawer;
}
}
}

```

### Secondary drawer content view

The drawer content can be provided to the default drawer using the `DrawerContentView` property inside the `DrawerSettings` class of `SecondaryDrawerSettings`. The following code demonstrates how to set the drawer content to the secondary drawer.

### XML

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings>
<navigationdrawer:DrawerSettings>
<navigationdrawer:DrawerSettings.DrawerContentView>
<Label Text="DrawerContent "
HorizontalTextAlignment="Center"
HorizontalOptions="Center"
FontSize="20"
TextColor="White"/>
</navigationdrawer:DrawerSettings.DrawerContentView>
</navigationdrawer:DrawerSettings>
</navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings>
</ContentPage>

```

### C#

```

using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
DrawerSettings secondaryDrawer = new DrawerSettings();
Grid Layout = new Grid();
Layout.BackgroundColor = Color.FromHex("#1aa1d6");
Label content = new Label();
content.Text = "DrawerContent";
content.FontSize = 20;
content.TextColor = Color.White;
}
}
}

```

```

content.HorizontalTextAlignment = TextAlignment.Center;
Layout.Children.Add(content);
secondaryDrawer.DrawerContentView = Layout;
this.Content = navigationDrawer;
}
}
}

```

### Secondary drawer footer view

The footer content can be provided to the secondary drawer using the **DrawerFooterView** property inside the **DrawerSettings** class of **SecondaryDrawerSettings**. The following code demonstrates how to set footer content to the secondary drawer.

### XML

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings>
<navigationdrawer:DrawerSettings.DrawerFooterView>
<Grid BackgroundColor="#1aald6">
<Grid.RowDefinitions>
<RowDefinition Height="120"/>
</Grid.RowDefinitions>
<Label Text="Close"
Grid.Row="0"
HorizontalTextAlignment="Center"
HorizontalOptions="Center"
FontSize="20"
TextColor="White"/>
</Grid>
</navigationdrawer:DrawerSettings.DrawerFooterView>
</navigationdrawer:SfNavigationDrawer.SecondaryDrawerSettings>
</ContentPage>

```

### C#

```

using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfNavigationDrawer navigationDrawer = new SfNavigationDrawer();
            DrawerSettings secondaryDrawer = new DrawerSettings();
            Grid Layout = new Grid();

```

```

Layout.BackgroundColor = Color.FromHex("#1aa1d6");
Label footer = new Label();
footer.Text = "Close";
footer.FontSize = 20;
footer.TextColor = Color.White;
footer.HorizontalTextAlignment = TextAlignment.Center;
Layout.Children.Add(footer);
secondaryDrawer.DrawerFooterView = Layout;
this.Content = navigationDrawer;
}
}
}

```

### Toggle method

Users can toggle the secondary drawer using the `ToggleSecondaryDrawer` method.

### C#

```
navigationDrawer.ToggleSecondaryDrawer();
```

### Opening the drawer programmatically

The `IsOpen` property in the `DrawerSettings` of `SecondaryDrawerSettings` is used to open or close the drawer programmatically.

---

**Note:** Users can open only one drawer at a time.

---

Note: The sample for implementing multiple drawers can be downloaded from this [link](#).

### Navigation Pane Sides

The supplemental pane can be drawn in and out from all four sides. `Position` property is used to change the side of pane and the values are

*Left Right Top Bottom*

---

**Note:** The default position is Left.

---

### Left

The navigation pane draws in and out from Left side. It can be set as shown below:

### XML

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

            listView.ItemsSource = list;
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
        private void listView_ItemSelected(object sender,
        SelectedItemChangedEventArgs e)
        {
            //    Your codes here
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

## Side Pane Content

The drawer pane content is viewable only if drawer is in open state. Its content can be set as

*Header Content* *Drawer Content* \* *Footer Content*

**Note:** Header and Footer content are optional but Drawer content is mandatory to allocate space for the drawer.

## Header Content

As the name suggests it is displayed at the top of drawer. `DrawerHeaderView` property is used to set the header content of drawer.

## XML

            hamburgerButton.Image =
                (ImageSource)ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

### Header Height

Height of the drawer header content can be adjusted using `DrawerHeaderHeight` property.

---

**Note:** DrawerHeaderView will be disabled by setting DrawerHeaderHeight to zero

---

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
DrawerHeaderHeight="50">
<navigationdrawer:SfNavigationDrawer.ContentView>
<StackLayout>
<Grid BackgroundColor="#1aa1d6"
HeightRequest="50"
VerticalOptions="Start">
<Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1aa1d6"
Clicked="hamburgerButton_Clicked"/>
</Grid>
</StackLayout>
```

```
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1aald6" >
<StackLayout VerticalOptions="Center"
HorizontalOptions="Center">
<Label Text="Header View"/>
</StackLayout>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            navigationDrawer.DrawerHeaderHeight = 50;
            hamburgerButton.Image =
                (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

### Footer Content

As the name suggests it is displayed at the bottom of drawer. `DrawerFooterView` property is used to set the footer content of drawer.

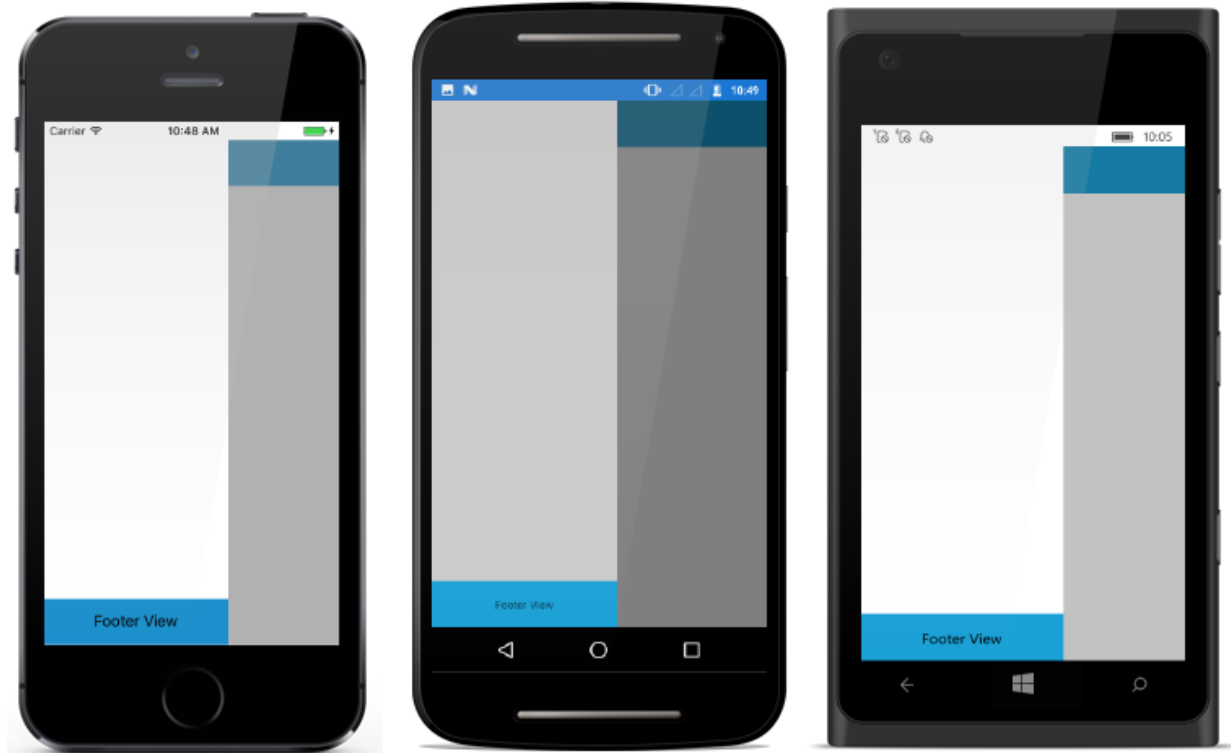

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
  <navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer">
    <navigationdrawer:SfNavigationDrawer.ContentView>
      <StackLayout>
        <Grid BackgroundColor="#1aa1d6"
HeightRequest="50"
VerticalOptions="Start">
          <Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1aa1d6"
Clicked="hamburgerButton_Clicked"/>
        </Grid>
      </StackLayout>
    </navigationdrawer:SfNavigationDrawer.ContentView>
  </navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

```
<navigationdrawer:SfNavigationDrawer.DrawerFooterView>
<Grid BackgroundColor="#1aald6" >
<StackLayout VerticalOptions="Center"
HorizontalOptions="Center">
<Label Text="Footer View"/>
</StackLayout>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerFooterView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            navigationDrawer.DrawerFooterHeight = 50;
            hamburgerButton.Image =
                (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

### Footer Height

Height of the drawer footer content can be adjusted using `DrawerFooterHeight` property.

**Note:** `DrawerFooterView` will be disabled by setting `DrawerFooterHeight` to zero

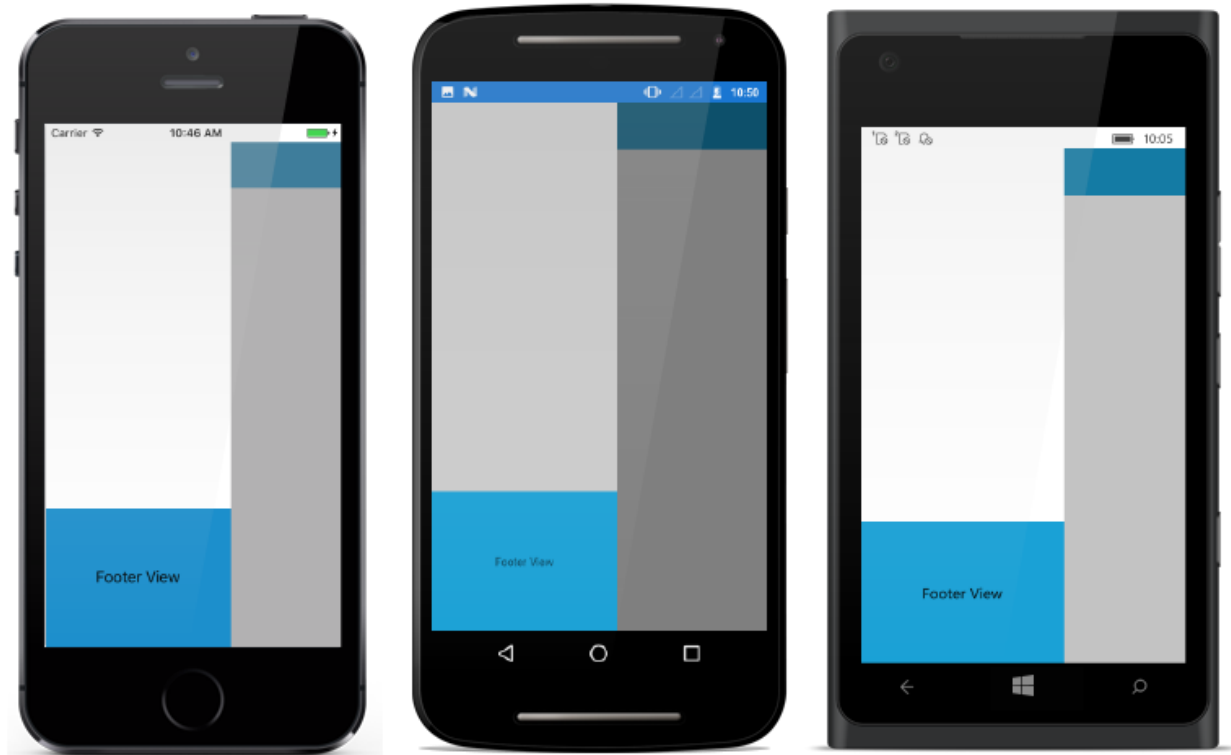

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
DrawerFooterHeight="50">
<navigationdrawer:SfNavigationDrawer.ContentView>
<StackLayout>
<Grid BackgroundColor="#1aa1d6"
HeightRequest="50"
VerticalOptions="Start">
<Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1aa1d6"
Clicked="hamburgerButton_Clicked"/>
</Grid>
</StackLayout>
```

```
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerFooterView>
<Grid BackgroundColor="#1aald6" >
<StackLayout VerticalOptions="Center"
HorizontalOptions="Center">

</StackLayout>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerFooterView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            navigationDrawer.DrawerFooterHeight = 50;
            hamburgerButton.Image =
                (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

### Main Content

Drawer main content is displayed in between header and footer content. It can be set using `DrawerContentView` property. Content view occupies the remaining space left by header and footer content.

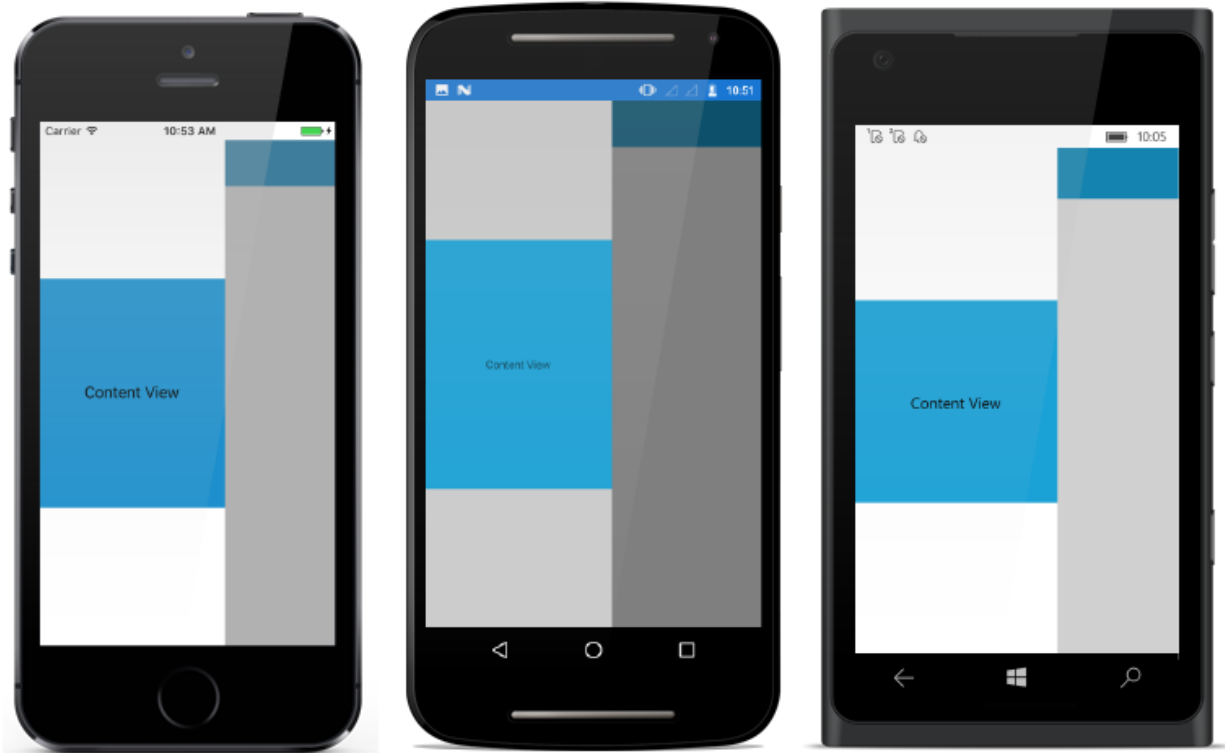

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  xmlns:local="clr-namespace:NaviSample"
  xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
  x:Class="NaviSample.MainPage">
  <navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer">
    <navigationdrawer:SfNavigationDrawer.ContentView>
      <StackLayout>
        <Grid BackgroundColor="#1aa1d6"
          HeightRequest="50"
          VerticalOptions="Start">
          <Button x:Name="hamburgerButton"
            HeightRequest="50"
            WidthRequest="50"
            HorizontalOptions="Start"
            FontSize="20"
            BackgroundColor="#1aa1d6"
            Clicked="hamburgerButton_Clicked"/>
        </Grid>
      </StackLayout>
    </navigationdrawer:SfNavigationDrawer.ContentView>
  </navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

```
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerContentView>
<Grid BackgroundColor="#1aald6">
<Label Text="Content View"
VerticalOptions="Center"
HorizontalOptions="Center"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerContentView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            hamburgerButton.Image =
                (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

## Side Pane Sizing

The size of side pane can be adjusted using `DrawerHeight` and `DrawerWidth` properties.

### Drawer Height

`DrawerHeight` property is used to change the height of side pane when the Position is Top or Bottom.

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationView.XForms;assembly=Syncfusion.SfNavi
gationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationView x:Name="navigationDrawer"
DrawerHeight="40"
Position="Top">
<navigationdrawer:SfNavigationView.DrawerHeaderView>
<Label Text="This is a very short content used to demonstrate the
DrawerHeight property "/>
</navigationdrawer:SfNavigationView.DrawerHeaderView>
</navigationdrawer:SfNavigationView>
</ContentPage>
```

### C#

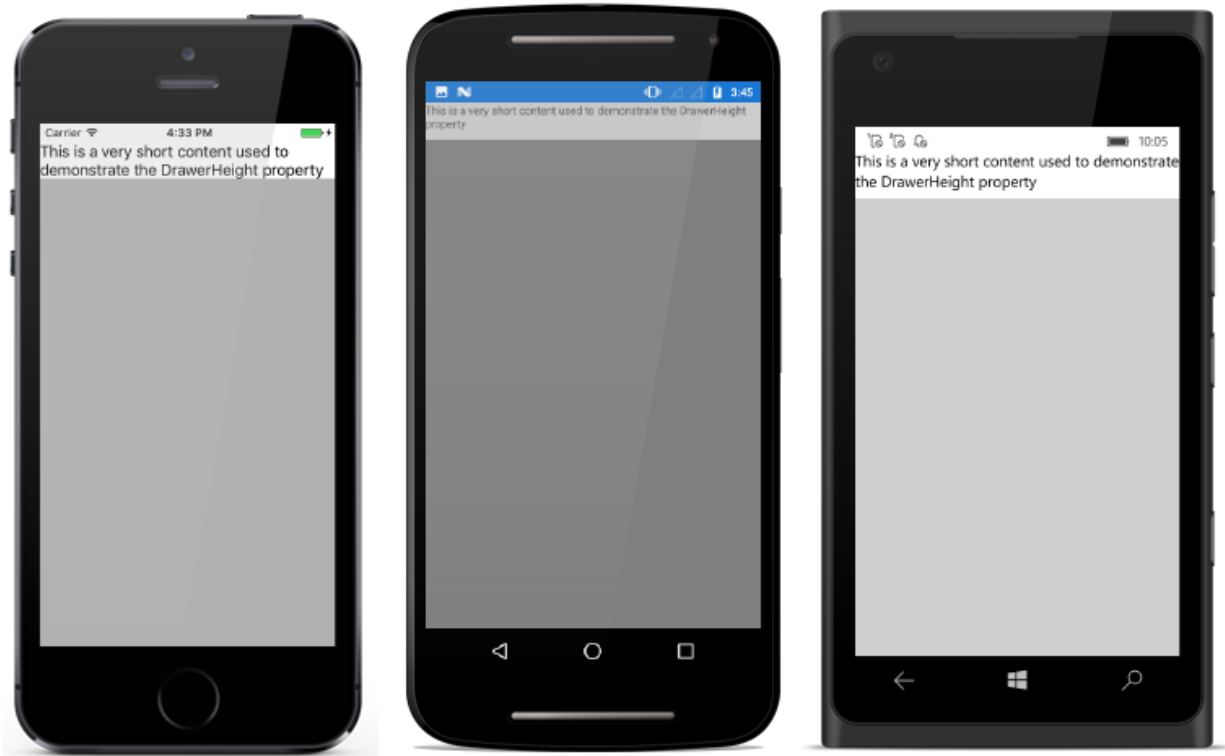

```
Syncfusion.SfNavigationView.XForms.SfNavigationView navigationDrawer =
new Syncfusion.SfNavigationView.XForms.SfNavigationView();
```

```

navigationDrawer.Position = Position.Top;
navigationDrawer.DrawerHeight = 40;
navigationDrawer.DrawerHeaderView = new Label()
{
    Text = "This is a very short content used to demonstrate the DrawerHeight property"
};
Content = navigationDrawer;

```

### Drawer Width

**DrawerWidth** property is used to change the width of side pane when the Position is Left or Right.

### XML

```

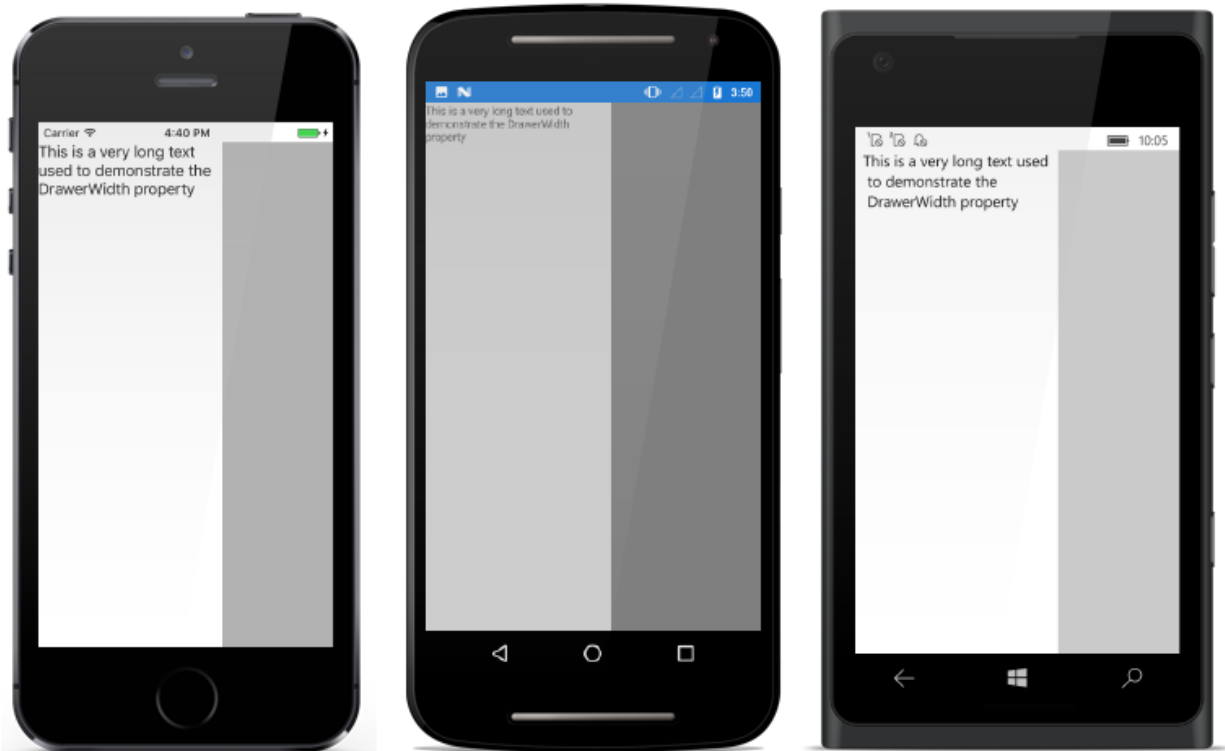

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
    xmlns:local="clr-namespace:NaviSample"
    xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
    x:Class="NaviSample.MainPage">
    <navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
        DrawerWidth="200"
        Position="Left">
        <navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
        <Label Text="This is a very short content used to demonstrate the
        DrawerHeight property" />
        </navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
    </navigationdrawer:SfNavigationDrawer>

```

```
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfNavigationDrawer navigationDrawer = new SfNavigationDrawer()
            {
                Position = Position.Left,
                DrawerWidth = 200,
                DrawerHeaderView = new Label()
                {
                    Text = "This is a very short content used to demonstrate the DrawerHeight property"
                }
            };
            Content = navigationDrawer;
        }
    }
}
```

## Swipe Gesture and Sensitivity

NavigationDrawer supports swipe gesture for opening and closing the drawer.

### Enabling Swipe Gesture

It can be enabled/disabled using `EnableSwipeGesture` property.

#### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigat
ionDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
EnableSwipeGesture="True">
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1aald6"
VerticalOptions="Center"
HorizontalOptions="Center">
<Label Text="Header view"
FontSize="16"
VerticalOptions="Center"
HorizontalOptions="Center"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

#### C#

```
navigationDrawer.EnableSwipeGesture = true;
```

### Swipe Sensitivity

In smaller screens user may find it difficult to swipe the drawer from the edge in such cases we can increase the swipe region using `TouchThreshold` property. It can be set as below:

#### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigat
ionDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
EnableSwipeGesture="True"
TouchThreshold="70">
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1aald6"
VerticalOptions="Center"
```

```

HorizontalOptions="Center">
<Label Text="Header view"
FontSize="16"
VerticalOptions="Center"
HorizontalOptions="Center"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>

```

**C#**

```
navigationDrawer.TouchThreshold = 70;
```

**Toggle Animations**

The drawer toggling animation can be changed using Transition property and it can be set to three different values. They are

- SlideOnTop
- Push
- Reveal

---

**Note:** The default animation is SlideOnTop.

---

**SlideOnTop**

The navigation pane overlays the main content area when opened. It can be set as shown below:

**XML**

```

<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
Transition="SlideOnTop"
DrawerHeaderHeight="50">
<navigationdrawer:SfNavigationDrawer.ContentView>
<StackLayout>
<Grid HeightRequest="50"
VerticalOptions="Start"
BackgroundColor="#1aa1d6">
<Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1aa1d6"
Clicked="hamburgerButton_Clicked"/>
</Grid>
</StackLayout>

```

```
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1aald6"
VerticalOptions="Center"
HorizontalOptions="Center">
<Label Text="Header view"
FontSize="16"
VerticalOptions="Center"
HorizontalOptions="Center"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            navigationDrawer.DrawerHeight = 200;
            navigationDrawer.Transition =
            Syncfusion.SfNavigationDrawer.XForms.Transition.SlideOnTop;
            hamburgerButton.Image =
            (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

### Push

The navigation pane is hidden. It pushes the main content area in opposite side up to drawer width when opened. It can be set as shown below:

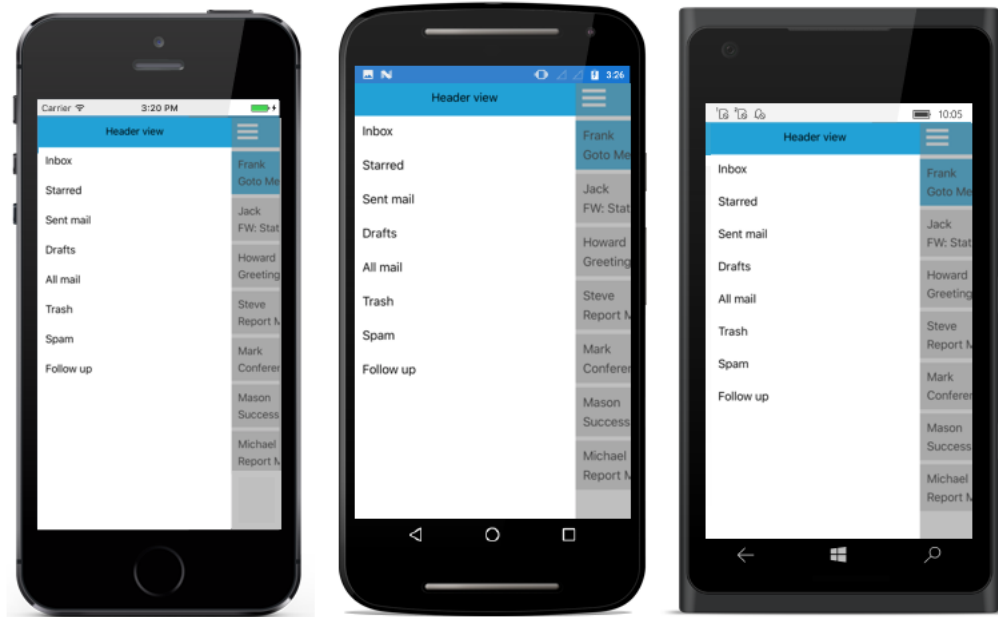

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
Transition="Push"
DrawerHeaderHeight="50">
<navigationdrawer:SfNavigationDrawer.ContentView>
<StackLayout>
<Grid HeightRequest="50"
VerticalOptions="Start"
BackgroundColor="#1a1d6">
<Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1a1d6"
Clicked="hamburgerButton_Clicked"/>
</Grid>
</StackLayout>
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1a1d6"
VerticalOptions="Center"
```

```
HorizontalOptions="Center">
<Label Text="Header view"
FontSize="16"
VerticalOptions="Center"
HorizontalOptions="Center"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            navigationDrawer.DrawerHeight = 200;
            navigationDrawer.Transition =
            Syncfusion.SfNavigationDrawer.XForms.Transition.Push;
            hamburgerButton.Image =
            (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

### Reveal

The navigation pane is hidden behind the main content. Main content moves away in opposite side up to drawer width to show the drawer content. It can be set as shown below:

### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-
namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigat
ionDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
Transition="Reveal"
DrawerHeaderHeight="50">
<navigationdrawer:SfNavigationDrawer.ContentView>
<StackLayout>
<Grid HeightRequest="50"
VerticalOptions="Start"
BackgroundColor="#1a1d6">
<Button x:Name="hamburgerButton"
HeightRequest="50"
WidthRequest="50"
HorizontalOptions="Start"
FontSize="20"
BackgroundColor="#1a1d6"
Clicked="hamburgerButton_Clicked"/>
</Grid>
</StackLayout>
</navigationdrawer:SfNavigationDrawer.ContentView>
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1a1d6"
VerticalOptions="Center"
```

```
HorizontalOptions="Center">
<Label Text="Header view"
FontSize="16"
VerticalOptions="Center"
HorizontalOptions="Center"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
using System;
using Syncfusion.SfNavigationDrawer.XForms;
using Xamarin.Forms;
namespace NaviSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            navigationDrawer.DrawerHeight = 200;
            navigationDrawer.Transition =
            Syncfusion.SfNavigationDrawer.XForms.Transition.Reveal;
            hamburgerButton.Image =
            (FileImageSource) ImageSource.FromFile("hamburger_icon.png");
        }
        void hamburgerButton_Clicked(object sender, EventArgs e)
        {
            navigationDrawer.ToggleDrawer();
        }
    }
}
```

## Toggling Drawer

Drawer can be toggled using

*IsOpen* property ToggleDrawer method \* Swipe gesture

## Opening Drawer Programmatically

**IsOpen** property and ToggleDrawer method can be used to open or close the drawer programmatically.

## XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:NaviSample"
xmlns:navigationdrawer="clr-namespace:Syncfusion.SfNavigationDrawer.XForms;assembly=Syncfusion.SfNavigationDrawer.XForms"
x:Class="NaviSample.MainPage">
<navigationdrawer:SfNavigationDrawer x:Name="navigationDrawer"
IsOpen="True">
<navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
<Grid BackgroundColor="#1aald6"
VerticalOptions="Center"
HorizontalOptions="Center">
<Label Text="Header view"
FontSize="16"
VerticalOptions="Center"
HorizontalOptions="Center"/>
</Grid>
</navigationdrawer:SfNavigationDrawer.DrawerHeaderView>
</navigationdrawer:SfNavigationDrawer>
</ContentPage>
```

## C#

```
navigationDrawer.IsOpen = true;
```

Using **ToggleDrawer** method,

### C#

```
navigationDrawer.ToggleDrawer();
```

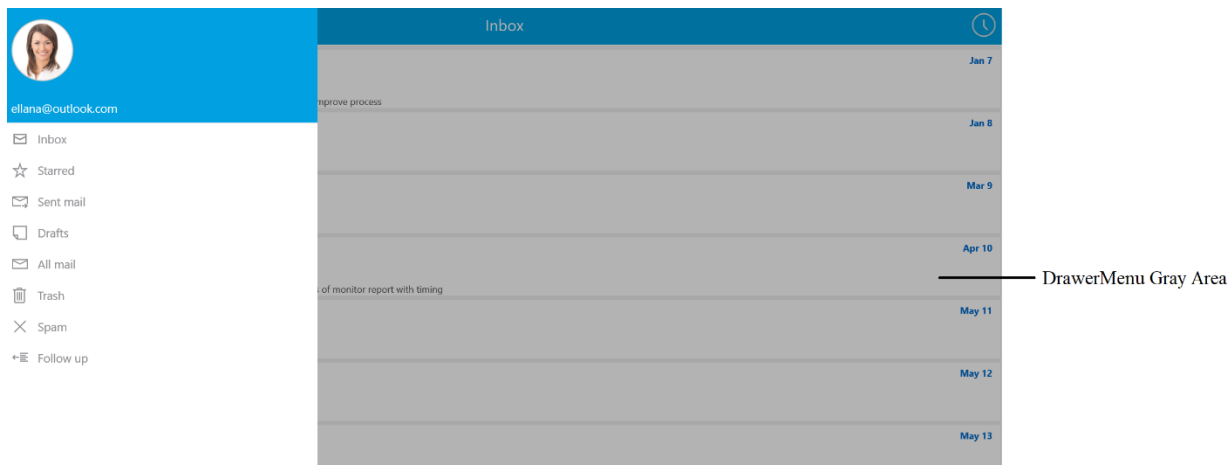

Toggling drawer through swipe gesture is explained in **Swipe Gesture and Sensitivity** section.

### AutomationId

The SfNavigationDrawer control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the **NavigationDrawer** control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's **AutomationId**.

For example, if you set SfNavigationDrawer's **AutomationId** as "DrawerMenu", then the automation framework will interact with the gray area as "DrawerMenu Gray Area".

The following screenshot illustrates the AutomationIds of inner elements. You can also interact with the elements inside the ContentView with the element's AutomationId.

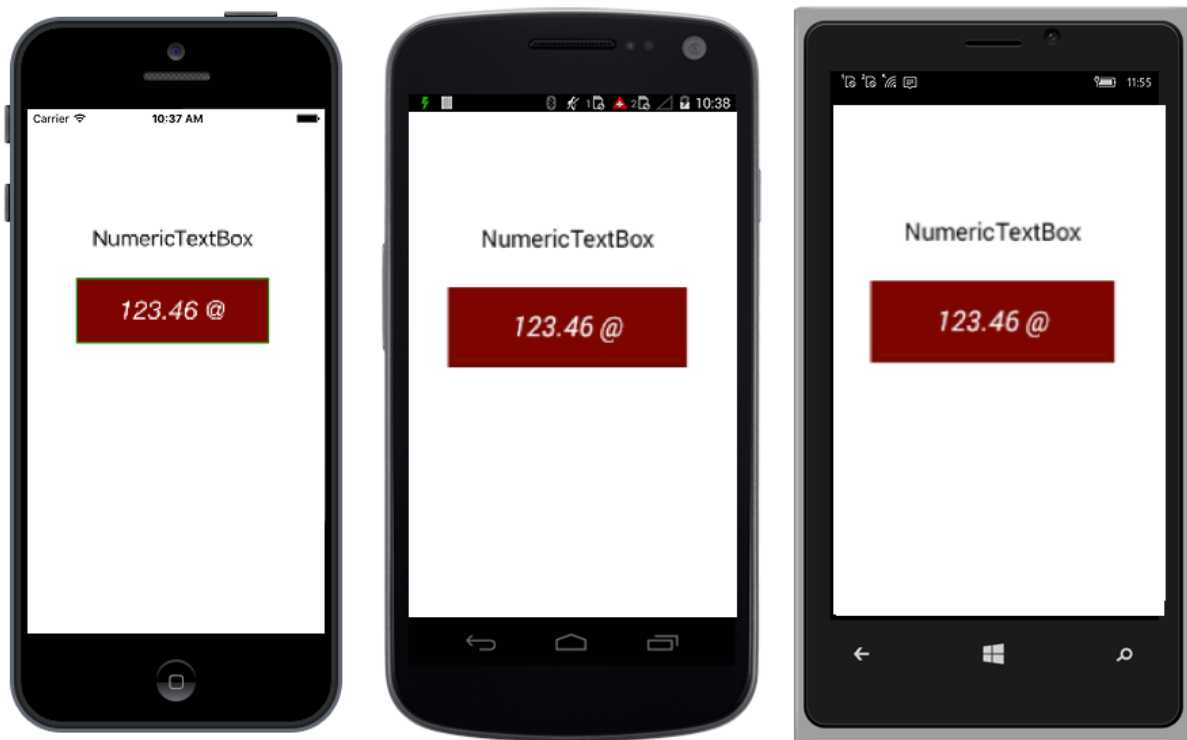

## SfNumericTextBox

### Overview

The Essential Xamarin.Forms NumericTextBox is an advanced version of the Entry control that restricts input to numeric values.

Also provides, a gesture friendly UI culture and can be configured to display different formats like currency format, scientific format etc.

## Key Features

- **FormatString** - Input string can be formatted by using the format strings.
- **Culture** - Number format can be localized to any specific culture.
- **AllowNull** - Allows the user to set null value.
- **ParserMode** - Value gets parsed based on parser mode.

## Getting Started

This section explains you the steps to configure a SfNumericTextBox control in a real-time scenario and also provides a walk-through on some of the customization features available in SfNumericTextBox control.

### Adding SfNumericTextBox reference

You can add SfNumericTextBox reference using one of the following methods:

#### Method 1: Adding SfNumericTextBox reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfNumericTextBox). To add SfNumericTextBox to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfNumericTextBox](https://www.nuget.org/packages/Syncfusion.Xamarin.SfNumericTextBox), and then install it.

![Adding SfNumericTextBox reference from NuGet](images/Adding SfNumericTextBox reference.png)

---

**Note:** Install the same version of SfNumericTextBox NuGet in all the projects.

---

#### Method 2: Adding SfNumericTextBox reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfNumericTextBox control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfNumericTextBox assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfNumericTextBox.Android.dll Syncfusion.SfNumericTextBox.XForms.Android.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfNumericTextBox.iOS.dll Syncfusion.SfNumericTextBox.XForms.iOS.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfNumericTextBox.XForms.UWP.dll Syncfusion.SfNumericTextBox.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the SfNumericTextBox on each platform

To use SfNumericTextBox inside an application, each platform application must initialize the SfNumericTextBox renderer. This initialization step varies from platform to platform and is discussed in the following sections.

**Note:** If you are adding the references from toolbox, below steps are not needed.

### *Android and UWP*

The Android and UWP launches the SfNumericTextBox without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application

### *iOS*

To launch SfNumericTextBox in iOS, need to create an instance of SfNumericTextBoxRenderer in FinishedLaunching overridden method of AppDelegate class in iOS Project as shown below.

### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    new SfNumericTextBoxRenderer();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

### *ReleaseMode issue in UWP platform*

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in Release Mode.

The above problem can be resolved by initializing the SfNumericTextBox assemblies in Main.xaml.cs in UWP project as like in below code snippet.

### **C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfNumericTextBoxRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a Simple SfNumericTextBox

The SfNumericTextBox control is configured entirely in C# code or by using XAML markup. The following steps explain on how to create a SfNumericTextBox and configure its elements,

- Adding namespace for the added assemblies.

### **XML**

```
xmlns:syncfusion="clr-namespace:Syncfusion.SfNumericTextBox.XForms;assembly=Syncfusion.SfNumericTextBox.XForms"
```

## C#

```
using Syncfusion.SfNumericTextBox.XForms;
```

- Now add the SfNumericTextBox control with a required optimal name by using the included namespace.

## XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" xmlns:local="clr-
namespace:GettingStarted"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfNumericTextBox.XForms;assembly=Syncfusion.SfNumericTe
xtBox.XForms"
x:Class="GettingStarted.NumericControlPage">
<ContentPage.Content>
<syncfusion:SfNumericTextBox x:Name="numericTextBox" />
</ContentPage.Content>
</ContentPage>
```

## C#

```
using Syncfusion.SfNumericTextBox.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class NumericControlPage : ContentPage
    {
        public NumericControlPage()
        {
            InitializeComponent();
            SfNumericTextBox numericTextBox = new SfNumericTextBox();
            this.Content = numericTextBox;
        }
    }
}
```

## Display Customization

### *Setting and Reading Value*

**Value** property is used to set and read the value presented by the SfNumericTextBox.

## XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="123.45" />
```

## C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.Value = 123.45;
this.Content = numericTextBox;
```

## Parsing the Value

Value of the SfNumericTextBox gets parsed based on **ParserMode** property. ParsingMode is of type Parsers which is enum of Double and Decimal. Hence we have option to display the value in double or decimal.

Following code shows the Decimal parsing mode which can be set through **ParserMode** property.

### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="123.45"
ParserMode="Decimal" />
```

### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.ParserMode=Parsers.Decimal;
numericTextBox.Value = 123.45;
this.Content = numericTextBox;
```

**Note:** The default Value for **ParserMode** is Double.

## Colors

SfNumericTextBox can be set to use a custom background, text and border colors via the following bindable properties:

- **TextColor** - sets the color of the NumericTextBox's value.
- **BackgroundColor** - sets the background color of NumericTextBox's frame.
- **BorderColor** - sets the border custom color of NumericTextBox
- **WatermarkColor** - sets the watermark custom color of NumericTextBox's watermark Text.

### TextColor

To set the TextColor color in XAML as well as in C#:

### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="123"
TextColor="Green" />
```

**C#**

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.TextColor = Color.Green;  
numericTextBox.Value = 123;  
this.Content = numericTextBox;
```

*BackgroundColor*

To set the BackgroundColor color in XAML as well as in C#:

**XML**

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="123"  
BackgroundColor="Maroon" TextColor="White"/>
```

**C#**

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.BackgroundColor = Color.Maroon;  
numericTextBox.TextColor = Color.White;  
numericTextBox.Value = 123;  
this.Content = numericTextBox;
```

*BorderColor*

To set the BorderColor color in XAML as well as in C#:

**XML**

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="123"  
BorderColor="Red" />
```

**C#**

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.BorderColor = Color.Red;  
numericTextBox.Value = 123;  
this.Content = numericTextBox;
```

### WatermarkColor

To set the WatermarkColor color in XAML as well as in C#:

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" AllowNull="true"
WatermarkColor="Blue" Watermark="Enter a Number"/>
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.AllowNull=true;
numericTextBox.WatermarkColor = Color.Blue;
numericTextBox.Watermark = "Enter a Number"
this.Content = numericTextBox;
```

### Number Formatting

The Values of the SfNumericTextBox can be configured to display different formats like currency format, percent format etc.

#### Format String

The **FormatString** property determines the format specifier by which the display text has to be formatted.

---

**Note:** The control displays the formatted text on lost focus. Default Value of **FormatString** is "n".

---

#### Display Currency Notation

c - Displays the value with currency notation.

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="1000"
FormatString="c" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.FormatString="c";  
numericTextBox.Value=1000;  
this.content=numericTextBox;
```

#### *Display Number Notation*

**n** – Displays the value in number format.

#### **XML**

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="1000"  
FormatString="n" />
```

#### **C#**

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.FormatString="n";  
numericTextBox.Value=1000;  
this.content=numericTextBox;
```

#### *Display Percentage Notation*

**p** – Displays the value in percentage.

#### **XML**

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="1000"  
FormatString="p" />
```

#### **C#**

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.FormatString="p";  
numericTextBox.Value=1000;  
this.content=numericTextBox;
```

**Note:** Instead of using above `FormatString` types, we can provide any symbol or value as string in `FormatString` property which will be appended with the value in `SfNumericTextBox`.

By passing any string , we can get the same as appended with the value of `NumericTextBox`

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="1000"
FormatString="years" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.FormatString="years";
numericTextBox.Value=23;
this.content=numericTextBox;
```

#### Compute to Percentage

When the `NumericTextBox` is in percentage format, the value can be displayed in two ways as follows

- **Value:** Displays the actual value with percentage symbol.

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" FormatString="p"
Value="1000" PercentDisplayMode="Value" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.PercentDisplayMode=PercentDisplayMode.Value;
numericTextBox.FormatString="p";
numericTextBox.Value=1000;
this.content=numericTextBox;
```

- **Compute**: Displays the computed value with percentage symbol.

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" FormatString="p"
Value="1000" PercentDisplayMode="Compute" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.PercentDisplayMode=PercentDisplayMode.Compute;
numericTextBox.FormatString="p";
numericTextBox.Value=1000;
this.Content=numericTextBox;
```

#### Set EnableGroupSeparator

**EnableGroupSeparator** property is used to get rid of the comma in the Value of SfNumericTextBox.

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.Value=12345;
numericTextBox.EnableGroupSeparator = true;
this.Content = numericTextBox;
```

#### Font Settings

NumericTextBox has the following two font-related properties that display the value's text:

We can customize the font style of NumericTextBox by using the following properties.

- **FontSize** : Sets the font size for NumericTextBox's text.

- **FontAttributes** : Sets the style of NumericTextBox's text. We can give three types of style on it. It is specifying style information like Italic and Bold (using the FontAttributes enumeration in C#)
  1. Bold- The font is bold
  2. Italic – The font is Italic
  3. None – The font is unmodified.

---

**Note:** Default value is None.

---

- **FontFamily** : Customizes the font family of the NumericTextBox's text.
- **TextAlignment** : Sets the style of NumericTextBox's text. We can give three types of style on it. It is specifying style information like Start, End and Center (using the TextAlignment enumeration in C#)

---

**Note:** Default value is Start.

---

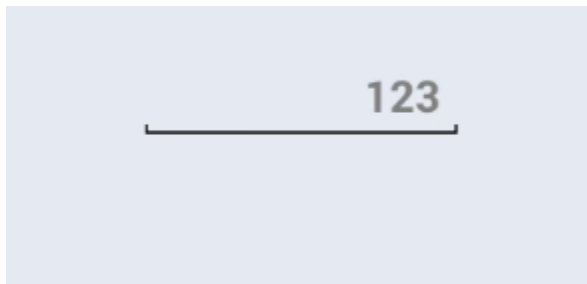

To set the font size and attributes in XAML as well as in C#:

#### XAML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" FontSize="27"
FontAttributes="Bold" Value="123" TextAlignment="End" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.FontSize = 27;
numericTextBox.Value = 123;
numericTextBox.TextAlignment=TextAlignment.End;
numericTextBox.FontAttributes = FontAttributes.Bold;
this.Content = numericTextBox;
```

#### Localization

The SfNumericTextBox value can be localized to any specific culture. It can be specified by setting the **Culture** property with **System.Globalization.CultureInfo** object instance.

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.Value=123.45;
numericTextBox.Culture = new System.Globalization.CultureInfo("fr-FR");
this.Content = numericTextBox;
```

Currency Format – French Culture

### Change Localization of Return key text

The SfNumericTextBox provides the Localization support for the Return Key in soft keypad of iOS. We have provided the knowledge base document for the same. Please refer the Knowledge Base document from this [link](#).

### Set Maximum Number of Decimal Digits

The maximum number of digits to be displayed after the decimal point can be specified by using `MaximumNumberDecimalDigits` property.

**Note:** The `MaximumNumberDecimalDigits` property can be provided with positive value only.

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Value="123.456"
MaximumNumberDecimalDigits="2" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.Value = 123.456;
numericTextBox.MaximumNumberDecimalDigits=2;
this.Content = numericTextBox;
```

123.45

### Assign Nullable Value

The null values can be set in SfNumericTextBox `Value` property, by setting `AllowNull` property value to true.

**Note:** By default, the property value is false.

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" AllowNull="true" />
```

#### C#

```
SfNumericTextBox numericTextBox = new SfNumericTextBox();
numericTextBox.AllowNull=true;
this.Content = numericTextBox;
```

### Set Hint Text

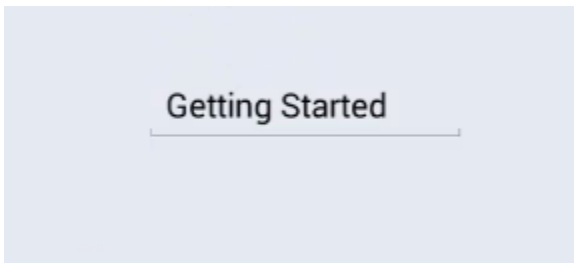

The **WaterMark** property can be used to provide a hint that helps the user to get started with their input. The watermark text is visible when value is empty or null.

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" AllowNull = "true"
Watermark="Getting Started" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.Watermark = "Getting Started";
numericTextBox.AllowNull = true;
this.Content=numericTextBox;
```

For customizing the color of NumericTextBox's Watermark [refer](#)

## Events and Interactivity

### Events

#### ValueChanged

We can perform operation while the changing the value of NumericTextBox's Value using ValueChanged event. ValueChanged event returns the changed value in NumericTextBox.

Members	Description
Value	Displays changed value in NumericTextBox

#### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox"
ValueChanged="Handle_ValueChanged" Value="123" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
numericTextBox.Value = 123;
numericTextBox.ValueChanged += Handle_ValueChanged;
this.Content=numericTextBox;
void Handle_ValueChanged(object sender,
Syncfusion.SfNumericTextBox.XForms.ValueEventArgs e)
```

```
{  
    System.Diagnostics.Debug.WriteLine(e.Value.ToString());  
}
```

### Interactivity : ValueChangeMode

The ValueChangeMode property is used to mention when the validation need to take place, either in key pressed or in focus lost. When ValueChangeMode is set to OnKeyFocus, the validation will be carried out for each key press. When ValueChangeMode is OnLostFocus, the validation occur when the control lost the focus or the focus move to next control. ValueChangeMode includes the following options:

1. OnKeyFocus
2. OnLostFocus

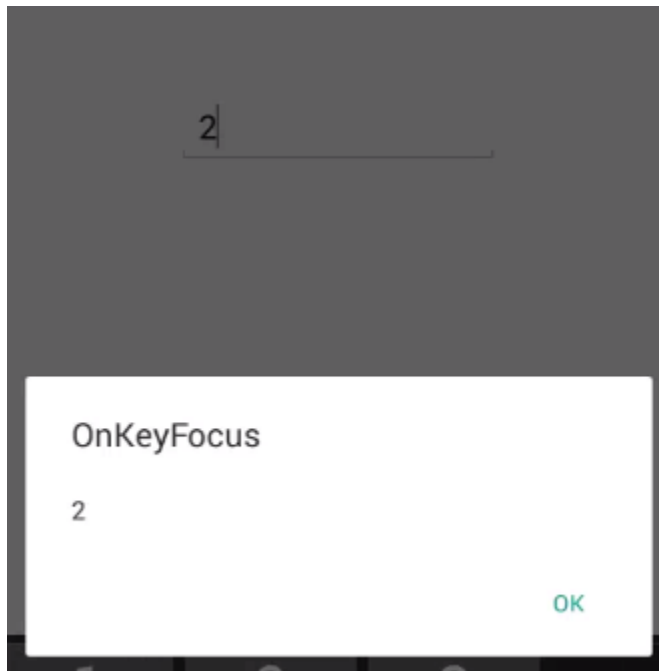

### OnKeyFocus

#### XML

```
<syncfusion:SfNumericTextBox ValueChangeMode="OnKeyFocus"  
x:Name="numericTextBox" Value="123" />
```

#### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.Value = 123;  
numericTextBox.ValueChangeMode = ValueChangeMode.OnKeyFocus;  
this.Content=numericTextBox;
```

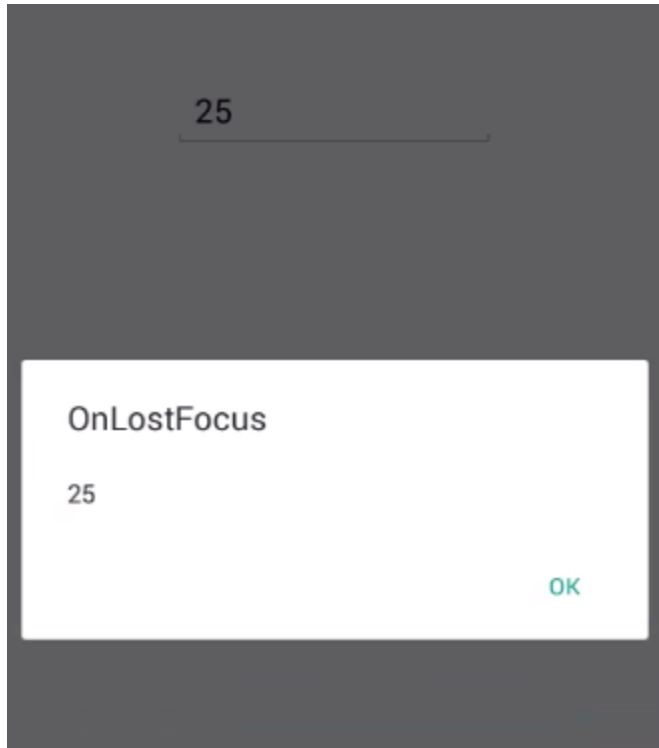

### OnLostFocus

#### XML

```
<syncfusion:SfNumericTextBox ValueChangeMode="OnLostFocus"  
x:Name="numericTextBox" Value="123" />
```

### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.Value = 123;  
numericTextBox.ValueChangeMode = ValueChangeMode.OnLostFocus;  
this.Content=numericTextBox;
```

### Completed

Raised when the user finalizes the text in the NumericTextBox by pressing return key on the keyboard.

### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox"  
Completed="Handle_Completed"/>
```

### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();  
numericTextBox.Completed += Handle_Completed;  
this.Content=numericTextBox;  
void Handle_Completed(object sender, System.EventArgs e)  
{  
    System.Diagnostics.Debug.WriteLine("Completed");  
}
```

## Range Support

Restrict the Values within a specific range by setting the Maximum and Minimum property values.

### XML

```
<syncfusion:SfNumericTextBox x:Name="numericTextBox" Maximum="1000"  
Minimum="50" Value="10"/>
```

### C#

```
StackLayout stack = new StackLayout();  
SfNumericTextBox numericTextBox = new SfNumericTextBox();  
numericTextBox.Minimum = 50;  
numericTextBox.Maximum = 1000;  
numericTextBox.Value = 10;  
stack.Children.Add(numericTextBox);  
this.Content = stack;
```

**Note:** Default Value of Maximum and Minimum is "null".

## Set SelectAllOnFocus

SelectAllOnFocus the property is used to specify whether the text should be selected when the control gets focus.

### XML

```
<numeric:SfNumericTextBox SelectAllOnFocus="True" Value="12345"/>
```

### C#

```
SfNumericTextBox numericTextBox=new SfNumericTextBox();
```

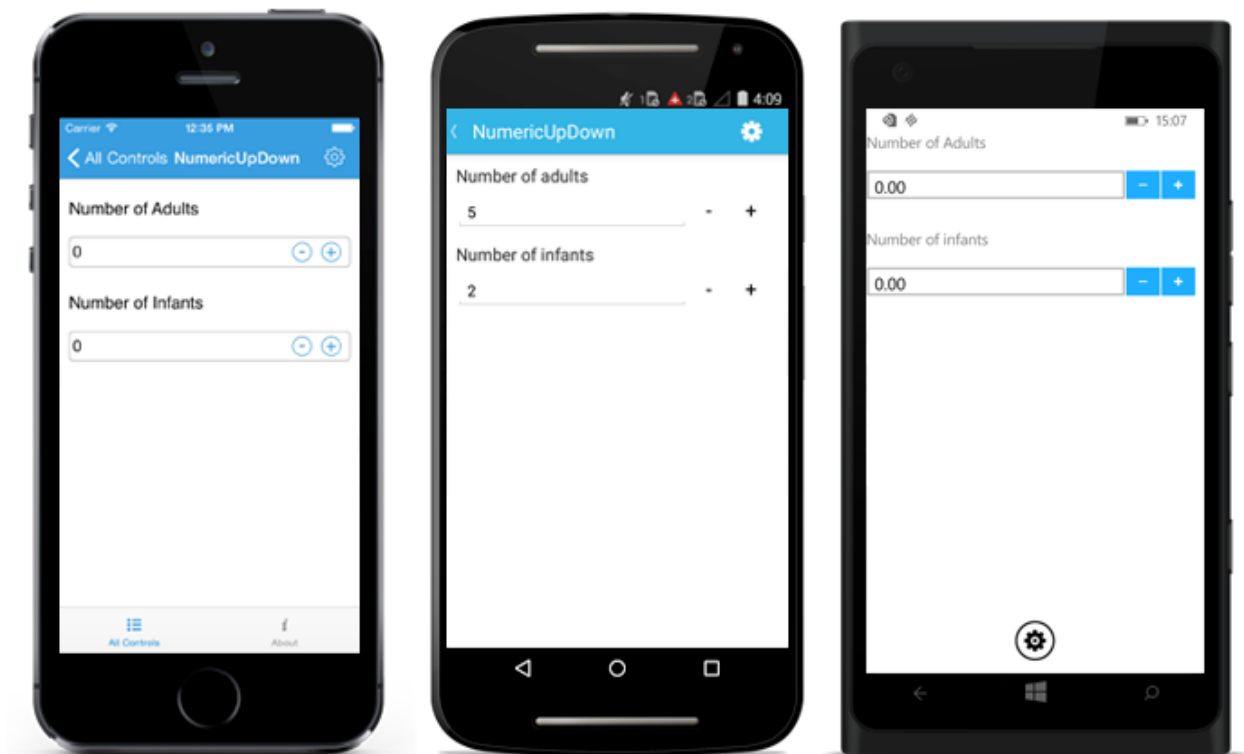

```
numericTextBox.Value=12345;  
numericTextBox.SelectAllOnFocus = true;  
this.Content = numericTextBox;
```

## SfNumericUpDown

### Overview

The Essential Xamarin.Forms NumericUpDown control provides up and down repeat buttons to increase and decrease values. The control respects UI culture and can be configured to display different formats like currency, scientific, etc.

### Key Features

- **FormatString** - Input string can be formatted by using the format strings.
- **Culture** - Number format can be localized to any specific culture.
- **AllowNull** - Allows the user to set null value.
- **ParserMode** - Value gets parsed based on parser mode.

### Getting Started

This section provides overview for working with Essential SfNumericUpDown for Xamarin.Forms. You can walk through the entire process of creating a SfNumericUpDown.

### Adding SfNumericUpDown reference

You can add SfNumericUpDown reference using one of the following methods:

#### Method 1: Adding SfNumericUpDown reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfNumericUpDown). To add SfNumericUpDown to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfNumericUpDown](https://www.nuget.org/packages/Syncfusion.Xamarin.SfNumericUpDown), and then install it.

![Adding SfNumericUpDown reference from NuGet](images/Adding SfNumericUpDown reference.png)

**Note:** Install the same version of SfNumericUpDown NuGet in all the projects.

#### Method 2: Adding SfNumericUpDown reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfNumericUpDown control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfNumericUpDown assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfNumericUpDown.XForms.Android.dll Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfNumericUpDown.XForms.iOS.dll Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfNumericUpDown.XForms.UWP.dll Syncfusion.SfNumericUpDown.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license](#)

[key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the SfNumericUpDown on each platform

To use SfNumericUpDown inside an application, each platform application must initialize the SfNumericUpDown renderer. This initialization step varies from platform to platform and is discussed in the following sections.

**Note:** If you are adding the references from toolbox, below steps are not needed.

#### Android and UWP

The Android and UWP launches the SfNumericUpDown without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

#### iOS

To launch SfNumericUpDown in iOS, need to create an instance of SfNumericUpDownRenderer in FinishedLaunching overridden method of AppDelegate class in iOS Project as shown below.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    SfNumericUpDownRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### ReleaseMode issue in UWP platform

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfNumericUpDown assemblies in **App.xaml.cs** in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfNumericUpDownRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a Simple SfNumericUpDown

The SfNumericUpDown control configured entirely in C# code or by using XAML markup. The following steps explains how to create a SfNumericUpDown and configure its elements.

- Adding namespace for the added assemblies.

#### XML

```
<xmlns:numeric="clr-namespace:Syncfusion.SfNumericUpDown.XForms;assembly=Syncfusion.SfNumericUpDown.XForms"/>
```

#### C#

```
using Syncfusion.SfNumericUpDown.XForms;
```

- Now add the SfNumericUpDown control with a required optimal name by using the included namespace.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown"/>
```

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
this.Content = numericUpDown;
```

### Set Value

The SfNumericUpDown control display value can be set using Value property.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" Value="5"/>
```

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.Value= 5;  
this.Content = numericUpDown;
```

### Parsing the Value

The value of NumericUpDown is parsed based on the ParsingMode property. ParsingMode is a type of Parsers; it can be enum of Double and Decimal. You have options to update the value in double or decimal.

The following code demonstrates the decimal parsing mode, which can be set using the ParsingMode property.

#### XML

```
<numeric:SfNumericUpDown x:Name="NumericUpDown" Value="123.45"
ParsingMode="Decimal" />
```

**C#**

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();
NumericUpDown.ParsingMode=Parsers.Decimal;
NumericUpDown.Value = 123.45;
this.Content = NumericUpDown;
```

**Note:** The default value of ParsingMode is Double.

**Colors**

SfNumericUpDown is used to set custom background, text, and border colors through the following bindable properties:

- **TextColor** - Sets the color of NumericUpDown's value
- **BackgroundColor** - Sets the background color of NumericUpDown.
- **BorderColor** - Sets the border custom color of NumericUpDown
- **WatermarkColor** - Sets the watermark custom color of NumericUpDown's watermark Text.

**TextColor**

The following code sample demonstrates how to set the TextColor in XAML and in C#:

**XML**

```
<numeric:SfNumericUpDown x:Name="NumericUpDown" Value="123"
TextColor="Green" />
```

**C#**

```
SfNumericUpDown NumericUpDown = new SfNumericUpDown();
NumericUpDown.TextColor = Color.Green;
NumericUpDown.Value = 123;
this.Content = NumericUpDown;
```

**BackgroundColor**

The following code sample demonstrates how to set the BackgroundColor in XAML and in C#:

**XML**

```
<numeric:SfNumericUpDown x:Name="NumericUpDown" Value="123"
BackgroundColor="Maroon" TextColor="White"/>
```

**C#**

```
SfNumericUpDown NumericUpDown = new SfNumericUpDown();  
NumericUpDown.BackgroundColor = Color.Maroon;  
NumericUpDown.TextColor = Color.White;  
NumericUpDown.Value = 123;  
this.Content = NumericUpDown;
```

*BorderColor*

The following code sample demonstrates how to set the BorderColor color in XAML and in C#:

**XML**

```
<numeric:SfNumericUpDown x:Name="NumericUpDown" Value="123"  
BorderColor="Red" />
```

**C#**

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();  
NumericUpDown.BorderColor = Color.Red;  
NumericUpDown.Value = 123;  
this.Content = NumericUpDown;
```

*WatermarkColor*

The following code sample demonstrates how to set the WatermarkColor in XAML and in C#:

**XML**

```
<numeric:SfNumericUpDown x:Name="NumericUpDown" AllowNull="true"  
WatermarkColor="Blue" />
```

**C#**

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();  
NumericUpDown.WatermarkColor = Color.Blue;  
NumericUpDown.AllowNull=true;  
this.Content = NumericUpDown;
```

*Number Formatting*

The Values of the SfNumericUpDown can be configured to display different formats like currency format, percent format etc.

### Format String

The `FormatString` property determines the format specifier by which the display text has to be formatted.

---

**Note:** The control displays the formatted text on lost focus. Default Value of `FormatString` is "n".

---

#### Display Currency Notation

**c** - Displays the value with currency notation.

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.FormatString="c";
```

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" FormatString="c"/>
```

#### Display Percentage Notation

**p** – Displays the value in percentage.

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.FormatString="p";
```

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" FormatString="p"/>
```

#### Display Number Notation

**n** – Displays the value in number format.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" FormatString="n"/>
```

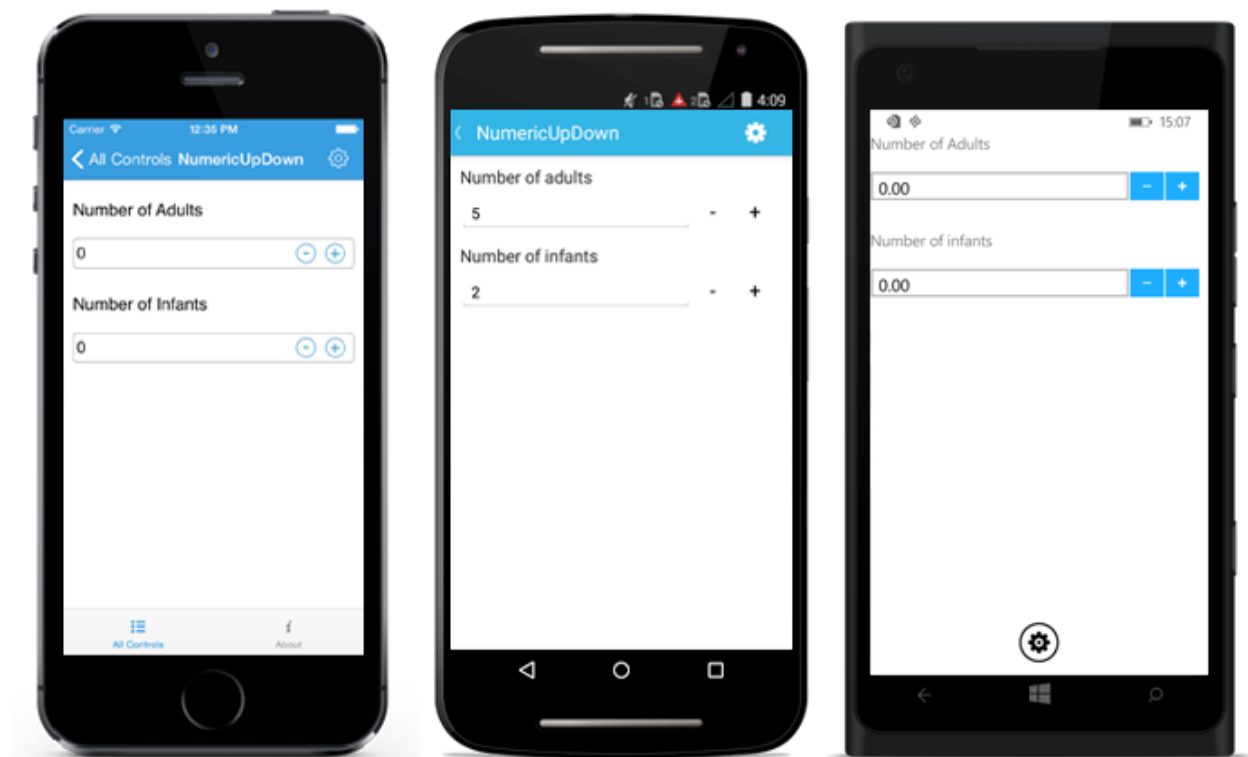

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.FormatString="n";
```

---

**Note:** Instead of using above `FormatString` types, we can provide any symbol or value as string in `FormatString` property which will be appended with the value in `SfNumericUpDown`.

---

### Compute to Percentage

When the control is in percentage format, the value can be displayed in two ways as follows

- **Value**: Displays the actual value with percentage symbol.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" Value="5" FormatString="p" PercentDisplayMode="Value"/>
```

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.Value = 5;  
numericUpDown.FormatString="p";  
numericUpDown.PercentDisplayMode=PercentDisplayMode.Value;
```

- **Compute**: Displays the value computed by 100 with percentage symbol.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" Value="5" FormatString="p"
PercentDisplayMode="Compute"/>
```

### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();
numericUpDown.Value = "5";
numericUpDown.FormatString="p";
numericUpDown.PercentDisplayMode=PercentDisplayMode.Compute;
```

**Note:** The control displays the percent value on lost focus.

### Set EnableGroupSeparator

The `EnableGroupSeparator` property is used to get rid of the comma in the Value of `SfNumericUpDown`.

### XML

```
<numeric:SfNumericUpDown x:Name="NumericUpDown" Value="12345"
EnableGroupSeparator="True"/>
```

### C#

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();
NumericUpDown.Value=12345;
NumericUpDown.EnableGroupSeparator = true;
this.Content = NumericUpDown;
```

### Font Customization

You can customize the font style of `NumericUpDown` using the following font-related properties that display the value's text:

- `FontSize` : Sets the font size for `NumericUpDown`'s text.
- `FontAttributes` : Sets the style of `NumericUpDown`'s text. You can add three types of styles to it. It specifies style information like Italic and Bold (using the `FontAttributes` enumeration in C#).
  1. Bold: Sets the style of `NumericUpDown`'s text to bold.
  2. Italic: Sets the style of `NumericUpDown`'s text to italic.
  3. None: Keeps the style of `NumericUpDown`'s text as same. It will not modify the style.

**Note:** The default value of this property is None.

- `FontFamily` : Customizes the font family of the `NumericUpDown`'s text.

- **TextAlignment** : Sets the style of NumericUpDown's text. We can give three types of style on it. It is specifying style information like Start, End and Center (using the TextAlignment enumeration in C#)

**Note:** The default value of this property is Start.

The following code sample demonstrates how to set the font size and attributes in XAML and in C#.

#### XAML

```
<numeric:SfNumericUpDown x:Name="NumericUpDown"
FontSize="27"
FontAttribute="Bold"
Value="123"
TextAlignment="End" />
```

#### C#

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();
NumericUpDown.FontSize = 27;
NumericUpDown.Value = 123;
NumericUpDown.TextAlignment=TextAlignment.End;
NumericUpDown.FontAttribute = FontAttributes.Bold;
this.Content = NumericUpDown;
```

#### Localization

The SfNumericUpDown value can be localized to any specific culture. It can be specified by setting the Culture property with System.Globalization.CultureInfo object instance.

**Note:** You cannot set value to the Culture property in XAML.

#### C#

```
numericUpDown.Culture = new System.Globalization.CultureInfo("hi-IN");
```

#### Change Localization of Return key text

The SfNumericUpDown provides the Localization support for the Return Key in soft keypad of iOS. We have provided the knowledge base document for the same. Please refer the Knowledge Base document from this [link](#).

#### Set Maximum Number of Decimal Digits

The maximum number of digits to be displayed after the decimal point can be specified by using [MaximumDecimalDigits](#) property.

**Note:** The [MaximumDecimalDigits](#). The MaximumDecimalDigits property is provided with positive value only. By default, the value of this property is 2.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" MaximumDecimalDigits="3"/>
```

#### C#

```
numericUpDown.MaximumDecimalDigits = 3;
```

A screenshot of the SfNumericUpDown control. It displays the value "3.234" in a text box. To the right of the text box are two circular buttons: a minus sign (-) and a plus sign (+).

#### Assign Nullable Value

The null values can be set in SfNumericUpDown **Value** property, by setting **AllowNull** property value to true.

**Note:** By default, the property value is false.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" AllowNull="true"/>
```

#### C#

```
numericUpDown.AllowNull=true;
```

A screenshot of the SfNumericUpDown control. The input field is empty. To the right of the input field are two circular buttons: a minus sign (-) and a plus sign (+).

#### Set Hint Text

The **WaterMark** property can be used to provide a hint that helps the user to get started with their input. The watermark text is visible when value is empty or null.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" Watermark="NumericUpDown"/>
```

#### C#

```
numericUpDown.Watermark = "NumericUpDown";
```

### Auto Reverse

While incrementing, the control will start from Minimum value once it reaches the Maximum value and vice-versa.

**Note:** By default the property value is false.

### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.AutoReverse = true;
```

### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" AutoReverse="true"/>
```

### Continuous Spinning Between Ranges

User can restrict the Values between a specific range by setting **Maximum** and **Minimum** property value.

**Note:** By default, the value of minimum property is Double.MinValue and the value of maximum property is Double.MaxValue.

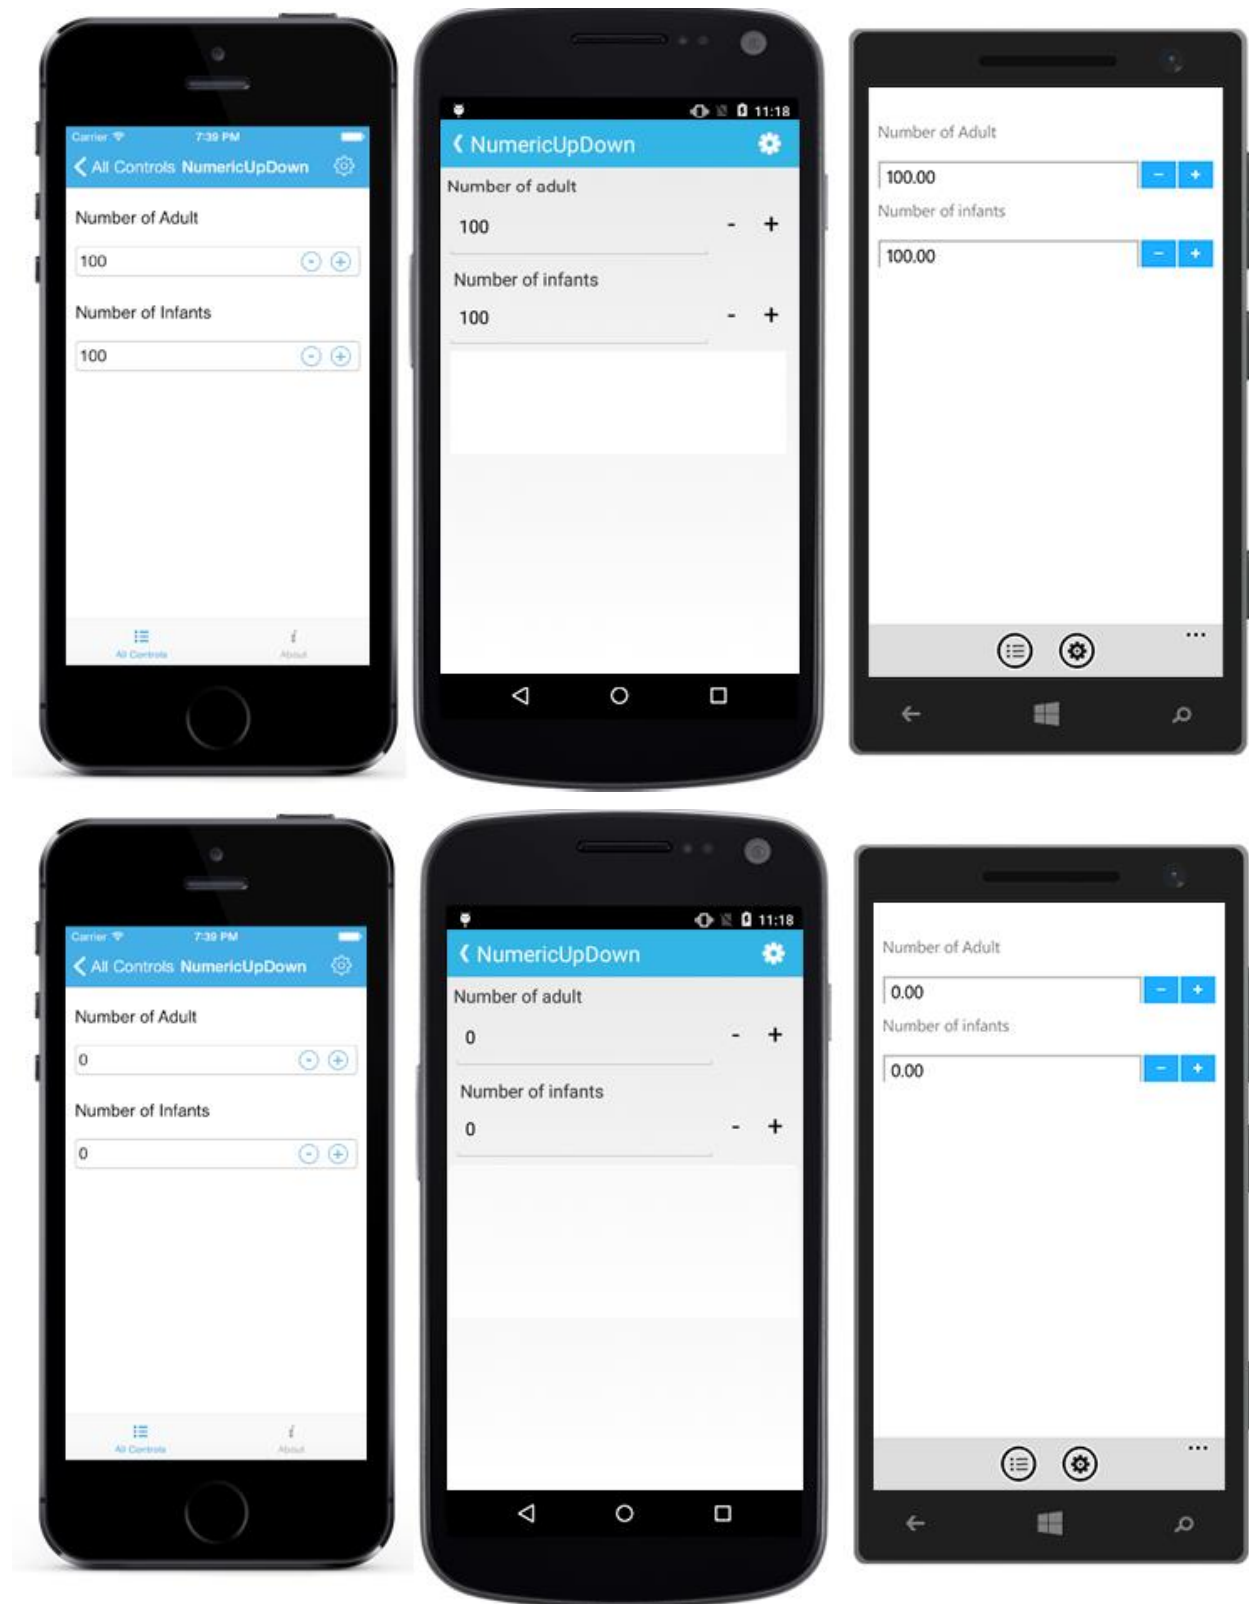

In iOS, if typed value is less than minimum value, the minimum value will be validated.

### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" Minimum="10" Maximum="100"/>
```

### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.Minimum = 0;  
numericUpDown.Maximum = 100;  
this.Content = numericUpDown;
```

### Set Increment

Frequency in which values gets incremented can be decided using `StepValue` property.

---

**Note:** By default the property value is 1.

---

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" StepValue="6"/>
```

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.StepValue = 6;  
this.Content = numericUpDown;
```

#### Set IsEditable

This property is used to decide whether users need to perform edit operation in input field.

---

**Note:** By default, the value of IsEditable property is true.

---

#### XML

```
<numeric:SfNumericUpDown Value="123" IsEditable="True"/>
```

#### C#

```
SfNumericUpDown numericUpDown=new SfNumericUpDown();  
numericUpDown.IsEditable = true;
```

#### Set SelectAllOnFocus

The **SelectAllOnFocus** property is used to specify whether the text should be selected when the control gets the focus.

#### XML

```
<numeric:SfNumericUpDown SelectAllOnFocus="True" Value="12345"/>
```

#### C#

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();  
NumericUpDown.Value=12345;  
NumericUpDown.SelectAllOnFocus = true;  
this.Content = NumericUpDown;
```

#### Events and Interactivity

##### Events

##### ValueChanged

You can perform any operation when changing the value of NumericUpDown using the ValueChanged event. The ValueChanged event returns the changed value in NumericUpDown.

For example you can restrict the NumericUpDown value if it exceed's greater than 3 digits using following code.

#### XML

```
<syncfusion:SfNumericUpDown x:Name="NumericUpDown"
ValueChangeMode="OnKeyFocus" ValueChanged="Handle_ValueChanged" Value="123"
/>
```

#### C#

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();
NumericUpDown.Value = 123;
NumericUpDown.ValueChangeMode = ValueChangeMode.OnKeyFocus;
NumericUpDown.ValueChanged += Handle_ValueChanged;
this.Content=NumericUpDown;
string updateValue = "";
void Handle_ValueChanged(object sender,
Syncfusion.SfNumericUpDown.XForms.ValueEventArgs e)
{
if (e.Value.ToString().Length <= 3 && e.Value != null)
{
updateValue = e.Value.ToString();
}
else
{
updown.Value = updateValue.ToString();
}
}
```

#### Interactivity : ValueChangeMode

The ValueChangeMode property is used to mention when value needs to update, either in key pressed or focus lost state. When ValueChangeMode is set to OnKeyFocus, the value will be updated on each key press. When ValueChangeMode is set to OnLostFocus, the value is updated when the control lose the focus or the focus is moved to the next control. ValueChangeMode includes the following options:

1. OnKeyFocus
2. OnLostFocus

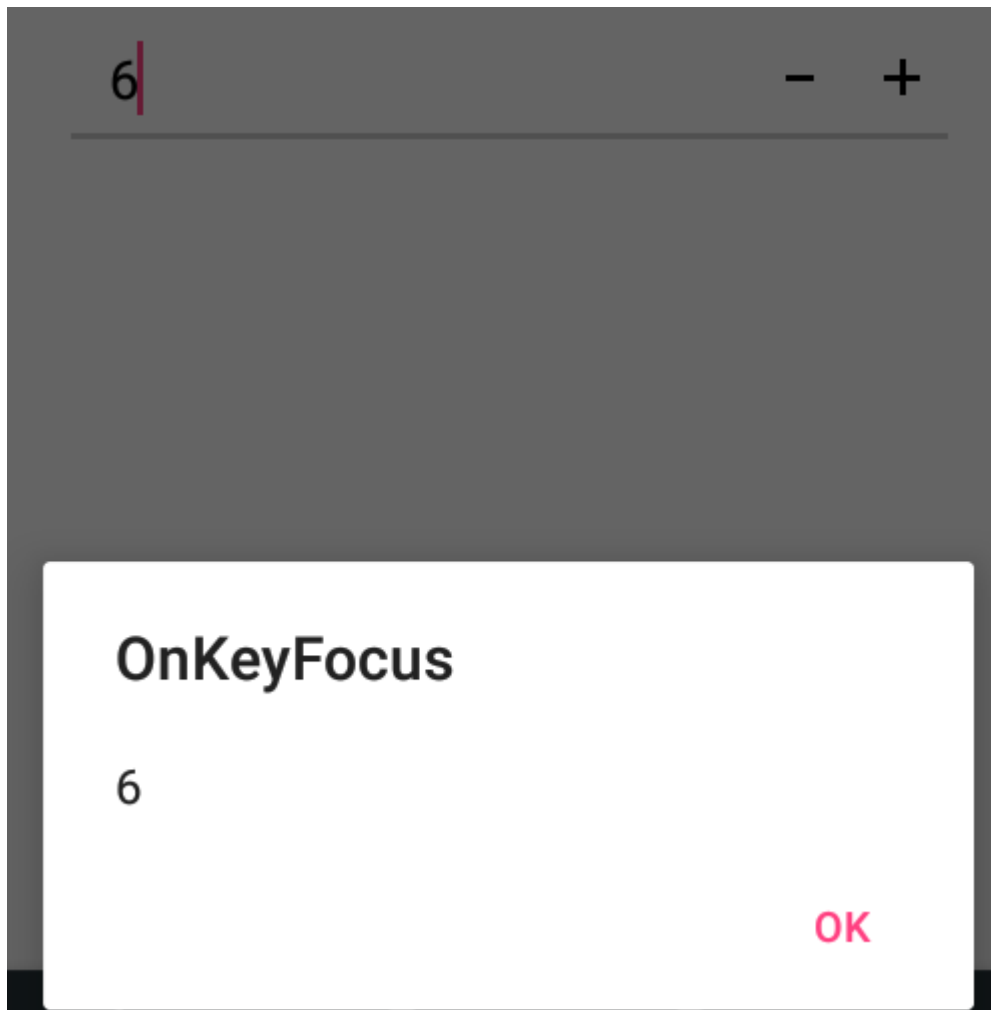

#### OnKeyFocus

##### XML

```
<syncfusion:SfNumericUpDown ValueChangeMode="OnKeyFocus"
x:Name="NumericUpDown" Value="123" />
```

##### C#

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();
NumericUpDown.Value = 123;
NumericUpDown.ValueChangeMode = ValueChangeMode.OnKeyFocus;
this.Content=NumericUpDown;
```

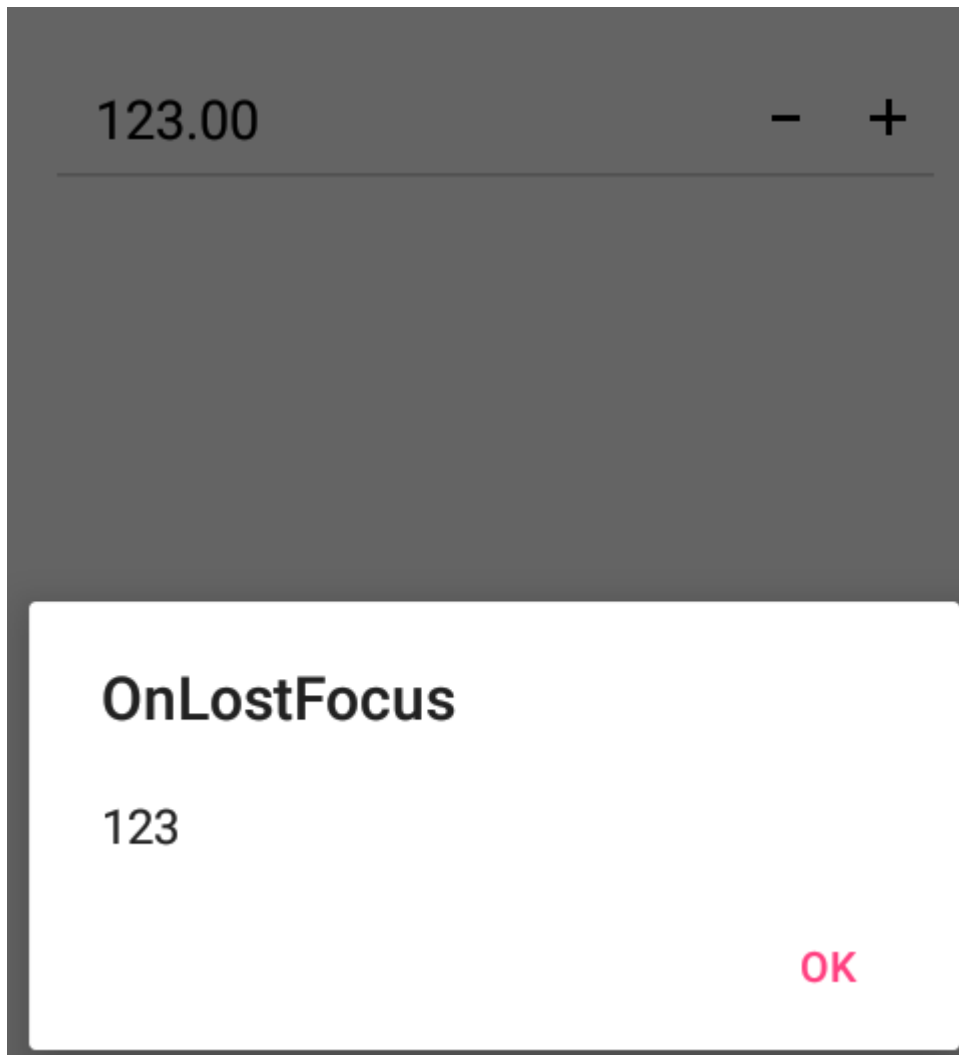

*OnLostFocus*

#### **XML**

```
<syncfusion:SfNumericUpDown ValueChangeMode="OnLostFocus"  
x:Name="NumericUpDown" Value="123" />
```

#### **C#**

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();  
NumericUpDown.Value = 123;  
NumericUpDown.ValueChangeMode = ValueChangeMode.OnLostFocus;  
this.Content=NumericUpDown;
```

#### Completed

This event occurs when users finalize the text in the NumericUpDown by pressing the return key(enter, ok) on keyboard.

#### XML

```
<syncfusion:SfNumericUpDown x:Name="NumericUpDown"
    Completed="Handle_Completed"/>
```

#### C#

```
SfNumericUpDown NumericUpDown=new SfNumericUpDown();
NumericUpDown.Completed += Handle_Completed;
this.Content=NumericUpDown;
void Handle_Completed(object sender, System.EventArgs e)
{
    System.Diagnostics.Debug.WriteLine("Completed");
}
```

## Spin Button Alignment

Spin Button position in the SfNumericUpDown control can be changed relative to the TextBox based on `SpinButtonAlignment` property.

There are three built-in modes.

### Right

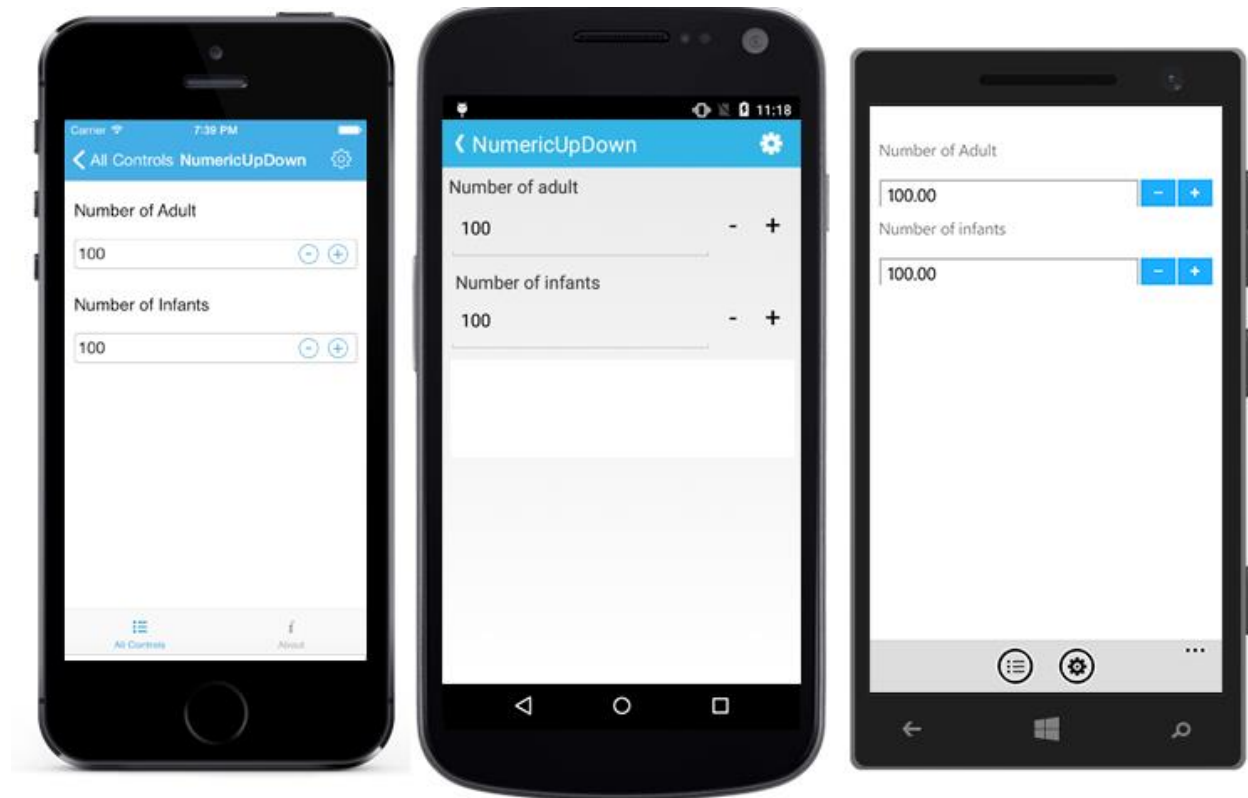

Spin Buttons will get aligned to the right side of the control.

#### C#

```
numericUpDown.SpinButtonAlignment = SpinButtonAlignment.Right;
```

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown"
    SpinButtonAlignment="Right"/>
```

### Left

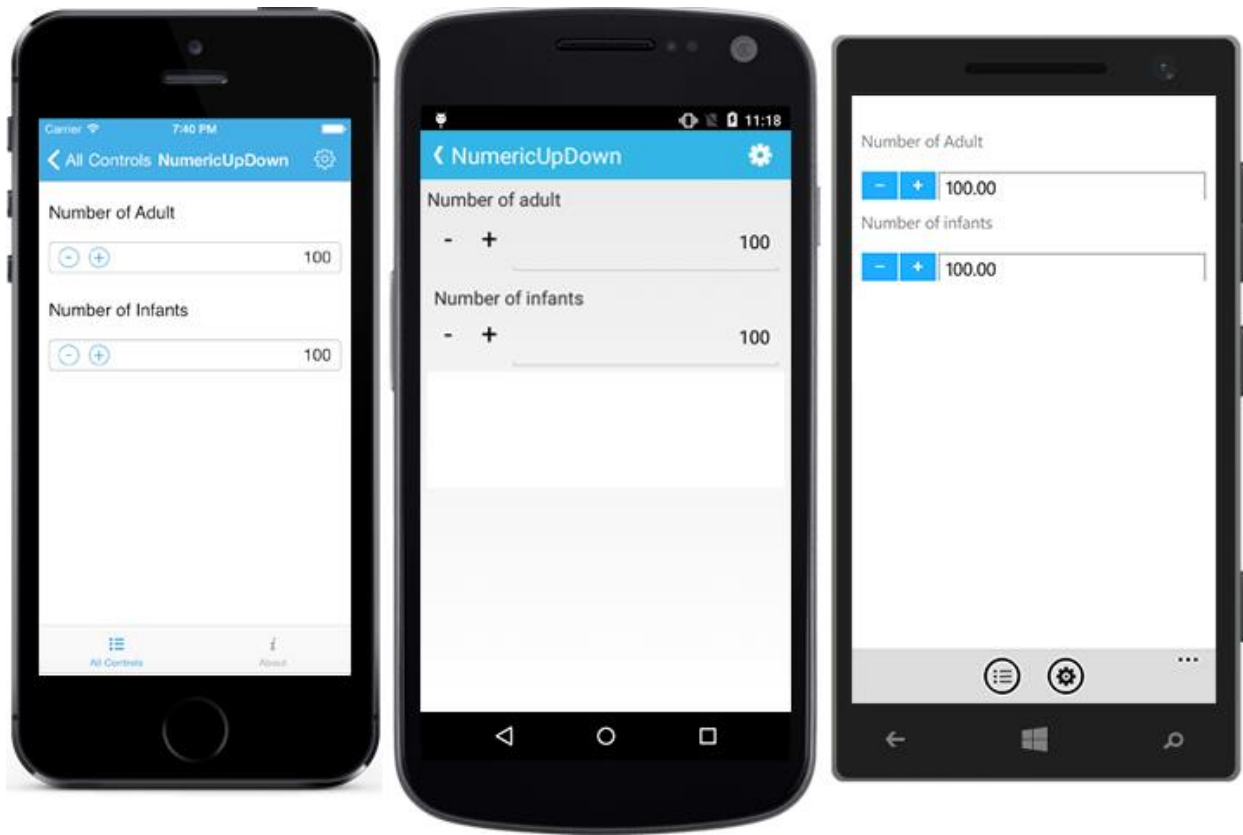

Spin Buttons will get aligned to the left side of the control.

#### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" SpinButtonAlignment="Left"/>
```

#### C#

```
numericUpDown.SpinButtonAlignment = SpinButtonAlignment.Left;
```

### *Both*

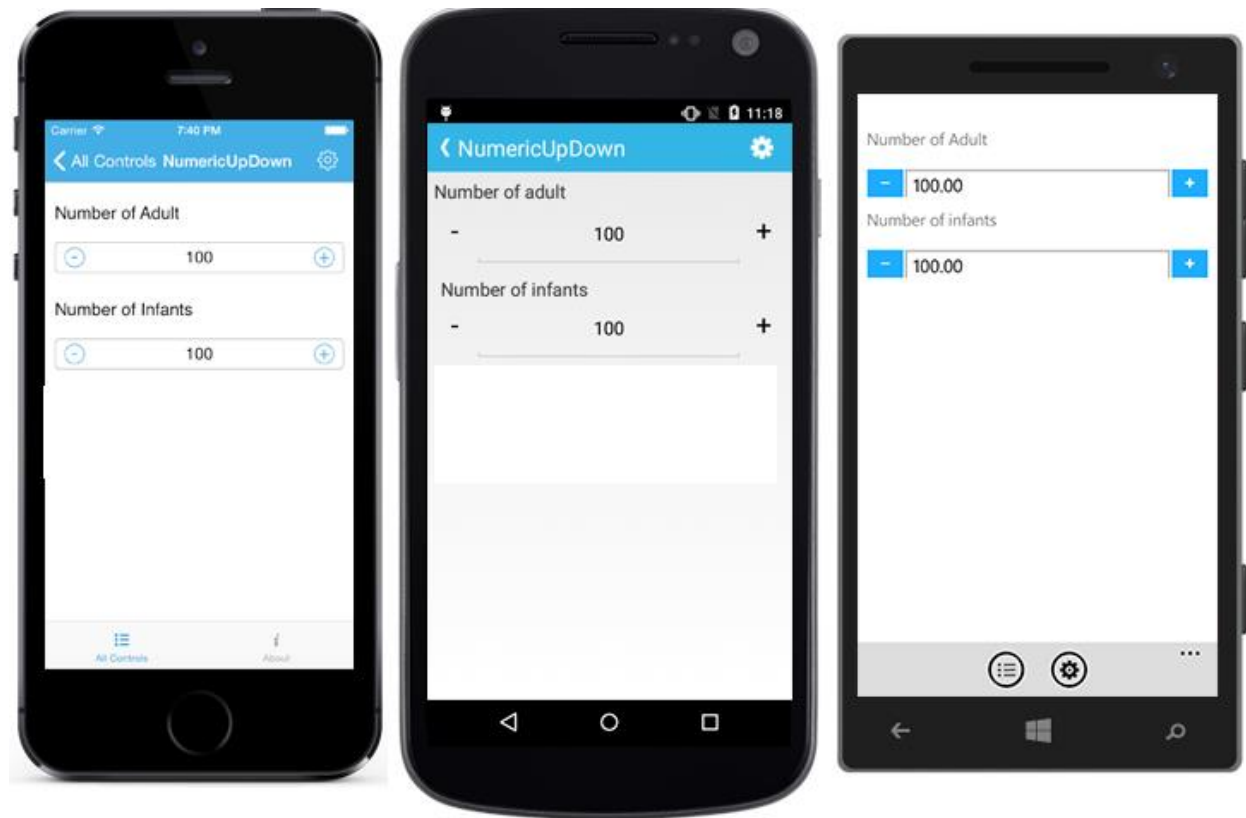

Spin Buttons will get aligned to the both side of the control.

### XML

```
<numeric:SfNumericUpDown x:Name="numericUpDown" SpinButtonAlignment="Both"/>
```

### C#

```
numericUpDown.SpinButtonAlignment = SpinButtonAlignment.Both;
```

**Note:** By default the property value is Right.

#### UpDownButtonSetting Customization

We can set the Up Down button of SfNumericUpDown control by using any of the below given ways.

1. View
2. Image
3. FontIconText

**Note:** For image and Font icon we need to add the the respective image and TTF file.

For android: Add image at Resource/Drawable/{Image} and .ttf file at Asserts/{.ttf}

For iOS: Add image and .ttf file to Resource/{Image/.ttf} and To use FontIcons, add respective FontFamily name in info.plist file under Fonts provided by application category.

For UWP: Add the image and .ttf file directly to the project.

*By using View*

#### XML

```
<updown:SfNumericUpDown x:Name="upDown" SpinButtonAlignment="Both"
    TextAlign="Center">
    <updown:SfNumericUpDown.IncrementButtonSettings>
    <updown:UpDownButtonSettings ButtonHeight="45" ButtonWidth="45">
    <updown:UpDownButtonSettings.ButtonView>
    <Grid HeightRequest="40" WidthRequest="40">
    <Image Source="up.png" Aspect="AspectFit" />
    </Grid>
```

```

</updown:UpDownButtonSettings.ButtonView>
</updown:UpDownButtonSettings>
</updown:SfNumericUpDown.IncrementButtonSettings>
<updown:SfNumericUpDown.DecrementButtonSettings>
<updown:UpDownButtonSettings ButtonHeight="45" ButtonWidth="45">
<updown:UpDownButtonSettings.ButtonView>
<Grid HeightRequest="40" WidthRequest="40">
<Image Source="down.png" Aspect="AspectFit" />
</Grid>
</updown:UpDownButtonSettings.ButtonView>
</updown:UpDownButtonSettings>
</updown:SfNumericUpDown.DecrementButtonSettings>
</updown:SfNumericUpDown>

```

**C#**

```

public partial class MainPage : ContentPage
{
    SfNumericUpDown upDown;
    Grid incrementGrid, decrementGrid;
    UpDownButtonSettings incSettings, decrementSettings;
    Image incrementImage, decrementImage;
    public MainPage()
    {
        InitializeComponent();
        incrementGrid = new Grid
        {
            HeightRequest = 40,
            WidthRequest = 40,
            BackgroundColor = Color.Blue
        };
        incSettings = new UpDownButtonSettings
        {
            ButtonView = incrementGrid,
            ButtonHeight = 45,
            ButtonWidth = 45
        };
        incrementImage = new Image
        {
            HorizontalOptions = LayoutOptions.Center,
            VerticalOptions = LayoutOptions.Center,
            Source = (FileImageSource)ImageSource.FromFile("up.png"),
            Aspect = Aspect.AspectFit
        };

        {
            ButtonView = decrementGrid,
            ButtonHeight = 45,
            ButtonWidth = 45
        };
        decrementGrid = new Grid
        {
            HeightRequest = 40,
            WidthRequest = 40,
            BackgroundColor = Color.Red
        };
    }
}

```

```

decrementImage = new Image
{
    Source = (FileImageSource) ImageSource.FromFile("down.png"),
    Aspect = Aspect.AspectFit,
    HorizontalOptions = LayoutOptions.Center,
    VerticalOptions = LayoutOptions.Center
};
upDown = new SfNumericUpDown
{
    SpinButtonAlignment = SpinButtonAlignment.Left,
    IncrementButtonSettings = incSettings,
    DecrementButtonSettings = decrementSettings
};
incrementGrid.Children.Add(incrementImage);
decrementGrid.Children.Add(decrementImage);
this.Content = upDown;
}
}

```

*By using Image with Button Height & Width*

#### **XML**

```

<updown:SfNumericUpDown x:Name="upDown" SpinButtonAlignment="Both"
    TextAlignment="Center">
    <updown:SfNumericUpDown.IncrementButtonSettings>
    <updown:UpDownButtonSettings ButtonImage="up" ButtonHeight="35"
        ButtonWidth="35" />
    </updown:SfNumericUpDown.IncrementButtonSettings>
    <updown:SfNumericUpDown.DecrementButtonSettings>
    <updown:UpDownButtonSettings ButtonImage="down" ButtonHeight="35"
        ButtonWidth="35" />
    </updown:SfNumericUpDown.DecrementButtonSettings>
</updown:SfNumericUpDown>

```

#### **C#**

```

public partial class MainPage : ContentPage
{
    SfNumericUpDown upDown;
    Grid incrementGrid, decrementGrid;
    UpDownButtonSettings incSettings, decrementSettings;
    Image incrementImage, decrementImage;
    public MainPage()
    {
        InitializeComponent();
        incSettings = new UpDownButtonSettings
        {
            ButtonImage = "up",
            ButtonHeight = 45,
            ButtonWidth = 45
        };
        decrementSettings = new UpDownButtonSettings
        {
            ButtonImage = "down",
            ButtonHeight = 45,

```

```

ButtonWidth = 45
};
upDown = new SfNumericUpDown
{
    SpinButtonAlignment = SpinButtonAlignment.Both,
    IncrementButtonSettings = incSettings,
    DecrementButtonSettings = decrementSettings
};
this.Content = upDown;
}
}

```

*By using FontIconText*

#### **XML**

```

<updown:SfNumericUpDown x:Name="upDown" SpinButtonAlignment="Both"
    TextAlignment="Center">
    <updown:SfNumericUpDown.IncrementButtonSettings>
    <updown:UpDownButtonSettings.ButtonFontFamily>
    <OnPlatform
    x:TypeArguments="x:String">
    <On
    Platform="Android"
    Value="numeric.ttf">
    </On>

```

**C#**

```

SfNumericUpDown upDown = new SfNumericUpDown();
upDown.SpinButtonAlignment = SpinButtonAlignment.Both;
UpDownButtonSettings incSettings = new UpDownButtonSettings();
incSettings.ButtonFontIcon = "\xe701";
if (Device.OS == TargetPlatform.Android)
{
    incSettings.ButtonFontFamily = "numeric.ttf";
    decrementSettings.ButtonFontFamily = "numeric.ttf";
}
else
{
    incSettings.ButtonFontFamily = "numeric";
    decrementSettings.ButtonFontFamily = "numeric";
}
upDown.IncrementButtonSettings = incSettings;
UpDownButtonSettings decrementSettings = new UpDownButtonSettings();
decrementSettings.ButtonFontIcon = "\xe700";
decrementSettings.ButtonWidth = 45;
upDown.DecrementButtonSettings = decrementSettings;
this.Content = upDown;

```

Additional customization properties of UpDownButtonSettings

*BackgroundColor*

This property is used to change the background color of increment and decrement buttons.

**XML**

```

<updown:SfNumericUpDown >
<updown:SfNumericUpDown.IncrementButtonSettings>
<updown:UpDownButtonSettings BackgroundColor="Red"/>
</updown:SfNumericUpDown.IncrementButtonSettings>
<updown:SfNumericUpDown.DecrementButtonSettings>
<updown:UpDownButtonSettings BackgroundColor="Green"/>
</updown:SfNumericUpDown.DecrementButtonSettings>
</updown:SfNumericUpDown>

```

**C#**

```

SfNumericUpDown numericUpDown = new SfNumericUpDown();
UpDownButtonSettings incrementButtonSettings = new UpDownButtonSettings();

```

```
UpDownButtonSettings decrementButtonSettings = new UpDownButtonSettings();
numericUpDown.IncrementButtonSettings = incrementButtonSettings;
numericUpDown.DecrementButtonSettings = decrementButtonSettings;
incrementButtonSettings.BackgroundColor = Color.Red;
decrementButtonSettings.BackgroundColor = Color.Green;
```

#### *HighlightedBackgroundColor*

This property is used to change the background color of when press the increment or decrement button.

#### **XML**

```
<updown:SfNumericUpDown >
<updown:SfNumericUpDown.IncrementButtonSettings>
<updown:UpDownButtonSettings HighlightedBackgroundColor="Red"/>
</updown:SfNumericUpDown.IncrementButtonSettings>
<updown:SfNumericUpDown.DecrementButtonSettings>
<updown:UpDownButtonSettings HighlightedBackgroundColor="Green"/>
</updown:SfNumericUpDown.DecrementButtonSettings>
</updown:SfNumericUpDown>
```

#### **C#**

```
SfNumericUpDown numericUpDown = new SfNumericUpDown();
UpDownButtonSettings incrementButtonSettings = new UpDownButtonSettings();
UpDownButtonSettings decrementButtonSettings = new UpDownButtonSettings();
numericUpDown.IncrementButtonSettings = incrementButtonSettings;
numericUpDown.DecrementButtonSettings = decrementButtonSettings;
incrementButtonSettings.HighlightedBackgroundColor = Color.Red;
decrementButtonSettings.HighlightedBackgroundColor = Color.Green;
```

#### *ButtonFontColor*

This property is used to change the text color of increment and decrement buttons.

#### **XML**

```
<updown:SfNumericUpDown >
<updown:SfNumericUpDown.IncrementButtonSettings>
<updown:UpDownButtonSettings ButtonFontColor="Red"/>
</updown:SfNumericUpDown.IncrementButtonSettings>
<updown:SfNumericUpDown.DecrementButtonSettings>
<updown:UpDownButtonSettings ButtonFontColor="Green"/>
</updown:SfNumericUpDown.DecrementButtonSettings>
</updown:SfNumericUpDown>
```

#### **C#**

```
SfNumericUpDown numericUpDown = new SfNumericUpDown();
UpDownButtonSettings incrementButtonSettings = new UpDownButtonSettings();
UpDownButtonSettings decrementButtonSettings = new UpDownButtonSettings();
numericUpDown.IncrementButtonSettings = incrementButtonSettings;
numericUpDown.DecrementButtonSettings = decrementButtonSettings;
```

```
incrementButtonSettings.ButtonFontColor = Color.Red;
decrementButtonSettings.ButtonFontColor = Color.Green;
```

### HighlightedButtonFontColor

This property is used to change the text color of button when press the increment or decrement button.

### XML

```
<updown:SfNumericUpDown >
  <updown:SfNumericUpDown.IncrementButtonSettings>
    <updown:UpDownButtonSettings HighlightedButtonFontColor="Red"/>
  </updown:SfNumericUpDown.IncrementButtonSettings>
  <updown:SfNumericUpDown.DecrementButtonSettings>
    <updown:UpDownButtonSettings HighlightedButtonFontColor="Green"/>
  </updown:SfNumericUpDown.DecrementButtonSettings>
</updown:SfNumericUpDown>
```

### C#

```
SfNumericUpDown numericUpDown = new SfNumericUpDown();
UpDownButtonSettings incrementButtonSettings = new UpDownButtonSettings();
UpDownButtonSettings decrementButtonSettings = new UpDownButtonSettings();
numericUpDown.IncrementButtonSettings = incrementButtonSettings;
numericUpDown.DecrementButtonSettings = decrementButtonSettings;
incrementButtonSettings.HighlightedButtonFontColor = Color.Red;
decrementButtonSettings.HighlightedButtonFontColor = Color.Green;
```

### AutomationId

The NumericUpDown control has built-in AutomationId for inner elements. To keep unique id for inner elements, AutomationId of inner elements are updated based on NumericUpDown's AutomationId. For example, if NumericUpDown's AutomationId is set as sfNumericUpDown.AutomationId = "numericUpDown", then AutomationId of inner elements will be updated as follows.

Element	Element AutomationId	Qualified AutomationId
Increment Button	increment button	numericUpDown increment button
Decrement Button	decrement button	numericUpDown decrement button

## PDF

## SfParallaxView

### Overview

SfParallaxView for Xamarin.Forms provides a perfect way for scrolling any control that implements the IParallaxView interface with a background element that translates slower than the foreground element. The SfParallaxView control binds the scroll position of a foreground element (e.g., list) to a background element and moves the background element at different speeds.

## Key features

- Customizes the speed of the parallax scroll.
- Supports horizontal and vertical orientation.
- Provides built-in integration with SfListView and SfRotator.
- Bind any control which implements IParallaxView interface.

## Getting Started

This section explains the steps required to configure the [SfParallaxView](#) control and add basic elements to it using various APIs.

### Adding SfParallaxView reference

You can add SfParallaxView reference using one of the following methods:

#### Method 1: Adding SfParallaxView reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfParallaxView). To add SfParallaxView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfParallaxView](https://www.nuget.org/packages/Syncfusion.Xamarin.SfParallaxView), and then install it.

![[Adding SfParallaxView reference from NuGet](ParallaxView\_Images/Adding SfParallaxView reference.png)]

---

**Note:** Install the same version of SfParallaxView NuGet in all the projects.

---

### Method 2: Adding SfParallaxView reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfParallaxView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfParallaxView assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfParallaxView.XForms.dll Syncfusion.Core.XForms.dll
Android	Syncfusion.SfParallaxView.XForms.Android.dll Syncfusion.SfParallaxView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll
iOS	Syncfusion.SfParallaxView.XForms.iOS.dll Syncfusion.SfParallaxView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll
UWP	Syncfusion.SfParallaxView.XForms.UWP.dll Syncfusion.SfParallaxView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

### Launch an application in iOS

To launch the parallax view in iOS, call the `SfParallaxViewRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    global::Xamarin.Forms.Forms.Init();
    Syncfusion.XForms.iOS.ParallaxView.SfParallaxViewRenderer.Init();
    LoadApplication(new App());
}
```

### Universal Windows Platform (UWP)

You need to initialize the parallax view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with parallax view in Release mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    // Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.ParallaxView.SfParallax
ViewRenderer).GetTypeInfo().Assembly);
    // Replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Android

The Android platform does not require any additional configuration to render the parallax view.

#### Initialize parallax view

1. Import SfParallaxView control namespace as `xmlns:parallax="clr-namespace:Syncfusion.XForms.ParallaxView;assembly=Syncfusion.SfParallaxView.XForms"` in the XAML page.
2. Set the SfParallaxView control as content to the ContentPage.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ParallaxSample"
xmlns:parallax="clr-
namespace:Syncfusion.XForms.ParallaxView;assembly=Syncfusion.SfParallaxView.
XForms"
x:Class="ParallaxSample.MainPage">
<ContentPage.Content>
<parallax:SfParallaxView />
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.ParallaxView;
using Xamarin.Forms;
public class App : Application
{
    public App()
    {
        MainPage = new ParallaxSample.MainPage();
    }
}
public class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        SfParallaxView parallaxView = new SfParallaxView();
        this.Content = parallaxView;
    }
}
```

Add content to the parallax view

*Content*

The **Content** represents the background view of a parallax view. You can set any kind of view to the **Content** property such as Image and StackLayout.

The following code sample demonstrates how to set the content property to the parallax view.

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ParallaxSample"
xmlns:parallax="clr-namespace:Syncfusion.XForms.ParallaxView;assembly=Syncfusion.SfParallaxView.XForms"
x:Class="ParallaxSample.MainPage">
    <ContentPage.Content>
        <Grid>
            <parallax:SfParallaxView x:Name="parallaxview">
                <parallax:SfParallaxView.Content>
                    <Image Source="{Binding Image}" BackgroundColor="Transparent"
HorizontalOptions="Fill" VerticalOptions="Fill" Aspect="AspectFill" />
                </parallax:SfParallaxView.Content>
            </parallax:SfParallaxView>
        </Grid>
    </ContentPage.Content>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.ParallaxView;
using Xamarin.Forms;
public partial class MainPage : ContentPage
```

```

{
    public MainPage()
    {
        InitializeComponent();
        BindingContext = new ParallaxViewModel();
    }
}

public class ParallaxViewModel
{
    public ImageSource Image { get; set; }
    public ParallaxViewModel()
    {
        Image = ImageSource.FromResource("ParallaxSample.ParallaxGuitar1.png",
        typeof(MainPage).GetTypeInfo().Assembly);
    }
}

```

Bind source to the parallax view

#### Source

The **Source** represents the foreground view of the parallax view. The value of **Source** should be a scrollable content or the view which implements **IParallaxView** interface.

As of now, the SfParallaxView supports the following controls directly. You can simply bind the control to the **Source** property.

1. ScrollView
2. SfListView
3. SfRotator

The following code sample demonstrates how to bind the SfListView to the **Source** property.

#### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ParallaxSample"
xmlns:list="clr-namespace:Syncfusion.ListView.XForms;assembly=Syncfusion.SfListView.XForms"
xmlns:parallax="clr-namespace:Syncfusion.XForms.ParallaxView;assembly=Syncfusion.SfParallaxView.XForms"
x:Class="ParallaxSample.MainPage">
<ContentPage.Content>
<Grid>
<parallax:SfParallaxView Source="{x:Reference Name = listview}"
x:Name="parallaxview" >
<parallax:SfParallaxView.Content>
<Image BackgroundColor="Transparent" Source="{Binding Image}"
HorizontalOptions="Fill" VerticalOptions="Fill" Aspect="AspectFill" />
</parallax:SfParallaxView.Content>
</parallax:SfParallaxView>
<list:SfListView x:Name="listview" ItemsSource="{Binding Items}"
BackgroundColor="Transparent" ItemSize="100">
<list:SfListView.ItemTemplate>

```

```

<DataTemplate>
<ViewCell>
<Grid Padding="20,0,20,0" RowSpacing="50">
<StackLayout BackgroundColor="Transparent" Grid.Column="1" Padding="0,0,0,0"
VerticalOptions="CenterAndExpand" HorizontalOptions="StartAndExpand"
Orientation="Vertical">
<Label HorizontalOptions="Start" TextColor="White" Text="{Binding Name}"
Font="25">
</Label>
<Label HorizontalOptions="Start" Text="{Binding Author}" TextColor="White">
</Label>
</StackLayout>
</Grid>
</ViewCell>
</DataTemplate>
</list:SfListView.ItemTemplate>
</list:SfListView>
</Grid>
</ContentPage.Content>
</ContentPage>

```

## C#

```

public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        BindingContext = new ParallaxViewModel();
    }
}

public class ParallaxViewModel
{
    public ImageSource Image { get; set; }
    public ObservableCollection<Contacts> Items { get; set; }
    public ParallaxViewModel()
    {
        Image = ImageSource.FromResource("ParallaxSample.ParallaxGuitar1.png",
        typeof(MainPage).GetTypeInfo().Assembly);
        Items = new ObservableCollection<Contacts>()
        {
            new Contacts() { Name = "Thriller", Author = "Michael Jackson" },
            new Contacts() { Name = "Like a Prayer", Author = "Madonna" },
            new Contacts() { Name = "When Doves Cry", Author = "Prince" },
            new Contacts() { Name = "I Wanna Dance", Author = "Whitney Houston" },
            new Contacts() { Name = "It's Gonna Be Me", Author = "N Sync" },
            new Contacts() { Name = "Everybody", Author = "Backstreet Boys" },
            new Contacts() { Name = "Rolling in the Deep", Author = "Adele" },
            new Contacts() { Name = "Don't Stop Believing", Author = "Journey" },
            new Contacts() { Name = "Billie Jean", Author = "Michael Jackson" },
            new Contacts() { Name = "Firework", Author = "Katy Perry" },
            new Contacts() { Name = "Thriller", Author = "Michael Jackson" },
            new Contacts() { Name = "Like a Prayer", Author = "Madonna" },
            new Contacts() { Name = "When Doves Cry", Author = "Prince" },
            new Contacts() { Name = "I Wanna Dance", Author = "Whitney Houston" },
            new Contacts() { Name = "It's Gonna Be Me", Author = "N Sync" },

```

```
new Contacts() { Name = "Everybody", Author = "Backstreet Boys" },  
new Contacts() { Name = "Rolling in the Deep", Author = "Adele" },  
new Contacts() { Name = "Don't Stop Believing", Author = "Journey"},  
};  
}  
}  
public class Contacts  
{  
    public string Name  
    {  
        get;  
        set;  
    }  
    public string Author  
    {  
        get;  
        set;  
    }  
}
```

**Note:** The size of the Content view will automatically be stretched to the size of the Source view.

You can find the complete getting started sample from this link: [Sample](#)

## Customization

### Speed Customization

The **Speed** value denotes the scrolling speed of the **Content** added as a background view. Based on the speed value, the background view will scroll along with the foreground view.

#### XML

```
<parallax:SfParallaxView Source="{x:Reference Name = listview}"
x:Name="parallaxview" Speed="0.5" >
<parallax:SfParallaxView.Content>
<Image BackgroundColor="Transparent" Source="{Binding Image}"
HorizontalOptions="Fill" VerticalOptions="Fill" Aspect="AspectFill" />
</parallax:SfParallaxView.Content>
</parallax:SfParallaxView>
```

#### C#

```
using Syncfusion.XForms.ParallaxView;
using Syncfusion.ListView.XForms;
namespace ParallaxView_GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            ParallaxViewModel view = new ParallaxViewModel();
            BindingContext = view;
            SfParallaxView parallax = new SfParallaxView();
            SfListView listview = new SfListView();
            Image image = new Image();
            Assembly assembly = typeof(MainPage).GetTypeInfo().Assembly;
            image.Source =
                ImageSource.FromResource("ParallaxView_GettingStarted.Images.ParallaxWallpaper.png", assembly);
            parallax.Content = image;
            parallax.Speed = 0.5;
            listview.ItemsSource = view.Items;
            parallax.Source = listview;
        }
    }
}
```

## Orientation

The orientation of the content scrolling can be customized to vertical or horizontal using the value of **Orientation** property.

#### XML

```
<Grid>
<parallax:SfParallaxView Source="{x:Reference Name = listview}"
x:Name="parallaxview" Orientation="Horizontal" >
<parallax:SfParallaxView.Content>
```

```

. . .
</parallax:SfParallaxView.Content>
</parallax:SfParallaxView>
<list:SfListView x:Name="listview" Orientation="Horizontal"
ItemsSource="{Binding Items}" BackgroundColor="Transparent" ItemSize="100">
. . .
</list:SfListView>
</Grid>

```

**C#**

```

using Syncfusion.XForms.ParallaxView;
using Syncfusion.ListView.XForms;
namespace ParallaxView_GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            ParallaxViewModel view = new ParallaxViewModel();
            BindingContext = view;
            SfParallaxView parallax = new SfParallaxView();
            SfListView listview = new SfListView();
            Image image = new Image();
            Assembly assembly = typeof(MainPage).GetTypeInfo().Assembly;
            image.Source =
            ImageSource.FromResource("ParallaxView_GettingStarted.Images.ParallaxWallpaper.png", assembly);
            parallax.Content = image;
            parallax.Speed = 0.5;
            parallax.Orientation =
            Syncfusion.XForms.ParallaxView.Orientation.Horizontal;
            listview.ItemsSource = view.Items;
            parallax.Source = listview;
        }
    }
}

```

## Scrolling support for custom controls

The Parallax view supports custom scrollable controls using the `IParallaxView` interface. This interface implements the `ScrollableContentSize` property and the `Scrolling` event.

**C#**

```

public class CustomListView : ListView, IParallaxView
{
    public Size ScrollableContentSize { get ; set ; }
    public event EventHandler<ParallaxScrollingEventArgs> Scrolling;
}

```

## Scrollable ContentSize

The `ScrollableContentSize` is the total content size of the scrollable custom control.

**C#**

```
public class CustomListView : ListView, IParallaxView
{
    public Size ScrollableContentSize { get; set; }
    public CustomListView()
    {
        this.ScrollableContentSize = ContentSize; // Total scrollable size of the
        custom control
    }
}
```

## Scrolling event

The **Scrolling** event occurs whenever the **ParallaxScrollingEventArgs** value is set through the scrollable custom control scrolled event.

The **ParallaxScrollingEventArgs** has the following three arguments:

- **ScrollX**: Denotes X position of the finished scroll.
- **ScrollY**: Denotes Y position of the finished scroll.
- **CanAnimate**: Defines whether to animate the scroll or not.

**XML**

```
<Grid>
<parallax:SfParallaxView Source="{x:Reference Name = listView}"
x:Name="parallaxview">
<parallax:SfParallaxView.Content>
<Image x:Name="image" BackgroundColor="Transparent" HorizontalOptions="Fill"
VerticalOptions="Fill" Aspect="AspectFill" />
</parallax:SfParallaxView.Content>
</parallax:SfParallaxView>
<local:CustomListView x:Name="listView" >
. . .
</local:CustomListView>
</Grid>
```

**C#**

```
public class CustomListView : ListView, IParallaxView
{
    public ListViewScrollingEventArgs scrollingEventArgs;
    internal event EventHandler<ListViewScrollingEventArgs>
CustomListViewScrolling;
    private Size scrollableContentSize = new Size();
    public Size ScrollableContentSize
    {
        get
        {
            return this.scrollableContentSize;
        }
        set
        {
            this.scrollableContentSize = value;
        }
    }
}
```

```

OnPropertyChanged("ScrollableContentSize");
}
}
public event EventHandler<ParallaxScrollingEventArgs> Scrolling;
protected virtual void OnScrollChanged(ParallaxScrollingEventArgs e)
{
    Scrolling?.Invoke(this, e);
}
public CustomListView()
{
    this.scrollingEventArgs = new ListViewScrollingEventArgs(); // Need to
    initiate event args
    CustomListViewScrolling += CustomListView_CustomListViewScrolling; // Need
    to invoke custom scroll event
}
private void CustomListView_CustomListViewScrolling(object sender,
    ListViewScrollingEventArgs e)
{
    OnScrollChanged(new ParallaxScrollingEventArgs(e.ScrollX, e.ScrollY,
        false));
}
}
public class ListViewScrollingEventArgs : EventArgs
{
    /// <summary>
    /// Initializes a new instance of the <see cref="ListViewScrollingEventArgs"
    /> class.
    /// </summary>
    public ListViewScrollingEventArgs()
    {
    }

    /// <summary>
    /// Gets or sets ScrollX value.
    /// </summary>
    public double ScrollX { get; set; }
    /// <summary>
    /// Gets or sets ScrollY value.
    /// </summary>
    public double ScrollY { get; set; }
}

```

By default, ParallaxView control supports `Xamarin.Forms ScrollView`. For custom controls you need to implement the `IParallaxView` interface.

You can achieve the parallax scroll support to the custom controls using the native renderers to calculate the total size of the scrollable content. Refer to this [KB article](#) for more details.

## SfPdfViewer

### PDF Viewer

PDF Viewer for Xamarin allows the user to view PDF documents within your Xamarin.Forms application.

**Key features:**

The following list shows the key features available in PDF Viewer control.

- View PDF documents
- Search a text in PDF document
- Select text and copy it to clipboard
- Scroll, pan, zoom in and out
- Page navigation

---

**Note:** PDF Viewer for Xamarin.Forms.Android will be supported from Android 5.0 (API Level 21) onwards.

**Note:** PDF Viewer for Xamarin.Forms.iOS will be supported from iOS version 9.0 onwards.

---

## Getting started

This section demonstrates how to create an application that displays a PDF file using SfPdfViewer control.

### Adding SfPdfViewer reference

You can add SfPdfViewer reference using one of the following methods:

**Method 1: Adding SfPdfViewer reference from nuget.org**

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfPdfViewer). To add SfPdfViewer to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfPdfViewer](https://www.nuget.org/packages/Syncfusion.Xamarin.SfPdfViewer), and then install it.

!{Adding SfPdfViewer reference from NuGet}(pdfviewer\_images/Adding SfPdfViewer reference.png)

**Note:** Install the same version of SfPdfViewer NuGet in all the projects.

**Method 2: Adding SfPdfViewer reference from toolbox**

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfPdfViewer control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

**Method 3: Adding SfPdfViewer assemblies manually from the installed location**

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Compression.Portable.dll Syncfusion.Pdf.Portable.dll Syncfusion.SfPdfViewer.XForms.dll Syncfusion.SfBusyIndicator.XForms.dll Syncfusion.SfRangeSlider.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Compression.Portable.dll Syncfusion.Pdf.Portable.dll Syncfusion.SfPdfViewer.XForms.dll Syncfusion.SfPdfViewer.XForms.Android.dll Syncfusion.SfBusyIndicator.XForms.dll Syncfusion.SfBusyIndicator.XForms.Android.dll Syncfusion.SfBusyIndicator.Android.dll Syncfusion.SfRangeSlider.XForms.dll Syncfusion.SfRangeSlider.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Compression.Portable.dll Syncfusion.Pdf.Portable.dll Syncfusion.SfPdfViewer.XForms.dll Syncfusion.SfPdfViewer.XForms.iOS.dll Syncfusion.SfBusyIndicator.XForms.dll Syncfusion.SfBusyIndicator.XForms.iOS.dll Syncfusion.SfBusyIndicator.iOS.dll Syncfusion.SfRangeSlider.XForms.dll Syncfusion.SfRangeSlider.XForms.iOS.dll

	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Compression.Portable.dll Syncfusion.Pdf.Portable.dll Syncfusion.SfPdfViewer.XForms.dll Syncfusion.SfPdfViewer.XForms.UWP.dll Syncfusion.SfRangeSlider.XForms.dll Syncfusion.SfRangeSlider.XForms.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfInput.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Creating a simple PDF Viewer application

Create a new cross platform application for Xamarin.Forms.Portable in the Visual Studio with the project name "GettingStarted" and refer the above mentioned assemblies to the respective projects.

**Note:** If you are adding the references from toolbox, this step is not needed.

An additional step is required to render the SfPdfViewer control in iOS project. You need to call the Syncfusion.SfPdfViewer.XForms.iOS.SfPdfDocumentViewRenderer.Init() and Syncfusion.SfRangeSlider.XForms.iOS.SfRangeSliderRenderer.Init(); in the FinishedLaunching overridden method of the AppDelegate class after the Xamarin.Forms Framework has been initialized and before the LoadApplication is called, as demonstrated in the following code example.

### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    Syncfusion.SfPdfViewer.XForms.iOS.SfPdfDocumentViewRenderer.Init();
    Syncfusion.SfRangeSlider.XForms.iOS.SfRangeSliderRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

### Resolving issue when deploying an application in ReleaseMode in the UWP platform

There is a known Framework issue in the UWP platform when an application using custom control is deployed in Release Mode, it will not be rendered.

This can be resolved by initializing the SfPdfViewer related assemblies in **App.xaml.cs** in the UWP project. Refer to the following code snippet.

### C#

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    //Add the assemblies `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies that your app uses
    assembliesToInclude.Add(typeof(SfPdfDocumentViewRenderer).GetTypeInfo().Assembly);
    assembliesToInclude.Add(typeof(SfRangeSliderRenderer).GetTypeInfo().Assembly);
    //Replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Loading a PDF using MVVM binding

File handling with Xamarin.Forms can be done using embedded resources or writing against the native filesystem APIs. Please find more details in the below link:

<https://developer.xamarin.com/guides/xamarin-forms/application-fundamentals/files/>

Add a folder in the portable project with the name "Assets" and add the PDF document you need to display in the PDF viewer, here a PDF file named "GIS Succinctly.pdf" was used. In the properties of the PDF document set the build action property to be "Embedded Resource".

Add a folder in the portable project with the name "ViewModel" and include a class file with a name "PdfViewerViewModel" inside it. Add below code snippet in the "PdfViewerViewModel" class. Ensure to maintain the namespace as "GettingStarted".

### C#

```
using System.IO;
using System.Reflection;
using System.ComponentModel;
namespace GettingStarted
{
    class PdfViewerViewModel : INotifyPropertyChanged
    {
        private Stream m_pdfDocumentStream;
        /// <summary>
        /// An event to detect the change in the value of a property.
        /// </summary>
        public event PropertyChangedEventHandler PropertyChanged;
        /// <summary>
        /// The PDF document stream that is loaded into the instance of the PDF
        /// viewer.
        /// </summary>
        public Stream PdfDocumentStream
        {
            get
```

```

{
    return m_pdfDocumentStream;
}
set
{
    m_pdfDocumentStream = value;
    NotifyPropertyChanged("PdfDocumentStream");
}
}
/// <summary>
/// Constructor of the view model class
/// </summary>
public PdfViewerViewModel()
{
    //Accessing the PDF document that is added as embedded resource as stream.
    m_pdfDocumentStream =
    typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted
    .Assets.GIS Succinctly.pdf");
}
private void NotifyPropertyChanged(string propertyName)
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
    }
}
}
}
}

```

Add the following XAML code in the MainPage.xaml in the portable project.

- Includes the necessary namespace where the control class resides
- Set BindingContext of ContentPage to PdfViewerViewModel
- Includes PDF Viewer into the page
- Binds InputFileStream property of PDF Viewer control to PdfDocumentStream property of PdfViewerViewModel

#### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
>
<ContentPage.BindingContext>
<local:PdfViewerViewModel></local:PdfViewerViewModel>
</ContentPage.BindingContext>
<Grid x:Name="pdfViewGrid">
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding
PdfDocumentStream}"/>
</Grid>

```

---

</ContentPage>

---

The sample that illustrates loading a PDF in MVVM binding can be downloaded from the link below.

<http://www.syncfusion.com/downloads/support/directtrac/general/ze/GettingStarted-2072455774>

#### *Loading a PDF in code-behind*

In code-behind a PDF can be loaded to PdfViewer just by using the [LoadDocument](#) method without the need of the "PdfViewerViewModel" class described in the previous section. Use the following code snippet in the code-behind of the XAML page.

#### **C#**

```
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        Stream fileStream;
        public MainPage()
        {
            InitializeComponent();
        }
        protected override void OnAppearing()
        {
            base.OnAppearing();
            fileStream =
                typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted
                .Assets.GIS Succinctly.pdf");
            //Load the PDF
            pdfViewerControl.LoadDocument(fileStream);
        }
    }
}
```

In the XAML code described in the previous section, remove the binding of InputFileStream property of SfPdfViewer and the BindingContext of the page.

#### **XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
    xmlns:local="clr-namespace:GettingStarted"
    x:Class="GettingStarted.MainPage"
    xmlns:syncfusion="clr-
    namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
    ms"
>
    <Grid x:Name="pdfViewGrid">
        <syncfusion:SfPdfViewer x:Name="pdfViewerControl" />
    </Grid>
</ContentPage>
```

The sample which illustrates loading a PDF in code-behind using LoadDocument method can be downloaded from the link below.

<http://www.syncfusion.com/downloads/support/directtrac/general/ze/GettingStarted-81946798>

### Unloading PDF document from the Viewer

The SfPdfViewer control allows you to unload the PDF document from the viewer, when the PDF document is not in use anymore. This releases the PDF document and all its associated resources of the application.

You need to call the Unload method of SfPdfViewer control as in the below code snippet to achieve the same.

#### C#

```
//Unloads the PDF document from the PDF viewer, freeing all the accessed resources.  
pdfViewerControl.Unload();
```

### How to get & set the current page number?

PDF viewer has a BindableProperty "PageNumber" using which the current page number can be retrieved and it can be set.

#### XML

```
<Entry Keyboard="Numeric" FontSize="18" x:Name="pageNumberEntry"  
HorizontalTextAlignment="Center" VerticalOptions="Center" Text="{Binding  
PageNumber, Source={x:Reference Name=pdfViewerControl}}"/>
```

On binding the Entry control to PageNumber property of the PDF viewer instance, the number of the current page being displayed in the PDF viewer will be displayed in the Entry control and the PDF viewer would navigate to the page number being entered in the same.

### How to get the total page number?

PDF viewer has a BindableProperty "PageCount" using which the total number of pages in the document can be retrieved.

#### XML

```
<Label x:Name="pageCountLabel" FontSize="18" VerticalTextAlignment="Center"  
HorizontalTextAlignment="Center" HorizontalOptions="FillAndExpand"  
VerticalOptions="Center" Text="{Binding PageCount, Source={x:Reference  
Name=pdfViewerControl}}"/>
```

On binding the Label to PageCount property of the PDF viewer instance, the total number of pages in the document can be displayed.

### How to navigate to next page and previous page?

PDF viewer has "GoToNextPageCommand" and "GoToPreviousPageCommand" which will navigate to the next page and previous page respectively.

#### XML

```
<Button x:Name="goToNextButton" Grid.Column="3"  
BackgroundColor="Transparent" Image="PageDown.png"  
HorizontalOptions="Center" VerticalOptions="Center" Command="{Binding  
GoToNextPageCommand, Source={x:Reference Name=pdfViewerControl}}"/>
```

```
<Button x:Name="goToPreviousButton" Grid.Column="4"
        BackgroundColor="Transparent" Image="PageUp.png" HorizontalOptions="Center"
        VerticalOptions="Center" Command="{Binding GoToPreviousPageCommand,
        Source={x:Reference Name=pdfViewerControl}}"/>
```

If the current page is already the last page of PDF document, then GoToNextPageCommand does not have any effect. Similarly, If the current page is already the first page of PDF document, then GoToPreviousPageCommand does not have any effect.

#### How to detect a page change?

PDF viewer has PageChanged event, which helps detecting changes in the page being displayed in the viewer.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" Grid.Row="1"
        PageChanged="pdfViewerControl_PageChanged"/>
```

#### C#

```
private void pdfViewerControl_PageChanged(object sender,
    Syncfusion.SfPdfViewer.XForms.PageChangedEventArgs args)
{
    int currentPageNumber = args.PageNumber;
}
```

The arguments of the PageChanged event contains details about to which page the document is navigated to.

#### How to get and set the zoom for SfPdfViewer?

PDF viewer has the BindableProperty ZoomPercentage that is used to retrieve and set the current zoom factor.

#### XML

```
<Entry Keyboard="Numeric" FontSize="18" x:Name="zoomPercentage"
        HorizontalTextAlignment="Center" VerticalOptions="Center" Text="{Binding
        ZoomPercentage, Source={x:Reference Name=pdfViewerControl}}"/>
```

On binding the entry control to ZoomPercentage property of the PDF viewer instance, the current zoom percentage being displayed in the PDF viewer is displayed in the entry control, and the PDF viewer would be zoomed based on the value entered.

#### How to get and set Horizontal and Vertical Offsets in PDF Viewer?

Navigate to the specified vertical and horizontal offset values in PDF Viewer using ScrollToOffset (HorizontalOffset and VerticalOffset) methods and you can also retrieve the current horizontal and vertical offset position by using HorizontalOffset and VerticalOffset properties respectively in [SfPdfViewer](#) class.

#### C#

```
//Retrieves the current horizontal offset of the PdfViewerControl
m_currentHorizontalOffset = pdfViewerControl.HorizontalOffset;
//Retrieves the current vertical offset of the PdfViewerControl
```

```
m_currentVerticalOffset = pdfViewerControl.VerticalOffset;  
//Scrolls the content to the specified vertical offset position in the PdfViewerControl  
pdfViewerControl.ScrollToOffset(m_currentHorizontalOffset+10,  
m_currentVerticalOffset+10);
```

## AutomationId

The SfPdfViewer control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the SfPdfViewer control. The following screenshots illustrate the AutomationIds of SfPdfViewer's inner elements.

### Top toolbar

![Top Toolbar](pdfviewerimages/automationid/Top Toolbar.png)

### Bottom toolbar

![Bottom Toolbar](pdfviewerimages/automationid/Bottom Toolbar.png)

### Search toolbar

![Search Toolbar](pdfviewerimages/automationid/Search Toolbar.png)

### Annotation toolbar

![Annotation Toolbar](pdfviewerimages/automationid/Annotation Toolbar.png)

### Text markup annotation toolbar

**View mode toolbar**

![[View mode Toolbar](pdfviewerimages/automationid/Flipview Mode.png)]

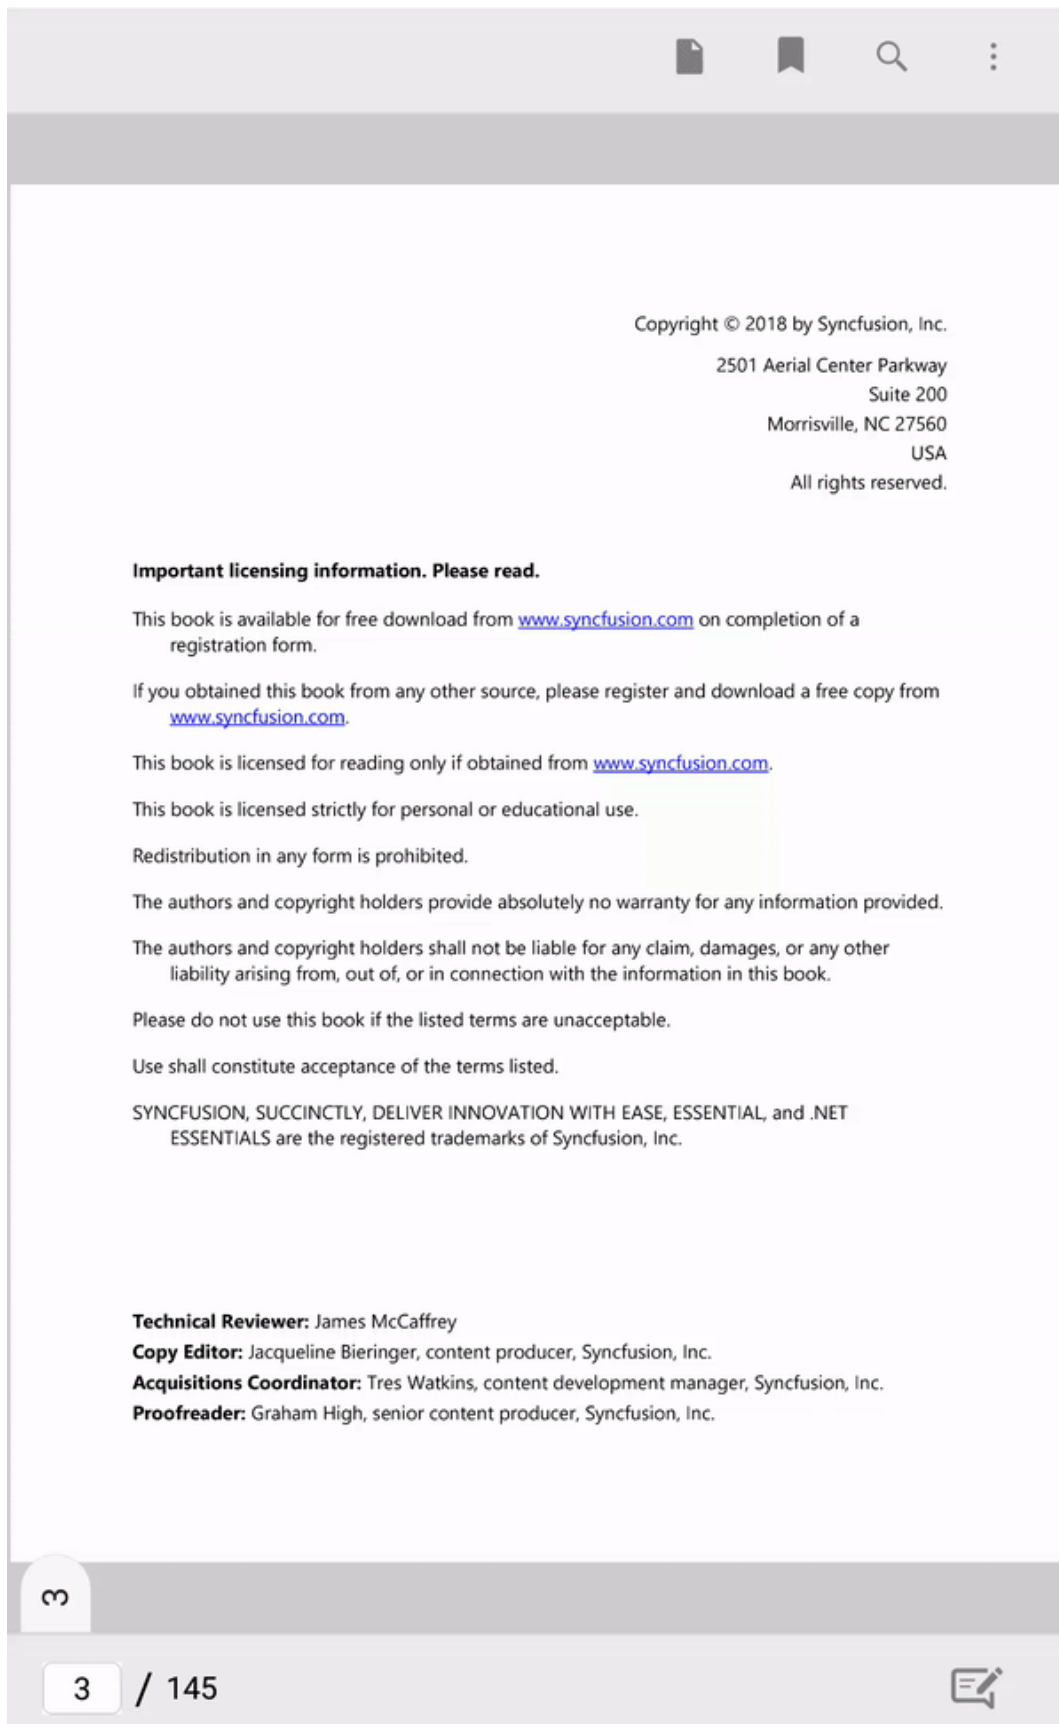

**More options toolbar**

![[More options Toolbar](pdfviewerimages/automationid/More Options Toolbar.png)]

**[Single page view mode](#)**

The default continuous view mode of PDF Viewer allows vertical scrolling. In addition to that, PDF Viewer also provides options to view PDFs page by page with horizontal navigation support.

### Switching between view modes

The view mode can be switched by choosing the corresponding option from the menu bar that appears when the view mode button is clicked. The view mode button is available on the top toolbar.

The view mode can also be changed programmatically using the `PageViewMode` property of the PDF viewer. The enum `PageViewMode` has two constants - `Continuous`, `PageByPage`. The default value is `Continuous`. The below code snippet illustrates how to switch to the page by page view mode.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" PageViewMode="PageByPage" />
```

#### C#

```
pdfViewerControl.PageViewMode = PageViewMode.PageByPage;
```

#### Tracking the changes in the 'PageViewMode' property

When the `PageViewMode` property changes, the `PageViewModeChanged` event is raised. The second parameter of the event handler is of type `PageViewModeChangedEventArgs` which provides the details about the old and new view modes.

#### C#

```
pdfViewerControl.PageViewModeChanged +=
PdfViewerControl_PageViewModeChanged1;
private void PdfViewerControl_PageViewModeChanged1(object sender,
PageViewModeChangedEventArgs e)
{
    PageViewMode oldViewMode = e.PreviousPageViewMode;
    PageViewMode newViewMode = e.CurrentPageViewMode;
}
```

#### Designing a custom toolbar

The built-in toolbar of the PDF Viewer can be disabled and a custom toolbar can be used at the sample. The below code snippet demonstrates how to create a simple toolbar for PDF Viewer with the options such as current page number, total page count in the PDF document, go to previous page and go to next page.

In this project, two images have been used with the names - "PageDown.png" and "PageUp.png", place the images in the below mentioned location within the respective projects.

OS	Location
Android	Resources/drawable
iOS	Resources
UWP	Directly in the project location

The MainPage.xaml would be as mentioned below.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
```

```

xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
>
<ContentPage.BindingContext>
<local:PdfViewerViewModel></local:PdfViewerViewModel>
</ContentPage.BindingContext>
<Grid x:Name="mainGrid">
<Grid.RowDefinitions>
<RowDefinition Height="50" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<AbsoluteLayout>
<Grid x:Name="toolbar" Grid.Row="0" BackgroundColor="#E9E9E9"
HorizontalOptions="Fill" VerticalOptions="Fill">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="1*" />
<ColumnDefinition Width="0.4*" />
<ColumnDefinition Width="1*" />
<ColumnDefinition Width="1*" />
<ColumnDefinition Width="1*" />
</Grid.ColumnDefinitions>
<Entry Keyboard="Numeric" FontSize="18" x:Name="pageNumberEntry"
HorizontalTextAlignment="Center" Grid.Column="0" VerticalOptions="Center"
Text="{Binding PageNumber, Source={x:Reference Name=pdfViewerControl}}"/>
<Label Text="/" Grid.Column="1" FontSize="18" x:Name="slashLabel"
VerticalTextAlignment="Center" HorizontalTextAlignment="Center"
HorizontalOptions="FillAndExpand" VerticalOptions="Center"/>
<Label x:Name="pageCountLabel" Grid.Column="2" FontSize="18"
VerticalTextAlignment="Center" HorizontalTextAlignment="Center"
HorizontalOptions="FillAndExpand" VerticalOptions="Center" Text="{Binding
PageCount, Source={x:Reference Name=pdfViewerControl}}"/>
<Button x:Name="goToNextButton" Grid.Column="3"
BackgroundColor="Transparent" Image="PageDown.png"
HorizontalOptions="Center" VerticalOptions="Center" Command="{Binding
GoToNextPageCommand, Source={x:Reference Name=pdfViewerControl}}"/>
<Button x:Name="goToPreviousButton" Grid.Column="4"
BackgroundColor="Transparent" Image="PageUp.png" HorizontalOptions="Center"
VerticalOptions="Center" Command="{Binding GoToPreviousPageCommand,
Source={x:Reference Name=pdfViewerControl}}"/>
</Grid>
</AbsoluteLayout>
<Grid x:Name="pdfViewGrid" Grid.Row="1">
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding
PdfDocumentStream}"/>
</Grid>
</Grid>
</ContentPage>

```

The final output will look like the below on iOS, Android and Windows (UWP) devices

This demo can be downloaded from the below link.

<http://www.syncfusion.com/downloads/support/directtrac/general/ze/GettingStarted-1533352385>

### Working with built-in toolbar

The SfPdfViewer has a built-in toolbar that has provisions to perform majority of the operations in the PDF Viewer and that can be disabled or enabled. You can disable the built-in toolbar and develop your own toolbar.

#### How to disable/enable built-in toolbar

By default, the built-in toolbar will be enabled. It can be disabled by setting the `Toolbar.Enabled` property of PDF Viewer to false.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace: PdfViewerGettingStarted "
xmlns:syncfusion ="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
x:Class=" PdfViewerGettingStarted.MainPage">
<ContentPage.Resources>
```

```
<ResourceDictionary>
<syncfusion:Toolbar x:Key="ToolbarSettings">
<syncfusion:Toolbar.Enabled>>false
</syncfusion:Toolbar.Enabled>
</syncfusion:Toolbar>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" Toolbar = "{StaticResource
ToolbarSettings}" />
</ContentPage.Content>
</ContentPage>
```

## C#

```
pdfViewerControl.Toolbar.Enabled = false;
```

The toolbar can be enabled by setting the `Toolbar.Enabled` property to true.

## XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
```

```
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace: PdfViewerGettingStarted "
xmlns:syncfusion ="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
x:Class=" PdfViewerGettingStarted.MainPage">
<ContentPage.Resources>
<ResourceDictionary>
<syncfusion:Toolbar x:Key="ToolbarSettings">
<syncfusion:Toolbar.Enabled>true
</syncfusion:Toolbar.Enabled>
</syncfusion:Toolbar>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" Toolbar = "{StaticResource
ToolbarSettings}"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
pdfViewerControl.Toolbar.Enabled = true;
```

---

**Note:** By default, the built-in toolbar of SfPdfViewer is always visible.

---

#### How to disable/enable bookmark

By default, the bookmark button will be enabled. It can be disabled by setting the `BookmarkNavigationEnabled` property of PDF Viewer to false.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace: PdfViewerGettingStarted "
xmlns:syncfusion ="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
x:Class=" PdfViewerGettingStarted.MainPage">
<ContentPage.Content>
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"
BookmarkNavigationEnabled="False"/>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
//Bookmark feature is disabled
pdfViewerControl.BookmarkNavigationEnabled = false;
```

### Search for a text instance

PDF Viewer provides support to find and highlight texts in the PDF document and it provides the following commands to perform text search operation.

Command/Binding property	Action
SearchTextCommand	Command that is executed to search for the specified text instance that is provided as the command parameter.
CancelSearchTextCommand	Command that is executed to cancel the text search operation when it is in progress and used to clear the highlighted text instances when the text search is completed.
SearchNextTextCommand	Command that is executed to navigate to the next text instance being searched.
SearchPreviousTextCommand	Command that is executed to navigate to the previous text instance of the text.

### How to initiate text search?

SearchTextCommand is used to initiate the text search, it takes the text to be searched as a parameter. The command searches for the text in the current page and highlights all the instances of the texts in complete document.

#### XML

```
<Entry x:Name="textSearchEntry" FontSize="18"
HorizontalTextAlignment="Center" HorizontalOptions="Fill"
VerticalOptions="Center"/>
<Button x:Name="searchTextButton" BackgroundColor="Transparent"
Image="SearchIcon.png" HorizontalOptions="Start" Command="{Binding
SearchTextCommand, Source={x:Reference Name=pdfViewerControl}}"
CommandParameter="{Binding Source={x:Reference textSearchEntry},
Path=Text}"/>
```

Here the text entered in the textSearchEntry control is provided as the parameter to the SearchTextCommand.

### How to identify if there is no instance of the text being searched?

SearchCompleted event of the PDF viewer can be used to identify if no instance of the searched text is found in the PDF document. This event has an event argument "NoMatchFound", when this it is true it means that the document does not have any match to the text searched and vice versa.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding
PdfDocumentStream}" SearchCompleted="pdfViewerControl_SearchCompleted" />
```

## C#

```
private void pdfViewerControl_SearchCompleted(object sender,
TextSearchCompletedEventArgs args)
{
    bool isNoMatchFound = args.NoMatchFound;
}
```

How to navigate to the next instance of the text?

SearchNextTextCommand is used to navigate to the next text instances in the PDF document. This command will highlight the current instance of the text with dark blue and all other instances in light blue. On executing the command continuously, the highlighted instance will navigate down the pages.

## XML

```
<Entry x:Name="textSearchEntry" FontSize="18"
HorizontalTextAlignment="Center" HorizontalOptions="Fill"
VerticalOptions="Center"/>
<Button x:Name="searchTextButton" BackgroundColor="Transparent"
Image="SearchIcon.png" HorizontalOptions="Start" Command="{Binding
SearchNextTextCommand, Source={x:Reference Name=pdfViewerControl}}"
CommandParameter="{Binding Source = {x:Reference textSearchEntry},
Path=Text}"/>
```

This command works both with and without a parameter. When a text parameter is provided to this command, it searches for the text provided as the parameter, when no parameter is sent to this command, it searches for the text that is provided as the parameter to the SearchTextCommand.

How to navigate to the previous instance of the text?

SearchPreviousTextCommand is used to navigate to the previous text instances in the PDF document. This command will highlight the current instance of the text with dark blue and all other instances in light blue. On executing the command continuously, the highlighted instance will navigate upwards in the pages.

## XML

```
<Entry x:Name="textSearchEntry" FontSize="18"
HorizontalTextAlignment="Center" HorizontalOptions="Fill"
VerticalOptions="Center"/>
<Button x:Name="searchTextButton" BackgroundColor="Transparent"
Image="SearchIcon.png" HorizontalOptions="Start" Command="{Binding
SearchPreviousTextCommand, Source={x:Reference Name=pdfViewerControl}}"
CommandParameter="{Binding Source = {x:Reference textSearchEntry},
Path=Text}"/>
```

This command works both with and without a parameter. When a text parameter is provided to this command, it searches for the text provided as the parameter, when no parameter is sent to this command, it searches for the text that is provided as the parameter to the SearchTextCommand.

How to identify if a complete cycle of text search is performed?

The first instance of the text in the page the text search is initiated is the first instance of the text, this first instance would be reset when we manually scroll the PDF document while navigating using the SearchNextTextCommand or SearchPreviousTextCommand.

When the search happens to hit the first instance again, the `NoMoreOccurrence` property of the `TextSearchEventArgs` of `SearchCompleted` event will be set to true.

For instance, if the text search is initiated at page 10 of a PDF document, the first instance in the page 10 will be considered as the first instance, on the occurrence of the same instance again in the cycle of text search `NoMoreOccurrence` property will be set to true.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding PdfDocumentStream}" SearchCompleted="pdfViewerControl_SearchCompleted" />
```

### C#

```
private void pdfViewerControl_SearchCompleted(object sender,
TextSearchEventArgs args)
{
    bool isNoMoreOccurrenceFound = args.NoMoreOccurrence;
}
```

### How to cancel text search?

`CancelSearchTextCommand` is used to cancel the text search progress. When the text search is in progress this command can be used to cancel the same, when text search is completed, this command can be used to clear all the highlighted texts in the PDF viewer.

### XML

```
<Button x:Name="cancelSearchButton" Grid.Column="3"
BackgroundColor="Transparent" Image="CancelSearch.png"
HorizontalOptions="Start" VerticalOptions="Center" Command="{Binding
CancelSearchTextCommand, Source={x:Reference Name=pdfViewerControl}}"/>
```

### How to track search progress?

Text search progress can be tracked using the `TextSearchInitiated` event and `TextMatchFound` event.

#### *SearchInitiated*

`TextSearchInitiated` event will be triggered soon after the call of the `SearchTextCommand`, the event argument of this event will contain details about the text being searched.

#### *TextMatchFound*

`TextMatchFound` event will be triggered once when the match of the text is found in the page of the PDF document. When text search is triggered using `SearchTextCommand` this event would be triggered for every page in which the match is found, when text search is triggered using `SearchPreviousCommand` or `SearchNextCommand` this event would be triggered for every match being found.

#### *SearchCompleted*

`TextSearchCompleted` event will be triggered once when all the pages are being search for the match of the input text at-least once. The event argument would contain properties `NoMatchFound` and `NoMoreOccurrenceFound`.

When `NoMatchFound` is set to true, it means that the PDF viewer could not find any match for the searched text in the PDF document.

When NoMoreOccurrence is set to true, it means that the PDF viewer had completed one full cycle of search and has hit the first instance again.

#### Implementing search bar with search features.

With the continuation of the getting started sample, you can extend the UI design to perform the text search in the PDF Viewer. Design the search toolbar in parallel to the main toolbar, here when the main toolbar is visible, search bar will be invisible and vice versa.

- Main toolbar – A new option to initiate text search toolbar will be added to the existing options.
- Search toolbar - A new and separate toolbar is created to search a text instance – it includes option to enter the text, perform search, cancel search and navigate back to the main toolbar.

In the PdfViewerViewModel class, create a new command (named – SearchAndToolbarToggleCommand) to toggle between the main toolbar and search toolbar. The view model class after the creation of the command and necessary boolean variables to toggle the visibility will be like

#### C#

```
using System.IO;
using System.Reflection;
using System.ComponentModel;
using System.Windows.Input;
using Xamarin.Forms;
namespace GettingStarted
{
    class PdfViewerViewModel : INotifyPropertyChanged
    {
        private Stream m_pdfDocumentStream;
        private bool m_isToolbarVisible = true;
        private bool m_isSearchBarVisible = false;
        /// <summary>
        /// An event to detect the change in the value of a property.
        /// </summary>
        public event PropertyChangedEventHandler PropertyChanged;
        /// <summary>
        /// Command used to toggle between search bar and document toolbar.
        /// </summary>
        public ICommand SearchAndToolbarToggleCommand { get; set; }
        /// <summary>
        /// The PDF document stream that is loaded into the instance of the PDF
        viewer.
        /// </summary>
        public Stream PdfDocumentStream
        {
            get
            {
                return m_pdfDocumentStream;
            }
            set
            {
                m_pdfDocumentStream = value;
                NotifyPropertyChanged("PdfDocumentStream");
            }
        }
    }
}
```

```
/// <summary>
/// Gets or sets the bool value which will toggle the visibility of the
/// toolbar.
/// </summary>
/// <remarks>
/// The value true will make the toolbar visible and false would make the
/// toolbar invisible.
/// </remarks>
public bool IsToolbarVisible
{
    get { return m_isToolbarVisible; }
    set
    {
        if (m_isToolbarVisible == value)
            return;
        m_isToolbarVisible = value;
        NotifyPropertyChanged("IsToolbarVisible");
    }
}
/// <summary>
/// Gets or sets the bool value which will toggle the visibility of the
/// search bar.
/// </summary>
/// <remarks>
/// The value true will make the toolbar visible and false would make the
/// search bar invisible.
/// </remarks>
public bool IsSearchBarVisible
{
    get { return m_isSearchBarVisible; }
    set
    {
        if (m_isSearchBarVisible == value)
            return;
        m_isSearchBarVisible = value;
        NotifyPropertyChanged("IsSearchBarVisible");
    }
}
/// <summary>
/// Constructor of the view model class
/// </summary>
public PdfViewerViewModel()
{
    //Accessing the PDF document that is added as embedded resource as stream.
    m_pdfDocumentStream =
        typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted
        .Assets.GIS Succinctly.pdf");
    //Command used to toggle the visibility of the toolbar and search bar.
    SearchAndToolbarToggleCommand= new
        Command<object>(OnSearchAndToolbarToggleCommand, CanExecute);
}
private void NotifyPropertyChanged(string propertyName)
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
    }
}
```

```

}
private bool CanExecute(object parameter)
{
    return true;
}
/// <summary>
/// Method used to toggle the visibility of the toolbar and search bar.
/// </summary>
private void OnSearchAndToolbarToggleCommand(object destinationPageParam)
{
    IsToolbarVisible = !IsToolbarVisible;
    IsSearchBarVisible = !IsToolbarVisible;
}
}
}

```

The complete XAML code after the design of the search bar will look like below

#### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

</Grid>
</Grid>
</ContentPage>

```

### Customizing search highlight color

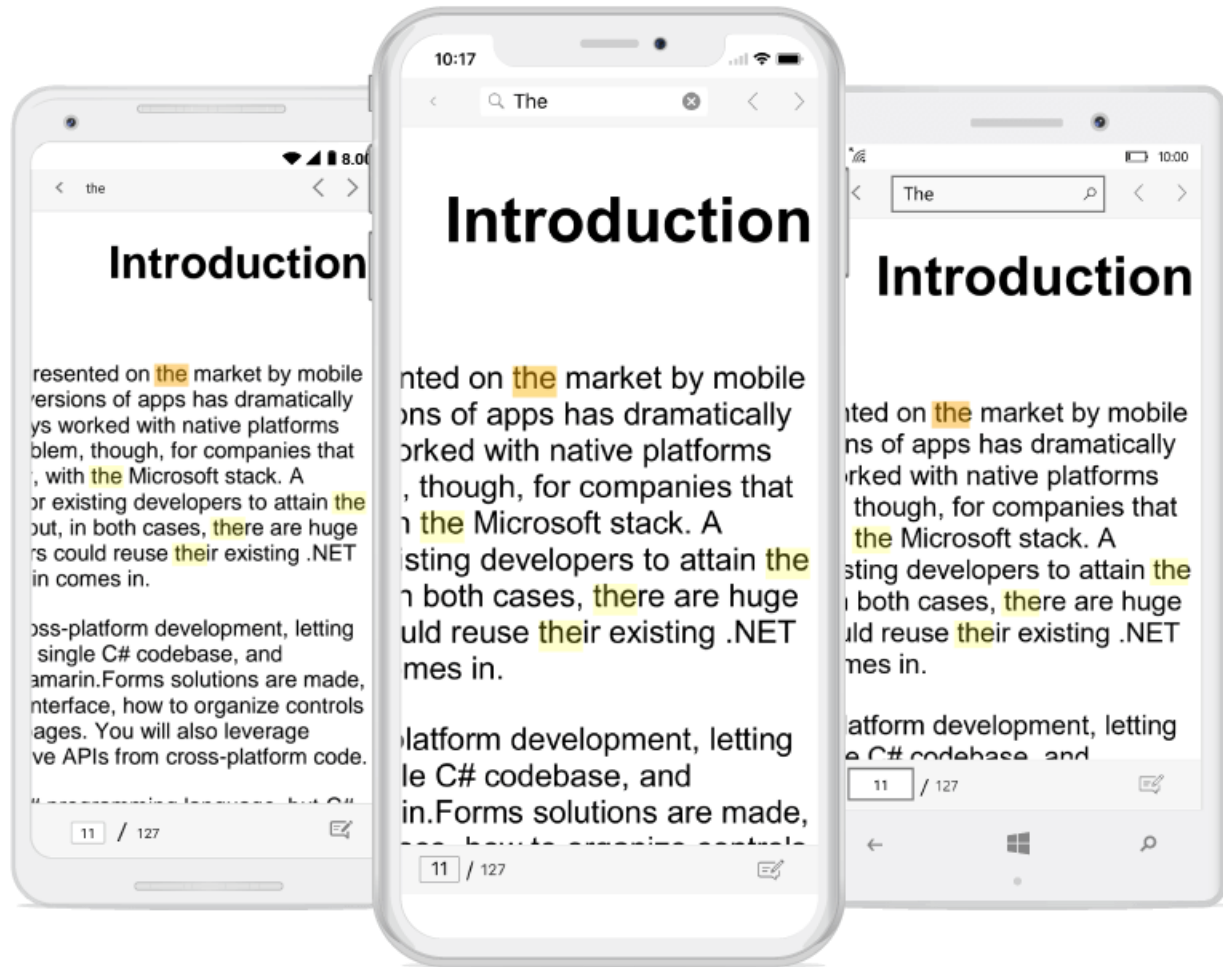

The colors in which the current instance and other instances are highlighted can be customized. The `TextSearchSettings` class in the PDF viewer instance can be used for this purpose.

### C#

```
pdfViewerControl.TextSearchSettings.OtherInstanceColor = Color.FromRgba(255, 255, 0, 50);  
pdfViewerControl.TextSearchSettings.CurrentInstanceColor =  
Color.FromRgba(255, 255, 0, 90);
```

## XML

```
<?xml version="1.0" encoding="utf-8" ?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:local="clr-namespace:GettingStarted"  
x:Class="GettingStarted.MainPage"  
xmlns:syncfusion="clr-  
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor  
ms"  
>  
<ContentPage.Resources>  
<ResourceDictionary>  
<sfpdfviewer:TextSearchSettings x:Key="SearchSettings">  
<sfpdfviewer:TextSearchSettings.CurrentInstanceColor>  
<Color>#90FFFF00</Color>  
</sfpdfviewer:TextSearchSettings.CurrentInstanceColor>  
<sfpdfviewer:TextSearchSettings.OtherInstanceColor>  
<Color>#50FFFF00</Color>  
</sfpdfviewer:TextSearchSettings.OtherInstanceColor>  
</sfpdfviewer:TextSearchSettings>  
</ResourceDictionary>  
</ContentPage.Resources>  
<Grid x:Name="mainGrid">  
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"  
TextSearchSettings="{StaticResource Key=SearchSettings}"/>  
</Grid>  
</ContentPage>
```

### Select and copy text

The PDF viewer supports text selection and copy feature, which allows user to select the text in the PDF document and copy it to the clipboard. This section illustrates about how to use this feature.

Property	Action
IsTextSelectionEnabled	Gets or sets the value that enables or disables the text selection feature in the PDF viewer. This property when set to true enables text selection and vice versa. By default, this property is set to true.

### XML

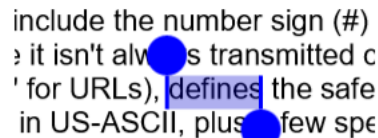

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"
IsTextSelectionEnabled="False"/>
```

### C#

```
//Text selection feature in the PDF viewer is disabled.
pdfViewerControl.IsTextSelectionEnabled = false;
```

### How to select text?

To select a text in the PDF page, press and hold any word of the text until selection bubbles appear at the top-left and bottom-right corners of its bounds. Then, use the left bubble to select the text at the left and top, and the right bubble to select the text at the right and bottom directions.

### How to enable or disable the context menu?

By default, PDF viewer comes with a context menu that will be displayed above the selected text in the PDF document, which has a button (option) to copy the selected text. The display of the context menu can be disabled by setting ShowContextMenu property of the TextSelectionSettings class to false. The below code illustrates the same. By default, context menu will be enabled in the PDF viewer.

#### C#

```
//The display of the default context menu for the text selection is disabled.
pdfViewerControl.TextSelectionSettings.ShowContextMenu = false;
```

### How to modify the selection and its handle color?

The color used for text selection and the color of the handle can be customized based on the developer's requirements. The properties TextSelectionColor and TextSelectionHandleColor of the TextSelectionSettings class can be used to customize them. The below code snippet illustrates the same.

#### C#

```
//Customizing the color being displayed while selecting the text from PDF document.
pdfViewerControl.TextSelectionSettings.TextSelectionColor =
Color.FromRgba(0, 0, 205, 80);
//Customizing the color of text selection handler displayed while selecting the text from PDF document.
pdfViewerControl.TextSelectionSettings.TextSelectionHandleColor =
Color.FromRgb(0, 0, 255);
```

### How to acquire selected text?

The completion of the text selection action would trigger TextSelectionCompleted event. The event argument of this event will contain a copy of the selected text in the String format.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding PdfDocumentStream}"
TextSelectionCompleted="PdfViewerControl_TextSelectionCompleted"/>
```

#### C#

```
private void PdfViewerControl_TextSelectionCompleted(object sender,
TextSelectionCompletedEventArgs args)
{
```

```
//The selected text is acquired and stored in the variable selectedText.  
string selectedText = args.SelectedText;  
}
```

How to acquire page number, page bounds and selected region?

The completion of the text selection action would trigger TextSelectionCompleted event. The event argument would contain details about the page number in which the selection operation is performed, bounds of the page and the selection region.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding  
PdfDocumentStream}"  
TextSelectionCompleted="PdfViewerControl_TextSelectionCompleted"/>
```

#### C#

```
private void PdfViewerControl_TextSelectionCompleted(object sender,  
TextSelectionCompletedEventArgs args)  
{  
//The number of the page in which the selection is performed is acquired.  
int pageNumber = args.PageNumber;  
//The bounds of the page in which the selection is performed is acquired.  
Rectangle pageBounds= args.PageBounds;  
//The region of the text being selected is acquired.  
Rectangle selectedRegion= args.SelectedRegion;  
}
```

### Working with Hyperlink navigation

PDF viewer supports hyperlink navigation that detects hyperlinks and tapping on the hyperlink will open the URL in the browser.

How to disable hyperlink navigation in PDF document using PDF viewer control?

You can disable the hyperlink navigation by setting the "AllowHyperlinkNavigation" property of PDF viewer to false. By default, hyperlink navigation is enabled in PDF viewer.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"  
AllowHyperlinkNavigation="False" InputFileStream="{Binding  
PdfDocumentStream}" />
```

How to acquire the properties of clicked URI from PDF viewer?

You can acquire the details of the hyperlink that is tapped in the PDF viewer control from the HyperlinkClickedEventArgs and HyperlinkClicked event. Refer to the following code snippet for more details.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"  
HyperlinkClicked="pdfViewerControl_HyperlinkClicked"  
InputFileStream="{Binding PdfDocumentStream}" />
```

## C#

```
public void pdfViewerControl_HyperlinkClicked(object sender, HyperlinkClickedEventArgs args)
{
    // Gets or sets a value indicating whether the hyperlink navigation was handled.
    args.Handled = false;
    // Gets the hyperlink being clicked.
    string uri = args.Uri;
    // Gets the current page index of the hyperlink.
    int pageIndex = args.PageIndex;
    //Gets the bounds of the hyperlink is being clicked.
    Rectangle hyperlinkBound = args.Bounds;
}
```

## Working with Document Link Annotation (Table of content)

The PDF viewer navigates to a specific destination within the PDF document.

How to disable document link navigation in PDF document using PDF viewer control?

Set the "EnableDocumentLinkAnnotation" property to false to disable the document link navigation in PDF viewer.

## XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"
    EnableDocumentLinkAnnotation="false" InputFileStream="{Binding PdfDocumentStream}" />
```

---

**Note:** By default, the EnableDocumentLinkAnnotation property is set to true.

---

## Working with ink annotation

PDF viewer allows you to include ink annotation in the PDF document and provides options to edit or remove the existing ink annotation in the PDF document.

### Inclusion of ink annotation

This section describes how to include ink annotation in PDF viewer control Xamarin.Forms.

### Enabling ink annotation mode

Set the `AnnotationMode` property of the PDF viewer object to `ink` to enable the ink annotation. By setting this, zooming and scrolling will be disabled and touch interactions will be converted into inks on the PDF pages. Refer to the following code.

## C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMode = AnnotationMode.Ink;
```

## XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>
<Button x:Name="inkAnnotationButton" Command="{Binding AnnotationModeCommand, Source={x:Reference Name=pdfViewer}}"
    CommandParameter="Ink" />
```

Use the following code to reset the annotation mode to none.

### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.AnnotationMode = AnnotationMode.None;
```

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>  
<Button x:Name="resetAnnotationButton" Command="{Binding  
AnnotationModeCommand, Source={x:Reference Name=pdfViewer}}"  
CommandParameter="None" />
```

### *Adding ink annotation*

Steps involved in adding ink annotation to the PDF document:

1. Switch to ink annotation mode. 2. Add inks to the pages of the PDF document, this will be recorded as a session. 3. You can perform undo and redo operations for every stroke made in the session. 4. You can also choose the color and thickness of the ink, here color and thickness are restricted to the complete ink and not individual strokes. 5. After adding ink annotation, you can either accept or discard the changes.

### *How to accept and include the ink annotation on to the PDF viewer?*

The following code can be used to accept and include the drawn ink annotation to the PDF viewer control.

### C#

```
pdfViewer.EndInkSession(true);
```

### *How to ignore/discard drawn ink annotation from the PDF viewer before inclusion?*

The following code can be used to ignore or discard the drawn ink annotation to the PDF viewer control.

### C#

```
pdfViewer.EndInkSession(false);
```

### *How to identify whether the ink annotation is included?*

You can identify whether the drawn ink annotation has been added to the PDF viewer control or not by using the **InkAdded** event. This event will be raised once the annotation is added.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer" InkAdded="PdfViewer_InkAdded"/>
```

### C#

```
private void PdfViewer_InkAdded(object sender, InkAddedEventArgs args)  
{  
    //Retrieves the bounds of the deselected annotation.  
    Rectangle bounds = args.Bounds;
```

```
//Retrieves the page number where the deselected annotation resides.  
int pageNumber = args.PageNumber;  
//Retrieves the color of the deselected annotation.  
Color color = args.Color;  
//Retrieves the thickness of the deselected annotation.  
float thickness = args.Thickness;  
//Retrieves the opacity of the deselected annotation.  
float opacity = args.Opacity;  
}
```

How to perform undo and redo operation during inking session?

You can perform undo and redo operations on the drawn ink annotations during the pre-conformance session.

The following code can be used to perform undo operation on the ink annotations drawn over the PDF viewer control.

#### **C#**

```
pdfViewer.UndoInk();
```

You can identify the undo operation in this session using the following event.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer" CanUndoInkModified =  
"PdfViewer_CanUndoInkModified" />
```

#### **C#**

```
private void PdfViewer_CanUndoInkModified(object sender,  
CanUndoInkModifiedEventArgs args)  
{  
    bool canUndoInk = args.CanUndoInk;  
}
```

The following code can be used to perform redo operation on the ink annotations drawn over the PDF viewer control.

#### **C#**

```
pdfViewer.RedoInk();
```

You can identify the redo operation in this session using the following event.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer" CanRedoInkModified =  
"PdfViewer_CanRedoInkModified" />
```

#### **C#**

```
private void PdfViewer_CanRedoInkModified(object sender,  
CanRedoInkModifiedEventArgs args)
```

```
{  
    bool CanRedoInk = args.CanRedoInk;  
}
```

### Deleting ink annotation

The PDF viewer can remove a selected annotation or all the annotations in the PDF document.

#### *Removing a selected annotation.*

The following code snippet illustrates removing a selected annotation from the PDF document.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
    InkSelected="PdfViewer_InkSelected"/>
```

#### **C#**

```
private void PdfViewer_InkSelected(object sender, InkSelectedEventArgs args)  
{  
    //Casts the sender object as Ink annotation.  
    InkAnnotation selectedInkAnnotation = sender as InkAnnotation;  
    //Removes the selected annotation from the PDF viewer.  
    pdfViewer.RemoveAnnotation(selectedInkAnnotation);  
}
```

#### *How to identify the removal of ink annotation?*

You can identify removal of ink annotation using the **InkRemoved** event, which is available in the PDF viewer control. This event will be raised when you remove the ink annotation from the PDF viewer control.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
    InkRemoved="PdfViewer_InkRemoved"/>
```

The following C# code shows how to acquire bounds, page number, color, thickness, and opacity of the removed ink annotation.

#### **C#**

```
private void PdfViewer_InkRemoved(object sender, InkRemovedEventArgs args)  
{  
    //Retrieves the bounds of the deselected annotation.  
    Rectangle bounds = args.Bounds;  
    //Retrieves the page number where the deselected annotation resides.  
    int pageNumber = args.PageNumber;  
    //Retrieves the color of the deselected annotation.  
    Color color = args.Color;  
    //Retrieves the thickness of the deselected annotation.  
    float thickness = args.Thickness;  
    //Retrieves the opacity of the deselected annotation.  
    float opacity = args.Opacity;  
}
```

## Working with ink annotation settings

You can customize the color, opacity, and thickness of the ink annotation.

### Changing the color

You can set the color of the ink annotation by using the `AnnotationSettings.Ink.Color` property. Refer to the following code sample.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace: PdfViewerGettingStarted "
xmlns:syncfusion ="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
x:Class=" PdfViewerGettingStarted.MainPage">
<ContentPage.Resources>
<ResourceDictionary>
<syncfusion:AnnotationSettings x:Key="InkAnnotationSettings">
<syncfusion:AnnotationSettings.Ink>
<Color>#FFFF0000</Color>
</syncfusion:AnnotationSettings.Ink>
</syncfusion:AnnotationSettings>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<syncfusion:SfPdfViewer x:Name="pdfViewer"
AnnotationSettings="{StaticResource InkAnnotationSettings}"/>
</ContentPage.Content>
</ContentPage>
```

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMode = AnnotationMode.Ink;
pdfViewer.AnnotationSettings.Ink.Color = Color.Red;
```

### Changing the opacity

You can set the opacity of the ink annotation by using the `AnnotationSettings.Ink.Opacity` property. Opacity value ranges from 0 to 1. Refer to the following code example.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace: PdfViewerGettingStarted "
xmlns:syncfusion ="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
x:Class=" PdfViewerGettingStarted.MainPage">
<ContentPage.Resources>
<ResourceDictionary>
<syncfusion:AnnotationSettings x:Key="InkAnnotationSettings">
<syncfusion:AnnotationSettings.Ink>
<Opacity>0.5</Opacity>
```

```

</syncfusion:AnnotationSettings.Ink>
</syncfusion:AnnotationSettings>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<syncfusion:SfPdfViewer x:Name="pdfViewer"
AnnotationSettings="{StaticResource InkAnnotationSettings}"/>
</ContentPage.Content>
</ContentPage>

```

## C#

```

SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMode = AnnotationMode.Ink;
pdfViewer.AnnotationSettings.Ink.Opacity = 0.5f;

```

### Changing the thickness

You can set the thickness of the ink annotation by using the `AnnotationSettings.Ink.Thickness` property. Refer to the following code example.

## XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace: PdfViewerGettingStarted "
xmlns:syncfusion ="clr-
namespace:Syncfusion.SfPdfViewer.XForms;assembly=Syncfusion.SfPdfViewer.XFor
ms"
x:Class=" PdfViewerGettingStarted.MainPage">
<ContentPage.Resources>
<ResourceDictionary>
<syncfusion:AnnotationSettings x:Key="InkAnnotationSettings">
<syncfusion:AnnotationSettings.Ink>
<Thickness>5</Thickness>
</syncfusion:AnnotationSettings.Ink>
</syncfusion:AnnotationSettings>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<syncfusion:SfPdfViewer x:Name="pdfViewer"
AnnotationSettings="{StaticResource InkAnnotationSettings}"/>
</ContentPage.Content>
</ContentPage>

```

## C#

```

SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMode = AnnotationMode.Ink;
pdfViewer.AnnotationSettings.Ink.Thickness = 5;

```

### How to select the ink annotation?

You can select the ink annotation by tapping the annotation.

### How to change the properties of ink annotation after selection?

You can select and change the properties of the ink annotation using the `InkSelected` event. This event will be raised when you select the ink annotation. This is illustrated in the following code sample.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
InkSelected="PdfViewer_InkSelected" />
```

You can change the properties of the selected annotation using the `InkSelectedEventArgs` object. The following code shows how to change the properties of the selected annotation in the `InkSelectedEventHandler`.

#### C#

```
private void pdfViewer_InkSelected(object sender, InkSelectedEventArgs args)
{
    //Casts the sender object as Ink annotation.
    InkAnnotation selectedInkAnnotation = sender as InkAnnotation;
    //Sets the color of the selected annotation using ink annotation settings.
    selectedInkAnnotation.Settings.Color = Color.Blue;
    //Sets the opacity of the selected annotation using ink annotation settings.
    selectedInkAnnotation.Settings.Opacity = 0.3f;
    //Sets the thickness of the selected annotation using ink annotation
    settings.
    selectedInkAnnotation.Settings.Thickness = 3;
}
```

You can identify whether the ink annotation is tapped or not using the `InkTapped` event. This event will be triggered if you tap the ink annotation whether to select or deselect the annotation.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer" InkTapped="PdfViewer_InkTapped"/>
```

#### C#

```
private void PdfViewer_InkTapped(object sender, InkTappedEventArgs args)
{
    //Retrieves the bounds of the deselected annotation.
    Rectangle bounds = args.Bounds;
    //Retrieves the page number where the deselected annotation resides.
    int pageNumber = args.PageNumber;
    //Retrieves the color of the deselected annotation.
    Color color = args.Color;
    //Retrieves the thickness of the deselected annotation.
    float thickness = args.Thickness;
    //Retrieves the opacity of the deselected annotation.
    float opacity = args.Opacity;
}
```

### How to deselect the ink annotation?

You can deselect the ink annotation by tapping on the selected annotation or on the PDF page. Deselection can be identified using the `InkDeselected` event.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
InkDeselected="PdfViewer_InkDeselected"/>
```

The following code shows how to identify the deselected annotation from the raised event.

#### C#

```
private void PdfViewer_InkDeselected(object sender, InkDeselectedEventArgs
args)
{
    //Retrieves the bounds of the deselected annotation.
    Rectangle bounds = args.Bounds;
    //Retrieves the page number where the deselected annotation resides.
    int page = args.PageNumber;
    //Retrieves the color of the deselected annotation.
    Color color = args.Color;
    //Retrieves the thickness of the deselected annotation.
    float thickness = args.Thickness;
    //Retrieves the opacity of the deselected annotation.
    float opacity = args.Opacity;
}
```

### How to move or resize the selected ink annotation?

Select and drag the annotation to move or resize the ink annotation.

#### How to identify whether the ink annotation is moved or resized?

The event `AnnotationMovedOrResized` will be raised when you move or resize the selected annotation.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
AnnotationMovedOrResized="PdfViewer_AnnotationMovedOrResized"/>
```

#### C#

```
private void PdfViewer_AnnotationMovedOrResized(object sender,
AnnotationMovedOrResizedEventArgs args)
{
    //Retrieves the old bounds of the annotation
    Rectangle oldBounds = args.OldBounds;
    //Retrieves the new bounds of the annotation
    Rectangle newBounds = args.NewBounds;
}
```

## Working with handwritten signatures

PDF viewer allows you to include handwritten signatures in PDF documents and provides options to modify or remove the existing ones.

## Adding handwritten signatures

### Enabling handwritten signature mode

Set the `AnnotationMode` property of the PDF viewer instance to `HandwrittenSignature`. After setting the signature mode the signature pad would appear on which the signature can be drawn. After drawing the signature, the `Done` button should be tapped to add the drawn signature to the PDF, you can use clear button to redraw the signature or close button to cancel signing.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>
<Button x:Name="signatureButton" Command="{Binding AnnotationModeCommand,
Source={x:Reference Name=pdfViewer}}"
CommandParameter="HandwrittenSignature" />
```

#### C#

```
pdfViewer.AnnotationMode = AnnotationMode.HandwrittenSignature;
```

### Disabling handwritten signature mode

Setting the `AnnotationMode` to `None` will disable the signature mode and would hide the signature pad.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>
<Button x:Name="resetAnnotationButton" Command="{Binding
AnnotationModeCommand, Source={x:Reference Name=pdfViewer}}"
CommandParameter="None" />
```

#### C#

```
pdfViewer.AnnotationMode = AnnotationMode.None;
```

## Customizing the appearance of handwritten signatures

You can customize the default values such as stroke color, opacity, and thickness of all signatures to be added. This will not affect the already added signatures.

### Setting the default stroke color

You can set the default stroke color of handwritten signatures by using the `SfPdfViewer.AnnotationSettings.HandwrittenSignature.Color` property. Refer to the following code.

#### C#

```
pdfViewer.AnnotationSettings.HandwrittenSignature.Color = Color.Red;
```

### Setting the default opacity

You can set the default opacity of handwritten signatures by using the `SfPdfViewer.AnnotationSettings.HandwrittenSignature.Opacity` property. Opacity value ranges from 0 to 1. Refer to the following code example.

#### C#

```
pdfViewer.AnnotationSettings.HandwrittenSignature.Opacity = 0.5f;
```

### Setting the default thickness

You can set the thickness of handwritten signatures by using the `SfPdfViewer.AnnotationSettings.HandwrittenSignature.Thickness` property. Refer to the following code example.

#### C#

```
pdfViewer.AnnotationSettings.HandwrittenSignature.Thickness = 5;
```

### Similarity with Ink annotations

The handwritten signatures are preserved as ink annotations in PdfViewer. However, on saving you can choose whether to preserve the signature as ink annotation or flatten it. This can be achieved using the `pdfViewer.AnnotationSettings.HandwrittenSignature.FlattenSignatureOnSave` property.

#### C#

```
pdfViewer.AnnotationSettings.HandwrittenSignature.FlattenSignatureOnSave = true;
```

**Note:** The default value of the property is `true`.

### Events

Since the handwritten signature is preserved as ink annotation, the events for both handwritten signatures and ink annotations are same. The events supported by ink annotations are described in detail [here](#).

When the common events occur, ink annotation and handwritten signature can be distinguished using the event argument's `IsChildSignature` property. Also, the `sender` parameter will be of type `InkAnnotation` and `HandwrittenSignature` for the respective annotations. For brevity, only the `InkSelected` event is illustrated below.

#### C#

```
pdfViewer.InkSelected += PdfViewer_InkSelected;
private void PdfViewer_InkSelected(object sender,
Syncfusion.SfPdfViewer.XForms.InkSelectedEventArgs args)
{
    if (args.IsSignature)
    {
        //The event occurred was raised by handwritten signature
        //The "sender" parameter is of type "HandwrittenSignature"
    }
    else
    {
        //The event occurred was raised by ink annotation
        //The "sender" parameter is of type "InkAnnotation"
    }
}
```

## Working with shape annotations

PDF viewer allows you to include shape annotations in a PDF document and provides options to modify or remove the existing shape annotations. The supported shape annotations are:

1. Rectangle
2. Circle
3. Line
4. Arrow

In all the code snippets, Rectangle shape annotation is used for illustration purpose.

### Adding shape annotations

#### Enabling shape annotation mode

Set the `AnnotationMode` property of the PDF viewer to `Rectangle`. After setting the annotation mode to any of the shapes, the zooming, panning, and scrolling options will be disabled. The shapes can be drawn only on the currently visible page area. Refer to the following code.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>
<Button x:Name="shapeAnnotationButton" Command="{Binding
AnnotationModeCommand, Source={x:Reference Name=pdfViewer}}"
CommandParameter="Rectangle" />
```

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMode = AnnotationMode.Rectangle;
```

#### Disabling shape annotation mode

Setting the `AnnotationMode` to `None` disables the shape annotation mode. When the annotation mode is reset, the zooming, panning, and scrolling will be enabled again.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>
<Button x:Name="resetAnnotationButton" Command="{Binding
AnnotationModeCommand, Source={x:Reference Name=pdfViewer}}"
CommandParameter="None" />
```

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMode = AnnotationMode.None;
```

#### Detecting the inclusion shape annotations

The event `ShapeAnnotationAdded` will be raised when shape annotations are added to the PDF.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
ShapeAnnotationAdded="PdfViewer_ShapeAnnotationAdded"/>
```

**C#**

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.ShapeAnnotationAdded += PdfViewer_ShapeAnnotationAdded;
```

## Detecting tap on shape annotations

Tapping a shape annotation selects it or deselects it if it is already selected. The event `ShapeAnnotationTapped` is raised when a shape is tapped.

**XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
ShapeAnnotationTapped="PdfViewer_ShapeAnnotationTapped"/>
```

**C#**

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.ShapeAnnotationTapped += PdfViewer_ShapeAnnotationTapped;
```

## Selecting shape annotations

You can select a shape annotation by tapping on it, this action is followed by the appearance of the selector around the selected annotation. When a shape is selected, the `ShapeAnnotationSelected` event will be raised.

The properties of the selected shape annotation can be obtained from the `args` parameter of the event handler.

**C#**

```
private void PdfViewer_ShapeAnnotationSelected(object sender,  
ShapeAnnotationSelectedEventArgs args)  
{  
    //Get the type of the annotation. Here it is rectangle  
    AnnotationMode annotationMode = args.AnnotationType;  
    //Get the bounds of the rectangle  
    Rectangle bounds = args.Bounds;  
    //Get the page number in which the annotations are present  
    int pageNumber = args.PageNumber;  
}
```

## Deselecting shape annotations

You can deselect a selected shape annotation by tapping on it or somewhere else on the PDF page. Deselection can be detected using the `ShapeAnnotationDeselected` event.

**XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
ShapeAnnotationDeselected="PdfViewer_ShapeAnnotationDeselected"/>
```

**C#**

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.ShapeAnnotationDeselected += PdfViewer.ShapeAnnotationDeselected;
```

### Customizing the appearance of shape annotations

You can customize the default values of stroke color, opacity, and thickness of all shape annotations to be added. This will not affect the already added shape annotations. The appearance of a selected free text can also be modified.

#### Setting the default stroke color

You can set the default stroke color of the shape annotations by using the `SfPdfViewer.AnnotationSettings.Rectangle.Settings.StrokeColor` property. Refer to the following code.

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.AnnotationSettings.Rectangle.Settings.StrokeColor = Color.Red;
```

#### Setting the default opacity

You can set the default opacity of the shape annotations by using the `SfPdfViewer.AnnotationSettings.Rectangle.Settings.Opacity` property. Opacity value ranges from 0 to 1. Refer to the following code example.

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.AnnotationSettings.Rectangle.Settings.Opacity = 0.5f;
```

#### Setting the default thickness

You can set the thickness of the shape annotations by using the `SfPdfViewer.AnnotationSettings.Rectangle.Settings.Thickness` property. Refer to the following code example.

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.AnnotationSettings.Rectangle.Settings.Thickness = 5;
```

### Changing the properties of a selected shape

You can change the properties of the selected annotation by casting the `sender` parameter of the `ShapeAnnotationSelected` event handler to `ShapeAnnotation` and modifying its properties. The following code shows how to change the properties.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
ShapeAnnotationSelected="PdfViewer.ShapeAnnotationSelected" />
```

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();  
pdfViewer.ShapeAnnotationSelected += PdfViewer.ShapeAnnotationSelected;
```

**C#**

```
private void PdfViewer_ShapeAnnotationSelected(object sender,
Syncfusion.SfPdfViewer.XForms.ShapeAnnotationSelectedEventArgs args)
{
    //Get the type of the annotation. Here it is Rectangle
    AnnotationMode annotationMode = args.AnnotationType;
    //Cast the sender object as shape annotation.
    ShapeAnnotation selectedShapeAnnotation = sender as ShapeAnnotation;
    //Set the stroke color of the selected annotation using shape annotation
    settings.
    selectedShapeAnnotation.Settings.StrokeColor = Color.Blue;
    //Set the opacity of the selected annotation using shape annotation
    settings.
    selectedShapeAnnotation.Settings.Opacity = 0.3f;
    //Set the thickness of the selected annotation using shape annotation
    settings.
    selectedShapeAnnotation.Settings.Thickness = 3;
}
```

**Moving or resizing shape annotations**

Select the shape annotation to move or resize it. After the selector appears around the annotation, dragging the annotation by tapping anywhere inside the selector will move the annotation. Similarly, tapping and dragging on the corner bubbles will resize the selected annotation.

**Detecting the move or resize of a shape**

The event **AnnotationMovedOrResized** will be raised when you move or resize the selected annotation.

**XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
AnnotationMovedOrResized="PdfViewer_AnnotationMovedOrResized"/>
```

**C#**

```
SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMovedOrResized += PdfViewer_AnnotationMovedOrResized;
```

**C#**

```
private void PdfViewer_AnnotationMovedOrResized(object sender,
AnnotationMovedOrResizedEventArgs args)
{
    //Determine whether the moved or resized annotation is a shape or some other
    annotation.
    if(sender as ShapeAnnotation == null)
    {
        //The annotation is not a shape
    }
    else
    {
        //The annotation is a shape
    }
}
```

```
}  
//Retrieve the old bounds of the annotation  
Rectangle oldBounds = args.OldBounds;  
//Retrieve the new bounds of the annotation  
Rectangle newBounds = args.NewBounds;  
}
```

### Deleting shape annotations

The PDF viewer supports removing a single annotation and all the annotations in the PDF document.

#### Removing a selected annotation

The following code snippet illustrates removing a selected annotation from the PDF document.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
ShapeAnnotationSelected="PdfViewer_ShapeAnnotationSelected"/>  
<Button x:Name="deleteShapeAnnotationButton" Grid.Row="1"  
Clicked="deleteShapeAnnotationButton_Clicked" />
```

#### C#

```
ShapeAnnotation selectedShapeAnnotation;  
private void PdfViewer_ShapeAnnotationSelected(object sender,  
ShapeAnnotationSelectedEventArgs args)  
{  
    //Cast the sender object as Shape annotation.  
    selectedShapeAnnotation = sender as ShapeAnnotation;  
}  
private void deleteShapeAnnotationButton_Clicked(object sender, EventArgs e)  
{  
    //Delete the selected shape annotation  
    pdfViewer.RemoveAnnotation(selectedShapeAnnotation);  
}
```

#### Removing all annotations

The following code snippet illustrates removing all annotations from the PDF.

#### C#

```
pdfViewer.ClearAllAnnotations();
```

#### Detecting the removal of a shape

The event **ShapeAnnotationRemoved** will be raised when a shape annotation is removed from the PDF.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
ShapeAnnotationRemoved="PdfViewer_ShapeAnnotationRemoved"/>
```

#### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();
```

```
pdfViewer.ShapeAnnotationRemoved += PdfViewer.ShapeAnnotationRemoved;
```

The properties of the removed shape annotation can be obtained from the `args` parameter of the event handler.

### C#

```
private void PdfViewer_ShapeAnnotationRemoved(object sender,
ShapeAnnotationRemovedEventArgs args)
{
    //Get the type of the annotation. Here it is rectangle
    AnnotationMode annotationMode = args.AnnotationType;
    //Get the bounds of the rectangle
    Rectangle bounds = args.Bounds;
    //Get the data points of the shape
    List<Point> dataPoints = args.DataPoints;
    //Get the opacity value
    float opacity = args.Opacity;
    //Get the page number in which the annotations are present
    int pageNumber = args.PageNumber;
    //Get the position of the shape within the page
    Point position = args.Position;
    //Get the stroke color of the shape
    Color strokeColor = args.StrokeColor;
    //Get the thickness of the shape
    float thickness = args.Thickness;
}
```

## Working with free text annotations

PDF viewer allows you to include free text annotations in a PDF document and provides options to modify or remove the existing ones.

### Adding free text annotations

#### Enabling free text annotation mode

Set the `AnnotationMode` property of the PDF viewer to `FreeText`. After setting the annotation mode, the zooming, panning, and scrolling will be disabled. Tap anywhere on the displayed PDF page, a popup will appear. Type the text in the popup and click `&#34;Ok&#34;` to add text to the page. Once the free text annotation is added, the zooming, panning, and scrolling will be enabled again.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>
<Button x:Name="freeTextAnnotationButton" Command="{Binding
AnnotationModeCommand, Source={x:Reference Name=pdfViewer}}">
    CommandParameter="FreeText" />
```

### C#

```
SfPdfViewer pdfViewer = new SfPdfViewer();
pdfViewer.AnnotationMode = AnnotationMode.FreeText;
```

#### Disabling free text annotation mode

Setting the annotation mode to `None` disables the free text mode.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"/>
<Button x:Name="resetAnnotationButton" Command="{Binding
AnnotationModeCommand, Source={x:Reference Name=pdfViewer}}"
CommandParameter="None" />
```

### C#

```
pdfViewer.AnnotationMode = AnnotationMode.None;
```

#### Detecting the inclusion of free text annotations

The event `FreeTextAnnotationAdded` will be raised when a free text annotation is added to the PDF.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
FreeTextAnnotationAdded="PdfViewer_FreeTextAnnotationAdded"/>
```

### C#

```
pdfViewer.FreeTextAnnotationAdded += PdfViewer_FreeTextAnnotationAdded;
```

#### Detecting tap on free text annotations

Tapping a free text annotation selects it or deselects if it is already selected. The event `FreeTextAnnotationTapped` is raised when a free text is tapped.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
FreeTextAnnotationTapped="PdfViewer_FreeTextAnnotationTapped"/>
```

### C#

```
pdfViewer.FreeTextAnnotationTapped += PdfViewer_FreeTextAnnotationTapped;
```

#### Selecting free text annotations

You can select a free text annotation by tapping on it. When a free text is selected, the `FreeTextAnnotationSelected` event will be raised. The properties of the selected free text can be retrieved using the `args` parameter of the event handler.

### C#

```
private void PdfViewer_FreeTextAnnotationSelected(object sender,
FreeTextAnnotationSelectedEventArgs args)
{
    //Get the bounds
    Rectangle bounds = args.Bounds;
    //Get the page number on which the deselected free text is
    int pageNumber = args.PageNumber;
    //Get the text of the free text annotation
    string text = args.Text;
    //Get the text color
}
```

```
Color textColor = args.TextColor;
//Get the text size
float textSize = args.TextSize;
}
```

### Deselecting free text annotations

You can deselect a selected free text annotation by tapping on it or somewhere on the PDF page. Deselection can be detected using the `FreeTextAnnotationDeselected` event.

#### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
FreeTextAnnotationDeselected="PdfViewer_FreeTextAnnotationDeselected"/>
```

#### C#

```
pdfViewer.FreeTextAnnotationDeselected +=
PdfViewer_FreeTextAnnotationDeselected;
```

### Customizing the appearance of free text annotations

You can customize the default text color and text size of free text annotations to be added. This will not affect the already added free text annotations. The appearance of a selected free text can also be modified.

#### Setting the default text color

You can set the default text color of the free text annotations by using the `SfPdfViewer.AnnotationSettings.FreeTextAnnotationSettings.TextColor` property. Refer to the following code.

#### C#

```
pdfViewer.AnnotationSettings.FreeTextAnnotationSettings.TextColor =
Color.Red;
```

#### Setting the default text size

You can set the default text size of the free text annotations by using the `SfPdfViewer.AnnotationSettings.FreeTextAnnotationSettings.TextSize` property. Refer to the following code example.

#### C#

```
pdfViewer.AnnotationSettings.FreeTextAnnotationSettings.TextSize = 4;
```

### Changing the properties of a selected free text

You can change the properties of the selected annotation by casting the `sender` parameter of the `FreeTextAnnotationSelected` event handler to `FreeTextAnnotation` and modify its properties. The following code shows how to change the properties.

#### C#

```
Button changeFreeTextPropertiesButton = new Button();
```

```
changeFreeTextPropertiesButton.Clicked +=  
changeFreeTextPropertiesButton_Clicked;  
FreeTextAnnotation selectedFreeTextAnnotation;  
private void PdfViewer_FreeTextAnnotationSelected(object sender,  
FreeTextAnnotationSelectedEventArgs args)  
{  
    //Cast the sender object to FreeTextAnnotation  
    selectedFreeTextAnnotation = sender as FreeTextAnnotation;  
}  
private void changeFreeTextPropertiesButton_Clicked(object sender, EventArgs  
e)  
{  
    //Change the color of the text  
    selectedFreeTextAnnotation.Settings.TextColor = Color.Blue;  
    //Change the size of the text  
    selectedFreeTextAnnotation.Settings.TextSize = 7;  
}
```

### Moving or resizing free text annotations

To move or resize the annotation, it should be selected. After the selector appears, tapping and dragging anywhere inside the selector will move the annotation. Tapping on the bubbles around the selector and dragging will resize the annotation.

#### *Detecting the move or resize of a free text annotation*

The event `FreeTextAnnotationMovedOrResized` will be raised when you move or resize the free text annotation.

### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"  
FreeTextAnnotationMovedOrResized="PdfViewer_FreeTextAnnotationMovedOrResized"  
/>
```

### **C#**

```
pdfViewer.FreeTextAnnotationMovedOrResized +=  
PdfViewer_FreeTextAnnotationMovedOrResized;
```

The properties of the moved or resized free text can be obtained from the `args` parameter of the event handler.

### **C#**

```
private void PdfViewer_FreeTextAnnotationMovedOrResized(object sender,  
FreeTextAnnotationMovedOrResizedEventArgs args)  
{  
    //Retrieve the old bounds of the annotation  
    Rectangle oldBounds = args.OldBounds;  
    //Retrieve the new bounds of the annotation  
    Rectangle newBounds = args.NewBounds;  
    //Retrieve the page number in which the free text is  
    int pageNumber = args.PageNumber;  
}
```

## Deleting free text annotations

PDF viewer can remove a selected annotation or all annotations in the PDF document.

### *Removing a selected free text annotation*

The following code snippet illustrates removing a selected free text from the PDF document.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
FreeTextAnnotationSelected="PdfViewer_FreeTextAnnotationSelected"/>
<Button x:Name="deleteFreeTextAnnotationButton" Grid.Row="1"
Clicked="deleteFreeTextAnnotationButton_Clicked" />
```

#### **C#**

```
FreeTextAnnotation selectedFreeTextAnnotation;
private void PdfViewer_FreeTextAnnotationSelected(object sender,
FreeTextAnnotationSelectedEventArgs args)
{
    //Cast the sender object to free text annotation.
    selectedFreeTextAnnotation = sender as FreeTextAnnotation;
}
private void deleteFreeTextAnnotationButton_Clicked(object sender, EventArgs
e)
{
    //Delete the selected free text annotation
    pdfViewer.RemoveAnnotation(selectedFreeTextAnnotation);
}
```

### *Removing all annotations*

The `ClearAllAnnotations` method can be used to delete all annotations irrespective of their types from the PDF.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer" />
<Button x:Name="deleteAllAnnotationsButton" Command="{Binding
ClearAllAnnotationsCommand, Source={x:Reference Name=pdfViewer}}" />
```

#### **C#**

```
private void DeleteAllAnnotationsButton_Clicked(object sender, EventArgs e)
{
    pdfViewer.ClearAllAnnotations();
}
```

### *Detecting the removal of a free text*

The event `FreeTextAnnotationRemoved` will be raised when a free text annotation is removed from the PDF.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewer"
FreeTextAnnotationRemoved="PdfViewer_FreeTextAnnotationRemoved"/>
```

**C#**

```
pdfViewer.FreeTextAnnotationRemoved += PdfViewer_FreeTextAnnotationRemoved;
```

The properties of the removed free text can be obtained from the `args` parameter of the event handler.

**C#**

```
private void PdfViewer_FreeTextAnnotationRemoved(object sender,
FreeTextAnnotationRemovedEventArgs args)
{
    //Get the bounds
    Rectangle bounds = args.Bounds;
    //Get the page number on which the deselected free text is
    int pageNumber = args.PageNumber;
    //Get the text of the free text annotation
    string text = args.Text;
    //Get the text color
    Color textColor = args.TextColor;
    //Get the text size
    float textSize = args.TextSize;
}
```

### Working with text markup annotation

The PDF viewer supports to add, edit, and delete text markup annotations (highlight, underline, and strikethrough) in the PDF document.

#### Highlight a text

The two ways to highlight a text in the PDF document are:

1. By selecting the text and highlight option
  - o Select the text in the PDF document.
  - o Select “Highlight” option in the context menu that appears.
2. Enabling the highlight mode and selecting the text

By default, the PDF viewer will be in the scrolling and text selection mode. Once highlight annotation mode is activated, scrolling of the document will be frozen and highlight annotations will be included when you swipe over the texts in the pages of the PDF document.

XAML code to switch to highlight annotation mode

**XML**

```
<Button x:Name="highlightAnnotationButton" BackgroundColor="Transparent"
Image="TextHighlightIcon.png" HorizontalOptions="CenterAndExpand"
VerticalOptions="CenterAndExpand" Command="{Binding AnnotationModeCommand,
Source={x:Reference Name=pdfViewerControl}}" CommandParameter="Highlight" />
```

C# code to switch to highlight annotation mode

**C#**

```
pdfViewerControl.AnnotationMode = AnnotationMode.Highlight;
```

XAML code to switch to normal mode from annotation mode.

#### XML

```
<Button x:Name="resetAnnotationButton" BackgroundColor="Transparent"
Image="resetIcon.png" HorizontalOptions="CenterAndExpand"
VerticalOptions="CenterAndExpand" Command="{Binding AnnotationModeCommand,
Source={x:Reference Name=pdfViewerControl}}" CommandParameter="None" />
```

C# code to switch to normal mode from annotation mode.

#### C#

```
pdfViewerControl.AnnotationMode = AnnotationMode.None;
```

### Underline a text

The two ways to underline a text in the PDF document are:

1. By selecting the text and underline option
  - o Select the text in the PDF document.
  - o Select "Underline" option in the context menu that appears.
2. Enabling the underline mode and selecting the text

By default, the PDF viewer will be in the scrolling and text selection mode. Once underline annotation mode is activated, scrolling of the document will be frozen and underline annotations will be included when you swipe over the texts in the pages of the PDF document.

XAML code to switch to underline annotation mode

#### XML

```
<Button x:Name="underlineAnnotationButton" BackgroundColor="Transparent"
Image="TextUnderlineIcon.png" HorizontalOptions="CenterAndExpand"
VerticalOptions="CenterAndExpand" Command="{Binding AnnotationModeCommand,
Source={x:Reference Name=pdfViewerControl}}" CommandParameter="Underline" />
```

C# code to switch to underline annotation mode

#### C#

```
pdfViewerControl.AnnotationMode = AnnotationMode.Underline;
```

XAML code to switch to normal mode from annotation mode.

#### XML

```
<Button x:Name="resetAnnotationButton" BackgroundColor="Transparent"
Image="resetIcon.png" HorizontalOptions="CenterAndExpand"
VerticalOptions="CenterAndExpand" Command="{Binding AnnotationModeCommand,
Source={x:Reference Name=pdfViewerControl}}" CommandParameter="None" />
```

C# code to switch to normal mode from annotation mode.

### **C#**

```
pdfViewerControl.AnnotationMode = AnnotationMode.None;
```

### Strikethrough a text

The two ways to strikethrough a text in the PDF document are:

1. By selecting the text and strikethrough option
  - o Select the text in the PDF document.
  - o Select “Strikethrough” option in the context menu that appears.
2. Enabling the strikethrough mode and selecting the text

By default, the PDF viewer will be in the scrolling and text selection mode. Once strikethrough annotation mode is activated, scrolling of the document will be frozen and strikethrough annotations will be included when you swipe over the texts in the pages of the PDF document.

XAML code to switch to strikethrough annotation mode

### **XML**

```
<Button x:Name="strikethroughAnnotationButton" BackgroundColor="Transparent"
Image="TextStrikethroughIcon.png" HorizontalOptions="CenterAndExpand"
VerticalOptions="CenterAndExpand" Command="{Binding AnnotationModeCommand,
Source={x:Reference Name=pdfViewerControl}}"
CommandParameter="Strikethrough" />
```

C# code to switch to strikethrough annotation mode

### **C#**

```
pdfViewerControl.AnnotationMode = AnnotationMode.Strikethrough;
```

XAML code to switch to normal mode from annotation mode.

### **XML**

```
<Button x:Name="resetAnnotationButton" BackgroundColor="Transparent"
Image="resetIcon.png" HorizontalOptions="CenterAndExpand"
VerticalOptions="CenterAndExpand" Command="{Binding AnnotationModeCommand,
Source={x:Reference Name=pdfViewerControl}}" CommandParameter="None" />
```

C# code to switch to normal mode from annotation mode.

### **C#**

```
pdfViewerControl.AnnotationMode = AnnotationMode.None;
```

### Deleting a text markup annotation

The PDF viewer removes a single annotation in the PDF document, removes all the annotations in a page, and removes all the annotations in the document.

*Removing a single annotation.*

The following code snippet illustrates removing a single annotation from the PDF document.

**XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"
TextMarkupSelected="PdfViewerControl_TextMarkupSelected" />
```

C# code to remove selected annotation from the PDF document

**C#**

```
private void PdfViewerControl_TextMarkupSelected(object sender,
TextMarkupSelectedEventArgs args)
{
TextMarkupAnnotation selectedAnnotation = sender as TextMarkupAnnotation;
pdfViewerControl.RemoveAnnotation(selectedAnnotation);
}
```

*Removing all the annotations in a page*

The ClearAllAnnotations(int pageNumber) API can be used to remove all the annotations in a page of the PDF document.

**XML**

```
<Button x:Name="clearAllAnnotationsButton"
Clicked="clearAllAnnotationsButton_Clicked" />
```

C# code to clear all the annotations in a given page number.

**C#**

```
private void clearAllAnnotationsButton_Clicked(object sender, EventArgs e)
{
pdfViewerControl.ClearAllAnnotations(pageNumber);
}
```

*Removing all the annotations in the PDF document*

The ClearAllAnnotations API can be used to remove all the annotations in the PDF document.

**XML**

```
<Button x:Name="clearAllAnnotationsButton"
Clicked="clearAllAnnotationsButton_Clicked" />
```

C# code to clear all the annotations in a PDF document.

**C#**

```
private void clearAllAnnotationsButton_Clicked(object sender, EventArgs e)
{
pdfViewerControl.ClearAllAnnotations();
}
```

### Editing the color of the text markup annotation

You can edit the color of the text markup annotation before including the annotation and after including the annotation.

#### *Before inclusion of the annotation or Default color*

You can alter the default color of the annotation to change the color while including annotation. Refer to the following code sample.

#### **C#**

```
pdfViewerControl.AnnotationSettings.TextMarkup.Highlight.Color = Color.Red;
pdfViewerControl.AnnotationSettings.TextMarkup.Underline.Color =
Color.Magenta;
pdfViewerControl.AnnotationSettings.TextMarkup.Strikethrough.Color =
Color.Yellow;
```

---

**Note:** Setting this property will not edit the color of annotations that are included in prior.

---

#### *After inclusion of the annotation*

- Select the annotation.
- TextMarkupSelected event will be triggered and you will get a copy of selected annotation.
- Edit the copy of annotation, so that you can edit the color of the text markup annotation.

The following code snippet illustrates the same.

#### **XML**

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"
TextMarkupSelected="PdfViewerControl_TextMarkupSelected" />
```

#### **C#**

```
private void PdfViewerControl_TextMarkupSelected(object sender,
TextMarkupSelectedEventArgs args)
{
    TextMarkupAnnotation selectedAnnotation = sender as TextMarkupAnnotation;
    selectedAnnotation.Settings.Color = Color.Yellow;
}
```

### Performing undo and redo

The PDF viewer performs undo and redo for the changes made in annotations in the PDF document. In text markup annotation undo and redo actions are provided for:

- Inclusion of new text markup annotation.
- Deletion of text markup annotation.
- Changing the color of the text markup annotation.

Refer to the following code sample to perform undo and redo operations:

#### **XML**

```
<Button x:Name="undoButton" BackgroundColor="Transparent"
Image="UndoIcon.png" HorizontalOptions="Center" VerticalOptions="Center"
Command="{Binding PerformUndoCommand ,Source={x:Reference
Name=pdfViewerControl}}"/>
<Button x:Name="redoButton" BackgroundColor="Transparent"
Image="RedoIcon.png" HorizontalOptions="Center" VerticalOptions="Center"
Command="{Binding PerformRedoCommand ,Source={x:Reference
Name=pdfViewerControl}}"/>
```

**C#**

```
pdfViewerControl.PerformUndo();
pdfViewerControl.PerformRedo();
```

**Saving the PDF document**

After performing all the changes over the PDF document in the PDF viewer, the resultant document can be saved using the `SaveDocument()` API.

**XML**

```
<Button x:Name="saveButton" Clicked="saveButton_Clicked" />
```

**C#**

```
private void saveButton_Clicked(object sender, EventArgs e)
{
    Stream stream = pdfViewerControl.SaveDocument();
}
```

**Note:** The `CanUndo` property is used to identify whether a document loaded in the PDF viewer is edited or not. When this property is set to true, means that the document in the PDF viewer is edited.

**Working with Bookmark Navigation**

PDF viewer allows users to view the bookmarks present in the loaded PDF document and navigate to the destination saved in the bookmarks.

**Enabling and disabling bookmark feature**

You can enable and disable the bookmark button from the built-in toolbar using the `BookmarkNavigationEnabled` property available in PDF viewer.

Property	Action
<code>BookmarkNavigationEnabled</code>	Gets or sets the value that enable and disable the bookmark feature in PDF viewer. By default, this property is set to true.

This property removes the bookmark button from the built-in toolbar and disable the bookmark feature, when it is set to false and vice versa.

**XML**

```
<pdfviewer:SfPdfViewer x:Name="pdfViewerControl"
BookmarkNavigationEnabled="False"/>
```

**C#**

```
//Bookmark feature is disabled
pdfViewerControl. BookmarkNavigationEnabled = false;
```

**Expand and collapse the bookmark pane from built-in toolbar**

The bookmark pane is expanded and collapsed by clicking the bookmark button from the built-in toolbar.

**Expand and collapse the bookmark pane programmatically**

The bookmark pane is expanded and collapsed programmatically by using the **BookmarkPaneVisible** bindable property available in PDF viewer.

Property	Action
BookmarkPaneVisible	Gets or sets the value to expand and collapse the bookmark pane in PDF viewer. Setting this property to true expands the pane and vice versa. By default, this property is set to true.

**XML**

```
<pdfviewer:SfPdfViewer x:Name="pdfViewerControl"
BookmarkPaneVisible="False"/>
```

**C#**

```
//Bookmark pane will be collapsed, if it is expanded  
pdfViewerControl.BookmarkPaneVisible = true;
```

## Programmatically navigate to a bookmark destination

You can navigate to a desired bookmark destination using the `GotoBookmark(PdfBookmark)` method. The target/destination bookmark should be provided as the argument to this method. Refer to the following code sample.

**C#**

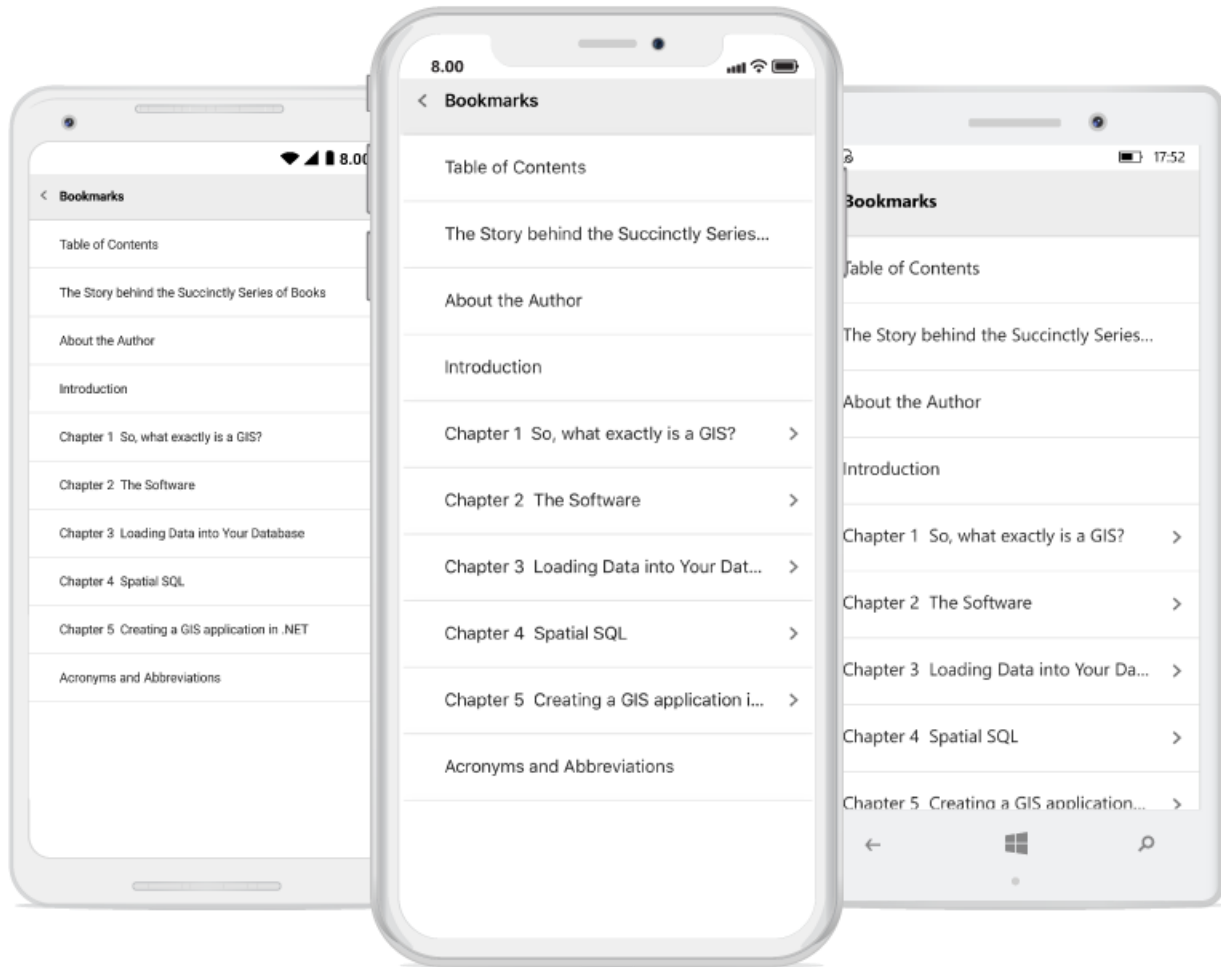

```
//Loads the PDF document in PdfLoadedDocument  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(documentStream);  
//Retrieves the bookmark collection from the loaded PDF document  
PdfBookmarkBase bookmark = loadedDocument.Bookmarks;  
//Navigate to the specified bookmark destination offset  
pdfViewerControl.GoToBookmark(bookmark[0]);
```

## Track the occurrence of the bookmark navigation

You can track the bookmark navigation operation using the `BookmarkNavigationOccurred` event. The argument of this event will provide the instance of the bookmark, destination page number, and vertical offset. Refer to the following code example.

**C#**

```
pdfViewerControl.BookmarkNavigationOccurred +=  
PdfViewerControl_BookmarkNavigationOccurred;  
private void PdfViewerControl_BookmarkNavigationOccurred(object sender,  
Syncfusion.SfPdfViewer.XForms.BookmarkNavigationOccurredEventArgs e)  
{  
//Retrieves the current bookmark  
PdfBookmark bookmark = e.Bookmark;  
//Gets the vertical offset of the bookmark  
double destinationOffset = e.Offset;  
//Gets the current page number in which the bookmark destination resides  
int pageNumber = e.PageNumber;  
}
```

## Touch interaction events

### Tapped

The [Tapped](#) event will be triggered when the user taps on the document display area of the PDF Viewer control. The event argument of this event contains the following information:

- [PageNumber](#) : The page number in which the tap event occurred.
- [Position](#) : The position of the tap event location with respect to the start of the page.

### DoubleTapped

The [DoubleTapped](#) event will be triggered when the user double taps on the document display area of the PDF Viewer control. The event argument of this event contains the following information:

- [PageNumber](#) : The page number in which the double tap event occurred.
- [Position](#) : The position of the double tap event location with respect to the start of the page.

### LongPressed

The [LongPressed](#) event triggered when the user long presses on the document display area of the PDF Viewer control. The event argument of this event contains the following information:

- [PageNumber](#) : The page number in which the double tap event occurred.
- [Position](#) : The position of the double tap event location with respect to the start of the page.

### XML

```
<Grid x:Name="pdfViewGrid">
<syncfusion:SfPdfViewer x:Name="pdfViewerControl"
Tapped="PdfViewerControl_Tapped"
DoubleTapped="PdfViewerControl_DoubleTapped"
LongPressed="PdfViewerControl_LongPressed"
InputFileStream="{Binding PdfDocumentStream}"/>
</Grid>
```

### C#

```
public MainPage()
{
    InitializeComponent();
}

private void PdfViewerControl_LongPressed(object sender,
Syncfusion.SfPdfViewer.XForms.TouchInteractionEventArgs e)
{
    //Gets the page number of the PDF Viewer where you tapped.
    int pageNumber = e.PageNumber;
    //Gets the position of the PDF Viewer where you tapped.
    Point position = e.Position;
}

private void PdfViewerControl_DoubleTapped(object sender,
Syncfusion.SfPdfViewer.XForms.TouchInteractionEventArgs e)
{
    //Gets the page number of the PDF Viewer where you double tapped.
    int pageNumber = e.PageNumber;
    //Gets the position of the PDF Viewer where you double tapped.
    Point position = e.Position;
}

private void PdfViewerControl_Tapped(object sender,
Syncfusion.SfPdfViewer.XForms.TouchInteractionEventArgs e)
{
    //Gets the page number of the PDF Viewer where you long pressed.
    int pageNumber = e.PageNumber;
    //Gets the position of the PDF Viewer where you long pressed.
    Point position = e.Position;
}
```

## Working with PDF AcroForms

PDF Viewer supports adding/modifying the existing forms fields content present in the PDF document. By default, it detects the form fields present in the PDF document and enables modifying or filling the values.

### How to restrict editing the form field values in the existing PDF document

By setting the `EnableFormFilling` property of the PdfViewerControl instance to false, you can avoid modifying the values of the form field elements present in the loaded PDF document.

### C#

```
//Does not load the form fields in PDF viewer
pdfViewerControl.EnableFormFilling = false;
```

**Note:** By default, the EnableFormFilling property is set to true.

#### How to flatten and save the form fields data

Flattening PDF form is a process of removing the form fields in the PDF document, thereby rendering the form fields appearance and its content in the page graphics. This will avoid the PDF form being edited in any device. PDF Viewer supports flattening the PDF form when saving. You can perform this action by passing the parameter `true` to the Save method of PDF Viewer.

#### C#

```
//Flatten and save the form fields during saving process
pdfViewerControl.SaveDocument(true);
```

### Working with ScrollHead

The scroll head in the PDF Viewer allows users to easily scroll through and navigate to destination page in the PDF document. ScrollHead always appears on the right side of PDF Viewer.

#### Enabling and disabling ScrollHead

By setting the `EnableScrollHead` property of the PdfViewerControl instance to false, you can disable the scroll head.

Property	Action
EnableScrollHead	Gets or sets the value that enable and disable the ScrollHead feature in PDF Viewer. By default, this property is set to true.

#### XML

```
<pdfviewer:SfPdfViewer x:Name="pdfViewerControl" EnableScrollHead="False"/>
```

#### C#

```
//Disables the scroll head
pdfViewerControl.EnableScrollHead = false;
```

#### Navigate to a desired page using ScrollHead

PDF Viewer allows users to navigate to a desired destination page using ScrollHead. On tapping the ScrollHead of PDF Viewer, a page navigation pop-up will appear and users can navigate to the destination page by entering a valid page number.

#### Localization

Localization is the process of configuring the application to a specific language. PdfViewerControl supports to localize its static text. SfPdfViewer uses the following static text that can be localized in application level:

- SfPdfViewerCancel
- SfPdfViewerCopy

- SfPdfViewerHighlight
- SfPdfViewerHyperlinkCancel
- SfPdfViewerHyperlinkMessage
- SfPdfViewerHyperlinkMessageTitle
- SfPdfViewerHyperlinkOpen
- SfPdfViewerInvalidPageMessage
- SfPdfViewerInvalidPageMessageTitle
- SfPdfViewerNoMatches
- SfPdfViewerNoOccurrences
- SfPdfViewerOkMessage
- SfPdfViewerPageEntryCancel
- SfPdfViewerPageEntryOkay
- SfPdfViewerPageNumberEntryMessage
- SfPdfViewerPageNumberEntryMessageTitle
- SfPdfViewerPlaceholderText
- SfPdfViewerRedo
- SfPdfViewerSave
- SfPdfViewerSearchResult
- SfPdfViewerStrikethrough
- SfPdfViewerUnderline
- SfPdfViewerUndo

To localize the SfPdfViewer, follow the steps in application level:

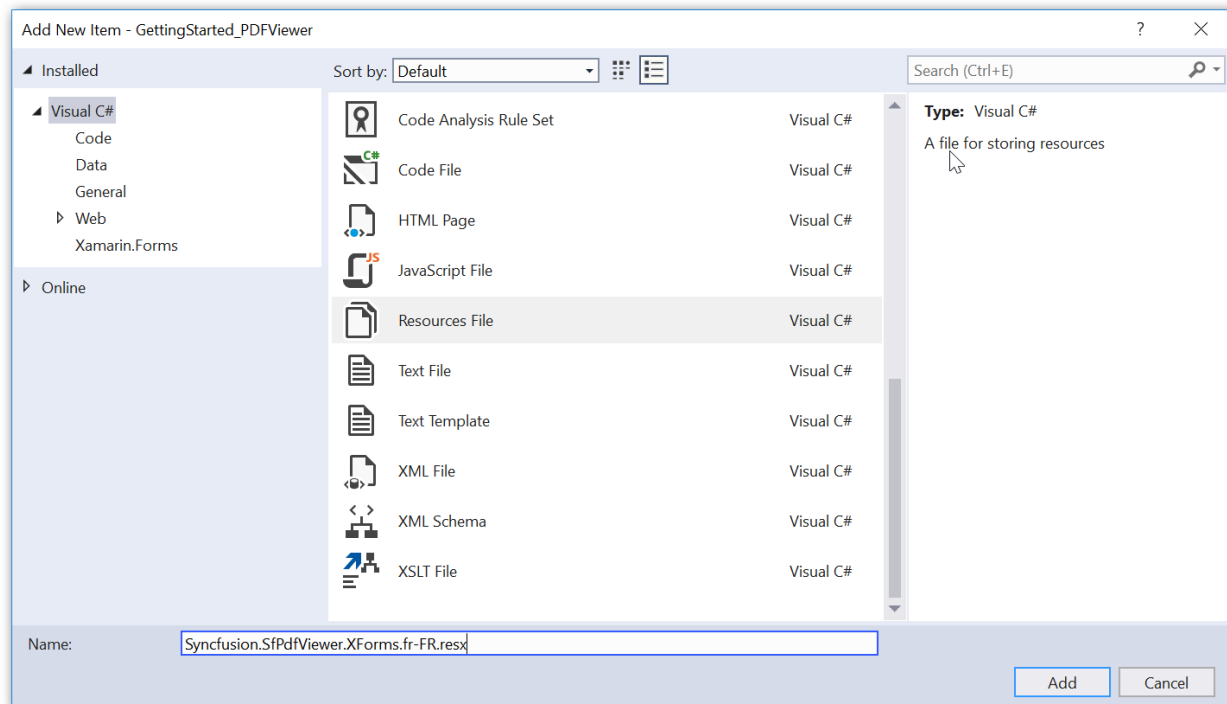

1. Add a .resx file.
2. Convert the platform specific language format to .NET format.
3. Apply the converted format.

#### Add a .resx file

In the portable project of your application, add a .resx file inside the resources folder with **Build Action - > EmbeddedResource**. File name should be **Syncfusion control's Namespace + language code** format.

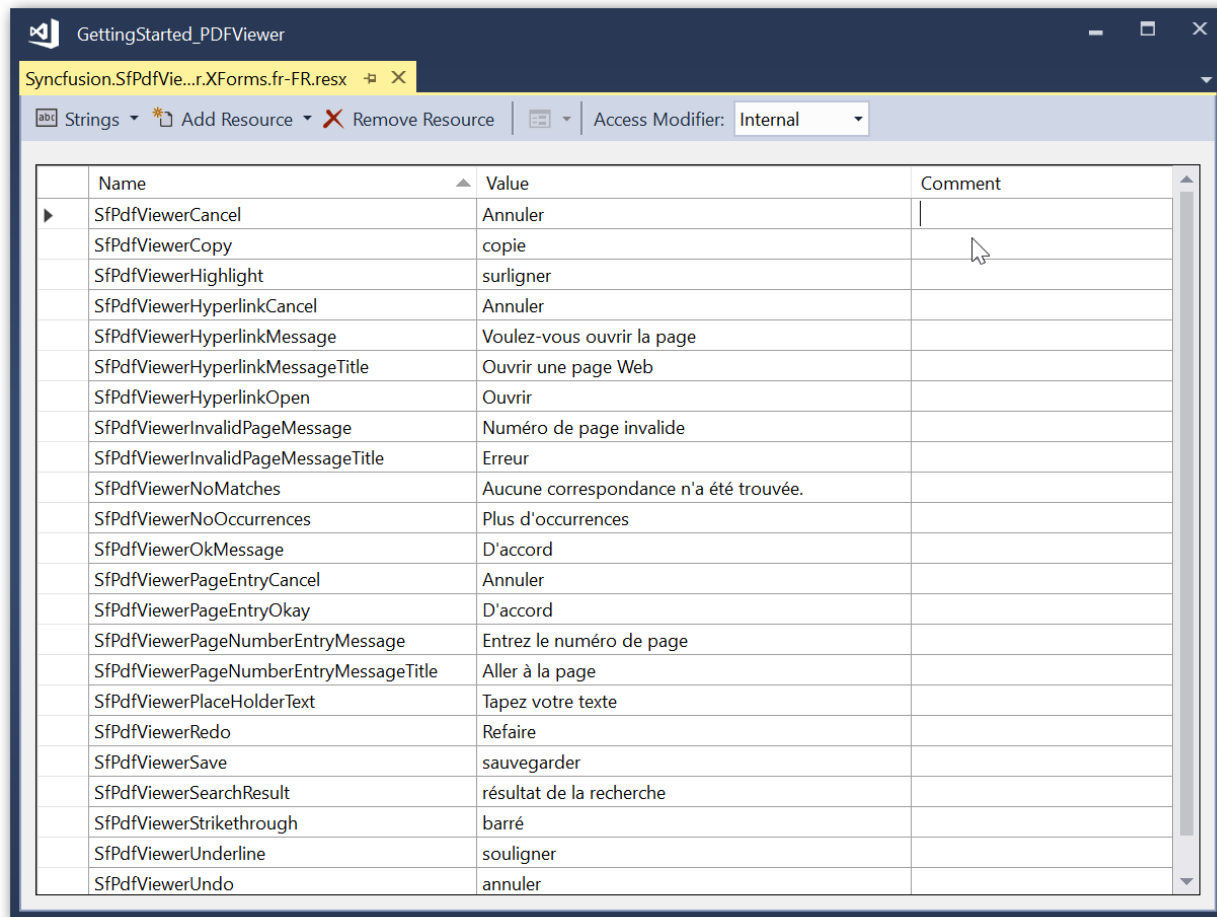

For example, to set the culture as French, the file should be named as **Syncfusion.SfPdfViewer.XForms.fr-FR.resx**.

Based on the language, set the appropriate equivalent text to the static text in the .resx file.

**Note:** You should create and add separate .resx files for individual languages.

### Convert the platform specific language format to .NET format

To get the localized text from the added `.resx` file, declare an interface named `ILocalize` in your PCL project and implement the interface in each platform renderer. This will query the language set in the device using platform specific code and convert to .NET format.

Refer to the following code snippet to declare the interface in PCL project.

#### C#

```
public interface ILocalize
{
    CultureInfo GetCurrentCultureInfo();
    void SetLocale(CultureInfo cultureInfo);
}

public class PlatformCulture
{
    public PlatformCulture(string platformCultureString)
    {
        if (!String.IsNullOrEmpty(platformCultureString))
        {
            PlatformString = platformCultureString.Replace("_", "-"); // .NET expects
            // dash, not underscore
            var dashIndex = PlatformString.IndexOf("-", StringComparison.Ordinal);
            if (dashIndex > 0)
            {

```

```
var parts = PlatformString.Split('-');
LanguageCode = parts[0];
LocaleCode = parts[1];
}
else
{
    LanguageCode = PlatformString;
    LocaleCode = "";
}
}
}
public string PlatformString
{
    get; private set;
}
public string LanguageCode
{
    get; private set;
}
public string LocaleCode
{
    get; private set;
}
public override string ToString()
{
    return PlatformString; ;
}
}
```

Refer to the following code to implement the interface in Android renderer project.

### **C#**

```
public class Localize : ILocalize
{
    public void SetLocale(CultureInfo cultureInfo)
    {
        Thread.CurrentThread.CurrentCulture = cultureInfo;
        Thread.CurrentThread.CurrentUICulture = cultureInfo;
    }
    public CultureInfo GetCurrentCultureInfo()
    {
        var netLanguage = "en";
        var androidLocale = Java.Util.Locale.Default;
        netLanguage = AndroidToDotnetLanguage(androidLocale.ToString().Replace("_", "-"));
        // this gets called a lot - try/catch can be expensive so consider caching or something
        CultureInfo cultureInfo = null;
        try
        {
            cultureInfo = new CultureInfo(netLanguage);
        }
        catch
        {
            // iOS locale not valid .NET culture (eg. "en-ES" : English in Spain)
        }
    }
}
```

```

// fallback to first characters, in this case "en"
try
{
    var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
    cultureInfo = new CultureInfo(fallback);
}
catch
{
    // iOS language not valid .NET culture, falling back to English
    cultureInfo = new CultureInfo("en");
}
}
return cultureInfo;
}
private string AndroidToDotnetLanguage(string androidLanguage)
{
    var netLanguage = androidLanguage;
    //certain languages need to be converted to CultureInfo equivalent
    switch (androidLanguage)
    {
        case "ms-BN": // "Malaysian (Brunei)" not supported .NET culture
        case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
        case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
            netLanguage = "ms"; // closest supported
            break;
        case "in-ID": // "Indonesian (Indonesia)" has different code in .NET
            netLanguage = "id-ID"; // correct code for .NET
            break;
        case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
            culture
            netLanguage = "de-CH"; // closest supported
            break;
        // add more application-specific cases here (if required)
        // ONLY use cultures that have been tested and known to work
    }
    return netLanguage;
}
private string ToDotnetFallbackLanguage(PlatformCulture platformCulture)
{
    var netLanguage = platformCulture.LanguageCode; // use the first part of the
    identifier (two chars, usually);
    switch (platformCulture.LanguageCode)
    {
        case "gsw":
            netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
            break;
        // add more application-specific cases here (if required)
        // ONLY use cultures that have been tested and known to work
    }
    return netLanguage;
}
}

```

Refer to the following code to implement the interface in iOS renderer project.

### **C#**

```
public class Localize : ILocalize
{
    public void SetLocale(CultureInfo cultureInfo)
    {
        Thread.CurrentThread.CurrentCulture = cultureInfo;
        Thread.CurrentThread.CurrentUICulture = cultureInfo;
    }
    public CultureInfo GetCurrentCultureInfo()
    {
        var netLanguage = "en";
        if (NSLocale.PreferredLanguages.Length > 0)
        {
            var pref = NSLocale.PreferredLanguages[0];
            netLanguage = iOSToDotnetLanguage(pref);
        }
        // this gets called a lot - try/catch can be expensive so consider caching
        // or something
        CultureInfo cultureInfo = null;
        try
        {
            cultureInfo = new CultureInfo(netLanguage);
        }
        catch
        {
            // iOS locale not valid .NET culture (eg. "en-ES" : English in Spain)
            // fallback to first characters, in this case "en"
            try
            {
                var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
                cultureInfo = new CultureInfo(fallback);
            }
            catch
            {
                // iOS language not valid .NET culture, falling back to English
                cultureInfo = new CultureInfo("en");
            }
        }
        return cultureInfo;
    }
    private string iOSToDotnetLanguage(string iOSLanguage)
    {
        var netLanguage = iOSLanguage;
        //certain languages need to be converted to CultureInfo equivalent
        switch (iOSLanguage)
        {
            {
                case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
                case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
                    netLanguage = "ms"; // closest supported
                    break;
                case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
                    culture
                    netLanguage = "de-CH"; // closest supported
                    break;
                // add more application-specific cases here (if required)
                // ONLY use cultures that have been tested and known to work
            }
        }
        return netLanguage;
    }
}
```

```

}
private string ToDotnetFallbackLanguage(PlatformCulture platCulture)
{
    var netLanguage = platCulture.LanguageCode; // use the first part of the
identifier (two chars, usually);
    switch (platCulture.LanguageCode)
    {
        //
        case "pt":
            netLanguage = "pt-PT"; // fallback to Portuguese (Portugal)
            break;
        case "gsw":
            netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
            break;
        // add more application-specific cases here (if required)
        // ONLY use cultures that have been tested and known to work
    }
    return netLanguage;
}
}

```

Implementation of the interface is not required for UWP project, since the resources automatically recognizes the selected language.

#### Apply the converted format

After setting the root/main page of the application in your MainPage.Xaml.cs file of the PCL project, initialize a new instance of the `ResourceManager` class and set it to the `PdfViewerResourceManager.Manager` property to look up into the resources with specified root name in the given assembly. Using `DependencyService`, call `SetLocale()` of the implemented interface with necessary language code as parameter.

#### C#

```

public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        //The PDF is in the Assets folder of this project. Read it into a stream
        Stream stream =
            typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted
            .Assets.Xamarin_Forms_Succinctly.pdf");
        //Load the stream to PdfViewer
        pdfViewerControl.LoadDocument(stream);
        //Assign the localized string to the specific culture
        PdfViewerResourceManager.Manager=new
        ResourceManager("GettingStarted.Resources.Syncfusion.SfPdfViewer.XForms",
        GetType().GetTypeInfo().Assembly);
    }
}

```

For Android and iOS, it is mandatory to implement the previous steps. However, to set the specific language to the application irrespective of the selected language in the device, use `CultureInfo.CurrentUICulture` in a specific project of UWP platform.

Refer to the following code example to localize the text in UWP platform.

MainPage.Xaml.cs

**C#**

```
public MainPage ()
{
    this.InitializeComponent();
    SfPdfViewerRenderer.Init();
    // Applying localization for UWP
    CultureInfo.CurrentUICulture = new CultureInfo("fr");
    LoadApplication(new GettingStarted.App());
}
```

## Loading password protected PDFs

Password protected PDFs can be loaded using the `LoadDocument(Stream pdfStream, string password)` method.

**C#**

```
string password = "PASSWORD";
pdfViewerControl.LoadDocument(pdfStream, password);
```

In the above code snippet, `pdfStream` is the Stream instance read from the encrypted PDF and `password` is the key with which the PDF is encrypted.

### Handling invalid passwords

If the password provided with the `LoadDocument(Stream pdfStream, string password)` is invalid, then the `PasswordErrorOccurred` event is raised. The `Title` property of the `PasswordErrorOccurredEventArgs` parameter helps identify whether the event raised due to invalid password. In that case the `Title` property will read "Error loading encrypted PDF document".

#### C#

```
pdfViewerControl.PasswordErrorOccurred +=  
PdfViewerControl_PasswordErrorOccurred;  
private void PdfViewerControl_PasswordErrorOccurred(object sender,  
PasswordErrorOccurredEventArgs args)  
{  
    //Get the details regarding the password error occurred.  
    string title = args.Title;  
    string description = args.Description;  
}
```

**Note:** The event will also be raised when an encrypted PDF is loaded without providing a password using the `LoadDocument(Stream pdfStream)` overload.

### Importing and exporting form data

PDF viewer provides options to import and export data to and from form fields in the PDF document. The form data files with the following extensions are supported.

1. fdf
2. xfdf
3. json
4. xml

The required file type can be chosen from the `DataFormat` enumeration. In the following sections only the fdf file type is illustrated for brevity.

#### Exporting form data

The `ExportFormData` method exports the current data filled in the form fields into a stream in the specified file format. The name of the PDF, with extension, from which the data are exported should be given as the second argument to the method.

#### C#

```
Stream fdfStreamToSave = pdfViewerControl.ExportFormData(DataFormat.Fdf,  
"PdfFileName.Pdf");
```

**Note:** While saving the stream returned by the `ExportFormData` method, the file name must have the same extension as the file type that was given as the first argument. e.g. In the above case the file type provided is fdf, so the saved file extension should be .fdf.

#### Importing form data

The `ImportFormData` method imports the data from a file of specified type and fills the new data into the form fields.

## C#

```
Stream fdfStreamToImport =  
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("SampleDefaultN  
amespace.Assets.FileName.fdf");  
pdfViewerControl.ImportFormData(fdfStreamToImport, DataFormat.Fdf);
```

## Exporting the pages of PDF document as images

The PdfViewerControl allows users to export the pages of a PDF document as image streams using the **ExportAsImage** method. The resultant image streams can be saved as image files in the local storage.

### Exporting a single PDF page as image

To export a single PDF page as image, you should use the **ExportAsImage** method that accepts page index as its parameter. The following code example describes exporting page at index 0 as image stream.

## C#

```
//Accessing the PDF document that is added as embedded resource as stream  
var fileStream =  
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted  
.Assets.Xamarin-Forms-Succinctly.pdf");  
//Initialize the SfPdfViewer  
SfPdfViewer pdfViewerControl = new SfPdfViewer();  
//Load the PDF document as stream  
pdfViewerControl.LoadDocument(fileStream);  
//Export the page of PDF document to image stream with the given index  
Stream stream = pdfViewerControl.ExportAsImage(0);
```

### Exporting a single PDF page as image with custom scale factor

To export a single PDF page as image with custom scale factor, you should use the **ExportAsImage** method that accepts page index and scale factor as its parameters. The following code example describes exporting page at index 0 with the scale factor 2.0 as image stream.

## C#

```
//Accessing the PDF document that is added as embedded resource as stream  
var fileStream =  
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted  
.Assets.Xamarin-Forms-Succinctly.pdf");  
//Initialize the SfPdfViewer  
SfPdfViewer pdfViewerControl = new SfPdfViewer();  
//Load the PDF document as stream  
pdfViewerControl.LoadDocument(fileStream);  
//Export the 0th index of PDF page to image stream with size two times  
greater than the original size  
Stream stream = pdfViewerControl.ExportAsImage(0, 2.0f);
```

### Exporting a range of PDF pages as images

To export a range of PDF pages as images, you should use the **ExportAsImage** method that accepts start page index and end page index as its parameter. The following code example describes exporting pages ranging between index 0 and 3 as image stream array.

## C#

```
var fileStream =  
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted  
.Assets.Xamarin-Forms-Succinctly.pdf");  
//Initialize the SfPdfViewer  
SfPdfViewer pdfViewerControl = new SfPdfViewer();  
//Load the PDF document as stream  
pdfViewerControl.LoadDocument(fileStream);  
//Export the pages of PDF document from the index 0 to 3 to the array of  
image stream  
Stream[] stream = pdfViewerControl.ExportAsImage(0, 3);
```

### Exporting a range of PDF pages as images with custom scale factor

To export a range of PDF pages as images, you should use the `ExportAsImage` method that accepts start page index, end page index, and scale factor as its parameter. The following code example describes exporting pages ranging between index 0 and 3 with the scale factor 2 as image stream array.

## C#

```
var fileStream =  
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("GettingStarted  
.Assets.Xamarin-Forms-Succinctly.pdf");  
//Initialize the SfPdfViewer  
SfPdfViewer pdfViewerControl = new SfPdfViewer();  
//Load the PDF document as stream  
pdfViewerControl.LoadDocument(fileStream);  
//Export the pages of PDF document from the index 0 to 3 to the array of  
image stream  
//All the exported images are scaled 2 times larger than its original size  
Stream[] stream = pdfViewerControl.ExportAsImage(0, 3, 2.0f);
```

## Working with magnification

Magnification of the PDF document can be done in multiple ways and the different ways are explained below. By default, the PdfViewer supports panning and Ctrl+ mouse scroll (in XForms.UWP) to manipulate the magnification of the document.

### Set custom zoom percentage

The users can set custom magnification factor between 100 and 300 to magnify the document displayed. The following code explains this,

## XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding  
PdfDocumentStream}" ZoomPercentage="150" />
```

## C#

```
pdfViewerControl.ZoomPercentage = 150;
```

### Get custom zoom factor

The following code explains accessing zoom factor in which the document is displayed in the viewer.

### XML

```
<Entry Keyboard="Numeric" FontSize="18" x:Name="zoomPercentage"
HorizontalTextAlignment="Center" VerticalOptions="Center" Text="{Binding
ZoomPercentage, Source={x:Reference Name=pdfViewerControl}}"/>
```

### C#

```
int zoom = pdfViewerControl.ZoomPercentage;
```

On binding entry control to the ZoomPercentage property of the PDF Viewer instance, the current zoom percentage being displayed in PDF Viewer is displayed in the entry control, and the PDF Viewer will be zoomed based on the value entered.

#### Set maximum zoom percentage

The PDF Viewer control allows you to set the maximum zoom percentage value for the PDF document being displayed. The following code example will set the maximum zoom percentage of PDF Viewer instance to 200.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding
PdfDocumentStream}" MaximumZoomPercentage="200" />
```

### C#

```
pdfViewerControl.MaximumZoomPercentage = 200;
```

#### Set minimum zoom percentage

The PDF Viewer control allows you to set the minimum zoom percentage value for the PDF document being displayed. The following code example will set the minimum zoom percentage of PDF Viewer instance to 10.

### XML

```
<syncfusion:SfPdfViewer x:Name="pdfViewerControl" InputFileStream="{Binding
PdfDocumentStream}" MinimumZoomPercentage="10" />
```

### C#

```
pdfViewerControl.MinimumZoomPercentage = 10;
```

## SfPicker

### Overview

The picker control allows you to pick an item among a list of items that can be customized with custom view. This control can be opened as dialog. Its rich feature set includes functionalities such as data binding, multi column, header/footer, custom view on header/footer, and default validation buttons.

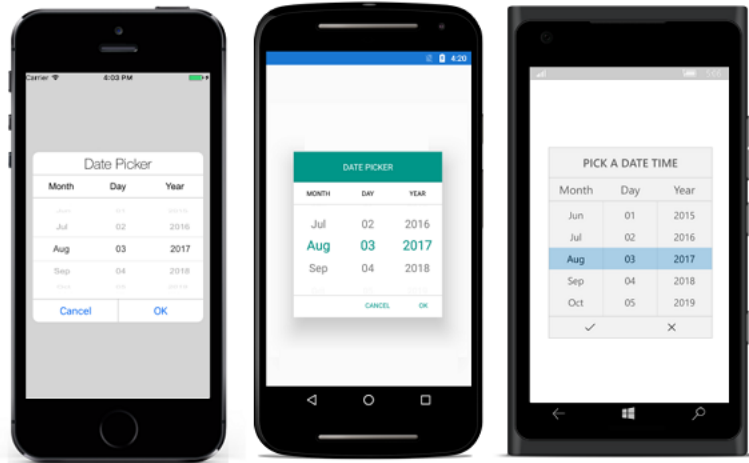

## Feature comparisons across iOS, Android, and UWP

Features	Xamarin.Forms (Android, iOS and UWP)	Xamarin.Android	Xamarin.iOS
Show Picker in Dialog			
Selection			
Header Customization			
Footer Customization			
Item Customization			
Multi Column Support			
Customize each column width			
Column Header support			
Column Header Customization			

The following screenshot illustrates picker's color selection

The following screenshot illustrates picker's multicolumn

## Getting Started

This section explains the steps required to configure a picker control in a real-time scenario, and provides a walk-through on some of the customization features available in picker control.

### Adding SfPicker reference

You can add SfPicker reference using one of the following methods:

#### Method 1: Adding SfPicker reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.syncfusion.com/nuget-packages). To add SfPicker to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfPicker](https://www.syncfusion.com/nuget-packages), and then install it.

!{Adding SfPicker reference from NuGet}(images/Adding SfPicker reference.png)

---

**Note:** Install the same version of SfPicker NuGet in all the projects.

---

#### Method 2: Adding SfPicker reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfPicker control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfPicker assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfPicker.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfPicker.Android.dll Syncfusion.SfPicker.XForms.Android.dll Syncfusion.SfPicker.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll

iOS	Syncfusion.SfPicker.iOS.dll Syncfusion.SfPicker.XForms.iOS.dll Syncfusion.SfPicker.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfPicker.XForms.UWP.dll Syncfusion.SfPicker.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Initialize picker on each platform

To use picker in Xamarin application, each platform project must initialize the picker renderer. These initializing steps vary from platform to platform, and it is discussed in the following sections.

#### Android

The Android launches the picker without any initialization, and it is enough to only initialize the Xamarin.Forms Framework to launch the application.

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the picker in iOS, call the `SfPickerRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework has been initialized and before the `LoadApplication` is called as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    SfPickerRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

### Universal Windows Platform (UWP)

To launch the picker in UWP, call the `SfPickerRenderer.Init()` in the `MainPage` constructor before the `LoadApplication` is called as demonstrated in the following code example.

#### C#

```
public MainPage()
{
    ...
    SfPickerRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

### ReleaseMode issue in UWP platform

There is a known Framework issue in UWP platform. The custom controls will not render when deployed application is in Release Mode.

The above issues can be resolved by initializing the picker assemblies in `App.xaml.cs` in UWP project as shown in the following code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfPickerRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a simple picker

This section explains how to create a simple picker control and configure it. picker can be configured by using XAML or C# code.

### Create a Xamarin.Forms project

Create a new blank project (Xamarin.Forms portable) by using Visual Studio or Xamarin Studio for Xamarin.Forms.

### Adding picker in Xamarin.Forms project

1. Add the required assembly reference in PCL, and other renderer projects as discussed in **Adding picker reference** section.
2. Add picker control's two way XAML or C#.
  - o XAML Page

- Set SfPicker control namespace as `xmlns:syncfusion="clr-namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms"` in XAML Content page.
- Set the SfPicker control in content property of contentPage.
- C# Page
- Import SfPicker control namespace as `using Syncfusion.SfPicker.XForms;` in C# ContentPage.
- Create a new SfPicker instance in ContentPage constructor, and assign SfPicker instance to ContentPage content property.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:syncfusion="clr-namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="GettingStarted.PickerSample">
<ContentPage.Content>
<syncfusion:SfPicker x:Name="picker" />
</ContentPage.Content>
</ContentPage>
```

### C#

```
using Syncfusion.SfPicker.XForms;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace GettingStarted
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class PickerSample : ContentPage
    {
        SfPicker picker;
        public PickerSample()
        {
            InitializeComponent();
            picker = new SfPicker();
            this.Content = picker;
        }
    }
}
```

#### *Set header to the picker*

The picker control allows you to define header text by setting the `SfPicker.HeaderText`, and enable SfPicker header by setting `SfPicker.ShowHeader` property to true. Default value of `SfPicker.ShowHeader` is true.

### XML

```
<syncfusion:SfPicker x:Name="picker" HeaderText="Select a Color" />
```

## C#

```
picker.HeaderText = "Select a Color";
```

### *Adding picker items*

picker control is a data bounded control. Hence, you must create collection of data's and bind it to picker control.

- Create a simple Observable Collection with string type of data for the picker

## C#

```
public class ColorInfo
{
    private ObservableCollection<string> _color;
    public ObservableCollection<string> Colors
    {
        get { return _color; }
        set { _color = value; }
    }
    public ColorInfo()
    {
        Colors = new ObservableCollection<string>();
        Colors.Add("Red");
        Colors.Add("Green");
        Colors.Add("Yellow");
        Colors.Add("Blue");
        Colors.Add("SkyBlue");
        Colors.Add("Orange");
        Colors.Add("Gray");
        Colors.Add("Pink");
    }
}
```

- Bind the Collection to picker

picker control allows you to bind collection of data by setting the `SfPicker.ItemsSource` property. You can bind the collection of data in both XAML or C#.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage
    x:Class="GettingStarted.PickerSample"
    xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
    xmlns:local="clr-namespace:GettingStarted"
    xmlns:syncfusion="clr-namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
    <ContentPage.BindingContext>
        <local:ColorInfo />
    </ContentPage.BindingContext>
    <ContentPage.Content>
        <syncfusion:SfPicker
```

```
x:Name="picker"
HeaderText="Select a Color"
ItemsSource="{Binding Colors}" />
</ContentPage.Content>
</ContentPage>
```

### C#

```
ColorInfo info = new ColorInfo();
picker.ItemsSource = info.Colors;
```

#### Set title to the items

picker control allows you to define title to the picker items by setting `SfPicker.ColumnHeaderText` and enable title of the picker items by setting `SfPicker.ShowColumnHeader` property to true. Default value of `SfPicker.ShowColumnHeader` is false.

### XML

```
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderText="Color"
ShowColumnHeader="True" />
```

### C#

```
picker.ColumnHeaderText = "Color";
picker.ShowColumnHeader = true;
```

#### Enable validation button in footer

In picker control, validation buttons (OK and Cancel) can be enabled by setting `SfPicker.ShowFooter` property to true. Default value of `SfPicker.ShowFooter` property is false

### XML

```
<syncfusion:SfPicker
x:Name="picker"
ShowFooter="True" />
```

### C#

```
picker.ShowFooter = true;
```

#### Open as dialog

picker can be rendered as a dialog by setting the `SfPicker.PickerMode` property to Dialog. Default value of `SfPicker.PickerMode` property is Default.

### XML

```
<syncfusion:SfPicker x:Name="picker" PickerMode="Dialog" />
```

### C#

```
picker.PickerMode = PickerMode.Dialog;
```

The picker can be opened programmatically by setting `SfPicker.IsOpen` property to true. Default value of `SfPicker.IsOpen` is false.

Note: This property is automatically changed to false when you close the dialog by click outside of dialog.

### XML

```
<syncfusion:SfPicker  
x:Name="picker"  
IsOpen="True"  
PickerMode="Dialog" />
```

### C#

```
picker.IsOpen = true;
```

The following screenshot illustrates the output of above code.

We have attached sample for reference. You can download the sample from the following link.

Sample link: [GettingStarted](#)

### Populating Items

This section explains the ways of populating items for picker control.

#### Binding data source

picker control is bound to the external data source to display the data. It supports any collections that implements the `IEnumerable` interface.

To bind the data source in picker, set the `SfPicker.ItemsSource` property as shown in the following code.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage
  x:Class="GettingStarted.PickerSample"
  xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  xmlns:local="clr-namespace:GettingStarted"
  xmlns:syncfusion="clr-namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
  <ContentPage.BindingContext>
  <local:ColorInfo />
  </ContentPage.BindingContext>
  <ContentPage.Content>
  <syncfusion:SfPicker
    x:Name="picker"
    HeaderText="Select a Color"
    ItemsSource="{Binding Colors}" />
  </ContentPage.Content>
</ContentPage>
```

### C#

```
ColorInfo info = new ColorInfo();
picker.ItemsSource = info.Colors;
```

### Multi-column items

The picker automatically populates the items as Multi-column based on the data source.

Collection of items can be created and assigned to a Collection, and each item Collection is a column of picker.

The following code example illustrates how to populate Month, Day, and Year values in each column of picker.

### C#

```
public class DateTimePicker : SfPicker
{
  #region Public Properties
  // Months api is used to modify the Day collection as per change in Month
  internal Dictionary<string, string> Months { get; set; }
  /// <summary>
  /// Date is the actual DataSource for SfPicker control which will holds the
  collection of Day ,Month and Year
  /// </summary>
  /// <value>The date.</value>
  public ObservableCollection<object> Dates { get; set; }
  //Day is the collection of day numbers
  internal ObservableCollection<object> Day { get; set; }
  //Month is the collection of Month Names
  internal ObservableCollection<object> Month { get; set; }
  //Year is the collection of Years from 1990 to 2042
```

```

internal ObservableCollection<object> Year { get; set; }
/// <summary>
/// Headers api is holds the column name for every column in date picker
/// </summary>
/// <value>The Headers.</value>
public ObservableCollection<string> Headers { get; set; }
#endregion
public DateTimePicker()
{
    Months = new Dictionary<string, string>();
    Dates = new ObservableCollection<object>();
    Day = new ObservableCollection<object>();
    Month = new ObservableCollection<object>();
    Year = new ObservableCollection<object>();
    Headers = new ObservableCollection<string>();
    //First column of picker
    Headers.Add("Month");
    //Second column of picker
    Headers.Add("Day");
    //Third column of picker
    Headers.Add("Year");
    HeaderText = "Date Time Picker";
    PopulateDateCollection();
    this.ItemsSource = Dates;
    this.ColumnHeaderText = Headers;
    ShowFooter = true;
    ShowHeader = true;
    ShowColumnHeader = true;
}
private void PopulateDateCollection()
{
    //populate months
    for (int i = 1; i < 13; i++)
    {
        if
        (!Months.ContainsKey(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(
            i).Substring(0, 3)))
        Months.Add(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i).Substri
            ng(0, 3), CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i));
        Month.Add(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i).Substrin
            g(0, 3));
    }
    //populate year
    for (int i = 1990; i < 2050; i++)
    {
        Year.Add(i.ToString());
    }
    //populate Days
    for (int i = 1; i <= DateTime.DaysInMonth(DateTime.Now.Year,
        DateTime.Now.Month); i++)
    {
        if (i < 10)
        {
            Day.Add("0" + i);
        }
        else
        Day.Add(i.ToString());
    }
}

```

```

}
Dates.Add(Month);
Dates.Add(Day);
Dates.Add(Year);
}
}

```

## XML

```

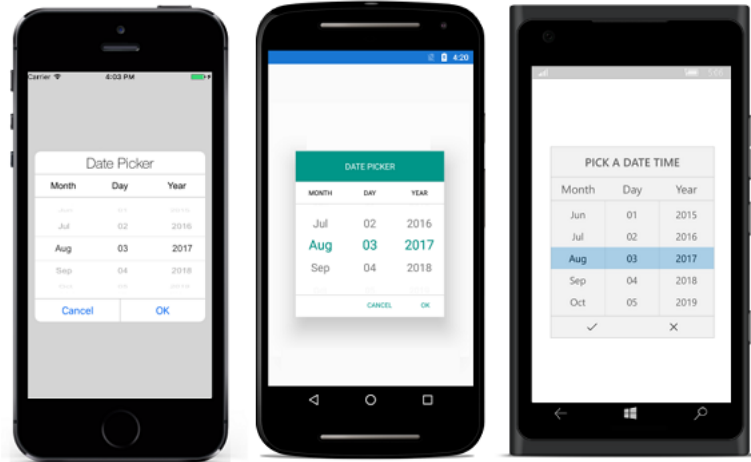

<ContentPage.BindingContext>
<local:DateTimeViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<local:DateTimePicker x:Name="picker"
PickerHeight="400"
PickerWidth="300"
HeaderText="Date Picker"
SelectedItem="{Binding StartDate}"
ColumnHeaderHeight="50">
</local:DateTimePicker>
</ContentPage.Content>

```

You can download the multi column sample from the following link.

Sample link: [MultiColumn](#)

The following screenshot illustrates the output of the above code.

Set items colors and font attributes customization

picker control, both items text color and font can be selected and unselected by customizing as shown in the following code.

*Selected item customization*

Text Color

Selected item's text color can be customized by setting `SfPicker.SelectedItemTextColor` property.

## XML

```

<syncfusion:SfPicker
x:Name="picker"

```

```
ItemsSource="{Binding Colors}"
SelectedItemTextColor="Red" />
```

### **C#**

```
picker.SelectedItemTextColor = Color.Red;
```

### *Font*

This section explains about the customization of selected item's font.

#### *FontFamily*

Selected item's text FontFamily can be customized by setting SfPicker.SelectedItemFontFamily property.

### **XML**

```
<syncfusion:SfPicker
x:Name="picker"
ItemsSource="{Binding Colors}"
SelectedItemFontFamily="Arial" />
```

### **C#**

```
picker.SelectedItemFontFamily = "Arial";
```

### *FontSize*

Selected item's text FontSize can be customized by setting SfPicker.SelectedItemFontSize property.

### **XML**

```
<syncfusion:SfPicker
x:Name="picker"
ItemsSource="{Binding Colors}"
SelectedItemFontSize="12" />
```

### **C#**

```
picker.SelectedItemFontSize = 12;
```

### *FontAttribute*

Selected item's text FontAttribute can be customized by setting SfPicker.SelectedItemFontAttribute property.

### **XML**

```
<syncfusion:SfPicker
x:Name="picker"
ItemsSource="{Binding Colors}"
SelectedItemFontAttribute="Bold" />
```

### **C#**

```
picker.SelectedItemFontAttribute = FontAttributes.Bold;
```

### *Unselected item customization*

#### Text Color

Unselected item's text color can be customized by setting `SfPicker.UnSelectedItemTextColor` property.

#### **XML**

```
<syncfusion:SfPicker
  x:Name="picker"
  ItemsSource="{Binding Colors}"
  UnSelectedItemTextColor="Gray" />
```

#### **C#**

```
picker.UnSelectedItemTextColor = Color.Gray;
```

#### Font

This section explains about the customization of unselected item's font.

#### *FontFamily*

Unselected item's text FontFamily can be customized by setting `SfPicker.UnSelectedItemFontFamily` property.

#### **XML**

```
<syncfusion:SfPicker
  x:Name="picker"
  ItemsSource="{Binding Colors}"
  UnSelectedItemFontFamily="Calibri" />
```

#### **C#**

```
picker.UnSelectedItemFontFamily = "Calibri";
```

#### *FontSize*

Unselected item's text FontSize can be customized by setting `SfPicker.UnSelectedItemFontSize` property.

#### **XML**

```
<syncfusion:SfPicker
  x:Name="picker"
  ItemsSource="{Binding Colors}"
  UnSelectedItemFontSize="11" />
```

#### **C#**

```
picker.UnSelectedItemFontSize = 11;
```

### FontAttribute

Unselected item's text FontAttribute can be customized by setting SfPicker.UnSelectedItemFontAttribute property.

### XML

```
<syncfusion:SfPicker
x:Name="picker"
ItemsSource="{Binding Colors}"
UnSelectedItemFontAttribute="Italic" />
```

### C#

```
picker.UnSelectedItemFontAttribute = FontAttributes.Italic;
```

### Adding custom view to items

In picker control, the items can be customized with custom view of each item by hooking SfPicker.OnPickerItemLoaded event, and assign custom view in PickerViewEventArgs.View property to add the all the item with custom view.

### XML

```
<Grid x:Name="main">
<Button
x:Name="button"
Text="Open Picker"
Clicked="Handle_Clicked"
HeightRequest="100"
WidthRequest="200"
VerticalOptions="Center"
HorizontalOptions="Center" />
<picker:SfPicker
x:Name="picker"
HeaderHeight="40"
ShowHeader="true"
HeaderText="SfPicker Sample"
ShowColumnHeader="True"
ColumnHeaderHeight="46"
PickerMode="Dialog"
ItemsHeight="40"
PickerHeight="350"
PickerWidth="350"
ShowFooter="True"
FooterHeight="46"/>
</Grid>
```

### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        ObservableCollection<object> mainCollection = new
        ObservableCollection<object>();
    }
}
```

```

ObservableCollection<object> column0 = new ObservableCollection<object>();
ObservableCollection<object> column1 = new ObservableCollection<object>();
ObservableCollection<string> columnHeader = new
ObservableCollection<string>();
columnHeader.Add("Custom View");
columnHeader.Add("Labels");
picker.ColumnHeaderText = columnHeader;
picker.OnPickerItemLoaded+=HandlePickerViewEvent;
column0.Add("India.png");
column0.Add("UAE.png");
column0.Add("USA.png");
column0.Add("UK.png");
column0.Add("Germany.png");
column1.Add("TestingLabel 1");
column1.Add("TestingLabel 2");
column1.Add("TestingLabel 3");
column1.Add("TestingLabel 4");
column1.Add("TestingLabel 5");
mainCollection.Add(column0);
mainCollection.Add(column1);
picker.ItemsSource = mainCollection;
picker.Parent = main;
}
void HandlePickerViewEvent(object sender,
Syncfusion.SfPicker.XForms.PickerViewEventArgs e)
{
    if (e.Column == 0)
    {
        Country country = new Country() { Name = e.Item.ToString() };
        e.View = new ItemView(country);
    }
}
void Handle_Clicked(object sender, System.EventArgs e)
{
    picker.IsOpen = true;
}
}

```

### CustomView Xaml

#### XML

```

<Grid>
<Grid.ColumnDefinitions>
<ColumnDefinition Width="40" />
<ColumnDefinition Width="*" />
</Grid.ColumnDefinitions>
<Image
Source="{Binding Name}"
Margin="8,0,0,0"
VerticalOptions="Center" />
<Label
Text="{Binding Text}"
Grid.Column="1" />
</Grid>

```

**C#**

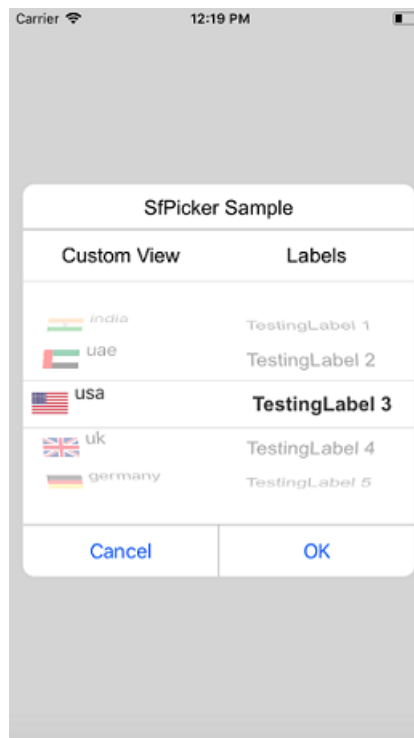

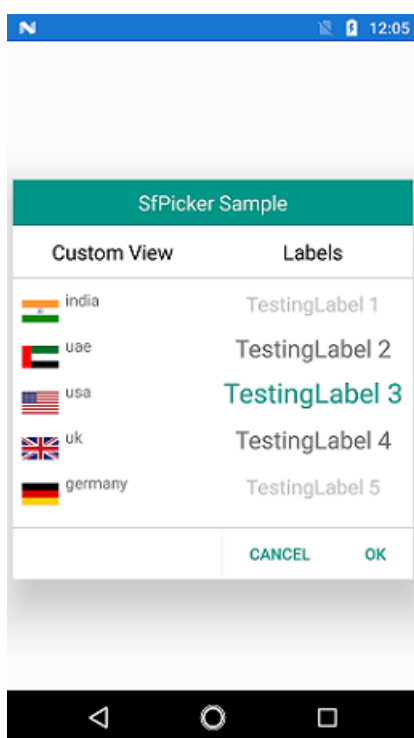

```

public partial class ItemView : ContentView
{
    Country countryName;
    int i;
    public ItemView(Country country)
    {
        i = 0;
        countryName = country;
        InitializeComponent();
        foreach(char count in country.Name)
        {
            i++;
        }
        countryName.Text = country.Name.Remove(i - 4);
        this.BindingContext = countryName;
    }
}

public class Country
{
    public string Name { get; set; }
    public string Text { get; set; }
}

```

Screen shot for the above code.

[DataTemplateSelector](#)

SfPicker supports DataTemplateSelector which you can choose a DataTemplate based on the data object.

**XML**

```

<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="DefaultTemplate">
<Grid >
<Label Text="{Binding LanguageName}" FontSize="Medium"
HorizontalOptions="Center" VerticalOptions="Center"/>
</Grid>
</DataTemplate>
<DataTemplate x:Key="SepcificTemplate">
<Grid BackgroundColor="Green">
<Label HorizontalOptions="CenterAndExpand" FontSize="Medium"
VerticalOptions="CenterAndExpand" Text="{Binding LanguageName}"/>
</Grid>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<Grid>
<syncfusion:SfPicker
ItemsSource="{Binding LanguageCollection }" >
<syncfusion:SfPicker.ItemTemplate>
<local:DataTemplateSelectorViewModel DefaultTemplate="{StaticResource
DefaultTemplate}" SpecificTemplate="{StaticResource SepcificTemplate}"/>
</syncfusion:SfPicker.ItemTemplate>
</syncfusion:SfPicker>
</Grid>
</Grid>
</Grid>
</ContentPage.Content>

```

**C#**

```

public partial class MainPage : ContentPage
{
    SfPicker picker = new SfPicker();
    DataTemplate defaultTemplate;
    DataTemplate specifictempalte;
    public MainPage()
    {
        InitializeComponent();
        this.BindingContext = new ViewModel();
        ViewModel view = new ViewModel();
        defaultTemplate = new DataTemplate(() =>
        {
            Grid grid = new Grid();
            Label label = new Label();
            label.SetBinding(Label.TextProperty, "LanguageName");
            label.HorizontalOptions = LayoutOptions.Center;
            label.VerticalOptions = LayoutOptions.Center;
            label.FontSize = 20;
            grid.Children.Add(label);
            return grid;
        });
        specifictempalte = new DataTemplate(() =>

```

```

{
    Grid maingrid = new Grid();
    Grid labelgrid = new Grid();
    Grid imagegrid = new Grid();
    Label label = new Label();
    Image image = new Image();
    label.SetBinding(Label.TextProperty, "LanguageName");
    label.FontSize = 20;
    label.HorizontalOptions = LayoutOptions.Center;
    label.VerticalOptions = LayoutOptions.Center;
    image.Source = "Crown.png";
    image.HeightRequest = 15;
    image.WidthRequest = 15;
    image.HorizontalOptions = LayoutOptions.Center;
    image.VerticalOptions = LayoutOptions.Center;
    labelgrid.Children.Add(label);
    imagegrid.Children.Add(image);
    imagegrid.Padding = new Thickness(-80, 0, 0, 0);
    maingrid.Children.Add(labelgrid);
    maingrid.Children.Add(imagegrid);
    return maingrid;
});
Grid mainGrid = new Grid();
RowDefinition firstrow = new RowDefinition();
RowDefinition secondrow = new RowDefinition();
Button button = new Button();
button.Clicked += Button_Clicked;
button.HorizontalOptions = LayoutOptions.Center;
button.VerticalOptions = LayoutOptions.Center;
button.Text = "Pick a Language";
Grid.SetRow(button, 0);
picker.ShowHeader = true;
picker.ShowFooter = true;
picker.HeaderText = "Select a Language";
picker.PickerMode = PickerMode.Dialog;
picker.ItemsSource = view.LanguageCollection;
picker.ItemTemplate = new DataTemplateSelectorViewModel { DefaultTemplate =
defaultTemplate, SpecificTemplate = specifictempalte };
Grid.SetRow(picker, 1);
mainGrid.RowDefinitions.Add(firstrow);
mainGrid.RowDefinitions.Add(secondrow);
mainGrid.Children.Add(button);
mainGrid.Children.Add(picker);
firstrow.Height = new GridLength(80);
secondrow.Height = new GridLength(500);
this.Content = mainGrid;
}

```

### *OnSelectTemplate*

The `OnSelectTemplate` is a overridden method to return a particular `DataTemplate`, which shown in the following code:

### **C#**

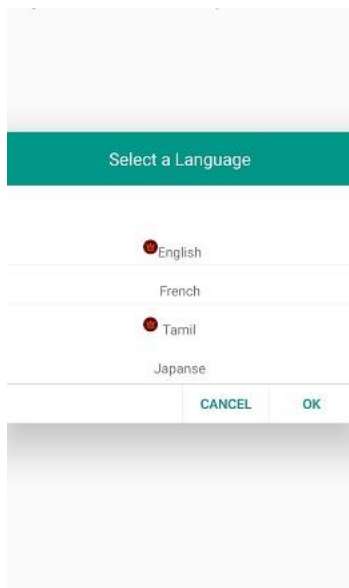

```

public class DataTemplateSelectorViewModel : DataTemplateSelector
{

```

```
private DataTemplate defaulttemplate;
public DataTemplate DefaultTemplate
{
    get { return defaulttemplate; }
    set { defaulttemplate = value; }
}
private DataTemplate specifictemplate;
public DataTemplate SpecificTemplate
{
    get { return specifictemplate; }
    set { specifictemplate = value; }
}
protected override DataTemplate OnSelectTemplate(object item, BindableObject
container)
{
    var message = item as Model;
    if (message == null)
        return null;
    return message.IsPremium ? SpecificTemplate : DefaultTemplate;
}
```

The following screenshot illustrates the output of above code.

We have attached sample for reference. You can download the sample from the following link.

Sample link: [DataTemplateSelectorSample](#)

## Dealing with Header and Footer

This section explains about the header and footer customization of picker control.

### Enable or disable header

SfPicker allows enabling or disabling the header section by setting `SfPicker.ShowHeader` property to True or False. Default value of `SfPicker.ShowHeader` property is True.

### XML

```
<syncfusion:SfPicker
x:Name="picker" ShowColumnHeader="False"
HeaderText="Select a Date" />
```

### C#

```
picker.ShowHeader = false;
```

### Set custom header

SfPicker allows providing custom text to its header by setting `SfPicker.HeaderText` property. Default value of `SfPicker.HeaderText` property is Null.

### XML

```
<syncfusion:SfPicker
x:Name="picker">
<syncfusion:SfPicker.HeaderView>
<Grid>
<Button Text="Select a Color" TextColor="Red" />
</Grid>
</syncfusion:SfPicker.HeaderView>
</syncfusion:SfPicker>
```

### C#

```
picker.HeaderText = "Select a Date";
```

### Header customization

SfPicker allows customizing background, text color, and fonts.

#### Background

Header's background color can be customized by setting `SfPicker.HeaderBackgroundColor` property.

### XML

```
<syncfusion:SfPicker
x:Name="picker"
HeaderBackgroundColor="SkyBlue"
HeaderText="Select a Date" />
```

### C#

```
picker.HeaderBackgroundColor = Color.SkyBlue;
```

#### Text-Color

Header text's color can be customized by setting `SfPicker.HeaderTextColor` property.

### XML

```
<syncfusion:SfPicker
x:Name="picker"
HeaderText="Select a Date" />
```

**C#**

```
picker.HeaderTextColor = Color.Red;
```

*Font*

This section explains about the customization of header text's of Font.

*FontFamily*

Header text's FontFamily can be customized by setting `SfPicker.HeaderFontFamily` property.

**XML**

```
<syncfusion:SfPicker
x:Name="picker"
HeaderFontFamily="Arial"
HeaderText="Select a Date" />
```

**C#**

```
picker.HeaderFontFamily = "Arial";
```

*FontSize*

Header text's FontSize can be customized by setting `SfPicker.HeaderFontSize` property.

**XML**

```
<syncfusion:SfPicker
x:Name="picker"
HeaderFontSize="18"
HeaderText="Select a Date" />
```

**C#**

```
picker.HeaderFontSize = 18;
```

*FontAttribute*

Header text's FontAttribute can be customized by setting `SfPicker.HeaderFontAttribute` property.

**XML**

```
<syncfusion:SfPicker
x:Name="picker"
HeaderFontAttribute="Italic"
HeaderText="Select a Date" />
```

**C#**

```
picker.HeaderFontAttribute = FontAttributes.Italic;
```

### Enable or disable footer

Picker allows enabling or disabling the footer section by setting `SfPicker.ShowFooter` property to True or False. Default value of `SfPicker.ShowFooter` property is False.

#### XML

```
<syncfusion:SfPicker  
x:Name="picker" ShowFooter="True"  
>
```

#### C#

```
picker.ShowFooter = true;
```

### Set custom footer

picker allows providing custom view to its footer by setting `SfPicker.FooterView` property. Default value of `SfPicker.FooterView` property is Null.

#### XML

```
<syncfusion:SfPicker x:Name="picker" ShowFooter="True">  
  <syncfusion:SfPicker.FooterView>  
    <Grid>  
      <Label Text="Cancel" TextColor="Red" />  
    </Grid>  
  </syncfusion:SfPicker.FooterView>  
</syncfusion:SfPicker>
```

#### C#

```
picker.ShowFooter = true;  
Grid layout = new Grid();  
layout.Children.Add(new Button() { Text = "Ok", TextColor = Color.Red });  
picker.FooterView = layout;
```

### Perform validation with default validation button

Picker allows performing validation based on OK or Cancel button by hooking `SfPicker.OkButtonClicked` and `SfPicker.CancelButtonClicked`. In this event, from the `SelectionChangedEventArgs` argument, current selected items can be obtained.

#### XML

```
<syncfusion:SfPicker  
x:Name="picker"  
CancelButtonClicked="picker_CancelButtonClicked"  
OkButtonClicked="picker_OkButtonClicked"  
ShowFooter="True" />
```

#### C#

```
picker.OkButtonClicked += picker_OkButtonClicked;  
picker.CancelButtonClicked += picker_CancelButtonClicked;
```

## Dealing with Columns

This section explains about the customization of picker columns

### Adjust column width

Picker allows user to adjust the column width by hooking `SfPicker.OnColumnLoaded` event, and check the column by using the `ColumnLoadedEventArgs.Column` property, and then adjust width of column by setting the `ColumnLoadedEventArgs.ColumnWidth` property.

The following code snippets demonstrate the DateTimePicker sample by using `OnColumnLoaded` event.

#### MainPage

Column width of the each column can be adjusted by using the `OnColumnLoaded` event in picker. That is implemented in the following code.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:ColumnDateTime"
x:Class="ColumnDateTime.MainPage"
xmlns:picker="clr-
namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
<!--Assign the TimePickerViewModel to BindingContext of Page-->
<ContentPage.BindingContext>
<local:DateTimePickerViewModel />
</ContentPage.BindingContext>

</Grid>
</ContentPage>
```

#### C#

```
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class MainPage : ContentPage
{
    public MainPage ()
    {
```

```
InitializeComponent();
}
private void Button_Clicked(object sender, EventArgs e)
{
    //open picker dialog
    date.IsOpen = !date.IsOpen;
}
private void date_OnColumnLoaded(object sender, ColumnLoadedEventArgs e)
{
    //Column width adjusted based on platform
    if (Device.OS == TargetPlatform.Android)
    {
        if (e.Column == 0)
            e.ColumnWidth = 400;
        if (e.Column == 1)
            e.ColumnWidth = 150;
        if (e.Column == 2)
            e.ColumnWidth = 150;
        if (e.Column == 3)
            e.ColumnWidth = 200;
    }
    if (Device.OS == TargetPlatform.iOS)
    {
        if (e.Column == 0)
            e.ColumnWidth = 130;
        if (e.Column == 1)
            e.ColumnWidth = 50;
        if (e.Column == 2)
            e.ColumnWidth = 50;
        if (e.Column == 3)
            e.ColumnWidth = 70;
    }
    else
    {
        if (e.Column == 0)
            e.ColumnWidth = 130;
        }
    }
}
```

You can download the sample for reference from the following link.

#### Add caption

picker allows users to add header for each column by setting the `SfPicker.ColumnHeaderText` property and enabling the `SfPicker.ShowColumnHeader` property to True.

The `ColumnHeaderText` property is object type and user can assign string or collection.

If a string type is assigned in `SfPicker.ColumnHeaderText`, that string will be updated in all the column of picker.

To assign the collection in `SfPicker.ColumnHeaderText`, picker column header should be updated based on index with value or collection.

The following code illustrates assigning the ColumnHeaderText for picker

### C#

```
public class DatesInfo
{
    public ObservableCollection<object> Dates { get; set; }
    //Day is the collection of day numbers
    private ObservableCollection<string> Day { get; set; }
    //Month is the collection of Month Names
    private ObservableCollection<string> Month { get; set; }
    //Year is the collection of Years from 1990 to 2050
    private ObservableCollection<string> Year { get; set; }
    //ColumnHeader is the collection of Header Day,Month and Year
    public ObservableCollection<string> ColumnHeader { get; set; }
    public DatesInfo()
    {
        Dates = new ObservableCollection<object>();
        //Populate Day, Month and Year values of each collection
        PopulateDates();
        //first column of SfPicker
        Dates.Add(Day);
        //Second column of SfPicker
        Dates.Add(Month);
        //Third column of SfPicker
        Dates.Add(Year);
        ColumnHeader = new ObservableCollection<string>();
        ColumnHeader.Add("Day");
        ColumnHeader.Add("Month");
        ColumnHeader.Add("Year");
    }
    private void PopulateDates()
    {
        Day = new ObservableCollection<string>();
        Month = new ObservableCollection<string>();
        Year = new ObservableCollection<string>();
        for (int i = 1; i <= 31; i++)
            Day.Add(i.ToString());
        for (int i = 1; i <= 12; i++)
            Month.Add(System.Globalization.CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i));
        for (int i = 1990; i <= 2050; i++)
            Year.Add(i.ToString());
    }
}
```

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage
    x:Class="GettingStarted.PickerSample"
    xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
    xmlns:local="clr-namespace:GettingStarted"
    xmlns:syncfusion="clr-namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
    <ContentPage.BindingContext>
```

```
<local:DatesInfo />
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderText="{Binding ColumnHeader}"
HeaderText="Select a Date"
ItemsSource="{Binding Dates}"
ShowColumnHeader="True" />
</ContentPage.Content>
</ContentPage>
```

### Caption customization

This section explains about the column header's Background, TextColor, and Fonts customization of picker.

#### Background

Column header's background color can be customized by setting the `SfPicker.ColumnHeaderBackgroundColor` property.

#### XML

```
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderBackgroundColor="SkyBlue"
ColumnHeaderText="Color"
ShowColumnHeader="True" />
```

#### C#

```
picker.ColumnHeaderBackgroundColor = Color.SkyBlue;
```

#### Text-Color

Column header's text color can be customized by setting the `SfPicker.ColumnHeaderTextColor` property.

#### XML

```
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderTextColor="Red"
ColumnHeaderText="Color"
ShowColumnHeader="True" />
```

#### C#

```
picker.ColumnHeaderTextColor = Color.Red;
```

#### Font

This section explains about the customization of column header's text or Font.

### FontFamily

Column header's text FontFamily can be customized by setting the SfPicker.ColumnHeaderFontFamily property.

#### XML

```
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderFontFamily="Courier New"
ColumnHeaderText="Color"
ShowColumnHeader="True" />
```

#### C#

```
picker.ColumnHeaderFontFamily = "Courier New";
```

### FontSize

Column header's text FontSize can be customized by setting the SfPicker.ColumnHeaderFontSize property.

#### XML

```
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderFontSize="16"
ColumnHeaderText="Color"
ShowColumnHeader="True" />
```

#### C#

```
picker.ColumnHeaderFontSize = 16;
```

### FontAttribute

Column header's text FontAttribute can be customized by setting the SfPicker.ColumnHeaderFontAttribute property.

#### XML

```
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderFontAttribute="Bold"
ColumnHeaderText="Color"
ShowColumnHeader="True" />
```

#### C#

```
picker.ColumnHeaderFontAttribute = FontAttributes.Bold;
```

### Cascading

Picker allows users to get selection change intimation by setting the SfPicker.SelectionChanged event.

Refer the following code example to prepare cascading sample for change the picker's background color when change the selection of picker.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage
  x:Class="ColorCascading.MainPage"
  xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  xmlns:local="clr-namespace:ColorCascading"
  xmlns:syncfusion="clr-namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
  <ContentPage.BindingContext>
    <local:ColorInfo />
  </ContentPage.BindingContext>
  <Grid HorizontalOptions="Center" VerticalOptions="Center">
    <syncfusion:SfPicker
      x:Name="picker"
      HeaderText="Select a Color"
      ItemsSource="{Binding Colors}"
      PickerHeight="260"
      PickerWidth="300"
      SelectionChanged="picker_SelectionChanged"
    />
  </Grid>
</ContentPage>
```

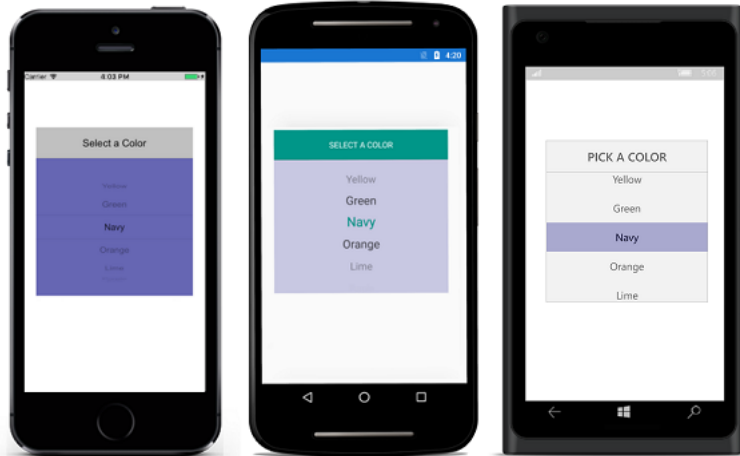

## C#

```
*MainPage*
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
    private void Button_Clicked(object sender, EventArgs e)
    {
        picker.IsOpen = true;
    }
    private void picker_SelectionChanged(object sender,
        Syncfusion.SfPicker.XForms.SelectionChangedEventArgs e)
    {
        if (e.NewValue != null)
        {
            var color = PickerHelper.GetColor(e.NewValue.ToString());
            if ((Device.OS==TargetPlatform.Android) || (Device.OS==TargetPlatform.iOS))
            {
                picker.BackgroundColor = Color.FromRgba(color.R, color.G, color.B, 0.2);
            }
            else
            {
                picker.SelectionBackgroundColor = color;
            }
        }
    }
    ColorInfo:
    public class ColorInfo
    {
```

```
private ObservableCollection<string> _color;
public ObservableCollection<string> Colors
{
    get { return _color; }
    set { _color = value; }
}
public ColorInfo()
{
    Colors = new ObservableCollection<string>();
    Colors.Add("Red");
    Colors.Add("Green");
    Colors.Add("Yellow");
    Colors.Add("Purple");
    Colors.Add("SkyBlue");
    Colors.Add("Orange");
    Colors.Add("Gray");
    Colors.Add("Pink");
    SelectedColor = "Yellow";
}
}
PickerHelper:
public static class PickerHelper
{
    static Dictionary<string, Color> colors = new Dictionary<string, Color>();
    public static Color GetColor(string color)
    {
        colors.Clear();
        colors.Add("Yellow", Color.Yellow);
        colors.Add("Green", Color.Green);
        colors.Add("Orange", Color.Orange);
        colors.Add("Lime", Color.Lime);
        colors.Add("Purple", Color.Purple);
        colors.Add("Pink", Color.Pink);
        colors.Add("Black", Color.Black);
        colors.Add("SkyBlue", Color.SkyBlue);
        colors.Add("Navy", Color.Navy);
        colors.Add("Red", Color.Red);
        colors.Add("Gray", Color.Gray);
        return colors[color.ToString()];
    }
}
```

The following screenshot illustrates the output of above code example.

You can download the sample for reference from the following link.

Sample link:[Cascading](#)

## Looping

The Looping support is used to automatically navigate the first item to repeat the list of items after reached the last item. Each forward iteration is followed by a backward iteration in the picker control. This can be achieved by `EnableLooping` property.

## EnableLooping

The looping support is achieved by setting the `EnableLooping` property to true.

## XML

```
<ContentPage.BindingContext>
<local:ColorInfo />
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfPicker
x:Name="picker"
HeaderText="Select a Color"
EnableLooping="True"
ItemsSource="{Binding Colors}" />
</ContentPage.Content>
</ContentPage>
```

## C#

```
SfPicker picker = new SfPicker();
ColorInfo info = new ColorInfo();
picker.ItemsSource = info.Colors;
// Enable Looping in carousel control
picker.EnableLooping = true;
```

You can find the complete Looping sample from this [link](#).

How to restrict Looping in a particular column of the picker

The looping support can be restricted in a particular column of the picker by setting the `EnableLooping` of `ColumnLoaded` event argument to false.

#### XML

```
<syncfusion:SfPicker
x:Name="picker"
OnColumnLoaded="Picker_OnColumnLoaded"/>
```

#### C#

```
private void Picker_OnColumnLoaded(object sender,
Syncfusion.SfPicker.XForms.ColumnLoadedEventArgs e)
{
    //restrict an Looping in Column 1
    if(e.Column == 1)
    {
        e.EnableLooping = false;
    }
}
```

TIME PICKER		
Hour	Minute	Format
10		
11		
12		AM
1	00	PM
2	01	
3	02	
4	03	
OK		Cancel

You can find the sample from this [link](#).

### Cascading

This section explains the steps required to create custom cascading sample by using picker control.

The cascading sample has been created for updating the state collection based on selected item picker.

Please refer the following steps to create the cascading sample

**Step 1 :** Create three ObservableCollection with object type in PickerCascading class.

#### Collection details :

Area collection, Country collection, and State collection.

Country collection -Add country names.

State collection -Add state names.

Area collection -Add above 2 collections.

Area collection is the main collection, and this collection has been assigned to ItemsSource of picker Control.

The following code demonstrates Area collection creation.

#### C#

```
public class PickerCascading:INotifyPropertyChanged
{
    #region Public Properties
    /// <summary>
    /// Area is the actual DataSource for SfPicker control which will holds the
    /// collection of Country and State
    /// </summary>
    /// <value>The area.</value>
    public ObservableCollection<object> Area { get; set; }
    //Country is the collection of country names
    private ObservableCollection<object> Country { get; set; }
```

```

//State is the collection of state names
private ObservableCollection<object> State { get; set; }
/// <summary>
/// Headers API is holds the column name for every column in cascading
picker
/// </summary>
/// <value>The Headers.</value>
public ObservableCollection<string> Header { get; set; }
private object _selectedArea;
public event PropertyChangedEventHandler PropertyChanged;
#endregion
//Identify the selected area using property changed method
public object SelectedArea
{
    get { return _selectedArea; }
    set { _selectedArea = value; RaisePropertyChanged("SelectedArea"); }
}
public PickerCascading()
{
    Area = new ObservableCollection<object>();
    Header = new ObservableCollection<string>();
    Country = new ObservableCollection<object>();
    State = new ObservableCollection<object>();
    //populate Countries
    Country.Add("UK");
    Country.Add("USA");
    Country.Add("India");
    Country.Add("UAE");
    Country.Add("Germany");
    //populate states
    State.Add("London");
    State.Add("Manchester");
    State.Add("Cambridge");
    State.Add("Edinburgh");
    State.Add("Glasgow");
    State.Add("Birmingham");
    Area.Add(Country);
    Area.Add(State);
    SelectedArea = new ObservableCollection<object>() { "UK", "London" };
}
//Hooked when changes occurred
public void RaisePropertyChanged(string name)
{
    if (PropertyChanged != null)
        PropertyChanged(this, new PropertyChangedEventArgs(name));
}
}

```

**Step 2 :** Update the state collection based on selected item of country name by using the Selection changed event of picker control.

### C#

```

private void picker_SelectionChanged(object sender,
Syncfusion.SfPicker.XForms.SelectionChangedEventArgs e)
{

```

```

if (picker.ItemsSource != null && e.NewValue is IList && (picker.ItemsSource
as IList).Count > 1 && CurrentItem != (e.NewValue as IList)[0].ToString())
{
    //Updated the second column collection based on first column selected value.
    (picker.ItemsSource as ObservableCollection<object>).RemoveAt(1);
    (picker.ItemsSource as
    ObservableCollection<object>).Add(GetCountry((e.NewValue as
    IList)[0].ToString()));
}
}

```

**Step 3 :** Define column headers as “Country” and “State” by using ColumnHeaderText property of picker control. The following code demonstrates how to define header for each column of picker control.

### C#

```

public class PickerCascading:INotifyPropertyChanged
{
    /// <summary>
    /// Headers API is holds the column name for every column in cascading
    picker
    /// </summary>
    /// <value>The Headers.</value>
    public ObservableCollection<string> Header { get; set; }
    public PickerCascading()
    {
        Header = new ObservableCollection<string>();
        Header.Add("Country");
        Header.Add("State");
    }
}

```

**Step 4 :** Add the cascading picker control in main page of XAML. Please refer the following code snippets.

### XML

```

<ContentPage
x:Class="CascadingPicker.MainPage"
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:CascadingPicker"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
    <ContentPage.BindingContext>
    <local:PickerCascading />
    </ContentPage.BindingContext>
    <ContentPage.Content>
    <Grid HorizontalOptions="Center" VerticalOptions="Center">
    <StackLayout>
    <Button
Clicked="Button_Clicked"
HeightRequest="40"
Text="Open Picker"
WidthRequest="200" />

```

```

</StackLayout>
<syncfusion:SfPicker
x:Name="picker"
ColumnHeaderText="{Binding Header}"
HeaderText="Select your Area"
HeightRequest="350"
ItemsSource="{Binding Area}"
PickerHeight="250"
PickerMode="Dialog"
PickerWidth="280"
SelectedItem="{Binding SelectedArea}"
SelectionChanged="picker_SelectionChanged"
ShowColumnHeader="True"
WidthRequest="300" />
</Grid>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

Grid mainGrid = new Grid();
mainGrid.HorizontalOptions = LayoutOptions.Center;
mainGrid.VerticalOptions = LayoutOptions.Center;
StackLayout mainStack = new StackLayout();
mainStack.VerticalOptions = LayoutOptions.Center;
mainStack.HorizontalOptions = LayoutOptions.Center;
Button button = new Button();
button.HeightRequest = 40;
button.Text = "Open Picker";
button.WidthRequest = 200;
mainStack.Children.Add(button);
SfPicker picker = new SfPicker();
picker.HeaderText = "Select your Area";
picker.HeightRequest = 350;
picker.PickerHeight = 250;
picker.PickerMode = PickerMode.Dialog;
picker.PickerWidth = 280;
picker.SelectionChanged += Picker_SelectionChanged;
picker.ShowColumnHeader = true;
picker.SetBinding(Picker.SelectedItemProperty, "SelectedArea");
picker.SetBinding(Picker.ItemsSourceProperty, "Area");
picker.SetBinding(Picker.ColumnHeaderText, "Header");
picker.ShowFooter = true;
picker.WidthRequest = 300;
mainGrid.Children.Add(mainStack);
mainGrid.Children.Add(picker);
this.Content = mainGrid;

```

The code in the code behind is as follows.

**C#**

```

public partial class MainPage : ContentPage
{
    string CurrentItem;
    public MainPage()

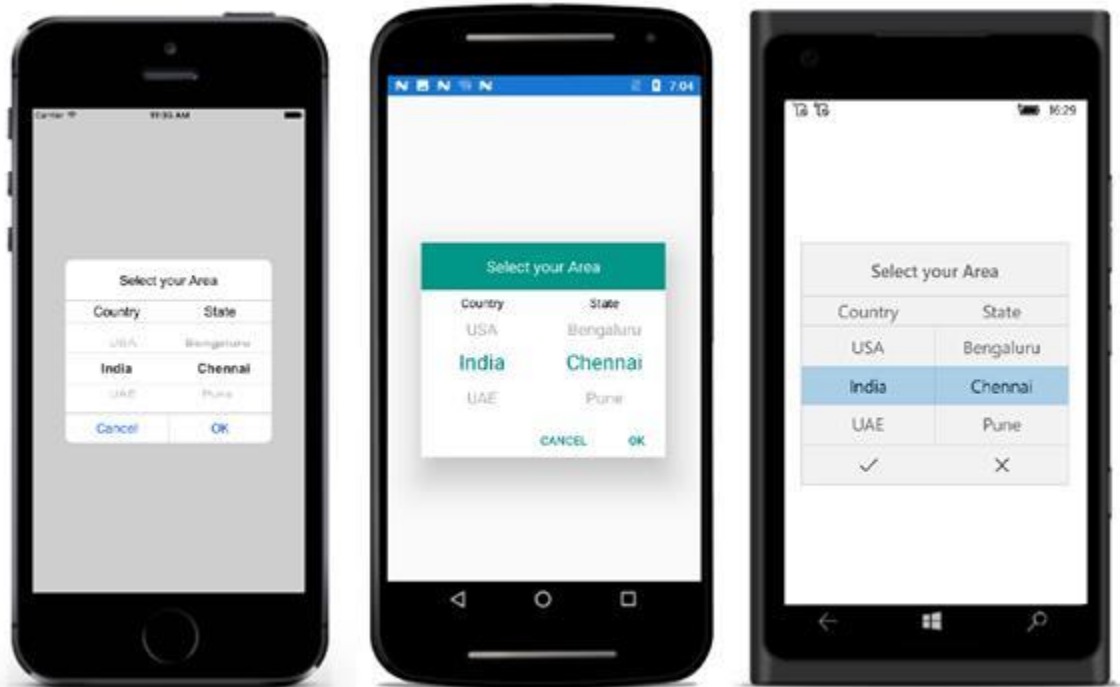

```

```

{
    InitializeComponent();
}
private void Button_Clicked(object sender, EventArgs e)
{
    picker.IsOpen = true;
}
}

```

The following screenshot illustrates the output of above code snippets.

You can download the sample for reference from the following link.

Sample link: [CascadingSample](#)

## Time Picker

This section explains the steps required to create custom TimePicker by using picker control.

**Step 1 :** Create a custom class, and name it as “CustomTimePicker”. This class should be inherited from the picker control.

### C#

```

public class CustomTimePicker: SfPicker
{
}

```

**Step 2 :** Create four ObservableCollection with object type in CustomTimePicker class.

### Collection details :

Time collection, Minute collection, Hour collection, and Format collection.

Time Collection -Add all the three collections.

Minute collection -Added minutes from 0 to 59.

Hour collection -Added hours from 1 to 12.

Format Collection -Add two formats, namely AM and PM.

The following code demonstrates time collection creation.

### **C#**

```
public class CustomTimePicker: SfPicker
{
    // Time api is used to modify the Hour collection as per change in Time
    /// <summary>
    /// Time is the actual DataSource for SfPicker control which will holds the
    collection of Hour ,Minute and Format
    /// </summary>
    public ObservableCollection<object> Time { get; set; }
    //Minute is the collection of minute numbers
    public ObservableCollection<object> Minute;
    //Hour is the collection of hour numbers
    public ObservableCollection<object> Hour;
    //Format is the collection of AM and PM
    public ObservableCollection<object> Format;
    /// <summary>
    /// Header api is holds the column name for every column in time picker
    /// </summary>
    public ObservableCollection<string> Headers { get; set; }
    public CustomTimePicker()
    {
        Time = new ObservableCollection<object>();
        Hour = new ObservableCollection<object>();
        Minute = new ObservableCollection<object>();
        Format = new ObservableCollection<object>();
        PopulateTimeCollection();
        this.ItemsSource = Time;
    }
    private void PopulateTimeCollection()
    {
        //Populate Hour
        for (int i = 1; i <= 12; i++)
        {
            Hour.Add(i.ToString());
        }
        //Populate Minute
        for (int j = 0; j < 60; j++)
        {
            if (j < 10)
            {
                Minute.Add("0" + j);
            }
            else
            {
                Minute.Add(j.ToString());
            }
        }
        //Populate Format
        Format.Add("AM");
    }
}
```

```
Format.Add("PM");  
Time.Add(Hour);  
Time.Add(Minute);  
Time.Add(Format);  
}  
}
```

**Step 3 :** Define each column headers “Hour”, “Minute”, and “Format” by using the ColumnHeaderText property of picker control. The following code demonstrates how to define header for each column of picker control.

### C#

```
public class CustomTimePicker: SfPicker  
{  
    /// <summary>  
    /// Header API is holds the column name for every column in time picker  
    /// </summary>  
    public ObservableCollection<string> Headers { get; set; }  
    public CustomTimePicker()  
    {  
        Headers = new ObservableCollection<string>();  
        if (Device.RuntimePlatform == Device.Android)  
        {  
            Headers.Add("HOUR");  
            Headers.Add("MINUTE");  
            Headers.Add("FORMAT");  
        }  
        else  
        {  
            Headers.Add("Hour");  
            Headers.Add("Minute");  
            Headers.Add("Format");  
        }  
        //SfPicker header text  
        HeaderText = "TIME PICKER";  
        // Column header text collection  
        this.ColumnHeaderText = Headers;  
    }  
}
```

**Step 4 :** Finally, enable the picker header, column header, and footer by using the ShowHeader, ShowFooter, and ShowColumnHeader properties.

### C#

```
public CustomTimePicker()  
{  
    //Enable Footer of SfPicker  
    ShowFooter = true;  
    //Enable Header of SfPicker  
    ShowHeader = true;  
    //Enable Column Header of SfPicker  
    ShowColumnHeader = true;  
}
```

**Step 5 :** Add the CustomTimePicker control in main XAML page. Please refer the following code snippets.

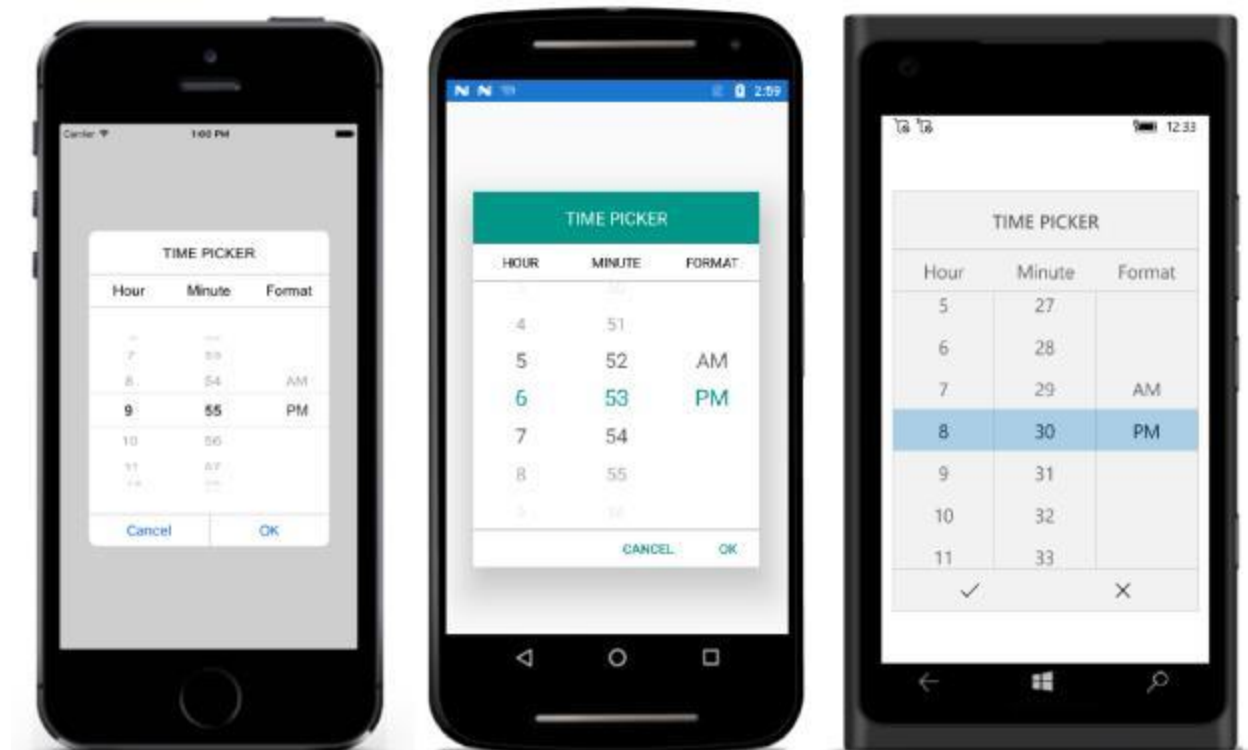

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:TimePicker"
x:Class="TimePicker.MainPage"
xmlns:picker="clr-
namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
<!--Assign the TimePickerViewModel to BindingContext of Page-->
<ContentPage.BindingContext>
<local:TimePickerViewModel />
</ContentPage.BindingContext>
<Grid>
<Button
Clicked="Button_Clicked"
HeightRequest="50"
VerticalOptions="Center"
HorizontalOptions="Center"
Text="Show TimePicker"
WidthRequest="200" />
<!--Initialize the CustomTimePicker-->
<local:CustomTimePicker
x:Name="date"
ColumnHeaderHeight="40"
HorizontalOptions="Center"
VerticalOptions="Center"
PickerHeight="400"
PickerMode="Dialog"
PickerWidth="300"
SelectedItem="{Binding SelectedTime,Mode=TwoWay}" />
</Grid>
</ContentPage>
```

#### C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
    private void Button_Clicked(object sender, EventArgs e)
    {
        //open picker dialog
        date.IsOpen = !date.IsOpen;
    }
}
```

The following screenshot illustrates the output of the above code snippets.

You can download the TimePicker sample for reference from the following link.

Sample link: [TimePicker](#)

### Date Time Picker

In our Xamarin.Forms, picker control has multi column support. By using this, you we can populate day, month, year, hour, and minute values of collection in picker control.

This section explains create custom DateTimePicker by using picker control.

**Step 1 :** Create a custom class, and name it as “DateTimePicker”. This class should be inherited from picker control.

#### C#

```
public class DateTimePicker : SfPicker
{
}
```

**Step 2 :** Create six ObservableCollection with object type in DateTimePicker class.

#### Collection details :

Day collection, Month collection, Year collection, Hour collection, and Minute collection.

Day collection Add current month's days by using DateTime.DaysInMonth.

Month collection -Add months from January to December.

Year collection -Add years from 1990 to 2050.

Hour collection -Add hours from 0 to 24.

Minute collection -Add minutes from 00 to 59.

Date collection -Add all the five collections.

Date collection is the main collection, and this collection has been assigned to ItemsSource of picker control.

The following code demonstrates date collection creation.

### C#

```
public class DateTimePicker : SfPicker
{
    #region Public Properties
    // Months API is used to modify the Day collection as per change in Month
    internal Dictionary<string, string> Months { get; set; }
    /// <summary>
    /// Date is the actual DataSource for SfPicker control which will holds the
    collection of Day ,Month and Year
    /// </summary>
    /// <value>The date.</value>
    public ObservableCollection<object> Date { get; set; }
    //Day is the collection of day numbers
    internal ObservableCollection<object> Day { get; set; }
    //Month is the collection of Month Names
    internal ObservableCollection<object> Month{ get; set; }
    //Year is the collection of Years from 1990 to 2042
    internal ObservableCollection<object> Year{ get; set; }
    //Hour is the collection of Hours in Railway time format
    internal ObservableCollection<object> Hour{ get; set; }
    //Minute is the collection of Minutes from 00 to 59
    internal ObservableCollection<object> Minute{ get; set; }
    #endregion
    public DateTimePicker()
    {
        Months = new Dictionary<string, string>();
        Date = new ObservableCollection<object>();
        Day = new ObservableCollection<object>();
        Month = new ObservableCollection<object>();
        Year = new ObservableCollection<object>();
        Hour = new ObservableCollection<object>();
        Minute = new ObservableCollection<object>();
        PopulateDateCollection();
        this.ItemsSource = Date;
    }
    private void PopulateDateCollection()
    {
        //populate months
        for (int i = 1; i < 13; i++)
        {
            if
            (!Months.ContainsKey(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(
            i).Substring(0, 3)))
            Months.Add(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i).Substri
            ng(0, 3), CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i));
            Month.Add(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i).Substrin
            g(0, 3));
        }
    }
}
```

```
//populate year
for (int i = 1990; i < 2050; i++)
{
    Year.Add(i.ToString());
}
//populate Days
for (int i = 1; i <= DateTime.DaysInMonth(DateTime.Now.Year,
    DateTime.Now.Month); i++)
{
    if (i < 10)
    {
        Day.Add("0" + i);
    }
    else
    {
        Day.Add(i.ToString());
    }
}
//populate Hours
for (int i = 1; i <= 24; i++)
{
    if (i < 10)
    {
        Hour.Add("0" + i.ToString());
    }
    else
    {
        Hour.Add(i.ToString());
    }
}
//populate Minutes
for (int j = 0; j < 60; j++)
{
    if (j < 10)
    {
        Minute.Add("0" + j);
    }
    else
    {
        Minute.Add(j.ToString());
    }
}
Date.Add(Year);
Date.Add(Month);
Date.Add(Day);
Date.Add(Hour);
Date.Add(Minute);
}
```

**Step 3 :** Update the day value based on month and year values by using Selection changed event of picker control. Since the days of each month differs, you should handle this collection.

### C#

```
public DateTimePicker()
{
    //hook selection changed event
    this.SelectionChanged += CustomDatePicker_SelectionChanged;
}
private void CustomDatePicker_SelectionChanged(object sender,
    SelectionChangedEventArgs e)
```

```

{
    UpdateDays(Date, e);
}
//Update days method is used to alter the Date collection as per selection change in Month column(if Feb is Selected day collection has value from 1 to 28)
public void UpdateDays(ObservableCollection<object> Date,
    SelectionChangedEventArgs e)
{
    Device.BeginInvokeOnMainThread(() =>
    {
        if (Date.Count == 5)
        {
            bool flag = false;
            if (e.OldValue != null && e.NewValue != null && (e.OldValue is
                ObservableCollection<object>) && (e.OldValue as
                ObservableCollection<object>).Count > 0)
            {
                if (!object.Equals((e.OldValue as IList)[1], (e.NewValue as IList)[1]))
                {
                    flag = true;
                }
                if (!object.Equals((e.OldValue as IList)[0], (e.NewValue as IList)[0]))
                {
                    flag = true;
                }
            }
            if (flag)
            {
                ObservableCollection<object> days = new ObservableCollection<object>();
                int month = DateTime.ParseExact(Months[(e.NewValue as IList)[1].ToString()],
                    "MMMM", CultureInfo.InvariantCulture).Month;
                int year = int.Parse((e.NewValue as IList)[0].ToString());
                for (int j = 1; j <= DateTime.DaysInMonth(year, month); j++)
                {
                    if (j < 10)
                    {
                        days.Add("0" + j);
                    }
                    else
                    {
                        days.Add(j.ToString());
                    }
                }
                ObservableCollection<object> PreviousValue = new
                ObservableCollection<object>();
                foreach (var item in e.NewValue as IList)
                {
                    PreviousValue.Add(item);
                }
                if (days.Count > 0)
                {
                    Date.RemoveAt(2);
                    Date.Insert(2, days);
                }
                if ((Date[2] as IList).Contains(PreviousValue[2]))
                {
                    this.SelectedItem = PreviousValue;
                }
            }
        }
    }
}

```

```

else
{
    PreviousValue[2] = (Date[2] as IList)[(Date[2] as IList).Count - 1];
    this.SelectedItem = PreviousValue;
}
}
}
});
}

```

**Step 4 :** Define each column headers “Day”, “Month”, “Year”, “Hour”, and “Minute” by using the ColumnHeaderText property. The following code demonstrates how to define header for each column of picker control.

#### C#

```

public class DateTimePicker : SfPicker
{
    /// <summary>
    /// Headers API is holds the column name for every column in date picker
    /// </summary>
    /// <value>The Headers.</value>
    public ObservableCollection<string> Headers { get; set; }
    public DateTimePicker()
    {
        Headers = new ObservableCollection<string>();
        Headers.Add("Year");
        Headers.Add("Month");
        Headers.Add("Day");
        Headers.Add("Hour");
        Headers.Add("Minute");
        //SfPicker header text
        HeaderText = "Date Picker";
        // Column header text collection
        this.ColumnHeaderText = Headers;
    }
}

```

**Step 5 :** Finally enable the picker header, Column header and footer by using the ShowHeader, ShowFooter and ShowColumnHeader properties.

#### C#

```

public DateTimePicker()
{
    //Enable Footer
    ShowFooter = true;
    //Enable SfPicker Header
    ShowHeader = true;
    //Enable Column Header of SfPicker
    ShowColumnHeader = true;
}

```

**Step 6 :** Add the DateTimePicker control in main XAML page. Please refer the following code snippets.

## XML

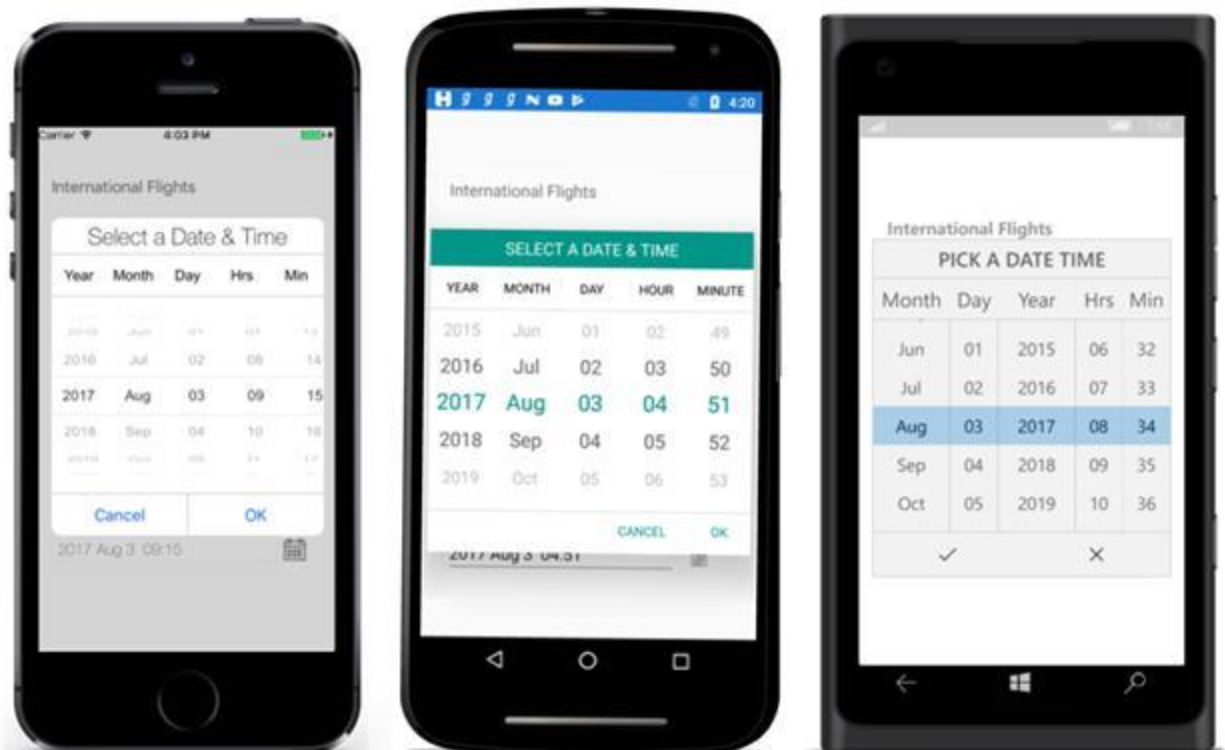

```
<ContentPage
x:Class="SfPDatetimeSample.MainPage"
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:SfPDatetimeSample"
xmlns:picker="clr-
namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
  <ContentPage.BindingContext>
  <local:DateTimeViewModel />
  </ContentPage.BindingContext>
  <Grid>
    <Button
      Clicked="Button_Clicked"
      HeightRequest="50"
      HorizontalOptions="Center"
      Text="Show Picker"
      VerticalOptions="Center"
      WidthRequest="200" />
    <local:DateTimePicker
      x:Name="date"
      ColumnHeaderHeight="40"
      HorizontalOptions="Start"
      PickerHeight="400"
      PickerMode="Dialog"
      PickerWidth="300"
      SelectedItem="{Binding StartDate}"
      VerticalOptions="Center" />
  </Grid>
</ContentPage>
```

## C#

```
public partial class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
    }
    private void Button_Clicked(object sender, EventArgs e)
    {
        date.IsOpen = !date.IsOpen;
    }
}
```

The following screenshot illustrates the output of the above codes.

You can download the DateTimePicker sample for reference from the following link.

Sample link: [DateTimePicker](#)

## Date Picker

This section explains the steps required to create custom Date Picker by using picker control.

**Step 1 :** Create a custom class, and named it as “CustomDatePicker”. This class should be inherited from picker control.

### C#

```
public class CustomDatePicker : SfPicker
{
}
```

**Step 2 :** Create four ObservableCollection with object type in CustomDatePicker class.

### Collection details :

Date collection, Day collection, Month collection, and Year collection.

Day collection -Add current month's days by using DateTime.DaysInMonth.

Month collection -Add months from January to December.

Year collection -Add years from 1990 to 2050.

Date collection -Add all the three collections.

Date Collection is the main collection, and this collection has been assigned to ItemsSource of picker control.

The following code demonstrates Date collection creation.

### C#

```
public class CustomDatePicker : SfPicker
{
    #region Public Properties
    // Months API is used to modify the Day collection as per change in Month
    internal Dictionary<string, string> Months { get; set; }
    /// <summary>
    /// Date is the actual DataSource for SfPicker control which will holds the
    collection of Day ,Month and Year
    /// </summary>
    /// <value>The date.</value>
    public ObservableCollection<object> Date { get; set; }
    //Day is the collection of day numbers
    internal ObservableCollection<object> Day { get; set; }
    //Month is the collection of Month Names
    internal ObservableCollection<object> Month{ get; set; }
    //Year is the collection of Years from 1990 to 2042
    internal ObservableCollection<object> Year{ get; set; }
    #endregion
    public CustomDatePicker()
    {
        Months = new Dictionary<string, string>();
        Date = new ObservableCollection<object>();
        Day = new ObservableCollection<object>();
        Month = new ObservableCollection<object>();
        Year = new ObservableCollection<object>();
        PopulateDateCollection();
        this.ItemsSource = Date;
    }
    private void PopulateDateCollection()
    {
        //populate months
        for (int i = 1; i < 13; i++)
        {
            if
            (!Months.ContainsKey(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(
            i).Substring(0, 3)))
            Months.Add(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i).Substri
            ng(0, 3), CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i));
            Month.Add(CultureInfo.CurrentCulture.DateTimeFormat.GetMonthName(i).Substrin
            g(0, 3));
        }
        //populate year
        for (int i = 1990; i < 2050; i++)
        {
            Year.Add(i.ToString());
        }
        //populate Days
        for (int i = 1; i <= DateTime.DaysInMonth(DateTime.Now.Year,
            DateTime.Now.Month); i++)
        {
            if (i < 10)
            {
                Day.Add("0" + i);
            }
        }
    }
}
```

```

}
else
Day.Add(i.ToString());
}
Date.Add(Month);
Date.Add(Day);
Date.Add(Year);
}
}

```

**Step 3 :** Update the day value based on month and year values by using Selection changed event of picker control. Since the days of each month differs, you should handle this collection.

### C#

```

public CustomDatePicker()
{
    //hook selection changed event
    this.SelectionChanged += CustomDatePicker_SelectionChanged;
}

private void CustomDatePicker_SelectionChanged(object sender,
SelectionChangedEventArgs e)
{
    UpdateDays(Date, e);
}

//Update days method is used to alter the Date collection as per selection
change in Month column(if Feb is Selected day collection has value from 1 to
28)
public void UpdateDays(ObservableCollection<object> Date,
SelectionChangedEventArgs e)
{
    Device.BeginInvokeOnMainThread(() =>
    {
        if (Date.Count == 3)
        {
            bool flag = false;
            if (e.OldValue != null && e.NewValue != null && (e.OldValue as
ObservableCollection<object>).Count == 3 && (e.NewValue as
ObservableCollection<object>).Count== 3 )
            {
                if (!object.Equals((e.OldValue as IList)[0], (e.NewValue as IList)[0]))
                {
                    flag = true;
                }
                if (!object.Equals((e.OldValue as IList)[2], (e.NewValue as IList)[2]))
                {
                    flag = true;
                }
            }
            if (flag)
            {
                ObservableCollection<object> days = new ObservableCollection<object>();
                int month = DateTime.ParseExact(Months[(e.NewValue as IList)[0].ToString()],
"MMMM", CultureInfo.InvariantCulture).Month;
                int year = int.Parse((e.NewValue as IList)[2].ToString());
                for (int j = 1; j <= DateTime.DaysInMonth(year, month); j++)

```

```

{
    if (j < 10)
    {
        days.Add("0" + j);
    }
    else
    {
        days.Add(j.ToString());
    }
    ObservableCollection<object> PreviousValue = new
    ObservableCollection<object>();
    foreach (var item in e.NewValue as IList)
    {
        PreviousValue.Add(item);
    }
    if (days.Count > 0)
    {
        Date.RemoveAt(1);
        Date.Insert(1, days);
    }
    if ((Date[1] as IList).Contains(PreviousValue[1]))
    {
        this.SelectedItem = PreviousValue;
    }
    else
    {
        PreviousValue[1] = (Date[1] as IList)[(Date[1] as IList).Count - 1];
        this.SelectedItem = PreviousValue;
    }
}
});
}

```

**Step 4 :** Define each column headers “Day”, “Month”, and “Year” by using ColumnHeaderText property of picker control. The following code demonstrates how to define header for each column of picker control.

#### C#

```

public class CustomDatePicker : SfPicker
{
    /// <summary>
    /// Headers API is holds the column name for every column in date picker
    /// </summary>
    /// <value>The Headers.</value>
    public ObservableCollection<string> Headers { get; set; }
    public CustomDatePicker()
    {
        Headers = new ObservableCollection<string>();
        Headers.Add("Month");
        Headers.Add("Day");
        Headers.Add("Year");
        //SfPicker header text
        HeaderText = "Date Picker";
        // Column header text collection
        this.ColumnHeaderText = Headers;
    }
}

```

```
}
}
```

**Step 5 :** Finally, enable the picker header, Column header, and footer by using ShowHeader, ShowFooter and ShowColumnHeader properties.

### C#

```
public CustomDatePicker()
{
    //Enable Footer
    ShowFooter = true;
    //Enable SfPicker Header
    ShowHeader = true;
    //Enable Column Header of SfPicker
    ShowColumnHeader = true;
}
```

**Step 6 :** Add the CustomDatePicker control in main XAML page. Please refer the following code snippets.

### XML

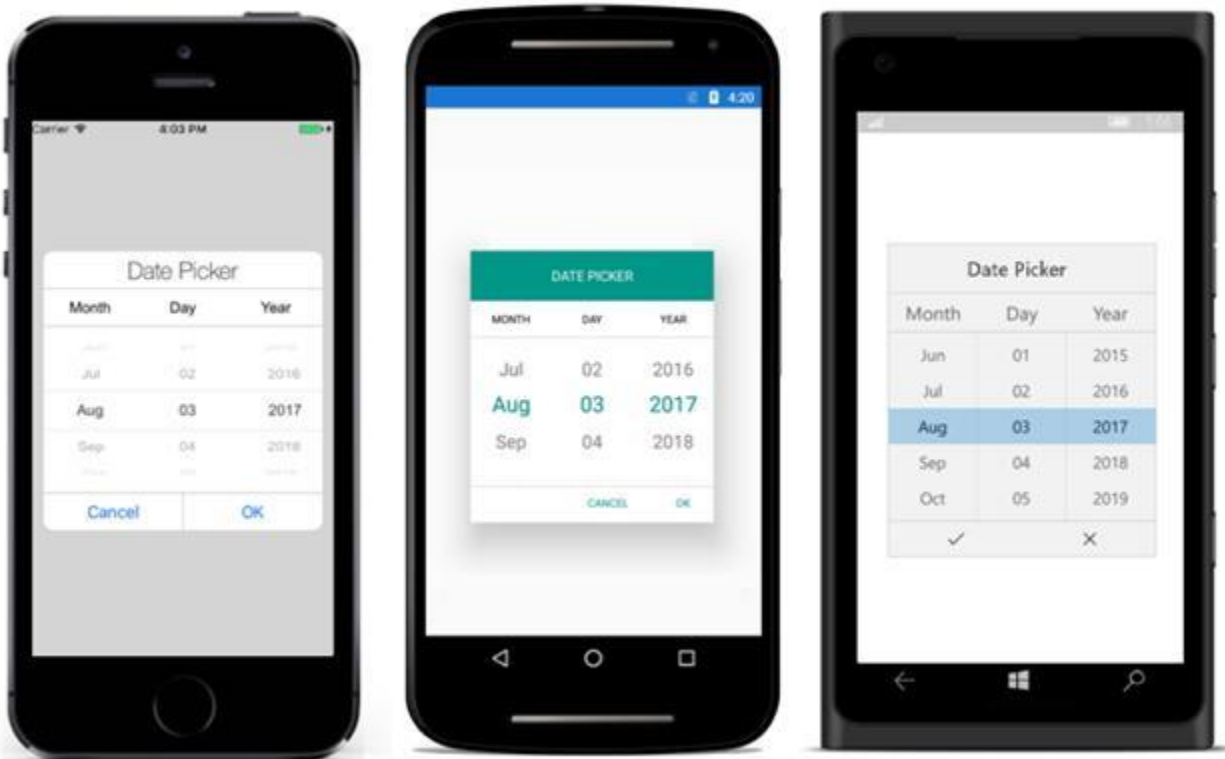

```
<ContentPage
x:Class="DatePicker.DatePickerPage"
xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:DatePicker"
xmlns:picker="clr-
namespace:Syncfusion.SfPicker.XForms;assembly=Syncfusion.SfPicker.XForms">
<ContentPage.BindingContext>
<local:DatePickerViewModel />
</ContentPage.BindingContext>
<Grid>
<Button
Clicked="Button_Clicked"
HeightRequest="30"
HorizontalOptions="Center"
Text="Show Picker"
VerticalOptions="Center"
WidthRequest="200" />
<local:CustomDatePicker
x:Name="date"
ColumnHeaderHeight="40"
HorizontalOptions="Center"
PickerHeight="400"
PickerMode="Dialog"
PickerWidth="300"
SelectedItem="{Binding StartDate}"
VerticalOptions="Center" />
</Grid>
</ContentPage>
```

### C#

```
public partial class DatePickerPage : ContentPage
```

```
{  
public DatePickerPage()  
{  
InitializeComponent();  
}  
private void Button_Clicked(object sender, EventArgs e)  
{  
date.IsOpen = !date.IsOpen;  
}  
}
```

The following screenshot illustrates the output of above code snippets.

You can download the DatePicker sample for reference from the following link.

Sample link: [DatePicker](#)

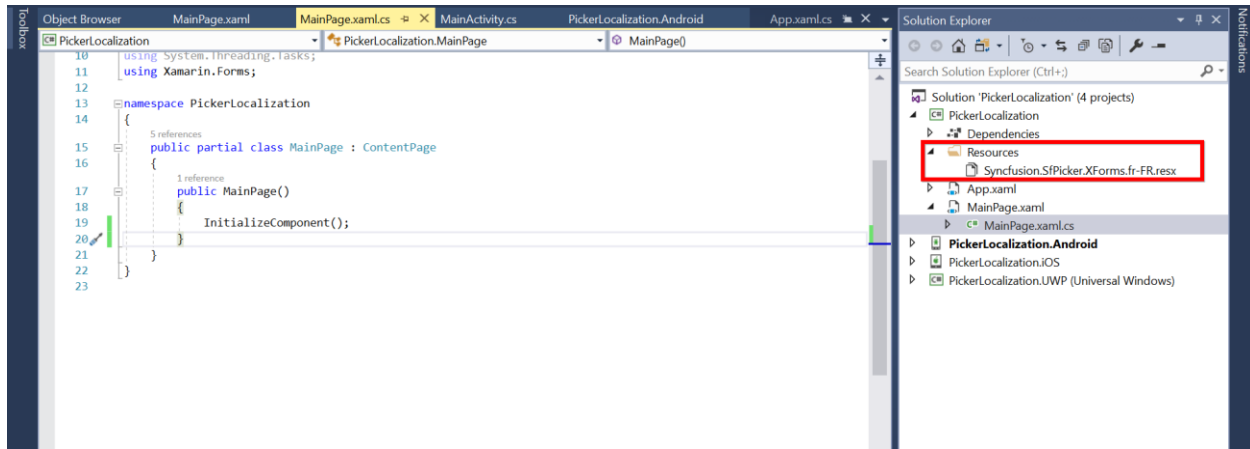

### Localization

You can localize Picker in all the platforms by adding a.resx file in a .NET Standard project alone. The following steps describe how to localize SfPicker in a project and you can download the complete sample from this [link](#).

**NOTE:** Here, the resources have been already created for some cultures and shared them on [Syncfusion GitHub](#) for your convenience.

1. Add a new folder in the .NET Standard project named Resources.
2. Add resource files for the languages you wish to support, and set their Build Action to EmbeddedResource. The name of the resource file should be \$name of the Syncfusion component\$+\$language code\$.resx. For example, if you add a resource file for the French

culture, add the Syncfusion.SfPicker.XForms.fr-FR.resx file to Resources folder as illustrated in the following screenshot.

3. Provide the French values for each key in the respective .resx files. Here, "Cancel" and "Ok" are the keys, and "Annuler" and "D'accord" are their respective French values.

#### XML

```
<data name="Cancel" xml:space="preserve">
<value>Annuler</value>
</data>
<data name="Ok" xml:space="preserve">
<value>D'accord</value>
</data>
```

4. Set the resource manager to `PickerResourceManager.Manager` as demonstrated in the following code to get the resource manager from the users. For more details, refer [Localization](#).

#### C#

```
PickerResourceManager.Manager = new
ResourceManager("PickerLocalization.Resources.Syncfusion.SfPicker.XForms",
Application.Current.GetType().Assembly);
```

#### Localize at application level

You can also localize the text at application-level regardless of the language selected on the device. The following platform-specific codes are needed to localize the text at application-level.

#### C#

```
//For Android and iOS,
Thread.CurrentThread.CurrentUICulture = new CultureInfo("fr-FR");
//For UWP,
CultureInfo.CurrentUICulture = new CultureInfo("fr-FR");
```

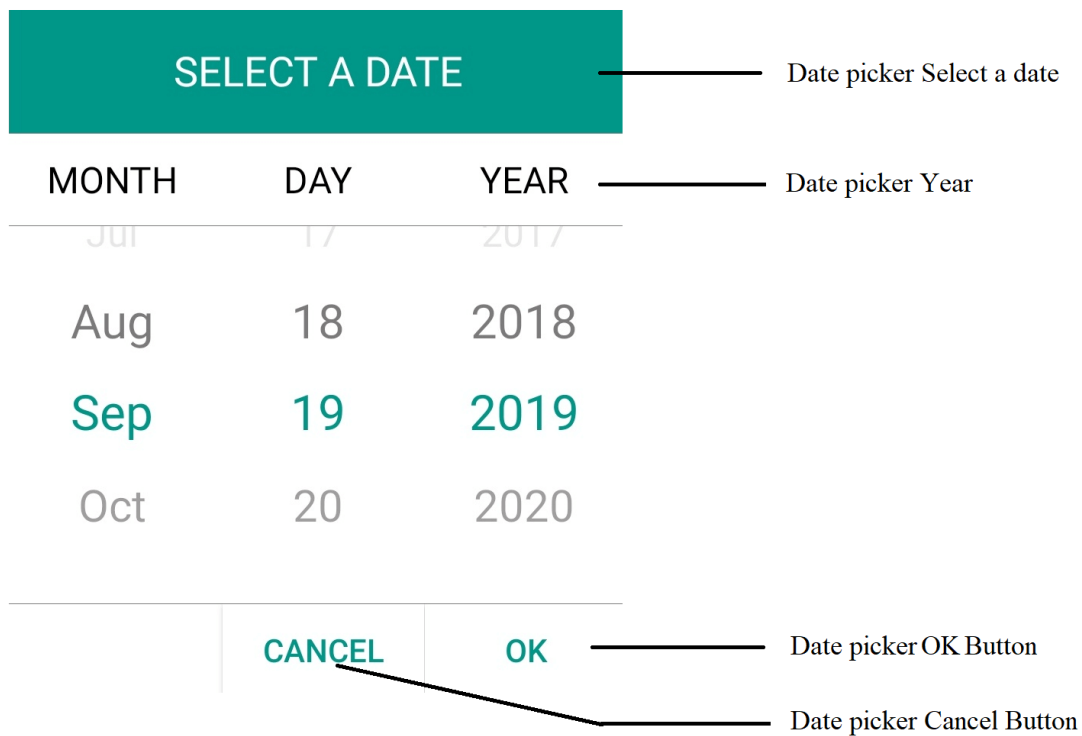

![Localization support in Xamarin.Forms SfPicker](images/Xamarin.Forms SfPicker.jpg)

### AutomationId

The SfPicker control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the **SfPicker** control. To keep unique **AutomationId**, these inner elements' **AutomationIds** are updated based on the control's **AutomationId**.

For example, if you set SfPicker's **AutomationId** as "Date picker", then the automation framework will interact with the OK button as "Date picker OK Button". The following screenshot illustrates the **AutomationIds** of inner elements.

You can only interact with the header, column header, OK, and Cancel buttons.

## SfPopupLayout

### Overview

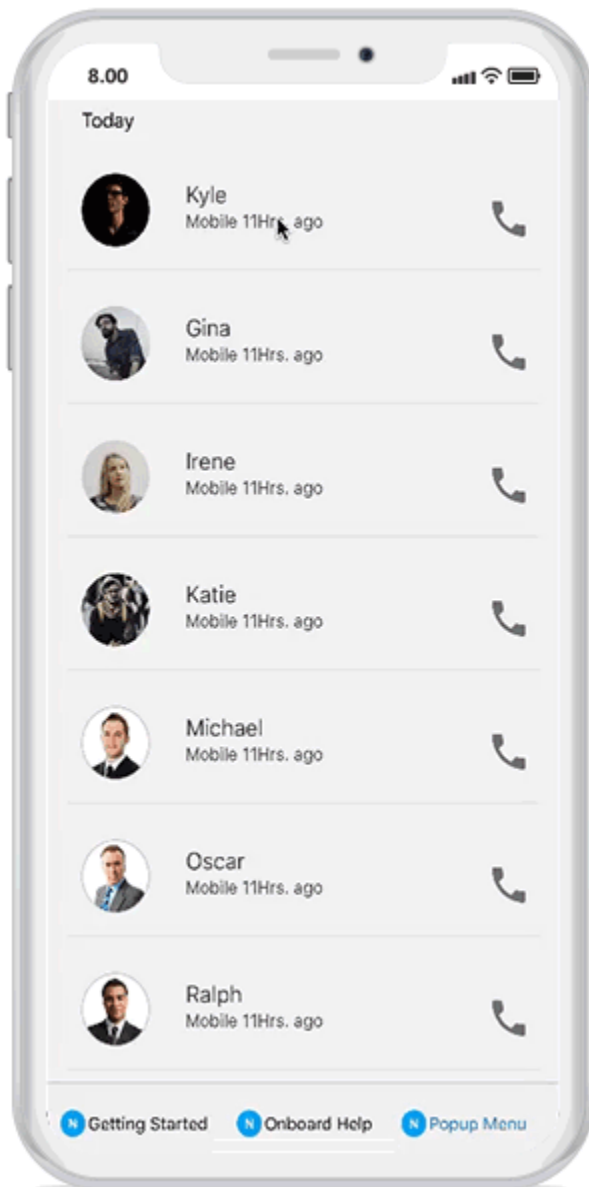

Popup layout provides a layout that allows users to display an alert message with customizable buttons or load any desired view inside a popup. It provides options to fully customize the popup with custom header, body, and footer capabilities, allowing you to display important information to use precisely how user want to.

### Key features

- Load complex views and layouts as content.

- Display popups with minimalistic code by calling only a single method.
- Choose from default layouts, such as one-button layout and two-button layout, to display simple and minimalistic information.
- Display popups in positions relative to a view on screen.
- Display popups at the touch interaction positions.
- Display popups at specific x and y coordinates with desired height and width or with default dimensions in the center.

## Getting Started

This section provides a quick overview for working with the SfPopupLayout for Xamarin.Forms.

### Assembly deployment

After installing Essential Studio for Xamarin, you can get all the required assemblies in the {Syncfusion Essential Studio Installed location}\Essential Studio\{{ site.releaseversion }}\Xamarin\lib installation folder.

E.g. C:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Xamarin\lib

---

**Note:** Assemblies can be found in an unzipped package location in Mac.

---

### NuGet configuration

To install the required NuGet for the SfPopupLayout control in the application, configure the NuGet packages of the Syncfusion components.

Refer to the following KB to configure the NuGet package of the Syncfusion components:

[How to configure package source and install Syncfusion NuGet packages in an existing project?](#)

The following NuGet package should be installed to use the SfPopupLayout control in the application.

Project	Required package
Xamarin.Forms	Syncfusion.Xamarin.SfPopupLayout

### Adding SfPopupLayout reference

You can add SfPopupLayout reference using one of the following methods:

#### Method 1: Adding SfPopupLayout reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfPopupLayout). To add SfPopupLayout to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfPopupLayout](#), and then install it.

![Adding SfPopupLayout reference from NuGet](GettingStarted\_images/Adding SfPopupLayout reference.png)

---

**Note:** Install the same version of SfPopupLayout NuGet in all the projects.

---

#### Method 2: Adding SfPopupLayout reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfPopupLayout control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfPopupLayout assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfPopupLayout.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfPopupLayout.XForms.dll Syncfusion.SfPopupLayout.XForms.Android.dll

	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfPopupLayout.XForms.dll Syncfusion.SfPopupLayout.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfPopupLayout.XForms.dll Syncfusion.SfPopupLayout.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the SfPopupLayout on each platform

To use the SfPopupLayout inside an application, each platform application must initialize the SfPopupLayout renderer. This initialization step varies from platform to platform and is discussed in the following sections.

#### Android

If you are using SfPopupLayout by [Displaying popup when the SfPopupLayout is set as root view](#), the Android launches the SfPopupLayout without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

If you are using SfPopupLayout by [Displaying popup on the go](#), call the `SfPopupLayoutRenderer.Init()` in the `OnCreate` overridden method of the MainActivity.cs class after the Xamarin.Forms Framework initialization and before the LoadApplication is called as demonstrated in the following code example.

#### C#

```
protected override void OnCreate(Bundle bundle)
{
    ...
    global::Xamarin.Forms.Forms.Init(this, bundle);
    Syncfusion.XForms.Android.PopupLayout.SfPopupLayoutRenderer.Init();
    LoadApplication(new App());
}
```

**Note:** If you are adding the references from toolbox, this step is not needed.

*iOS*

To launch the SfPopupLayout in iOS, call the `SfPopupLayoutRenderer.Init()` in the `FinishedLaunching` overridden method of the AppDelegate class after the Xamarin.Forms Framework initialization and before the `LoadApplication` is called as demonstrated in the following code example.

**C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.XForms.iOS.PopupLayout.SfPopupLayoutRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

*Universal Windows Platform (UWP)*

To launch the SfPopupLayout in UWP, call the `SfPopupLayoutRenderer.Init()` in the `MainPage` constructor before the `LoadApplication` is called as demonstrated in the following code example.

**C#**

```
public MainPage()
{
    ...
    Syncfusion.XForms.UWP.PopupLayout.SfPopupLayoutRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

*ReleaseMode issue in UWP platform*

The known Framework issue in UWP platform is the custom controls will not render when deployed the application in **Release Mode**. It can be resolved by initializing the SfPopupLayout assemblies in `App.xaml.cs` in UWP project as in the following code snippet.

**C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfPopupLayoutRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a simple popup

This section explains how to create a SfPopupLayout and configure it.

Create a new BlankApp (Xamarin.Forms.Portable) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding SfPopupLayout in Xamarin.Forms

1. Add the required assembly references to the pcl and renderer projects as discussed in the [Assembly deployment](#) section.
2. Import the control namespace as xmlns:syncfusion="clr-namespace:Syncfusion.XForms.SfPopupLayout;assembly=Syncfusion.SfPopupLayout.XForms" in XAML Page.
3. The SfPopupLayout can be displayed by the following cases.

#### Displaying popup when the SfPopupLayout is set as root view

The SfPopupLayout can be displayed by making it as base view or content view of the main page. For the first case, set the view over which the SfPopupLayout should be displayed as the content of the SfPopupLayout by using the [SfPopupLayout.Content](#) property.

Refer to the following code example for displaying popup.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="mainLayout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked"/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

#### C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
    }
}
```

```
private void ClickToShowPopup_Clicked(object sender, EventArgs e)
{
    popupLayout.Show();
}
}
```

### Displaying popup on the go

You can continue to keep your view as the content view of the main page and still display popup over your view by simply calling the [SfPopupLayout.Show](#) method.

Refer to the following code example for displaying popup.

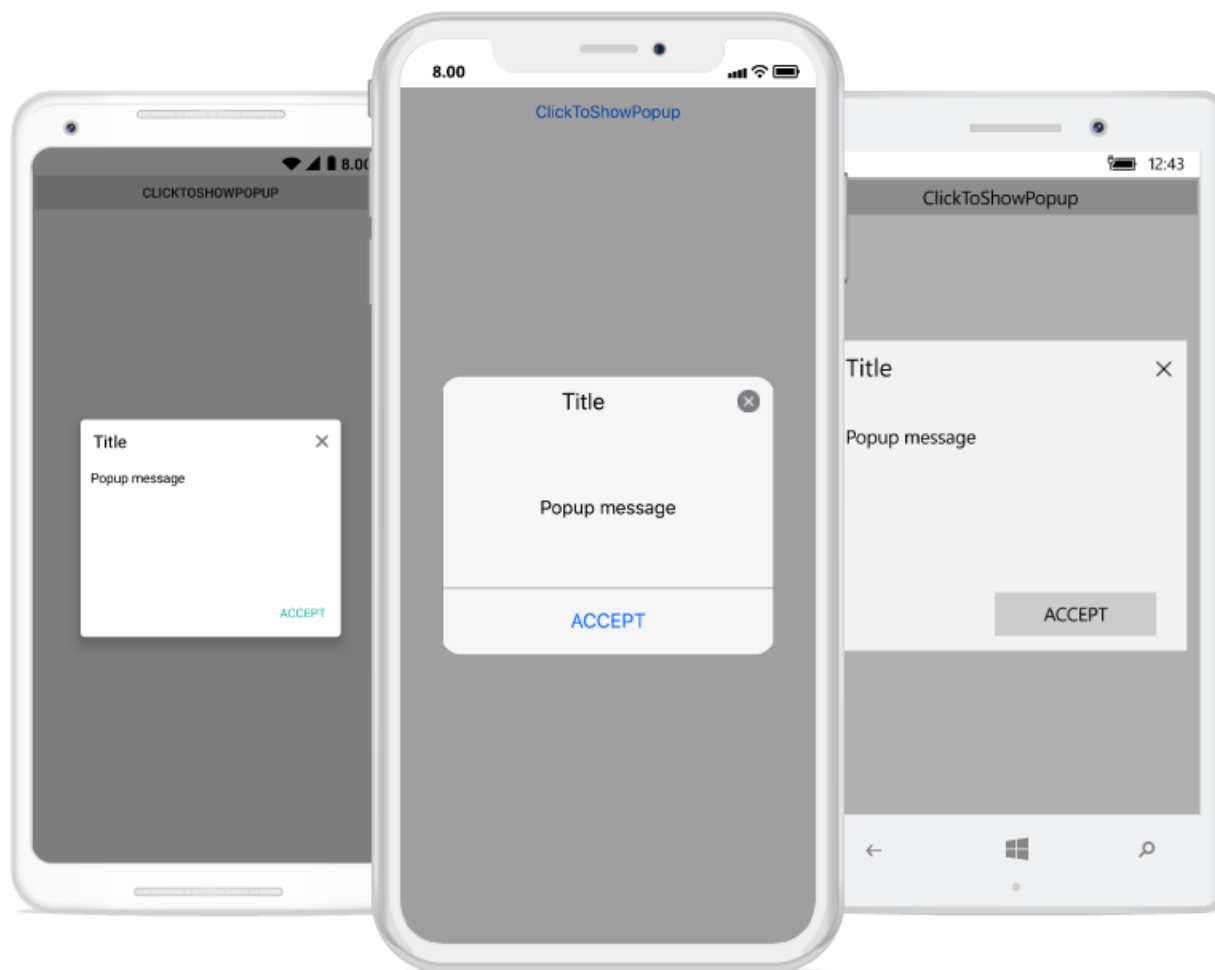

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0">
<StackLayout x:Name="mainLayout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
</ContentPage>
```

### C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        SfPopupLayout popupLayout;
        public MainPage()
        {
            InitializeComponent();
            popupLayout = new SfPopupLayout();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

You can download the source code of this sample [here](#).

---

**Note:** Two Popups cannot be displayed at the same time in a page.

---

### Customize positioning

The SfPopupLayout allows showing the popup content at various positions.

The following list of options are available to position the SfPopupLayout in the desired position:

- **Center Positioning:** Use the [SfPopupLayout.IsOpen](#) property or [SfPopupLayout.Show](#) method to display the SfPopupLayout at the center.
- **Absolute Positioning:** Use the [SfPopupLayout.Show\(x-position, y-position\)](#) to display the SfPopupLayout at the specified X and y position.
- **OnTouch:** Use the [SfPopupLayout.ShowAtTouchPoint\(\)](#) to display the SfPopupLayout at the touch point.
- **Relative Positioning:** Use the [SfPopupLayout.ShowRelativeToView\(View, RelativePosition\)](#) to display the SfPopupLayout at any of the 8 positions relative to the specified view.
- **Absolute relative positioning:** Use the [SfPopupLayout.ShowRelativeToView\(View, RelativePosition, x position, y position\)](#) to display the SfPopupLayout at an absolute x,y coordinate from the relative position of the specified view.

More information for popup positioning is in this [link](#).

### Customizing layouts

By default, you can choose a layout from the following available layouts in the SfPopupLayout by using the property [SfPopupLayout.AppearanceMode](#).

- [OneButton](#): Shows the SfPopupLayout with one button in the footer view. This is the default value.
- [TwoButton](#): Shows the SfPopupLayout with two buttons in the footer view.

You can also customize the entire view of the popup by loading the templates or custom views for the header, body, and footer.

More information for popup positioning is in this [link](#).

### *Load your template view in the popup body*

Any view can be added as popup content by using the [SfPopupLayout.PopupView.ContentTemplate](#) property to refresh it. Refer to the following code example in which a label is added as a popup content and displaying the popup when the SfPopupLayout is set as root view.

### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.PopupView>
<sfPopup:PopupView>
<sfPopup:PopupView.ContentTemplate>
<DataTemplate>
<Label Text="This is SfPopupLayout" BackgroundColor="SkyBlue"
HorizontalTextAlignment="Center"/>
</DataTemplate>
</sfPopup:PopupView.ContentTemplate>
</sfPopup:PopupView>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start"
HorizontalOptions="FillAndExpand" Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

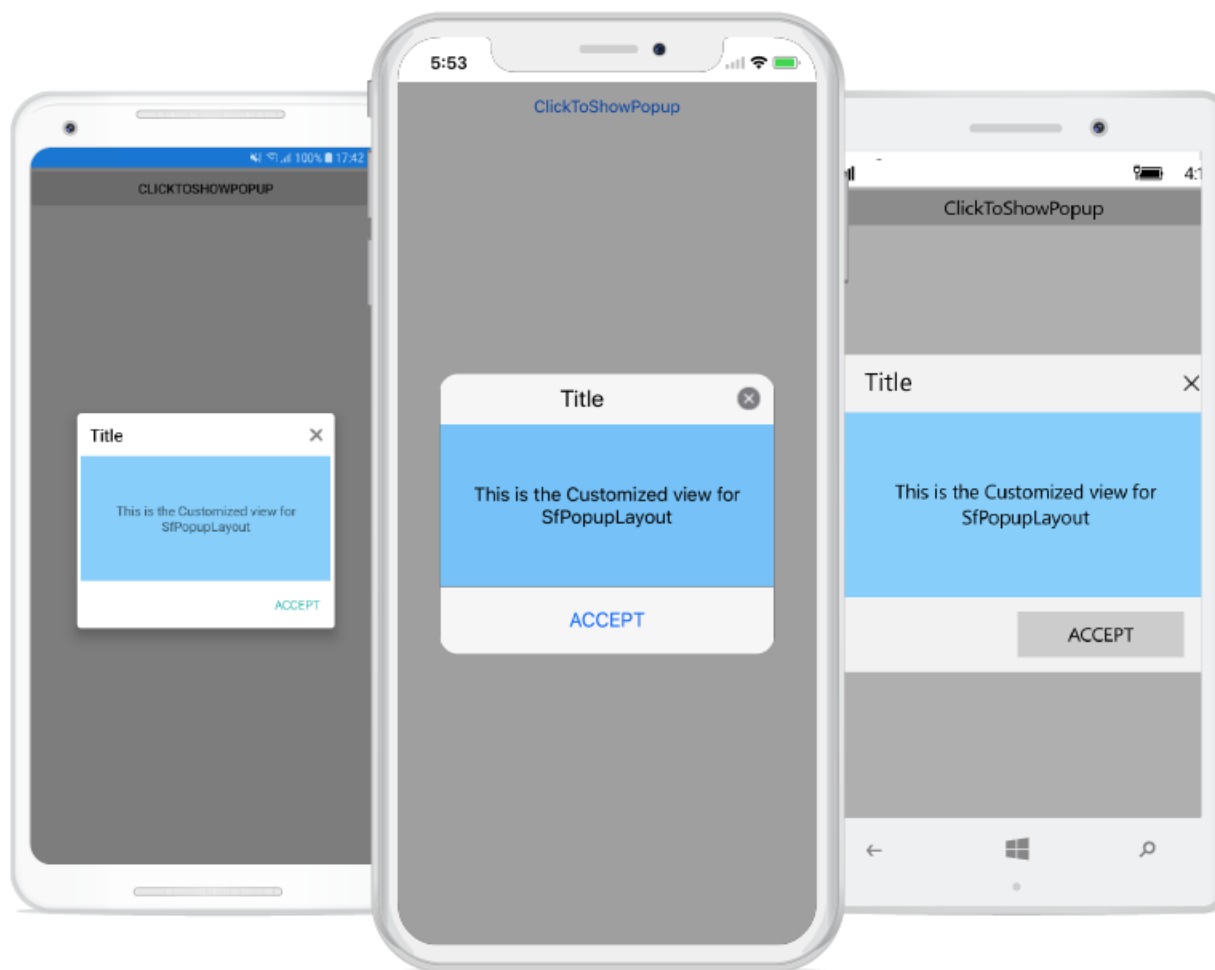

### **C#**

```
using Syncfusion.XForms.PopupLayout;
```

```
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        DataTemplate templateView;
        Label popupContent;
        public MainPage()
        {
            InitializeComponent();
            templateView = new DataTemplate(() =>
            {
                popupContent = new Label();
                popupContent.Text = "This is the SfPopupLayout";
                popupContent.BackgroundColor = Color.LightSkyBlue;
                popupContent.HorizontalTextAlignment = TextAlignment.Center;
                return popupContent;
            });
            // Adding ContentTemplate of the SfPopupLayout
            popupLayout.PopupView.ContentTemplate = templateView;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

**Note:** Setting the content view is same for both cases i.e. displaying the popup when the SfPopupLayout is set as root view and vice versa.

### Customizing animations

Available built-in animations will be applied to the SfPopupLayout when the PopupView opens and closes in the screen. By default, you can choose from the following animations available in the SfPopupLayout by using the property [SfPopupLayout.AnimationMode](#):

- [Zoom](#): Zoom-out animation will be applied when the PopupView opens and zoom-in animation will be applied when the PopupView closes. This is the default AnimationMode.
- [Fade](#): Fade-out animation will be applied when the PopupView opens and fade-in animation will be applied when the PopupView closes.
- [SlideOnLeft](#): PopupView will be animated from left-to-right when it opens and from right-to-left when the PopupView closes.
- [SlideOnRight](#): PopupView will be animated from right-to-left when it opens and from left-to-right when the PopupView closes.
- [SlideOnTop](#): PopupView will be animated from top-to-bottom when it opens and from bottom-to-top when the PopupView closes.

- [SlideOnBottom](#): PopupView will be animated from bottom-to-top when it opens and from top-to-bottom when the PopupView closes
- [None](#): Animations will not be applied.

More information for popup animations is in this [link](#).

#### XML

```
<sfPopup:SfPopupLayout x:Name="popupLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView AnimationMode="Fade" />
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

#### C#

```
//MainPage.cs
public MainPage()
{
    InitializeComponent();
    popupLayout.PopupView.AnimationMode = AnimationMode.Fade;
}
```

### Popup Positioning

The SfPopupLayout allows showing the popup content at various available positions.

Following are the list of options available to show SfPopupLayout at various positions.

Methods / Properties	Description
<a href="#">SfPopupLayout.IsOpen</a>	Shows the SfPopupLayout at center.
<a href="#">SfPopupLayout.Show</a>	Similar as SfPopupLayout.IsOpen property.
<a href="#">SfPopupLayout.Show(x-position, y-position)</a>	Shows the SfPopupLayout at the specified X and y positions.
<a href="#">SfPopupLayout.ShowAtTouchPoint()</a>	Shows the SfPopupLayout at the touch point.
<a href="#">SfPopupLayout.ShowRelativeToView(View, RelativePosition)</a>	Shows the SfPopupLayout at the position relative to the specified view.
<a href="#">SfPopupLayout.ShowRelativeToView(View, RelativePosition,x-position,y-position)</a>	Shows the SfPopupLayout at an absolute x, y coordinate from the relative position of the specified view.
<a href="#">SfPopupLayout.PopupView.IsFullScreen</a>	Shows the SfPopupLayout in full width and height of the screen.
<a href="#">SfPopupLayout.Show(bool)</a>	Similar as SfPopupLayout.PopupView.IsFullScreen property.

### Center positioning

SfPopupLayout can be shown at the center by using the following options.

- [IsOpen property](#)
- [SfPopupLayout.Show](#)

To open the SfPopupLayout, use the `SfPopupLayout.IsOpen` property as in the following code sample.

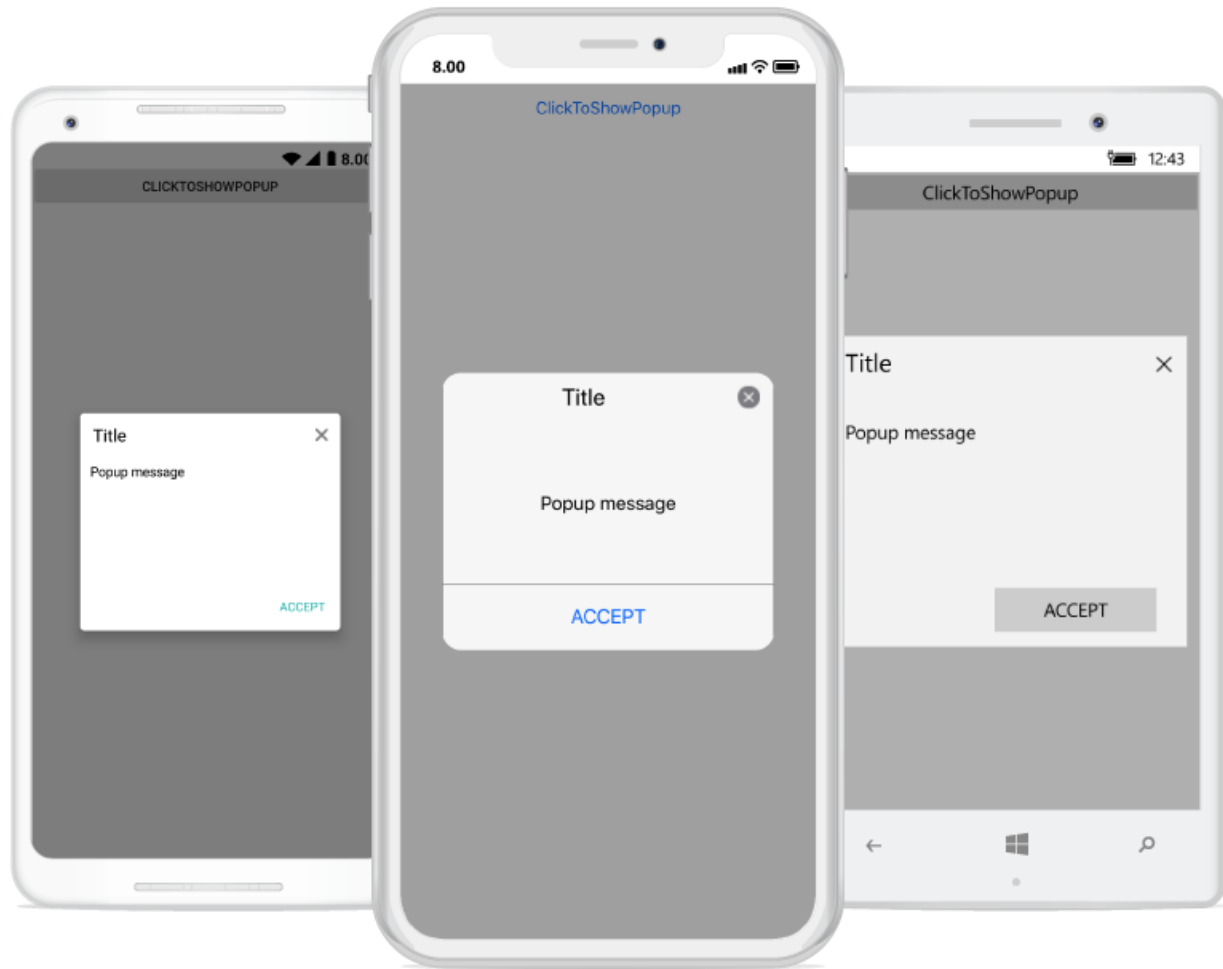

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

#### C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            // Shows SfPopupLayout at the center of the view.
            popupLayout.IsOpen = true;
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

To open the SfPopupLayout, use the [SfPopupLayout.Show](#) method as in the following code sample.

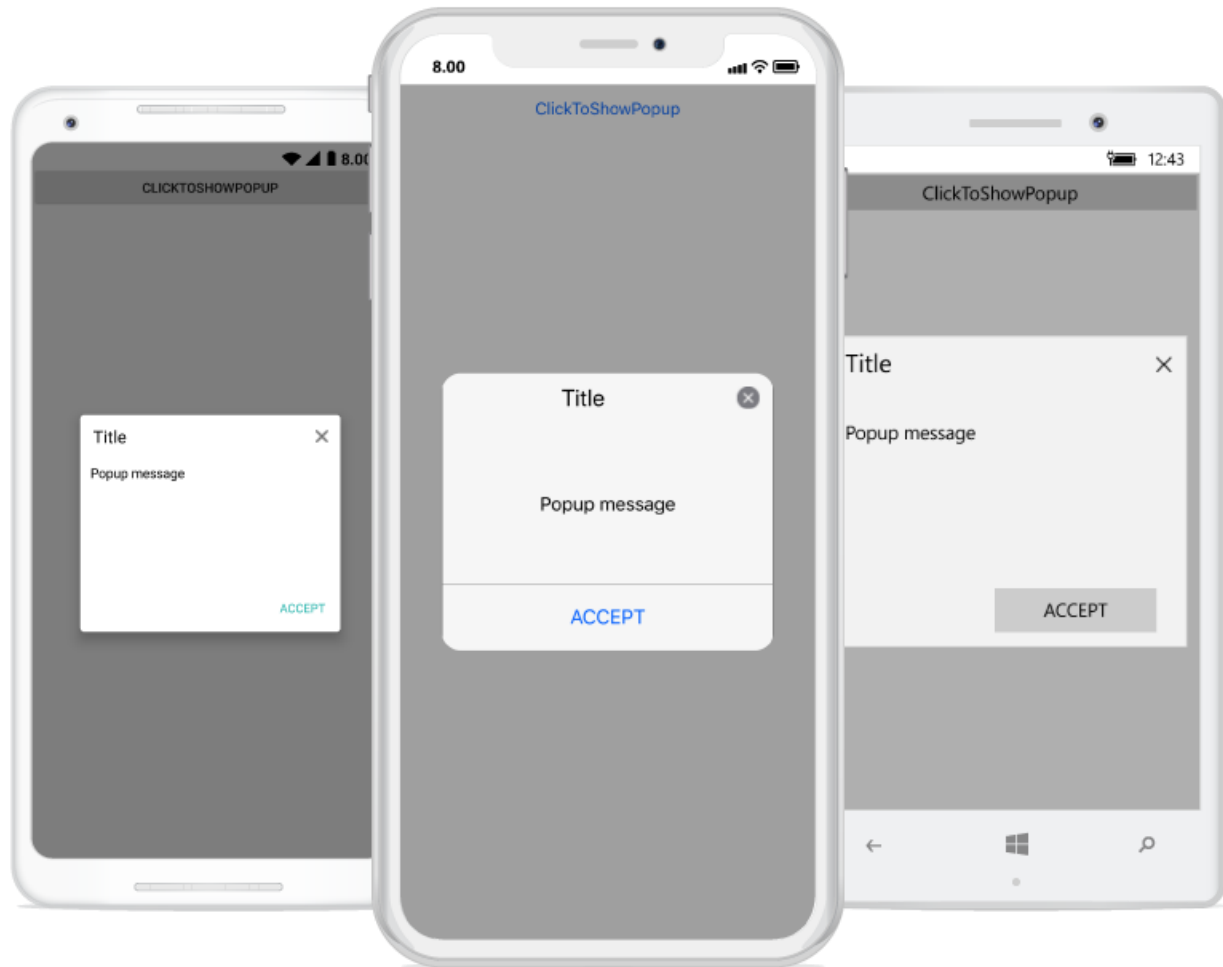

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            // Shows SfPopupLayout at the center of the view.
            popupLayout.Show();
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

### Absolute positioning

To open the SfPopupLayout in specific X,Y coordinates, use the `SfPopupLayout.Show(x-position, y-position)` property as in the following code sample.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
</sfPopup:SfPopupLayout>
```

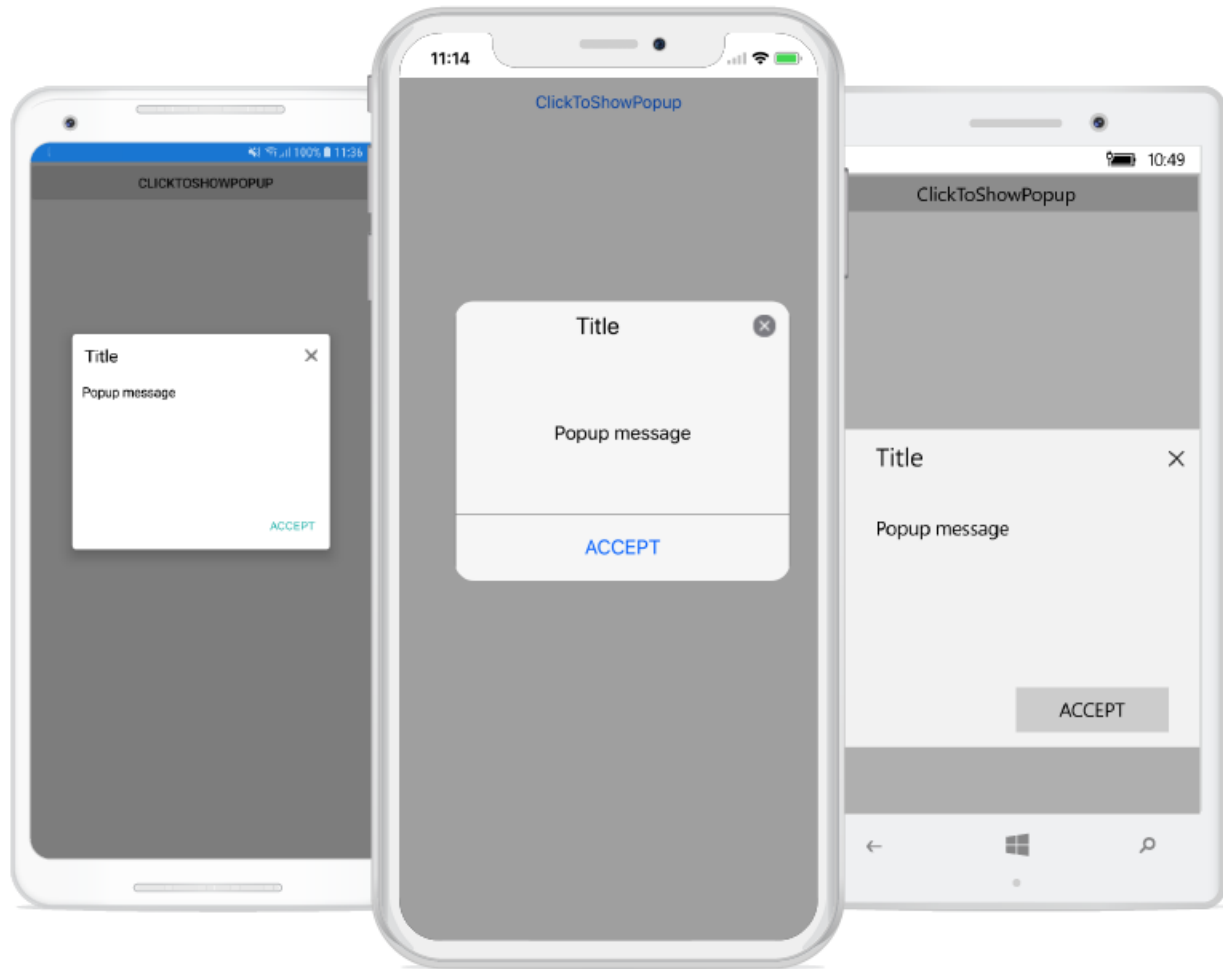

```
</sfPopup:SfPopupLayout.Content>  
</sfPopup:SfPopupLayout>  
</ContentPage>
```

## C#

```
using Syncfusion.XForms.PopupLayout;  
namespace GettingStarted  
{  
    public partial class MainPage : ContentPage  
    {  
        public MainPage()  
        {  
            InitializeComponent();  
        }  
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)  
        {  
            // Shows SfPopupLayout at x-position 100 and y position 100.  
            popupLayout.Show(100, 700);  
        }  
    }  
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

Position popup at touch point

To open the SfPopupLayout from the touch point in the screen, use the [SfPopupLayout.ShowAtTouchPoint](#) method as in the following code sample.

#### XML

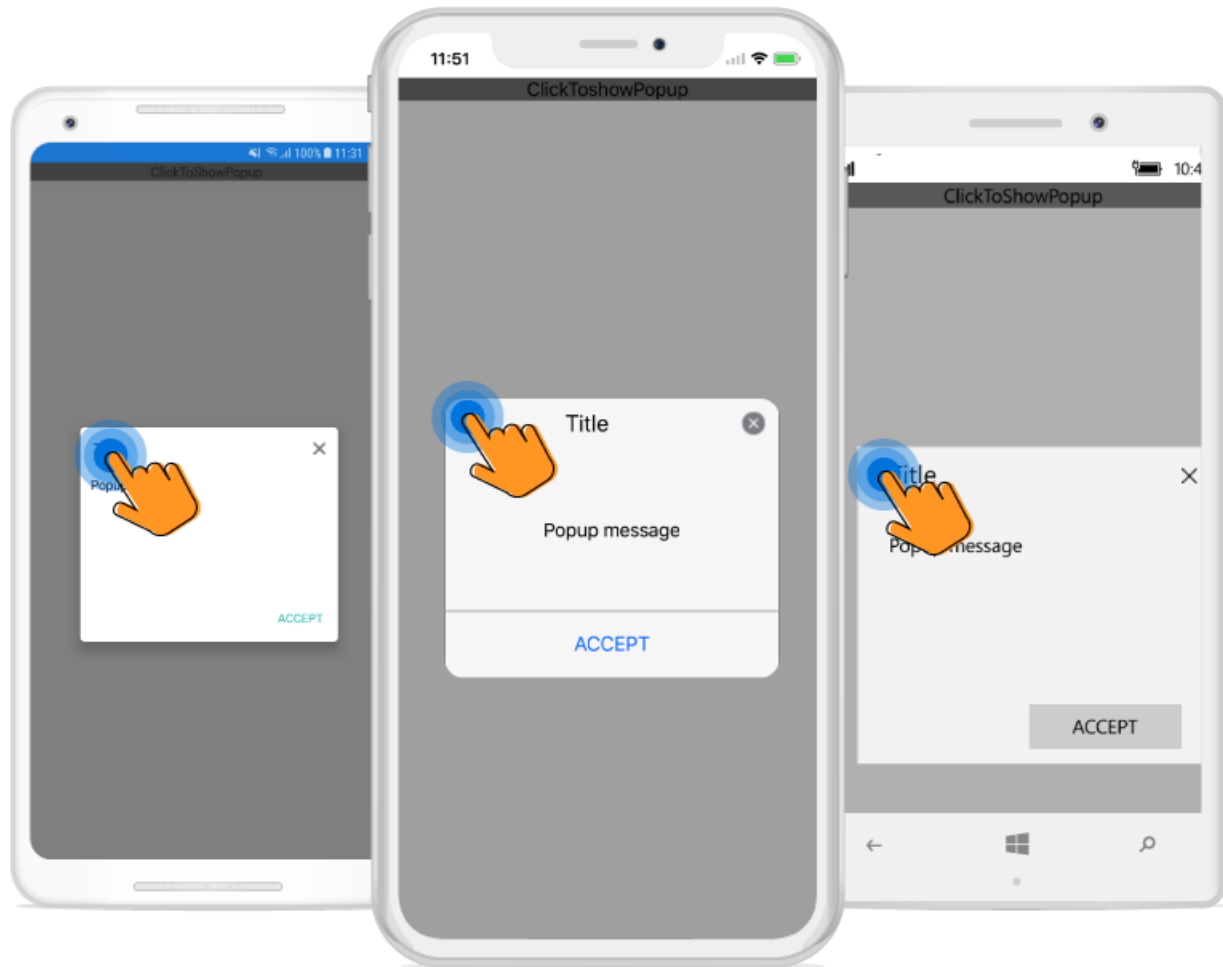

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
```

```
</sfPopup:SfPopupLayout.Content>  
</sfPopup:SfPopupLayout>  
</ContentPage>
```

### **C#**

```
using Syncfusion.XForms.PopupLayout;  
namespace GettingStarted  
{  
    public partial class MainPage : ContentPage  
    {  
        public MainPage()  
        {  
            InitializeComponent();  
        }  
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)  
        {  
            // Shows SfPopupLayout at the touch point.  
            popupLayout.ShowAtTouchPoint();  
        }  
    }  
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

**Note:** Positioning popup at touch point is not supported when using the approach of **Displaying popup on the fly**.

### Relative positioning

SfPopupLayout can be shown at the relative position by using the following method.

#### *Display popup relative to a view*

To open the SfPopupLayout relative to a view, use the **SfPopupLayout.ShowRelativeToView(View, RelativePosition,x-position,y-position)** method.

### XML

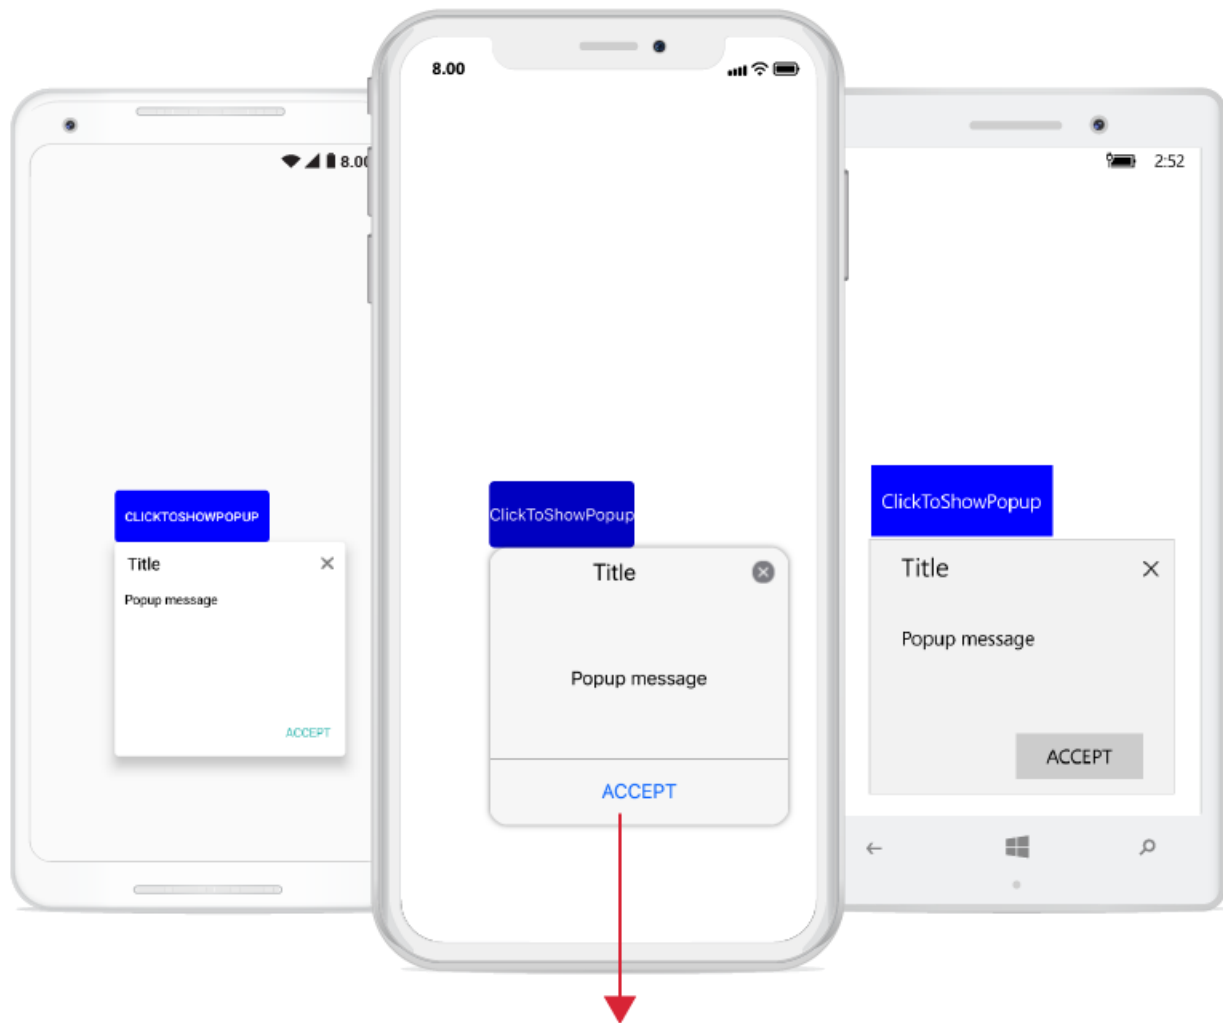

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
```

```
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="mainLayout" VerticalOptions="Center"
HorizontalOptions="Center">
<StackLayout VerticalOptions="CenterAndExpand"
HorizontalOptions="StartAndExpand">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup" TextColor="White"
HeightRequest="60" VerticalOptions="Center" Margin="100,0,0,0"
HorizontalOptions="Center" BackgroundColor="Blue"
Clicked="ClickToShowPopup_Clicked"/>
</StackLayout>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

### C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            // Shows SfPopupLayout at the bottom of the label.
            popupLayout.ShowRelativeToView(label, RelativePosition.AlignBottom, 0, 0);
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

Popup is shown at the bottom of the button

#### *Display popup relatively to a view with absolute coordinates*

The SfPopupLayout can be displayed at an absolute x, y coordinate from the relative position of the specified view by using the following method.

To open the SfPopupLayout in the specific x, y coordinate relative to a view, use the `SfPopupLayout.ShowRelativeToView(View, RelativePosition,x-position,y-position)` method.

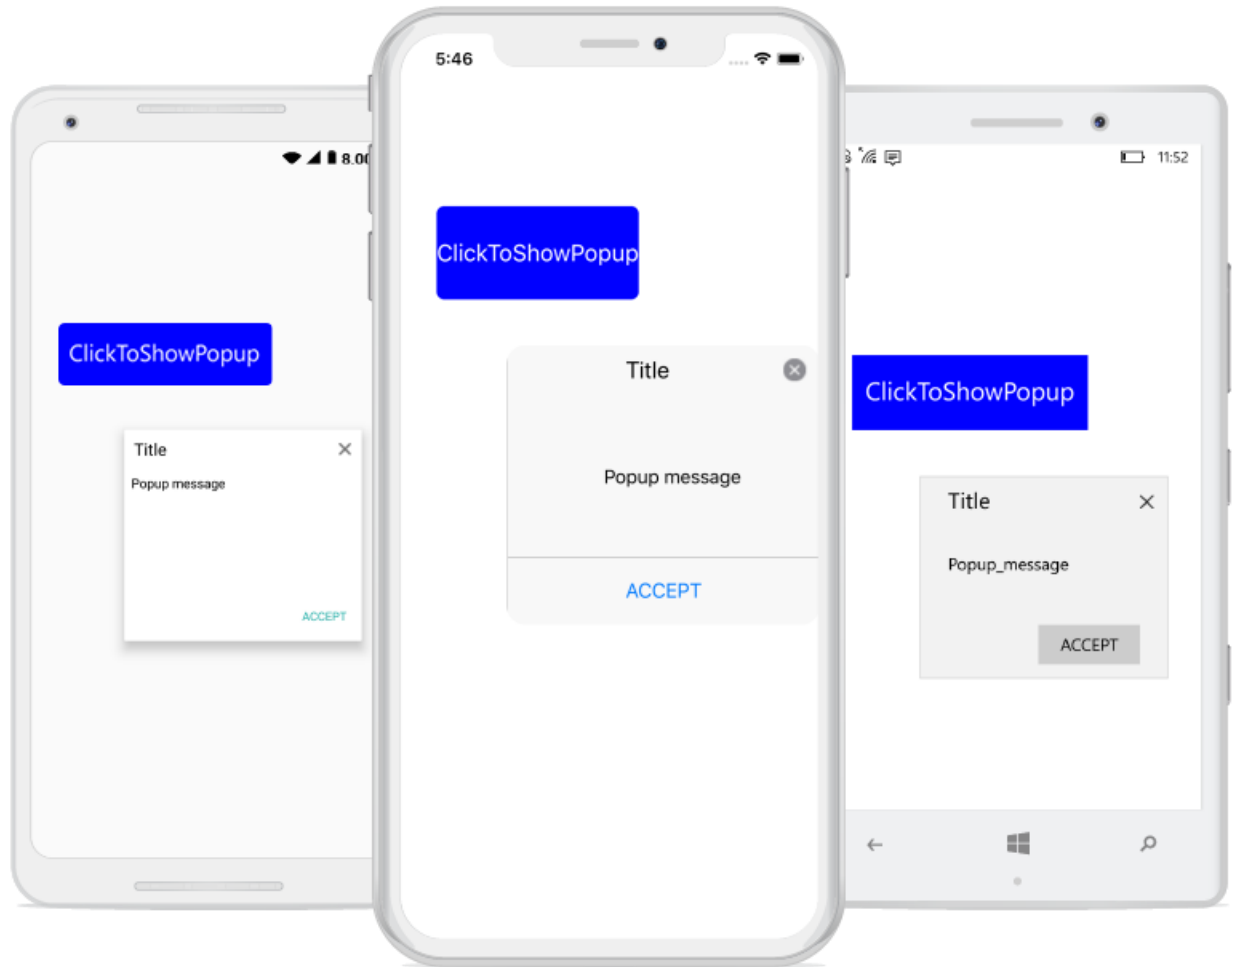

#### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,200,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
```

```
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="mainLayout" VerticalOptions="StartAndExpand"
HorizontalOptions="Start">
<StackLayout VerticalOptions="StartAndExpand"
HorizontalOptions="StartAndExpand">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup" TextColor="White"
HeightRequest="60" VerticalOptions="Start" Margin="50,0,0,0"
HorizontalOptions="StartAndExpand" BackgroundColor="Blue"
Clicked="ClickToShowPopup_Clicked"/>
</StackLayout>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            // Shows SfPopupLayout at the bottom of the label and with absolute relative
            position.
            popupLayout.ShowRelativeToView(label, RelativePosition.AlignBottom, 50, 50);
        }
    }
}
```

You can pass both negative and positive values as parameters to the `SfPopupLayout.ShowRelativeToView(View, RelativePosition, x-position, y-position)`. The popup will be positioned by considering the relative position as (0, 0) the center point. For example, if you have set the `RelativePosition` as `RelativePosition.BottomRight` and `RelativeLayout` as a button, bottom right corner of the button will be considered as the 0, 0 point and a negative x-position value will place the popup to the left of that point and a positive x-position value will place the popup to the right of that point. The same applies for y-position also.

---

**Note:** To open the `SfPopupLayout` relative to a view without absolute position, pass the x-position and y-position parameters as 0 in `SfPopupLayout.ShowRelativeToView(View, RelativePosition, x-position, y-position)`.

---

#### Show relative to view in MVVM

To open the `SfPopupLayout` relative to a view in MVVM assign values to the `SfPopupLayout.RelativeLayout` and `SfPopup.RelativePosition` properties and use the `SfPopupLayout.IsOpen` property to open or close the popup using binding.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
```

```

xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<ContentPage.BindingContext>
<local:ViewModel x:Name="viewModel" />
</ContentPage.BindingContext>
<ContentPage.Content>
<sfPopup:SfPopupLayout x:Name="popupLayout" IsOpen="{Binding DisplayPopup}"
RelativePosition="AlignBottom" AbsoluteX="0" AbsoluteY="0">
<sfPopup:SfPopupLayout.Content>
<StackLayout >
<Label x:Name="relativeView" Text="Showing Popup at relative position in
MVVM" VerticalOptions="StartAndExpand" HorizontalOptions="FillAndExpand"
HorizontalTextAlignment="Center" HeightRequest="60" LineBreakMode="WordWrap"
FontSize="Medium" BackgroundColor="Blue" TextColor="White"/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
<sfPopup:SfPopupLayout.RelativeView>
<x:Reference Name="relativeView"/>
</sfPopup:SfPopupLayout.RelativeView>
</sfPopup:SfPopupLayout>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        protected override void OnAppearing()
        {
            base.OnAppearing();
            viewModel.DisplayPopup = true;
        }
    }
}

```

```
// ViewModel
```

```

public class ViewModel: INotifyPropertyChanged
{
    private bool displayPopup;
    public bool DisplayPopup

```

```
{
get { return displayPopup; }
set { displayPopup = value; RaisePropertyChanged("DisplayPopup"); }
}
public ViewModel()
{
this.displayPopup = false;
}
public void RaisePropertyChanged(string propName)
{
if (this.PropertyChanged != null)
this.PropertyChanged(this, new PropertyChangedEventArgs(propName));
}
public event PropertyChangedEventHandler PropertyChanged;
}
```

Executing the above codes renders the following output in Android device respectively.

## Popup Size

SfPopupLayout allows displaying the Popup at any desired width and height by setting the SfPopupLayout.PopupView.WidthRequest and SfPopupLayout.PopupView.HeightRequest. The Popup size can also be changed by setting width request and height request to the views loaded inside the templates of the Popup.

In the following code snippet the Popup is loaded in 350x350 pixels, where width request is set for the ListView that is loaded as template content and height request is set for the PopupView.

### XML

```

{
    popupLayout.Show();
}
}
```

## Full Screen

SfPopupLayout can be shown in full width and height of the screen using,

- [SfPopupLayout.PopupView.IsFullScreen](#)
- [SfPopupLayout.Show\(bool\)](#)

Refer the below code example to open the popup in full screen.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

</ContentPage>

```

**C#**

```
using Syncfusion.XForms.PopupLayout;
```

```
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            // Shows SfPopupLayout in full width and height of the screen using the
            // SfPopupLayout.PopupView.IsFullScreen property.
            popupLayout.PopupView.IsFullScreen = true;
            popupLayout.IsOpen = true;
            // Shows SfPopupLayout in full width and height of the screen using the
            // SfPopupLayout.Show(bool) method.
            // popupLayout.Show(true);
        }
    }
}
```

Executing the above codes renders the following output in an Android device.

### Auto-size Popup

The SfPopupLayout can auto-size the popup view based on the contents loaded inside its SfPopupLayout.PopupView.ContentTemplate property using the SfPopupLayout.PopupView.AutoSizeMode property. The default value is AutoSizeMode.None. You can choose to auto-size the Popup in height, width, or in both height and width of its contents. By default, the HeightRequest and WidthRequest set to the SfPopupLayout.PopupView or the views loaded inside the template is given higher priority than the AutoSizeMode.

In the following code snippet the Popup is auto-sized in height based on the content loaded inside the SfPopupLayout.PopupView.ContentTemplate property.

#### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView AutoSizeMode="Height">
      <sfPopup:PopupView.ContentTemplate>
        <DataTemplate>
          <StackLayout Padding="5,5,5,0">
            <Label Text="Window loads under the parent window surrounded by an overlay
which prevents clicking anywhere else on the screen apart from the control
of the modal. Modal opens in the same window. It also does not require any
user action to open, and give callbacks when closing or opening the modal."
BackgroundColor="White"
LineBreakMode="WordWrap"
/>
          </StackLayout>
        </DataTemplate>
      </sfPopup:PopupView.ContentTemplate>
    </sfPopup:PopupView>
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

#### C#

```
popUpLayout.PopupView.AutoSizeMode = AutoSizeMode.Height;
```

Executing the above codes renders the following output in Android devices.

You can download the above sample code by clicking the following link: [Sample](#).

### Layout Customizations

The SfPopupLayout supports two types of [SfPopupLayout.PopupView.AppearanceMode](#). By default, the `AppearanceMode.OneButton` is set. You can change the appearance by using the `SfPopupLayout.PopupView.AppearanceMode` property.

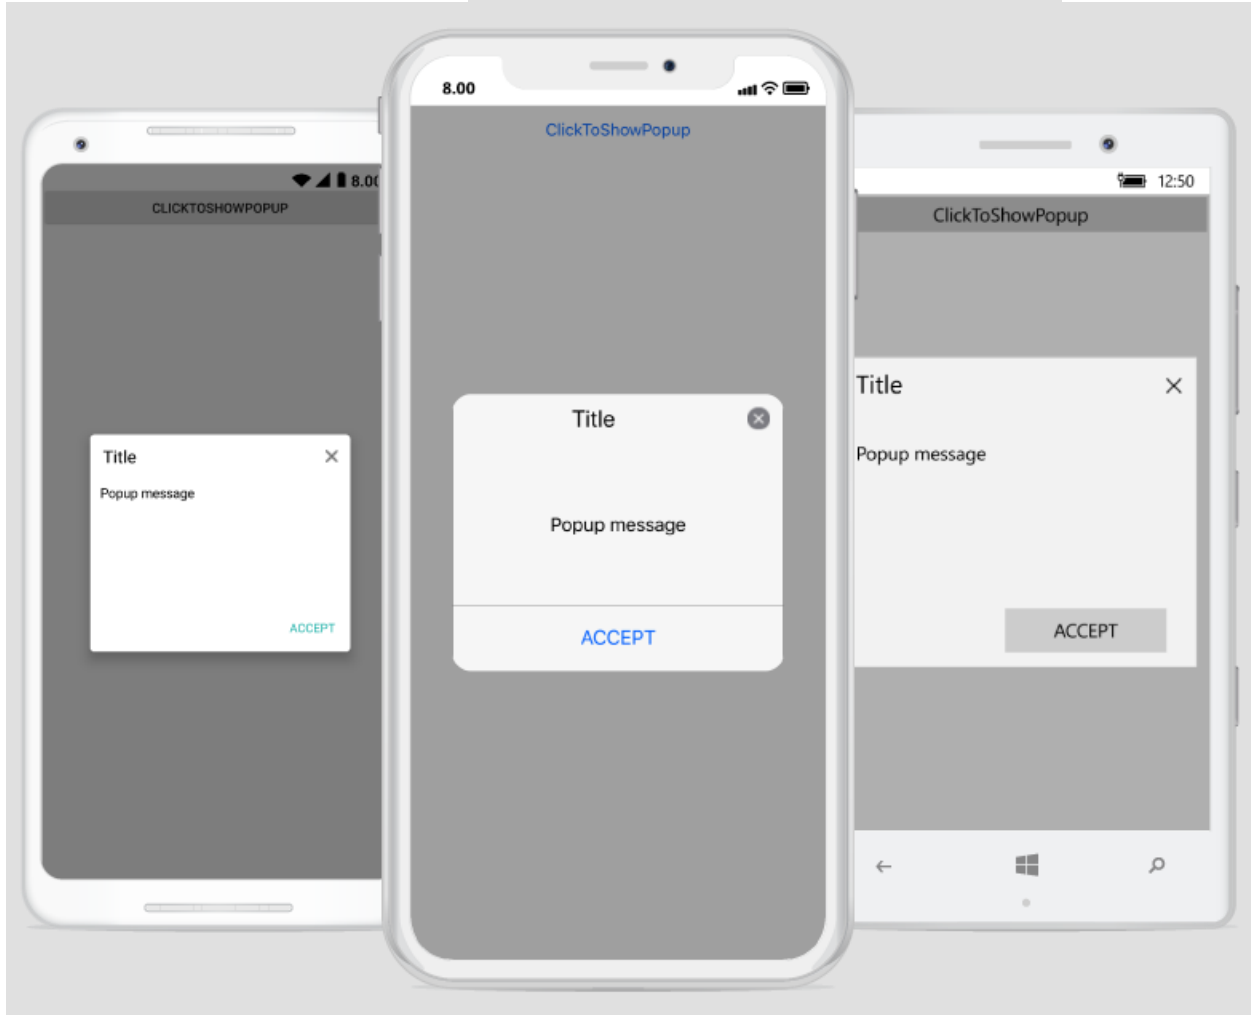

The two different appearance modes in the SfPopupLayout are as follows:

Modes	Description
<a href="#">OneButton</a>	Shows the SfPopupLayout with one button in the footer view. This is the default value.

<a href="#">TwoButton</a>	Shows the SfPopupLayout with two buttons in the footer view.
---------------------------	--

### Popup with one button in the footer

In the following code example, set the `SfPopupLayout.PopupView.AppearanceMode` property as

`OneButton` which displays only the Accept button in the footer view.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.PopupView>
<sfPopup:PopupView AppearanceMode="OneButton" />
</sfPopup:SfPopupLayout>
</ContentPage>
```

```
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand" Clicked +=
ClickToShowPopup_Clicked/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

## C#

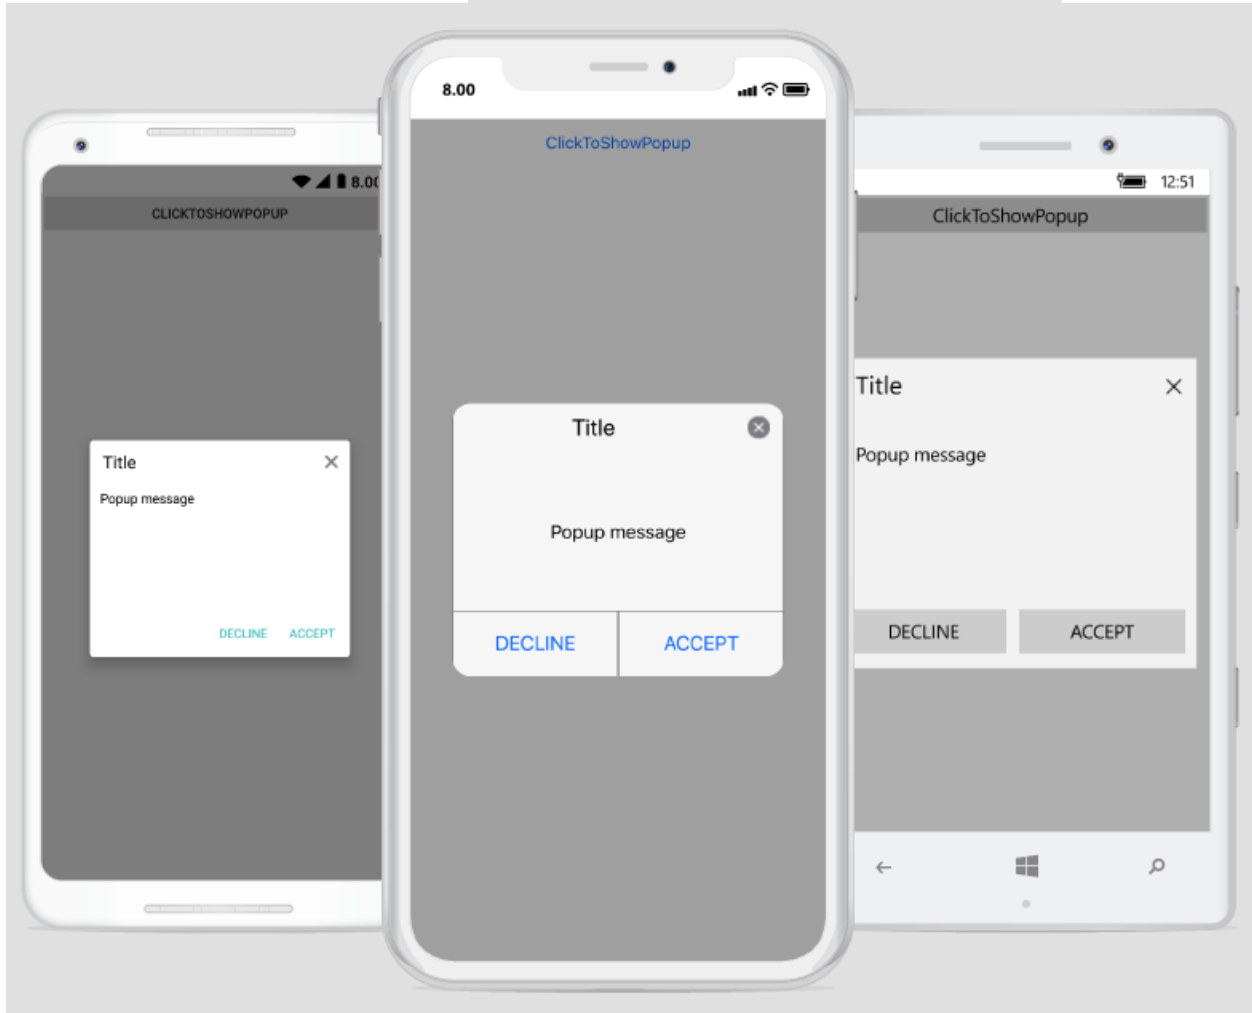

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            // Setting the AppearanceMode as OneButton
            popupLayout.PopupView.AppearanceMode = AppearanceMode.OneButton;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

![Popup with one button](GettingStartedimages/AppearanceModeOneButton.png)

### Popup with two buttons in the footer

In the following code example, set the `SfPopupLayout.PopupView.AppearanceMode` property as

`TwoButton` which displays both Accept button and Decline button in the footer view.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  xmlns:local="clr-namespace:GettingStarted"
  x:Class="GettingStarted.MainPage"
  Padding="0,40,0,0"
  xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
  <sfPopup:SfPopupLayout x:Name="popupLayout">
    <sfPopup:SfPopupLayout.PopupView>
      <sfPopup:PopupView AppearanceMode="TwoButton" />
    </sfPopup:SfPopupLayout.PopupView>
    <sfPopup:SfPopupLayout.Content>
      <StackLayout x:Name="layout">
```

```
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            // Setting the AppearanceMode as TwoButton
            popupLayout.PopupView.AppearanceMode = AppearanceMode.TwoButton;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

![Popup with two button](GettingStartedimages/AppearanceModeTwoButton.png)

Popup without header

You can display the Popup without header by using the property, [SfPopupLayout.PopupView.ShowHeader](#), find the code example of the same below.

**XML**

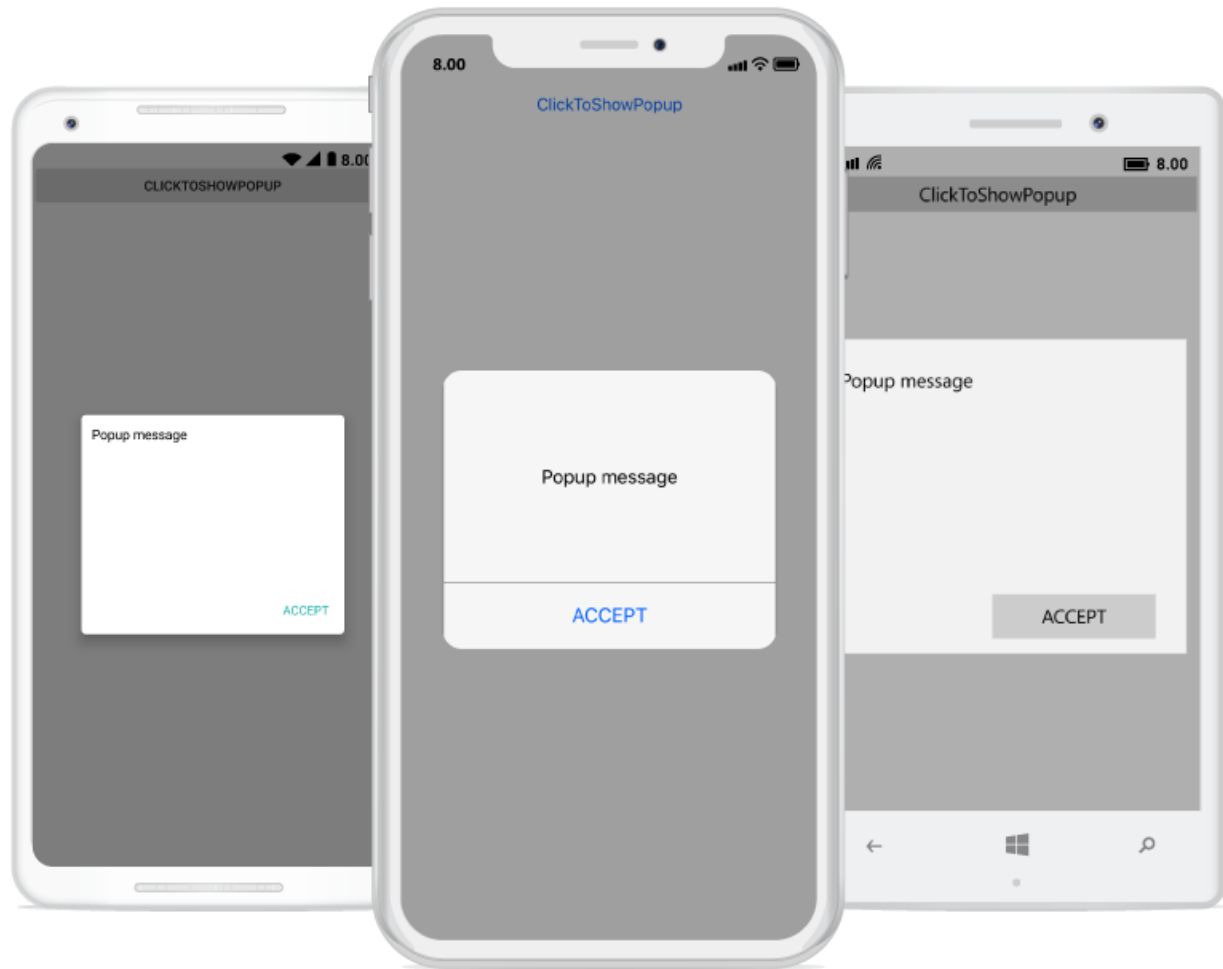

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
    <sfPopup:SfPopupLayout x:Name="popupLayout">
        <sfPopup:SfPopupLayout.PopupView>
            <sfPopup:PopupView ShowHeader="False"/>
        </sfPopup:SfPopupLayout.PopupView>
        <sfPopup:SfPopupLayout.Content>
            <StackLayout x:Name="layout">
```

```
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand" Clicked +=
ClickToShowPopup_Clicked/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            popupLayout.PopupView.ShowHeader = false;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

### Popup without Footer

You can display the Popup without footer by using the property, [SfPopupLayout.PopupView.ShowFooter](#), find the code example of the same below.

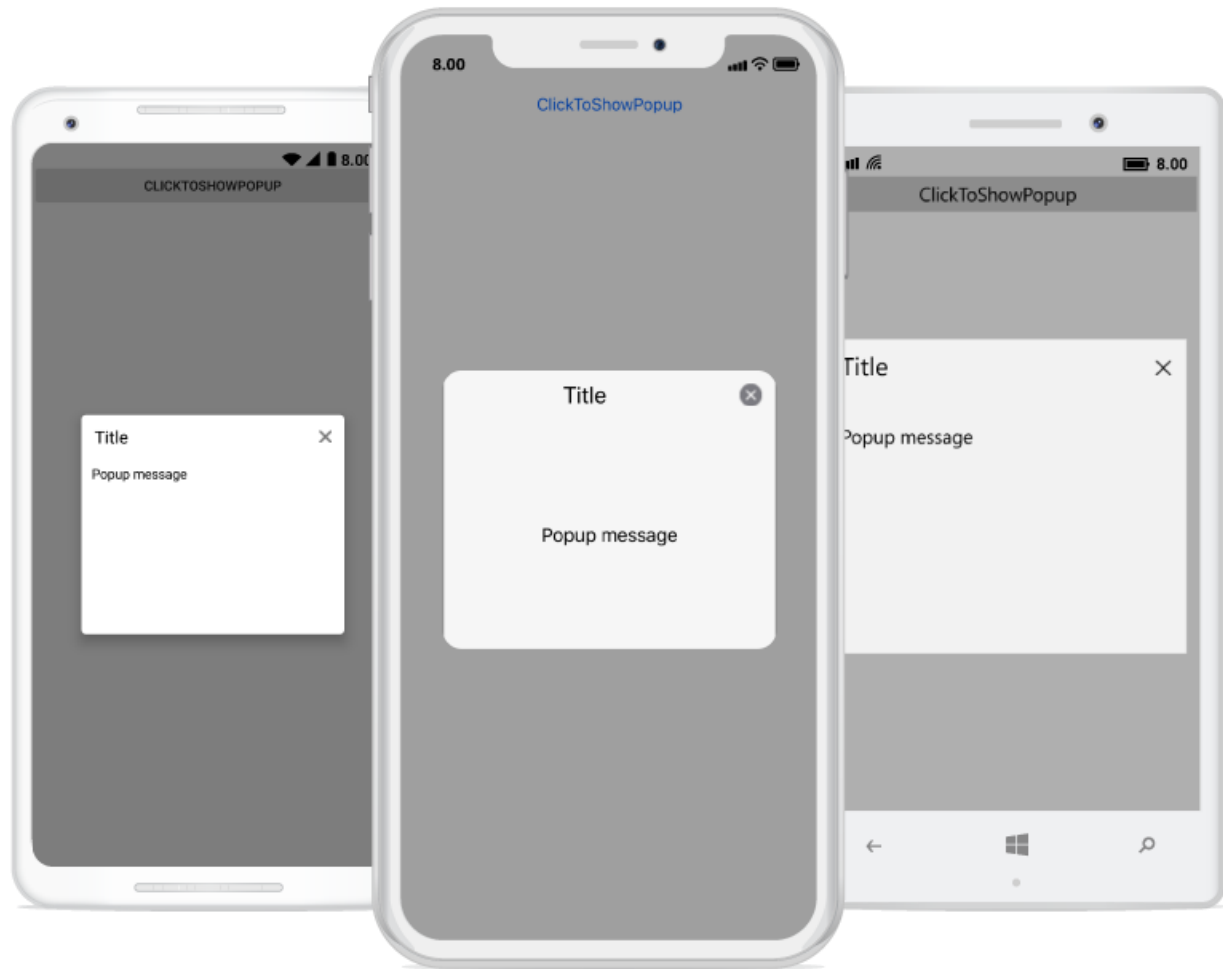

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
  <sfPopup:SfPopupLayout x:Name="popupLayout">
    <sfPopup:SfPopupLayout.PopupView>
      <sfPopup:PopupView ShowFooter="False"/>
    </sfPopup:SfPopupLayout.PopupView>
    <sfPopup:SfPopupLayout.Content>
      <StackLayout x:Name="layout">
```

```
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand" Clicked +=
ClickToShowPopup_Clicked/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            popupLayout.PopupView.ShowFooter = false;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

### Popup without header and footer

You can display only the content of the SfPopupLayout, by removing the header and footer by using [SfPopupLayout.PopupView.ShowHeader](#) and [SfPopupLayout.PopupView.ShowFooter](#), code example of the same below.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.PopupView>
<sfPopup:PopupView ShowFooter="False" ShowHeader="False"/>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
```

```
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand" Clicked +=
ClickToShowPopup_Clicked/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            popupLayout.PopupView.ShowFooter = false;
            popupLayout.PopupView.ShowHeader = false;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

## Customizing popup header

Any view can be added as the header content using the [SfPopupLayout.PopupView.HeaderTemplate](#) property. Refer to the following code example in which a label is added as a header content.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
    <sfPopup:SfPopupLayout x:Name="popupLayout">
        <sfPopup:SfPopupLayout.PopupView>
            <sfPopup:PopupView ShowCloseButton="False">
                <sfPopup:PopupView.HeaderTemplate>
                    <DataTemplate>
                        <Label Text="Customized Header"
FontAttributes="Bold"
BackgroundColor="Blue"
FontSize="16"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center"
/>
                    </DataTemplate>
                </sfPopup:PopupView>
            </sfPopup:SfPopupLayout>
        </sfPopup:SfPopupLayout>
    </ContentPage>
```

```

</DataTemplate>
</sfPopup:PopupView.HeaderTemplate>
</sfPopup:PopupView>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>

```

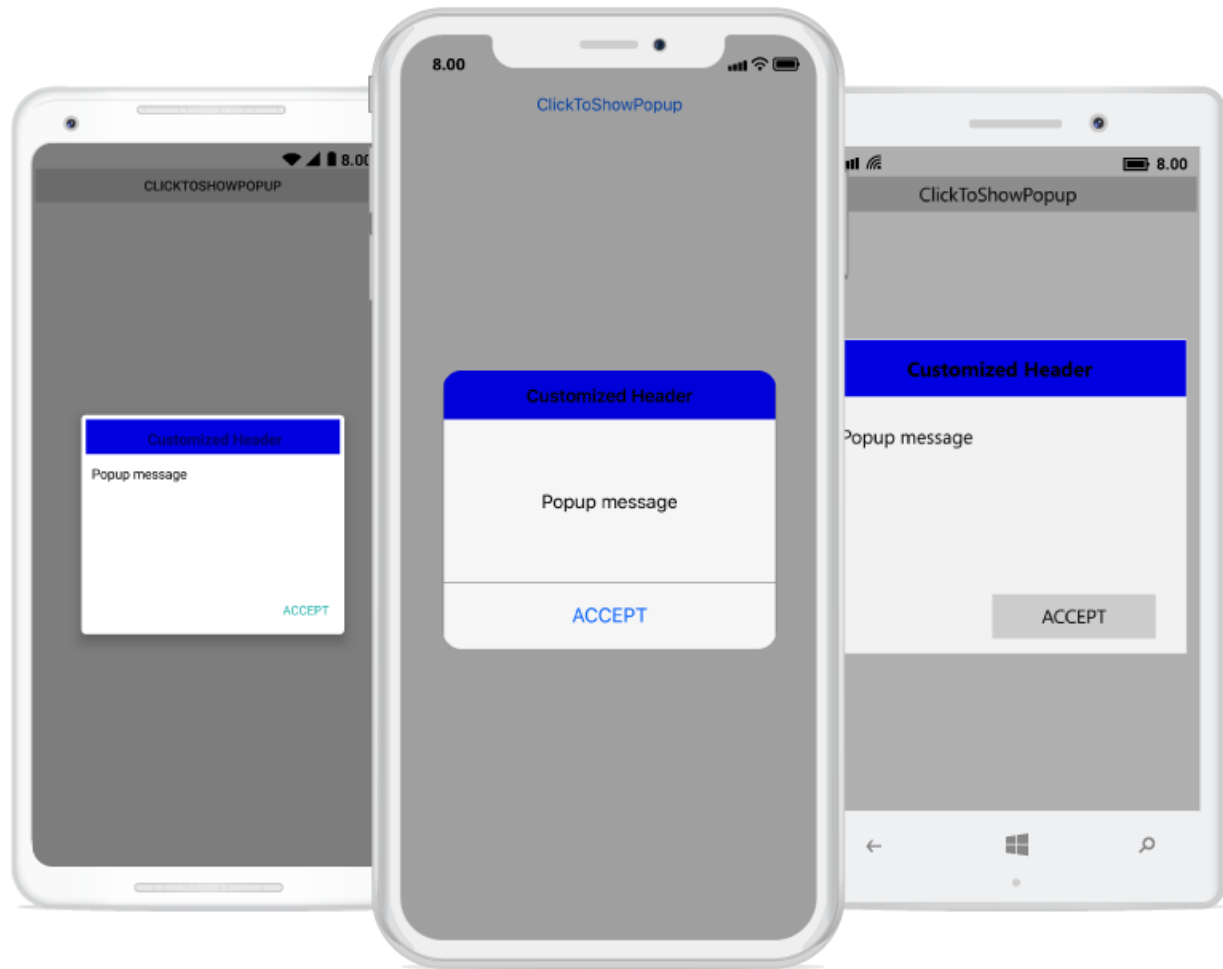

## C#

```

using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        DataTemplate headerTemplateView;
        Label headerContent;
        public MainPage()
        {
            InitializeComponent();
            clickToShowPopup.Clicked += ClickToShowPopup_Clicked;
            headerTemplateView = new DataTemplate(() =>
            {
                headerContent = new Label();
                headerContent.Text = "Customized Header";
                headerContent.FontAttributes = FontAttributes.Bold;
                headerContent.BackgroundColor = Color.FromRgb(0, 0, 225);
                headerContent.FontSize = 16;
                headerContent.HorizontalTextAlignment = TextAlignment.Center;
                headerContent.VerticalTextAlignment = TextAlignment.Center;
                return headerContent;
            });
            popupLayout.PopupView.ShowCloseButton = false;
            // Adding HeaderTemplate of the SfPopupLayout
            popupLayout.PopupView.HeaderTemplate = headerTemplateView;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}

```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

### Customizing popup footer

Any view can be added as the footer content using the [SfPopupLayout.PopupView.FooterTemplate](#) property. Refer to the following code example in which a label is added as a footer content.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
  <sfPopup:SfPopupLayout x:Name="popupLayout">
    <sfPopup:SfPopupLayout.PopupView>
      <sfPopup:PopupView>
        <sfPopup:PopupView.FooterTemplate>
          <DataTemplate>
            <Label Text="Customized Footer"
FontAttributes="Bold"
BackgroundColor="Blue"/>
          </DataTemplate>
        </sfPopup:PopupView.FooterTemplate>
      </sfPopup:PopupView>
    </sfPopup:SfPopupLayout.PopupView>
  </sfPopup:SfPopupLayout>
</ContentPage>
```

```

FontSize="16"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center"
/>
</DataTemplate>
</sfPopup:PopupView.FooterTemplate>
</sfPopup:PopupView>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>

```

**C#**

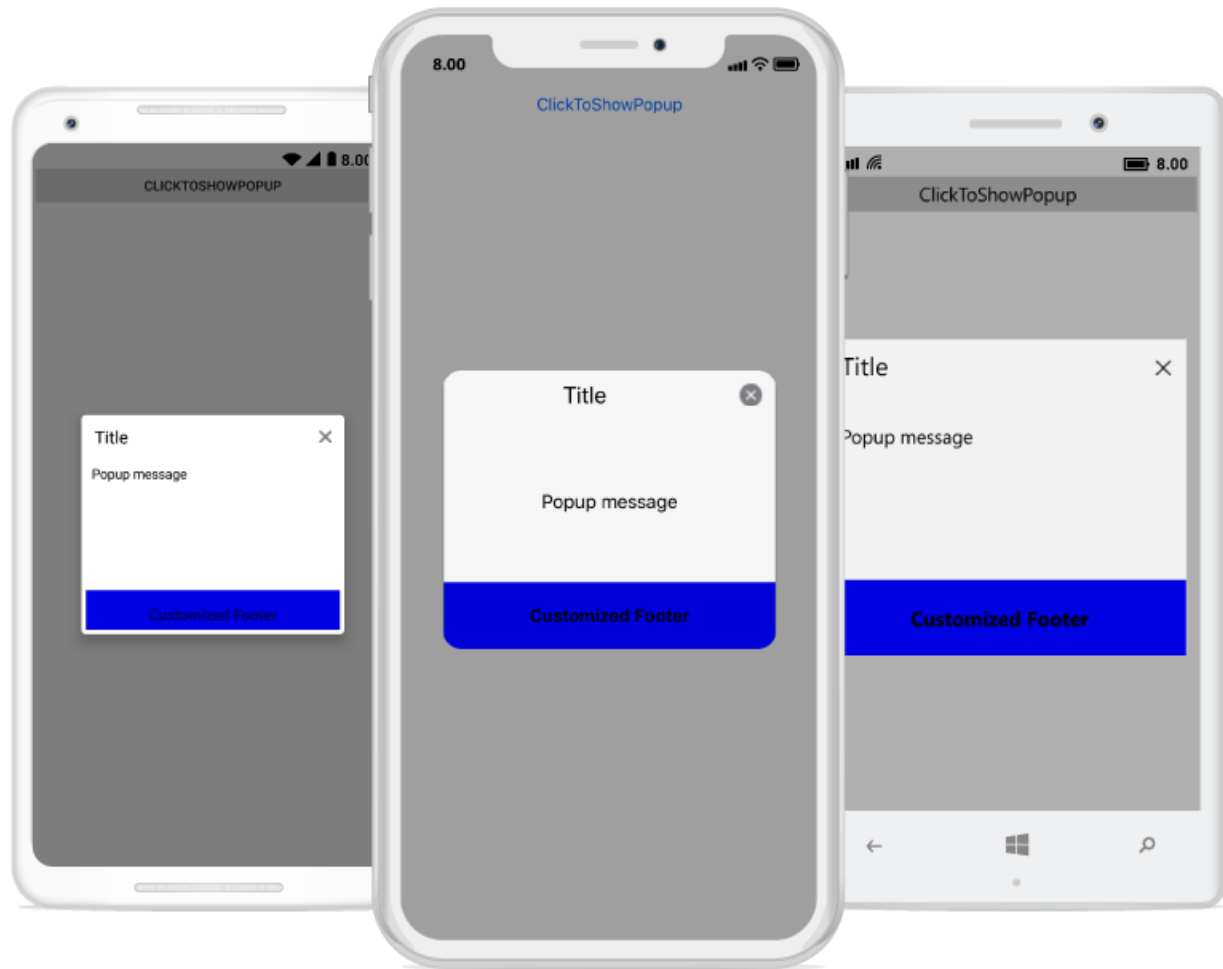

```

using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
public partial class MainPage : ContentPage
{
DataTemplate footerTemplateView;
Label footerContent;
public MainPage()
{
InitializeComponent();
clickToShowPopup.Clicked += ClickToShowPopup_Clicked;
footerTemplateView = new DataTemplate(() =>
{
footerContent = new Label();
footerContent.Text = "Customized Footer";
footerContent.FontAttributes = FontAttributes.Bold;
footerContent.BackgroundColor = Color.FromRgb(0, 0, 225);
footerContent.FontSize = 16;
footerContent.HorizontalTextAlignment = TextAlignment.Center;
footerContent.VerticalTextAlignment = TextAlignment.Center;
return footerContent;
});
// Adding FooterTemplate of the SfPopupLayout
popupLayout.PopupView.FooterTemplate = footerTemplateView;
}
private void ClickToShowPopup_Clicked(object sender, EventArgs e)
{
popupLayout.Show();
}
}
}

```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

### Customizing popup content

Any view can be added as popup content by using the [SfPopupLayout.PopupView.ContentTemplate](#) property. Refer to the following code example in which a label is added as a popup content.

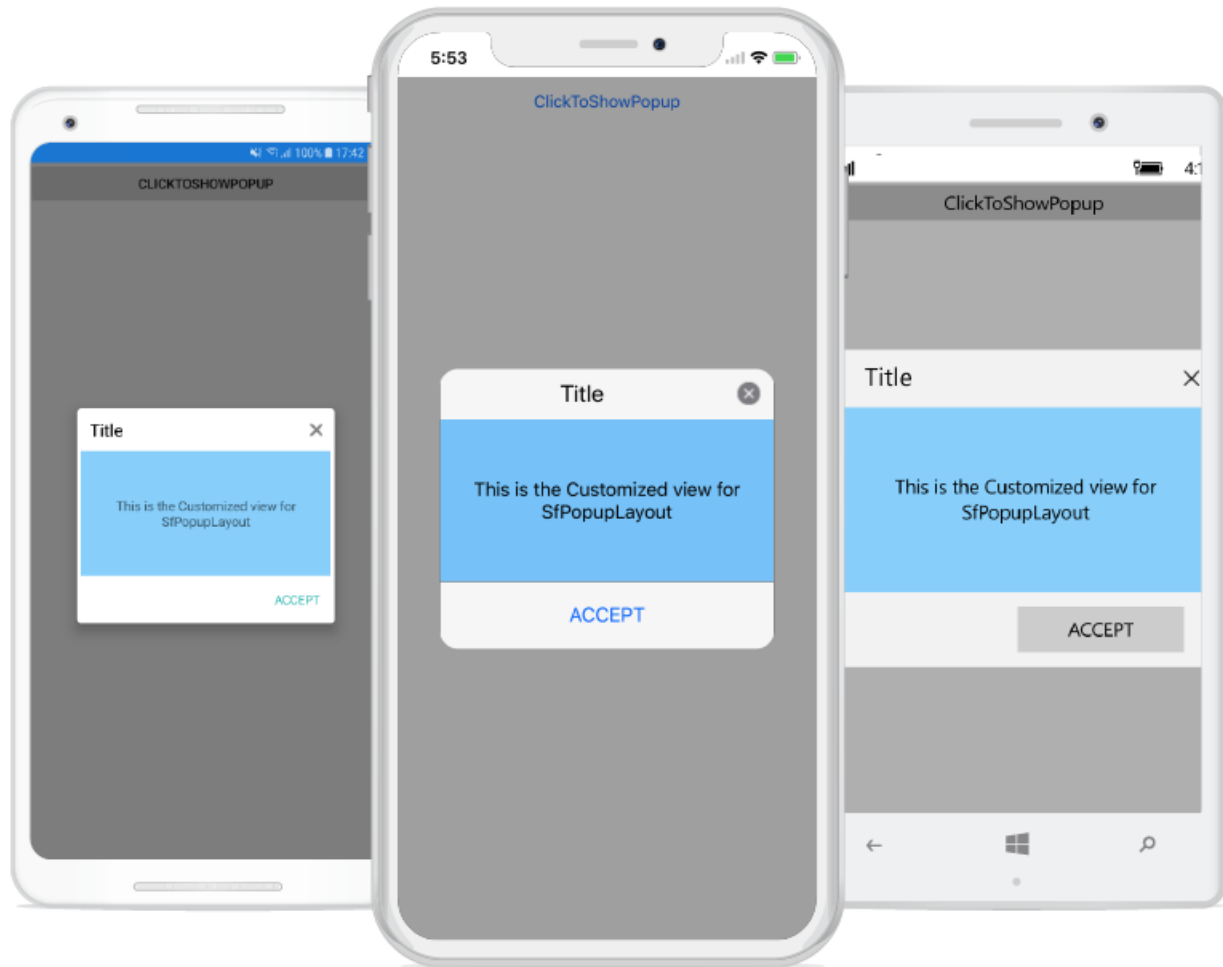

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
  <sfPopup:SfPopupLayout x:Name="popupLayout">
    <sfPopup:SfPopupLayout.PopupView>
      <sfPopup:PopupView>
        <sfPopup:PopupView.ContentTemplate>
          <DataTemplate>
            <Label Text="This is SfPopupLayout" BackgroundColor="SkyBlue"
HorizontalTextAlignment="Center"/>
          </DataTemplate>
        </sfPopup:PopupView>
      </sfPopup:SfPopupLayout.PopupView>
    </sfPopup:SfPopupLayout>
  </ContentPage>
```

```
</sfPopup:PopupView.ContentTemplate>
</sfPopup:PopupView>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="layout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start"
HorizontalOptions="FillAndExpand" Clicked="ClickToShowPopup_Clicked" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        DataTemplate templateView;
        Label popupContent;
        public MainPage()
        {
            InitializeComponent();
            templateView = new DataTemplate(() =>
            {
                popupContent = new Label();
                popupContent.Text = "This is the SfPopupLayout";
                popupContent.BackgroundColor = Color.LightSkyBlue;
                popupContent.HorizontalTextAlignment = TextAlignment.Center;
                return popupContent;
            });
            // Adding ContentTemplate of the SfPopupLayout
            popupLayout.PopupView.ContentTemplate = templateView;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}
```

To display ListView as content of the Popup, refer to this [documentation](#).

### Styles

The SfPopupLayout applies style to all of its elements by using the [SfPopupLayout.PopupView.PopupStyle](#) property.

#### Styling popup header

The SfPopupLayout allows customizing the header elements with various header customizations as follows:

Property	Description
<a href="#">SfPopupLayout.PopupView.PopupStyle.HeaderBackgroundColor</a>	Gets or sets the background color for the header.
<a href="#">SfPopupLayout.PopupView.PopupStyle.HeaderFontAttribute</a>	Gets or sets the font attribute for the header title.
<a href="#">SfPopupLayout.PopupView.PopupStyle.HeaderFontFamily</a>	Gets or sets the font style for the header title.

<a href="#">SfPopupLayout.PopupView.PopupStyle.HeaderFontSize</a>	Gets or sets the font size for the header title.
<a href="#">SfPopupLayout.PopupView.PopupStyle.HeaderTextAlignment</a>	Gets or sets the text alignment for the header.
<a href="#">SfPopupLayout.PopupView.PopupStyle.HeaderTextColor</a>	Gets or sets the text color to be applied for the header title.

Refer to the following code example for customizing the header elements.

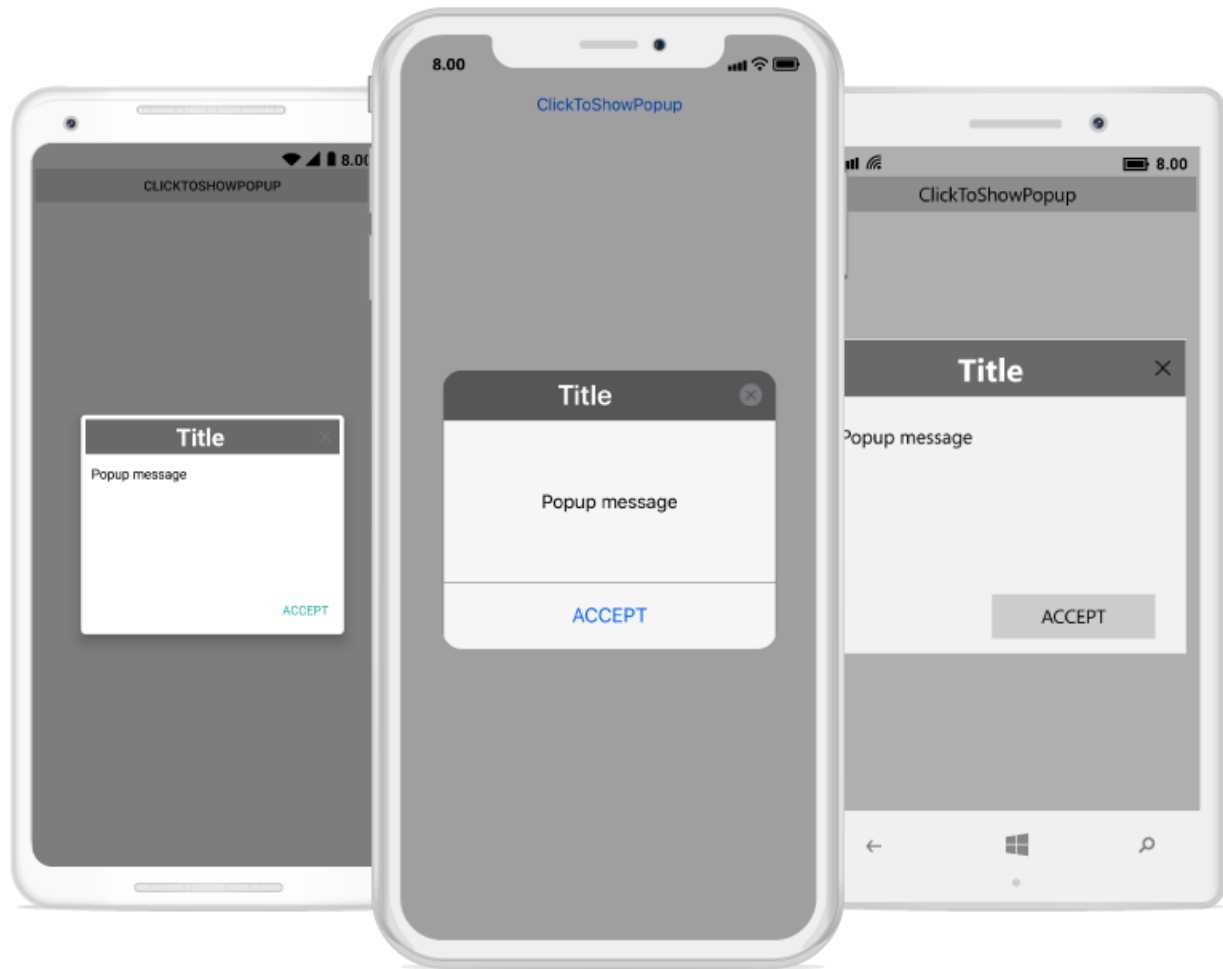

#### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView>
      <sfPopup:PopupView.PopupStyle>
        <sfPopup:PopupStyle HeaderBackgroundColor="DimGray"
HeaderFontAttribute="Bold"
HeaderFontFamily="Helvetica-Bold"
HeaderFontSize="25"
HeaderTextAlignment="Center"
HeaderTextColor="White"/>
      </sfPopup:PopupView.PopupStyle>
    </sfPopup:PopupView>
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

#### C#

```
//MainPage.cs
public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.PopupView.PopupStyle.HeaderBackgroundColor =
    Color.FromRgb(105, 105, 105);
    popupLayout.PopupView.PopupStyle.HeaderFontAttribute = FontAttributes.Bold;
    popupLayout.PopupView.PopupStyle.HeaderFontFamily = "Helvetica-Bold";
    popupLayout.PopupView.PopupStyle.HeaderFontSize = 25;
    popupLayout.PopupView.PopupStyle.HeaderTextAlignment = TextAlignment.Center;
    popupLayout.PopupView.PopupStyle.HeaderTextColor = Color.White;
    ....
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

### Styling popup footer

The SfPopupLayout allows customizing the footer elements with various footer customizations as follows:

Property	Description
<a href="#">SfPopupLayout.PopupView.PopupStyle.FooterBackgroundColor</a>	Gets or sets the background color for the footer.
<a href="#">SfPopupLayout.PopupView.PopupStyle.AcceptButtonBackgroundColor</a>	Gets or sets the background color for the Accept button in the footer.
<a href="#">SfPopupLayout.PopupView.PopupStyle.AcceptButtonTextColor</a>	Gets or sets the foreground color for the Accept button in the footer.
<a href="#">SfPopupLayout.PopupView.PopupStyle.DeclineButtonBackgroundColor</a>	Gets or sets the background color for the Decline button in the footer.

<a href="#">SfPopupLayout.PopupView.PopupStyle.DeclineButtonTextColor</a>	Gets or sets the foreground color for the Decline button in the footer.
---	---

Refer to the following code example for customizing the footer elements.

#### **XML**

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView AppearanceMode="TwoButton">
      <sfPopup:PopupView.PopupStyle>
        <sfPopup:PopupStyle FooterBackgroundColor="LightGray"
          AcceptButtonBackgroundColor="DimGray"
          AcceptButtonTextColor="White"
          DeclineButtonBackgroundColor="DimGray"
          DeclineButtonTextColor="White"
        />
      </sfPopup:PopupView.PopupStyle>
    </sfPopup:PopupView>
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

#### **C#**

```
//MainPage.cs
public MainPage()
{
    ....
    InitializeComponent();
    // Setting the AppearanceMode as TwoButton
    popupLayout.PopupView.AppearanceMode =
    Syncfusion.XForms.PopupLayout.AppearanceMode.TwoButton;
    // Footer customization
    popupLayout.PopupView.PopupStyle.FooterBackgroundColor = Color.LightGray;
    popupLayout.PopupView.PopupStyle.AcceptButtonBackgroundColor =
    Color.FromRgb(105, 105, 105);
    popupLayout.PopupView.PopupStyle.AcceptButtonTextColor = Color.White;
    popupLayout.PopupView.PopupStyle.DeclineButtonBackgroundColor =
    Color.FromRgb(105, 105, 105);
    popupLayout.PopupView.PopupStyle.DeclineButtonTextColor = Color.White;
    ....
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

### Border customization

The SfPopupLayout allows customizing the border appearance with various border customizations as follows:

Property	Description
<a href="#">SfPopupLayout.PopupView.PopupStyle.BorderColor</a>	Gets or sets the border color for the PopupView.
<a href="#">SfPopupLayout.PopupView.PopupStyle.BorderThickness</a>	Gets or sets the border thickness for the PopupView.
<a href="#">SfPopupLayout.PopupView.PopupStyle.CornerRadius</a>	Gets or sets the corner radius for the PopupView.

Refer to the following code example for customizing the border elements.

### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
```

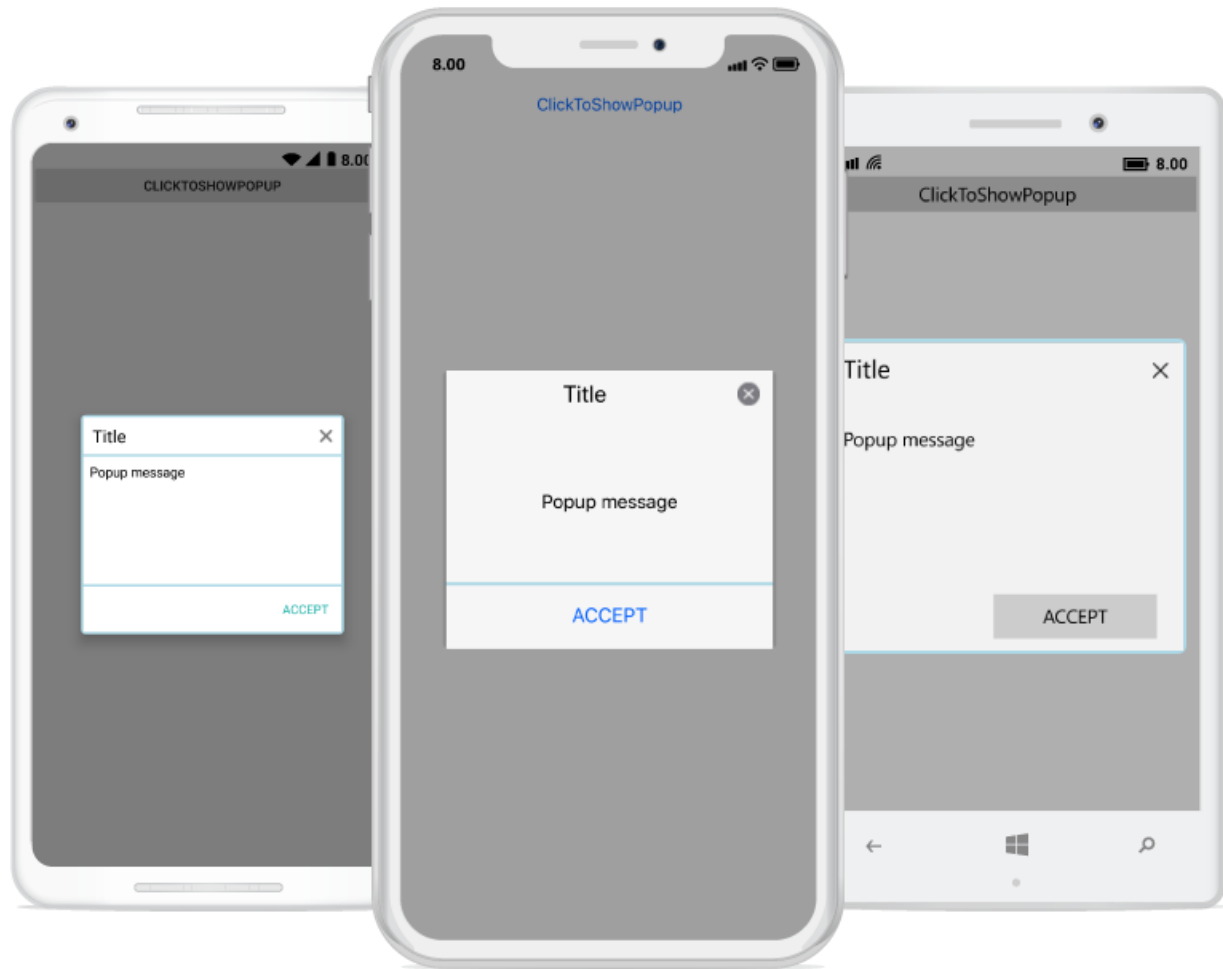

```
<sfPopup:PopupView>
<sfPopup:PopupView.PopupStyle>
<sfPopup:PopupStyle BorderColor="LightBlue"
BorderThickness="3"
CornerRadius="5"
/>
</sfPopup:PopupView.PopupStyle>
</sfPopup:PopupView>
</sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

## C#

```
//MainPage.cs
public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.PopupView.PopupStyle.BorderColor = Color.LightBlue;
    popupLayout.PopupView.PopupStyle.BorderThickness = 3;
    popupLayout.PopupView.PopupStyle.CornerRadius = 5;
    ....
}
```

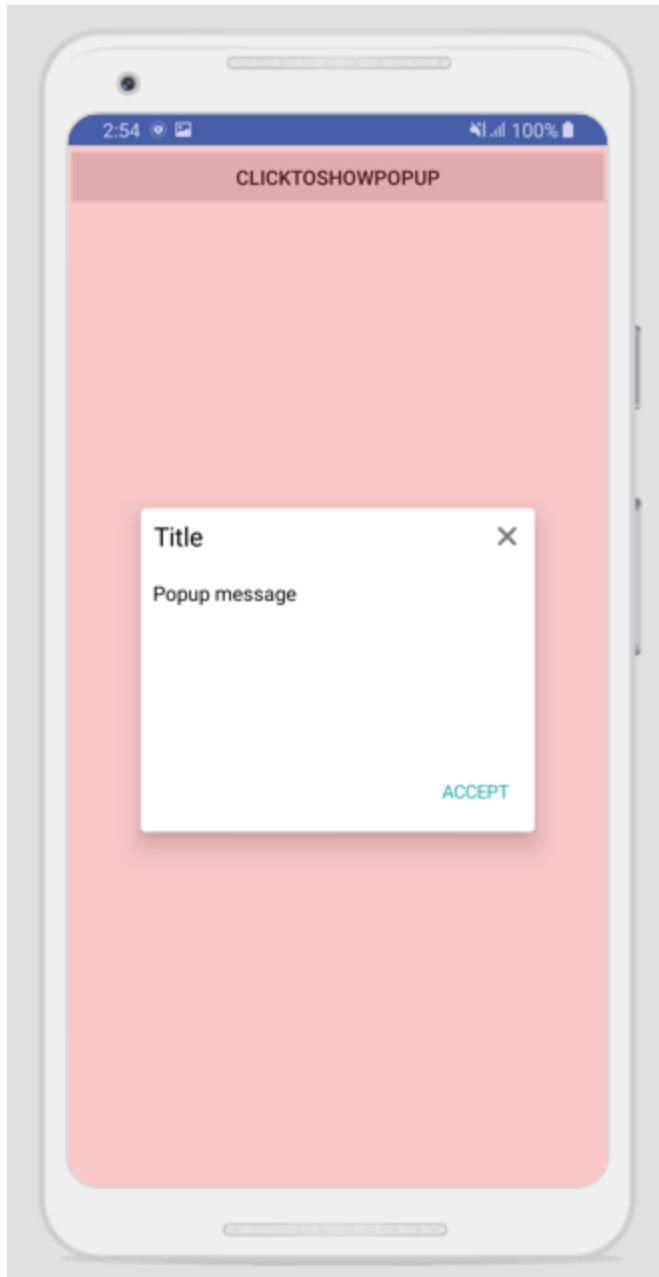

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

### Styling overlay background

The SfPopupLayout allows to customize the opacity and the background color of overlay using the SfPopupLayout.PopupView.PopupStyle.OverlayOpacity and

`SfPopupLayout.PopupView.PopupStyle.OverlayColor` properties, respectively.

Refer to the following code example for customizing the overlay opacity and the background color.

#### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView>
      <sfPopup:PopupView.PopupStyle>
        <sfPopup:PopupStyle OverlayColor="Red" OverlayOpacity="0.2">
        </sfPopup:PopupStyle>
      </sfPopup:PopupView.PopupStyle>
    </sfPopup:PopupView>
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

```
</sfPopup:SfPopupLayout>
```

### C#

```
popUpLayout.PopupView.PopupStyle.OverlayColor = Color.Red;
popUpLayout.PopupView.PopupStyle.OverlayOpacity = 0.2;
```

Executing the above codes renders the following output in Android devices.

![Popup with overlay customization](PopupLayoutimages/PopupViewOverlay.png)

### Popup Animations

Built-in animations are available in SfPopupLayout, which is applied when the PopupView opens and closes in the screen.

The SfPopupLayout has different animation modes as listed below:

- [Zoom](#)
- [Fade](#)
- [SlideOnLeft](#)
- [SlideOnRight](#)
- [SlideOnTop](#)
- [SlideOnBottom](#)
- [None](#)

**Note:** Setting of AnimationMode is same for both **Displaying popup when the SfPopupLayout is set as root view** and **Displaying popup on the go**.

### Zoom

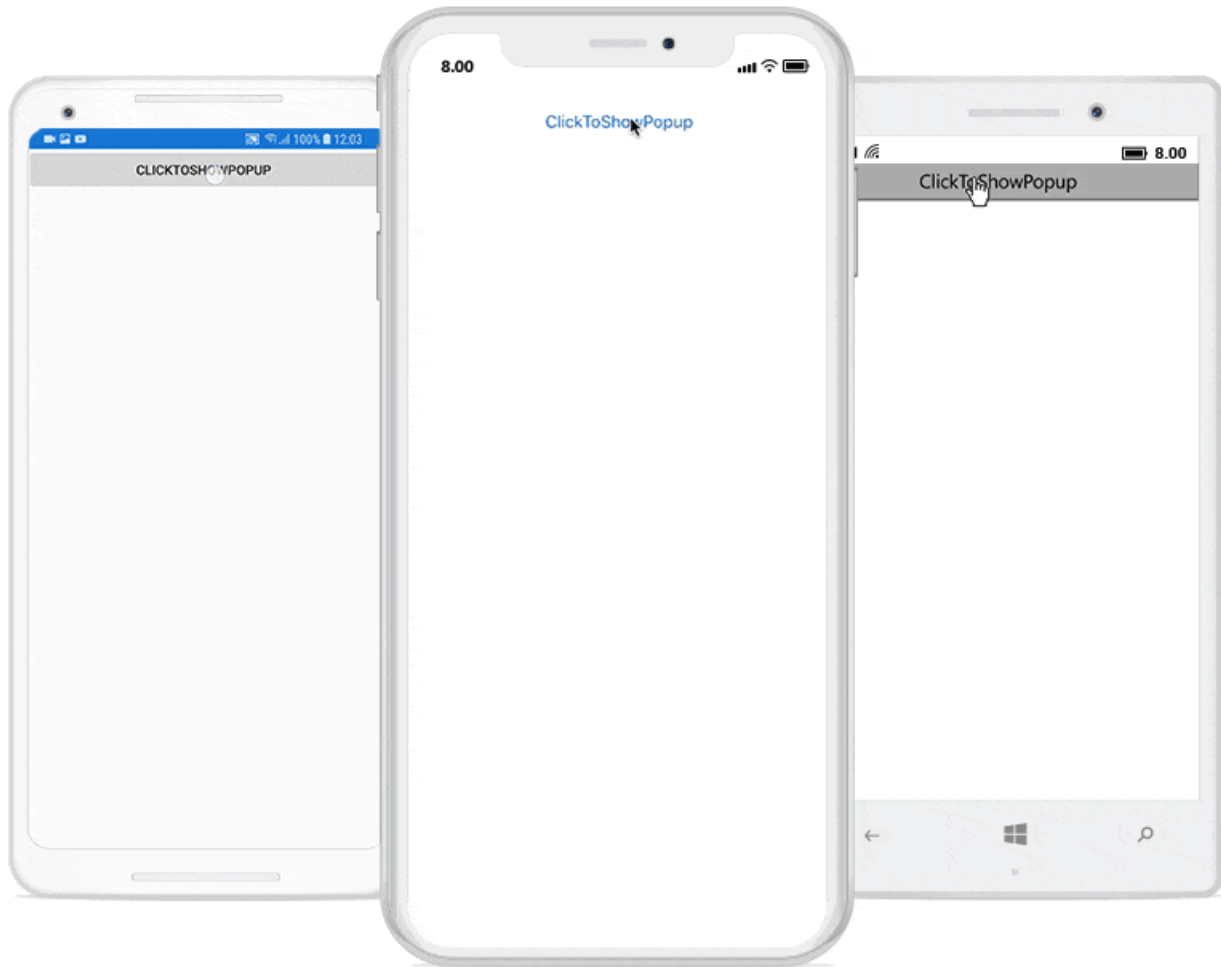

Zoom-out animation will be applied when the PopupView opens and Zoom-in animation will be applied when the PopupView closes.

### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView AnimationMode="Zoom" />
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

### C#

```
//MainPage.cs
public MainPage ()
{
    ....
    InitializeComponent();
    popUpLayout.PopupView.AnimationMode = AnimationMode.Zoom;
    ....
}
```

## Fade

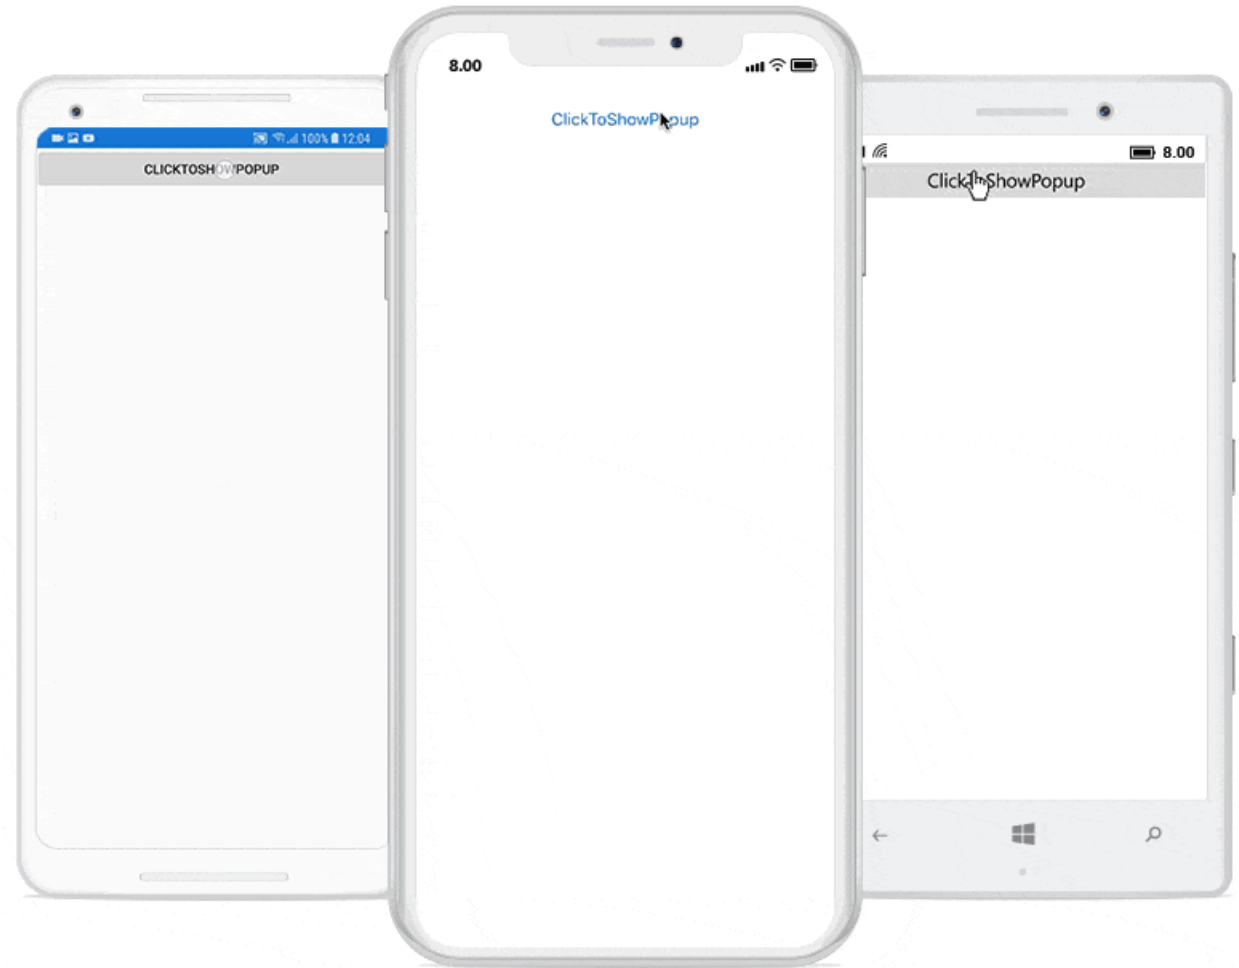

Fade-out animation will be applied when the PopupView opens and Fade-in animation will be applied when the PopupView closes.

### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView AnimationMode="Fade" />
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

### C#

```
//MainPage.cs
public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.PopupView.AnimationMode = AnimationMode.Fade;
    ....
}
```

### SlideOnLeft

PopupView will be animated from left-to-right when it opens and from right-to-left when it closes.

#### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView AnimationMode="SlideOnLeft" />
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

#### C#

```
//MainPage.cs
public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.PopupView.AnimationMode = AnimationMode.SlideOnLeft;
    ....
}
```

```
}
```

### SlideOnRight

PopupView will be animated from right-to-left when it opens and from left-to-right when it closes.

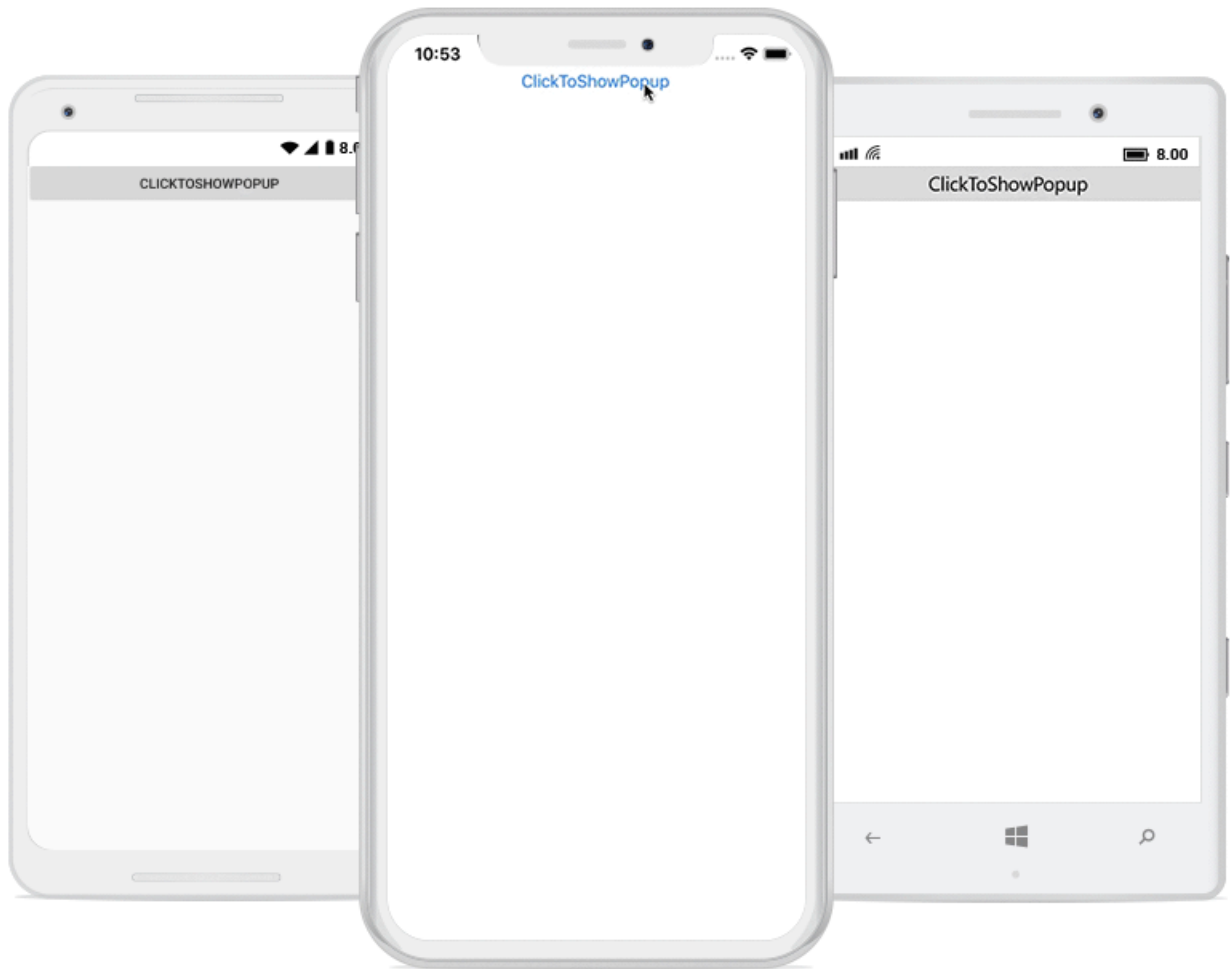

#### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">
  <sfPopup:SfPopupLayout.PopupView>
    <sfPopup:PopupView AnimationMode="SlideOnRight" />
  </sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

#### C#

```
//MainPage.cs
public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.PopupView.AnimationMode = AnimationMode.SlideOnRight;
}
```

```
.....  
}
```

### SlideOnTop

PopupView will be animated from top-to-bottom when it opens and from bottom-to-top when it closes.

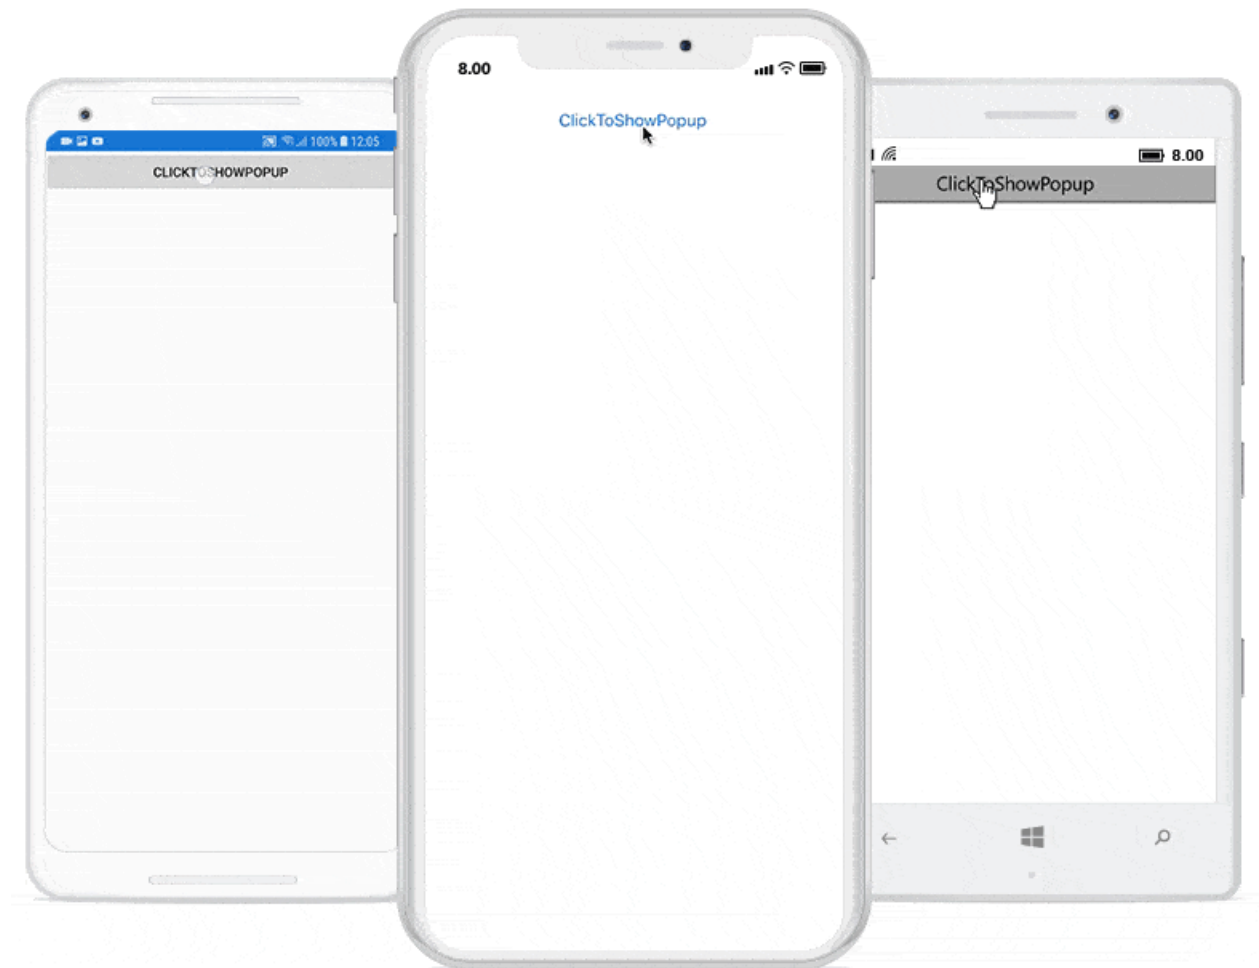

#### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">  
  <sfPopup:SfPopupLayout.PopupView>  
    <sfPopup:PopupView AnimationMode="SlideOnTop" />  
  </sfPopup:SfPopupLayout.PopupView>  
</sfPopup:SfPopupLayout>
```

#### C#

```
//MainPage.cs  
public MainPage()  
{  
  .....  
  InitializeComponent();  
}
```

```
popupLayout.PopupView.AnimationMode = AnimationMode.SlideOnTop;  
....  
}
```

### SlideOnBottom

PopupView will be animated from bottom-to-top when it opens and from top-to-bottom when it closes.

#### XML

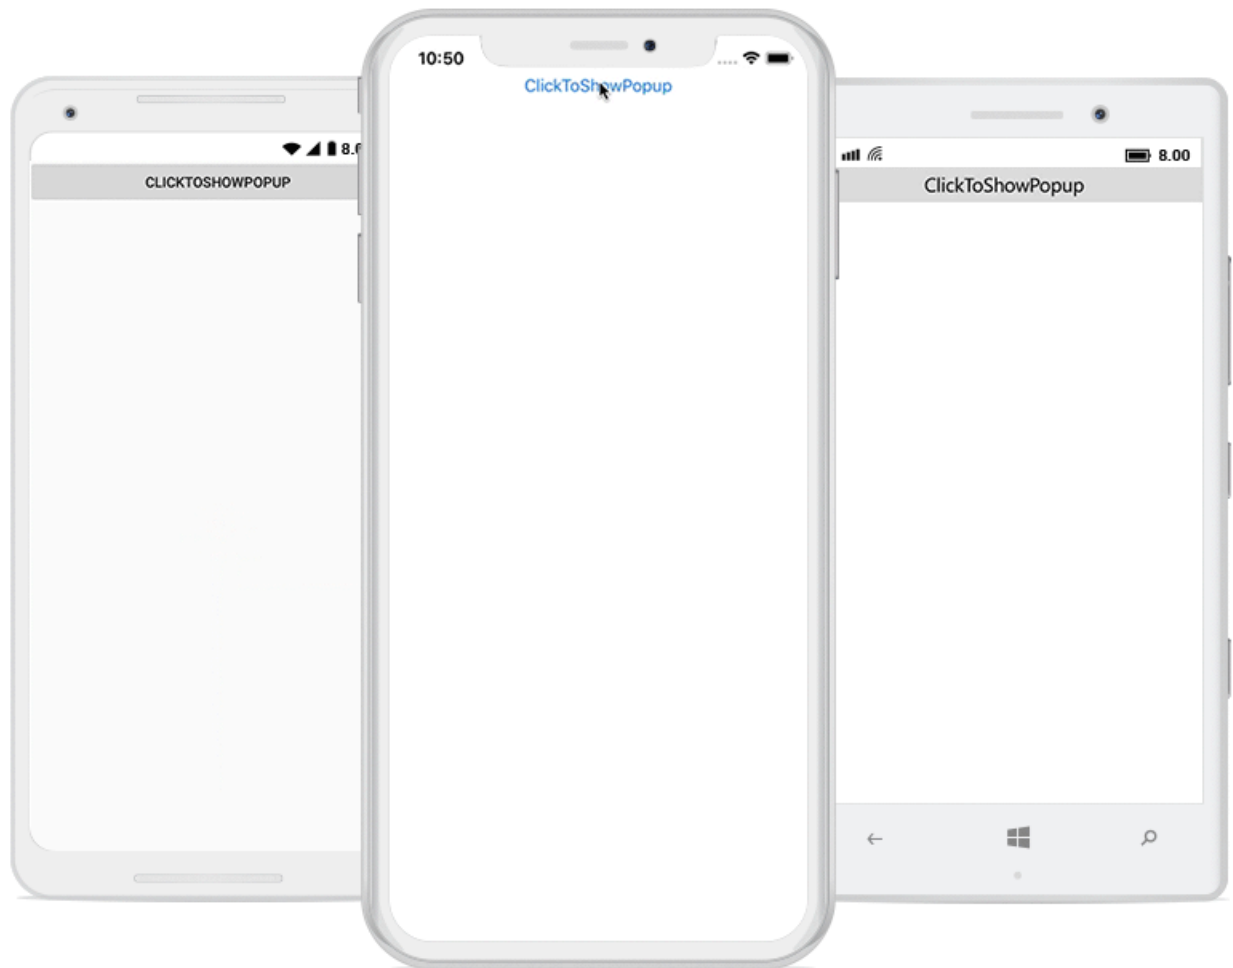

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">  
  <sfPopup:SfPopupLayout.PopupView>  
    <sfPopup:PopupView AnimationMode="SlideOnBottom" />  
  </sfPopup:SfPopupLayout.PopupView>  
</sfPopup:SfPopupLayout>
```

#### C#

```
//MainPage.cs  
public MainPage()  
{  
  ....  
}
```

```
InitializeComponent();  
popupLayout.PopupView.AnimationMode = AnimationMode.SlideOnBottom;  
....  
}
```

None

Animation will not be applied.

#### XML

```
<sfPopup:SfPopupLayout x:Name="popUpLayout">  
  <sfPopup:SfPopupLayout.PopupView>  
    <sfPopup:PopupView AnimationMode="None" />  
  </sfPopup:SfPopupLayout.PopupView>  
</sfPopup:SfPopupLayout>
```

#### C#

```
//MainPage.cs  
public MainPage()  
{
```

```

.....
InitializeComponent();
popupLayout.PopupView.AnimationMode = AnimationMode.None;
.....
}

```

## Modal Window Popup

You can use popup layout as modal window by using the built-in Close icon and the [SfPopupLayout.StaysOpen](#) property prevents interaction with your application until you close the window.

**Modal:** Window loads under the parent window surrounded by an overlay which prevents clicking anywhere else on the screen apart from the control of the modal.

Modal does not require any action to open. It opens in the same window and gives callbacks when closing or opening the window.

Refer to the following code example in which the popup will close only if you click on Close icon.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popUpLayout">
<sfPopup:SfPopupLayout.PopupView>
<sfPopup:PopupView HeightRequest="230"
HeaderTitle="Modal Window"
ShowFooter="False">
<sfPopup:PopupView.ContentTemplate>
<DataTemplate>
<Label Text="Window loads under the parent window surrounded by an
overlay which prevents clicking anywhere else on the screen
apart from the control of the modal. Modal opens in the same
window. It also does not require any user action to open, and
give callbacks when closing or opening the modal."
WidthRequest="260"
BackgroundColor="White"
HorizontalOptions="FillAndExpand"
/>
</DataTemplate>
</sfPopup:PopupView.ContentTemplate>
</sfPopup:PopupView>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="mainLayout">
<Button x:Name="clickToShowPopup" Text="ClickToShowPopup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand" />
</StackLayout>
</sfPopup:SfPopupLayout.Content>

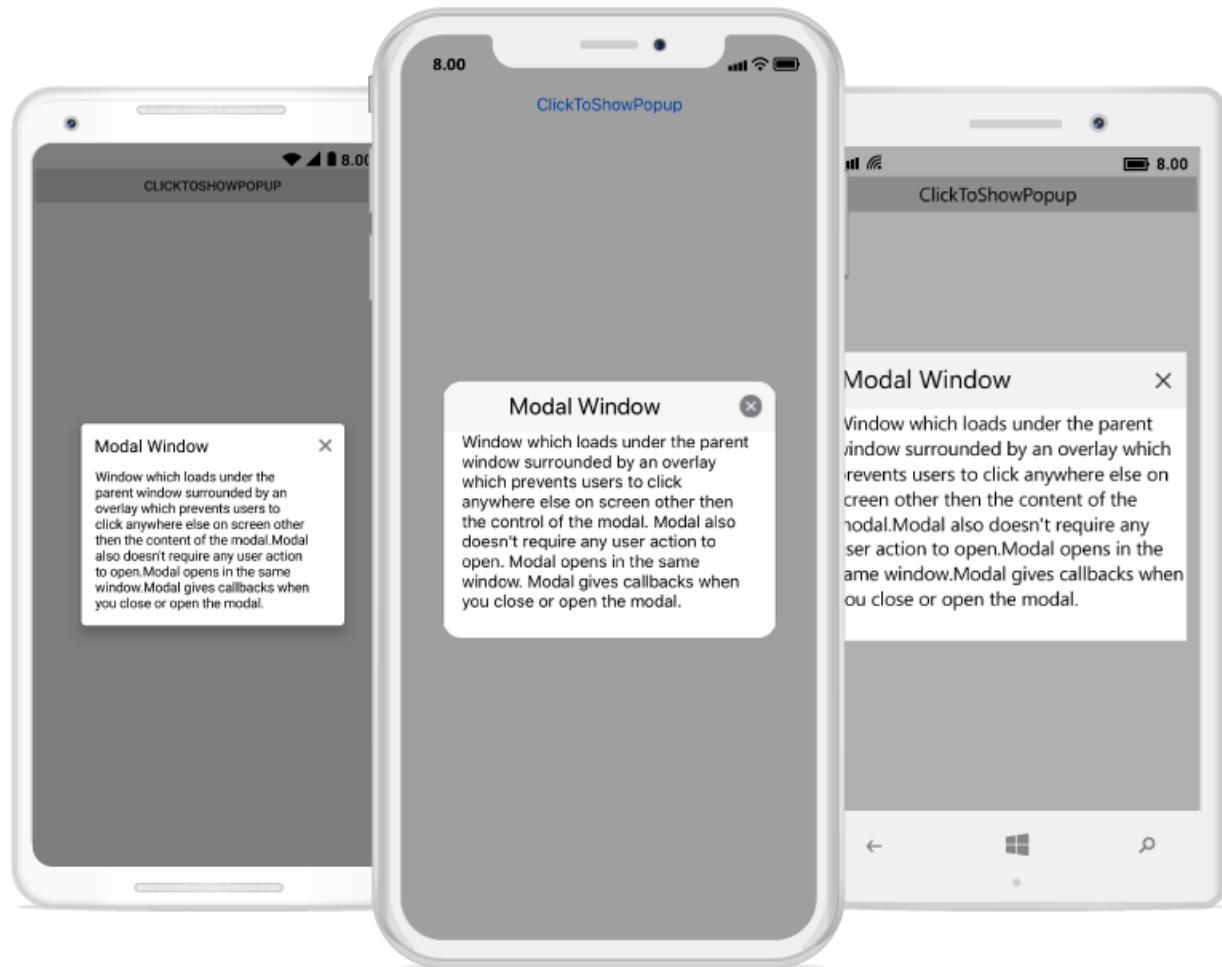

```

```
</sfPopup:SfPopupLayout>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        DataTemplate contentTemplateView;
        Label popupContent;
        public MainPage()
        {
            InitializeComponent();
            contentTemplateView = new DataTemplate(() =>
            {
                popupContent = new Label();
                popupContent.Text = "Window loads under the parent window surrounded by an overlay which prevents clicking anywhere else on the screen apart from the control of the modal. Modal opens in the same window. It also does not require any user action to open, and give callbacks when closing or opening the modal.";
                popupContent.WidthRequest = 260;
                popupContent.BackgroundColor = Color.White;
                popupContent.HorizontalOptions = LayoutOptions.FillAndExpand;
                return popupContent;
            });
            popupLayout.PopupView.HeightRequest = 230;
            popupLayout.PopupView.HeaderTitle = "Modal Window";
            popupLayout.PopupView.ContentTemplate = contentTemplateView;
            popupLayout.PopupView.ShowFooter = false;
            clickToShowPopup.Clicked += ClickToShowPopup_Clicked;
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            // Below code ensures that the popup doesn't collapse when user interacts outside the popup.
            popupLayout.StaysOpen = true;
            popupLayout.PopupView.ShowCloseButton = true;
            popupLayout.IsOpen = true;
        }
    }
}
```

Executing the above codes renders the following output in iOS, Android and Windows Phone devices respectively.

## Popup Events And Commands

There are four built-in events in the SfPopupLayout control namely:

- Opening
- Opened
- Closing
- Closed

### Opening event

The [SfPopupLayout.Opening](#) event will be fired whenever opening the PopupView in the application. It can cancel popup opening with [CancelEventArgs](#) that contains the following property:

- [Cancel](#): Popup opening is based on this value.

### XML

```
<sfPopup:SfPopupLayout x:Name="popupLayout" Opening="PopupLayout_Opening"/>
```

### C#

```

public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.Opening += PopupLayout_Opening;
    ....
}
private void PopupLayout_Opening(object sender,
System.ComponentModel.CancelEventArgs e)
{
    e.Cancel = true;
}

```

### Opened event

The [SfPopupLayout.Opened](#) event will be fired whenever displaying the PopupView in the application.

You can execute your own set of codes once the popup is opened, and visible in the application in its respective event handler.

### XML

```

<sfPopup:SfPopupLayout x:Name="popupLayout" Opened="PopupLayout_Opened"/>

```

### C#

```

public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.Opened += PopupLayout_Opened;
    ....
}
private void PopupLayout_Opened(object sender, EventArgs e)
{
    // Codes that needs to be executed once popup is visible in the screen.
}

```

### Closing event

The [SfPopupLayout.Closing](#) event will be fired whenever closing the PopupView in the application. It can cancel popup closing with `CancelEventArgs` that contains the following property:

- [Cancel](#): Popup opening is based on this value.

### XML

```

<sfPopup:SfPopupLayout x:Name="popupLayout" Closing="PopupLayout_Closing"/>

```

### C#

```

public MainPage()
{
    ....
    InitializeComponent();
}

```

```
popupLayout.Closing += PopupLayout_Closing;
....
}
private void PopupLayout_Closing(object sender,
System.ComponentModel.CancelEventArgs e)
{
e.Cancel = true;
}
```

### Closed event

The [SfPopupLayout.Closed](#) event will be fired whenever dismissing the PopupView from the view.

You can execute your own set of codes once the popup is completely closed in its respective event handler.

### XML

```
<sfPopup:SfPopupLayout x:Name="popupLayout" Closed="PopupLayout_Closed"/>
```

### C#

```
public MainPage()
{
....
InitializeComponent();
popupLayout.Closed += PopupLayout_Closed;
....
}
private void PopupLayout_Closed(object sender, EventArgs e)
{
// Codes that needs to be executed once popup is completely closed.
}
```

### Accept command

The [SfPopupLayout.PopupView.AcceptCommand](#) will be fired when clicking the Accept button in the popup footer.

To handle the Accept button, follow the procedure:

- Derive a class from `ICommand`, and implement the necessary interface.
- Return true in the `CanExecute()` override method to close the popup, and fire the `Execute()` method.
- Return false to prevent popup from closing, and `Execute()` method is not fired.

### XML

```
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.PopupView>
<sfPopup:PopupView AppearanceMode="TwoButton" />
</sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>
```

**C#**

```

public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.PopupView.AppearanceMode = AppearanceMode.TwoButton;
    popupLayout.PopupView.AcceptCommand = new AcceptButtonCustomCommand();
    ....
}
//Accept Button Event handler
public class AcceptButtonCustomCommand : ICommand
{
    public event EventHandler CanExecuteChanged;
    public bool CanExecute(object parameter)
    {
        return false;
    }
    public void Execute(object parameter)
    {
        // You can write your set of codes that needs to be executed
    }
}

```

## Decline command

The [SfPopupLayout.PopupView.DeclineCommand](#) will be fired when clicking the Decline button in the popup footer.

To handle the Decline button, follow the procedure:

- Derive a class from `ICommand`, and implement the necessary interface.
- Return true in the `CanExecute()` override method to close the popup, and fire the `Execute()` method.
- Return false to prevent popup from closing, and `Execute()` method is not fired.

**XML**

```

<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.PopupView>
<sfPopup:PopupView AppearanceMode="TwoButton" />
</sfPopup:SfPopupLayout.PopupView>
</sfPopup:SfPopupLayout>

```

**C#**

```

public MainPage()
{
    ....
    InitializeComponent();
    popupLayout.PopupView.AppearanceMode = AppearanceMode.TwoButton;
    popupLayout.PopupView.DeclineCommand = new DeclineButtonCustomCommand();
    ....
}
//Decline Button Event handler

```

```
public class DeclineButtonCustomCommand : ICommand
{
    public event EventHandler CanExecuteChanged;
    public bool CanExecute(object parameter)
    {
        return false;
    }
    public void Execute(object parameter)
    {
        // You can write your set of codes that needs to be executed
    }
}
```

## Localization

Localization is the process of translating application resources into different languages for specific cultures. SfPopupLayout uses the following static text that can be localized in application level:

- Title
- ACCEPT
- DECLINE
- Popup\_message

To localize the SfPopupLayout, follow the steps in application level:

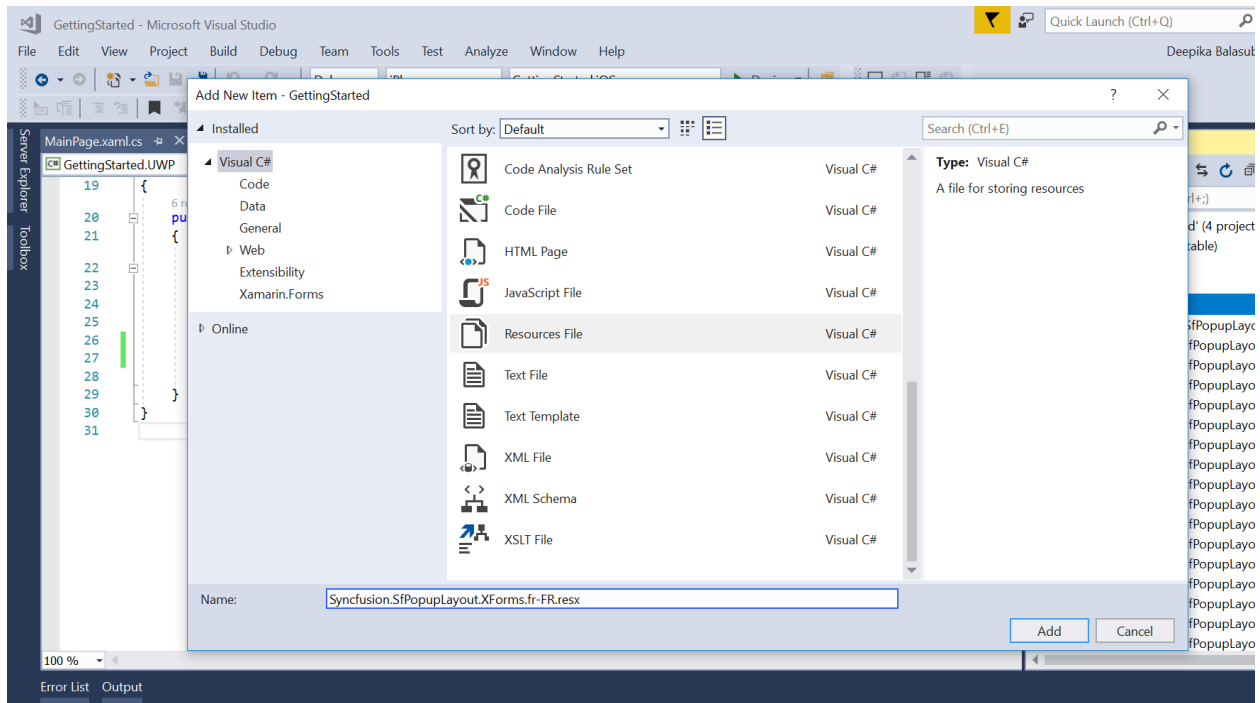

1. Add a .resx file.
2. Convert the platform specific language format to .NET format.
3. Apply the converted format.

### Add a .resx file

In the portable project of your application, add a .resx file inside the resources folder with **Build Action - > EmbeddedResource**. File name should be Syncfusion control's Namespace + language code format.

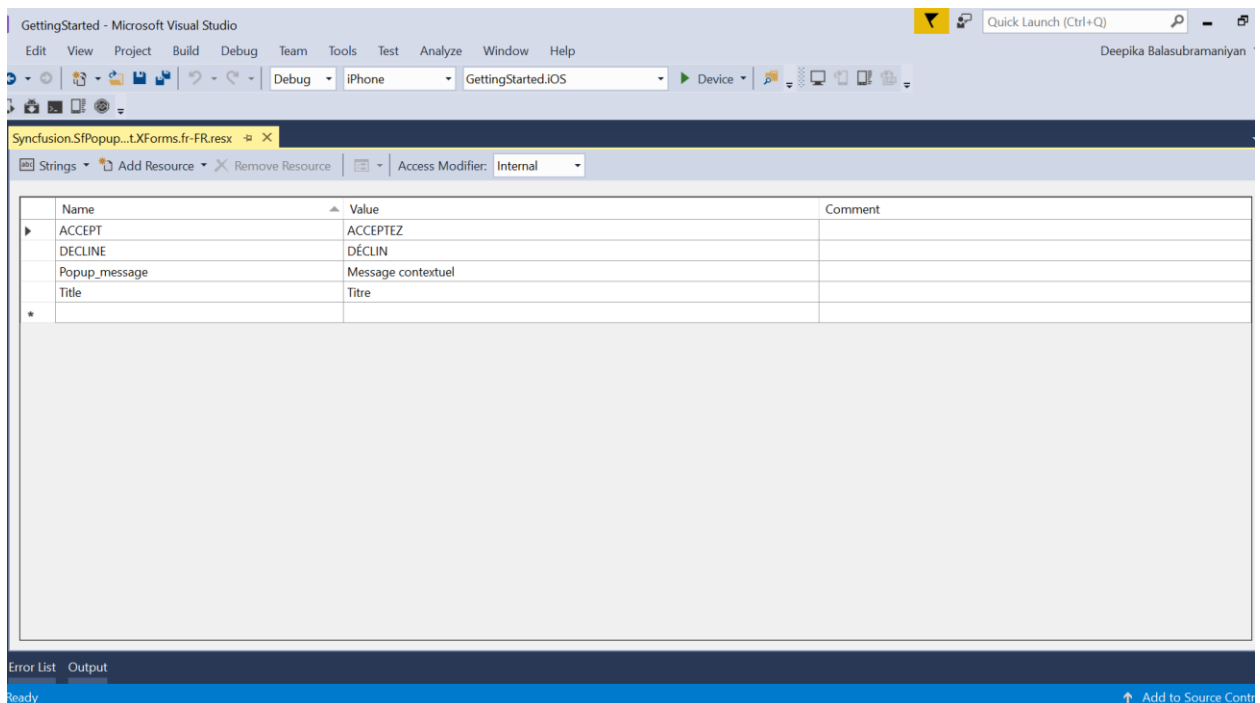

For example, to set the culture as French, the file should be named as **Syncfusion.SfPopupLayout.XForms.fr-FR.resx**.

Based on the language, set the appropriate equivalent text to the static text in the .resx file.

**Note:** You should create and add separate .resx files for the individual languages.

Convert the platform specific language format to .NET format

To get the localized text from the added .resx file, declare an interface named `ILocalize` in your PCL project and implement the interface in each platform renderer. This will query the language set in the device using platform specific code and convert to .NET format.

Refer to the following code snippet to declare the interface in PCL project.

### C#

```
public interface ILocalize
{
    CultureInfo GetCurrentCultureInfo();
    void SetLocale(CultureInfo cultureInfo);
}

public class PlatformCulture
{
    public PlatformCulture(string platformCultureString)
    {
        if (String.IsNullOrEmpty(platformCultureString))
            throw new ArgumentException("Expected culture identifier",
                "platformCultureString"); // in C# 6 use nameof(platformCultureString)
        PlatformString = platformCultureString.Replace("_", "-"); // .NET expects
        dash, not underscore
        var dashIndex = PlatformString.IndexOf("-", StringComparison.Ordinal);
        if (dashIndex > 0)
        {
            var parts = PlatformString.Split('-');
            LanguageCode = parts[0];
            LocaleCode = parts[1];
        }
        else
        {
            LanguageCode = PlatformString;
            LocaleCode = "";
        }
    }

    public string PlatformString
    {
        get; private set;
    }

    public string LanguageCode
    {
        get; private set;
    }

    public string LocaleCode
    {
        get; private set;
    }

    public override string ToString()
    {
        return PlatformString; ;
    }
}
```

Refer to the following code to implement the interface in Android renderer project.

### C#

```
public class Localize : ILocalize
{
    public void SetLocale(CultureInfo cultureInfo)
    {
    }
```

```

Thread.CurrentThread.CurrentCulture = cultureInfo;
Thread.CurrentThread.CurrentUICulture = cultureInfo;
}
public CultureInfo GetCurrentCultureInfo()
{
    var netLanguage = "en";
    var androidLocale = Java.Util.Locale.Default;
    netLanguage = AndroidToDotnetLanguage(androidLocale.ToString().Replace("_",
    "-"));
    // this gets called a lot - try/catch can be expensive so consider caching
    // or something
    CultureInfo cultureInfo = null;
    try
    {
        cultureInfo = new CultureInfo(netLanguage);
    }
    catch
    {
        // iOS locale not valid .NET culture (eg. "en-ES" : English in Spain)
        // fallback to first characters, in this case "en"
        try
        {
            var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
            cultureInfo = new CultureInfo(fallback);
        }
        catch
        {
            // iOS language not valid .NET culture, falling back to English
            cultureInfo = new CultureInfo("en");
        }
    }
    return cultureInfo;
}
private string AndroidToDotnetLanguage(string androidLanguage)
{
    var netLanguage = androidLanguage;
    //certain languages need to be converted to CultureInfo equivalent
    switch (androidLanguage)
    {
        case "ms-BN": // "Malaysian (Brunei)" not supported .NET culture
        case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
        case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
            netLanguage = "ms"; // closest supported
            break;
        case "in-ID": // "Indonesian (Indonesia)" has different code in .NET
            netLanguage = "id-ID"; // correct code for .NET
            break;
        case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
            culture
            netLanguage = "de-CH"; // closest supported
            break;
        // add more application-specific cases here (if required)
        // ONLY use cultures that have been tested and known to work
    }
    return netLanguage;
}
private string ToDotnetFallbackLanguage(PlatformCulture platformCulture)

```

```

{
    var netLanguage = platformCulture.LanguageCode; // use the first part of the
    identifier (two chars, usually);
    switch (platformCulture.LanguageCode)
    {
        case "gsw":
            netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
            break;
        // add more application-specific cases here (if required)
        // ONLY use cultures that have been tested and known to work
    }
    return netLanguage;
}

```

Refer to the following code to implement the interface in iOS renderer project.

### C#

```

public class Localize : ILocalize
{
    public void SetLocale(CultureInfo cultureInfo)
    {
        Thread.CurrentThread.CurrentCulture = cultureInfo;
        Thread.CurrentThread.CurrentUICulture = cultureInfo;
    }
    public CultureInfo GetCurrentCultureInfo()
    {
        var netLanguage = "en";
        if (NSLocale.PreferredLanguages.Length > 0)
        {
            var pref = NSLocale.PreferredLanguages[0];
            netLanguage = iOSToDotnetLanguage(pref);
        }
        // this gets called a lot - try/catch can be expensive so consider caching
        or something
        CultureInfo cultureInfo = null;
        try
        {
            cultureInfo = new CultureInfo(netLanguage);
        }
        catch
        {
            // iOS locale not valid .NET culture (eg. "en-ES" : English in Spain)
            // fallback to first characters, in this case "en"
            try
            {
                var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
                cultureInfo = new CultureInfo(fallback);
            }
            catch
            {
                // iOS language not valid .NET culture, falling back to English
                cultureInfo = new CultureInfo("en");
            }
        }
    }
}

```

```

return cultureInfo;
}
private string iOSToDotnetLanguage(string iosLanguage)
{
var netLanguage = iosLanguage;
//certain languages need to be converted to CultureInfo equivalent
switch (iosLanguage)
{
case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
netLanguage = "ms"; // closest supported
break;
case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
culture
netLanguage = "de-CH"; // closest supported
break;
// add more application-specific cases here (if required)
// ONLY use cultures that have been tested and known to work
}
return netLanguage;
}
private string ToDotnetFallbackLanguage(PlatformCulture platCulture)
{
var netLanguage = platCulture.LanguageCode; // use the first part of the
identifier (two chars, usually);
switch (platCulture.LanguageCode)
{
//
case "pt":
netLanguage = "pt-PT"; // fallback to Portuguese (Portugal)
break;
case "gsw":
netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
break;
// add more application-specific cases here (if required)
// ONLY use cultures that have been tested and known to work
}
return netLanguage;
}
}
}

```

Implementation of the interface is not required for UWP project, since the resources automatically recognizes the selected language.

#### Apply the converted format

After setting the root/main page of the application in your App.Xaml.cs file of the PCL project, initialize a new instance of the `ResourceManager` class and set it to the [PopupLayoutResourceManager.Manager](#) property to look up into the resources with specified root name in the given assembly. Using `DependencyService`, call `SetLocale()` of the implemented interface with necessary language code as parameter.

#### C#

```

public partial class App : Application
{

```

```
public App()
{
    InitializeComponent();
    MainPage = new GettingStarted.MainPage();
    if (Device.RuntimePlatform == Device.iOS || Device.RuntimePlatform ==
        Device.Android)
    {
        PopupLayoutResourceManager.Manager = new
        ResourceManager("GettingStarted.Resources.Syncfusion.SfPopupLayout.XForms",
            this.GetType().GetTypeInfo().Assembly);
        // the ResourceManager class constructor has two parameters.
        // 1. ResXPath => Full path of the resx file in the application. Here in the
        // above line GettingStarted refers to the namespace of the Application
        // 2. Assembly => Application assembly (PCL)
        // Sets the required culture to the static texts in the control.
        DependencyService.Get<ILocalize>().SetLocale(new CultureInfo("fr-FR"));
    }
}
```

For Android and iOS, it is mandatory to implement the previous steps. However, to set the specific language to the application irrespective of the selected language in the device, use `CultureInfo.CurrentCulture` in a specific project of UWP platform.

Refer to the following code example to localize the text in UWP platform.

MainPage.Xaml.cs

### **C#**

```
public MainPage()
{
    this.InitializeComponent();
    SfPopupLayoutRenderer.Init();
    // Applying localization for UWP
    CultureInfo.CurrentCulture = new CultureInfo("fr");
    LoadApplication(new GettingStarted.App());
}
```

You can download the sample [here](#).

### AutomationId

SfPopupLayout supports built-in [AutomationId](#) for all its inner elements. These `AutomationId` values allow the automation framework to find and interact with the inner elements when the test scripts are run. A unique `AutomationId` is maintained for each inner element by prefixing the control's `AutomationId` with the inner element's Id.

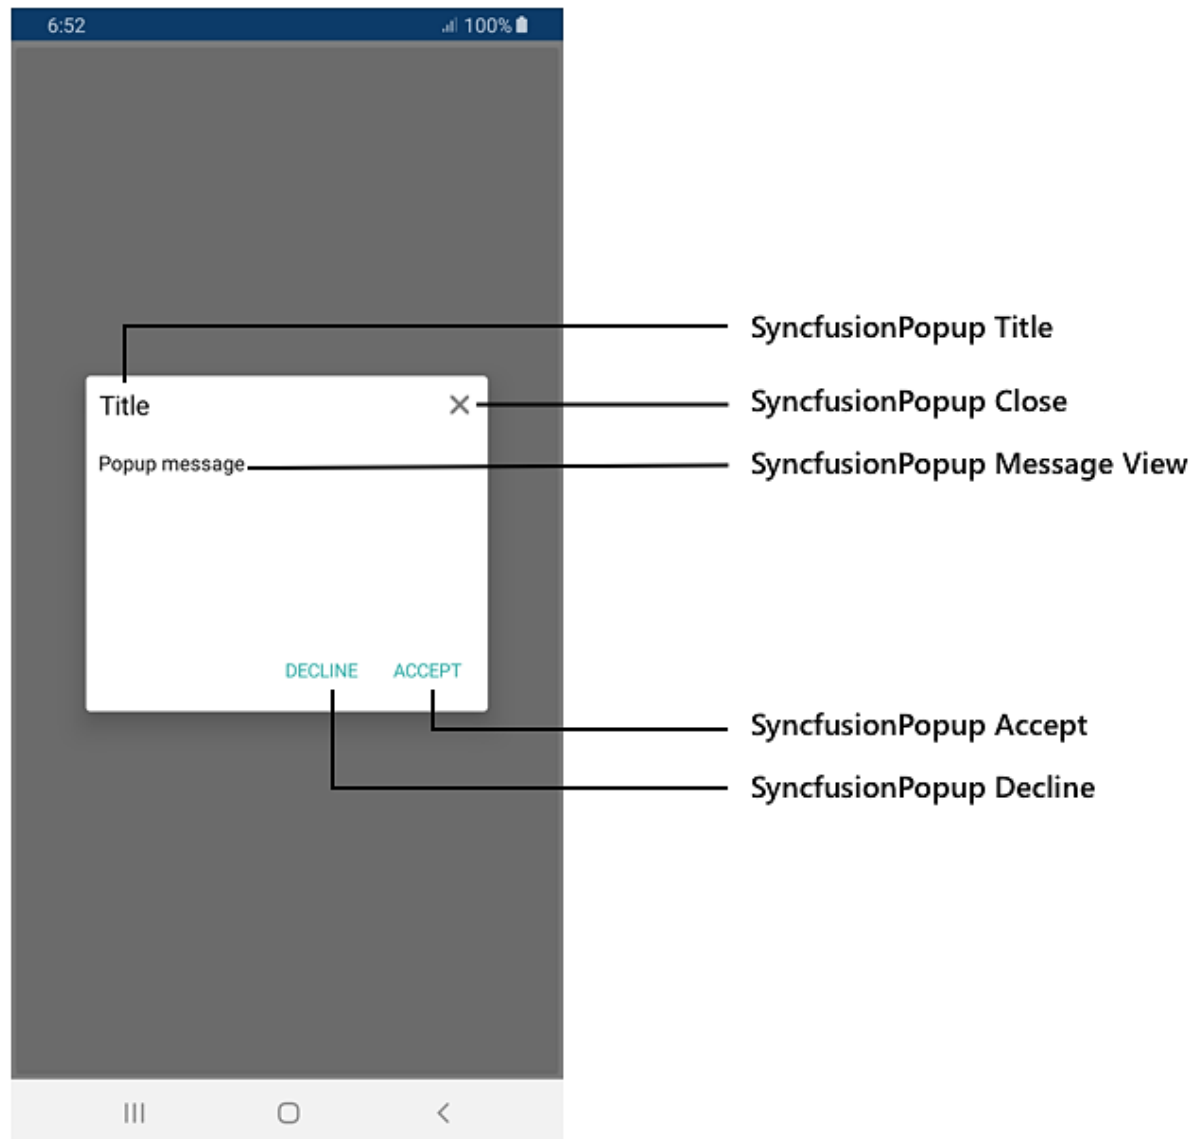

#### AutomationId for popup view inner elements

The below table illustrates the predefined automation values set internally which can be used to identify the PopupView's elements.

Element	Value
Header title	"Title"
Header close button	"Close"
PopupView content	"Message"
Accept button	"Accept"
Decline button	"Decline"

The following screenshot illustrates the `AutomationId` values of the inner elements of SfPopupView.

The following code snippet demonstrates how to set `AutomationId` to the `SfPopupLayout`.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms">
<sfPopup:SfPopupLayout x:Name="popupLayout" AutomationId="SyncfusionPopup">
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="mainLayout">
<Button x:Name="clickToShowPopup" Text="Click To Show Popup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked"/>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

```

</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>

```

**C#**

```

using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}

```

The following code snippet demonstrates how to access the inner elements of SfPopupView from the automation script.

**C#**

```

[Test]
[Description("SfPopupLayout Automation Id")]
public void SfPopupLayout_AutomationId()
{
    // To tap the Accept button
    App.Tap("SyncfusionPopup Accept");
    // To tap the Decline button
    App.Tap("SyncfusionPopup Decline");
    // To tap the Close button
    App.Tap("SyncfusionPopup Close");
    // To tap the Header Title label
    App.Tap("SyncfusionPopup Title");
    // To tap the MessageView
    App.Tap("SyncfusionPopup MessageView");
}

```

## AutomationId for template content

To access the template elements from script, set the **AutomationId** directly to the template view from the sample level.

The following code snippet explains how to set **AutomationId** for the template content.

**XML**

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"

```

```

x:Class="GettingStarted.MainPage"
Padding="0,40,0,0"
xmlns:sfPopup="clr-
namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XF
orms">
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:PopupView>
<sfPopup:PopupView.ContentTemplate>
<DataTemplate>
<Button Text="This is SfPopupLayout" BackgroundColor="SkyBlue"
AutomationId="TemplateButton"/>
</DataTemplate>
</sfPopup:PopupView.ContentTemplate>
</sfPopup:PopupView>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout x:Name="mainLayout">
<Button x:Name="clickToShowPopup" Text="Click To Show Popup"
VerticalOptions="Start" HorizontalOptions="FillAndExpand"
Clicked="ClickToShowPopup_Clicked"/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>

```

**C#**

```

using Syncfusion.XForms.PopupLayout;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void ClickToShowPopup_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
    }
}

```

Refer to the following code snippet to access the template content of SfPopupView from the automation script.

**C#**

```

[Test]
[Description("SfPopupLayout Template Automation Id")]
public void Template_AutomationId()
{
    // To tap the Content template button
    App.Tap("TemplateButton");
}

```

## FAQ

Load the SfPopupLayout in GridTappedEvent of the SfDataGrid

The SfPopupLayout allows opening it in the GridTapped event of the SfDataGrid

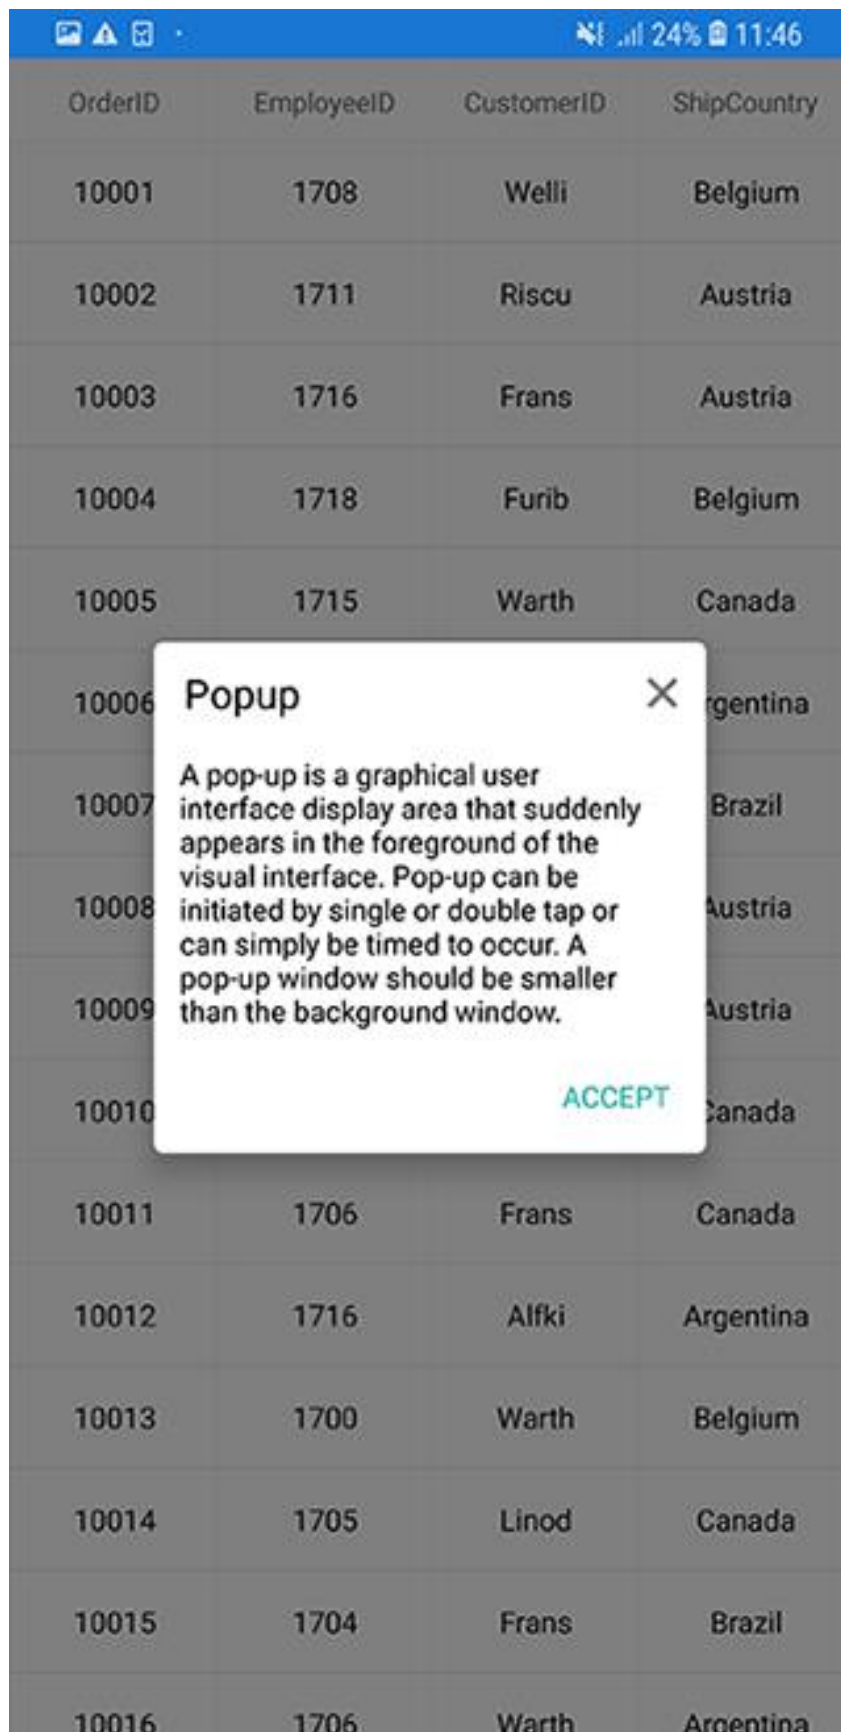

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

>
</sfDataGrid:SfDataGrid>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.PopupLayout;
using Syncfusion.SfDataGrid.XForms;
namespace GettingStarted
{
public partial class MainPage : ContentPage
```

```
{
SfDataGrid dataGrid;
ViewModel viewModel;
SfPopupLayout popupLayout;
public MainPage()
{
InitializeComponent();
dataGrid = new SfDataGrid();
viewModel = new ViewModel();
dataGrid.ItemsSource = viewModel.OrdersInfo;
dataGrid.GridTapped += DataGrid_GridTapped;
dataGrid.ColumnSizer = ColumnSizer.Star;
popupLayout = new SfPopupLayout();
popupLayout.PopupView.HeaderTitle = "Popup";
popupLayout.PopupView.ContentTemplate = new DataTemplate(() =>
{
return new Label()
{
Text = "A pop-up is a graphical user interface display area that suddenly
appears in the foreground of the visual interface. Pop-up can be initiated
by single or double tap or can simply be timed to occur. A pop-up window
should be smaller than the background window or interface; otherwise, its a
replacement interface.",
BackgroundColor = Color.White,
TextColor = Color.Black
};
});
popupLayout.Content = dataGrid;
this.Content = popupLayout;
}
private void DataGrid_GridTapped(object sender,
Syncfusion.SfDataGrid.XForms.GridTappedEventArgs e)
{
// Popup is opened at the Grid tapped event
popupLayout.Show();
}
}
```

Sample Link: You can download the above sample code by clicking [here](#).

Open SfPopupLayout in ItemTapped event of SfListView

The SfPopupLayout allows opening it in the ItemTapped event of the SfListView.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>

        TextColor = Color.Black,
        HorizontalTextAlignment = TextAlignment.Center
    };
});
popupLayout.Content = listView;
this.Content = popupLayout;
}
private void ListView_ItemTapped(object sender,
Syncfusion.ListView.XForms.ItemTappedEventArgs e)
{
    popupLayout.Show();
}
}
```

Sample Link: You can download the above sample code by clicking [here](#).

### Show ListView as a popup

The SfPopupLayout allows loading the SfListView as a content of the popup. You have to set **WidthRequest** and **HeightRequest** properties for loading SfListView in the SfPopupLayout.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

                    HorizontalOptions = LayoutOptions.Center,
                    HeightRequest = 50
                };
                contactImage.SetBinding(Image.SourceProperty, new Binding("ContactImage"));
                var contactName = new Label()
                {
                    HorizontalTextAlignment = TextAlignment.Center,
                    LineBreakMode = LineBreakMode.NoWrap,
                    FontSize = Font.SystemFontSize(NamedSize.Medium).FontSize,
                };
                contactName.SetBinding(Label.TextProperty, new Binding("ContactName"));
                var contactType = new Image()

```

```
{
    VerticalOptions = LayoutOptions.End,
    HorizontalOptions = LayoutOptions.End,
    HeightRequest = 50,
};
contactType.SetBinding(Image.SourceProperty, new Binding("ContactType"));
grid.Children.Add(contactImage, 0, 0);
grid.Children.Add(contactName, 1, 0);
grid.Children.Add(contactType, 2, 0);
viewCell.View = grid;
return viewCell;
});
viewModel = new ContactsViewModel();
listView.ItemsSource = viewModel.Items;
popupLayout = new SfPopupLayout();
popupLayout.PopupView.HeaderTitle = "ListView";
popupLayout.PopupView.ContentTemplate = new DataTemplate(() =>
{
    return listView;
});
StackLayout stackLayout = new StackLayout();
Button isOpenButton = new Button();
isOpenButton.Clicked += isOpenButton_Clicked;
isOpenButton.Text = "Click to show popup";
stackLayout.Children.Add(isOpenButton);
popupLayout.Content = stackLayout;
this.Content = popupLayout;
}
private void isOpenButton_Clicked(object sender, EventArgs e)
{
    popupLayout.Show();
}
}
```

Sample Link: You can download the above sample code by clicking [here](#).

Display popup when interacting with a switch

[SfPopupLayout.IsOpen](#) is a bindable property and hence can be binded to any property and based on its value the popup will open or close. In the below code example, we have binded the `IsOpen` property with the `IsToggled` property of the the switch and the popup will be opened or closed as the switch toggles.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:SamplePopup"
xmlns:sfpopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms"
x:Class="SamplePopup.MainPage"
Padding="0,20,0,0">
<sfpopup:SfPopupLayout IsOpen="{Binding Source={x:Reference popupSwitch},
Path=IsToggled}">
<sfpopup:SfPopupLayout.Content>
<StackLayout Orientation="Horizontal">
<Label Text="On the switch to show popup" />
<Switch x:Name="popupSwitch" IsToggled="False" VerticalOptions="Start" />
</StackLayout>
</sfpopup:SfPopupLayout.Content>
</sfpopup:SfPopupLayout>
</ContentPage>
```

Display popup in MVVM

SfPopup can be used in MVVM architecture applications easily. In the below example [SfPopupLayout.IsOpen](#) property is binded to a property in the ViewModel based on which the popup is opened or closed. Refer the below code example to display popup in MVVM.

In the below code snippet, note that the Binding context is set for the page and the property (DisplayPopup) of the ViewModel is binded to the [SfPopupLayout.IsOpen](#).

#### XML

```
<ContentPage.BindingContext>
<local:ViewModel />
</ContentPage.BindingContext>
<sfpopup:SfPopupLayout x:Name="popup" IsOpen="{Binding DisplayPopup}">
<sfpopup:SfPopupLayout.Content>
<StackLayout x:Name="rootView">
<Button x:Name="isOpenButton" Text="Click to open popup" Command="{Binding
OpenPopupCommand}" />
</StackLayout>
</sfpopup:SfPopupLayout.Content>
</sfpopup:SfPopupLayout>
```

#### C#

```
// ViewModel.cs
public class ViewModel : INotifyPropertyChanged
```

```

{
private bool displayPopup;
public ICommand OpenPopupCommand { get; set; }
public bool DisplayPopup
{
get
{
return displayPopup;
}
set
{
displayPopup = value;
RaisePropertyChanged("DisplayPopup");
}
}
public ViewModel()
{
OpenPopupCommand = new Command(OpenPopup);
}
private void OpenPopup()
{
DisplayPopup = true;
}
#region INotifyPropertyChanged
public event PropertyChangedEventHandler PropertyChanged;
private void RaisePropertyChanged(string propertyName)
{
if(this.PropertyChanged != null)
{
this.PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
}
}
#endregion
}

```

### Load SfPopupLayout in Prism

Refer to the following code in which the SfPopupLayout is shown, when navigated to the next and previous pages via button click.

#### XML

```

// App.xaml
<prism:PrismApplication xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:prism="clr-namespace:Prism.Unity;assembly=Prism.Unity.Forms"
x:Class="PopupDemo.App">
</prism:PrismApplication>
//MainPage.xaml
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:PopupDemo"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms"
x:Class="PopupDemo.MainPage">

```

```

<ContentPage.Content>
<StackLayout>
<Button Text="GO TO NEXT PAGE" VerticalOptions="Center"
HorizontalOptions="Center" Command="{Binding NavigateCommand}"/>
</StackLayout>
</ContentPage.Content>
</ContentPage>
// SecondPage.xaml
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="PopupDemo.SecondPage">
<ContentPage.Content>
<StackLayout>
<Button Text="GO TO PREVIOUS PAGE" VerticalOptions="Center"
HorizontalOptions="Center" Command="{Binding NavigateCommand}"/>
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

## C#

```

// App.xaml.cs
using Prism.Unity;

using System.Windows.Input;
namespace PopupDemo
{
    public class SecondPageViewModel : INavigationAware
    {
        public INavigationService navigation_service;
        public ICommand NavigateCommand { get; set; }
        public SecondPageViewModel(INavigationService navigationService)
        {
            navigation_service = navigationService;
            NavigateCommand = new Command(Navigate);
        }
        private void Navigate()
        {
            navigation_service.NavigateAsync("MainPage");
        }
        public void OnNavigatedFrom(NavigationParameters parameters)
        {
        }
        public void OnNavigatedTo(NavigationParameters parameters)
        {
            if (App.Current.MainPage != null)
            {
                SfPopupLayout popup = new SfPopupLayout();
                popup.Show();
            }
        }
        public void OnNavigatingTo(NavigationParameters parameters)
        {
        }
    }
}
```

Sample Link: You can download the above sample code by clicking [here](#).

### Change the close button icon

You can change the close button icon of the SfPopupLayout, please find the code example of the same below.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:PopupDemo"
xmlns:sfPopup="clr-namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XForms"
x:Class="PopupDemo.MainPage">
<ContentPage.Resources>
<ResourceDictionary>
<local:CustomStyle x:Key="customStyle" />
</ResourceDictionary>
</ContentPage.Resources>
<sfPopup:SfPopupLayout x:Name="popupLayout">
<sfPopup:SfPopupLayout.PopupView>
<sfPopup:PopupView PopupStyle="{StaticResource customStyle}"/>
</sfPopup:SfPopupLayout.PopupView>
<sfPopup:SfPopupLayout.Content>
<StackLayout>
<Button x:Name="isOpenButton" Text="Click to open popup"
Clicked="isOpenButton_Clicked"/>
</StackLayout>
</sfPopup:SfPopupLayout.Content>
</sfPopup:SfPopupLayout>
</ContentPage>
```

#### C#

```
namespace PopupDemo
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void isOpenButton_Clicked(object sender, EventArgs e)
        {
            popupLayout.Show();
        }
        public class CustomStyle : PopupStyle
        {
            public CustomStyle()
            {
                this.CloseButtonIcon =
                    ImageSource.FromResource("PopupDemo.Images.RedDown.png");
            }
        }
    }
}
```

```

}
}
}

```

Sample Link: You can download the above sample code by clicking [here](#).

How to close popup view

The [SfPopupLayout.IsOpen](#) or [SfPopupLayout.IsVisible](#) property is used to close the [SfPopupLayout](#)

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Popup_Demo"
x:Class="Popup_Demo.MainPage"
xmlns:sfPopup="clr-
namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XF
orms">
<ContentPage.Content>
<StackLayout x:Name="mainLayout">
<Button x:Name="clickToShowPopup" Text="click to show popup"/>
<Button x:Name="clickToClosePopup" Text="click to close popup"/>
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.XForms.PopupLayout;
using System;
using Xamarin.Forms;
namespace Popup_Demo
{
public partial class MainPage : ContentPage
{
SfPopupLayout popupLayout;
public MainPage()
{
InitializeComponent();
this.popupLayout = new SfPopupLayout();
this.popupLayout.StaysOpen = true;
this.popupLayout.PopupView.HeightRequest = 200;
this.popupLayout.PopupView.WidthRequest = 200;
this.clickToShowPopup.Clicked += ClickToShowPopup_Clicked;
this.clickToClosePopup.Clicked += ClickToClosePopup_Clicked;
}
private void ClickToShowPopup_Clicked(object sender, EventArgs e)
{
////// Opens SfPopupLayout.
this.popupLayout.Show(0, 0);
}
private void ClickToClosePopup_Clicked(object sender, EventArgs e)
{
////// Set IsOpen or IsVisible property as false to close the popup view
programmatically.
}
}

```

```

this.popupLayout.IsOpen = false;
this.popupLayout.IsVisible = false;
}
}
}

```

How to change popup view background color

The background color of popup view can be customized by setting the

[SfPopupLayout.PopupView.BackgroundColor](#)

property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Popup_Demo"
x:Class="Popup_Demo.MainPage"
xmlns:sfPopup="clr-
namespace:Syncfusion.XForms.PopupLayout;assembly=Syncfusion.SfPopupLayout.XF
orms">
<ContentPage.Content>
<StackLayout x:Name="mainLayout">
<Button x:Name="clickToShowPopup" Text="click to show popup"/>
</StackLayout>
</ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.XForms.PopupLayout;
using System;
using Xamarin.Forms;
namespace Popup_Demo
{
    public partial class MainPage : ContentPage
    {
        SfPopupLayout popupLayout;
        DataTemplate dataTemplate;
        public MainPage()
        {
            InitializeComponent();
            this.popupLayout = new SfPopupLayout();
            this.dataTemplate = new DataTemplate(() =>
            {
                Label label = new Label();
                label.Text = "Syncfusion";
                label.BackgroundColor = Color.Transparent;
                return label;
            });
            this.popupLayout.PopupView.HeaderTitle = "Company name";
            this.popupLayout.PopupView.ContentTemplate = dataTemplate;
            //// You can customize your color based on the requirement.
            this.popupLayout.PopupView.BackgroundColor = Color.LightBlue;
            this.clickToShowPopup.Clicked += ClickToShowPopup Clicked;

```

```

}
private void ClickToShowPopup_Clicked(object sender, EventArgs e)
{
    //// Opens SfPopupLayout.
    this.popupLayout.Show();
}
}
}

```

Sample Link: You can download the above sample code by clicking [here](#).

How to prevent the Popup from being closed when pressing the back navigation button

By default, the Popup will be closed whenever the back navigation button is pressed in Android devices.

To prevent the Popup from being closed when the back navigation button is pressed, set **False** to the **SfPopupLayout.ClosePopupOnBackButtonPressed** property.

#### XML

```

<sfPopup:SfPopupLayout x:Name="popUpLayout"
    ClosePopupOnBackButtonPressed="False">
</sfPopup:SfPopupLayout>

```

#### C#

```

popUpLayout.ClosePopupOnBackButtonPressed = false;

```

How to show overlay background always in Xamarin.Forms Popup?

By default, the overlay background will not be shown around the Popup if all the **WidthRequest**, **HeightRequest**, **StartX**, and **StartY** properties are set to **SfPopupLayout.PopupView**. For cases where the overlay background should always be shown around the Popup, set **True** to the **SfPopupLayout.ShowOverlayAlways** property.

#### XML

```

<sfPopup:SfPopupLayout x:Name="popUpLayout" ShowOverlayAlways="True">
</sfPopup:SfPopupLayout>

```

#### C#

```

popUpLayout.ShowOverlayAlways = true;

```

## Progress Bar

### Overview

The progress bar control for Xamarin.Forms provides a customizable visual to indicate the progress of a task.

### Key features

- Visualizes the progress in different shapes, such as rectangle and circle.
- Customizes the ranges with different colors in linear progress bar.

- Customizes the progress and tracks the thickness.
- Displays the custom content at the center of the circular progress bar.
- Visualizes the progress in segments.
- Customizes the angle of the circular progress bar.

## Getting Started

This section explains the steps required to work with the progress bar control for Xamarin.Forms.

### Adding SfProgressBar reference

You can add SfProgressBar reference using one of the following methods:

#### Method 1: Adding SfProgressBar reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfProgressBar). To add SfProgressBar to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfProgressBar](https://www.nuget.org/packages/Syncfusion.Xamarin.SfProgressBar), and then install it.

![Adding SfProgressBar reference from NuGet](overview\_images/Adding SfProgressBar reference.png)

---

**Note:** Install the same version of SfProgressBar NuGet in all the projects.

---

#### Method 2: Adding SfProgressBar reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfProgressBar control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfProgressBar assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfProgressBar.XForms.Android.dll Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfProgressBar.XForms.iOS.dll Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfProgressBar.XForms.UWP.dll Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the application on each platform with progress bar

To use the progress bar in an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the progress bar in iOS, call the SfLinearProgressBarRenderer.Init() or SfCircularProgressBarRenderer.Init() in the FinishedLaunching overridden method of the AppDelegate class after the Xamarin.Forms framework has been initialized and before the LoadApplication is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
...
global::Xamarin.Forms.Forms.Init();
// Add the below line if you are using SfLinearProgressBar.
Syncfusion.XForms.iOS.ProgressBar.SfLinearProgressBarRenderer.Init();
// Add the below line if you are using SfCircularProgressBar.
Syncfusion.XForms.iOS.ProgressBar.SfCircularProgressBarRenderer.Init();
LoadApplication(new App());
...
}
```

### Universal Windows Platform (UWP)

To launch the progress bar in UWP, initialize the progress bar assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with progress bar in **Release** mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
...
if (rootFrame == null)
{
List<Assembly> assembliesToInclude = new List<Assembly>();
// Add the below line if you are using SfLinearProgressBar.
assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.ProgressBar.SfLinearPro
gressRenderer).GetTypeInfo().Assembly);
// Add the below line if you are using SfCircularProgressBar.
assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.ProgressBar.SfCircularP
rogressBarRenderer).GetTypeInfo().Assembly);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
}
...
}
```

### Android

The Android platform does not require any additional configuration to render the progress bar.

#### Initializing the progress bar

Import the progress bar namespace as demonstrated in the following code sample in your respective page.

#### XML

```
xmlns:progressBar="clr-
namespace:Syncfusion.XForms.ProgressBar;assembly=Syncfusion.SfProgressBar.XF
orms"
```

#### C#

```
using Syncfusion.XForms.ProgressBar;
```

The progress bar control has two variants: `SfLinearProgressBar` and `SfCircularProgressBar`. Each renders the progress in its own shape, such as rectangle and circle, respectively. Initialize both the progress bars with a progress value using the `Progress` property as demonstrated in the following code sample.

#### XML

```
<!--Using linear progress bar-->
<progressBar:SfLinearProgressBar Progress="75"/>
<!--Using circular progress bar-->
<progressBar:SfCircularProgressBar Progress="75"/>
```

#### C#

```
// Using linear progress bar.
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar { Progress =
75 };
// Using circular progress bar.
SfCircularProgressBar circularProgressBar = new SfCircularProgressBar {
Progress = 75 };
```

---

**Note:** By default, the value of progress should be specified between 0 and 100. To specify progress value between 0 and 1, specify the `Minimum` property to 0 and `Maximum` property to 1.

---

Run the project, and check if you get following output to make sure that the project has been configured properly to add the progress bar.

### Enabling indeterminate state

When the progress of a task cannot be shown determinately, you can enable the indeterminate state using the [IsIndeterminate](#) property to know that any progress is happening in the background.

#### XML

```
<!--Using linear progress bar-->  
<progressBar:SfLinearProgressBar IsIndeterminate="True"/>  
<!--Using circular progress bar-->  
<progressBar:SfCircularProgressBar IsIndeterminate="True"/>
```

#### C#

```
// Using linear progress bar.  
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar {  
    IsIndeterminate = true };  
// Using circular progress bar.  
SfCircularProgressBar circularProgressBar = new SfCircularProgressBar {  
    IsIndeterminate = true };
```

### Enable segments

To visualize the progress of a multiple sequential task, split the progress bar into the multiple segments by defining the [SegmentCount](#) property as demonstrated in the following code sample.

#### XML

```
<!--Using linear progress bar-->  
<progressBar:SfLinearProgressBar SegmentCount="4" Progress="75"/>  
<!--Using circular progress bar-->  
<progressBar:SfCircularProgressBar SegmentCount="4" Progress="75"/>
```

#### C#

```
// Using linear progress bar.  
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar { Progress =  
75, SegmentCount = 4 };  
// Using circular progress bar.  
SfCircularProgressBar circularProgressBar = new SfCircularProgressBar {  
Progress = 75, SegmentCount = 4 };
```

## Apply colors

You can customize the color of the progress indicator and track by defining the [ProgressColor](#) and [TrackColor](#) properties, respectively.

### XML

```
<!--Using linear progress bar-->
<progressBar:SfLinearProgressBar Progress="75" TrackColor="#33ffbe06"
ProgressColor="#FFffbe06"/>
<progressBar:SfLinearProgressBar Progress="75" TrackColor="#3351483a"
ProgressColor="#FF51483a"/>
<!--Using circular progress bar-->
<progressBar:SfCircularProgressBar Progress="75" TrackColor="#33c15244"
ProgressColor="#FFc15244"/>
<progressBar:SfCircularProgressBar Progress="75" TrackColor="#3390a84e"
ProgressColor="#FF90a84e"/>
```

### C#

```
// Using linear progress bar.
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar{Progress =
75,TrackColor = Color.FromHex("#33ffbe06"),ProgressColor =
Color.FromHex("#FFffbe06")};
SfLinearProgressBar sfLinearProgressBar = new SfLinearProgressBar{Progress =
75,TrackColor = Color.FromHex("#3351483a"),ProgressColor =
Color.FromHex("#FF51483a")};
// Using circular progress bar.
SfCircularProgressBar circularProgressBar = new
SfCircularProgressBar{Progress = 75,TrackColor =
Color.FromHex("#33c15244"),ProgressColor = Color.FromHex("#FFc15244")};
SfCircularProgressBar sfCircularProgressBar = new
SfCircularProgressBar{Progress = 75,TrackColor =
Color.FromHex("#3390a84e"),ProgressColor = Color.FromHex("#FF90a84e")};
```

You can find the complete getting started sample here: [Getting started](#).

## States

You can configure the states of the progress bar control depending on the usage.

### Determinate

This is the default state. You can use it when the progress estimation is known.

### Indeterminate

By enabling the [IsIndeterminate](#) property, the state of the progress bar can be changed to indeterminate when the progress cannot be estimated or is not being calculated. It can be combined with determinate mode to know that the application is estimating progress before the actual progress starts.

### XML

```
<!--Using linear progress bar-->  
<progressBar:SfLinearProgressBar IsIndeterminate="True"/>  
<!--Using circular progress bar-->  
<progressBar:SfCircularProgressBar IsIndeterminate="True"/>
```

**C#**

```
// Using linear progress bar.
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar {
    IsIndeterminate = true};
// Using circular progress bar.
SfCircularProgressBar circularProgressBar = new SfCircularProgressBar {
    IsIndeterminate = true };
```

**Buffer**

The secondary task's progress can be defined using the [SecondaryProgress](#) property as demonstrated in the following code sample.

**XML**

```
<progressBar:SfLinearProgressBar x:Name="LinearProgressBar" Progress="25"
    SecondaryProgress="75"/>
```

**C#**

```
this.LinearProgressBar.Progress = 75;
this.LinearProgressBar.SecondaryProgress = 25;
```

## Range

Range represents the entire span of the progress bar and can be defined using the [Minimum](#) and [Maximum](#) properties. The default value of the range is 0 to 100.

The following code sample demonstrates how to customize the range as factor value to the progress bar.

### XML

```
<!--Using linear progress bar-->
<progressBar:SfLinearProgressBar x:Name="LinearProgressBar" Minimum="0"
Progress="0.5" Maximum="1"/>
<!--Using circular progress bar-->
<progressBar:SfCircularProgressBar x:Name="CircularProgressBar" Minimum="0"
Progress="0.5" Maximum="1"/>
```

### C#

```
// Using linear progress bar.
this.LinearProgressBar.Minimum = 0;
this.LinearProgressBar.Maximum = 1;
this.LinearProgressBar.Progress = 0.5;
```

```
// Using circular progress bar.  
this.CircularProgressBar.Minimum = 0;  
this.CircularProgressBar.Maximum = 1;  
this.CircularProgressBar.Progress = 0.5;
```

## Custom Content

In the circular progress bar, you can add any view to the center using the [Content](#) property.

For example, you can include add, start, or pause button to control the progress. You can also add an image that indicates the actual task in progress or add custom text that conveys how far the task is completed.

The following code sample demonstrates how to add custom text content.

### XML

```
<progressBar:SfCircularProgressBar x:Name="CustomContentCircularProgressBar"  
Progress="23" HorizontalOptions="Center" >  
  <progressBar:SfCircularProgressBar.Content>  
    <Grid>  
      <Grid.RowDefinitions>  
        <RowDefinition Height="3*" />  
      </Grid.RowDefinitions>  
    </Grid>  
  </progressBar:SfCircularProgressBar.Content>  
</progressBar:SfCircularProgressBar>
```

```

<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Label x:Name="CustomContentProgressBarLabel" Grid.Row="0"
TextColor="#007cee" Text="{Binding Progress,StringFormat='{0}%'}"
BindingContext="{x:Reference CustomContentCircularProgressBar}"
HorizontalTextAlignment="Center" VerticalTextAlignment="End">
</Label>
<Label Grid.Row="1" TextColor="#007cee" Text="used" VerticalOptions="Start"
Margin="0,-5,0,0" HorizontalTextAlignment="Center"
VerticalTextAlignment="Start">
</Label>
</Grid>
</progressBar:SfCircularProgressBar.Content>
</progressBar:SfCircularProgressBar>

```

**C#**

```

SfCircularProgressBar circularProgressBar = new SfCircularProgressBar();
circularProgressBar.Progress = 23;
Grid grid = new Grid();
grid.RowDefinitions.Add(new RowDefinition() { Height = new GridLength(3,
GridUnitType.Star) });
grid.RowDefinitions.Add(new RowDefinition() { Height = new GridLength(1,
GridUnitType.Star) });
Label label = new Label();
label.BindingContext = circularProgressBar;
Binding binding = new Binding();
binding.Path = "Progress";
binding.StringFormat = "{0}%";
label.SetBinding(Label.TextProperty, binding);
label.HorizontalTextAlignment = TextAlignment.Center;
label.VerticalOptions = LayoutOptions.End;
label.FontSize = 10;
label.TextColor = Color.FromHex("007cee");
Grid.SetRow(label, 0);
grid.Children.Add(label);
Label textLabel = new Label();
textLabel.Text = "used";
textLabel.HorizontalTextAlignment = TextAlignment.Center;
textLabel.VerticalOptions = LayoutOptions.Start;
textLabel.FontSize = 10;
textLabel.TextColor = Color.FromHex("007cee");
Grid.SetRow(textLabel, 1);
grid.Children.Add(textLabel);
circularProgressBar.Content = grid;

```

By default, the progress value will be displayed at the center. You can hide the label in the circular progress bar by setting the [ShowProgressValue](#) property to false.

## Segments

To visualize the progress of multiple sequential tasks, split the progress bar into multiple segments by setting the [SegmentsCount](#) property as demonstrated in the following code sample.

### XML

```
<!--Using linear progress bar-->
<progressBar:SfLinearProgressBar x:Name="LinearProgressBar" Progress="25"
SegmentCount="4" />
<!--Using circular progress bar-->
<progressBar:SfCircularProgressBar x:Name="CircularProgressBar"
Progress="25" SegmentCount="7" />
```

### C#

```
// Using linear progress bar.
this.LinearProgressBar.SegmentCount = 4;
// Using circular progress bar.
this.CircularProgressBar.SegmentCount = 7;
```

### Gap customization

You can also customize the default spacing between the segments using the [GapWidth](#) property as demonstrated in following code sample.

#### XML

```
<!--Using linear progress bar-->
<progressBar:SfLinearProgressBar x:Name="LinearProgressBar" Progress="25"
SegmentCount="4" GapWidth="5" />
<!--Using circular progress bar-->
<progressBar:SfCircularProgressBar x:Name="CircularProgressBar"
Progress="25" SegmentCount="7" GapWidth="10" />
```

#### C#

```
// Using linear progress bar.
this.LinearProgressBar.GapWidth = 5;
// Using circular progress bar.
this.CircularProgressBar.GapWidth = 10;
```

## Appearance

### Angle

The appearance of the circular progress bar can be customized to semi-circle, arc, etc. The start and end angles can be customized using the [StartAngle](#) and [EndAngle](#) properties.

The following code sample demonstrates how to change the appearance of the circular progress bar to semi-circle.

### XML

```
<progressBar:SfCircularProgressBar x:Name="CircularProgressBar"
    Progress="75" StartAngle="180" EndAngle="360" />
```

### C#

```
SfCircularProgressBar circularProgressBar = new SfCircularProgressBar();
circularProgressBar.Progress = 75;
circularProgressBar.StartAngle = 180;
circularProgressBar.EndAngle = 360;
```

### Range colors

You can visualize the multiple ranges with different colors that are mapped to each range to enhance the readability of progress.

The colors can be mapped to the specific ranges using the [RangeColors](#) property, which holds a collection of [RangeColor](#).

The following properties in the [RangeColor](#) are used to map the colors to a range:

- [Color](#): Represents the color to the specified range.
- [Start](#): Represents the start range of the color.
- [End](#): Represents the end range of the color.
- [IsGradient](#): Represents whether the gradient effect is applied to the color.

The following code sample demonstrates how to map the solid color range in the progress bar.

### XML

```
<!--Using linear progress bar-->  
<progressBar:SfLinearProgressBar Progress="100">  
  <progressBar:SfLinearProgressBar.RangeColors>  
    <progressBar:RangeColorCollection>
```

```

<progressBar:RangeColor Color="#00bdaf" Start="0" End="25"/>
<progressBar:RangeColor Color="#2f7ecc" Start="25" End="50"/>
<progressBar:RangeColor Color="#e9648e" Start="50" End="75"/>
<progressBar:RangeColor Color="#fbb78a" Start="75" End="100"/>
</progressBar:RangeColorCollection>
</progressBar:SfLinearProgressBar.RangeColors>
</progressBar:SfLinearProgressBar>
<!--Using circular progress bar-->
<progressBar:SfCircularProgressBar Progress="100" ProgressColor="#FF90a84e">
<progressBar:SfCircularProgressBar.RangeColors>
<progressBar:RangeColorCollection>
<progressBar:RangeColor Color="#00bdaf" Start="0" End="25"/>
<progressBar:RangeColor Color="#2f7ecc" Start="25" End="50"/>
<progressBar:RangeColor Color="#e9648e" Start="50" End="75"/>
<progressBar:RangeColor Color="#fbb78a" Start="75" End="100"/>
</progressBar:RangeColorCollection>
</progressBar:SfCircularProgressBar.RangeColors>
</progressBar:SfCircularProgressBar>

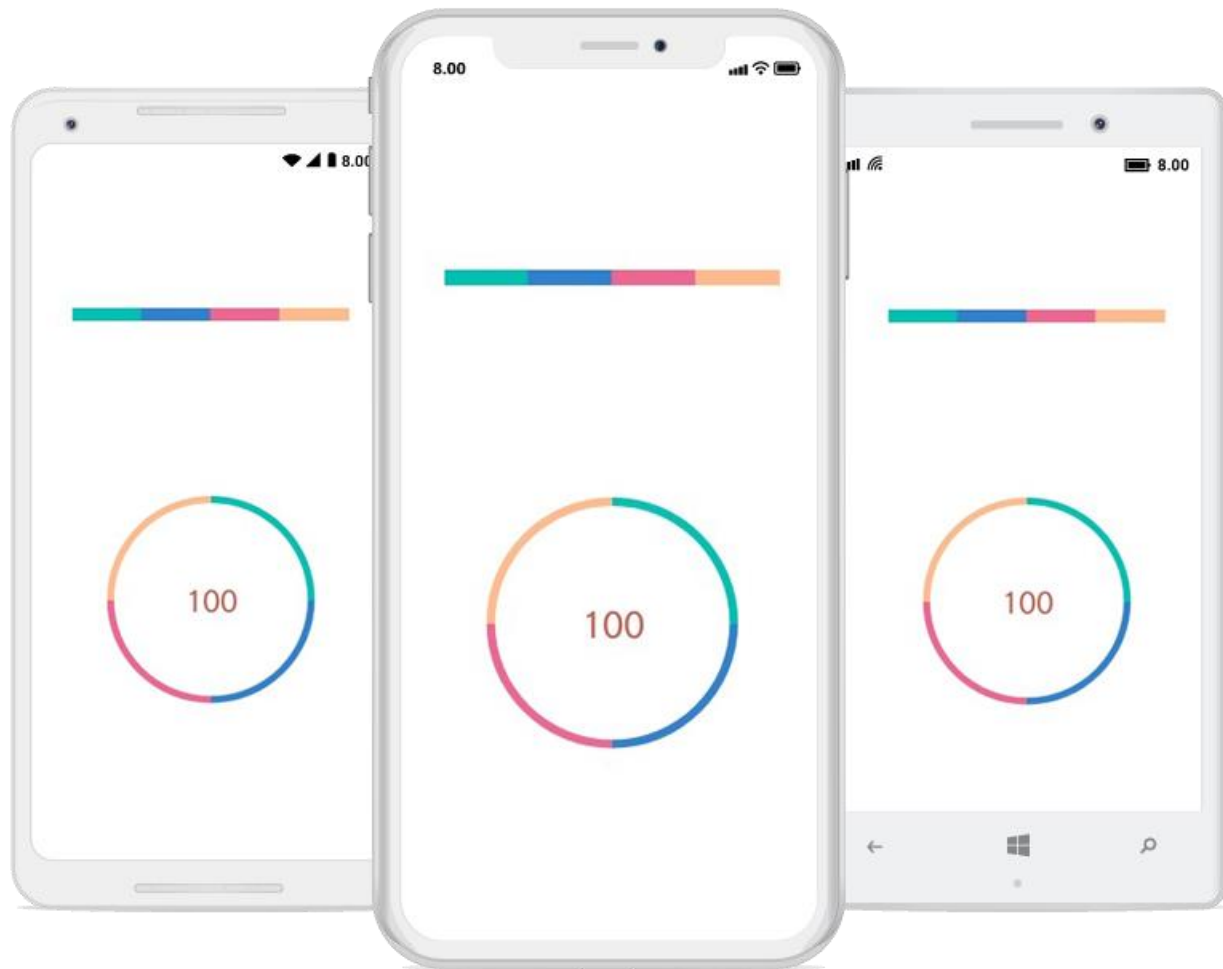

```

**C#**

```

// Using linear progress bar.
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();
linearProgressBar.Progress = 100;
RangeColorCollection rangeColors = new RangeColorCollection();
rangeColors.Add(new RangeColor() { Color = Color.FromHex("00bdaf"), Start =
0, End = 25 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("2f7ecc"), Start =
25, End = 50 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("e9648e"), Start =
50, End = 75 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("fbb78a"), Start =
75, End = 100 });
linearProgressBar.RangeColors = rangeColors;
// Using circular progress bar.
SfCircularProgressBar circularProgressBar = new SfCircularProgressBar();
circularProgressBar.Progress = 100;
circularProgressBar.ProgressColor = Color.FromHex("FF90a84e");
RangeColorCollection rangeColors = new RangeColorCollection();
rangeColors.Add(new RangeColor() { Color = Color.FromHex("00bdaf"), Start =
0, End = 25 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("2f7ecc"), Start =
25, End = 50 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("e9648e"), Start =
50, End = 75 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("fbb78a"), Start =
75, End = 100 });
circularProgressBar.RangeColors = rangeColors;

```

The following code sample demonstrates how to apply gradient transition effect to the range colors in the linear progress bar.

#### XML

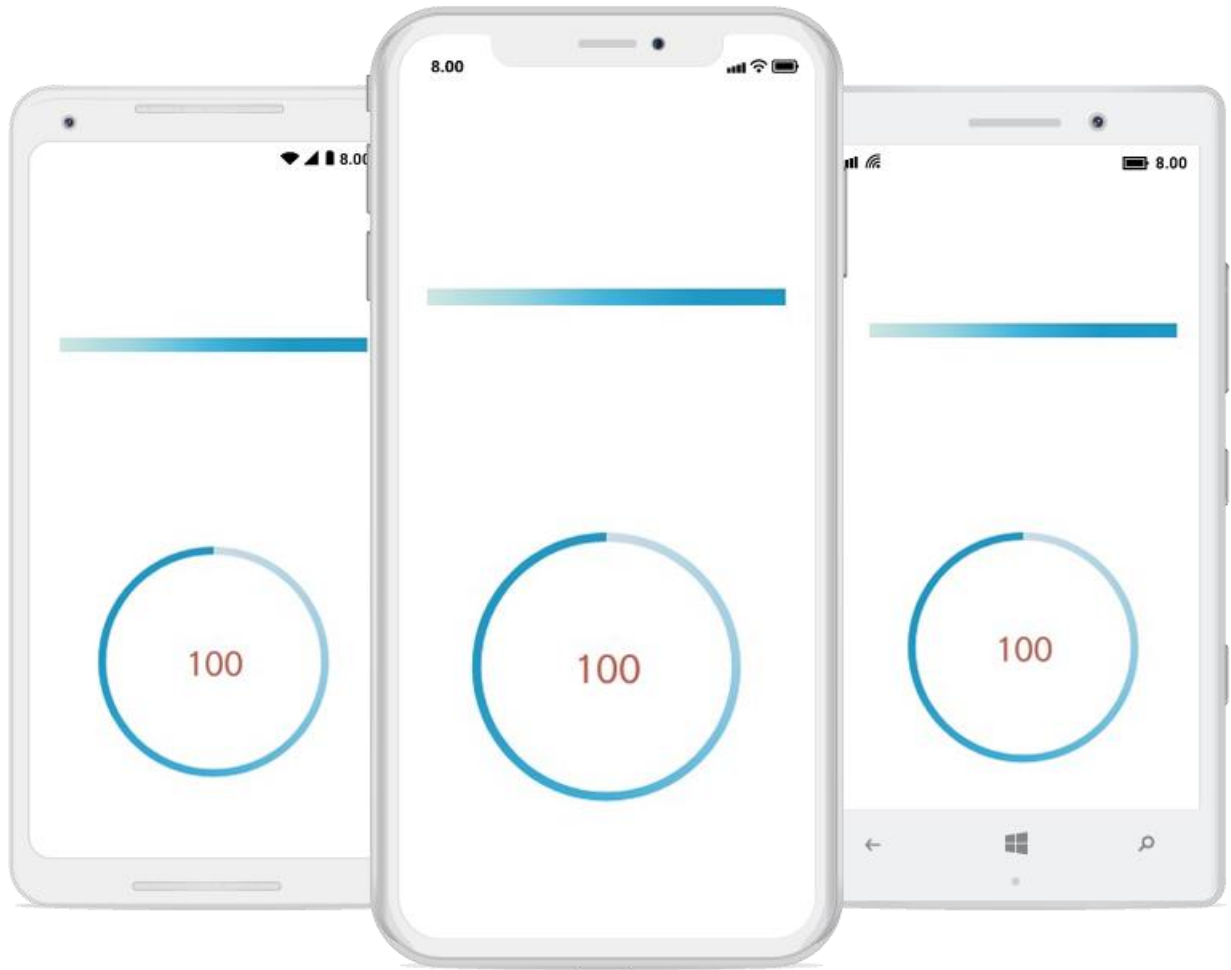

```
<progressBar:SfLinearProgressBar Progress="100" >
  <progressBar:SfLinearProgressBar.RangeColors>
    <progressBar:RangeColorCollection>
      <progressBar:RangeColor IsGradient="True" Color="#88A0D9EF" Start="0"
        End="25"/>
      <progressBar:RangeColor IsGradient="True" Color="#AA62C1E5" Start="25"
        End="50"/>
      <progressBar:RangeColor IsGradient="True" Color="#DD20A7DB" Start="50"
        End="75"/>
      <progressBar:RangeColor IsGradient="True" Color="#FF1C96C5" Start="75"
        End="100"/>
    </progressBar:RangeColorCollection>
  </progressBar:SfLinearProgressBar.RangeColors>
</progressBar:SfLinearProgressBar>
<progressBar:SfCircularProgressBar Progress="100" ProgressColor="#FF90a84e">
  <progressBar:SfCircularProgressBar.RangeColors>
    <progressBar:RangeColorCollection>
```

```
<progressBar:RangeColor IsGradient="True" Color="#88A0D9EF" Start="0"
End="25"/>
<progressBar:RangeColor IsGradient="True" Color="#AA62C1E5" Start="25"
End="50"/>
<progressBar:RangeColor IsGradient="True" Color="#DD20A7DB" Start="50"
End="75"/>
<progressBar:RangeColor IsGradient="True" Color="#FF1C96C5" Start="75"
End="100"/>
</progressBar:RangeColorCollection>
</progressBar:SfCircularProgressBar.RangeColors>
</progressBar:SfCircularProgressBar>
```

**C#**

```
// Using linear progress bar.
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();
linearProgressBar.Progress = 100;
RangeColorCollection rangeColors = new RangeColorCollection();
rangeColors.Add(new RangeColor() { Color = Color.FromHex("88A0D9EF"),
IsGradient = true, Start = 0, End = 25 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("AA62C1E5"),
IsGradient = true, Start = 25, End = 50 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("DD20A7DB"),
IsGradient = true, Start = 50, End = 75 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("FF1C96C5"),
IsGradient = true, Start = 75, End = 100 });
linearProgressBar.RangeColors = rangeColors;
// Using circular progress bar.
SfCircularProgressBar circularProgressBar = new SfCircularProgressBar();
circularProgressBar.Progress = 100;
circularProgressBar.ProgressColor = Color.FromHex("FF90a84e");
RangeColorCollection rangeColors = new RangeColorCollection();
rangeColors.Add(new RangeColor() { Color = Color.FromHex("88A0D9EF"),
IsGradient = true, Start = 0, End = 25 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("AA62C1E5"),
IsGradient = true, Start = 25, End = 50 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("DD20A7DB"),
IsGradient = true, Start = 50, End = 75 });
rangeColors.Add(new RangeColor() { Color = Color.FromHex("FF1C96C5"),
IsGradient = true, Start = 75, End = 100 });
circularProgressBar.RangeColors = rangeColors;
```

### Thickness

#### *Linear progress bar*

In the linear progress bar, the height of the track and padding of the progress indicator can be customized using the [TrackHeight](#) and [Padding](#) properties, respectively.

#### **XML**

```
<progressBar:SfLinearProgressBar Progress="100" TrackHeight="10"
Padding="2">
</progressBar:SfLinearProgressBar>
```

#### **C#**

```
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();
linearProgressBar.Progress = 100;
linearProgressBar.TrackHeight = 10;
linearProgressBar.Padding = 2;
```

### *Circular progress bar*

The following properties are used to customize the appearance of the circular progress bar:

- [IndicatorOuterRadius](#): Defines the outer radius of the progress indicator.
- [IndicatorInnerRadius](#): Defines the inner radius of the progress indicator.
- [TrackOuterRadius](#): Defines the outer radius of the track indicator.
- [TrackInnerRadius](#): Defines the inner radius of the track indicator.

The following code sample demonstrates how to customize the appearance of circular progress bar.

### **XML**

```
<!--Circular progress bar with radius customization -->
<progressBar:SfCircularProgressBar x:Name="TrackOutsideProgressBar"
Grid.Column="0" Grid.Row="0"
Progress="75" Margin="0,10,0,0" IndicatorOuterRadius="0.7"
IndicatorInnerRadius="0.65" ShowProgressValue="False">
</progressBar:SfCircularProgressBar>
```

### **C#**

```
SfCircularProgressBar trackOutsideProgressBar = new SfCircularProgressBar();  
trackOutsideProgressBar.Progress = 75;  
trackOutsideProgressBar.IndicatorOuterRadius = 0.7;  
trackOutsideProgressBar.IndicatorInnerRadius = 0.65;  
trackOutsideProgressBar.ShowProgressValue = false;
```

### Corner radius

The [CornerRadius](#) property is used to customize the rounded edges in the linear progress bar as demonstrated in the following code sample.

#### XML

```
<progressBar:SfLinearProgressBar Progress="50" TrackHeight="10"  
CornerRadius="10">  
</progressBar:SfLinearProgressBar>
```

#### C#

```
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();  
linearProgressBar.Progress = 50;  
linearProgressBar.CornerRadius = 10;
```

### Color customization

The following properties are used to customize the color in the progress bar:

- [ProgressColor](#): Represents the color of the progress indicator.
- [TrackColor](#): Represents the color of the track indicator.

The following code sample demonstrates the color customization in progress and track indicator.

#### XML

```
<progressBar:SfLinearProgressBar Progress="75" TrackColor="#3351483a"
ProgressColor="#FF51483a">
</progressBar:SfLinearProgressBar>
```

#### C#

```
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();
linearProgressBar.Progress = 75;
linearProgressBar.ProgressColor = Color.FromHex("FF51483a");
```

```
linearProgressBar.TrackColor = Color.FromHex("3351483a");
```

The linear progress bar provides support to customize the color for the secondary progress bar using the [SecondaryProgressColor](#) property as demonstrated in the following code sample.

#### XML

```
<progressBar:SfLinearProgressBar Progress="25" SecondaryProgress="75"  
SecondaryProgressColor="CornflowerBlue"></progressBar:SfLinearProgressBar>
```

#### C#

```
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();  
linearProgressBar.Progress = 25;  
linearProgressBar.SecondaryProgress = 75;  
linearProgressBar.SecondaryProgressColor = Color.CornflowerBlue;
```

## Animation

The progress bar provides animation support to visualize the progress value changes in an interactive way.

The following properties are used to define the duration of animation for the specific states:

- [AnimationDuration](#): Represents animation duration of the determinate state's progress indicator.
- [SecondaryAnimationDuration](#): Represents animation duration of the determinate state's secondary progress indicator.
- [IndeterminateAnimationDuration](#): Represents animation duration of the indeterminate state's indicator.

## Easing effects

The [EasingEffect](#) property allows you specify the transfer function that controls animation speed when they run.

The following code sample demonstrates the [CubicInOut](#) easing function of the linear progress bar.

## XML

```
<progressBar:SfLinearProgressBar Progress="75" EasingEffect="CubicInOut">
</progressBar:SfLinearProgressBar>
```

**C#**

```
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();
linearProgressBar.Progress = 75;
linearProgressBar.EasingEffect = EasingEffects.CubicInOut;
```

The [SetProgress\(\)](#) method in the progress bar is used to set progress value along with animation duration and easing effect applicable for the specific method call.

**C#**

```
void SetProgress(double progress, int animationDuration, Easing
easingEffect)
```

**Note:** The animationDuration and easingEffect parameters will not affect the configuration of the [AnimationDuration](#) and [EasingEffect](#) properties.

## Indeterminate Easing Effects

The [IndeterminateEasingEffect](#) property allows you to specify a transfer function for indeterminate state, which controls animation speed when they run.

The following code sample demonstrates the [BounceIn](#) easing function of the linear progress bar.

**XML**

```
<progressBar:SfLinearProgressBar IsIndeterminate="True"
IndeterminateEasingEffect="BounceIn">
</progressBar:SfLinearProgressBar>
```

**C#**

```
SfLinearProgressBar linearProgressBar = new SfLinearProgressBar();
linearProgressBar.IsIndeterminate = true;
linearProgressBar.IndeterminateEasingEffect =
IndeterminateEasingEffects.BounceIn;
```

## Events

## ValueChanged

This event is triggered when the progress value is changed. This event contains the following event argument.

- [Progress](#): Represents the progress value.

The following code sample demonstrates how to customize the color of a progress indicator based on progress using this event.

**XML**

```
<progressBar:SfLinearProgressBar Progress="100" x:Name="LinearProgressBar"
ValueChanged="ProgressBarBase_OnValueChanged">
</progressBar:SfLinearProgressBar>
```

**C#**

```
private void ProgressBarBase_OnValueChanged(object sender,
ProgressValueEventArgs e)
{
    if (e.Progress < 50)
    {
        this.LinearProgressBar.ProgressColor = Color.Red;
    }
    else if (e.Progress >= 50)
    {
        this.LinearProgressBar.ProgressColor = Color.Green;
    }
}
```

**ProgressCompleted**

This event is triggered when the progress attains the [Maximum](#) value. This event contains the following argument.

- [Progress](#): Represents the progress value.

The following code sample demonstrates how to customize the progress bar when progress reaches maximum using this event.

**XML**

```
<progressBar:SfCircularProgressBar x:Name="CircularProgressBar"
Minimum="100" Maximum="500" Progress="500"
ProgressCompleted="ProgressBarBase_OnProgressCompleted" >
<progressBar:SfCircularProgressBar.Content>
<Label Text="Start" FontSize="15" x:Name="Label"></Label>
</progressBar:SfCircularProgressBar.Content>
</progressBar:SfCircularProgressBar>
```

**C#**

```
private void ProgressBarBase_OnProgressCompleted(object sender,
ProgressValueEventArgs e)
{
    if (e.Progress.Equals(this.CircularProgressBar.Maximum))
    {
        // Changed the label text when progress reaches maximum value.
        this.Label.Text = "Completed";
    }
}
```

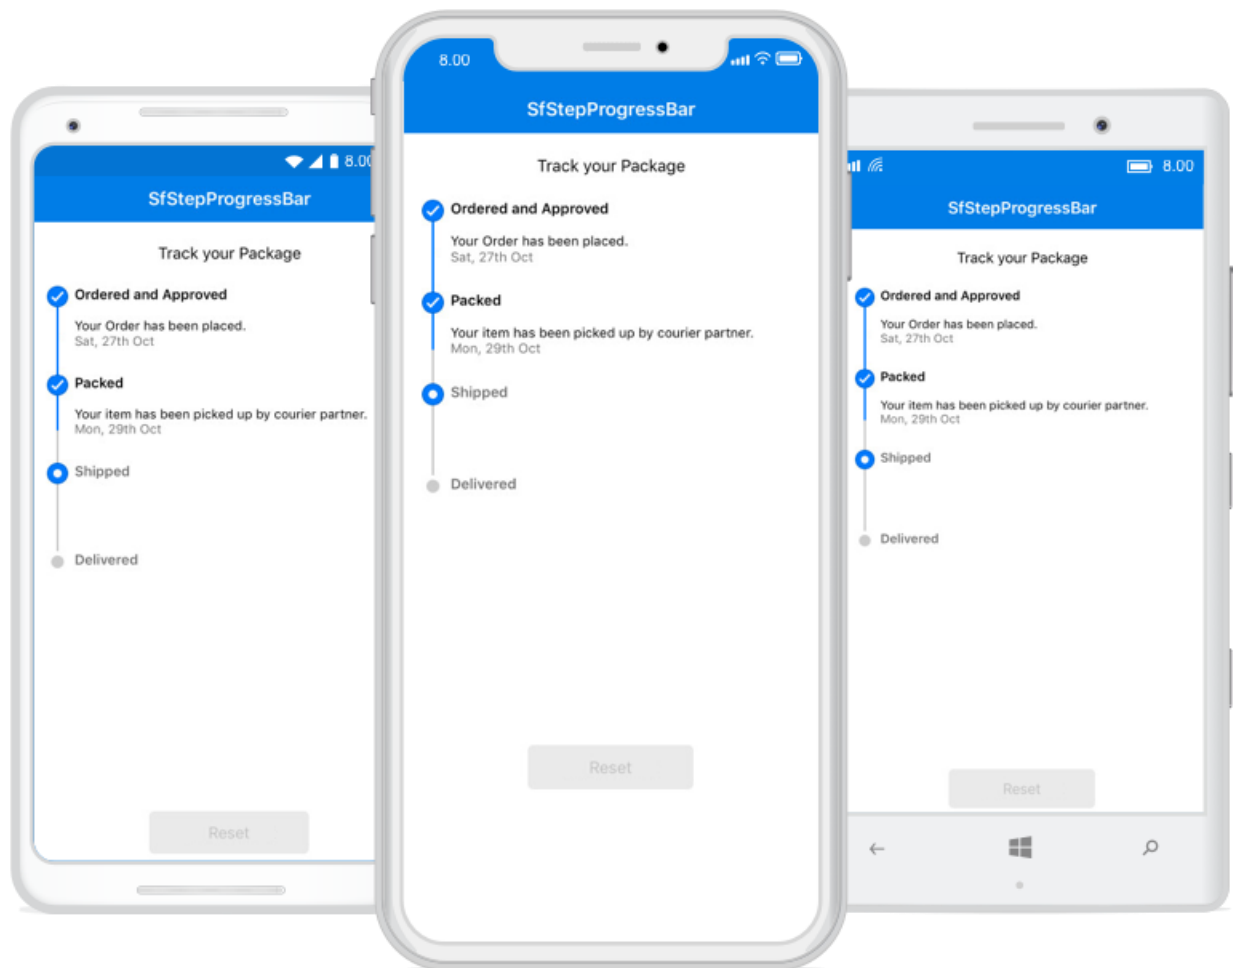

## Step Progress Bar

### Overview

The Xamarin StepProgressBar is a control that indicates the progress of a multiple step (state) process. This control can be used to track the progress of an online purchase, new user registration, live location tracking of buses, trains, flights, and more.

### Key features

- Display the progress in horizontal or vertical orientation.
- Provides three-state progress indication: Not Started, In Progress, and Completed.
- Customize the shape of the state or step as a circle or a square.
- Add descriptions to each state on both sides.
- Customize the step content with numbers, ticks, crosses, dots, or images.
- Allows initializing the state and progress value.

### Getting Started

This section explains the steps required to work with the StepProgressBar control for Xamarin.Forms.

### Adding SfStepProgressBar reference

You can add SfStepProgressBar reference using one of the following methods:

#### Method 1: Adding SfStepProgressBar reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfProgressBar). To add SfStepProgressBar to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfProgressBar](https://www.nuget.org/packages/Syncfusion.Xamarin.SfProgressBar), and then install it.

![Adding SfStepProgressBar reference from NuGet](overview\_images/Adding SfStepProgressBar reference.png)

---

**Note:** Install the same version of SfProgressBar NuGet in all the projects.

---

#### Method 2: Adding SfStepProgressBar reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the StepProgressBar control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfStepProgressBar assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from the NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfProgressBar.XForms.Android.dll Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfProgressBar.XForms.iOS.dll Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfProgressBar.XForms.UWP.dll Syncfusion.SfProgressBar.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To learn more about obtaining Syncfusion components, refer to [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Refer the [Syncfusion license](#)

[key](#) to learn about registering Syncfusion license key in your Xamarin application to use Syncfusion components.

### Launching the application on each platform with StepProgressBar

To use the StepProgressBar in an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not required.

#### iOS

To launch the StepProgressBar in iOS, call the 'SfLinearProgressBarRenderer.Init()' and 'SfBorderRenderer.Init()' in the FinishedLaunching overridden method of the AppDelegate class after the Xamarin.Forms framework has been initialized and before the LoadApplication is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init();
    // Add the below line for using SfLinearProgressBar.
    Syncfusion.XForms.iOS.ProgressBar.SfLinearProgressBarRenderer.Init();
    // Add the below line for using SfBorder.
    Syncfusion.XForms.iOS.Border.SfBorderRenderer.Init();
    LoadApplication(new App());
    ...
}
```

#### Universal Windows Platform (UWP)

To launch the StepProgressBar in UWP, initialize the progress bar assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with progress bar in **Release** mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        // Add the below line for using SfLinearProgressBar.
        assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.ProgressBar.SfLinearProgressRenderer).GetTypeInfo().Assembly);
        // Add the below line for using SfBorder.
        assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Border.SfBorderRenderer).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
    ...
}
```

### Android

The Android platform does not require any additional configuration to render the `StepProgressBar`.

### Initializing the `StepProgressBar`

Import the progress bar namespace as demonstrated in the following code sample in your respective page.

#### XML

```
xmlns:progressBar="clr-namespace:Syncfusion.XForms.ProgressBar;assembly=Syncfusion.SfProgressBar.XForms"
```

#### C#

```
using Syncfusion.XForms.ProgressBar;
```

Then, initialize the `SfStepProgressBar` as shown in the following code:

#### XML

```
<Grid>
<progressBar:SfStepProgressBar HorizontalOptions="Center"
VerticalOptions="Center">
<progressBar:StepView PrimaryText="Step 1" />
<progressBar:StepView PrimaryText="Step 2" />
<progressBar:StepView PrimaryText="Step 3" />
<progressBar:StepView PrimaryText="Step 4" Status="InProgress" />
<progressBar:StepView PrimaryText="Step 5" />
</progressBar:SfStepProgressBar>
</Grid>
```

#### C#

```
public MainPage()
{
    InitializeComponent();
    Grid mainGrid = new Grid();
    // Create StepProgressBar control
    SfStepProgressBar stepProgressBar = new SfStepProgressBar();
    stepProgressBar.VerticalOptions = LayoutOptions.Center;
    stepProgressBar.HorizontalOptions = LayoutOptions.Center;
    stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 1" });
    stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 2" });
    stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 3" });
    stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 4", Status
= StepStatus.InProgress });
    stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 5" });
    mainGrid.Children.Add(stepProgressBar);
    this.Content = mainGrid;
}
```

The complete Getting Started sample is available in this [link](#).

## Orientation

The StepProgressBar control provides options to change the default orientation, so a multi-step process can be visualized in horizontal or vertical orientation.

### Horizontal

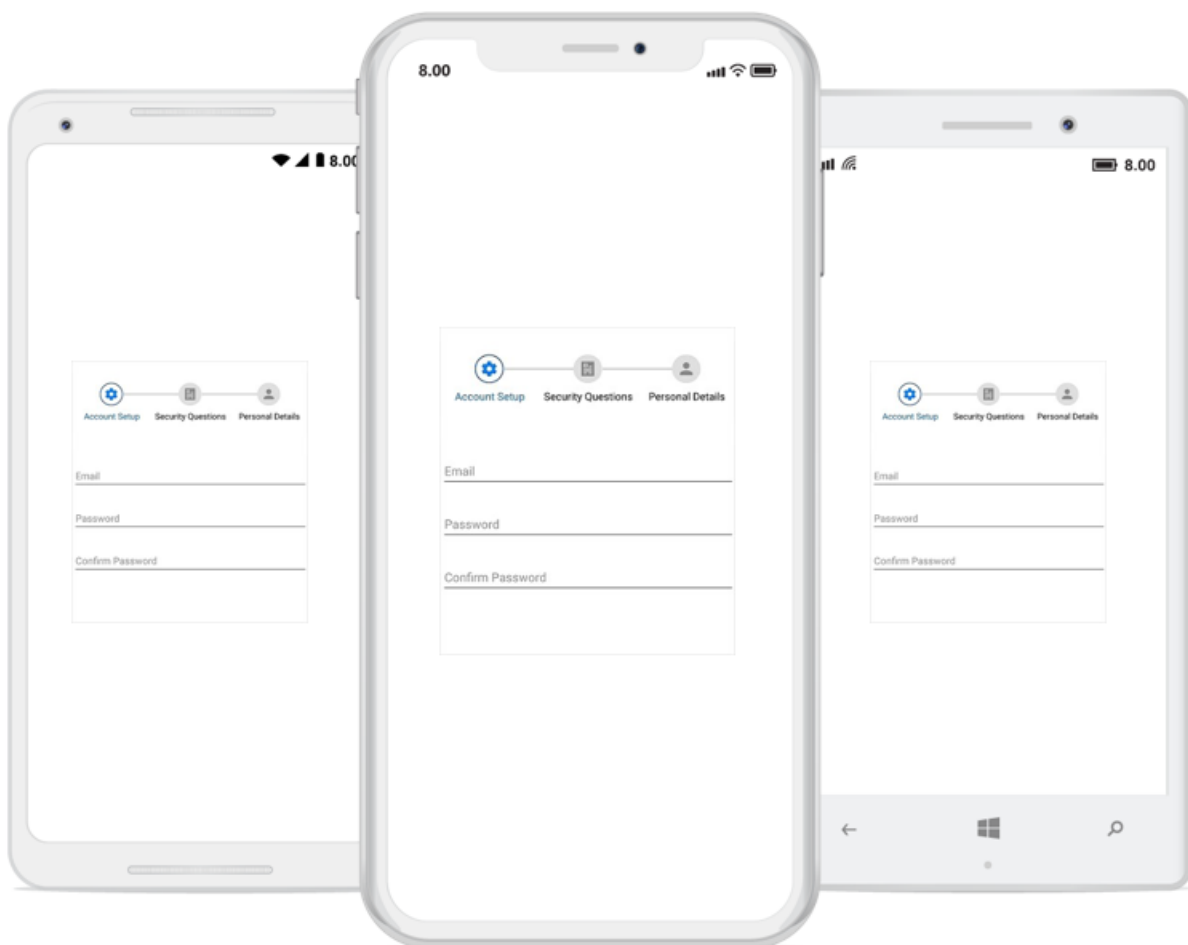

By default, StepProgressBar step views are displayed horizontally. You can also define the orientation as demonstrated in the following code example.

#### XML

```
<progressBar:SfStepProgressBar Orientation="Horizontal" />
```

#### C#

```
SfStepProgressBar stepProgress = new SfStepProgressBar();  
stepProgress.Orientation = StepOrientation.Horizontal;
```

### Vertical

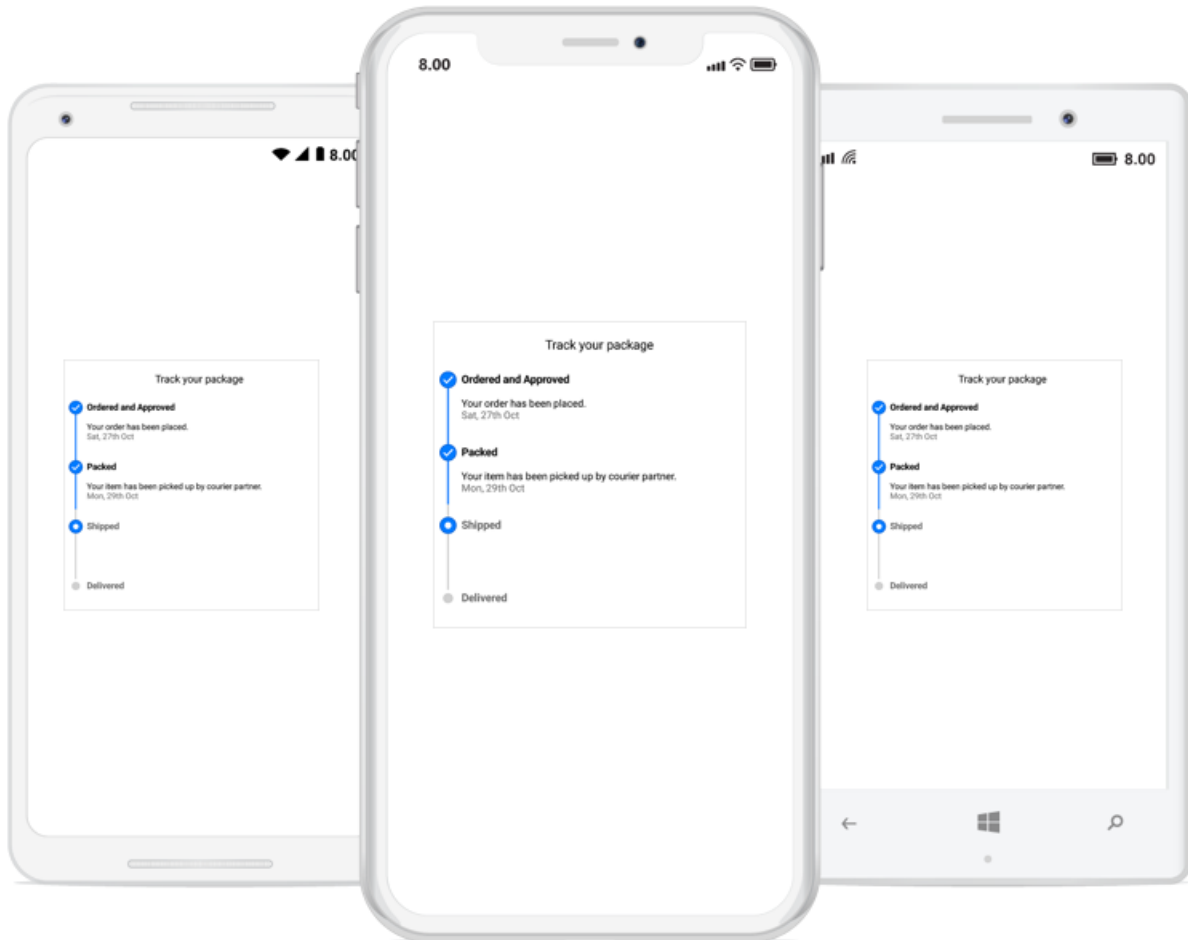

To view the step progress bar control vertically, you can define the vertical orientation as demonstrated in the following code example.

**XML**

```
<progressBar:SfStepProgressBar Orientation="Vertical" />
```

**C#**

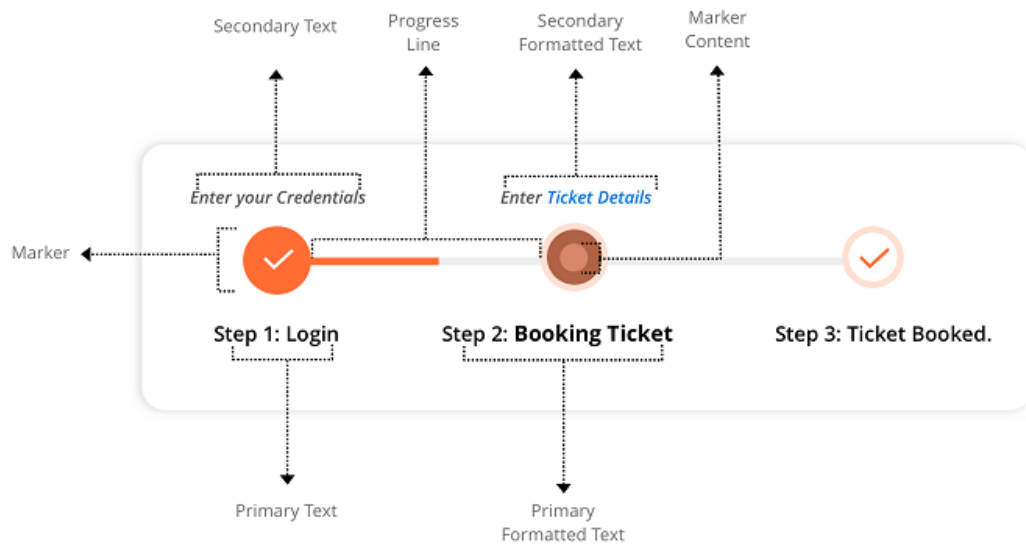

```
SfStepProgressBar stepProgress = new SfStepProgressBar();  
stepProgress.Orientation = StepOrientation.Vertical;
```

**Description**

Each step in a multi-step process has a different operation. To provide self-explanatory information about a step, description can be shown on either side. A primary description will be on the right or bottom of the step, and a secondary description will be on the left or top of the step.

**StepProgressBar overview**

The following overview image illustrates the major elements presented in StepProgressBar.

### Text

The primary and secondary description for a step view can be set using the `PrimaryText` and `SecondaryText` properties as demonstrated in the following code example.

### XML

```
<progressBar:SfStepProgressBar Orientation="Horizontal"
HorizontalOptions="Center" VerticalOptions="Center">
  <progressBar:StepView PrimaryText="Completed" SecondaryText="Task"
  Status="Completed"/>
</progressBar:SfStepProgressBar>
```

### C#

```
SfStepProgressBar stepProgress = new SfStepProgressBar();
stepProgress.Orientation = StepOrientation.Vertical;
StepView step1 = new StepView();
step1.SecondaryText = "Task";
step1.PrimaryText = "Completed";
step1.Status = StepStatus.Completed;
stepProgress.Children.Add(step1);
```

### Formatted text

To customize the description with different formatting style, `PrimaryFormattedText` and `SecondaryFormattedText` can be used. The following code example explains how to set `PrimaryFormattedText` and `SecondaryFormattedText` to a step view.

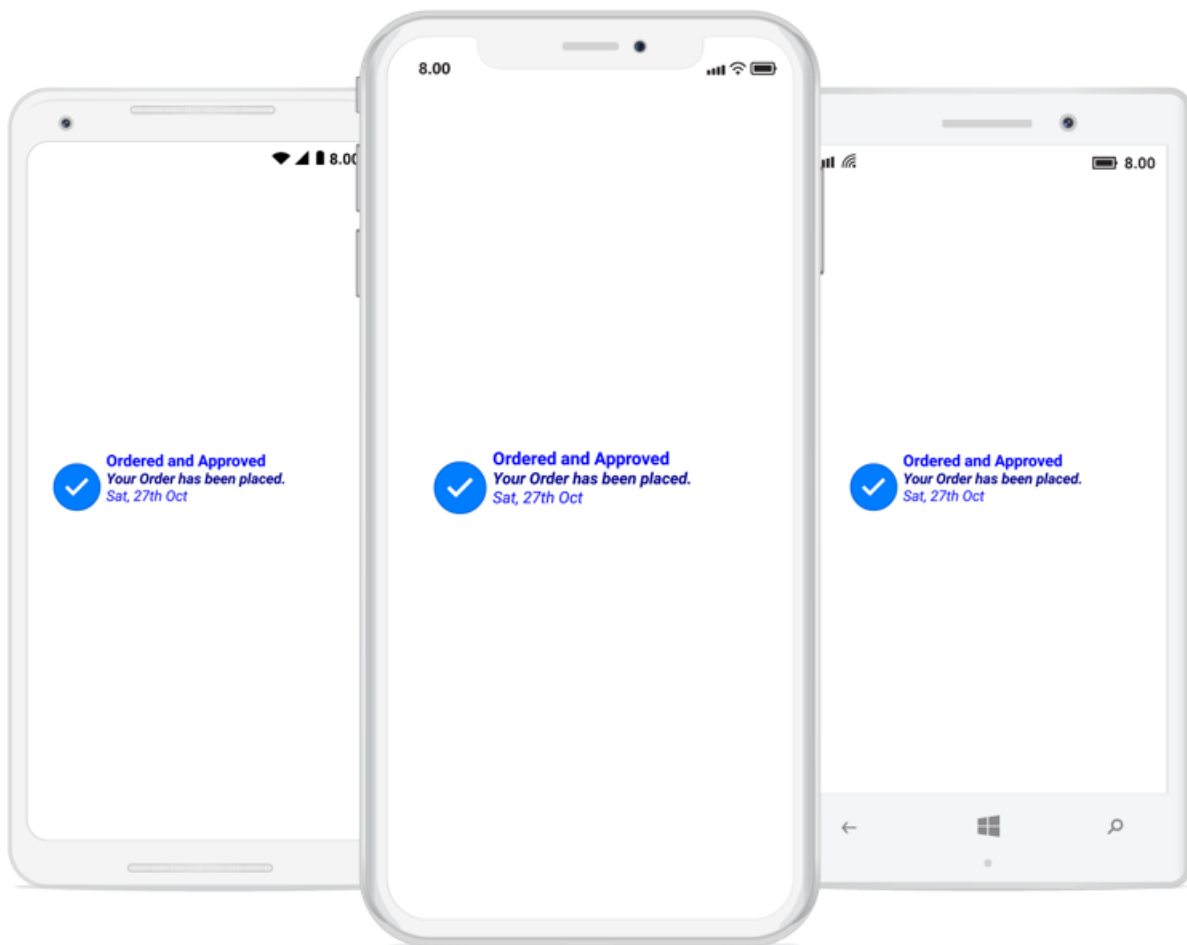

### XML

```
<progressBar:SfStepProgressBar Orientation="Vertical" >
  <progressBar:StepView Status="Completed">
    <progressBar:StepView.PrimaryFormattedText>
      <FormattedString>
        <Span x:Name="span1" ClassId="1" Text="Ordered and Approved" FontSize="13"
          FontAttributes="Bold" TextColor="Blue"/>
        <Span x:Name="span2" ClassId="2" Text="&#10;Your Order has been placed."
          FontAttributes="Italic,Bold" FontSize="12" TextColor="DarkBlue"/>
        <Span x:Name="span3" ClassId="3" Text="&#10;Sat, 27th Oct&#10;"
          FontSize="12" FontAttributes="Italic" TextColor="Blue"/>
      </FormattedString>
    </progressBar:StepView.PrimaryFormattedText>
  </progressBar:StepView>
</progressBar:SfStepProgressBar>
```

**C#**

```
SfStepProgressBar stepProgress = new SfStepProgressBar();
stepProgress.Orientation = StepOrientation.Vertical;
StepView step1 = new StepView();
step1.Status = StepStatus.Completed;
stepProgress.CompletedStepStyle.MarkerSize = 50;
stepProgress.CompletedStepStyle.MarkerContentSize = 25;
step1.PrimaryFormattedText = new FormattedString();
step1.PrimaryFormattedText.Spans.Add(new Span { Text = "Ordered and
Approved", FontSize = 13, FontAttributes = FontAttributes.Bold, TextColor =
Color.Blue });
step1.PrimaryFormattedText.Spans.Add(new Span { Text = "\nYour Order has
been placed", FontSize = 12, FontAttributes = FontAttributes.Italic |
FontAttributes.Bold, TextColor = Color.DarkBlue });
step1.PrimaryFormattedText.Spans.Add(new Span { Text = "\nSat, 27th Oct",
FontSize = 12, FontAttributes = FontAttributes.Italic, TextColor =
Color.Blue });
stepProgress.Children.Add(step1);
```

**Note:** To learn more about defining formats for different span in a text, refer to [FormattedString](#).

### Customize description

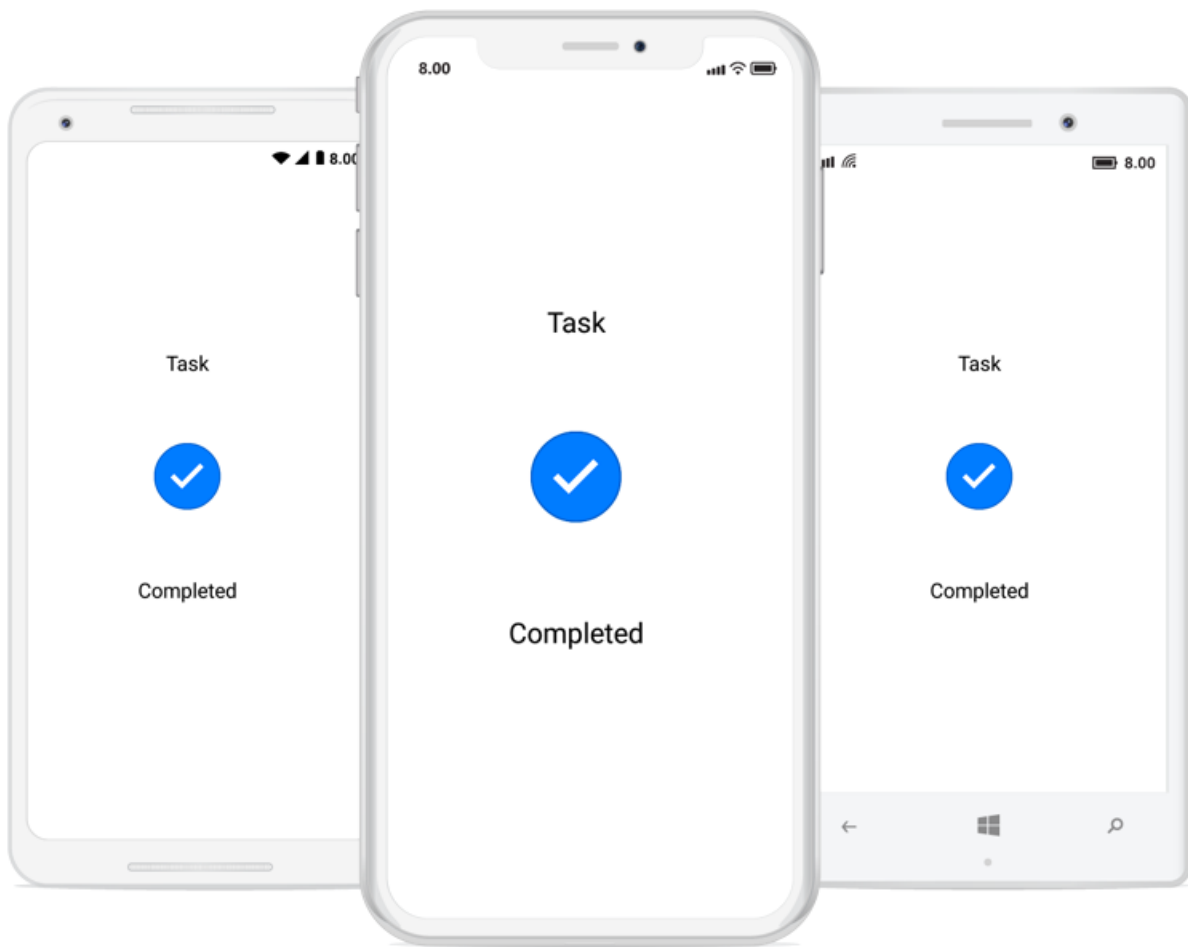

Using `TitleAlignment` and `TitleSpace`, the description alignment and space between the description and marker can be customized, respectively. The following code example explains how to customize the `TitleSpace` and `TitleAlignment` properties.

#### XML

```
<progressBar:SfStepProgressBar x:Name="stepProgress"
Orientation="Horizontal" TitleAlignment="Center" TitleSpace="50">
<progressBar:SfStepProgressBar.CompletedStepStyle>
<progressBar:StepStyle x:TypeArguments ="progressBar:CompletedStepState"
MarkerSize="50" MarkerContentSize="25" />
</progressBar:SfStepProgressBar.CompletedStepStyle>
<progressBar:StepView Status="Completed" PrimaryText="Completed"
SecondaryText="Task">
</progressBar:StepView>
</progressBar:SfStepProgressBar>
```

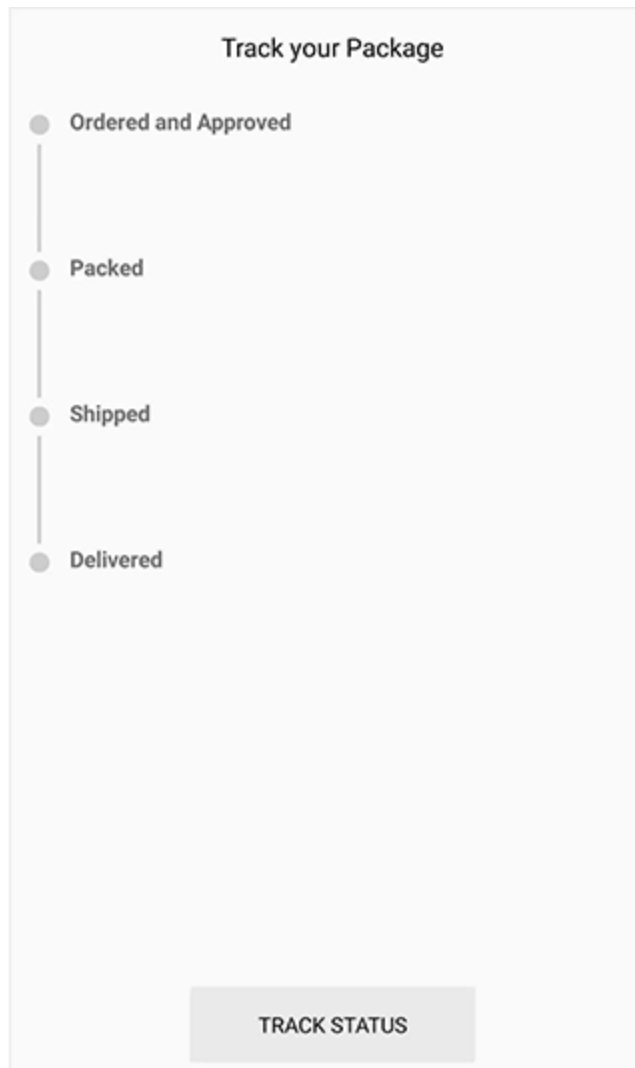

#### C#

```
SfStepProgressBar stepProgress = new SfStepProgressBar();
stepProgress.Orientation = StepOrientation.Horizontal;
stepProgress.TitleSpace = 50;
stepProgress.TitleAlignment = StepTitleAlignment.Center;
stepProgress.CompletedStepStyle.MarkerSize = 50;
stepProgress.CompletedStepStyle.MarkerContentSize = 25;
StepView step1 = new StepView();
step1.Status = StepStatus.Completed;
step1.SecondaryText = "Task";
step1.PrimaryText = "Completed";
stepProgress.Children.Add(step1);
```

### Status

A step has three statuses: not started, in progress, and completed. Based on the status, you can format a step with different styles, which means whenever the status of a step changes, the style of the visual will change synchronously. Refer the following GIF in which the status of step is updated dynamically.

The following code example explains how to set a status for a step view.

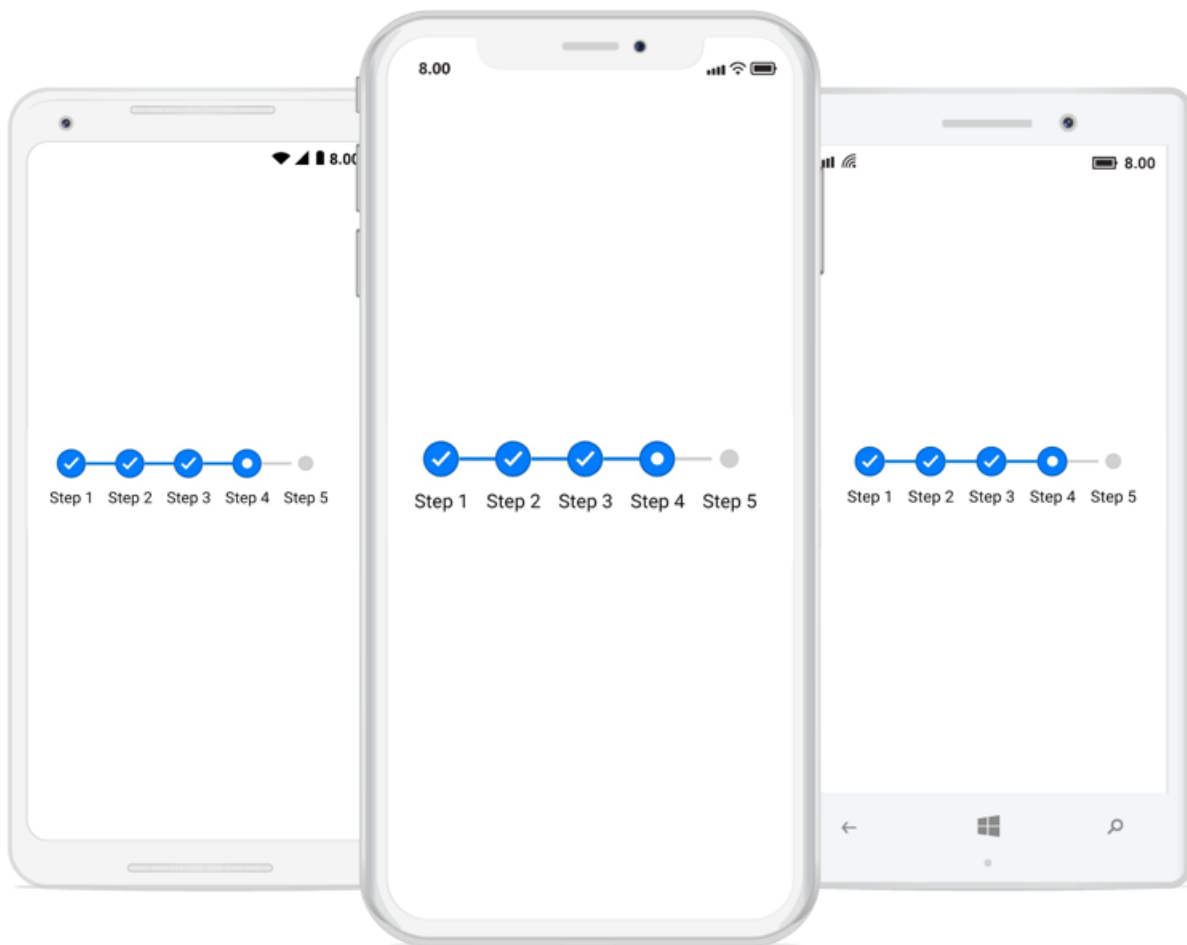

#### XML

```
<progressBar:SfStepProgressBar HorizontalOptions="Center"
VerticalOptions="Center">
  <progressBar:StepView PrimaryText="Step 1" />
  <progressBar:StepView PrimaryText="Step 2" />
  <progressBar:StepView PrimaryText="Step 3" />
  <progressBar:StepView PrimaryText="Step 4" Status="InProgress" />
  <progressBar:StepView PrimaryText="Step 5" />
</progressBar:SfStepProgressBar>
```

#### C#

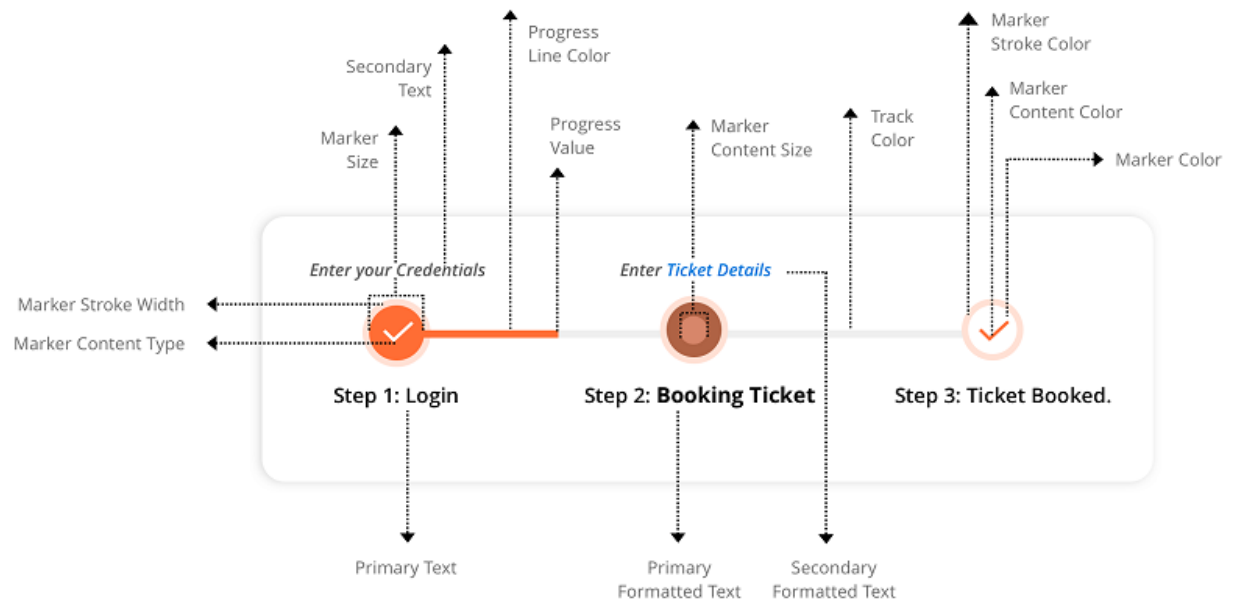

```
//Create StepProgressBar control
SfStepProgressBar stepProgressBar = new SfStepProgressBar();
stepProgressBar.VerticalOptions = LayoutOptions.Center;
stepProgressBar.HorizontalOptions = LayoutOptions.Center;
stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 1" });
stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 2" });
```

```
stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 3" });  
stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 4", Status  
= StepStatus.InProgress });  
stepProgressBar.Children.Add(new StepView() { PrimaryText = "Step 5" });
```

### Customizing Step view style based on their status

The Xamarin.Forms `StepProgressBar` control allows you to customize a step based on its status. Define an individual style for each status to achieve this. Marker color, marker shape type, marker content color, marker content type, marker stroke color, marker stroke width, marker size, marker content size, progress line color, and font can be defined for a style. The following overview image explains different properties available in `StepProgressBar`.

### Marker shape

The shape of a step marker can be a circle or a square.

#### *Content type*

You can customize the step content with numbers, ticks, crosses, dots or images.

The following code example explains how to customize a step view based on their status.

#### XML

```
<progressBar:SfStepProgressBar TitleAlignment="Start"
  BackgroundColor="Transparent" Orientation="Vertical" x:Name="stepProgress"
  Margin="16,16,0,0">
  <progressBar:SfStepProgressBar.NotStartedStepStyle>
  <progressBar:StepStyle x:TypeArguments="progressBar:NotStartedStepState"
  MarkerShapeType="Square" MarkerStrokeColor="Red" MarkerContentType="Cross"
  MarkerContentFillColor="Red"/>
  </progressBar:SfStepProgressBar.NotStartedStepStyle>
  <progressBar:SfStepProgressBar.InProgressStepStyle>
  <progressBar:StepStyle x:TypeArguments="progressBar:InProgressStepState"
  MarkerShapeType="Circle" MarkerContentType="None" MarkerFillColor="Black"/>
  </progressBar:SfStepProgressBar.InProgressStepStyle>
  <progressBar:SfStepProgressBar.CompletedStepStyle>
  <progressBar:StepStyle x:TypeArguments="progressBar:CompletedStepState"
  MarkerShapeType="Circle" MarkerContentType="Tick"
  MarkerContentFillColor="White" MarkerFillColor="Green"/>
  </progressBar:SfStepProgressBar.CompletedStepStyle>
  <progressBar:StepView x:Name="stepView1">
  <progressBar:StepView.PrimaryFormattedText>
```

```

<FormattedString>
<Span x:Name="span1" ClassId="1" Text="Ordered and Approved" FontSize="13"
FontAttributes="Bold"/>
<Span x:Name="span2" ClassId="2" Text="&#10;&#10;Your Order has been
placed." FontSize="12" />
<Span x:Name="span3" ClassId="3" Text="&#10;Sat, 27th Oct&#10;"
FontSize="12" />
</FormattedString>
</progressBar:StepView.PrimaryFormattedText>
</progressBar:StepView>
<progressBar:StepView x:Name="stepView2">
<progressBar:StepView.PrimaryFormattedText>
<FormattedString>
<Span x:Name="span21" ClassId="1" Text="Packed" FontSize="13"
FontAttributes="Bold" />
<Span x:Name="span22" ClassId="2" Text="&#10;&#10;Your item has been picked
up by courier partner." FontSize="12"/>
<Span x:Name="span23" ClassId="3" Text="&#10;Mon, 29th Oct" FontSize="12" />
</FormattedString>
</progressBar:StepView.PrimaryFormattedText>
</progressBar:StepView>
<progressBar:StepView x:Name="stepView3" Status="InProgress"
ProgressValue="50">
<progressBar:StepView.PrimaryFormattedText>
<FormattedString>
<Span x:Name="span31" ClassId="1" Text="Shipped" FontSize="13"
FontAttributes="Bold" />
</FormattedString>
</progressBar:StepView.PrimaryFormattedText>
</progressBar:StepView>
<progressBar:StepView x:Name="stepView4">
<progressBar:StepView.PrimaryFormattedText>
<FormattedString>
<Span x:Name="span41" ClassId="1" Text="Delivered" FontSize="13"
FontAttributes="Bold" />
</FormattedString>
</progressBar:StepView.PrimaryFormattedText>
</progressBar:StepView>
</progressBar:SfStepProgressBar>

```

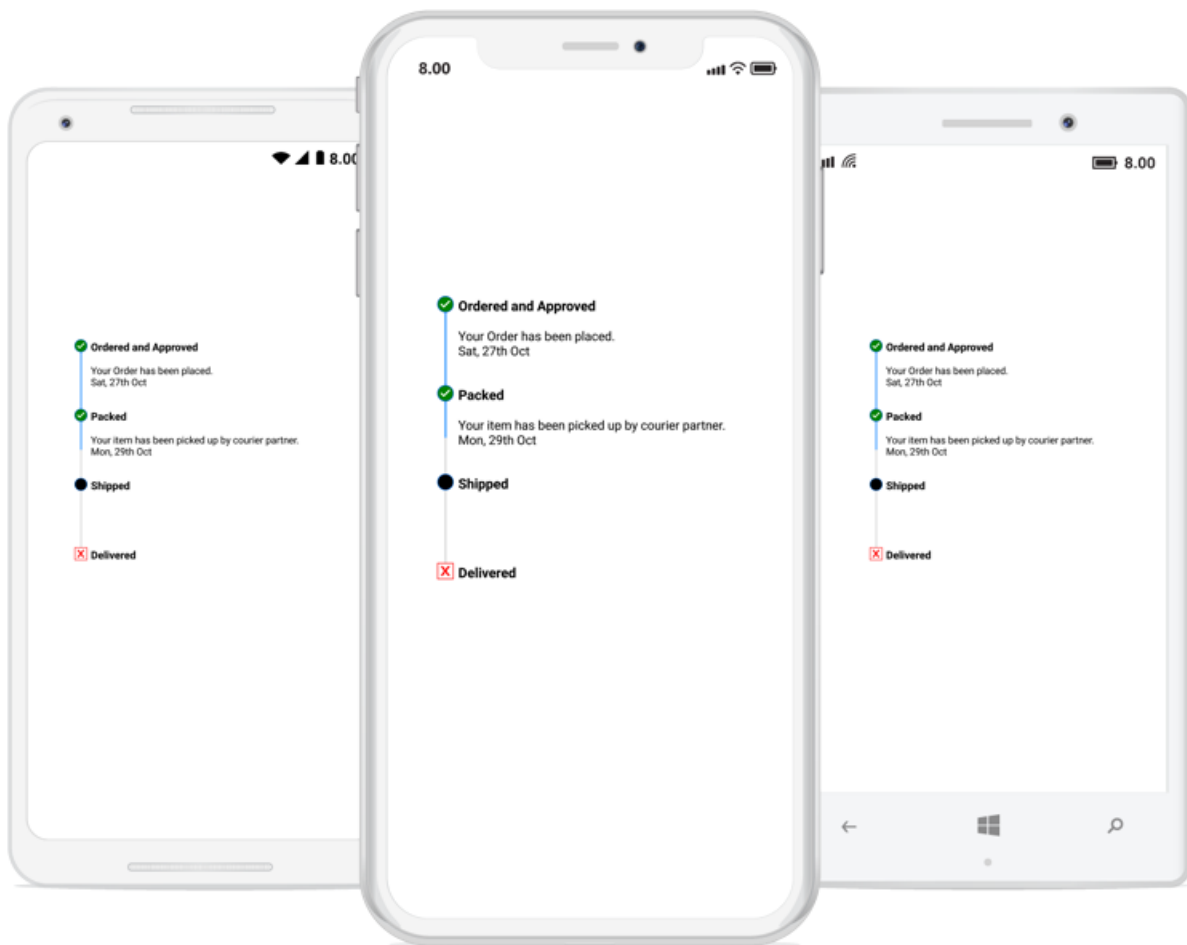

## C#

```

//Initialize the StepProgressBar
SfStepProgressBar stepProgress = new SfStepProgressBar();
stepProgress.Orientation = StepOrientation.Vertical;
stepProgress.TitleAlignment = StepTitleAlignment.Start;
//Modify NotStartedStepStyle
stepProgress.NotStartedStepStyle.MarkerShapeType = StepShapeType.Square;
stepProgress.NotStartedStepStyle.MarkerStrokeColor = Color.Red;
stepProgress.NotStartedStepStyle.MarkerContentType = StepContentType.Cross;
stepProgress.NotStartedStepStyle.MarkerContentFillColor = Color.Red;
//Modify InProgressStepStyle
stepProgress.InProgressStepStyle.MarkerContentType = StepContentType.None;
stepProgress.InProgressStepStyle.MarkerFillColor = Color.Black;
stepProgress.InProgressStepStyle.MarkerShapeType = StepShapeType.Circle;
//Modify CompletedStepStyle

```

```
stepProgress.CompletedStepStyle.MarkerShapeType = StepShapeType.Circle;
stepProgress.CompletedStepStyle.MarkerContentType = StepContentType.Tick;
stepProgress.CompletedStepStyle.MarkerContentFillColor = Color.White;
stepProgress.CompletedStepStyle.MarkerFillColor = Color.Green;
//Define StepView
StepView step1 = new StepView();
step1.PrimaryFormattedText = new FormattedString();
step1.PrimaryFormattedText.Spans.Add(new Span { Text = "Ordered and
Approved", FontSize = 13, FontAttributes = FontAttributes.Bold, TextColor =
Color.Blue });
step1.PrimaryFormattedText.Spans.Add(new Span { Text = "\nYour Order has
been placed", FontSize = 12, FontAttributes = FontAttributes.Italic |
FontAttributes.Bold, TextColor = Color.DarkBlue });
step1.PrimaryFormattedText.Spans.Add(new Span { Text = "\nSat, 27th Oct\n",
FontSize = 12, FontAttributes = FontAttributes.Italic, TextColor =
Color.Blue });
stepProgress.Children.Add(step1);
StepView step2 = new StepView();
step2.PrimaryFormattedText = new FormattedString();
step2.PrimaryFormattedText.Spans.Add(new Span { Text = "Packed", FontSize =
13, FontAttributes = FontAttributes.Bold, TextColor = Color.Blue });
step2.PrimaryFormattedText.Spans.Add(new Span { Text = "\nYour item has been
picked up by courier partner.", FontSize = 12, FontAttributes =
FontAttributes.Italic | FontAttributes.Bold, TextColor = Color.DarkBlue });
step2.PrimaryFormattedText.Spans.Add(new Span { Text = "\nMon, 29th Oct\n",
FontSize = 12, FontAttributes = FontAttributes.Italic, TextColor =
Color.Blue });
stepProgress.Children.Add(step2);
StepView step3 = new StepView();
step3.Status = StepStatus.InProgress;
step3.ProgressValue = 50;
step3.PrimaryFormattedText = new FormattedString();
step3.PrimaryFormattedText.Spans.Add(new Span { Text = "Shipped", FontSize =
13, FontAttributes = FontAttributes.Bold, TextColor = Color.Blue });
stepProgress.Children.Add(step3);
StepView step4 = new StepView();
step4.PrimaryFormattedText = new FormattedString();
step4.PrimaryFormattedText.Spans.Add(new Span { Text = "Delivered", FontSize
= 13, FontAttributes = FontAttributes.Bold, TextColor = Color.Blue });
stepProgress.Children.Add(step4);
```

## SfPullToRefresh

### Overview

SfPullToRefresh is a refresh control that allows you to interact and refresh the view loaded in it. The SfPullToRefresh control allows you to refresh the view upon performing the pull to refresh action. A progress indicator will be shown while start the pulling. The application will be refreshed once you have pulled down a certain distance and release the touch.

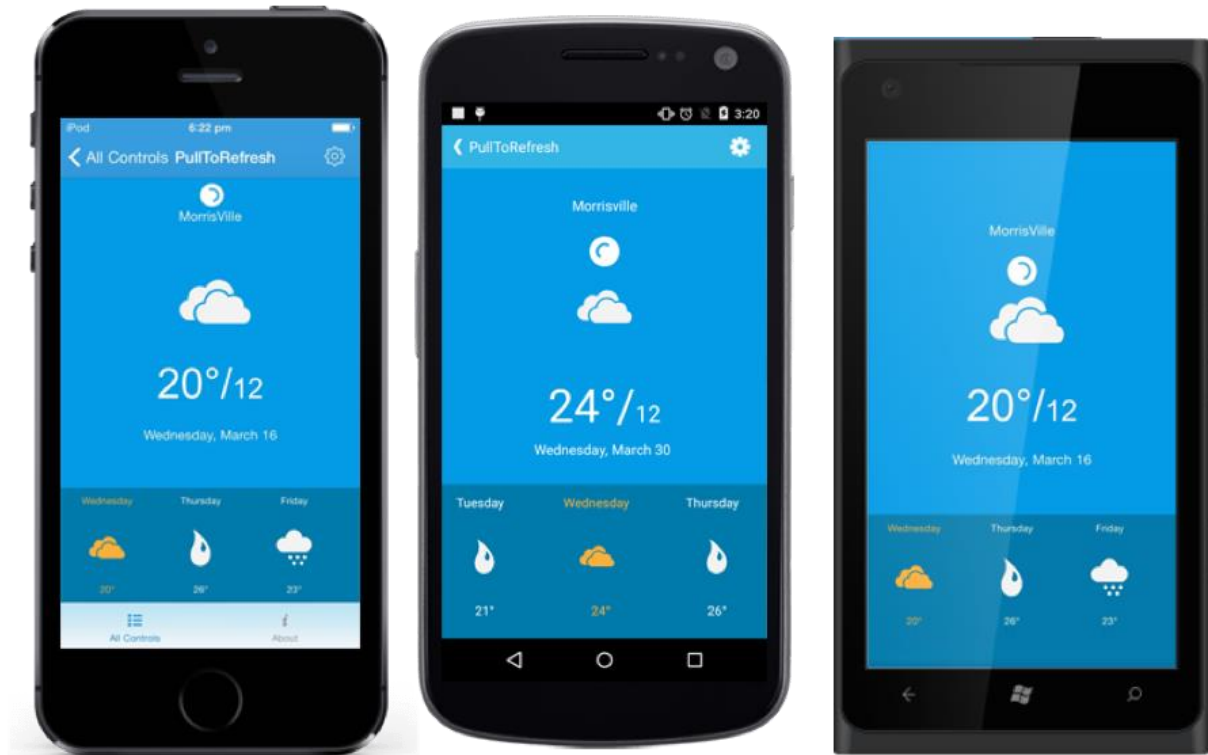

### Use Case Scenarios

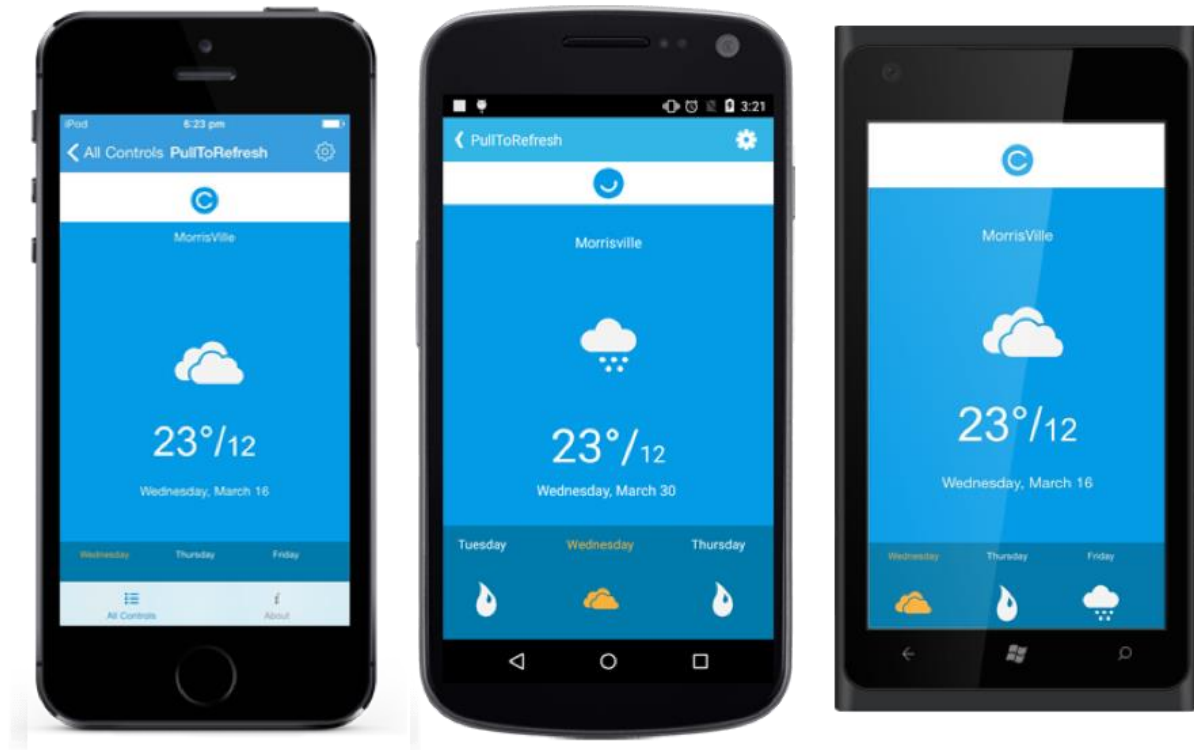

SfPullToRefresh controls are mainly used in applications where the user needs to refresh the content on demand. PullToRefresh controls are mainly used in applications where the user needs to refresh the content on demand. The main applications that use the PullToRefresh are listed below:

1. Facebook
2. Weather
3. Gmail
4. Live Score applications

## Key Features

- **TransitionMode:** Specifies the transition mode of the SfPullToRefresh.
- **Sizing:** Width, Height and progress stroke width customization support for SfPullToRefresh.
- **Color:** Background and progress stroke color customization support for SfPullToRefresh.
- **StartRefreshing():** Starts the programmatic refreshing.
- **EndRefreshing():** Ends the programmatic refreshing.

## Getting Started

This section provides a quick overview for working with SfPullToRefresh for Xamarin.Forms.

### Assembly deployment

After installing Essential Studio for Xamarin, you can find all the required assemblies in the installation folders,

{Syncfusion Essential Studio Installed location}\Essential Studio\{{ site.releaseversion }}\Xamarin\lib

Eg: C:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Xamarin\lib

---

**Note:** Assemblies can be found in unzipped package location in Mac

---

### NuGet configuration

To install the required NuGet for the SfPullToRefresh control in the application, configure the NuGet packages of the Syncfusion components.

Refer to the following KB to configure the NuGet package of the Syncfusion components:

[How to configure package source and install Syncfusion NuGet packages in an existing project?](#)

The following NuGet package should be installed to use the SfPullToRefresh control in the application.

Project	Required package
Xamarin.Forms	Syncfusion.Xamarin.SfPullToRefresh

### Adding SfPullToRefresh reference

You can add SfPullToRefresh reference using one of the following methods:

#### Method 1: Adding SfPullToRefresh reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfPullToRefresh). To add SfPullToRefresh to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfPullToRefresh](https://www.nuget.org/packages/Syncfusion.Xamarin.SfPullToRefresh), and then install it.

![Adding SfPullToRefresh reference from NuGet](SfPullToRefresh\_images/Adding SfPullToRefresh reference.png)

**Note:** When there is a mismatch between Syncfusion NuGet packages among your projects, `System.IO.FileLoadException` will occur. To overcome this exception, install the same version of SfPullToRefresh assemblies in all your projects.

#### Method 2: Adding SfPullToRefresh reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfPullToRefresh control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfPullToRefresh assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.SfPullToRefresh.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.SfPullToRefresh.XForms.dll Syncfusion.SfPullToRefresh.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.SfPullToRefresh.XForms.dll Syncfusion.SfPullToRefresh.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.SfPullToRefresh.XForms.dll Syncfusion.SfPullToRefresh.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

---

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

**Note:** When there is a mismatch of Xamarin NuGet packages between your sample and SfPullToRefresh assemblies, an error `Could not load type Xamarin.Forms.ElementTemplate` will occur. Please refer to `ReadMe` to know the software requirements of Syncfusion controls.

---

### Launching the SfPullToRefresh on each platform

To use SfPullToRefresh inside an application, each platform application must initialize the SfPullToRefresh renderer. This initialization step varies from platform to platform and is discussed in the following sections.

#### Android

The Android launches the SfPullToRefresh without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

#### iOS

To launch the SfPullToRefresh in iOS, you need to call the `SfPullToRefreshRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework initialization and before the `LoadApplication` is called, as demonstrated in the following code example:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    SfPullToRefreshRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### Universal Windows Platform (UWP)

To launch the SfPullToRefresh in UWP, you need to call the `SfPullToRefreshRenderer.Init()` in the `MainPage` constructor before the `LoadApplication` is called, as demonstrated in the following code example:

#### C#

```
public MainPage()
{
    ...
    SfPullToRefreshRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

### *ReleaseMode issue in UWP platform*

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfPullToRefresh assemblies in **App.xaml.cs** in UWP project as like in below code snippet.

#### **C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfPullToRefreshRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

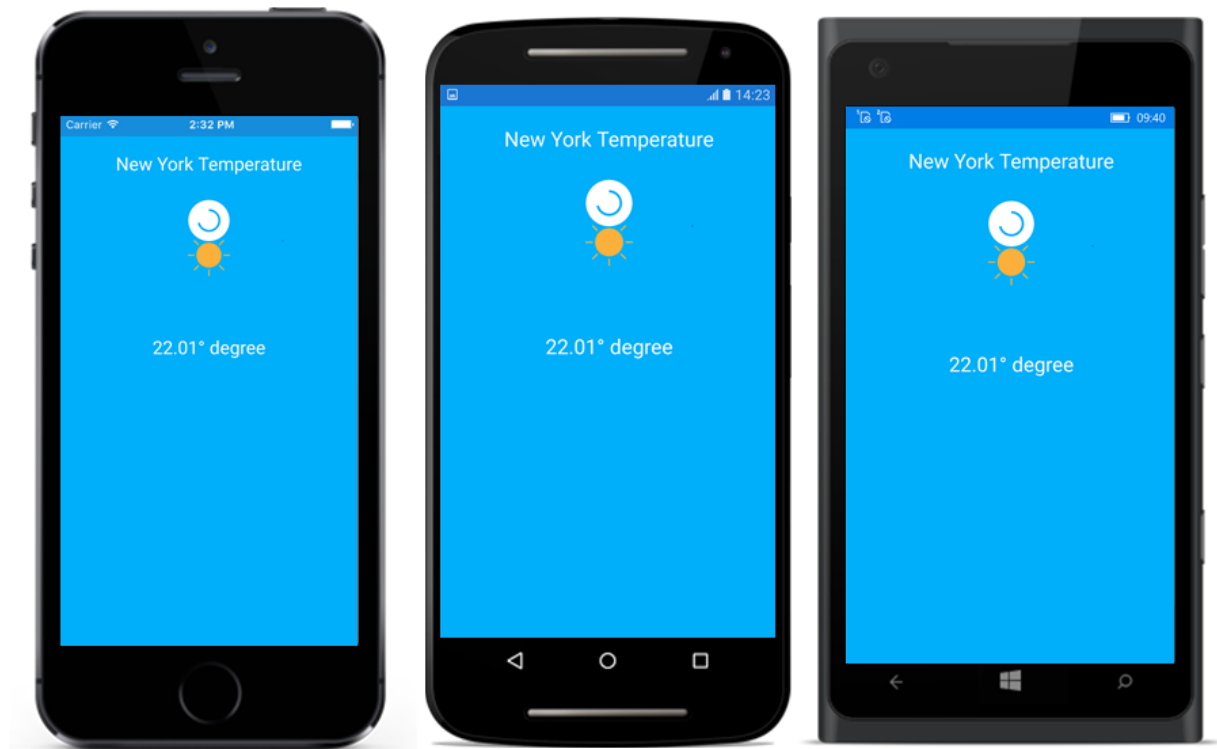

### Create a sample with SfPullToRefresh

This section explains how to create a SfPullToRefresh and configure it.

You can download the entire source code of this demo for Xamarin.Forms from [here](#).

#### Creating the project

Create a new BlankApp (Xamarin.Forms.Portable) application in Xamarin Studio or Visual Studio for Xamarin.Forms. This is how the final output will look like on iOS, Android and Windows Phone devices.

### Adding SfPullToRefresh in Xamarin.Forms

1. Add the required assembly references to the pcl and renderer projects as discussed in the [Assembly deployment](#) section.
2. Import SfPullToRefresh control namespace `Syncfusion.SfPullToRefresh.XForms`.
3. Set the any View as `PullableContent` of the `SfPullToRefresh`.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage"
xmlns:syncfusion="clr-namespace:Syncfusion.SfPullToRefresh.XForms;assembly=Syncfusion.SfPullToRefresh.XForms">
  <syncfusion:SfPullToRefresh x:Name="pullToRefresh"
    IsRefreshing="False"
    PullingThreshold="100"
    RefreshContentHeight="30"
    RefreshContentThreshold="30"
    RefreshContentWidth="30">
    <syncfusion:SfPullToRefresh.PullableContent>
      <StackLayout BackgroundColor="#00AFF9" Orientation="Vertical">
        <Label Text="New York Temperature" FontSize="Large" TextColor="White"
          HorizontalTextAlignment="Center" Margin="20"/>
      </StackLayout>
    </syncfusion:SfPullToRefresh.PullableContent>
  </syncfusion:SfPullToRefresh>
</ContentPage>
```

```

<Image WidthRequest="100" HorizontalOptions="Center" HeightRequest="100"
Margin="20" Source="GettingStarted/warmselected.png"/>
<Label x:Name="weatherData" FontSize="Large" TextColor="White"
HorizontalTextAlignment="Center" Margin="20"/>
</StackLayout>
</syncfusion:SfPullToRefresh.PullableContent>
</syncfusion:SfPullToRefresh>
</ContentPage>

```

**C#**

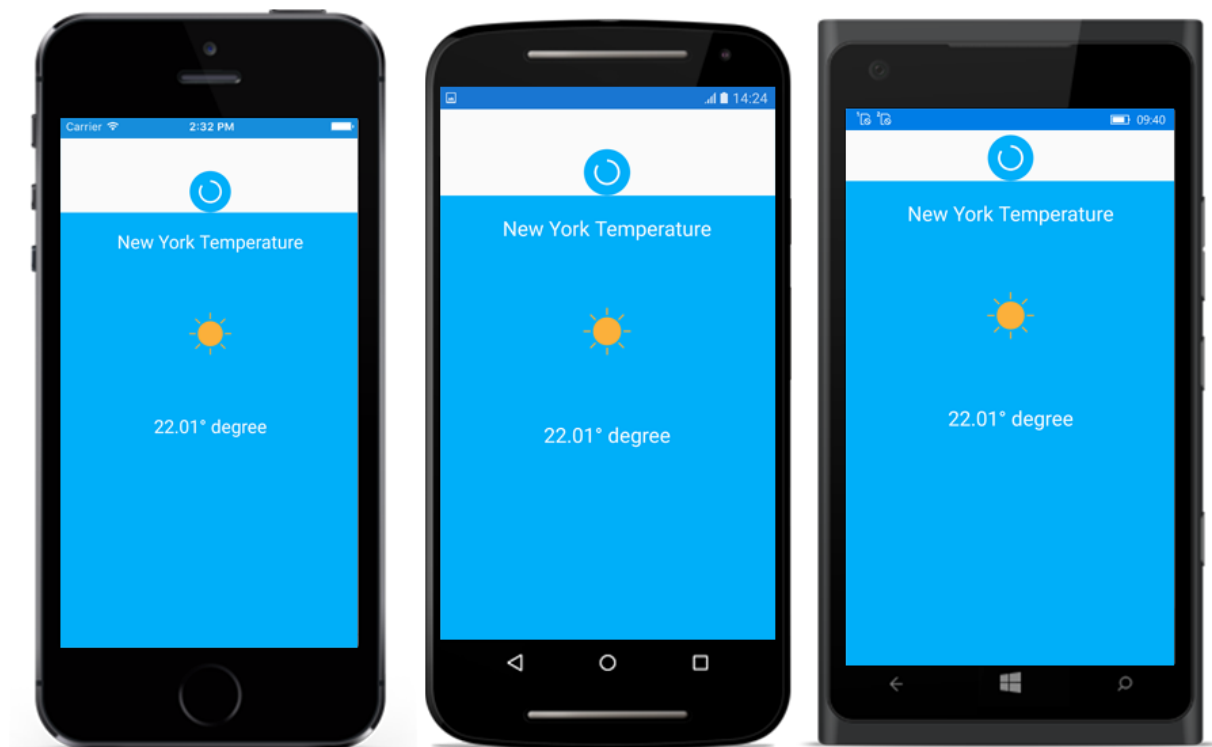

```

using Syncfusion.SfPullToRefresh.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        Random random = new Random();
        string[] temperatures = new string[] { "22°", "18°", "12°", "25°", "23°",
        "20°", "25°" };
        public MainPage()
        {
            InitializeComponent();
            this.BindingContext = this;
            weatherData.Text = temperatures[0].ToString()+" degree";
            pullToRefresh.Pulling += PullToRefresh_Pulling;
            pullToRefresh.Refreshing += PullToRefresh_Refreshing;
        }
        private async void PullToRefresh_Refreshing(object sender, EventArgs args)
        {
            pullToRefresh.IsRefreshing = true;
            await Task.Delay(2000);
            int number = random.Next(0, 6);
            new WeatherData(temperatures[number]);
            weatherData.Text = temperatures[number].ToString() + " degree";
            pullToRefresh.IsRefreshing = false;
        }
        private void PullToRefresh_Pulling(object sender, PullingEventArgs args)
        {
            args.Cancel = false;
            var progress = args.Progress;
        }
    }
    Model class:
    public class WeatherData: INotifyPropertyChanged
    {
        private string _temperature;
        public WeatherData(string temperature)
        {
            Temperature = temperature;
        }
        public string Temperature
        {
            get
            {

```

```
return _temperature;
}
set
{
    _temperature = value;
    RaisePropertyChanged("Temperature");
}
}
#region INotifyPropertyChanged implementation
public event PropertyChangedEventHandler PropertyChanged;
private void RaisePropertyChanged(String Name)
{
    if (PropertyChanged != null)
        this.PropertyChanged(this, new PropertyChangedEventArgs(Name));
}
#endregion
}
```

If we run the above sample with `TransitionMode` as `Push`, the output will look like on iOS, Android and Windows Phone devices as shown below.

## Features

### PullableContent

Gets or sets the content of the refresh view. `PullableContent` is the main view of the `SfPullToRefresh` control on which the desired items can be placed.

### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh"
    PullingThreshold="120"
    RefreshContentHeight="30"
    RefreshContentThreshold="30"
    RefreshContentWidth="30">
    <syncfusion:SfPullToRefresh.PullableContent>
    <Label x:Name="Monthlabel"
        TextColor="White"
        HorizontalTextAlignment="Center"
        VerticalTextAlignment="Start" />
    </syncfusion:SfPullToRefresh.PullableContent>
</syncfusion:SfPullToRefresh>
```

### TransitionMode

The **TransitionMode** property specifies the mode of the animations. It has the following two modes:

- **SlideOnTop**
- **Push**

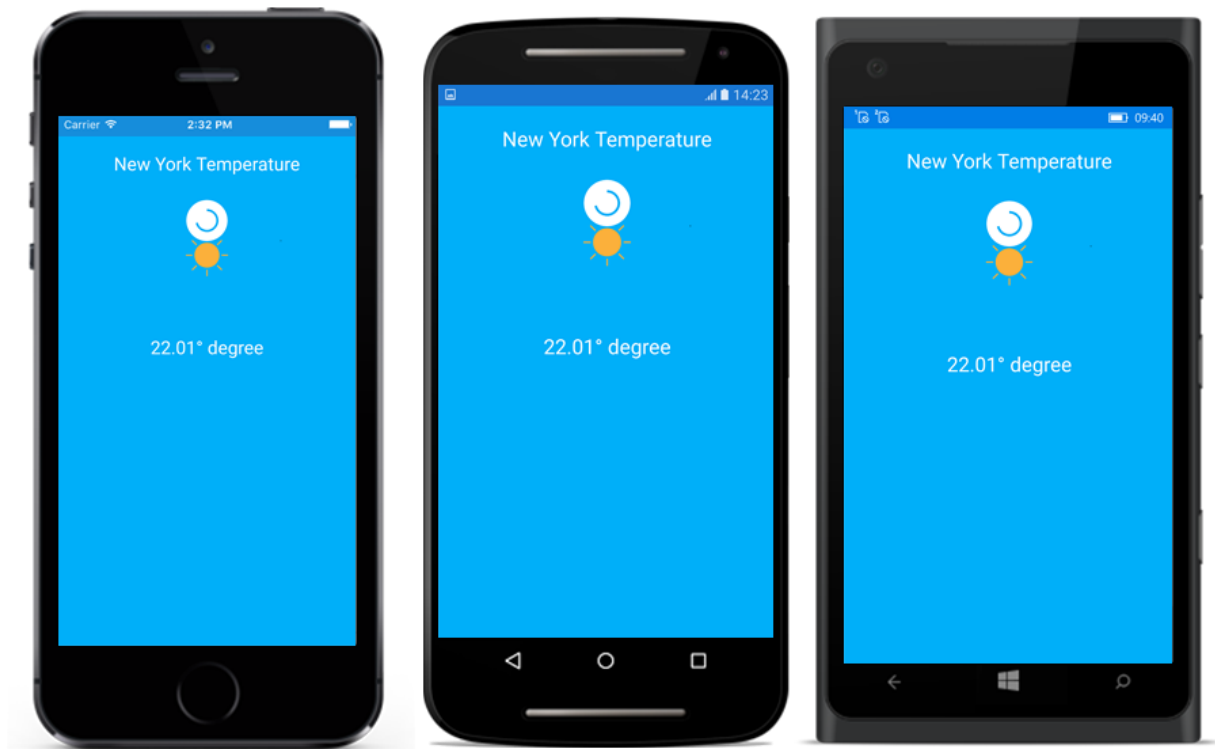

The default transition is **SlideOnTop** that draws the RefreshContent on top of the **PullableContent**.

### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh"
    TransitionMode="SlideOnTop" />
```

### C#

```
pullToRefresh.TransitionMode = TransitionType.SlideOnTop;
```

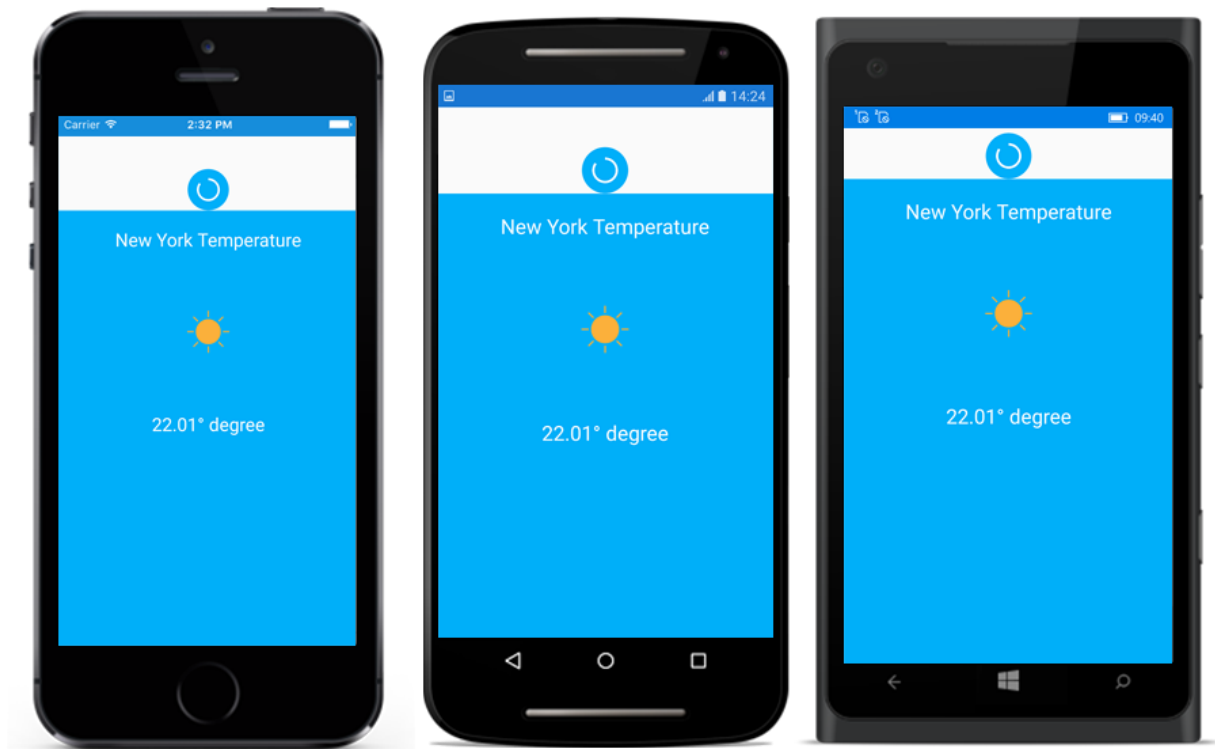

The following code example shows how to set `TransitionMode` as `Push` to `SfPullToRefresh`. This transition moves the refresh content and main content simultaneously.

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh" TransitionMode="Push" />
```

#### C#

```
pullToRefresh.TransitionMode = TransitionType.Push;
```

### RefreshContentThreshold

Gets or sets the refresh content threshold value that indicates progress indicator starting position in view

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh"
RefreshContentThreshold="50"/>
```

#### C#

```
pullToRefresh.RefreshContentThreshold = 50d;
```

### PullingThreshold

Gets or sets the value for the refresh content threshold, this indicate progress indicator maximum pulling position in view.

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh" PullingThreshold="200"/>
```

#### C#

```
pullToRefresh.PullingThreshold = 200d;
```

### IsRefreshing

Get or set the state for refreshing the view. View will get refresh while `IsRefreshing` property is set `true` and View refreshing will be stopped when you set `IsRefreshing` is `false`.

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh" IsRefreshing = "True"/>
```

#### C#

```
pullToRefresh.IsRefreshing = true;
```

### ProgressBackgroundColor

Get or set the background color to the progress indicator.

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh" ProgressBackgroundColor = "White"/>
```

#### C#

```
pullToRefresh.ProgressBackgroundColor = Color.White;
```

### ProgressStrokeColor

Get or set the color to the progress indicator stroke

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh" ProgressStrokeColor = "Blue"/>
```

#### C#

```
pullToRefresh.ProgressStrokeColor = Color.Blue;
```

### ProgressStrokeWidth

Get or set the width to the progress indicator stroke.

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh" ProgressStrokeWidth="5"/>
```

#### C#

```
pullToRefresh.ProgressStrokeWidth = 5d;
```

### RefreshContentWidth

Get or set the width to the refresh content.

#### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh"
RefreshContentWidth="50"/>
```

### C#

```
pullToRefresh.RefreshContentWidth = 50d;
```

### RefreshContentHeight

Get or set the width to the refresh content.

### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh"
RefreshContentHeight="50"/>
```

### C#

```
pullToRefresh.RefreshContentHeight = 50d;
```

### Programmatic Support

#### *StartRefreshing()*

StartRefreshing method is used to refresh the content without interaction in pullable content. When invoke this StartRefreshing() method, then Progress indicator will be shown.

### C#

```
pullToRefresh.StartRefreshing();
```

#### *EndRefreshing()*

EndRefreshing method is used to end the progress animation of SfPullToRefresh.

### C#

```
pullToRefresh.EndRefreshing();
```

### Host SfDataGrid as pullable content

SfPullToRefresh controls provides support for loading any custom control as pullable content. To host SfDataGrid inside the SfPullToRefresh, follow the below steps.

<ol>

<li> Add the required assembly references to the pcl and renderer projects as discussed in the Assembly deployment section of <https://help.syncfusion.com/xamarin/sfdatagrid/getting-started#assembly-deployment> and <https://help.syncfusion.com/xamarin/sfpulltorefresh/getting-started#assembly-deployment>.

<li> Import SfPullToRefresh and SfDataGrid control namespace as follows.</li>

<br/>

### XML

```
<xmlns:syncfusion="clr-  
namespace:Syncfusion.SfDataGrid.XForms;assembly=Syncfusion.SfDataGrid.XForms  
">  
<xmlns:pull="clr-  
namespace:Syncfusion.SfPullToRefresh.XForms;assembly=Syncfusion.SfPullToRefr  
esh.XForms">
```

## C#

```
using Syncfusion.SfPullToRefresh.XForms;  
using Syncfusion.SfDataGrid.XForms;
```

<br/>

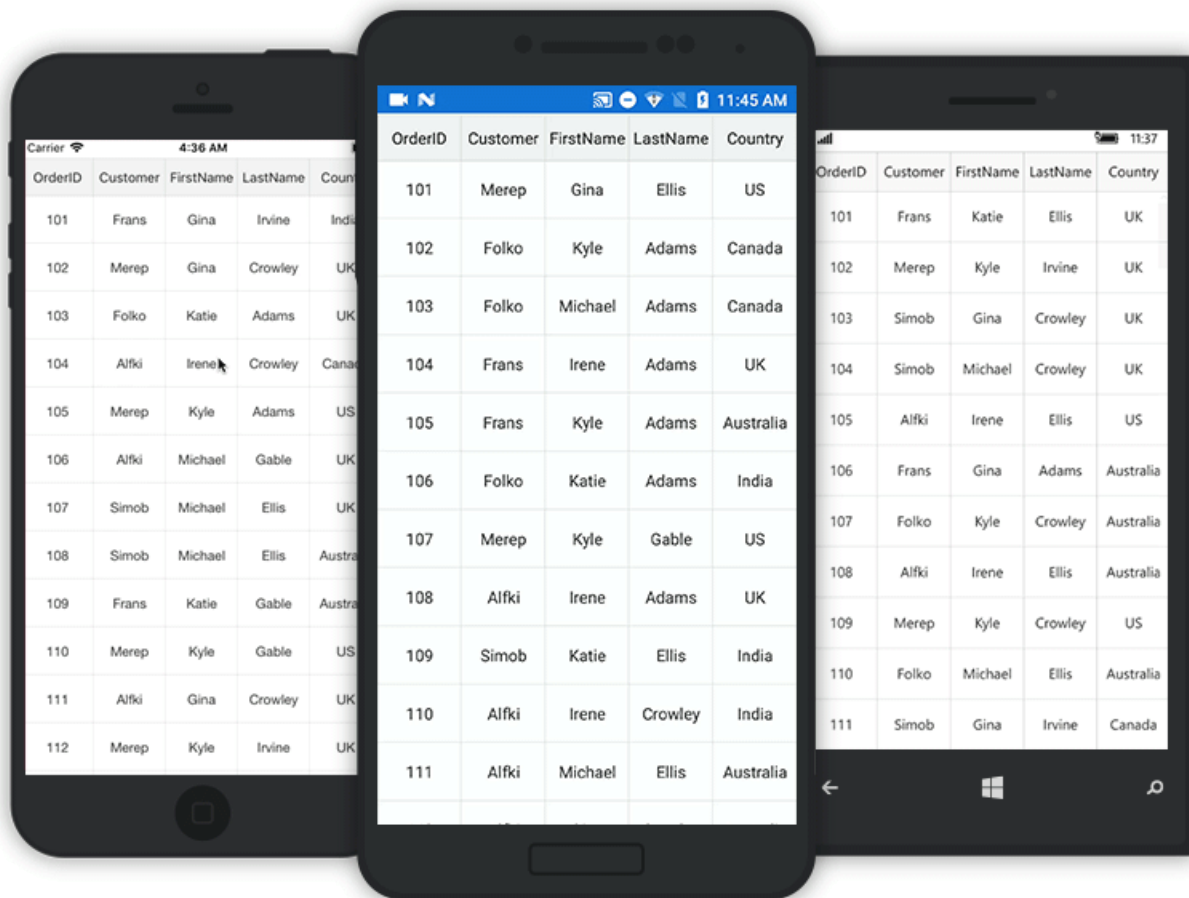

<li> Define SfDataGrid as PullableContent of the SfPullToRefresh.</li>

<li> Handle the pull to refresh events for refreshing the data. </li>

<li> Customize the required properties of SfDataGrid and SfPullToRefresh based on your requirement.</li>

</ol>

This is how the final output will look like on iOS, Android and Windows Phone devices when hosting a SfDatagrid control as pullable content.

## XML

## C#

```
using Syncfusion.SfPullToRefresh.XForms;
using Xamarin.Forms;
using Syncfusion.ListView.XForms;
namespace PullToRefreshSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            pullToRefresh.Refreshing += PullToRefresh_Refreshing; ;
        }
        private async void PullToRefresh_Refreshing(object sender, EventArgs e)
        {
            pullToRefresh.IsRefreshing = true;
            await Task.Delay(2000);
            ViewModel.RefreshItemSource();
            pullToRefresh.IsRefreshing = false;
        }
    }
}
```

If we run the above sample with TransitionMode as Push, the output will look like on iOS, Android and Windows Phone devices as shown below.

### Pulling and refreshing template

The SfPullToRefresh allows you set a template for pulling and refreshing the view. The pulling and refreshing a template can be set using the [SfPullToRefresh.PullingViewTemplate](#) and [SfPullToRefresh.RefreshingViewTemplate](#) properties, respectively.

Refer to the following code example in which a SfProgressBar is loaded in the pulling view template and refreshing view template.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

You can download the sample code by clicking the following link: [Sample](#).

## Events

There are three built-in events in the PullToRefresh control namely:

1. Pulling
2. Refreshing
3. Refreshed

The Pulling event will be notified whenever the swipe gesture is started. This event will notify the listener each and every time until the refresh content height exceeds. When we release the gesture from pullable content, Refreshing event will be triggered. Now the refresh operation can be performed. Once the content is refreshed, we should set `SfPullToRefresh.IsRefreshing` to `false` to stop the animation. Once the animation is stopped the Refreshed event will be triggered to notify that the refreshing is completed.

### Pulling

Pulling event is triggered whenever you start pulling down on the `PullableContent` with `PullingEventArgs` that contains the following properties

- **Cancel** - You can cancel the pulling action based on the `Progress` value.
- **Progress** - Gets the progress completion value.

### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh"
    PullingEvent="PullToRefresh_Pulling" />
```

### C#

```
pullToRefresh.Pulling += PullToRefresh_Pulling;
private void PullToRefresh_Pulling(object sender, PullingEventArgs args)
{
    args.Cancel = false;
    var progress = args.Progress;
}
```

### Refreshing

Refreshing event is triggered once pointer is released. This event will occur till the `IsRefreshing` property is set as `false`.

### XML

```
<syncfusion:SfPullToRefresh x:Name="pullToRefresh"
    RefreshingEvent="PullToRefresh_Refreshing" />
```

### C#

```
pullToRefresh.Refreshing += PullToRefresh_Refreshing;
private async void PullToRefresh_Refreshing(object sender, EventArgs args)
{
    pullToRefresh.IsRefreshing = true;
    await Task.Delay(2000);
    pullToRefresh.IsRefreshing = false;
}
```

### Refreshed

Refreshed event is triggered once the `Refreshing` event is completed.

### XML

```
<syncfusion:SfPullToRefresh x:Name=" pullToRefresh"
    RefreshedEvent="PullToRefresh_Refreshed" />
```

### C#

```
pullToRefresh.Refreshed += PullToRefresh_Refreshed;
private void PullToRefresh_Refreshed(object sender, EventArgs args)
```

```
{  
}
```

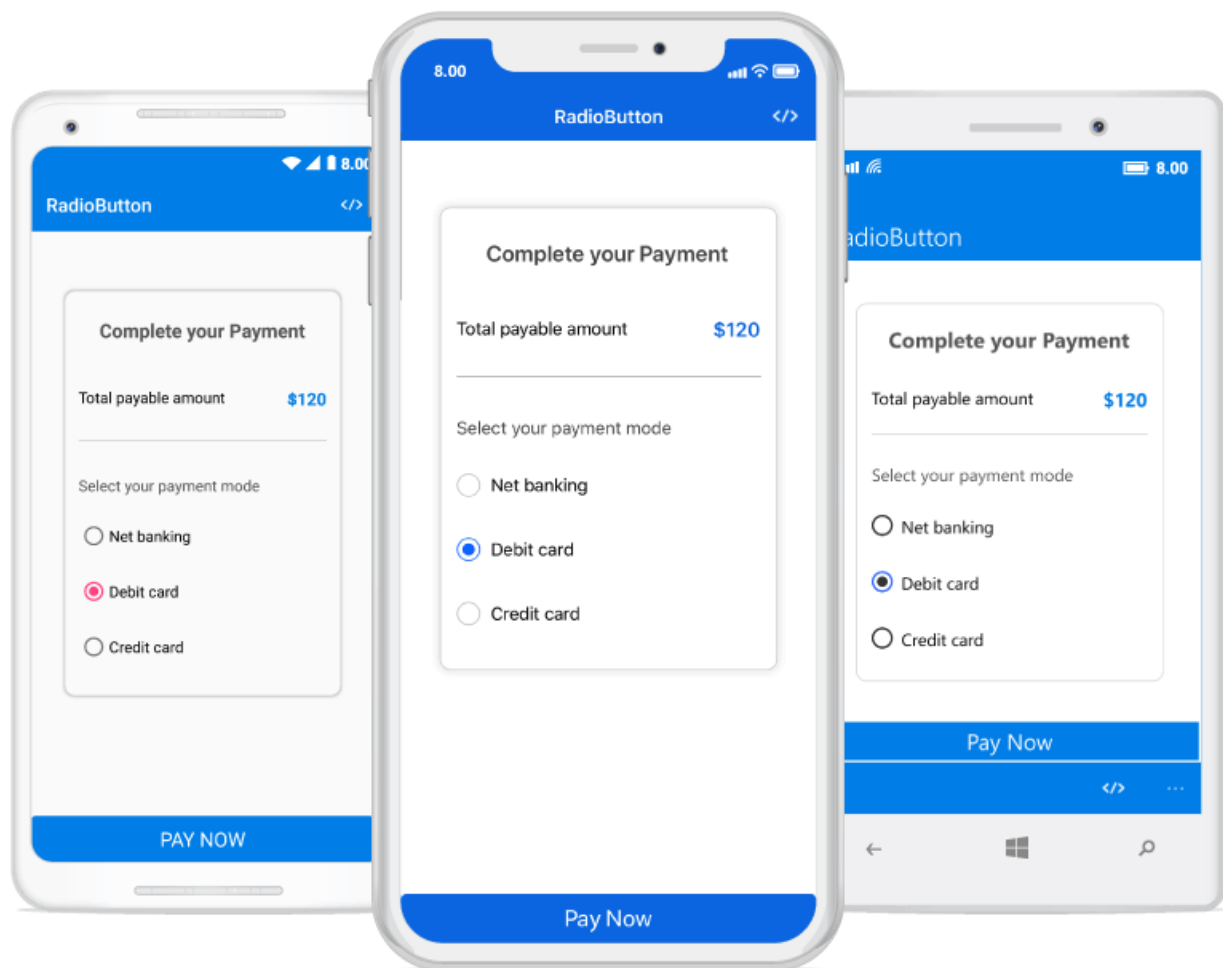

## SfRadioButton

### Overview

The radio button is a selection control that allows users to select one option from a set. The two states of radio button are checked and unchecked.

### Key features

- Allow users to select and clear the control by tapping.
- Supports radio button color and label text customization.

### Getting Started

This section explains the steps required to configure the **SfRadioButton** control in a real-time scenario and provides a walk-through on some of the customization features available in **SfRadioButton** control.

### Adding SfRadioButton reference

You can add SfRadioButton reference using one of the following methods:

#### Method 1: Adding SfRadioButton reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org). To add SfRadioButton to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Buttons](#), and then install it.

![Adding SfRadioButton reference from NuGet](Images/Adding SfRadioButton reference.png)

#### Note:

- Install the same version of SfRadioButton NuGet in all the projects.
- In addition, you need to install the [Syncfusion.Xamarin.Buttons.WPF]() package for Xamarin.Forms WPF platform only.

#### Method 2: Adding SfRadioButton reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfRadioButton control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfRadioButton assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Buttons.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.WPF.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** After adding the assembly reference, an additional step is required for iOS and UWP projects. If you are adding the references from toolbox, this step is not needed.

#### *Additional step for iOS*

To launch **SfRadioButton** in iOS, call the **SfRadioButtonRenderer.Init()** in **FinishedLaunching** overridden method of **AppDelegate** class in iOS Project, as demonstrated in the following code example.

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    SfRadioButtonRenderer.Init();
    return base.FinishedLaunching(app, options);
}
```

#### *Additional step for UWP*

This step is required only if the application is deployed in Release mode with .NET native tool chain enabled. It is for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the **SfRadioButton** assembly at **OnLaunched** overridden method of the **App** class in UWP project is the suggested work around, as demonstrated in the following code example.

#### **C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    .....
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies that your app uses
    assembliesToInclude.Add(typeof(SfRadioButtonRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    .....
}
```

*Additional step for WPF*

To launch the radio button in WPF, call the `SfRadioButtonRenderer.Init()` method in the `MainWindow` constructor of the `MainWindow` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

**C#**

```
public partial class MainWindow : FormsApplicationPage
{
    public MainWindow()
    {
        InitializeComponent();
        Forms.Init();
        Syncfusion.XForms.WPF.Buttons.SfRadioButtonRenderer.Init();
        LoadApplication(new App());
    }
}
```

*Create a Simple SfRadioButton*

The `SfRadioButton` control is configured entirely in C# code or by using XAML markup. The following steps explain how to create a `SfRadioButton` and configure its elements.

*Add namespace for referred assemblies***XML**

```
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
```

**C#**

```
using Syncfusion.XForms.Buttons;
```

*Refer SfRadioButton control with declared suffix name for Namespace***XML**

```
<?xml version="1.0" encoding="utf-8">
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<StackLayout>
<syncfusion:SfRadioButton x:Name="radioButton"/>
</StackLayout>
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace GettingStarted
```

```
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
StackLayout stackLayout = new StackLayout();
SfRadioButton radioButton = new SfRadioButton();
stackLayout.Children.Add(radioButton);
this.Content = stackLayout;
}
}
}
```

### Setting caption

The radio button caption can be defined using the `Text` property of `SfRadioButton`. This caption normally describes the meaning of the radio button and it displays next to radio button.

#### XML

```
<syncfusion:SfRadioButton x:Name="radioButton" Text="RadioButton"/>
```

#### C#

```
SfRadioButton radioButton = new SfRadioButton();
radioButton.Text = "RadioButton";
```

This demo can be downloaded from this [link](#).

### Change the radio button state

The two different visual states of the `SfRadioButton` are:

- Checked
- Unchecked

You can change the state of the radio button using the `IsChecked` property of `SfRadioButton`. In the checked state, an inner circle is added to the visualization of radio button.

The radio buttons are used when there is a list of two or more options or group that are mutually exclusive and the user must select exactly one choice, such as “Select Gender” or “Choose the best option!”.

#### XML

```
<syncfusion:SfRadioGroup x:Name="radioGroup">
<syncfusion:SfRadioButton x:Name="male" Text="Male" IsChecked="True"/>
```

```
<syncfusion:SfRadioButton x:Name="female" Text="Female"/>
</syncfusion:SfRadioGroup>
```

### C#

```
SfRadioGroup radioGroup = new SfRadioGroup();
SfRadioButton male = new SfRadioButton();
male.IsChecked = true;
male.Text = "Male";
SfRadioButton female = new SfRadioButton();
female.Text = "Female";
radioGroup.Children.Add(male);
radioGroup.Children.Add(female);
```

**Note:** SfRadioButtons are mutually exclusive among them when they are defined within SfRadioGroup.

This demo can be downloaded from this [link](#).

### Visual Customization

#### Customizing state color

The default state colors can be customized using the **CheckedColor** and **UncheckedColor** properties. The checked state color is updated to the **CheckedColor** property value when the state is changed to the checked. The unchecked state color is updated to the **UncheckedColor** property value when the state is changed to unchecked.

### XML

```
<syncfusion:SfRadioGroup x:Name="radioGroup">
<syncfusion:SfRadioButton x:Name="check" Text="RadioButton" IsChecked="True"
CheckedColor="Green"/>
<syncfusion:SfRadioButton x:Name="uncheck" Text="RadioButton"
UncheckedColor="Violet"/>
</syncfusion:SfRadioGroup>
```

### C#

```
SfRadioGroup radioGroup = new SfRadioGroup();
SfRadioButton check = new SfRadioButton();
check.Text = "RadioButton";
check.IsChecked = true;
```

```
check.CheckedColor = Color.Green;
SfRadioButton uncheck = new SfRadioButton();
uncheck.Text = "RadioButton";
uncheck.UncheckedColor = Color.Violet;
radioGroup.Children.Add(check);
radioGroup.Children.Add(uncheck);
```

#### Setting caption text appearance

You can customize the display text appearance of the **SfRadioButton** control using the following properties:

- **TextColor** : Changes the color of the text.
- **HorizontalTextAlignment**: Changes the horizontal alignment of the caption text.
- **FontFamily**: Changes the font family of the caption text.
- **FontAttributes**: Sets font attributes(bold/italic/none) of the caption text.
- **FontSize**: Sets font size of the caption text.

#### XML

```
<syncfusion:SfRadioButton x:Name="radioButton" Text="RadioButton"
IsChecked="True" TextColor="Violet" HorizontalTextAlignment="Center"
FontFamily="Arial" FontAttributes="Bold" FontSize="20"/>
```

#### C#

```
SfRadioButton radioButton = new SfRadioButton();
radioButton.Text = "RadioButton";
radioButton.IsChecked = true;
radioButton.TextColor = Color.Violet;
radioButton.HorizontalTextAlignment = TextAlignment.Center;
radioButton.FontFamily = "Arial";
radioButton.FontAttributes = FontAttributes.Bold;
radioButton.FontSize = 20;
```

RadioButton

### LineBreakMode

The `LineBreakMode` allows you to wrap or truncate the text. The default value of this property is `NoWrap`. The following other options are available in `LineBreakMode`:

- `NoWrap` - Avoids the text wrap.
- `WordWrap` - Wraps the text by words.
- `CharacterWrap` - Wraps the text by character.
- `HeadTruncation` - Truncates the text at the start.
- `MiddleTruncation` - Truncates the text at the center.
- `TailTruncation` - Truncates the text at the end.

This demo can be downloaded from this [link](#).

### Visual States

The visual of Radio Button can be customized using `VisualStates`. The [SfRadioButton](#) control contains the following two visual states:

- Checked
- Unchecked

### XML

```
<buttons:SfRadioButton Text="Radio Button">
  <VisualStateManager.VisualStateGroups>
    <VisualStateGroup x:Name="CommonStates">
      <VisualState x:Name="Checked">
        <VisualState.Setters>
          <Setter Property="TextColor" Value="Accent"/>
          <Setter Property="BackgroundColor" Value="#8bc5fb"/>
          <Setter Property="CheckedColor" Value="Accent"/>
        </VisualState.Setters>
      </VisualState>
      <VisualState x:Name="Unchecked">
        <VisualState.Setters>
          <Setter Property="TextColor" Value="#ea3737"/>
          <Setter Property="BackgroundColor" Value="#f6acac"/>
          <Setter Property="UncheckedColor" Value="#ea3737"/>
        </VisualState.Setters>
      </VisualState>
    </VisualStateGroup>
  </VisualStateManager.VisualStateGroups>
</buttons:SfRadioButton>
```

### C#

```
SfRadioButton radioButton = new SfRadioButton { Text = "Radio Button" };
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState checkedState = new VisualState
{
    Name = "Checked"
};
```

```
checkedState.Setters.Add(new Setter { Property =
SfRadioButton.TextColorProperty, Value = Color.Accent });
checkedState.Setters.Add(new Setter { Property =
SfRadioButton.BackgroundColorProperty, Value = Color.FromHex("#8bc5fb") });
checkedState.Setters.Add(new Setter { Property =
SfRadioButton.CheckedColorProperty, Value = Color.Accent });
VisualState uncheckedState = new VisualState
{
    Name = "Unchecked"
};
uncheckedState.Setters.Add(new Setter { Property =
SfRadioButton.TextColorProperty, Value = Color.FromHex("#ea3737") });
uncheckedState.Setters.Add(new Setter { Property =
SfRadioButton.BackgroundColorProperty, Value = Color.FromHex("#f6acac") });
uncheckedState.Setters.Add(new Setter { Property =
SfRadioButton.UncheckedColorProperty, Value = Color.FromHex("#ea3737") });
commonStateGroup.States.Add(checkedState);
commonStateGroup.States.Add(uncheckedState);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(radioButton, visualStateGroupList);
```

#### Checked visual state:

#### Unchecked visual state:

## Grouping

### Group Key

The [GroupKey](#) in [SfRadioButton](#) allows you to group a set of radio buttons present inside any layout. By grouping in this way, you can select only one radio button that comes under same [GroupKey](#) at a time.

- [CheckedItem](#) - Gets the current checked item from radio group.

### XML

```
<ContentPage.Resources>
<syncfusion:SfRadioGroupKey x:Key="carBrand" />
</ContentPage.Resources>
<FlexLayout Wrap="Wrap" AlignItems="Start" AlignContent="Start">
<syncfusion:SfRadioButton Text="Honda" GroupKey="{StaticResource
carBrand}"/>
```

```
<syncfusion:SfRadioButton Text="Hyundai" GroupKey="{StaticResource
carBrand}"/>
<syncfusion:SfRadioButton Text="Volkswagen" GroupKey="{StaticResource
carBrand}"/>
<syncfusion:SfRadioButton Text="Toyota" GroupKey="{StaticResource
carBrand}"/>
<syncfusion:SfRadioButton Text="Volvo" GroupKey="{StaticResource
carBrand}"/>
</FlexLayout>
```

**C#**

```
SfRadioGroupKey carBrand = new SfRadioGroupKey();
SfRadioButton honda = new SfRadioButton();
honda.Text = "Honda";
honda.GroupKey = carBrand;
SfRadioButton hyundai = new SfRadioButton();
hyundai.Text = "Hyundai";
hyundai.GroupKey = carBrand;
SfRadioButton volkswagen = new SfRadioButton();
volkswagen.Text = "Volkswagen";
volkswagen.GroupKey = carBrand;
SfRadioButton toyota = new SfRadioButton();
toyota.Text = "Toyota";
toyota.GroupKey = carBrand;
SfRadioButton volvo = new SfRadioButton();
volvo.Text = "Volvo";
volvo.GroupKey = carBrand;
FlexLayout flexLayout = new FlexLayout()
{
    Wrap = FlexWrap.Wrap,
    AlignContent = FlexAlignContent.Start,
    AlignItems = FlexAlignItems.Start
};
flexLayout.Children.Add(honda);
flexLayout.Children.Add(hyundai);
flexLayout.Children.Add(volkswagen);
flexLayout.Children.Add(toyota);
flexLayout.Children.Add(volvo);
```

*CheckedChanged event*

The [CheckedChanged](#) event of [SfRadioGroupKey](#) occurs when a checked item is changed. The argument contains the following information:

- [PreviousItem](#) – Gets the previously checked radio button from group.
- [CurrentItem](#) – Gets the currently checked radio button from group.

### SfRadioGroup

[SfRadioGroup](#) is a container that contains a set of radio buttons. When you select a radio button in a radio group, all other items will be deselected automatically. At a time, you can select only one radio button from the same radio group. It also contains the [CheckedChanged](#) event and the [CheckedItem](#) property.

#### XML

```
<syncfusion:SfRadioGroup>
<syncfusion:SfRadioButton Text="Net banking" />
<syncfusion:SfRadioButton Text="Debit card" />
<syncfusion:SfRadioButton Text="Credit card" />
</syncfusion:SfRadioGroup>
```

#### C#

```
SfRadioGroup radioGroup = new SfRadioGroup();
SfRadioButton netBanking = new SfRadioButton();
netBanking.Text = "Net banking";
SfRadioButton debitCard = new SfRadioButton();
debitCard.Text = "Debit card";
SfRadioButton creditCard = new SfRadioButton();
creditCard.Text = "Credit card";
radioGroup.Children.Add(netBanking);
radioGroup.Children.Add(debitCard);
radioGroup.Children.Add(creditCard);
```

### Event

#### StateChanged event

Occurs when the value(state) of the `IsChecked` property is changed by either touching the check box or setting the value to the `IsChecked` property using XAML or C# code. The event arguments are of type `StateChangedEventArgs` and expose the following property:

- `IsChecked`: The new value(state) of the `IsChecked` property.

#### XML

```

<syncfusion:SfRadioGroup x:Name="radioGroup">
<syncfusion:SfRadioButton x:Name="check" Text="Checked State"
IsChecked="True" StateChanged="RadioButton_StateChanged"/>
<syncfusion:SfRadioButton x:Name="uncheck" Text="Unchecked State"
StateChanged="RadioButton_StateChanged"/>
</syncfusion:SfRadioGroup>
private void RadioButton_StateChanged(object sender, StateChangedEventArgs
e)
{
if (e.IsChecked.HasValue && e.IsChecked.Value)
{
(sender as SfRadioButton).Text = "Checked State";
}
else if (e.IsChecked.HasValue && !e.IsChecked.Value)
{
(sender as SfRadioButton).Text = "Unchecked State";
}
}
}

```

**C#**

```

SfRadioGroup radioGroup = new SfRadioGroup();
SfRadioButton check = new SfRadioButton();
check.Text = "Checked State";
check.IsChecked = true;
check.StateChanged += RadioButton_StateChanged;
SfRadioButton uncheck = new SfRadioButton();
uncheck.Text = "Unchecked State";
uncheck.StateChanged += RadioButton_StateChanged;
radioGroup.Children.Add(check);
radioGroup.Children.Add(uncheck);
private void RadioButton_StateChanged(object sender, StateChangedEventArgs
e)
{
if (e.IsChecked.HasValue && e.IsChecked.Value)
{
(sender as SfRadioButton).Text = "Checked State";
}
else if (e.IsChecked.HasValue && !e.IsChecked.Value)
{
(sender as SfRadioButton).Text = "Unchecked State";
}
}
}

```

## SfRadialMenu

### Overview

The Essential Xamarin SfRadialMenu displays a hierarchical menu in a circular layout, which is optimized for touch enabled devices. Typically, it is used as a context menu, and it can expose more menu items in the same space than traditional menus.

### Key features

Key features in SfRadialMenu:

- Drag — The SfRadialMenu can be floated over the layout to avoid obscuring the content behind it.
- Rotation — SfRadialMenu supports rotating items.
- FontIcon — The built-in icon font option helps users add vector images that prevent the control from experiencing any image glitches often faced with traditional image icons.
- Custom view — SfRadialMenu supports the custom view like image.
- Custom segments — Complete customization options for the menu and its items, such as coloring, sizing, placement, and shapes, using the segmentation option.
- Auto arrange — SfRadialMenu supports automatic item arrangement.
- Custom arrange — SfRadialMenu has options to place items as users needed.

## Getting Started

This section explains the steps required to launch the radial menu with hierarchical items that can be used as mobile phone system settings. This section covers only the minimal features that needed to get started with the radial menu.

### Adding SfRadialMenu reference

You can add SfRadialMenu reference using one of the following methods:

#### Method 1: Adding SfRadialMenu reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfRadialMenu to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfRadialMenu](#), and then install it.

![Adding SfRadialMenu reference from NuGet](images/Adding SfRadialMenu reference.png)

---

**Note:** Install the same version of SfRadialMenu NuGet in all the projects.

---

#### Method 2: Adding SfRadialMenu reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfRadialMenu control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfRadialMenu assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfRadialMenu.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfRadialMenu.Android.dll Syncfusion.SfRadialMenu.XForms.Android.dll Syncfusion.SfRadialMenu.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfRadialMenu.iOS.dll Syncfusion.SfRadialMenu.XForms.iOS.dll Syncfusion.SfRadialMenu.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfRadialMenu.UWP.dll Syncfusion.SfRadialMenu.XForms.UWP.dll Syncfusion.SfRadialMenu.XForms.dll Syncfusion.SfShared.UWP.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### *Additional step for iOS*

To launch [SfRadialMenu](#) in iOS, call `SfRadialMenuRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class in the iOS project as demonstrated in the following code example.

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    SfRadialMenuRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### *Additional step for UWP*

This step is required only if the application is deployed in release mode with .NET native tool chain enabled. It is needed for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the [SfRadialMenu](#) assembly at the `OnLaunched` overridden method of the `App` class in UWP project is the suggested workaround. The following code example demonstrates how to initialize the [SfRadialMenu](#) assembly.

#### **C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfRadialMenuRenderer).GetTypeInfo().Assembly);
    ;
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Creating a simple radial menu

The [SfRadialMenu](#) control is configured entirely in C# code or in XAML markup. The following steps explain how to create [SfRadialMenu](#) and configure its elements:

#### *Create the project*

Create a new BlankApp (Xamarin.Forms.Portable) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

#### *Adding radial menu in Xamarin.Forms*

1. Add the required assembly references to the pcl and renderer projects.
2. Add namespace for the referred assemblies.

#### **XML**

```
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
```

#### **C#**

```
using Syncfusion.XForms.SfRadialMenu;
```

3. Set the radial menu control as content to the ContentPage.

#### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<radialMenu:SfRadialMenu x:Name="radialMenu"/>
</ContentPage.Content>
</ContentPage>
```

#### **C#**

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            SfRadialMenu radialMenu = new SfRadialMenu();
            this.Content = radialMenu;
        }
    }
}
```

```
}
}
```

*Adding radial menu with items*

### **XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu x:Name="radialMenu"
CenterButtonText="Edit"
CenterButtonFontSize="15">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Cut"
FontSize="15"/>
<radialMenu:SfRadialMenuItem Text="Copy"
FontSize="15"/>
<radialMenu:SfRadialMenuItem Text="Paste"
FontSize="15"/>
<radialMenu:SfRadialMenuItem Text="Crop"
FontSize="15"/>
<radialMenu:SfRadialMenuItem Text="Paint"
FontSize="15"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### **C#**

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu()
{
CenterButtonText = "Edit",
CenterButtonFontSize = 15
};
ObservableCollection<SfRadialMenuItem> itemCollection = new
ObservableCollection<SfRadialMenuItem>();
itemCollection.Add(new SfRadialMenuItem()
{
Text = "Cut",
FontSize = 15
});
}
```

```
});  
itemCollection.Add(new SfRadialMenuItem()  
{  
    Text = "Copy",  
    FontSize = 15  
});  
itemCollection.Add(new SfRadialMenuItem()  
{  
    Text = "Paste",  
    FontSize = 15  
});  
itemCollection.Add(new SfRadialMenuItem()  
{  
    Text = "Crop",  
    FontSize = 15  
});  
itemCollection.Add(new SfRadialMenuItem()  
{  
    Text = "Paint",  
    FontSize = 15  
});  
radialMenu.Items = itemCollection;  
this.Content = radialMenu;  
}  
}  
}
```

We have attached sample for reference. You can download the sample from the following link.

Sample link:[GettingStarted](#)

### Populating Items

This section explains the ways about populating items through radial menu item and item source with item template.

#### Through radial menu items

By passing a collection of `SfRadialMenuItem`, you can get the view of `SfRadialMenu` control. The radial menu item class provides various options to customize the items by giving custom views, font icons, and images. You can add radial menu items by hierarchy.

#### *Adding outer rim items of radial menu*

The following code snippet demonstrates how to add the outer rim items of radial menu.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

## C#

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            ObservableCollection<SfRadialMenuItem> itemCollection = new
            ObservableCollection<SfRadialMenuItem>();
            itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
            });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
            });
            radialMenu.Items = itemCollection;
            this.Content = radialMenu;
        }
    }
}
```

### *Adding nested items of radial menu*

You can populate the nested levels of items within a menu to group similar actions based on their result. For example, you can group the clipboard operations by adding a clipboard as a main menu and cut, copy, and paste as its children.

The following code snippet demonstrates how to add the nested items of radial menu.

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu CenterButtonText="Edit"
CenterButtonFontSize="12">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold"
FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy"
FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo"
FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste"
FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12">
<radialMenu:SfRadialMenuItem.Items>
<radialMenu:SfRadialMenuItem Text="Font"
FontSize="12"
ItemWidth="50"/>
<radialMenu:SfRadialMenuItem Text="Gradient"
FontSize="12"
ItemWidth="50"/>
<radialMenu:SfRadialMenuItem Text="Highlight"
FontSize="12"
ItemWidth="50"/>
</radialMenu:SfRadialMenuItem.Items>
</radialMenu:SfRadialMenuItem>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

**C#**

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            string[] mainItem = new string[] { "Bold", "Copy", "Paste", "Undo", "Color"
        };
            string[] colorItem = new string[] { "Font", "Gradient", "Highlight" };
            SfRadialMenu radialMenu = new SfRadialMenu();
            // Adding radial menu outer rim items.
            for (int i = 0; i < 5; i++)
```

```

{
    SfRadialMenuItem mainMenuItems = new SfRadialMenuItem();
    mainMenuItems.Text = mainItem[i];
    mainMenuItems.FontSize = 12;
    radialMenu.Items.Add(mainMenuItems);
}
// Adding inner rim items.
for (int i = 0; i < 3; i++)
{
    SfRadialMenuItem colorSubMenuItem = new SfRadialMenuItem();
    colorSubMenuItem.Text = colorItem[i];
    colorSubMenuItem.FontSize = 12;
    colorSubMenuItem.ItemWidth = 50;
    radialMenu.Items[4].Items.Add(colorSubMenuItem);
}
}
}
}

```

### Through ItemsSource and ItemTemplate

Using ItemsSource, objects of any class can be given as items for SfRadialMenu. The views corresponding to the objects can be set using the ItemTemplate property. A simple usage of ItemTemplate and ItemsSource to display a default image and name of users is shown in the following code.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="RadialSample.MainPage">
<ContentPage.BindingContext>
<local:EmployeeViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<radialMenu:SfRadialMenu
x:Name="radial_Menu"
ItemsSource="{Binding EmployeeCollection}">

```

```

<radialMenu:SfRadialMenu.ItemTemplate>
<DataTemplate>
<StackLayout>
<Image Source="user.png"
HorizontalOptions="Center"
WidthRequest="15"/>
<Label Text="{Binding EmployeeName}"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center"/>
</StackLayout>
</DataTemplate>
</radialMenu:SfRadialMenu.ItemTemplate>
</radialMenu:SfRadialMenu>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
}
}
public class EmployeeModel
{
private string employeeName;
public string EmployeeName
{
get { return employeeName; }
set { employeeName = value; }
}
}
public class EmployeeViewModel
{
private ObservableCollection<EmployeeModel> employeeCollection = new
ObservableCollection<EmployeeModel>();
public ObservableCollection<EmployeeModel> EmployeeCollection
{
get { return employeeCollection; }
set { employeeCollection = value; }
}
public EmployeeViewModel()
{
EmployeeCollection.Add(new EmployeeModel() { EmployeeName = "Alex" });
EmployeeCollection.Add(new EmployeeModel() { EmployeeName = "Lee" });
EmployeeCollection.Add(new EmployeeModel() { EmployeeName = "Ben" });
EmployeeCollection.Add(new EmployeeModel() { EmployeeName = "Carl" });
EmployeeCollection.Add(new EmployeeModel() { EmployeeName = "Yang" });
}
}

```

```
}
}
```

### Animation duration

Duration of animation in radial menu can be changed using the [AnimationDuration](#) property. It is used to change the speed of opening and closing of radial menu.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu AnimationDuration="1000">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu()
{
AnimationDuration = 1000
};
ObservableCollection<SfRadialMenuItem> itemCollection = new
ObservableCollection<SfRadialMenuItem>();
itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
});
itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
});
radialMenu.Items = itemCollection;
this.Content = radialMenu;
```

```

}
}
}

```

IsOpen

The [IsOpen](#) property indicates whether the radial menu is in open or close state.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu IsOpen="True">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>

```

### C#

```

using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu()
            {
                IsOpen = true
            };
            ObservableCollection<SfRadialMenuItem> itemCollection = new
            ObservableCollection<SfRadialMenuItem>();
            itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
            });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
            });
            radialMenu.Items = itemCollection;
            this.Content = radialMenu;
        }
    }
}

```

```
}
}
```

### Selection color of radial menu

Selection color of an item can be changed using the [SelectionColor](#) property of radial menu.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu SelectionColor="#FFFF33">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu()
            {
                SelectionColor = Color.FromHex("#FFFF33")
            };
            ObservableCollection<SfRadialMenuItem> itemCollection = new
            ObservableCollection<SfRadialMenuItem>();
            itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
            });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
            });
            radialMenu.Items = itemCollection;
            this.Content = radialMenu;
        }
    }
}
```

```
}

```

### Separator thickness and color in radial menu

Thickness of strip between the two items can be changed using the [SeparatorThickness](#) property and the color of strip can be changed using the [SeparatorColor](#) property.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu SeparatorThickness="5"
SeparatorColor="#FF1493">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu()
{
SeparatorThickness = 50,
SeparatorColor = Color.FromHex("#FF1493")
};
ObservableCollection<SfRadialMenuItem> itemCollection = new
ObservableCollection<SfRadialMenuItem>();
itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
});
itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
});
radialMenu.Items = itemCollection;
```

```

this.Content = radialMenu;
}
}
}

```

Rim color and rim radius in radial menu

The radius of rim can be changed using the [RimRadius](#) property and the color of rim can be changed using the [RimColor](#) property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu RimRadius="150"
RimColor="#FF1493">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>

```

### C#

```

using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu()
{
RimRadius = 150,
RimColor = Color.FromHex("#FF1493")
};
ObservableCollection<SfRadialMenuItem> itemCollection = new
ObservableCollection<SfRadialMenuItem>();
itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
});
itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });

```

```
itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
});
radialMenu.Items = itemCollection;
this.Content = radialMenu;
}
}
}
```

### DisplayMemberPath

The control is populated with a list of employees, and the employee model contains two properties: ID and EmployeeName. So, it is necessary to intimate by which property it should display to the items. The [DisplayMemberPath](#) property specifies the property path.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<ContentPage.BindingContext>
<local:EmployeeViewModel/>
</ContentPage.BindingContext>
<radialMenu:SfRadialMenu
ItemsSource="{Binding EmployeeCollection}"
DisplayMemberPath="EmployeeName"/>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
}
}
public class Employee
{
private int id;
public int ID
{
get { return id; }
set { id = value; }
}
private string employeeName;
public string EmployeeName
```

```

{
    get { return employeeName; }
    set { employeeName = value; }
}
}
public class EmployeeViewModel
{
    private ObservableCollection<Employee> employeeCollection;
    public ObservableCollection<Employee> EmployeeCollection
    {
        get { return employeeCollection; }
        set { employeeCollection = value; }
    }
    public EmployeeViewModel()
    {
        employeeCollection = new ObservableCollection<Employee>();
        employeeCollection.Add(new Employee() { ID = 1, EmployeeName = "Eric" });
        employeeCollection.Add(new Employee() { ID = 2, EmployeeName = "James" });
        employeeCollection.Add(new Employee() { ID = 3, EmployeeName = "Jacob" });
        employeeCollection.Add(new Employee() { ID = 4, EmployeeName = "Lucas" });
    }
}
}

```

## SfRadialMenuItem Customization

The `SfRadialMenuItem` class provides various options to customize the items by giving Custom Views, FontIcons, and Images. You can add radial menu items by hierarchy. To add a `SfRadialMenuItem` with `SfRadialMenu`, create an instance of `SfRadialMenuItem`, and add it to the `Items` property, which is available in `SfRadialMenu`.

### Items

The `Items` property populates the items to the inner rim of `SfRadialMenu` when tapping the items of outer rim.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
    xmlns:local="clr-namespace:RadialSample"
    xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
    x:Class="RadialSample.MainPage">
    <radialMenu:SfRadialMenu>
        <radialMenu:SfRadialMenu.Items>
            <radialMenu:SfRadialMenuItem Text="Copy">
                <radialMenu:SfRadialMenuItem.Items>
                    <radialMenu:SfRadialMenuItem Text="Paste"/>
                </radialMenu:SfRadialMenuItem.Items>
            </radialMenu:SfRadialMenuItem>
        </radialMenu:SfRadialMenu.Items>
    </radialMenu:SfRadialMenu>
</ContentPage>

```

## C#

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem() { Text = "Copy" });
            radialMenu.Items[0].Items.Add(new SfRadialMenuItem() { Text = "Paste" });
            this.Content = radialMenu;
        }
    }
}
```

## Text

The [Text](#) property provides text to the [SfRadialMenuItem](#).

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="RadialSample.MainPage">
    <radialMenu:SfRadialMenu>
        <radialMenu:SfRadialMenu.Items>
            <radialMenu:SfRadialMenuItem Text="Cut"/>
        </radialMenu:SfRadialMenu.Items>
    </radialMenu:SfRadialMenu>
</ContentPage>
```

## C#

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem() { Text = "Copy" });
            this.Content = radialMenu;
        }
    }
}
```

## ItemHeight

The [ItemHeight](#) changes the height of the [SfRadialMenuItem](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Cut"
ItemHeight="10"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                Text = "Cut",
                ItemHeight = 10
            });
            this.Content = radialMenu;
        }
    }
}
```

## ItemWidth

The [ItemWidth](#) property changes the width of the [SfRadialMenuItem](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
```

```
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"

<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Cut"
BackgroundColor="Pink"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

**C#**

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                Text = "Cut",
                BackgroundColor = Color.Pink
            });
            this.Content = radialMenu;
        }
    }
}
```

**FontFamily**

The [FontFamily](#) property changes the font family of text in [SfRadialMenuItem](#).

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="RadialSample.MainPage">
    <radialMenu:SfRadialMenu>
        <radialMenu:SfRadialMenu.Items>
            <radialMenu:SfRadialMenuItem Text="Cut"
FontFamily="Times New Roman"/>
        </radialMenu:SfRadialMenu.Items>
    </radialMenu:SfRadialMenu>
</ContentPage>
```

**C#**

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
```

```
{
    Text = "Cut",
    FontFamily = "Times New Roman"
});
this.Content = radialMenu;
}
}
```

### FontSize

The [FontSize](#) property changes the text size in the [SfRadialMenuItem](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Cut"
FontSize="20"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                Text = "Cut",
                FontSize = 20
            });
            this.Content = radialMenu;
        }
    }
}
```

### FontAttribute

The [FontAttributes](#) property changes the font attributes of text in [SfRadialMenuItem](#).

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Cut"
FontAttributes="Bold"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

**C#**

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                Text = "Cut",
                FontAttributes = FontAttributes.Bold
            });
            this.Content = radialMenu;
        }
    }
}
```

**Image**

The [Image](#) property provides image to the [SfRadialMenuItem](#).

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Image="user.png"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

```

</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>

```

**C#**

```

using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                Image = "user.png"
            });
            this.Content = radialMenu;
        }
    }
}

```

**VisibleSegmentCount**

The [VisibleSegmentsCount](#) property provides the number of items to be displayed in radial menu item.

**XML**

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="RadialSample.MainPage">
    <radialMenu:SfRadialMenu>
        <radialMenu:SfRadialMenu.Items>
            <radialMenu:SfRadialMenuItem VisibleSegmentsCount="3"/>
        </radialMenu:SfRadialMenu.Items>
    </radialMenu:SfRadialMenu>
</ContentPage>

```

**C#**

```

using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {

```

```
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu();
radialMenu.Items.Add(new SfRadialMenuItem()
{
    VisibleSegmentsCount = 3
});
this.Content = radialMenu;
}
}
```

### BackgroundImage

The [BackgroundImage](#) property provides the background image to the [SfRadialMenuItem](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem BackgroundImage="facebook.png"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                BackgroundImage = "facebook.png"
            });
            this.Content = radialMenu;
        }
    }
}
```

You can download the sample for reference from the following link: [Sample for adding BackgroundImage](#).

## FontIconText

The [FontIconText](#) property provides font icon to the [SfRadialMenuItem](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem FontIconText="&#xe734;"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>
```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                FontIconText = "\uE734"
            });
            this.Content = radialMenu;
        }
    }
}
```

## IconFontColor

The [IconFontColor](#) property changes the color of font icon in [SfRadialMenuItem](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu>
<radialMenu:SfRadialMenu.Items>
```

```
<radialMenu:SfRadialMenuItem FontIconText="&#xe734;"
IconFontColor="#313131"/>
</radialMenu:SfRadialMenuItem>
</radialMenu:SfRadialMenu>
</ContentPage>
```

**C#**

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                FontIconText = "\uE734",
                IconFontColor = Color.FromHex("#313131")
            });
            this.Content = radialMenu;
        }
    }
}
```

**IconFontSize**

The [IconFontSize](#) property changes the size of font icon in the [SfRadialMenuItem](#).

**XML**

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XForms"
x:Class="RadialSample.MainPage">
    <radialMenu:SfRadialMenu>
        <radialMenu:SfRadialMenu.Items>
            <radialMenu:SfRadialMenuItem FontIconText="&#xe734;"
IconFontColor="#313131"
IconFontSize="10"/>
        </radialMenu:SfRadialMenu.Items>
    </radialMenu:SfRadialMenu>
</ContentPage>
```

**C#**

```
using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample
```

```

{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu();
radialMenu.Items.Add(new SfRadialMenuItem()
{
FontIconText = "\uE734",
IconFontColor = Color.FromHex("#313131"),
IconFontSize = 10
});
this.Content = radialMenu;
}
}
}

```

### IconFontFamily

The [IconFontFamily](#) property changes the font family of font icon in the [SfRadialMenuItem](#).

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem FontIconText="&#xe734;"
IconFontColor="#313131"
IconFontSize="10"
IconFontFamily="{StaticResource customfontfamily}"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage.Content>
</ContentPage>

```

### C#

```

using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;

```

```

namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            radialMenu.Items.Add(new SfRadialMenuItem()
            {
                FontIconText = "\uE734",
                IconFontColor = Color.FromHex("#313131"),
                IconFontSize = 10,
                IconFontFamily = Device.RuntimePlatform == Device.iOS ? "Segoe MDL2 Assets"
                : Device.RuntimePlatform == Device.Android ? "radialmenu_Segoe MDL2
                Assets.ttf" : "radialmenu_Segoe_MDL2_Assets.ttf#Segoe MDL2 Assets"
            });
            this.Content = radialMenu;
        }
    }
}

```

**Note:** <https://xamarinhelp.com/custom-fonts-xamarin-forms/> provides how to add the ttf file in each platform

View

The [View](#) provides custom view to the [SfRadialMenuItem](#).

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
    <radialMenu:SfRadialMenu>
        <radialMenu:SfRadialMenu.Items>
            <radialMenu:SfRadialMenuItem>
                <radialMenu:SfRadialMenuItem.View>
                    <Label Text="Cut"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center"/>
                </radialMenu:SfRadialMenuItem.View>
            </radialMenu:SfRadialMenuItem>
        </radialMenu:SfRadialMenu.Items>
    </radialMenu:SfRadialMenu>
</ContentPage>

```

### C#

```

using Syncfusion.SfRadialMenu.XForms;
using Xamarin.Forms;
namespace RadialSample

```

```

{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu();
radialMenu.Items.Add(new SfRadialMenuItem()
{
View = new Label()
{
Text = "Cut",
HorizontalTextAlignment = TextAlignment.Center,
VerticalTextAlignment = TextAlignment.Center
}
});
this.Content = radialMenu;
}
}
}

```

## Layout types

There are two different layout types available for radial menu:

- Default
- Custom

Both the layout types divide the available space equally among all the children in the circular panel.

### Default

Number of segments in the panel is determined by children count in the level. Hence, segment count in each hierarchical level differs, radial menu items are arranged in the sequential order as added in the radial menu.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:RadialSample"
xmlns:radialMenu="clr-
namespace:Syncfusion.SfRadialMenu.XForms;assembly=Syncfusion.SfRadialMenu.XF
orms"
x:Class="RadialSample.MainPage">
<radialMenu:SfRadialMenu LayoutType="Default">
<radialMenu:SfRadialMenu.Items>
<radialMenu:SfRadialMenuItem Text="Bold" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Copy" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Undo" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Paste" FontSize="12"/>
<radialMenu:SfRadialMenuItem Text="Color" FontSize="12"/>
</radialMenu:SfRadialMenu.Items>
</radialMenu:SfRadialMenu>
</ContentPage>

```

**XML**

```

using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu()
            {
                LayoutType = LayoutType.Default
            };
            ObservableCollection<SfRadialMenuItem> itemCollection = new
            ObservableCollection<SfRadialMenuItem>();
            itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12 });
            radialMenu.Items = itemCollection;
            this.Content = radialMenu;
        }
    }
}

```

**Custom**

The number of segments in the panel is determined using the `VisibleSegmentsCount` property. Since the segment count in all the hierarchical levels are same, radial menu items are arranged in any order based on the `SegmentIndex` property.

**XML**

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

            itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
            });
            radialMenu.Items = itemCollection;
            this.Content = radialMenu;
        }
    }
}
```

### [VisibleSegmentsCount](#)

The **VisibleSegmentsCount** property is used to specify the number of segments available in circular panel. When children count is greater than the value given in the VisibleSegmentsCount property, the overflowing children are not arranged in the panel. When children count is lesser than the VisibleSegmentsCount property, then remaining segments are left free.

If number of item count is higher than VisibleItemCount, excessive items will not be shown.

### SegmentIndex

**SegmentIndex** property is used to specify the index of the radial menu item in circular panel. Based on the index, the radial menu items are inserted in the segment. When the SegmentIndex is not specified for a RadialMenuItem the menu item is arranged in the next available free segment.

Code snippet for VisibleSegmentCount and SegmentIndex

}
```

## Placing and Dragging RadialMenu

You can place radial menu anywhere on its parent layout, and drag it with in the parent layout.

## Dragging RadialMenu

You can enable/disable dragging by using the `IsDragEnabled` property.

        }
    }
}

```

## DragEvents

SfRadialMenu provides for event for DragBegin and DragEnd in which the event get hooked when the RadialMenu is get dragged.

### DragBegin event

This event get triggered when RadialMenu is start to drag with `DragBeginEventArgs`.

- **Position** - Gets the Start position of the RadialMenu
- **Handled** - Gets and Sets the boolean value for enabling and disabling the dragging of RadialMenu.

To hook the `DragBegin` event, and to get the start position and restricts the dragging, follow the code example:

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

this.Content = radialMenu;
}
private void RadialMenu_DragBegin(object sender, DragBeginEventArgs e)
{
e.Handled = true;
}
}
}

```

### Drag End

This event gets triggered when dragging is ended in RadialMenu with **DragEventArgs**.

- **OldValue** - Gets the Start position of the RadialMenu
- **NewValue** - Gets the end position of the RadialMenu
- **Handled** - Gets and Sets the boolean value for restricting the RadialMenu to move another position.

To hook the **DragEnd** event, and to get the start position, end position and restricts the movement of the RadialMenu, follow the code example:

            };
            this.Content = radialMenu;
        }
    }
}

```

### CenterButton Customization

The CenterButton or BackButton in radial menu is a view in the center of the radial menu. It performs the operations such as opening and closing the rim and navigating to next level items. The radial menu allows you to customize the CenterButton/BackButton with **FontIcon**, **Custom View**, and **Caption**.

### CenterButtonText and CenterButtonBackText

The [CenterButtonText](#) changes the text of the center button in [SfRadialMenu](#), and the [CenterButtonBackText](#) changes the text of the center back button in [SfRadialMenu](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

```

### C#

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu()
            {
                EnableCenterButtonAnimation = true
            };
            ObservableCollection<SfRadialMenuItem> itemCollection = new
            ObservableCollection<SfRadialMenuItem>();
            itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
            });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
            });
            radialMenu.Items = itemCollection;
            this.Content = radialMenu;
        }
    }
}
```

## Events

Perform an action while navigating to next level

In radial menu, you can perform an action while navigating from one level to another level. The [Navigating](#) event occurs when navigating from one level to another level and the [Navigated](#) event occurs after navigating to another level.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>

using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
public partial class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
SfRadialMenu radialMenu = new SfRadialMenu();
ObservableCollection<SfRadialMenuItem> itemCollection = new
ObservableCollection<SfRadialMenuItem>();
itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
});
itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
});
radialMenu.Items = itemCollection;
radialMenu.Navigating += SfRadialMenu_Navigating;
radialMenu.Navigated += SfRadialMenu_Navigated;
this.Content = radialMenu;
}
```

```
private void SfRadialMenu_Navigating(object sender, NavigatingEventArgs e)
{
    DisplayAlert("Alert", "ItemNavigating", "Ok");
}
private void SfRadialMenu_Navigated(object sender, NavigatedEventArgs e)
{
    DisplayAlert("Alert", "ItemNavigated", "Ok");
}
}
```

**Note:** You can cancel navigation using the **Cancel** event argument.

Perform an action while opening the radial menu

You can perform an action while opening the radial menu. The [Opening](#) event occurs when opening the radial menu and the [Opened](#) event occurs after opening the radial menu.

</ContentPage>
```

## C#

```
using Syncfusion.SfRadialMenu.XForms;
using System.Collections.ObjectModel;
using Xamarin.Forms;
namespace RadialSample
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRadialMenu radialMenu = new SfRadialMenu();
            ObservableCollection<SfRadialMenuItem> itemCollection = new
            ObservableCollection<SfRadialMenuItem>();
            itemCollection.Add(new SfRadialMenuItem() { Text = "Bold", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Copy", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Paste", FontSize = 12
            });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Undo", FontSize = 12 });
            itemCollection.Add(new SfRadialMenuItem() { Text = "Color", FontSize = 12
            });
            radialMenu.Items = itemCollection;
            radialMenu.Items[0].ItemTapped += SfRadialMenuItem_ItemTapped;
            this.Content = radialMenu;
        }
        private void SfRadialMenuItem_ItemTapped(object sender,
            Syncfusion.SfRadialMenu.XForms.ItemTappedEventArgs e)
        {
            {
                DisplayAlert("Alert", "ItemTapped", "Ok");
            }
        }
    }
}
```

## AutomationId

The SfRadialMenu control has built-in AutomationId for inner elements. The AutomationId API allows the automation framework to find and interact with the inner elements of the SfRadialMenu control. To keep unique AutomationId, these inner elements AutomationIds are updated based on the control's AutomationId.

For example, if you set SfRadialMenu's AutomationId as "Circular Menu" and the first SfRadialMenuItem's AutomationId as "Circular Menu List", then the automation framework will interact with the center button as "Circular Menu Center Button" and the first radial item as "Circular Menu List Item 4 of 6" (6 denotes the total count).

The following screenshot illustrates the AutomationIds of inner elements. The automation framework will interact with the Center Back Button as "Circular Menu Center Back Button".

## SfRangeSlider

### Overview

The range slider control for Xamarin.Forms allows you select a range of values within the specified minimum and maximum limits. The range can be selected by moving the thumb along track.

## Key features

- Provides support to select values as a range.
- Restricts values to choose within a minimum and maximum constraints.
- Supports to change the tick intervals in uniform pattern.
- Provides user-friendly customization support to customize ticks and labels.

## Getting Started

This section explains you the steps to configure a SfRangeSlider control in a real-time scenario and also provides a walk-through on some of the customization features available in SfRangeSlider control.

### Adding SfRangeSlider reference

You can add SfRangeSlider reference using one of the following methods:

#### Method 1: Adding SfRangeSlider reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfRangeSlider). To add SfRangeSlider to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfRangeSlider](https://www.nuget.org/packages/Syncfusion.Xamarin.SfRangeSlider), and then install it.

![Adding SfRangeSlider reference from nuget.org](images/Adding SfRangeSlider reference.png)

---

**Note:** Install the same version of SfRangeSlider NuGet in all the projects.

---

#### Method 2: Adding SfRangeSlider reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfRangeSlider control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfRangeSlider assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfRangeSlider.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfRangeSlider.Android.dll Syncfusion.SfRangeSlider.XForms.Android.dll Syncfusion.SfRangeSlider.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfRangeSlider.iOS.dll Syncfusion.SfRangeSlider.XForms.iOS.dll Syncfusion.SfRangeSlider.XForms.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll Syncfusion.SfRangeSlider.XForms.UWP.dll Syncfusion.SfRangeSlider.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** Currently an additional step is required for iOS project. You need to create an instance of RangeSlider custom renderer. If you are adding the references from toolbox, this step is not needed.

Create an instance of SfRangeSliderRenderer in the FinishedLaunching overridden method of AppDelegate class in the iOS Project as shown below.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    new SfRangeSliderRenderer ();
}
```

#### Additional step for UWP

This step is required only if the application is deployed in release mode with .NET native tool chain enabled. It is needed for resolving the known Framework issue “Custom controls not rendering in Release mode” in UWP platform. Initializing the SfRangeSlider assembly at the OnLaunched overridden method of the App class in UWP project is the suggested workaround. The following code example demonstrates how to initialize the SfRangeSlider assembly.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfRangeSliderRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
```

```
Xamarin.Forms.Forms.Init(e, assembliesToInclude);  
...  
}
```

- Adding namespace for the added assemblies.

### XML

```
<xmlns:range="clr-  
namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.  
XForms"/>
```

### C#

```
using Syncfusion.SfRangeSlider.XForms;
```

- Now instantiate and add the SfRangeSlider control with a required optimal name.

### XML

```
<range:SfRangeSlider x:Name="rangeSlider"/>
```

### C#

```
SfRangeSlider rangeSlider=new SfRangeSlider();  
this.Content = rangeSlider;
```

### Set Range

SfRangeSlider provides option to set single thumb and double thumb. While setting the double thumb, each thumb value can be set using **RangeStart** and **RangeEnd** properties.

**Note:** The **ShowRange** property is used to switch between a single thumb and double thumb.

### XML

```
<range:SfRangeSlider x:Name="rangeSlider" RangeEnd="20" RangeStart="4"  
ShowRange="true"/>
```

### C#

```
SfRangeSlider rangeSlider=new SfRangeSlider();  
rangeSlider.RangeEnd=20;  
rangeSlider.RangeStart=4;  
rangeSlider.ShowRange=true;  
this.Content = rangeSlider;
```

### Restricting Values

SfRangeSlider provides option to restrict slider range between minimum and maximum values. Following code explains how to set the range using `Minimum` and `Maximum` properties in the SfRangeSlider.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" Minimum="0" Maximum="24"/>
```

#### C#

```
SfRangeSlider rangeSlider=new SfRangeSlider();  
rangeSlider.RangeEnd=20;  
rangeSlider.RangeStart=4;  
rangeSlider.ShowRange=true;  
rangeSlider.Minimum=0;  
rangeSlider.Maximum=24;  
this.Content = rangeSlider;
```

### Adding Snapping Mode

The movement of the thumb can be varied in different ways. This is achieved by setting the `SnapsTo` property.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" SnapsTo="Ticks"  
StepFrequency="6"/>
```

#### C#

```
SfRangeSlider rangeSlider=new SfRangeSlider();  
rangeSlider.RangeEnd=20;  
rangeSlider.RangeStart=4;  
rangeSlider.ShowRange=true;  
rangeSlider.Minimum=0;  
rangeSlider.Maximum=24;  
rangeSlider.SnapsTo=SnapsTo.Ticks;  
rangeSlider.StepFrequency=6;  
this.Content = rangeSlider;
```

The complete Getting Started sample is available in [this](#) link.

### Range

The SfRangeSlider control supports to select range of value by using two Thumbs.

#### Set Show Range

The `ShowRange` property should be set to true for displaying two thumbs in track with range of values.

**Note:** When this property is set to false, single thumb is displayed without any range

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" ShowRange="true"/>
```

### C#

```
rangeSlider.ShowRange= true;
```

### Set Range values

This section explains about setting Range start and end value.

#### RangeStart

Gets and sets the start value of the range.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" RangeStart="4" />
```

### C#

```
rangeSlider.RangeStart=0;
```

#### RangeEnd

Gets and sets the end value of the range.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" RangeEnd="20" />
```

### C#

```
rangeSlider.RangeEnd=10;
```

### ValueChangeMode

The ValueChangeMode property changes the value based on the touch of the SfRangeSlider control. It consists of the following two types

- Default
- OnThumbPress

**Note:** The default value of the ValueChangeMode property is Default.

#### Default

The value is updated when you touch inside the control.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" ValueChangeMode="Default" />
```

### C#

```
rangeSlider.ValueChangeMode = ValueChangeMode.Default;
```

#### OnThumb

The value is updated when you touch or move the thumb/knob.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" ValueChangeMode="OnThumb" />
```

### C#

```
rangeSlider.ValueChangeMode = ValueChangeMode.OnThumb;
```

### Value

Gets or sets the range value, which ranges between Minimum and Maximum. The default value of RangeSlider is 0.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" Minimum="0" Maximum="100" Value="30" />
```

### C#

```
rangeslider.Value = 30;
```

### Customizing ticks

Tick marks can be placed along the track in a uniform manner or its position can also be customized.

### TickPlacement

The **TickPlacement** property determines where to draw tick marks in relation to the track. Available options for this property are,

- BottomRight
- Inline
- None
- Outside
- TopLeft

**Note:** The default option is Inline.

#### *BottomRight*

Tick marks can be placed either below the track in horizontal orientation or right of the track in vertical orientation.

#### **XML**

```
<range:SfRangeSlider x:Name="rangeslider" TickPlacement="BottomRight"/>
```

#### **C#**

```
rangeSlider.TickPlacement=TickPlacement.BottomRight;
```

#### *TopLeft*

Tick marks are placed either above the track in horizontal orientation or left of the track in vertical orientation.

#### **XML**

```
<range:SfRangeSlider x:Name="rangeslider" TickPlacement="TopLeft"/>
```

#### **C#**

```
rangeSlider.TickPlacement=TickPlacement.TopLeft;
```

#### *Inline*

Ticks are placed along the track.

#### **XML**

```
<range:SfRangeSlider x:Name="rangeslider" TickPlacement="Inline"/>
```

#### **C#**

```
rangeSlider.TickPlacement=TickPlacement.Inline;
```

### Outside

Tick marks are placed on both sides of the track either in horizontal or vertical orientation.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" TickPlacement="Outside"/>
```

### C#

```
rangeSlider.TickPlacement=TickPlacement.Outside;
```

### Customizing tick color

The range slider control provides the `TickColor` property to customize the color of ticks in tick bar.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:range="clr-namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.XForms"
x:Class="GettingStarted.RangeSliderSample">
<ContentPage.Content>
<range:SfRangeSlider x:Name="rangeslider" Orientation="Horizontal"
TickColor="#FFFFFF"/>
</ContentPage.Content>
</ContentPage>
```

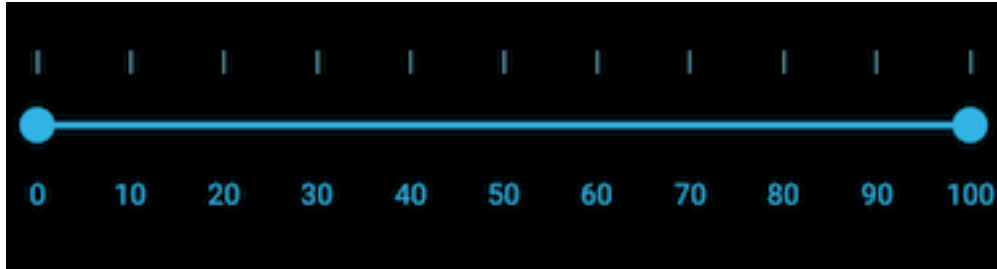

### C#

```
using Syncfusion.XForms.SfRangeSlider;
using Xamarin.Forms;
namespace GettingStarted
{
    /// <summary>
    /// Range slider sample.
    /// </summary>
    public partial class RangeSliderSample : ContentPage
    {
        public RangeSliderSample()
        {
            InitializeComponent();
            SfRangeSlider rangeSlider = new SfRangeSlider() { TickColor =
            Color.FromHex("#FFFFFF"), Orientation=Orientation.Horizontal};
```

```

this.Content = rangeSlider;
}
}
}

```

## TrackBar Customization

### Customizing track height

The thickness of track bar can be customized by setting the `TrackThickness` property of `SfRangeSlider`.

### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:TrackCustomization"
xmlns:slider="clr-
namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.
XForms"
x:Class="TrackCustomization.MainPage">
<slider:SfRangeSlider Orientation="Horizontal"
TrackThickness="10"
RangeStart="0"
RangeEnd="2"/>
</ContentPage>

```

### C#

```

using Syncfusion.SfRangeSlider.XForms;
using Xamarin.Forms;
namespace TrackCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRangeSlider slider = new SfRangeSlider();
            slider.Orientation = Orientation.Horizontal;
            slider.RangeStart = 0;
            slider.RangeEnd = 2;
            slider.TrackThickness = 10;
            Content = slider;
        }
    }
}

```

### *Customizing dragged area height*

The thickness for the selected range or selected portion of track bar can be customized by setting the `TrackSelectionThickness` property of `SfRangeSlider`.

### **XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:TrackCustomization"
xmlns:slider="clr-
namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.
XForms"
x:Class="TrackCustomization.MainPage">
<slider:SfRangeSlider Orientation="Horizontal"
TrackSelectionThickness="10"
RangeStart="10"
RangeEnd="30"/>
</ContentPage>
```

### **C#**

```
using Syncfusion.SfRangeSlider.XForms;
using Xamarin.Forms;
namespace TrackCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRangeSlider slider = new SfRangeSlider();
            slider.Orientation = Orientation.Horizontal;
            slider.TrackSelectionThickness = 10;
            slider.RangeStart = 10;
            slider.RangeEnd = 30;
            Content = slider;
        }
    }
}
```

### Customizing track color

The color of track bar can be customized by setting the TrackColor property of SfRangeSlider.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:TrackCustomization"
xmlns:slider="clr-
namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.
XForms"
x:Class="TrackCustomization.MainPage">
<slider:SfRangeSlider Orientation="Horizontal"
TrackColor="Maroon"
RangeStart="10"
RangeEnd="40"/>
</ContentPage>
```

### C#

```
using Syncfusion.SfRangeSlider.XForms;
using Xamarin.Forms;
namespace TrackCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRangeSlider slider = new SfRangeSlider();
            slider.Orientation = Orientation.Horizontal;
            slider.TrackColor = Color.Maroon;
            slider.RangeStart = 10;
            slider.RangeEnd = 40;
            Content = slider;
        }
    }
}
```

### Customizing dragged area color

The color for the selected range or selected portion of track bar can be customized by setting the `TrackSelectionColor` property of `SfRangeSlider`.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:TrackCustomization"
xmlns:slider="clr-
namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.
XForms"
x:Class="TrackCustomization.MainPage">
<slider:SfRangeSlider Orientation="Horizontal"
TrackSelectionColor="Red"
RangeStart="10"
RangeEnd="40"/>
</ContentPage>
```

### C#

```
using Syncfusion.SfRangeSlider.XForms;
using Xamarin.Forms;
namespace TrackCustomization
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
            SfRangeSlider slider = new SfRangeSlider();
            slider.Orientation = Orientation.Horizontal;
            slider.TrackSelectionColor = Color.Red;
            slider.RangeStart = 10;
            slider.RangeEnd = 40;
            Content = slider;
        }
    }
}
```

### Customizing knob color

The **KnobColor** property is used to change the knob color of SfRangeSlider.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" KnobColor="Red" Minimum="0"
Maximum="100"/>
```

#### C#

```
rangeslider.KnobColor = Color.Red;
```

### Customizing thumb size

The **ThumbSize** property is used to change the thumb size of SfRangeSlider.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" ThumbSize="3" Minimum="0"
Maximum="100"/>
```

#### C#

```
rangeslider.ThumbSize = 3;
```

## Formatting String

The Value label of the SfRangeSlider can be configured to display different formats like currency format, percent format etc. We can also customize the Value label with string formatting. We can customize using **FormatString** property which determines the format specifier by which the display Value has to be formatted.

### Formatting types

We have different formatting types such as currency format, exponential format, number format, percentage format etc. We can also add the text with Value using **FormatString**

#### XML

```
<StackLayout Margin="3">
<range:SfRangeSlider x:Name="rangeSlider1" FormatString="Money: {0:c}"
HeightRequest="90" WidthRequest="200" Minimum="0" Maximum="12"
RangeStart="0" RangeEnd="12" TickFrequency="2"/>
</StackLayout>
```

**C#**

```

StackLayout stack = new StackLayout();
SfRangeSlider rangeSlider2 = new SfRangeSlider();
rangeSlider2 .RangeEnd=12;
rangeSlider2 .RangeStart=0;
rangeSlider2 .TickFrequency = 2;
rangeSlider2 .HeightRequest="90";
rangeSlider2 .WidthRequest=200;
rangeSlider2 .FormatString = "{0:N2}"
rangeSlider2 .ShowRange=true;
rangeSlider2 .TrackHeight="4";
rangeSlider2 .Minimum=0;
rangeSlider2 .Maximum=12;
this.stack.Children.Add(rangeSlider2);
this.Content = stack;

```

**Culture Localization**

We have provided the support for changing the Culture when using Currency notation for the formatting type. For this we have to enable Currency format and set the desired culture to be shown.

**XML**

```

<range:SfRangeSlider x:Name="sfRangeSlider2" FormatString="c:{0:c2}"
HeightRequest="90" WidthRequest="200" Minimum="0" Maximum="12"
RangeStart="0" RangeEnd="12" TickFrequency="2"/>

```

**C#**

```

SfRangeSlider rangeSlider=new SfRangeSlider();
rangeSlider.RangeEnd=12;
rangeSlider.RangeStart=0;
rangeSlider.TickFrequency = 2;
rangeSlider.HeightRequest="90";
rangeSlider.WidthRequest=200;
rangeSlider.FormatString = "c:{0:C2}"
rangeSlider.Culture = new System.Globalization.CultureInfo("fr-FR");
rangeSlider.ShowRange=true;
rangeSlider.TrackHeight="4";
rangeSlider.Minimum=0;
rangeSlider.Maximum=12;
this.Content = rangeSlider;

```

## Selection Value Configuration

Various customization options are available to configure the selection value in SfRangeSlider.

### Set Minimum Value

Gets or sets the minimum possible value of the range. The thumb could not move beyond that value.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" Minimum="0"/>
```

#### C#

```
rangeSlider.Minimum=0;
```

### Set Maximum Value

Gets or sets the maximum possible value of the range. The thumb could not move after that value.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" Maximum="24"/>
```

#### C#

```
rangeSlider.Maximum=24;
```

### Set Tick Frequency

The `TickFrequency` property is used to decide the number of ticks to be displayed along the track based on Minimum and Maximum values.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" TickFrequency="4" />
```

#### C#

```
rangeSlider.TickFrequency=4;
```

---

**Note:** When the `SnapsTo` property is set to `Ticks`, the `TickFrequency` is used to specify the interval between snap points.

---

### Set Interval between Snap Points.

The `StepFrequency` property is used to specify the interval between snap points.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" StepFrequency="4"/>
```

#### C#

```
rangeSlider.StepFrequency=4;
```

**Note:** When the **SnapsTo** property is set to **StepValues**, the **StepFrequency** property is enabled.

### Set Snapping Mode

The **SnapsTo** property determines whether the RangeSlider snaps to steps or ticks. Available options for this property are

- **StepValues** - The **StepFrequency** property will be used to specify the interval between snap points.
- **Ticks** - The **TickFrequency** property will be used to specify the interval between snap points
- **None** - The thumb is moved independent of any values.

**Note:** The default option is Ticks.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" SnapsTo="Ticks"/>
```

### C#

```
rangeSlider.SnapsTo=SnapsTo.Ticks;
```

### Orientation

SfRangeSlider provides options to display values and slider to slide either horizontally or vertically.

**Note:** The default option is Vertical.

### Horizontal

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:Range="clr-namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.XForms"
xmlns:Local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.RangeSliderSample">
  <ContentPage.Content>
    <Range:SfRangeSlider Orientation="Horizontal"/>
  </Range:SfRangeSlider>
</ContentPage.Content>
</ContentPage>
```

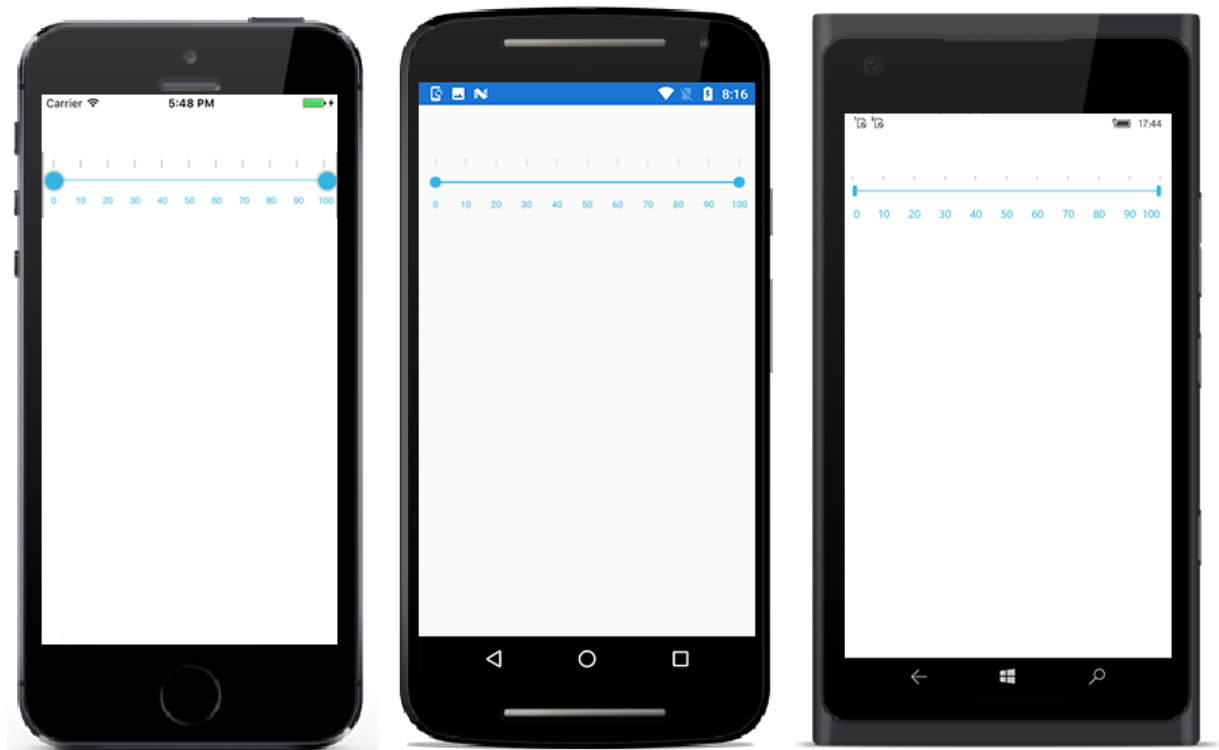

### C#

```
using System.Collections.ObjectModel;
using Syncfusion.XForms.SfRangeSlider;
using Xamarin.Forms;
namespace GettingStarted
{
    /// <summary>
```

```

/// Range slider sample.
/// </summary>
public partial class RangeSliderSample : ContentPage
{
    public RangeSliderSample()
    {
        InitializeComponent();
        SfRangeSlider rangeSlider = new SfRangeSlider();
        rangeSlider.Orientation=Orientation.Horizontal;
        this.Content = rangeSlider;
    }
}

```

## Vertical

### XML

```

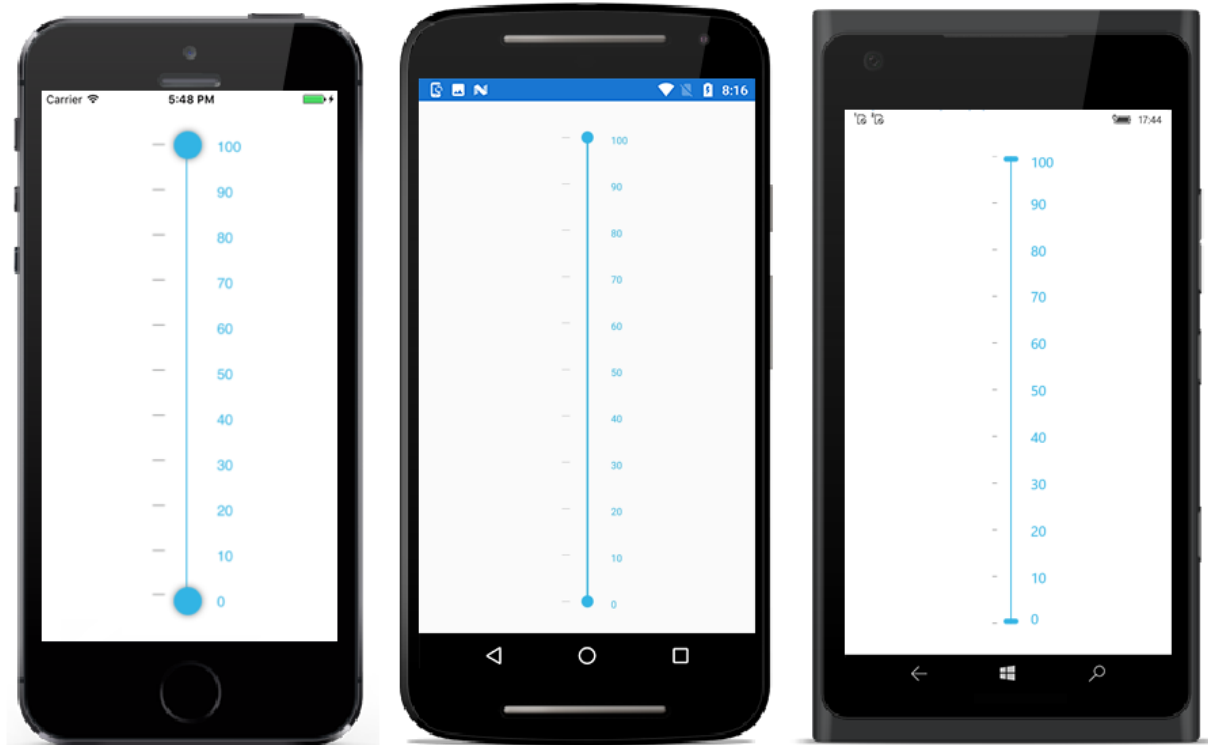

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:Range="clr-namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.XForms"
xmlns:Local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.RangeSliderSample">
    <ContentPage.Content>
        <Range:SfRangeSlider Orientation="Vertical"/>
    </Range:SfRangeSlider>
</ContentPage.Content>

```

```
</ContentPage>
```

## C#

```
using System.Collections.ObjectModel;
using Syncfusion.XForms.SfRangeSlider;
using Xamarin.Forms;
namespace GettingStarted
{
    /// <summary>
    /// Range slider sample.
    /// </summary>
    public partial class RangeSliderSample : ContentPage
    {
        public RangeSliderSample()
        {
            InitializeComponent();
            SfRangeSlider rangeSlider = new SfRangeSlider();
            rangeSlider.Orientation=Orientation.Vertical;
            this.Content = rangeSlider;
        }
    }
}
```

## Customizing labels

SfRangeSlider provides option to show or hide the label and position customization.

### Show Value Label

This property allows us to display labels for the ticks. When it sets to true, it displays the label for all the ticks based on the `ValuePlacement` property.

**Note:** The default value of the `ShowValueLabel` property is false.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" ShowValueLabel="true"/>
```

#### C#

```
rangeSlider.ShowValueLabel= true;
```

### Set Custom Label

To display custom labels, `ShowCustomLabel` property should be set to true and need to populate the `CustomLabels` property with observable collection of items by specifying the custom labels for corresponding values.

#### XML

```
<range:SfRangeSlider x:Name="rangeslider" HeightRequest="400"  
ShowCustomLabel="true" CustomLabels="customCollection"/>
```

#### C#

```
SfRangeSlider rangeSlider;  
ObservableCollection<Items> customCollection;  
public RangeSliderPage ()  
{  
    customCollection = new ObservableCollection<Items> ();  
    customCollection.Add(new Items() {Label = "Min", Value= 0});  
    customCollection.Add(new Items() { Label = "Max", Value = 100 });  
    rangeSlider = new SfRangeSlider ();  
    rangeSlider.HeightRequest = 400;  
    rangeSlider.ShowCustomLabel = true;  
    rangeSlider.CustomLabels = customCollection  
}
```

### Value Placement

The `ValuePlacement` property describes the position of the Value relative to ticks.

Available options for this property are:

- BottomRight
- TopLeft

### XML

```
<range:SfRangeSlider x:Name="rangeslider" ValuePlacement="TopLeft"/>
```

### C#

```
rangeSlider.ValuePlacement=ValuePlacement.TopLeft;
```

### XML

```
<range:SfRangeSlider x:Name="rangeslider" ValuePlacement="BottomRight"/>
```

**C#**

```
rangeSlider.ValuePlacement=ValuePlacement.BottomRight;
```

**Label Placement**

The **LabelPlacement** property describes the position of the custom labels relative to ticks.

Available options for this property are:

- BottomRight
- TopLeft

**XML**

```
<range:SfRangeSlider x:Name="rangeslider" LabelPlacement="TopLeft"/>
```

**C#**

```
rangeSlider.LabelPlacement=LabelPlacement.TopLeft;
```

**Customizing label font**

The range slider control provides the **FontFamily**, **FontSize**, and **FontAttribute** properties to customize the value text and custom label text.

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:Range="clr-namespace:Syncfusion.SfRangeSlider.XForms;assembly=Syncfusion.SfRangeSlider.XForms"
xmlns:Local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.RangeSliderSample">
  <ContentPage.Content>
    <Range:SfRangeSlider FontFamily="Times New Roman" ShowCustomLabel="true"
FontAttribute="Italic" FontSize="12" Orientation="Horizontal">
      <Range:SfRangeSlider.CustomLabels>
        <Local:ObservableCollectionList>
          <Range:Items Label="Min" Value="0"/>
          <Range:Items Label="Mid" Value="50"/>
          <Range:Items Label="Max" Value="100"/>
        </Local:ObservableCollectionList>
      </Range:SfRangeSlider.CustomLabels>
    </Range:SfRangeSlider>
  </ContentPage.Content>
</ContentPage>
```

```

</Range:SfRangeSlider>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

using System.Collections.ObjectModel;
using Syncfusion.XForms.SfRangeSlider;
using Xamarin.Forms;
namespace GettingStarted
{
    /// <summary>
    /// Range slider sample.
    /// </summary>
    public partial class RangeSliderSample : ContentPage
    {
        public RangeSliderSample()
        {
            InitializeComponent();
            SfRangeSlider rangeSlider = new SfRangeSlider() { FontFamily="Times New Roman", ShowCustomLabel=true, FontAttribute=FontAttributes.Italic, FontSize=12, Orientation=Orientation.Horizontal };
            rangeSlider.CustomLabels = new ObservableCollection<Items>()
            {
                new Items() { Value=0, Label="Min" },
                new Items() { Value=50, Label="Mid" },
                new Items() { Value=100, Label="Max" }
            };
            this.Content = rangeSlider;
        }
    }
}

```

**C#**

```

using System.Collections.ObjectModel;
using Syncfusion.XForms.SfRangeSlider;
using Xamarin.Forms;
namespace GettingStarted
{
    /// <summary>
    /// Observable collection of Items list.
    /// </summary>
    public class ObservableCollectionList : ObservableCollection<Items>
    {
    }

    /// <summary>
    /// Range slider sample.
    /// </summary>
    public partial class RangeSliderSample : ContentPage
    {
        public RangeSliderSample()
        {
            InitializeComponent();
        }
    }
}

```

```
}
```

### LabelColor

The **LabelColor** property used to change the color of the label.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" LabelColor="Red" Minimum="0"
Maximum="100"/>
```

### C#

```
rangeslider.LabelColor = Color.Red;
```

### ToolTip Support

The ToolTip shows the current value based on thumb position.

### Set ToolTip Precision

The `ToolTipPrecision` property is used to define the precision of the value displayed in the ToolTip.

### XML

```
<range:SfRangeSlider x:Name="rangeslider" ToolTipPrecision="2"/>
```

### C#

```
rangeSlider.ToolTipPrecision = 2;
```

### Set ToolTip Placement

The position of the ToolTip in relation to the thumb can be controlled by the `ToolTipPlacement` property. It has the following options.

1. BottomRight
2. TopLeft
3. None

### *BottomRight*

The ToolTip will be placed either below the Thumb in horizontal orientation or right of the Thumb in vertical orientation.

#### **XML**

```
<range:SfRangeSlider x:Name="rangeslider" ToolTipPlacement="BottomRight"/>
```

#### **C#**

```
rangeSlider.ToolTipPlacement = ToolTipPlacement.BottomRight;
```

### *TopLeft*

the ToolTip will be placed either above the Thumb in horizontal orientation or left of the Thumb in vertical orientation.

#### **XML**

```
<range:SfRangeSlider x:Name="rangeslider" ToolTipPlacement="TopLeft"/>
```

#### **C#**

```
rangeSlider.ToolTipPlacement = ToolTipPlacement.TopLeft;
```

### *None*

ToolTip will be collapsed.

#### **XML**

```
<range:SfRangeSlider x:Name="rangeslider" ToolTipPlacement="None"/>
```

#### **C#**

```
rangeSlider.ToolTipPlacement = ToolTipPlacement.None;
```

### *Tooltip color*

**ToolTipTextColor** - Changes the text color of tooltip.

**ToolTipBackgroundColor** - Changes the background color of tooltip.

#### How to Perform an Action while Selecting a Value?

ValueChanged event will be triggered when value is changed with single thumb. ValueEventArgs has RangeSlider and RangeValue of the control.

Members	Description
RangeSlider	Displays the native control.
Value	Displays the value when moved with single thumb.

#### C#

```
rangeSlider.ValueChanging += (object sender, ValueEventArgs e) =>
{
    float range = e.Value;
    SfRangeSlider rangeSlider = e.RangeSlider;
};
```

#### How to Perform an Action when the Range Get Changing?

RangeChanging event will be triggered when either RangeStart or RangeEnd values are changed. RangeEventArgs has RangeStart and RangeEnd value of SfRangeSlider.

**Note:** ShowRange value must be true.

Members	Description
---------	-------------

RangeSlider	Displays the native control
Start	It shows the start value when moved with thumb
End	It shows the end value when moved with thumb

**C#**

```
rangeSlider.RangeChanging+= (object sender, RangeEventArgs e) =>
{
    float rangeStart = e.Start;
    float rangeEnd = e.End;
    SfRangeSlider rangeSlider = e.RangeSlider;
};
```

[How to get notifications when a thumb drag is started and completed?](#)

The **DragStarted** event is raised when a thumb is dragged. After the thumb releases the pointer capture, the **DragCompleted** event is raised. The **IsStartThumb** property of the **DragThumbEventArgs** returns a boolean value, which indicates the thumb used for performing drag operations.

Members	Description
IsStartThumb	Indicates the thumb used for performing drag operations.

**C#**

```
rangeSlider.DragStarted+=(object sender, DragThumbEventArgs e) =>
{
    //perform the operation
};
rangeSlider.DragCompleted+=(object sender, DragThumbEventArgs e) =>
{
    //perform the operation
};
```

[How to trigger the ThumbTouchDown event?](#)

The **ThumbTouchDown** event occurs when touching the thumb. The argument contains the state of the thumb.

**IsStartThumb** - Gets the state whether thumb touch down position is start or end. If the thumb touch down position is start, then **IsStartThumb** state is true. If it's end, then **IsStartThumb** state is false. It is a read only property.

**C#**

```
private void Rangeslider_ThumbTouchDown(object sender,
Syncfusion.SfRangeSlider.XForms.DragThumbEventArgs e)
{
    var isStartThumb = e.IsStartThumb;
}
```

### How to trigger the ThumbTouchUp event?

**IsStartThumb** - Gets the state whether thumb touch up position is start or end. If the thumb touch up position is start, then **IsStartThumb** state is true. If it's end, then **IsStartThumb** state is false. It is a read only property.

#### C#

```
private void Rangeslider_ThumbTouchUp(object sender,
Syncfusion.SfRangeSlider.XForms.DragThumbEventArgs e)
{
    var isStartThumb= e.IsStartThumb;
}
```

**Note:** **ThumbTouchDown** and **ThumbTouchUp** events applicable only for Android, iOS platform and not for UWP.

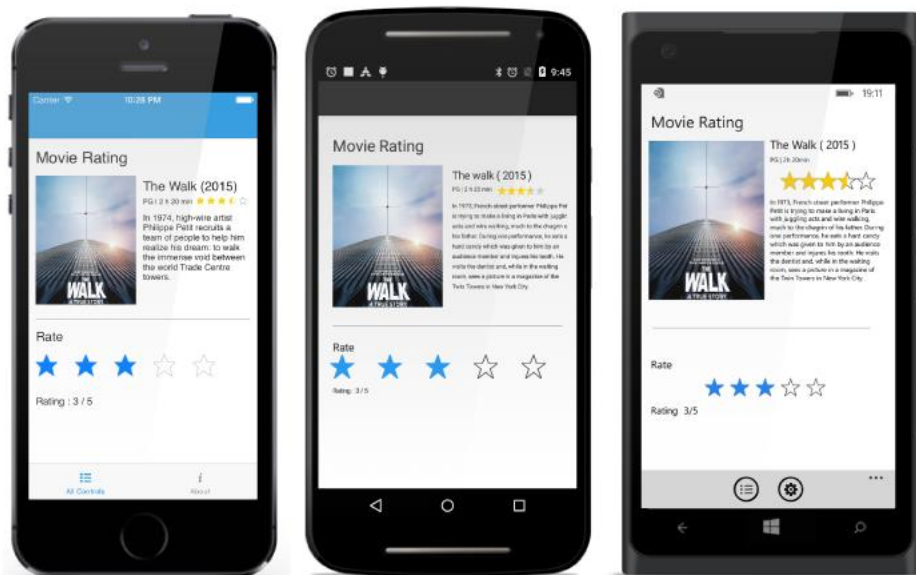

#### AutomationId

**SfRangeSlider** does not have support for **AutomationId** to access the thumb along track. Instead, you can change the **RangeStart**, **RangeEnd** using the co-ordinates and **Value** with the button click event with its **AutomationId**.

## SfRating

### Overview

The Essential Xamarin Rating control provides the number of stars that represents a rating. And also used to configure the item size, item spacing and the number of displayed items in the SfRating control. Essential Xamarin Rating control can be used in various scenarios like movie rating, rating the application etc.

## Key Features

- **Precision:** Options to decide the accuracy level of rating.
- **Item Count:** Support to determine the number of Rating items to be displayed.

## Getting Started

This section explains how to configure a SfRating control in a real-time scenario and also provides a walk-through on some of the customization features available in SfRating control.

### Adding SfRating reference

You can add SfRating reference using one of the following methods:

#### Method 1: Adding SfRating reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfRating). To add SfRating to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfRating](https://www.nuget.org/packages/Syncfusion.Xamarin.SfRating), and then install it.

![Adding SfRating reference from nuget](images/Adding SfRating reference.png)

---

**Note:** Install the same version of SfRating NuGet in all the projects.

---

#### Method 2: Adding SfRating reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfRating control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfRating assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfRating.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfRating.Android.dll Syncfusion.SfRating.XForms.Android.dll Syncfusion.SfRating.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfRating.iOS.dll Syncfusion.SfRating.XForms.iOS.dll Syncfusion.SfRating.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfInput.UWP.dll Syncfusion.SfShared.UWP.dll

	Syncfusion.SfRating.XForms.UWP.dll Syncfusion.SfRating.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
--	--

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** Currently an additional step is required for iOS project. You need to create an instance of the rating custom renderer. If you are adding the references from toolbox, this step is not needed.

Create an instance of SfRatingRenderer in FinishedLaunching overridden method of AppDelegate class in iOS Project as shown below

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    ...
    new SfRatingRenderer ();
    ...
}
```

#### *ReleaseMode issue in UWP platform*

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfRating assemblies in **App.xaml.cs** in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfRatingRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

The SfRating control is configured entirely in C# code or by using XAML markup. The following steps explains how to create a SfRating and configure its elements.

#### Adding namespace

Add the following namespace.

##### XML

```
<xmlns:rating="clr-namespace:Syncfusion.SfRating.XForms;assembly=Syncfusion.SfRating.XForms"/>
```

##### C#

```
using Syncfusion.SfRating.XForms;
```

#### Initialize Rating

Now, add the SfRating control with a required optimal name using the included namespace.

##### XML

```
<rating:SfRating x:Name="rating" />
```

##### C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    this.Content = rating;  
}
```

#### Set Number of Rating Items

The number of rating items to be displayed can be customized in the SfRating control. Users can create a rating application with 5 items as follows. The `ItemCount` property is used to define the number of rating items.

**Note:** The default value of ItemCount is 5.

##### XML

```
<rating:SfRating ItemCount="5" />
```

##### C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.ItemCount = 5;  
}
```

### Set Value

The display value can be set in the SfRating control, which is selected among the items. The following code example shows the display value of 3 with 5 rating items. The `Value` property is used to set display value.

**Note:** The default value of this property is 0.

#### XML

```
<rating:SfRating Value="3" />
```

#### C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.Value = 3;  
}
```

### Precision

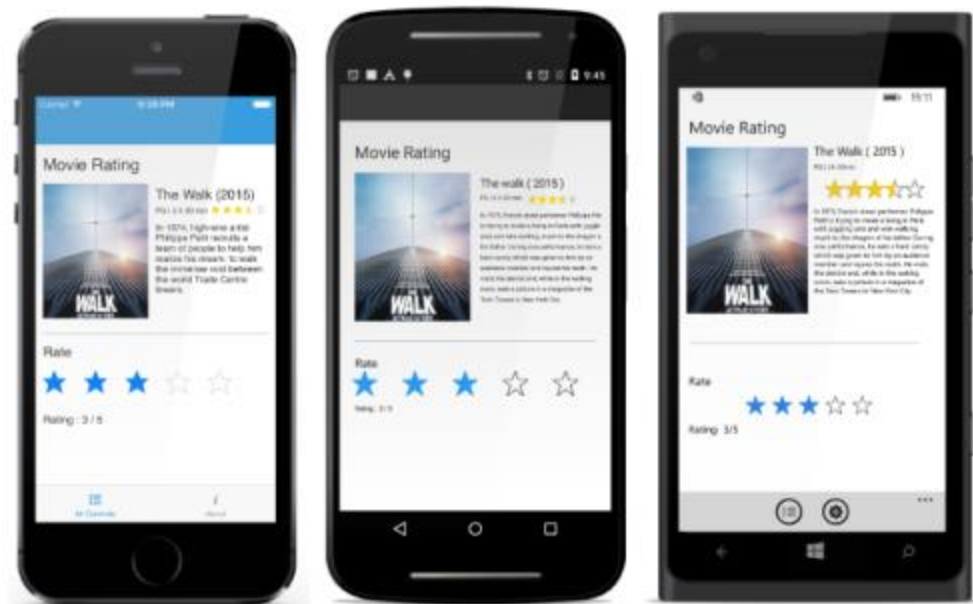

The SfRating control provides an option to rate the items in full, half, and exact values. This can be set using the `Precision` property. By default, the precision mode is `Standard`.

#### XML

```
<rating:SfRating Precision="Standard" />
```

#### C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.Precision = Precision.Standard;  
}
```

The complete Getting Started sample is available in this [documentation](#).

### Precision Mode

The Precision mode defines the accuracy level of the SfRating control. It has Standard, Half, and Exact options. The default precision mode of the SfRating control is **Standard**.

#### Standard

When the precision mode of SfRating is set as **Standard**, the rating item will be filled completely based on the rating value.

#### XML

```
<rating:SfRating x:Name="rating" Precision="Standard" />
```

#### C#

```
SfRating rating;
public MainPage()
{
    InitializeComponent();
    rating = new SfRating();
    rating.Precision = Precision.Standard;
}
```

#### Half

When the precision mode of SfRating is set as **Half**, the rating item will be filled partially based on the rating value.

## XML

```
<rating:SfRating x:Name="rating" Precision="Half" />
```

## C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.Precision = Precision.Half;  
}
```

### Exact

When the precision mode of SfRating is set as **Exact**, the rating item will be filled exactly based on the rating value.

## XML

```
<rating:SfRating x:Name="rating" Precision="Exact" />
```

## C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.Precision = Precision.Exact;  
}
```

## Tooltip

Tooltip provides additional information about objects that are unfamiliar to users and are not directly displayed in UI. In the Xamarin.Forms SfRating control, tooltip shows the data of **Value**. It will be displayed when the mouse is hovered over the rating items and will be disappeared when a rating item is selected.

### Set Tooltip Placement

Using **ToolTipPlacement** property, We can define where the ToolTip need to be displayed. ToolTipPlacement having the following three types of placement.

- \*BottomRight,
- \*None,
- \*TopLeft.

**Note:** By default, this property value is set to None.

#### *BottomRight*

The Tooltip will display on bottom of the SfRating control.

#### **XML**

```
<rating:SfRating TooltipPlacement="BottomRight" />
```

#### **C#**

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.TooltipPlacement = TooltipPlacement.BottomRight;  
}
```

#### *TopLeft*

The Tooltip will be displayed on top of the SfRating control.

#### **XML**

```
<rating:SfRating TooltipPlacement="TopLeft" />
```

#### **C#**

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.TooltipPlacement = TooltipPlacement.TopLeft;  
}
```

#### *None*

When we set `ToolTipPlacement` as None, The ToolTip will be disappear.

#### **XML**

```
<rating:SfRating TooltipPlacement="None" />
```

#### **C#**

```
SfRating rating;  
public MainPage()
```

```
{
    InitializeComponent();
    rating = new SfRating();
    rating.TooltipPlacement = TooltipPlacement.None;
}
```

### Set ToolTip Precision

The **ToolTipPrecision** property sets the number precisions to be displayed after decimal point in ToolTip.

**Note:** The default value of ToolTip precision is 1.

### XML

```
<rating:SfRating TooltipPrecision="6" />
```

### C#

```
SfRating rating;
public MainPage()
{
    InitializeComponent();
    rating = new SfRating();
    rating.ToolTipPrecision = 6;
}
```

### Appearance and Styling

When the default view is not needed, you can customize the view of Xamarin.Forms SfRating control. The SfRating control provides support to customize the size, item count, and space between rating items.

### Set Size

The **ItemSize** property sets the size of the rating items.

**Note:** By default, property value is 50.

### XML

```
<rating:SfRating ItemSize="20" />
```

### C#

```
SfRating rating;
public MainPage()
{
    InitializeComponent();
    rating = new SfRating();
}
```

```
rating.ItemSize = 20;  
}
```

#### Set Number of Items

The `ItemCount` property sets the number of rating items to be displayed.

**Note:** The default property value is 5.

#### XML

```
<rating:SfRating ItemCount="4" />
```

#### C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.ItemCount = 4;  
}
```

#### Set Space between Items

The `ItemSpacing` property sets the spacing between the rating items.

**Note:** By default, property value is 5.

#### XML

```
<rating:SfRating ItemSpacing="20" />
```

#### C#

```
SfRating rating;  
public MainPage()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.ItemSpacing = 20;  
}
```

#### Rating Settings

This section explains about various rating settings available in the SfRating control.

**XML**

```
<rating:SfRating Value="3">
  <rating:SfRating.RatingSettings>
    <rating:SfRatingSettings RatedFill="Red" UnRatedFill="Blue"
      RatedStrokeWidth="3" UnRatedStrokeWidth="2" />
  </rating:SfRating.RatingSettings>
</rating:SfRating>
```

**C#**

```
SfRating rating;
SfRatingSettings ratingSettings;
public MainPage()
{
    InitializeComponent();
    rating = new SfRating();
    ratingSettings = new SfRatingSettings();
    ratingSettings.RatedFill = Color.Red;
    ratingSettings.UnRatedFill = Color.Blue;
    ratingSettings.RatedStrokeWidth = 3;
    ratingSettings.UnRatedStrokeWidth = 2;
    rating.RatingSettings = ratingSettings;
}
```

**Restrict User Selection**

SfRating control provides support for changeable or unchangeable values for Rating control. This is achieved by the **ReadOnly** property. When this property is set to True, the Rating value becomes unchangeable. By default, this property value is set to False.

**C#**

```
rating.ReadOnly=true;
```

**XML**

```
<rating:SfRating x:Name="rating" ReadOnly="true" />
```

**Appearance Customization**

We can customize the rated and unrated items Color, Stroke width and Stroke color using the following properties of SfRatingSettings.

- RatedFill
- UnRatedFill
- RatedStroke
- UnRatedStroke
- RatedStrokeWidth
- UnRatedStrokeWidth

### Set Fill Color

SfRating control has support to set the fill color for the selected and unselected items.

#### *Selected Items*

The **RatedFill** property fills the rated item with the specified solid color in the SfRating control.

#### **XML**

```
<rating:SfRating Value="3">
  <rating:SfRating.RatingSettings>
    <rating:SfRatingSettings RatedFill="Red"/>
  </rating:SfRating.RatingSettings>
</rating:SfRating>
```

#### **C#**

```
SfRating rating= new SfRating();
rating.Value = 3;
SfRatingSettings ratingSettings = new SfRatingSettings();
ratingSettings.RatedFill = Color.Red;
rating.RatingSettings = ratingSettings;
```

#### *Unselected Items*

The **UnRatedFill** property fills the unrated item with the specified solid color in the SfRating control.

#### **XML**

```
<rating:SfRating Value="3">
  <rating:SfRating.RatingSettings>
    <rating:SfRatingSettings UnRatedFill="Gray"/>
  </rating:SfRating.RatingSettings>
</rating:SfRating>
```

#### **C#**

```
SfRating rating= new SfRating();
rating.Value = 3;
SfRatingSettings ratingSettings = new SfRatingSettings();
ratingSettings.UnRatedFill = Color.Gray;
rating.RatingSettings = ratingSettings;
```

### Set Stroke Color

SfRating control has support to set the stroke color for the selected and unselected items.

#### *Selected Items*

The **RatedStroke** property sets the stroke for the rated item with the specified solid color for the selected items in the SfRating control.

**XML**

```
<rating:SfRating Value="3">
  <rating:SfRating.RatingSettings>
    <rating:SfRatingSettings RatedStroke="Black"/>
  </rating:SfRating.RatingSettings>
</rating:SfRating>
```

**C#**

```
SfRating rating= new SfRating();
rating.Value = 3;
SfRatingSettings ratingSettings = new SfRatingSettings();
ratingSettings.RatedStroke=Color.Black;
rating.RatingSettings = ratingSettings;
```

*Unselected Items*

The **UnRatedStroke** property sets the stroke for the unrated area with the specified solid color in the SfRating control.

**XML**

```
<rating:SfRating Value="3">
  <rating:SfRating.RatingSettings>
    <rating:SfRatingSettings UnRatedStroke="Black"/>
  </rating:SfRating.RatingSettings>
</rating:SfRating>
```

**C#**

```
SfRating rating= new SfRating();
rating.Value = 3;
SfRatingSettings ratingSettings = new SfRatingSettings();
ratingSettings.UnRatedStroke = Color.Black;
rating.RatingSettings = ratingSettings;
```

*Set Stroke Width*

SfRating control has support to set the stroke width for the selected and unselected items.

*Selected Items*

The **RatedStrokeWidth** property sets the stroke width for the rated item with the specified value in the SfRating control.

**XML**

```
<rating:SfRating Value="3">
  <rating:SfRating.RatingSettings>
    <rating:SfRatingSettings RatedStrokeWidth="3"/>
  </rating:SfRating.RatingSettings>
</rating:SfRating>
```

```
</rating:SfRating.RatingSettings>
</rating:SfRating>
```

**C#**

```
SfRating rating= new SfRating();
rating.Value = 3;
SfRatingSettings ratingSettings = new SfRatingSettings();
ratingSettings.RatedStrokeWidth=3;
rating.RatingSettings = ratingSettings;
```

*Unselected Items*

The `UnRatedStrokeWidth` property sets the stroke width for the unrated item with the specified value in the SfRating control.

**XML**

```
<rating:SfRating Value="3">
  <rating:SfRating.RatingSettings>
    <rating:SfRatingSettings UnRatedStrokeWidth="3"/>
  </rating:SfRating.RatingSettings>
</rating:SfRating>
```

**C#**

```
SfRating rating= new SfRating();
rating.Value = 3;
SfRatingSettings ratingSettings = new SfRatingSettings();
ratingSettings.UnRatedStrokeWidth=3;
rating.RatingSettings = ratingSettings;
```

*Custom Views*

SfRating Items control provides support to add custom views.

**Note:** To use custom views in Xamarin.Forms UWP platform, you need to set `ItemCount` value.

*Add SfRating items*

To customize the view of rating items, create and set custom view as `SelectedView` and `UnSelectedView` of `SfRatingItem`. Refer to the following code snippet to create a custom view.

**XML**

```
<rating:SfRating EnableCustomView="true">
  <rating:SfRating.Items>
    <rating:SfRatingItem/>
  </rating:SfRating.Items>
</rating:SfRating>
```

**C#**

```
SfRating rating= new SfRating();  
SfRatingItem ratingItem = new SfRatingItem();  
rating.Items = ratingItem;  
rating.EnableCustomView = true;
```

## Set selected view

The **SelectedView** property is used to apply the given SelectedView to selected rating item.

**XML**

```
<rating:SfRatingItem>  
<rating:SfRatingItem.SelectedView>  
<Image Source="Angry_selected.png"/>  
</rating:SfRatingItem.SelectedView>  
</rating:SfRatingItem>
```

**C#**

```
ratingItem.SelectedView = new Image() { Source = "Angry_selected.png",  
Aspect = Aspect.Fill };
```

## Set unselected view

The **UnSelectedView** property is used to apply the given UnSelectedView to unselected rating item.

**XML**

```
<rating:SfRatingItem>  
<rating:SfRatingItem.UnSelectedView>  
<Image Source="Angry_Unselected.png"/>  
</rating:SfRatingItem.UnSelectedView>  
</rating:SfRatingItem>
```

**C#**

```
ratingItem.UnSelectedView = new Image() { Source = "Angry_Unselected.png",  
Aspect = Aspect.Fill };
```

## Add Items

The **Items** property is used to hold the collection of SfRatingItem.

---

**Note:** SfRatingItem keeps both selected and unselected view respectively.

---

**C#**

```
ObservableCollection<SfRatingItem> ratingItemList = new  
ObservableCollection<SfRatingItem>();  
ratingItemList.Add(ratingItem);  
rating.Items = ratingItemList;
```

### Enable custom items

When the `EnableCustomItems` property is enabled, the custom items added in the rating items will be displayed.

### XML

```
<rating:SfRating x:Name="rating" EnableCustomView="True" ItemCount="5">
  <rating:SfRating.Items>
    <collection:ObservableCollection x:TypeArguments="rating:SfRatingItem">
      <rating:SfRatingItem>
        <rating:SfRatingItem.SelectedView>
          <Image Source="Angry_selected.png"/>
        </rating:SfRatingItem.SelectedView>
        <rating:SfRatingItem.UnSelectedView>
          <Image Source="Angry_Unselected.png"/>
        </rating:SfRatingItem.UnSelectedView>
      </rating:SfRatingItem>
      <rating:SfRatingItem>
        <rating:SfRatingItem.SelectedView>
          <Image Source="UnHappy_selected.png"/>
        </rating:SfRatingItem.SelectedView>
        <rating:SfRatingItem.UnSelectedView>
          <Image Source="UnHappy_Unselected.png"/>
        </rating:SfRatingItem.UnSelectedView>
      </rating:SfRatingItem>
      <rating:SfRatingItem>
        <rating:SfRatingItem.SelectedView>
          <Image Source="Neutral_selected.png"/>
        </rating:SfRatingItem.SelectedView>
        <rating:SfRatingItem.UnSelectedView>
          <Image Source="Neutral_Unselected.png"/>
        </rating:SfRatingItem.UnSelectedView>
      </rating:SfRatingItem>
      <rating:SfRatingItem>
        <rating:SfRatingItem.SelectedView>
          <Image Source="Happy_selected.png"/>
        </rating:SfRatingItem.SelectedView>
        <rating:SfRatingItem.UnSelectedView>
          <Image Source="Happy_Unselected.png"/>
        </rating:SfRatingItem.UnSelectedView>
      </rating:SfRatingItem>
      <rating:SfRatingItem>
        <rating:SfRatingItem.SelectedView>
          <Image Source="Excited_selected.png"/>
        </rating:SfRatingItem.SelectedView>
        <rating:SfRatingItem.UnSelectedView>
          <Image Source="Excited_Unselected.png"/>
        </rating:SfRatingItem.UnSelectedView>
      </rating:SfRatingItem>
    </collection:ObservableCollection>
  </rating:SfRating.Items>
</rating:SfRating>
```

### C#

```
SfRating rating;
```

```

public MainPage()
{
    InitializeComponent();
    rating = new SfRating();
    rating.EnableCustomView = true;
    rating.ItemCount = 5;
    SfRatingItem angry = new SfRatingItem();
    angry.SelectedView = new Image() { Source = "Angry_selected.png" };
    angry.UnSelectedView = new Image() { Source = "Angry_Unselected.png" };
    SfRatingItem unhappy = new SfRatingItem();
    unhappy.SelectedView = new Image() { Source = "UnHappy_selected.png" };
    unhappy.UnSelectedView = new Image() { Source = "UnHappy_Unselected.png" };
    SfRatingItem neutral = new SfRatingItem();
    neutral.SelectedView = new Image() { Source = "Neutral_selected.png" };
    neutral.UnSelectedView = new Image() { Source = "Neutral_Unselected.png" };
    SfRatingItem happy = new SfRatingItem();
    happy.SelectedView = new Image() { Source = "Happy_selected.png" };
    happy.UnSelectedView = new Image() { Source = "Happy_Unselected.png" };
    SfRatingItem excited = new SfRatingItem();
    excited.SelectedView = new Image() { Source = "Excited_selected.png" };
    excited.UnSelectedView = new Image() { Source = "Excited_Unselected.png" };
    ObservableCollection<SfRatingItem> ratingItemList = new
    ObservableCollection<SfRatingItem>();
    customItems.Add(angry);
    customItems.Add(unhappy);
    customItems.Add(neutral);
    customItems.Add(happy);
    customItems.Add(excited);
    rating.Items = ratingItemList;
    this.Content = rating;
}

```

### View Range Selection

When using CustomView in SfRating, Only one item will be rated. If you need to change the view of all rated CustomView items, Use the `EnableViewRangeSelection` boolean property.

**Note:** The `EnableViewRangeSelection` property is used only for CustomViews.

### XML

```

<rating:SfRating x:Name="rating" EnableCustomView="True" ItemCount="5"
EnableViewRangeSelection="True" />

```

### C#

```

SfRating rating;
public MainPage()

```

```
{  
InitializeComponent();  
-----  
rating.EnableCustomView = true;  
rating.EnableViewRangeSelection = true;  
-----  
}
```

### AutomationId

The SfRating control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the SfRating control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's AutomationId.

For example, if you set SfRating's **AutomationId** as "Feedback" and you select the fourth item, then the automation framework will interact with the SfRating as "Feedback Rating 4". When the rating is added as custom view, the Automation framework will interact with the element's **AutomationId**.

---

**Note:** AutomationId support works only when the precision mode of SfRating is set as Standard.

---

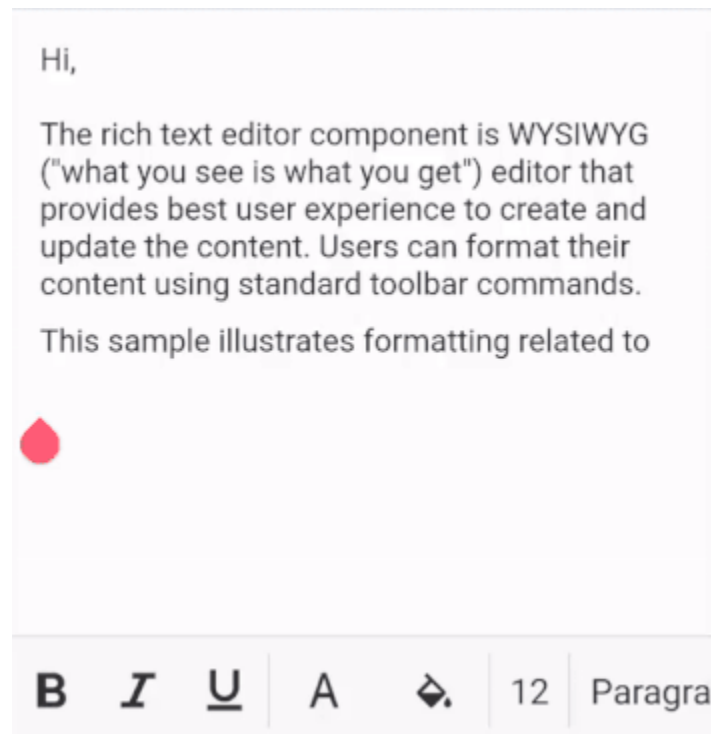

## SfRichTextEditor

### Overview

The Xamarin Rich Text Editor control is a WYSIWYG editor that provides a great user experience for composing or editing rich text content from your Xamarin.Forms applications. Users can format their content using standard toolbar commands.

## Key features

- Applies formatting such as bold, italics, and underline.
- Applies font color and background color to the content.
- Customizes the text size and selection.
- Creates bulleted and numbered lists.

## Getting Started

This section explains the steps required to work with the Rich Text Editor control for Xamarin.Forms.

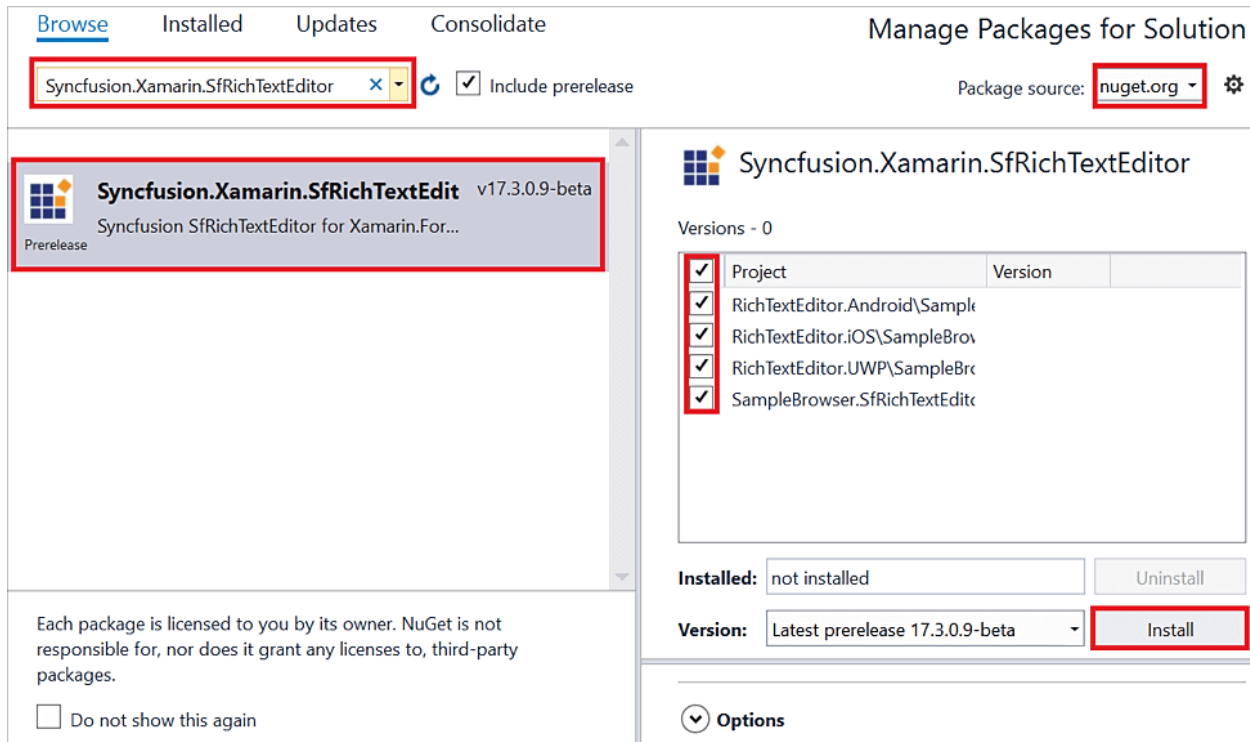

### Adding SfRichTextEditor reference

You can add Rich Text Editor reference using one of the following methods:

#### Method 1: Adding SfRichTextEditor reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfRichTextEditor). To add Rich Text Editor to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfRichTextEditor](https://www.nuget.org/packages/Syncfusion.Xamarin.SfRichTextEditor) and then install it.

**Note:** Install the same version of SfRichTextEditor NuGet in all the projects.

### Method 2: Adding SfRichTextEditor reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the Rich Text Editor control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfRichTextEditor assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from the NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfRichTextEditor.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfRichTextEditor.XForms.Android.dll Syncfusion.SfRichTextEditor.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfRichTextEditor.XForms.iOS.dll Syncfusion.SfRichTextEditor.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll

UWP	Syncfusion.SfRichTextEditor.XForms.UWP.dll Syncfusion.SfRichTextEditor.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
-----	--

**Note:** To learn more about obtaining Syncfusion components, refer to [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Refer to the [Syncfusion license key](#) to learn about registering Syncfusion license key in your Xamarin application to use Syncfusion components.

### Launching the application on each platform with Rich Text Editor

To use the Rich Text Editor in an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not required.

#### iOS

To launch the Rich Text Editor in iOS, call the 'SfRichTextEditorRenderer.Init()' in the FinishedLaunching overridden method of the AppDelegate class after the Xamarin.Forms framework has been initialized and before the LoadApplication is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary
options)
{
    ...
    global::Xamarin.Forms.Forms.Init();
    // Add the below line for using SfRichTextEditor.
    Syncfusion.XForms.iOS.RichTextEditor.SfRichTextEditorRenderer.Init();
    LoadApplication(new App());
    ...
}
```

#### Universal Windows Platform (UWP)

To launch the Rich Text Editor in UWP, initialize the Rich Text Editor assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with Rich Text Editor in **Release** mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        // Add the below line for using SfRichTextEditor.
    }
}
```

```

assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.RichTextEditor.SfRichTextEditorRenderer).GetTypeInfo().Assembly);
// Add the below line for using SfButton.
assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Buttons.SfButtonRenderer).GetTypeInfo().Assembly);
// Add the below line for using SfComboBox.
assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.ComboBox.SfComboBoxRenderer).GetTypeInfo().Assembly);
// Add the below line for using SfBorder.
assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Border.SfBorderRenderer).GetTypeInfo().Assembly);
Xamarin.Forms.Forms.Init(e, assembliesToInclude);
}
...
}

```

### Android

The Android platform does not require any additional configuration to render the Rich Text Editor.

### Initializing the Rich Text Editor

Import the Rich Text Editor namespace as demonstrated in the following code sample in your respective page.

#### XML

```

xmlns:richtexteditor="clr-namespace:Syncfusion.XForms.RichTextEditor;assembly=Syncfusion.SfRichTextEditor.XForms"

```

#### C#

```

using Syncfusion.XForms.RichTextEditor;

```

Then, initialize the SfRichTextEditor as shown in the following code:

#### XML

```

<StackLayout>
<richtexteditor:SfRichTextEditor VerticalOptions="FillAndExpand" Text= "The rich text editor component is WYSIWYG editor that provides the best user experience to create and update the content" />
</StackLayout>

```

#### C#

```

public MainPage()
{
InitializeComponent();
StackLayout stack = new StackLayout();
SfRichTextEditor editor = new SfRichTextEditor
{
VerticalOptions = LayoutOptions.FillAndExpand,
Text = "The rich text editor component is WYSIWYG editor that provides the best user experience to create and update the content"
};
}

```

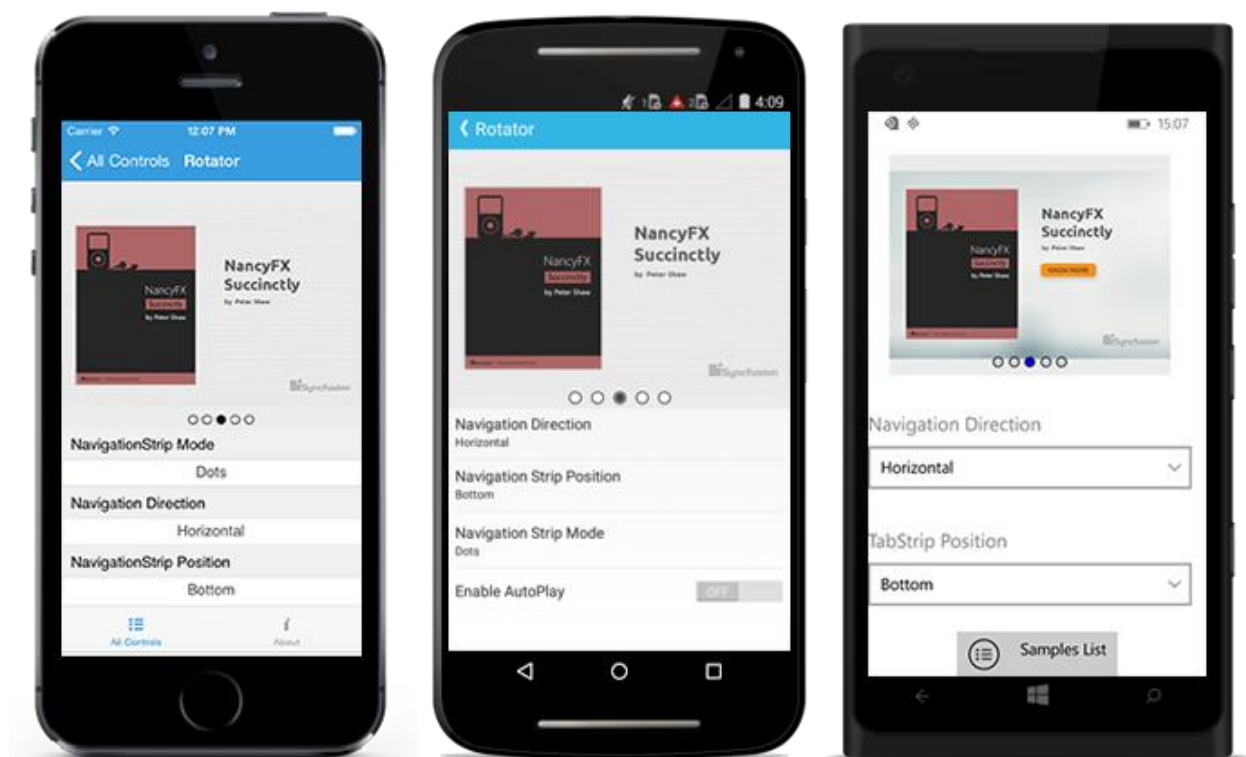

```
stack.Children.Add(editor);  
this.Content = stack;  
}
```

The complete Getting Started sample is available in this [link](#)

## SfRotator

### Overview

The SfRotator is a data control used to display image data and navigate through them. The images can be selected either by Thumbnail or by Dots support.

### Key Features

- **Modes** - Options to navigate data using dots or thumbnail navigation modes.
- **Position** - Support to decide the placement position of dots or thumbnail items in any of the four sides.
- **Autoplay and Items Looping** - Options for auto playing items and navigate items in loop.

### Getting Started

This section explains you the steps to configure a SfRotator control in a real-time scenario and also provides a walk-through on some of the customization features available in SfRotator control.

#### Adding SfRotator reference

You can add SfRotator reference using one of the following methods:

**Method 1: Adding SfRotator reference from nuget.org**

Syncfusion Xamarin components are available in [nuget.org](https://www.syncfusion.com/nuget-packages). To add SfRotator to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfRotator](#), and then install it.

![Adding SfRotator reference from nuget](images/Adding SfRotator reference.png)

---

**Note:** Install the same version of SfRotator NuGet in all the projects.

---

**Method 2: Adding SfRotator reference from toolbox**

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfRotator control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

**Method 3: Adding SfRotator assemblies manually from the installed location**

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfRotator.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfRotator.Android.dll Syncfusion.SfRotator.XForms.Android.dll Syncfusion.SfRotator.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfRotator.iOS.dll Syncfusion.SfRotator.XForms.iOS.dll Syncfusion.SfRotator.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfRotator.UWP.dll Syncfusion.SfRotator.XForms.UWP.dll Syncfusion.SfRotator.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching the SfRotator on each platform

To use SfRotator inside an application, each platform application must initialize the SfRotator renderer. This initialization step varies from platform to platform and is discussed in the following sections.

#### Android and UWP

The Android and UWP launches the SfRotator without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

#### iOS

To launch SfRotator in iOS, need to create an instance of SfRotatorRenderer in FinishedLaunching overridden method of AppDelegate class in iOS Project as shown below.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    new SfRotatorRenderer();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### ReleaseMode issue in UWP platform

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfRotator assemblies in **App.xaml.cs** in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfRotatorRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a Simple SfRotator

The SfRotator control is configured entirely in C# code or by using XAML markup. The following steps explain on how to create a SfRotator and configure its elements,

- Adding namespace for the added assemblies.

**XML**

```
xmlns:rotator="clr-
namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
```

**C#**

```
using Syncfusion.SfRotator.XForms;
```

- Now add the SfRotator control with a required optimal name by using the included namespace.

**XML**

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="GettingStarted.RotatorControlPage">
<ContentPage.Content>
<syncfusion:SfRotator x:Name="rotator" />
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using Syncfusion.SfRotator.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class RotatorControlPage : ContentPage
    {
        public RotatorControlPage()
        {
            InitializeComponent();
            SfRotator rotator = new SfRotator();
            this.Content = rotator;
        }
    }
}
```

**Add Rotator Items**

We can populate the rotator's items by using any one of the following ways,

- Through SfRotatorItem
- Through ItemTemplate

*Through SfRotatorItem*

By passing the list of **SfRotatorItem**, we can get the view of SfRotator control. In that we can pass Images as well as Item content.

The following code example illustrates to add list of Images in Rotator ,

### C#

```
using Syncfusion.SfRotator.XForms;
using System.Collections.Generic;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class Rotator : ContentPage
    {
        SfRotator rotator = new SfRotator();
        StackLayout stackLayout = new StackLayout();
        public Rotator()
        {
            InitializeComponent();
            stackLayout.HeightRequest = 300;
            List<SfRotatorItem> collectionOfItems = new List<SfRotatorItem>();
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie1.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie2.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie3.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie4.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie5.png" });
            rotator.DataSource = collectionOfItems;
            stackLayout.Children.Add(rotator);
            this.Content = stackLayout;
        }
    }
}
```

The following code example illustrates to add list of items through ItemContent API in Rotator ,

### C#

```
using Syncfusion.SfRotator.XForms;
```

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class Rotator : ContentPage
    {
        SfRotator rotator;
        public Rotator()
        {
            InitializeComponent();
            SfRotator rotator = new SfRotator();
            List<SfRotatorItem> collectionOfItems = new List<SfRotatorItem>();
            collectionOfItems.Add(new SfRotatorItem() { ItemContent = new
            Xamarin.Forms.Button() { Text = "RotatorButton", TextColor = Color.White,
            BackgroundColor = Color.FromHex("#7E6E6B"), FontSize = 12 } });
            collectionOfItems.Add(new SfRotatorItem() { ItemContent = new Label() { Text
            = "RotatorLabel", BackgroundColor = Color.FromHex("#7E6E6B"), FontSize = 12
            } });
            collectionOfItems.Add(new SfRotatorItem() { ItemContent = new Image() {
            Source = "image1.png", Aspect = Aspect.AspectFit } });
            rotator.DataSource = collectionOfItems;
            this.Content = rotator;
        }
    }
}
```

#### *Through ItemTemplate*

ItemTemplate property of SfRotator control is used to customize the contents of SfRotator items. ItemTemplate provides common template with different data. SfRotator items can be populated with a collection of image data. This collection includes Arrays, Lists and DataTables.

#### **C#**

```
// Model Class for Rotator.
public RotatorModel(string imageString)
{
    Image = imageString;
}
private String _image;
public String Image
{
    get { return _image; }
    set { _image = value; }
}
```

Create and populate Rotator collection as follows

#### **C#**

```
// ViewModel class for Rotator.
public RotatorViewModel()
{
    ImageCollection.Add(new RotatorModel("movie1.png"));
    ImageCollection.Add(new RotatorModel("movie2.png"));
    ImageCollection.Add(new RotatorModel("movie3.png"));
    ImageCollection.Add(new RotatorModel("movie4.png"));
    ImageCollection.Add(new RotatorModel("movie5.png"));
}
```

```

}
private List<RotatorModel> imageCollection = new List<RotatorModel>();
public List<RotatorModel> ImageCollection
{
    get { return imageCollection; }
    set { imageCollection = value; }
}

```

## XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Rotator"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="Rotator.Rotator">
<ContentPage.BindingContext>
<local:RotatorViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfRotator x:Name="rotator"
NavigationDelay="2000"
ItemsSource="{Binding ImageCollection}"
SelectedIndex="2"
NavigationDirection="Horizontal"
NavigationStripMode="Dots"
BackgroundColor="#ececec">
<syncfusion:SfRotator.ItemTemplate>
<DataTemplate>
<Image Source="{Binding Image}"/>
</DataTemplate>
</syncfusion:SfRotator.ItemTemplate>
</syncfusion:SfRotator>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class Rotator : ContentPage
    {
        public Rotator()
        {
            InitializeComponent();
            SfRotator rotator = new SfRotator();
            var ImageCollection = new List<RotatorModel> {

```

```
new RotatorModel ("movie1.png"),
new RotatorModel ("movie2.png"),
new RotatorModel ("movie3.png"),
new RotatorModel ("movie4.png"),
new RotatorModel ("movie5.png")
};
var itemTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var nameLabel = new Image();
    nameLabel.SetBinding(Image.SourceProperty, "Image");
    grid.Children.Add(nameLabel);
    return grid;
});
rotator.ItemTemplate = itemTemplate;
rotator.ItemsSource = ImageCollection;
this.Content = rotator;
}
}
public class RotatorModel
{
    public RotatorModel(string imageString)
    {
        Image = imageString;
    }
    private String _image;
    public String Image
    {
        get { return _image; }
        set { _image = value; }
    }
}
}
```

- Set the `BindingContext` for the items collection.

### XML

```
<ContentPage.BindingContext>
<local:RotatorViewModel/>
</ContentPage.BindingContext>
```

### C#

```
rotator.BindingContext = new RotatorViewModel();
```

**Information:** Rotator's Images are placed within the application folder for Android, iOS and UWP with build action Android Resource, Bundled Resource and Content respectively.

**Note:** In addition, rotator provides a support to load the Images from URL and SD Card location.

### Setting Navigation Mode

SfRotator provides option to display the navigating items either in Thumbnail or Dots mode. The navigation mode for navigating the items can be decided using `NavigationMode` property.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Rotator"
xmlns:syncfusion="clr-namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="Rotator.Rotator">
  <ContentPage.BindingContext>
    <local:RotatorViewModel/>
  </ContentPage.BindingContext>
  <ContentPage.Content>
    <syncfusion:SfRotator x:Name="rotator"
      NavigationDelay="2000"
      ItemsSource="{Binding ImageCollection}"
      SelectedIndex="2"
      NavigationDirection="Horizontal"
      NavigationStripMode="Thumbnail"
      BackgroundColor="#ececec">
      <syncfusion:SfRotator.ItemTemplate>
        <DataTemplate>
          <Image Source="{Binding Image}"/>
        </DataTemplate>
      </syncfusion:SfRotator.ItemTemplate>
    </syncfusion:SfRotator>
  </ContentPage.Content>
</ContentPage>
```

```

</DataTemplate>
</syncfusion:SfRotator.ItemTemplate>
</syncfusion:SfRotator>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class Rotator : ContentPage
    {
        public Rotator()
        {
            InitializeComponent();
            SfRotator rotator = new SfRotator();
            var ImageCollection = new List<RotatorModel> {
                new RotatorModel ("movie1.png"),
                new RotatorModel ("movie2.png"),
                new RotatorModel ("movie3.png"),
                new RotatorModel ("movie4.png"),
                new RotatorModel ("movie5.png")
            };
            var itemTemplate = new DataTemplate(() =>
            {
                var grid = new Grid();
                var nameLabel = new Image();
                nameLabel.SetBinding(Image.SourceProperty, "Image");
                grid.Children.Add(nameLabel);
                return grid;
            });
            rotator.ItemTemplate = itemTemplate;
            rotator.NavigationStripMode = NavigationStripMode.Thumbnail;
            rotator.ItemsSource = ImageCollection;
            this.Content = rotator;
        }
    }
    public class RotatorModel
    {
        public RotatorModel(string imageString)
        {
            Image = imageString;
        }
        private String _image;
        public String Image
        {
            get { return _image; }
        }
    }
}

```

```
set { _image = value; }
}
}
}
```

### Customizing Position

The placement position of navigation strip items such as Thumbnail or Dots can be customized in SfRotator. This can be specified using `NavigationStripPosition` property.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Rotator"
xmlns:syncfusion="clr-namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="Rotator.Rotator">
<ContentPage.BindingContext>
<local:RotatorViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfRotator x:Name="rotator"
NavigationDelay="2000"
ItemsSource="{Binding ImageCollection}"
SelectedIndex="2"
NavigationDirection="Horizontal"
NavigationStripMode="Dots"
BackgroundColor="#ececec"
NavigationStripPosition="Top">
<syncfusion:SfRotator.ItemTemplate>
<DataTemplate>
```

```

<Image Source="{Binding Image}"/>
</DataTemplate>
</syncfusion:SfRotator.ItemTemplate>
</syncfusion:SfRotator>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class Rotator : ContentPage
    {
        public Rotator()
        {
            InitializeComponent();
            SfRotator rotator = new SfRotator();
            var ImageCollection = new List<RotatorModel> {
                new RotatorModel ("movie1.png"),
                new RotatorModel ("movie2.png"),
                new RotatorModel ("movie3.png"),
                new RotatorModel ("movie4.png"),
                new RotatorModel ("movie5.png")
            };
            var itemTemplate = new DataTemplate(() =>
            {
                var grid = new Grid();
                var nameLabel = new Image();
                nameLabel.SetBinding(Image.SourceProperty, "Image");
                grid.Children.Add(nameLabel);
                return grid;
            });
            rotator.ItemTemplate = itemTemplate;
            rotator.NavigationStripMode = NavigationStripMode.Dots;
            rotator.NavigationStripPosition = NavigationStripPosition.Top;
            rotator.ItemsSource = ImageCollection;
            this.Content = rotator;
        }
    }
    public class RotatorModel
    {
        public RotatorModel(string imageString)
        {
            Image = imageString;
        }
        private String _image;
        public String Image

```

```
{  
get { return _image; }  
set { _image = value; }  
}  
}  
}
```

You can find the complete getting started sample from this [link](#).

## Populating Data

SfRotator control supports binding to different data sources such as IList Data Source, Observable Collection Data Source.

### Through Binding

This section explains about setting Item Source and applying custom template to the data.

#### Create a Model with Data

SfRotator items can be populated with a collection of image data. You can assign a collection to it. Collections include arrays, Lists and DataTables. For example you may want to create a Rotator model with Image as follows.

#### C#

```
// Model Class for Rotator.  
public RotatorModel(string imageString)  
{  
    Image = imageString;  
}  
private String _image;  
public String Image  
{  
    get { return _image; }  
    set { _image = value; }  
}
```

Create and populate SfRotator collection as follows

### C#

```
// ViewModel class for Rotator.
public RotatorViewModel()
{
    ImageCollection.Add(new RotatorModel("movie1.png"));
    ImageCollection.Add(new RotatorModel("movie2.png"));
    ImageCollection.Add(new RotatorModel("movie3.png"));
    ImageCollection.Add(new RotatorModel("movie4.png"));
    ImageCollection.Add(new RotatorModel("movie5.png"));
}
private List<RotatorModel> imageCollection = new List<RotatorModel>();
public List<RotatorModel> ImageCollection
{
    get { return imageCollection; }
    set { imageCollection = value; }
}
```

Assigning collection to ItemSource ,

### XML

```
<ContentPage.BindingContext>
<local:RotatorViewModel/>
</ContentPage.BindingContext>
```

### C#

```
rotator.BindingContext = new RotatorViewModel();
```

### *Binding the Data with Custom Template*

SfRotator provides support to add a custom view as RotatorItems by designing a view inside its ItemTemplate. This template will be applied for all its items and its data will be binded.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Rotator"
xmlns:syncfusion="clr-namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="Rotator.Rotator">
<ContentPage.BindingContext>
<local:RotatorViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfRotator x:Name="rotator"
NavigationDelay="2000"
ItemsSource="{Binding ImageCollection}"
SelectedIndex="2"
NavigationDirection="Horizontal"
NavigationStripMode="Dots"
BackgroundColor="#ececec">
<syncfusion:SfRotator.ItemTemplate>
```

```

<DataTemplate>
<Image Source="{Binding Image}"/>
</DataTemplate>
</syncfusion:SfRotator.ItemTemplate>
</syncfusion:SfRotator>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class Rotator : ContentPage
{
public Rotator()
{
InitializeComponent ();
SfRotator rotator = new SfRotator();
var ImageCollection = new List<RotatorModel> {
new RotatorModel ("movie1.png"),
new RotatorModel ("movie2.png"),
new RotatorModel ("movie3.png"),
new RotatorModel ("movie4.png"),
new RotatorModel ("movie5.png")
};
var itemTemplate = new DataTemplate(() =>
{
var grid = new Grid();
var nameLabel = new Image();
nameLabel.SetBinding(Image.SourceProperty, "Image");
grid.Children.Add(nameLabel);
return grid;
});
rotator.ItemTemplate = itemTemplate;
rotator.ItemsSource = ImageCollection;
this.Content = rotator;
}
}
public class RotatorModel
{
public RotatorModel(string imageString)
{
Image = imageString;
}
private String _image;
public String Image
{

```

```

get { return _image; }
set { _image = value; }
}
}
}

```

### Through Rotator Item

The ItemTemplate provides common template with different data, whereas if different views for every items is needed, it can also be provided using `ItemContent` property in `SfRotatorItem` class.

### C#

```

using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace RangeSlider
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class Rotator : ContentPage
    {
        public Rotator()
        {
            InitializeComponent();
            // Rotator Item as Label
            SfRotator rotator = new SfRotator();
            SfRotatorItem itemLabel = new SfRotatorItem();
            List<SfRotatorItem> rotatorItem = new List<SfRotatorItem>();
            Label label = new Label();
            label.Text = "RotatorItem as Label";
            label.BackgroundColor = Color.Aqua;
            label.FontSize = 20;
            label.VerticalTextAlignment = TextAlignment.Center;
            label.HorizontalTextAlignment = TextAlignment.Center;
            label.VerticalOptions = LayoutOptions.Center;
            itemLabel.ItemContent = label;
            rotatorItem.Add(itemLabel);
            // Rotator Item as Image
            SfRotatorItem itemImage = new SfRotatorItem();
            Image image = new Image();
            image.Source = ImageSource.FromFile("movie1.png");
            image.Aspect = Aspect.AspectFit;
            image.VerticalOptions = LayoutOptions.Center;
            image.HeightRequest = 400;
            image.WidthRequest = 400;
            itemImage.ItemContent = image;
            rotatorItem.Add(itemImage);
            rotator.ItemsSource = rotatorItem;
            this.Content = rotator;
        }
    }
}

```

And also rotator provides a support to display only the Image data with `Image` property in `SfRotatorItem` class.

### C#

```
public partial class RotatorControlPage : ContentPage
{
    public RotatorControlPage()
    {
        InitializeComponent();
        SfRotator rotator = new SfRotator();
        StackLayout stackLayout = new StackLayout();
        public Rotator()
        {
            InitializeComponent();
            stackLayout.HeightRequest = 300;
            List<SfRotatorItem> collectionOfItems = new List<SfRotatorItem>();
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie1.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie2.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie3.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie4.png" });
            collectionOfItems.Add(new SfRotatorItem() { Image = "movie5.png" });
            rotator.DataSource = collectionOfItems;
            stackLayout.Children.Add(rotator);
            this.Content = stackLayout;
        }
    }
}
```

Similarly every item can be created and customized in case of different Rotator item view is needed.

### DataTemplateSelector

SfRotator supports DataTemplateSelector which you can choose a DataTemplate based on the data object.

### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<DataTemplate x:Key="DefaultTemplate">
<Grid>
<Image Source="{Binding Image}" HorizontalOptions="Center"
VerticalOptions="Center"/>
</Grid>
</DataTemplate>
<DataTemplate x:Key="SpecificTemplate">
<Grid>
<Label Text="Not Available" FontSize="Large" HorizontalOptions="Center"
VerticalOptions="Center" FontAttributes="Italic" FontFamily="Calbiri"/>
<Image Source="{Binding Image}" Opacity="0.5" HorizontalOptions="Center"
VerticalOptions="Center"/>
</Grid>
</DataTemplate>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<Grid >
<syncfusion:SfRotator x:Name="sfRotator"
ItemsSource="{Binding ImageCollection}" >
<syncfusion:SfRotator.ItemTemplate>
<local:DataTemplateViewModel DefaultTemplate="{StaticResource
DefaultTemplate}" SpecificTemplate="{StaticResource SpecificTemplate}"/>
</syncfusion:SfRotator.ItemTemplate>
</syncfusion:SfRotator>
</Grid>
</ContentPage.Content>
```

</ContentPage>

**C#**

```
public partial class MainPage : ContentPage
{
    DataTemplate defaultTemplate;
    DataTemplate specifictempalte;
    public MainPage()
    {
        InitializeComponent();
        this.BindingContext = new ViewModel();
        SfRotator rotator = new SfRotator();
        defaultTemplate = new DataTemplate(() =>
        {
            Grid grid = new Grid();
            Image image = new Image();
            image.SetBinding(Image.SourceProperty, "Image");
            grid.Children.Add(image);
            return grid;
        });
        specifictempalte = new DataTemplate(() =>
        {
            Grid grid = new Grid();
            Image image = new Image();
            Label label = new Label();
            image.SetBinding(Image.SourceProperty, "Image");
            image.Opacity = 0.5;
            label.Text = "Not Available";
            label.FontSize = 50;
            label.HorizontalOptions = LayoutOptions.Center;
            label.VerticalOptions = LayoutOptions.Center;
            grid.Children.Add(image);
            grid.Children.Add(label);
            return grid;
        });
        var ImageCollection = new List<Model> {
            new Model ("movie1.png"),
            new Model ("movie2.png"),
            new Model ("movie3.png"),
            new Model ("movie4.png"),
            new Model ("movie5.png")
        };
        rotator.NavigationDirection = NavigationDirection.Horizontal;
        rotator.NavigationStripMode = NavigationStripMode.Thumbnail;
        rotator.BackgroundColor = Color.White;
        rotator.ItemsSource = ImageCollection;
        rotator.ItemTemplate = new DataTemplateViewModel { DefaultTemplate =
            defaultTemplate, SpecificTemplate = specifictempalte};
        this.Content = rotator;
    }
}
```

### OnSelectTemplate

The OnSelectTemplate is a overridden method to return a particular DataTemplate, which shown in the following code:

#### C#

```
public class DataTemplateViewModel : DataTemplateSelector
{
    private DataTemplate defaulttemplate;
    public DataTemplate DefaultTemplate
    {
        get { return defaulttemplate; }
        set { defaulttemplate = value; }
    }
    private DataTemplate specifictemplate;
    public DataTemplate SpecificTemplate
    {
        get { return specifictemplate; }
        set { specifictemplate = value; }
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject container)
    {
        var message = item as Model;
        if (message == null)
            return null;
        return message.Image.ToString() == "movie2.png" ? SpecificTemplate :
            DefaultTemplate;
    }
}
```

The following screenshot illustrates the output of above code.

We have attached sample for reference. You can download the sample from the following link.

Sample link: [DataTemplateSelectorSample](#)

### Adding Looping and Delays

Looping and delay can be enabled in SfRotator control and also we can customize the Text and Navigation direction.

### Toggle AutoPlay

The `EnableAutoPlay` property specifies whether the items should navigate automatically based on `NavigationDelay` property, when the property value is set to true.

**Note:** By default, the property value is set to false.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Rotator"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="Rotator.Rotator">
<ContentPage.BindingContext>
<local:RotatorViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfRotator x:Name="rotator"
ItemsSource="{Binding ImageCollection}"
SelectedIndex="2"
NavigationDirection="Horizontal"
NavigationStripMode="Thumbnail"
BackgroundColor="#ececec"
EnableAutoPlay="true"
NavigationStripPosition="Bottom">
<syncfusion:SfRotator.ItemTemplate>
<DataTemplate>
<Image Source="{Binding Image}"/>
</DataTemplate>
</syncfusion:SfRotator.ItemTemplate>
</syncfusion:SfRotator>
</ContentPage.Content>
</ContentPage>
```

### C#

```
using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class Rotator : ContentPage
{
public Rotator()
{
InitializeComponent();
SfRotator rotator = new SfRotator();
var ImageCollection = new List<RotatorModel> {
new RotatorModel ("movie1.png"),
```

```

new RotatorModel ("movie2.png"),
new RotatorModel ("movie3.png"),
new RotatorModel ("movie4.png"),
new RotatorModel ("movie5.png")
};
var itemTemplate = new DataTemplate(() =>
{
var grid = new Grid();
var nameLabel = new Image();
nameLabel.SetBinding(Image.SourceProperty, "Image");
grid.Children.Add(nameLabel);
return grid;
});
rotator.ItemTemplate = itemTemplate;
rotator.EnableAutoPlay = true;
rotator.ItemsSource = ImageCollection;
this.Content = rotator;
}
}
public class RotatorModel
{
public RotatorModel(string imageString)
{
Image = imageString;
}
private String _image;
public String Image
{
get { return _image; }
set { _image = value; }
}
}
}

```

### Setting Navigation Delay

The `NavigationDelay` property specifies the delay duration while switching to next navigation item, when `EnableAutoPlay` property is enabled.

**Note:** The property value should be in milliseconds.

### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Rotator"
xmlns:syncfusion="clr-namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="Rotator.Rotator">
<ContentPage.BindingContext>
<local:RotatorViewModel/>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfRotator x:Name="rotator"
NavigationDelay="2000"
ItemsSource="{Binding ImageCollection}"
SelectedIndex="2"

```

```

NavigationStripPosition="Bottom">
<syncfusion:SfRotator.ItemTemplate>
<DataTemplate>
<Image Source="{Binding Image}"/>
</DataTemplate>
</syncfusion:SfRotator.ItemTemplate>
</syncfusion:SfRotator>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class Rotator : ContentPage
{
public Rotator()
{
InitializeComponent ();
SfRotator rotator = new SfRotator();
var ImageCollection = new List<RotatorModel> {
new RotatorModel ("movie1.png"),
new RotatorModel ("movie2.png"),
new RotatorModel ("movie3.png"),
new RotatorModel ("movie4.png"),
new RotatorModel ("movie5.png")
};
var itemTemplate = new DataTemplate(() =>
{
var grid = new Grid();
var nameLabel = new Image();
nameLabel.SetBinding(Image.SourceProperty, "Image");
grid.Children.Add(nameLabel);
return grid;
});
rotator.ItemTemplate = itemTemplate;
rotator.EnableAutoPlay = true;
rotator.NavigationDelay = 2000;
rotator.ItemsSource = ImageCollection;
this.Content = rotator;
}
}
public class RotatorModel

```

```
{
public RotatorModel(string imageString)
{
Image = imageString;
}
private String _image;
public String Image
{
get { return _image; }
set { _image = value; }
}
}
}
```

### Looping Items

The `EnableLooping` property specifies whether the items should navigate to first item once it reaches the last item and vice-versa.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

```

```

return grid;
});
rotator.ItemTemplate = itemTemplate;
rotator.EnableSwiping = false;
rotator.ItemsSource = ImageCollection;
this.Content = rotator;
}
}
public class RotatorModel
{
public RotatorModel(string imageString)
{
Image = imageString;
}
private String _image;
public String Image
{
get { return _image; }
set { _image = value; }
}
}
}
}

```

## Navigation Modes

The `NavigationStripMode` property specifies the appearance of navigation bar items. The image data can be selected either by Thumbnail or by Dots navigation modes.

- **Thumbnail** - The slider items will be loaded in thumbnail view additionally. When a thumbnail item is clicked, the slider will switch to the corresponding image data.

## XML

```

    }
}

```

```
}
}
```

### Items / Dot Strip Positions

The `NavigationStripPosition` specifies the placement position of the navigation bar items such as thumbnail or dots relative to the slider area.

There are four available positions,

- **Bottom** - Sets the position of the navigation bar items to the bottom.
- **Left** - Sets the position of the navigation bar items to the left.
- **Top** - Sets the position of the navigation bar items to the top.
- **Right** - Sets the position of the navigation bar items to the right.

        public String Image
        {
            get { return _image; }
            set { _image = value; }
        }
    }
}
```

## Header Visibility

The `IsTextVisible` property can be used to enable the text area visibility in bottom area of SfRotator for providing additional information of items. `IsTextVisible` property is used to change the visibility of the Text panel that is displayed when SfRotatorItem collection is set and will have no effect when setting Item template.

**Note:** By default, the property value is false.

rotator.IsTextVisible = true;
rotator.DotPlacement = DotPlacement.Outside;
stackLayout.Children.Add(rotator);
this.Content = stackLayout;
}
}
}

```

## Placement Modes

By default, the rotator control displays the dots of each rotator item. It can be changed to any of the following types:

- Default
- None
- Outside

## DotsPlacement

The Display Type of Rotator can be modified using the DotsPlacement Mode. The “None” type can be used when the dots are not needed for the rotator control.

        }
    }
}

```

## Loading URL Images

This section describes how to load the online images in SfRotator Control.

### C#

```
using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace Rotator
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class Rotator : ContentPage
    {
        public Rotator()
        {
            InitializeComponent();
            SfRotator sfRotator = new SfRotator();
            sfRotator.ItemsSource = GetDataSource();
            var imageTemplate = new DataTemplate(() =>
            {
                Image image = new Image();
                image.SetBinding(Image.SourceProperty, "Image");
                return image;
            });
            sfRotator.ItemTemplate = imageTemplate;
            this.Content = sfRotator;
        }
        List<CustomData> GetDataSource()
        {
            List<CustomData> list = new List<CustomData>();
```

```
list.Add(new
CustomData("https://cdn.syncfusion.com/content/images/Images/Camtasia_Succin
ctly.png?v=22022017060923"));

c_sharp_developers_succinctly_cover_img.png?v=22022017060923"));
return list;
}
}
}
```

## C#

```
// Custom Data
using System;
using Xamarin.Forms;
namespace Rotator
{
    public class CustomData : ContentPage
    {
        public CustomData(string image)
        {
            Image = image;
        }
        public string Image
        {
            get;
            set;
        }
        public CustomData()
        {
        }
    }
}
```

## Events

### Selection Changed

The SelectionChanged event is used to notify when the selection is changed by swiping or dynamically setting the SelectedIndex property of SfRotator.

### ItemTapped

The ItemTapped event will be triggered whenever tapping the item.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Rotator"
xmlns:rotator="clr-
namespace:Syncfusion.SfRotator.XForms;assembly=Syncfusion.SfRotator.XForms"
x:Class="Rotator.MainPage">
<rotator:SfRotator.BindingContext>
<local:RotatorViewModel/>
</rotator:SfRotator.BindingContext>
<ContentPage.Content>
<Grid HorizontalOptions="FillAndExpand" VerticalOptions="Fill">
<rotator:SfRotator x:Name="rotator"
ItemTapped="Rotator_ItemTapped"
SelectedIndexChanged="Rotator_SelectedIndexChanged"
ItemsSource="{Binding ImageCollection}"
VerticalOptions="Start">
<rotator:SfRotator.ItemTemplate>
<DataTemplate>
<StackLayout>
<Image Source="{Binding Image}" />
```

```

</StackLayout>
</DataTemplate>
</rotator:SfRotator.ItemTemplate>
</rotator:SfRotator>
</Grid>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.SfRotator.XForms;
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Xamarin.Forms;
namespace Rotator
{
    public partial class MainPage : ContentPage
    {
        public MainPage()
        {
            InitializeComponent();
        }
        private void Rotator_ItemTapped(object sender, EventArgs e)
        {
            DisplayAlert("Notification", "Rotator Item is Tapped", "Ok");
        }
        private void Rotator_SelectedIndexChanged(object sender,
            SelectedIndexChangedEventArgs e)
        {
            DisplayAlert("Notification", "Selected Index is Changed", "Ok");
        }
        public class RotatorModel
        {
            public RotatorModel(string imageString)
            {
                Image = imageString;
            }
            private String _image;
            public String Image
            {
                get { return _image; }
                set { _image = value; }
            }
        }
        RotatorViewModel Class:
        using System;
        using System.Collections.Generic;
        using System.Collections.ObjectModel;
        using System.Text;
        namespace Rotator
        {

```

```
public class RotatorViewModel
{
    public RotatorViewModel()
    {
        ImageCollection.Add(new RotatorModel("movie1.png"));
        ImageCollection.Add(new RotatorModel("image1.png"));
        ImageCollection.Add(new RotatorModel("movie3.png"));
        ImageCollection.Add(new RotatorModel("movie4.png"));
        ImageCollection.Add(new RotatorModel("movie5.png"));
    }
    private ObservableCollection<RotatorModel> imageCollection = new
    ObservableCollection<RotatorModel>();
    public ObservableCollection<RotatorModel> ImageCollection
    {
        get { return imageCollection; }
        set { imageCollection = value; }
    }
}
```

The following screenshot illustrates the output of above code.

### AutomationId

The SfRotator control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the SfRotator control. To keep unique **AutomationId**, these inner elements' **AutomationIds** are updated based on the control's **AutomationId**.

For example, if you set SfRotator's **AutomationId** as "Book Display Rotator" and you want to select the fifth index, then the automation framework will interact with the Thumbnail as "Book Display Rotator Index 5 of 5".

The automation framework will interact only to the Dots and Thumbnail **NavigationStripMode**. You cannot interact with the rotator item when you want to select the index that is not visible in the view.

---

**Note:** You cannot provide **AutomationId** when the rotator item is populated with custom template.

---

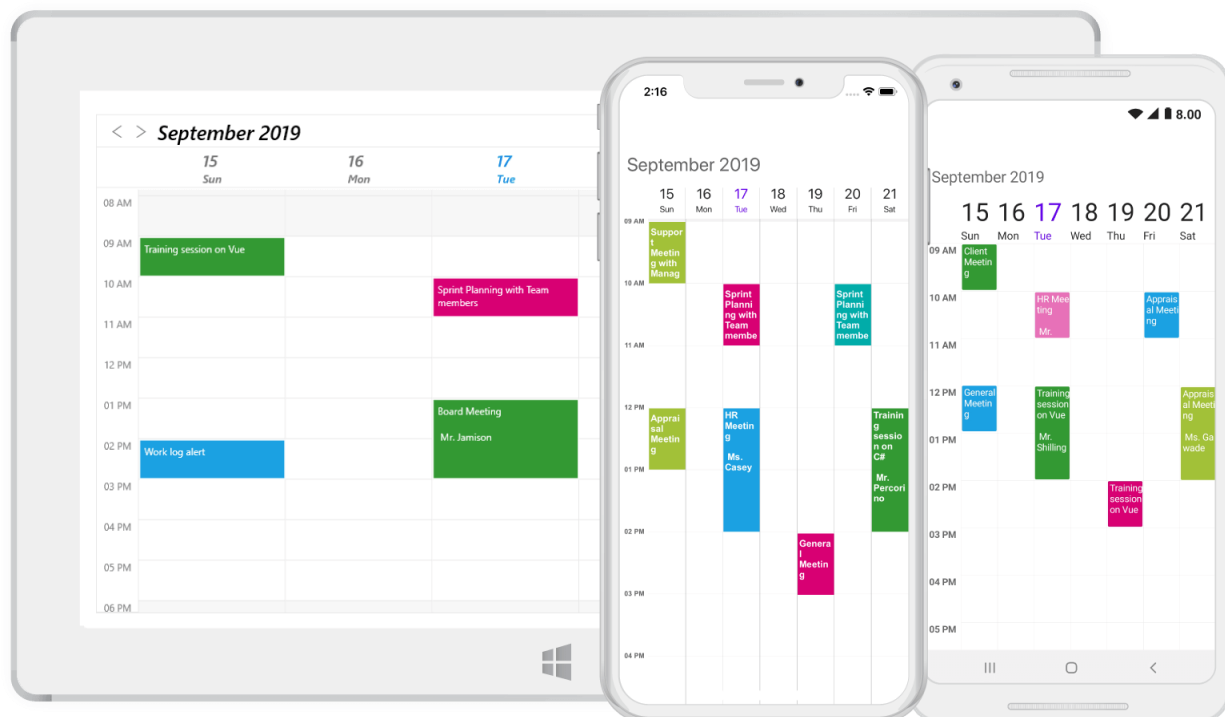

Book Display Rotator Item 5 of 5

## SfSchedule

### Overview

Essential Schedule for Xamarin.Forms provides all the common scheduling functionalities to create and manage appointments as well as exposes a gesture friendly UI to perform all common operations likes selection, navigation, etc. **Essential Schedule** is a perfect solution for developers looking to add advanced, feature rich **Schedule** to their applications.

## Key features

**Built-in Views** — Schedule provides five different types of views such as Day, WorkWeek, Week, Timeline and Month.

**Recurrence Appointment** — Recurring appointments can be created with Daily, weekly, monthly, and yearly recurrence patterns which is supported in iCal standard.

**Customization** — Control has simple APIs allowing for elegant customizations. You can edit the look to match the rest of your application.

**Localization** — The built-in content of the user interface can be changed according to culture that is needed. Also, it has built-in culture support for basic items such as day and month text representations.

## Getting Started

This section provides you an overview for working with SfSchedule for Xamarin.Forms and also provides a walk through to configure SfSchedule control in real time scenario.

### Adding SfSchedule reference

You can add SfSchedule reference using one of the following methods:

#### Method 1: Adding SfSchedule reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfSchedule). To add SfSchedule to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfSchedule](https://www.nuget.org/packages/Syncfusion.Xamarin.SfSchedule), and then install it.

![Adding SfSchedule reference from NuGet](GettingStarted\_images/Adding SfSchedule reference.png)

**Note:** When there is mismatch between the Syncfusion NuGet packages among the projects, `System.IO.FileLoadException` will occur. To overcome this exception, install the same version of the SfSchedule assemblies in all the projects.

#### Method 2: Adding SfSchedule reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfSchedule control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfSchedule assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfSchedule.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfSchedule.Android.dll Syncfusion.SfSchedule.XForms.Android.dll Syncfusion.SfSchedule.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll

iOS	Syncfusion.SfSchedule.iOS.dll Syncfusion.SfSchedule.XForms.iOS.dll Syncfusion.SfSchedule.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfSchedule.XForms.UWP.dll Syncfusion.SfSchedule.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.SfSchedule.XForms.WPF.dll Syncfusion.SfSchedule.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### *Launching SfSchedule on each platform*

To use SfSchedule inside an application, each platform application must initialize the SfScheduleRenderer. This initialization step varies from platform to platform and it is discussed in the following sections.

#### *Android*

Android application launches SfSchedule without any initialization.

**Note:** If you are adding the references from toolbox, this step is not needed.

#### *iOS*

To launch SfSchedule in iOS, you need to call `SfScheduleRenderer.Init()` in the FinishedLaunching overridden method of the AppDelegate class after the Xamarin.Forms Framework initialization.

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    Syncfusion.SfSchedule.XForms.iOS.SfScheduleRenderer.Init();
    LoadApplication(new App());
}
```

#### *Universal Windows Platform (UWP)*

UWP application launches SfSchedule without any initialization.

### ReleaseMode issue in UWP platform

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfSchedule assemblies in **App.xaml.cs** in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfSchedule.XForms.UWP.SfScheduleRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
}
```

### Windows Presentation Foundation (WPF)

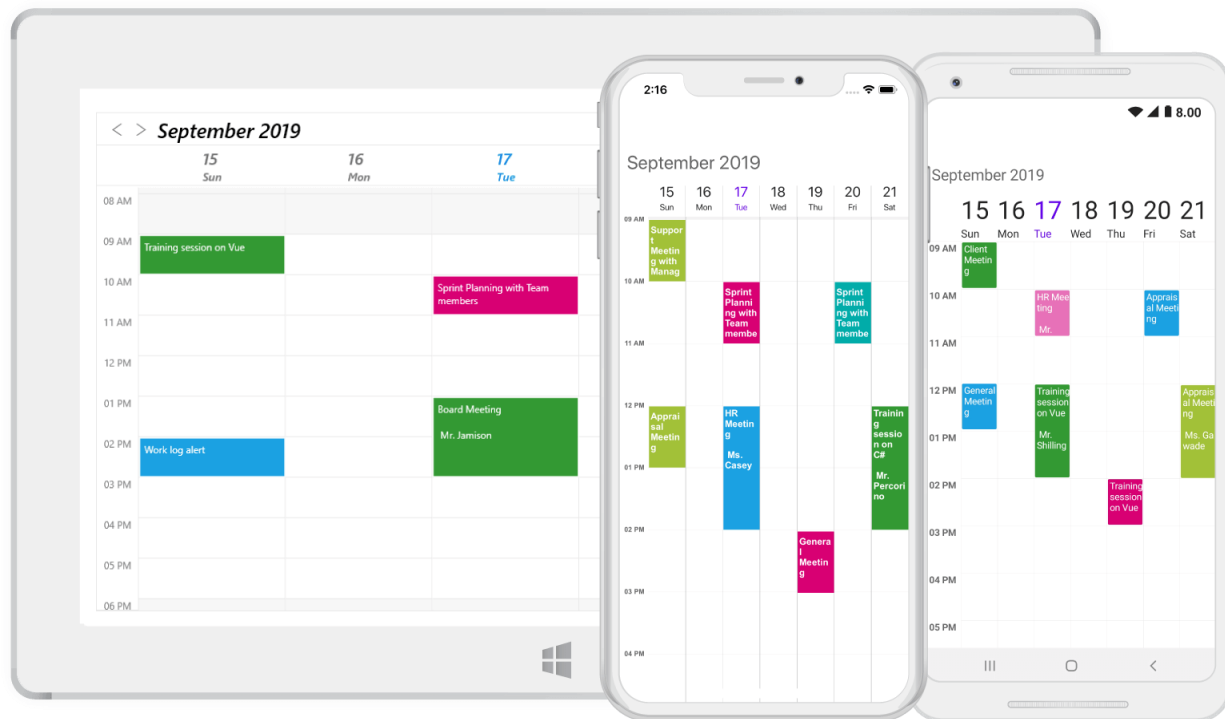

To launch the schedule in WPF SfScheduleRenderer.Init() method in the MainWindow constructor of the MainWindow class after the Xamarin.Forms Framework has been initialized and before the LoadApplication method is called as demonstrated in the following code sample.

#### C#

```
// In App.xaml.cs
public partial class MainWindow : FormsApplicationPage
{
    public MainWindow()
    {
        InitializeComponent();
        Forms.Init();
        Syncfusion.SfSchedule.XForms.WPF.SfScheduleRenderer.Init();
        LoadApplication(new App());
    }
}
```

### Create a simple application with SfSchedule

This section explains how to create a simple application using SfSchedule control. SfSchedule control can be configured entirely in C# code or by using XAML markup. This is how the final output will look like on iOS, Android and Windows Phone devices.

You can download the entire source code of this demo for Xamarin.Forms from here [ScheduleGettingStarted](#)

This section provides a walks through to create **MeetingRoomScheduler** using our Schedule control.

- [Creating a new project](#)
- [Adding SfSchedule to the project](#)
- [Changing Schedule Views](#)
- [Binding data to SfSchedule control](#)

### Creating a new project

Create a new Blank App (Xamarin.Forms) application in Xamarin Studio or Visual Studio.

Add the required assembly references to the .NET Standard and renderer projects as discussed in the [Assembly Configuration](#) section.

Import SfSchedule control namespace **Syncfusion.SfSchedule.XForms**.

### Adding SfSchedule to the project

Set the SfSchedule control as content to the ContentPage.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage
  x:Class="GettingStarted.Sample"
  xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted">
```

```
xmlns:syncfusion="clr-
namespace:Syncfusion.SfSchedule.XForms;assembly=Syncfusion.SfSchedule.XForms
">
<ContentPage.Content>
<syncfusion:SfSchedule x:Name="schedule" />
</ContentPage.Content>
</ContentPage>
```

## C#

```
using Syncfusion.SfSchedule.XForms;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfSchedule schedule;
        public App()
        {
            InitializeComponent();
            //Creating new instance for SfSchedule
            schedule = new SfSchedule();
            MainPage = new ContentPage { Content = schedule };
        }
    }
}
```

You can download the source code for rendering of schedule for Xamarin.Forms from here [ScheduleProject](#)

## Changing Schedule Views

SfSchedule control provides five different types of views to display dates and it can be assigned to the control by using [ScheduleView](#) property. By default the control is assigned with [DayView](#). Current date will be displayed initially for all the Schedule views.

Schedule control will be rendered with [Sunday](#) as the first day of the week, but you can customize to any day by using [FirstDayOfWeek](#) property of [SfSchedule](#).

## XML

```
<syncfusion:SfSchedule x:Name="schedule" FirstDayOfWeek="3"/>
```

## C#

```
//setting first day of the week
schedule.FirstDayOfWeek = (int) DayOfWeek.Tuesday;
```

September 2019						
Tue	Wed	Thu	Fri	Sat	Sun	Mon
27	28	29	30	31	1	2
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30
1	2	3	4	5	6	7

#### Day View

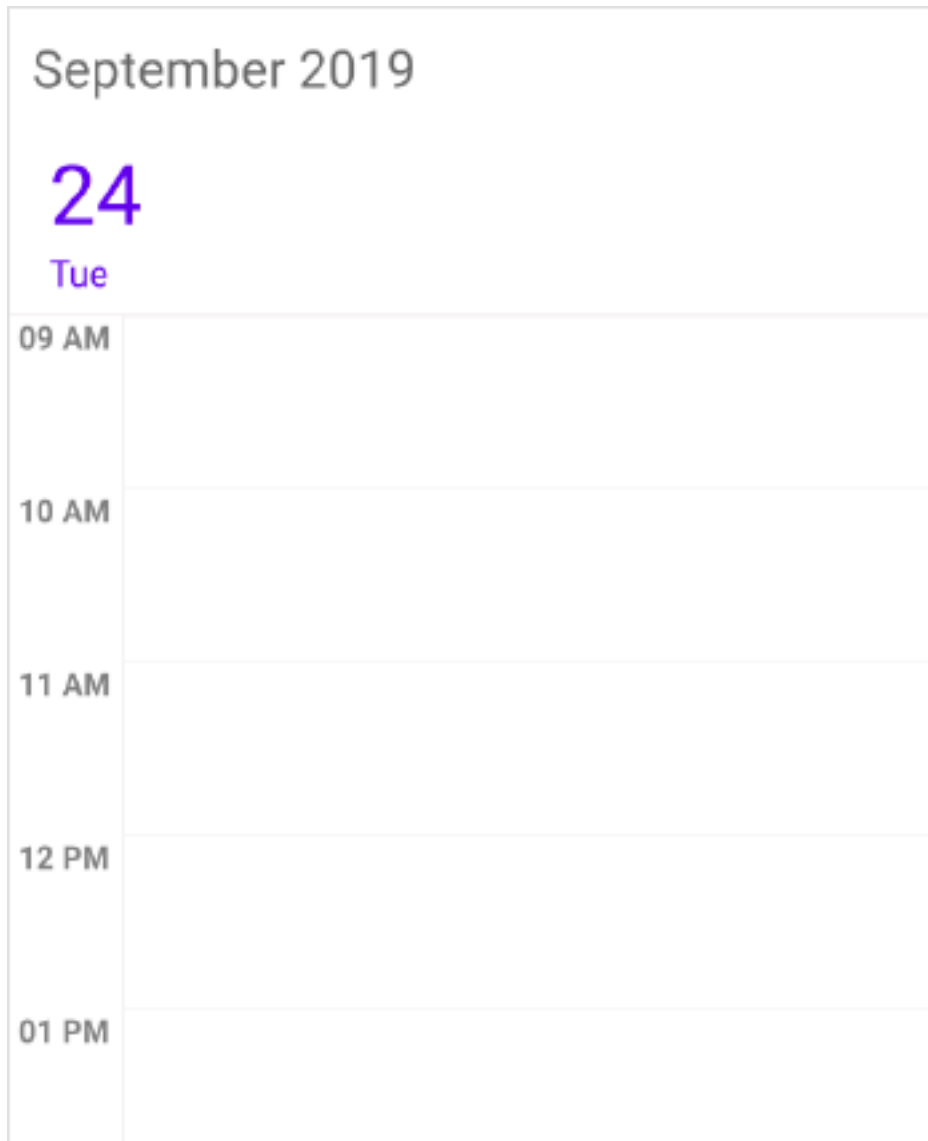

DayView is used to display a single day, current day will be visible by default. Appointments on a specific day will be arranged in respective timeslots based on its duration.

#### XML

```
<syncfusion:SfSchedule x:Name="schedule" ScheduleView="DayView" />
```

#### C#

```
schedule.ScheduleView = ScheduleView.DayView;
```

#### [Week View](#)

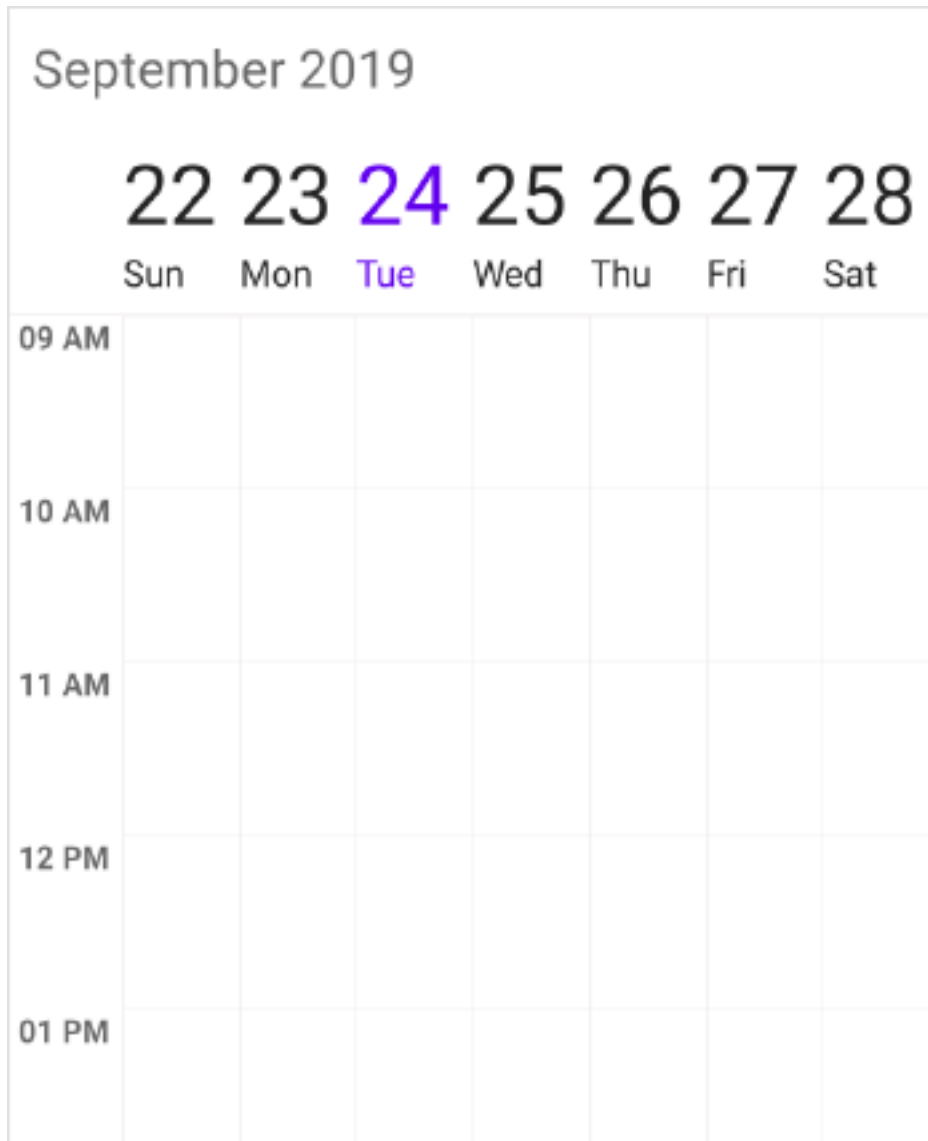

**WeekView** is to view all days of a particular week. Appointments will be arranged based on the dates on the week in respective timeslots.

#### **XML**

```
<syncfusion:SfSchedule x:Name="schedule" ScheduleView="WeekView" />
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.WeekView;
```

#### [Work Week View](#)

**WorkWeekView** is to view only working days of a particular week. By default, Saturday and Sunday are the non-working days. You can be customize it with any days of a Week. Appointments arranged in timeslots based on its duration with respective day of the week.

#### **XML**

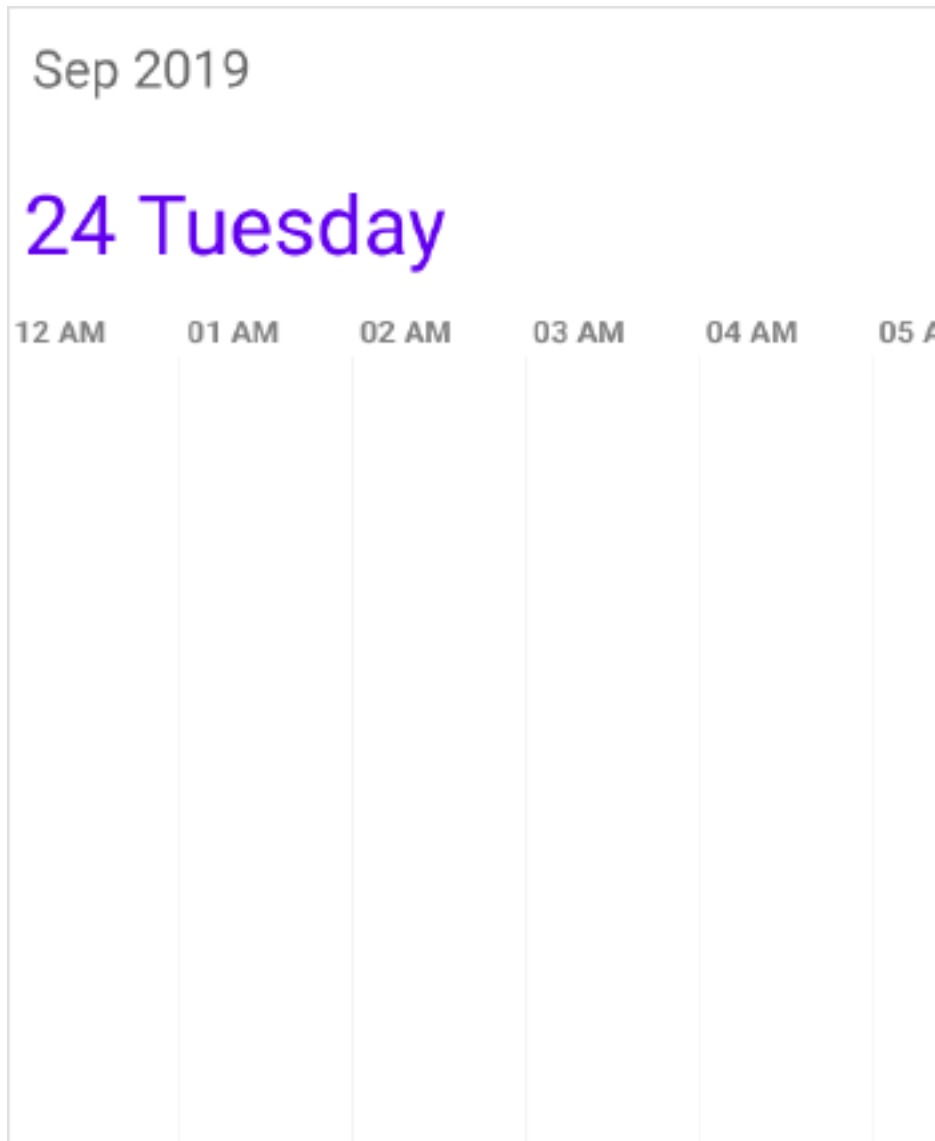

```
<syncfusion:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView" />
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
```

#### *Month View*

**MonthView** in Schedule control is to view entire dates of a particular month. Appointments can be viewed in inline by setting [ShowAppointmentsInline](#) property of **SfSchedule** as true.

#### **XML**

```
<syncfusion:SfSchedule
x:Name="schedule"
ScheduleView="MonthView"
ShowAppointmentsInline="True">
</syncfusion:SfSchedule>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.MonthView;
//view appointments in inline
schedule.ShowAppointmentsInline = true;
```

September 2019						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

### Binding data to SfSchedule control

Schedule control has a built-in capability to handle the appointment arrangement internally based on the `ScheduleAppointment` collections. You need to assign the created collection to the [DataSource](#) property of `SfSchedule`.

### Adding Appointments

[ScheduleAppointment](#) is a class, which holds the details about the appointment to be rendered in schedule. It has some basic properties such as [StartTime](#), [EndTime](#), [Subject](#) and some additional information about the appointment can be added using [Color](#), [Notes](#), [Location](#), [IsAllDay](#), [IsRecursive](#) properties.

### C#

```
ScheduleAppointmentCollection appointmentCollection = new
ScheduleAppointmentCollection();
//Creating new event
ScheduleAppointment clientMeeting = new ScheduleAppointment();
DateTime currentDate = DateTime.Now;
```

```

DateTime startTime = new DateTime
(currentDate.Year, currentDate.Month, currentDate.Day, 10, 0, 0);
DateTime endTime = new DateTime (currentDate.Year,
currentDate.Month, currentDate.Day, 12, 0, 0);
clientMeeting.StartTime = startTime;
clientMeeting.EndTime = endTime;
clientMeeting.Color = Color.Blue;
clientMeeting.Subject = "ClientMeeting";
appointmentCollection.Add(clientMeeting);
schedule.DataSource = appointmentCollection;

```

You can download the source code for rendering of schedule appointment using `ScheduleAppointmentCollection` for Xamarin.Forms from

here [ScheduleAppointment](#)

#### *Adding Custom Appointments*

You can also map custom appointments data to our schedule.

---

#### **NOTE**

CustomAppointment class should contain two DateTime fields and a string field as mandatory.

Here steps to render `MeetingRoomScheduler` using SfSchedule control with respective custom data properties created in a class Meeting.

- [Creating custom class for appointments](#)
- [Creating view model](#)
- [Mapping custom class](#)
- [Setting data source for SfSchedule](#)

#### *Creating custom class for appointments*

You can create a custom class `Meeting` with mandatory fields "From", "To" and "EventName".

#### **C#**

```

/// <summary>
/// Represents custom data properties.
/// </summary>
public class Meeting
{
    public string EventName { get; set; }
    public string Organizer { get; set; }
    public string ContactID { get; set; }
    public int Capacity { get; set; }
    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public Color color { get; set; }
    public bool AllDay { get; set; }
}

```

---

#### **NOTE**

You can inherit this class from `INotifyPropertyChanged` for dynamic changes in custom data.

### Creating view model

You can schedule meetings for a particular day by setting **From** and **To** of **Meeting** class. Also you can change subject and color of appointment using **EventName** and **color** of **Meeting** class. In a separate **ViewModel** class you can describe the collection of custom appointments.

### C#

```
/// <summary>
/// Represents collection of appointments.
/// </summary>
public class ViewModel
{
    public ObservableCollection<Meeting> Meetings { get; set; }
    List<string> eventNameCollection;
    List<Color> colorCollection;
    public ViewModel()
    {
        Meetings = new ObservableCollection<Meeting>();
        CreateEventNameCollection();
        CreateColorCollection();
        CreateAppointments();
    }
    /// <summary>
    /// Creates meetings and stores in a collection.
    /// </summary>
    private void CreateAppointments()
    {
        Random randomTime = new Random();
        List<Point> randomTimeCollection = GettingTimeRanges();
        DateTime date;
        DateTime DateFrom = DateTime.Now.AddDays(-10);
        DateTime DateTo = DateTime.Now.AddDays(10);
        DateTime dataRangeStart = DateTime.Now.AddDays(-3);
        DateTime dataRangeEnd = DateTime.Now.AddDays(3);
        for (date = DateFrom; date < DateTo; date = date.AddDays(1))
        {
            if ((DateTime.Compare(date, dataRangeStart) > 0) && (DateTime.Compare(date, dataRangeEnd) < 0))
            {
                for (int AdditionalAppointmentIndex = 0; AdditionalAppointmentIndex < 3; AdditionalAppointmentIndex++)
                {
                    Meeting meeting = new Meeting();
                    int hour =
                        (randomTime.Next((int)randomTimeCollection[AdditionalAppointmentIndex].X,
                        (int)randomTimeCollection[AdditionalAppointmentIndex].Y));
                    meeting.From = new DateTime(date.Year, date.Month, date.Day, hour, 0, 0);
                    meeting.To = (meeting.From.AddHours(1));
                    meeting.EventName = eventNameCollection[randomTime.Next(9)];
                    meeting.color = colorCollection[randomTime.Next(9)];
                    if (AdditionalAppointmentIndex % 3 == 0)
                        meeting.AllDay = true;
                    Meetings.Add(meeting);
                }
            }
            else
            {
                // ...
            }
        }
    }
}
```

```
{
Meeting meeting = new Meeting();
meeting.From = new DateTime(date.Year, date.Month, date.Day,
randomTime.Next(9, 11), 0, 0);
meeting.To = (meeting.From.AddHours(1));
meeting.EventName = eventNameCollection[randomTime.Next(9)];
meeting.color = colorCollection[randomTime.Next(9)];
Meetings.Add(meeting);
}
}
}

/// <summary>
/// Creates event names collection.
/// </summary>
private void CreateEventNameCollection()
{
eventNameCollection = new List<string>();
eventNameCollection.Add("General Meeting");
eventNameCollection.Add("Plan Execution");
eventNameCollection.Add("Project Plan");
eventNameCollection.Add("Consulting");
eventNameCollection.Add("Performance Check");
eventNameCollection.Add("Yoga Therapy");
eventNameCollection.Add("Plan Execution");
eventNameCollection.Add("Project Plan");
eventNameCollection.Add("Consulting");
eventNameCollection.Add("Performance Check");
}

/// <summary>
/// Creates color collection.
/// </summary>
private void CreateColorCollection()
{
colorCollection = new List<Color>();
colorCollection.Add(Color.FromHex("#FF339933"));
colorCollection.Add(Color.FromHex("#FF00ABA9"));
colorCollection.Add(Color.FromHex("#FFE671B8"));
colorCollection.Add(Color.FromHex("#FF1BA1E2"));
colorCollection.Add(Color.FromHex("#FFD80073"));
colorCollection.Add(Color.FromHex("#FFA2C139"));
colorCollection.Add(Color.FromHex("#FFA2C139"));
colorCollection.Add(Color.FromHex("#FFD80073"));
colorCollection.Add(Color.FromHex("#FF339933"));
colorCollection.Add(Color.FromHex("#FFE671B8"));
colorCollection.Add(Color.FromHex("#FF00ABA9"));
}

/// <summary>
/// Gets the time ranges.
/// </summary>
private List<Point> GettingTimeRanges()
{
List<Point> randomTimeCollection = new List<Point>();
randomTimeCollection.Add(new Point(9, 11));
randomTimeCollection.Add(new Point(12, 14));
randomTimeCollection.Add(new Point(15, 17));
return randomTimeCollection;
}
```

```
}

```

### Mapping custom class

You can map those properties of `Meeting` class with our schedule control by using [ScheduleAppointmentMapping](#).

#### XML

```
<syncfusion:SfSchedule x:Name="schedule">
  <syncfusion:SfSchedule.AppointmentMapping>
  <syncfusion:ScheduleAppointmentMapping
    ColorMapping="color"
    EndTimeMapping="To"
    StartTimeMapping="From"
    SubjectMapping="EventName"
    IsAllDayMapping="AllDay"/>
  </syncfusion:SfSchedule.AppointmentMapping>
</syncfusion:SfSchedule>
```

#### C#

```
ScheduleAppointmentMapping dataMapping = new ScheduleAppointmentMapping();
dataMapping.ColorMapping = "color";
dataMapping.EndTimeMapping = "To";
dataMapping.StartTimeMapping = "From";
dataMapping.SubjectMapping = "EventName";
dataMapping.IsAllDayMapping = "AllDay";
schedule.AppointmentMapping = dataMapping;
```

### Setting data source for SfSchedule

Create meetings of type `ObservableCollection<Meeting>` and assign those appointments collection `Meetings` to the `DataSource` property of `SfSchedule`.

#### XML

```
<syncfusion:SfSchedule x:Name="schedule"
  DataSource="{Binding Meetings}"
  ScheduleView="WeekView">
  <syncfusion:SfSchedule.BindingContext>
  <local:ViewModel/>
  </syncfusion:SfSchedule.BindingContext>
</syncfusion:SfSchedule>
```

#### C#

```
ViewModel viewModel = new ViewModel();
schedule.DataSource = viewModel.Meetings;
```

You can download the entire source code of this demo for `Xamarin.Forms` from here [ScheduleGettingStarted](#)

## Header

You can customize the header of the Schedule using [HeaderStyle](#) and [HeaderHeight](#) property in schedule.

## Header Height

You can customize the height for the Header in Schedule using [HeaderHeight](#) in schedule.

### XML

```
<syncfusion:SfSchedule x:Name="schedule" HeaderHeight="50" />
```

### C#

```
schedule.HeaderHeight = 50;
```

## Appearance

You can change the header format and style using [HeaderStyle](#) property in schedule.

You can change the background color, font family, font attributes and font size using properties such as [BackgroundColor](#), [FontFamily](#), [FontAttributes](#), [FontSize](#), [TextColor](#), of Header using [HeaderStyle](#) property in schedule.

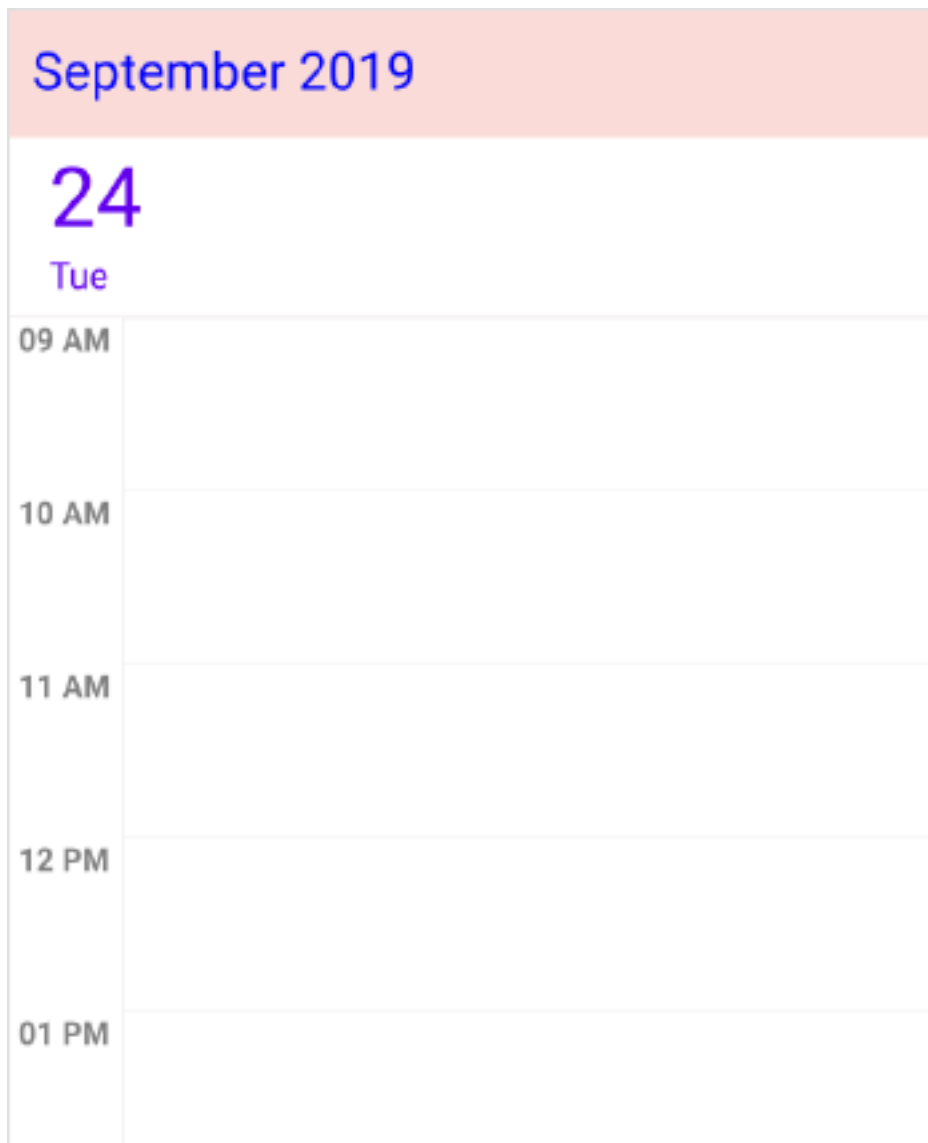

### XML

```
<syncfusion:SfSchedule x:Name="schedule" >  
  <syncfusion:SfSchedule.HeaderStyle>  
    <syncfusion:HeaderStyle  
      BackgroundColor="#FADBD8"  
      TextColor="Blue"  
      FontFamily="Arial"/>  
    </syncfusion:SfSchedule.HeaderStyle>  
  </syncfusion:SfSchedule>
```

### C#

```
HeaderStyle headerStyle = new HeaderStyle();  
headerStyle.BackgroundColor = Color.FromRgb(250, 219, 216);  
headerStyle.FontFamily = "Arial";  
headerStyle.TextColor=Color.Blue;  
schedule.HeaderStyle = headerStyle;
```

**NOTE**

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

*Customize Font Appearance*

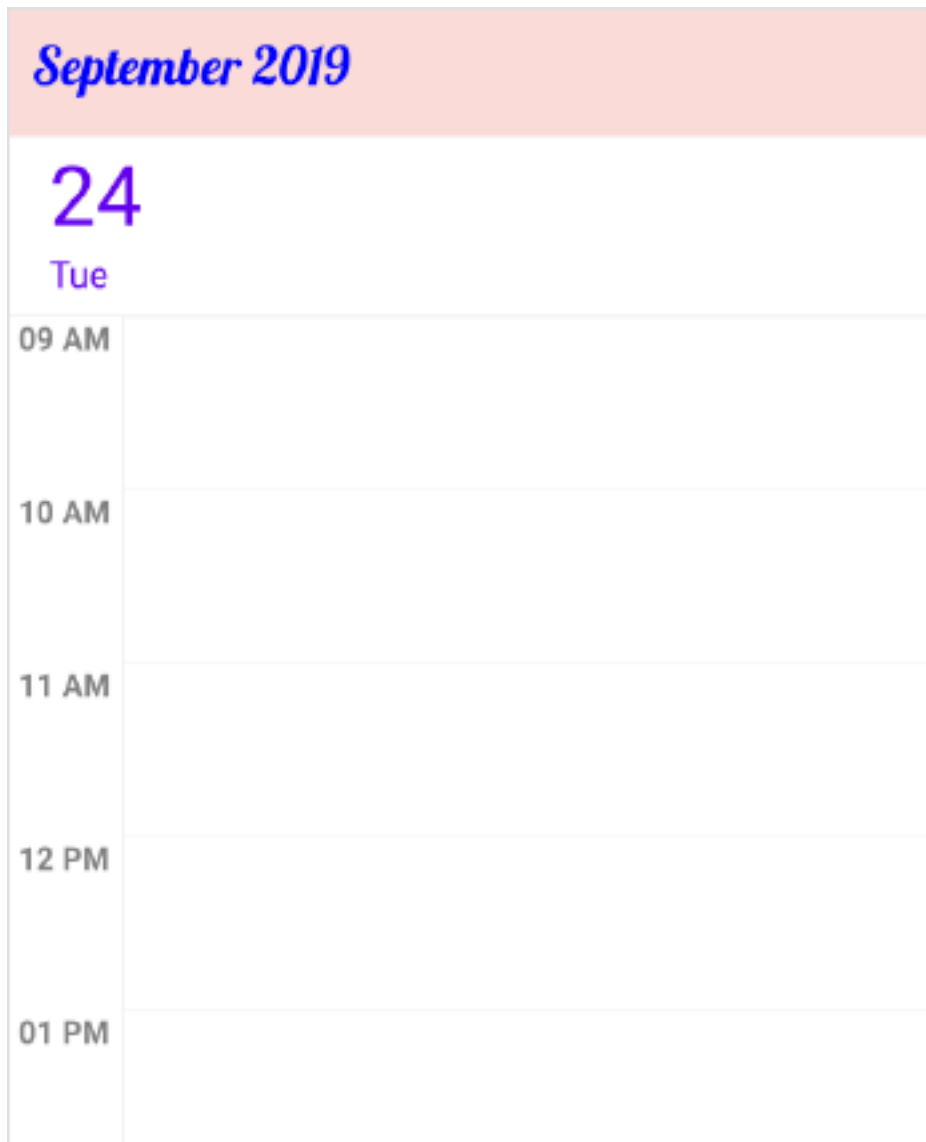

You can change the appearance of Font by setting the [FontFamily](#) property of [HeaderStyle](#) property in Schedule.

**XML**

```
<schedule:HeaderStyle.FontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:HeaderStyle.FontFamily>
```

**C#**

```
headerStyle.FontFamily = Device.OnPlatform("Lobster-Regular", "Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

Refer [this](#) to configure the custom fonts in Xamarin.Forms.

### Loading Custom Headers

You can collapse the default header of schedule by setting `HeaderHeight` property of `SfSchedule` as 0. Instead you can use your own custom header for it. While navigating views in schedule, text labels available in the header will be changed based on it visible dates, so while using custom header, respective text value can be obtained from the `VisibleDatesChanged` event of `SfSchedule`.

### C#

```
//triggering the visible dates changed event.  
schedule.VisibleDatesChangedEvent += Schedule_VisibleDatesChangedEvent;  
...
```

```
private void Schedule_VisibleDatesChangedEvent(object sender,
VisibleDatesChangedEventArgs args)
{
    List<DateTime> dateList = new List<DateTime>();
    dateList = (args.visibleDates);
    var headerString = String.Empty;
    var item = dateList[0];
    if (Schedule.ScheduleView == ScheduleView.DayView)
    {
        item = dateList[0];
        headerString = item.Date.ToString("MMMM, yyyy");
    }
    else
    {
        item = dateList[dateList.Count / 2];
        headerString = item.Date.ToString("MMMM, yyyy");
    }
}
```

You can get the complete sample for customizing the Header of Schedule [here](#)

#### Header Date Format

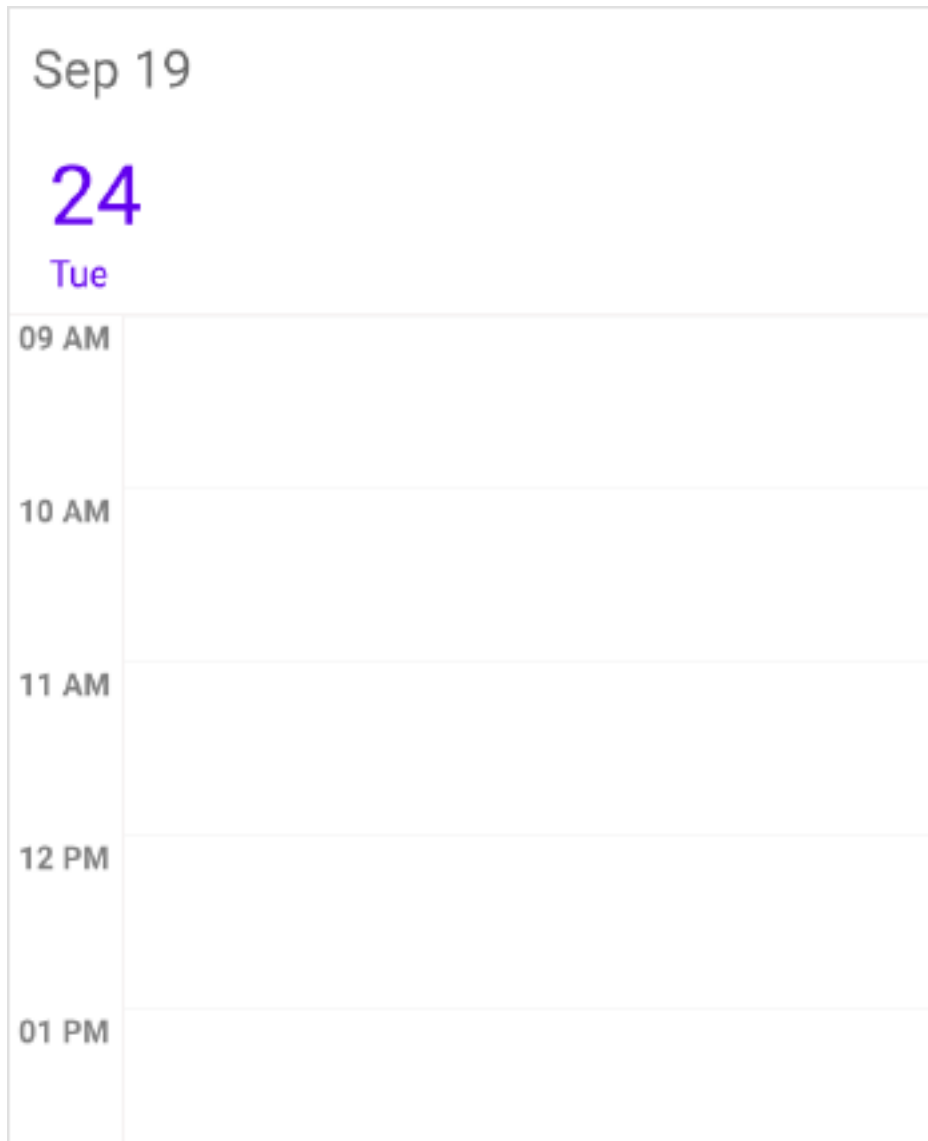

You can customize the date format of SfSchedule Header by using [ScheduleHeaderDateFormat](#) property of SfSchedule.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleHeaderDateFormat = "LLL yy" />
```

#### C#

```
//Creating instance of Schedule
SfSchedule schedule = new SfSchedule();
//Customizing date format
schedule.ScheduleHeaderDateFormat = "LLL yy";
```

### Header Tapped Event

You can handle single tap action of Header by using [HeaderTapped](#) event of [SfSchedule](#). This event will be triggered when the Header is Tapped. This event contains [HeaderTappedEventArgs](#) argument which holds [DateTime](#) details in it.

### XML

```
<schedule:SfSchedule x:Name="schedule" HeaderTapped="Handle_HeaderTapped" />
```

### C#

```
//Creating new instance of Schedule  
SfSchedule schedule = new SfSchedule();  
schedule.HeaderTapped += Handle_HeaderTapped;
```

### C#

```
private void Handle_HeaderTapped(object sender, HeaderTappedEventArgs e)
{
    var dateTime = e.DateTime;
}
```

## DayView

DayView is used to display a single day, current day will be visible by default. Appointments on a specific day will be arranged in respective timeslots based on its duration.

### ViewHeader Appearance

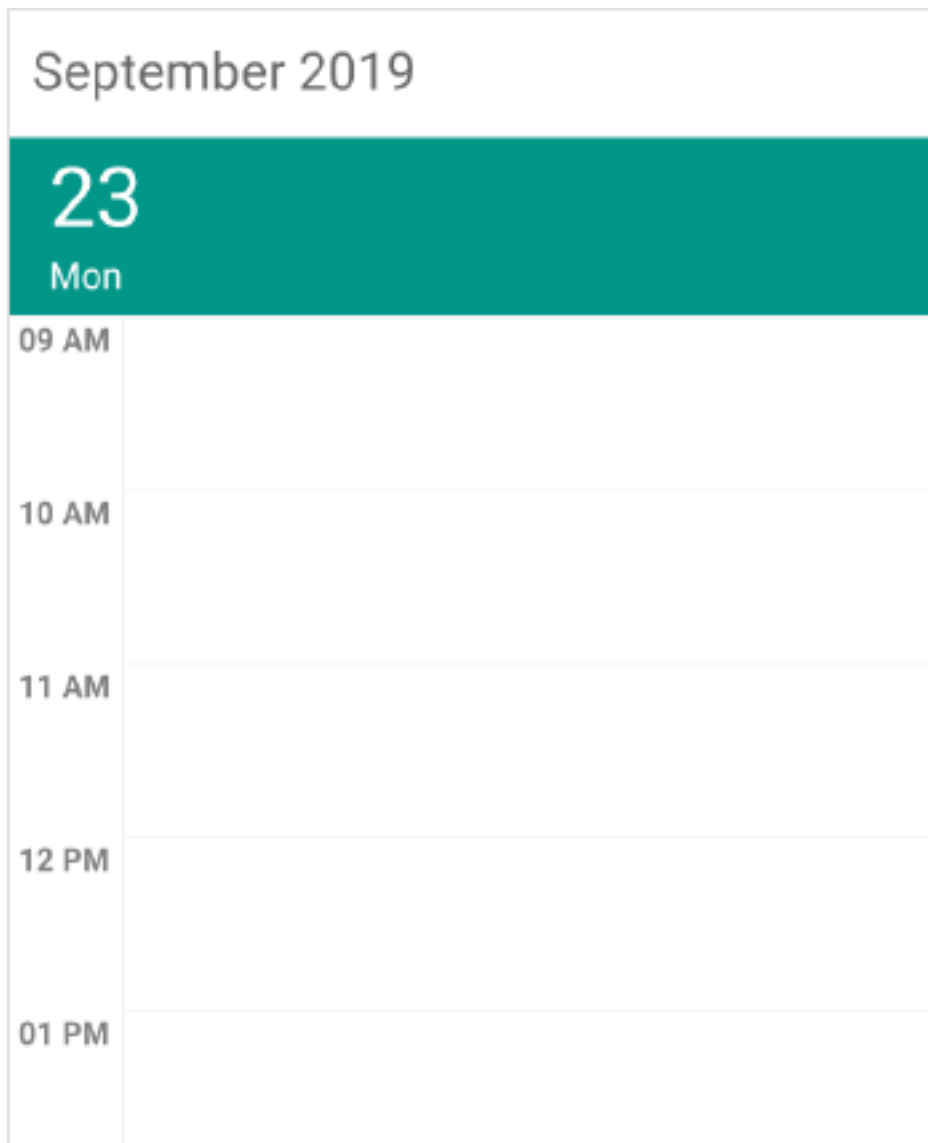

You can customize the default appearance of view header in [DayView](#) by setting [BackgroundColor](#), [DayTextColor](#), [DateTextColor](#), [DayFontFamily](#), [DateFontFamily](#), [CurrentDateTextColor](#), [CurrentDayTextColor](#), [DayFontAttributes](#), [DateFontAttributes](#), [DayFontSize](#) and [DateFontSize](#) properties of [ViewHeaderStyle](#) property in [SfSchedule](#).

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView = "DayView">
<schedule:SfSchedule.ViewHeaderStyle>
<schedule:ViewHeaderStyle
BackgroundColor="#009688"
DayTextColor="#FFFFFF"
DateTextColor="#FFFFFF"
DayFontFamily="Arial"
DateFontFamily="Arial">
</schedule:ViewHeaderStyle>
</schedule:SfSchedule.ViewHeaderStyle>
</schedule:SfSchedule>
```

### C#

```
//Create new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.DayView;
//Customize the schedule view header
ViewHeaderStyle viewHeaderStyle = new ViewHeaderStyle();
viewHeaderStyle.BackgroundColor = Color.FromHex("#009688");
viewHeaderStyle.DayTextColor = Color.FromHex("#FFFFFF");
viewHeaderStyle.DateTextColor = Color.FromHex("#FFFFFF");
viewHeaderStyle.DayFontFamily = "Arial";
viewHeaderStyle.DateFontFamily = "Arial";
schedule.ViewHeaderStyle = viewHeaderStyle;
```

**NOTE**

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

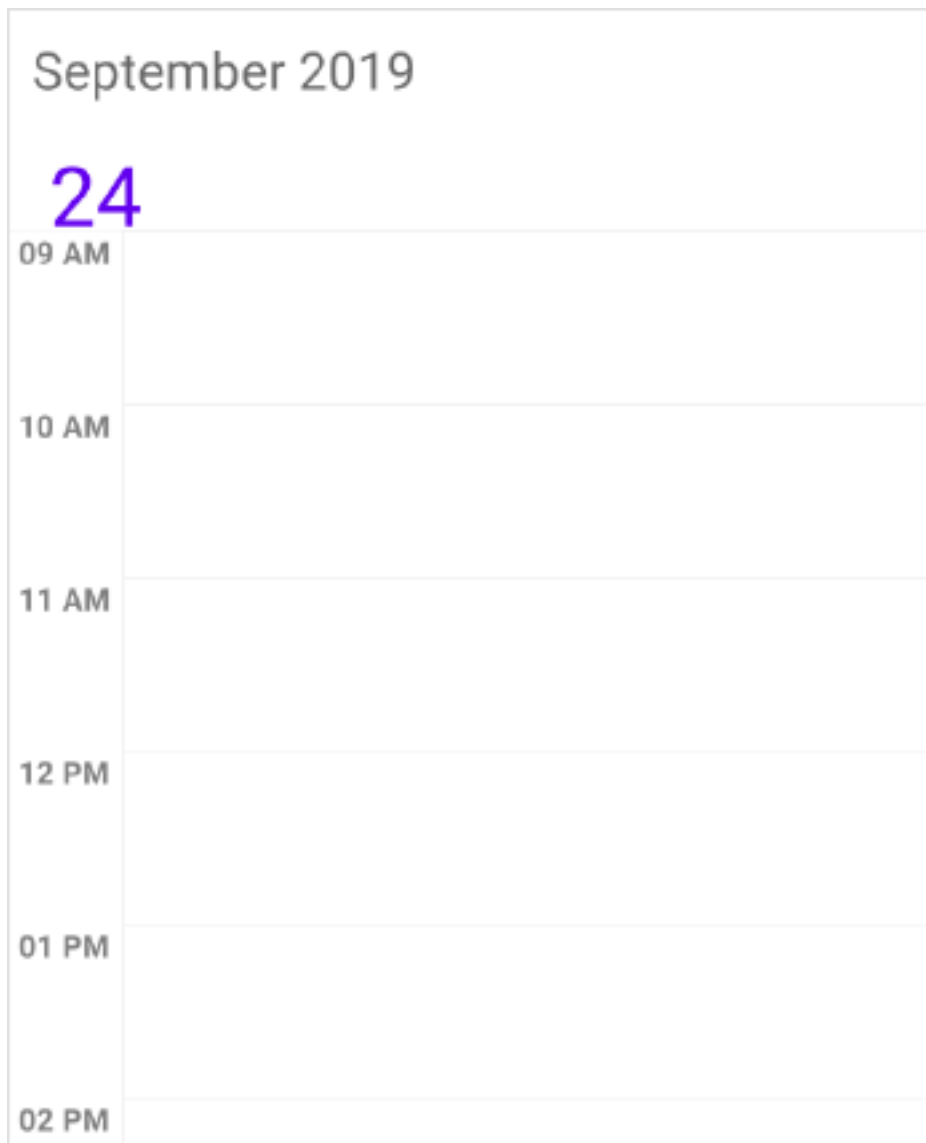

You can customize the height of the ViewHeader in **DayView** by setting [ViewHeaderHeight](#) property of SfSchedule.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView = "DayView"
ViewHeaderHeight="50" >
```

**C#**

```
schedule.ScheduleView = ScheduleView.DayView;
schedule.ViewHeaderHeight = 50;
```

#### *Customize Font Appearance*

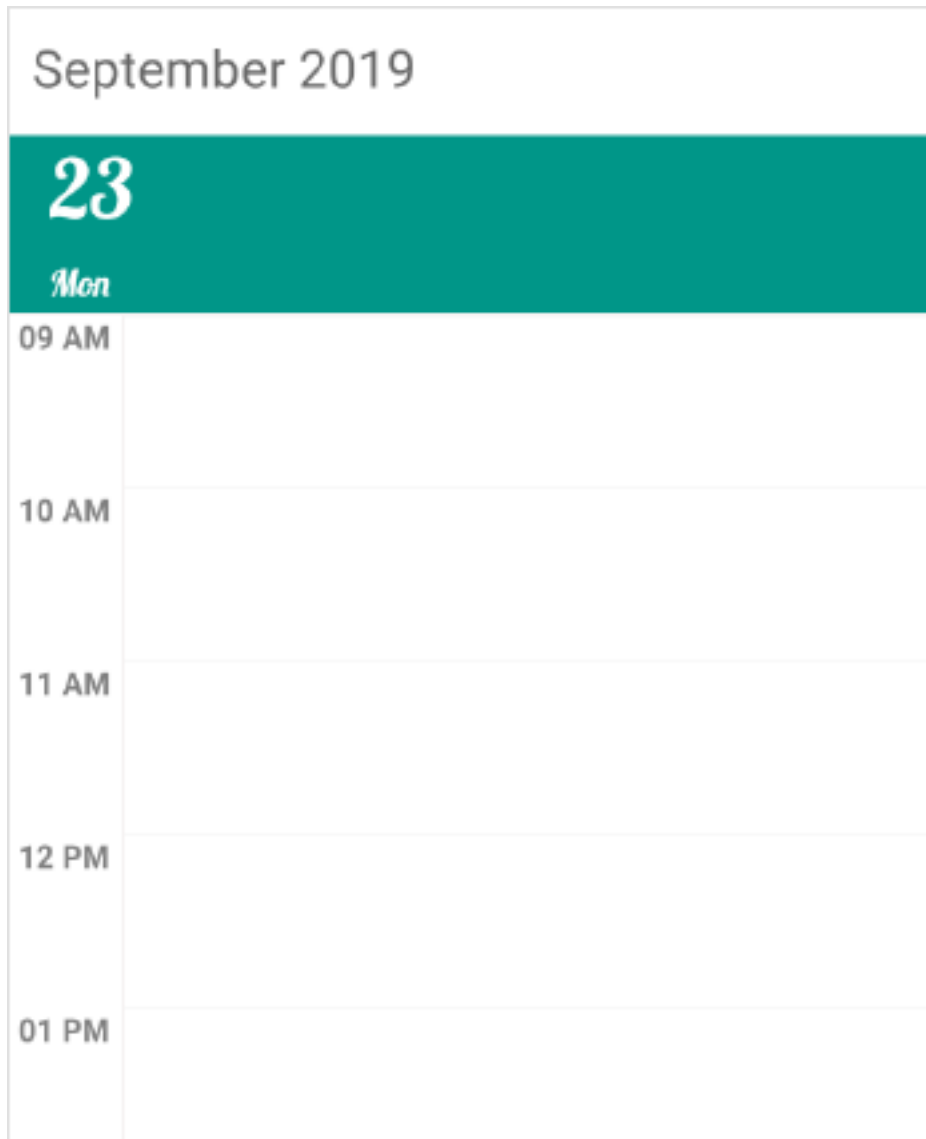

you can change the appearance of Font by setting the [DayFontFamily](#) and [DateFontFamily](#) property of [ViewHeaderStyle](#) property in Schedule.

#### **XML**

```
<schedule:ViewHeaderStyle.DayFontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:ViewHeaderStyle.DayFontFamily>
<schedule:ViewHeaderStyle.DateFontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:ViewHeaderStyle.DateFontFamily>
```

#### **C#**

```
viewHeaderStyle.DayFontFamily = Device.OnPlatform("Lobster-Regular",
"Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
viewHeaderStyle.DateFontFamily = Device.OnPlatform("Lobster-Regular",
"Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

Refer [this](#) to configure the custom fonts in Xamarin.Forms.

#### *ViewHeader Date Format*

You can customize the date and day format of SfSchedule ViewHeader by using [DateFormat](#) and [DayFormat](#) properties of [DayLabelSettings](#).

#### **XML**

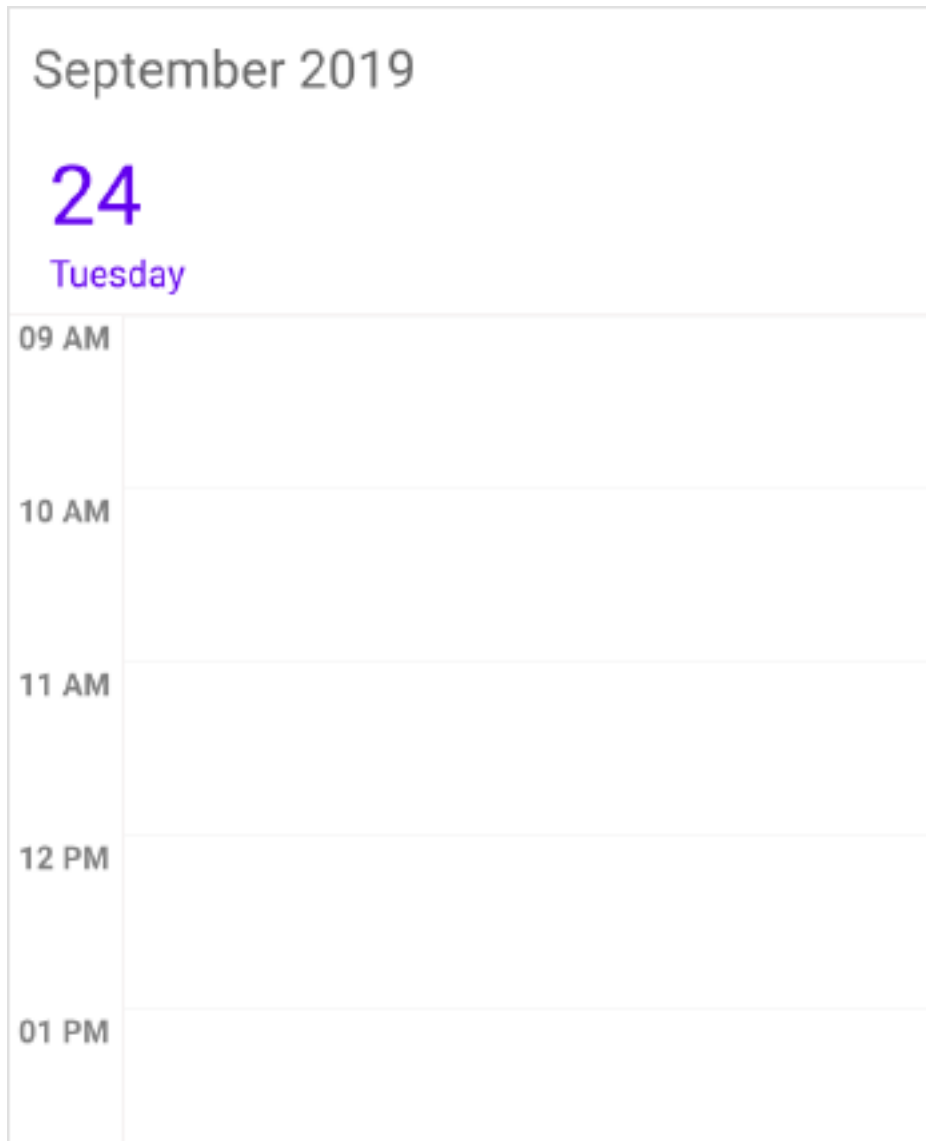

```
<schedule:SfSchedule>
  <schedule:SfSchedule.DayViewSettings>
    <schedule:DayViewSettings>
      <schedule:DayViewSettings.DayLabelSettings>
        <schedule:DayLabelSettings DateFormat="dd">
```

```
<schedule:DayLabelSettings.DayFormat>
<OnPlatform x:TypeArguments="x:String" iOS="EEE d MMMM YY" Android="EEEE"
WinPhone="dddd" />
</schedule:DayLabelSettings.DayFormat>
</schedule:DayLabelSettings>
</schedule:DayViewSettings.DayLabelSettings>
</schedule:DayViewSettings>
</schedule:SfSchedule.DayViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.DayView;
//Creating new instance of DayViewSettings
DayViewSettings dayViewSettings = new DayViewSettings();
//Creating new instance of DayLabelSettings
DayLabelSettings dayLabelSettings = new DayLabelSettings();
//Customizing date format
dayLabelSettings.DateFormat = "dd";
dayLabelSettings.DayFormat = Device.OnPlatform("EEE d MMMM YY", "EEEE",
"dddd");
dayViewSettings.DayLabelSettings = dayLabelSettings;
schedule.DayViewSettings = dayViewSettings;
```

#### *ViewHeader Tapped Event*

You can handle single tap action of ViewHeader by using [ViewHeaderTapped](#) event of **SfSchedule**. This event will be triggered when the ViewHeader is Tapped. This event contains [ViewHeaderTappedEventArgs](#) argument which holds [DateTime](#) details in it.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule"
ScheduleView="DayView"
ViewHeaderTapped="Handle_ViewHeaderTapped" >
</schedule:SfSchedule>
```

#### **C#**

```
//Creating new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.DayView;
schedule.ViewHeaderTapped += Handle_ViewHeaderTapped;
```

**C#**

```
private void Handle_ViewHeaderTapped(object sender,
ViewHeaderTappedEventArgs e)
{
    var dateTime = e.DateTime;
}
```

**Change Time Interval**

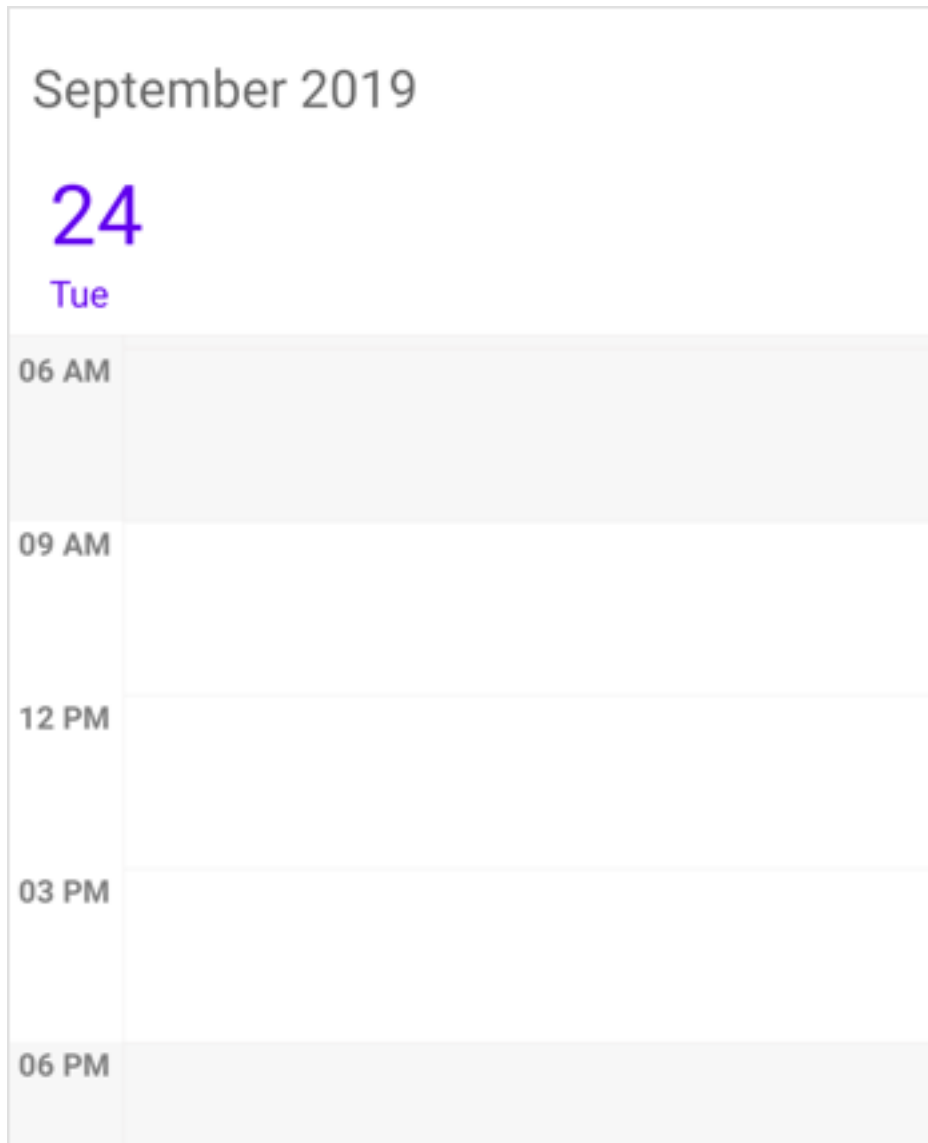

You can customize the interval of timeslots in **DayView** by setting [TimeInterval](#) property of **SfSchedule**.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView"
TimeInterval="180"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.DayView;
schedule.TimeInterval = 180;
```

**NOTE**

If you modify the `TimeInterval` value (in minutes), you need to change the time labels format by setting the `TimeFormat` value as "hh:mm". By default, `TimeFormat` value is "hh a". You can refer [here](#) for changing `TimeFormat` value.

**Change Time Interval Height**

You can customize the interval height of timeslots in `DayView` by setting [TimeIntervalHeight](#) property of `SfSchedule`.

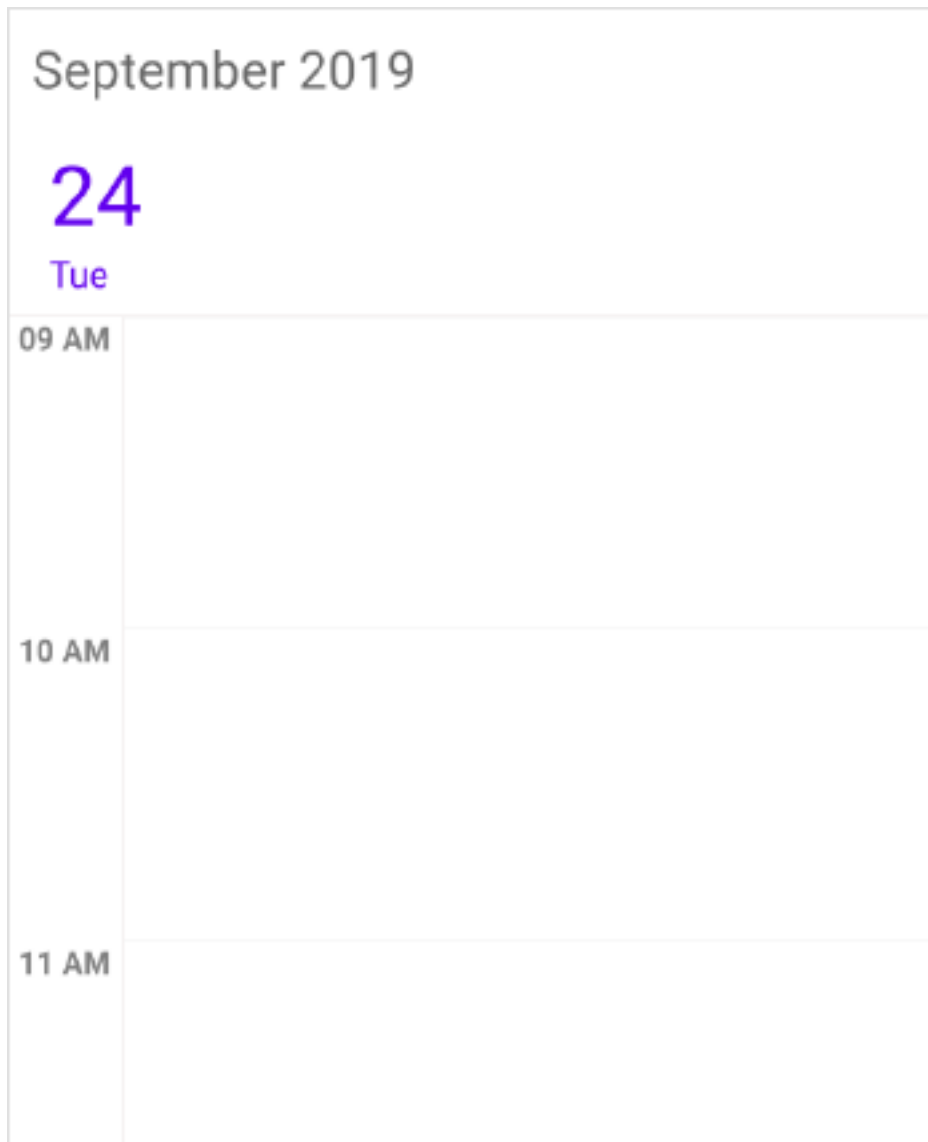

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView"
    TimeIntervalHeight="180"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.DayView;
```

```
schedule.TimeIntervalHeight = 180;
```

#### *Full screen scheduler*

Schedule time interval height can be adjusted based on screen height by changing the value of `TimeIntervalHeight` property to -1. It will auto-fit to the screen height and width.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView"
TimeIntervalHeight="-1"/>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.DayView;
schedule.TimeIntervalHeight = -1;
```

### Change Working hours

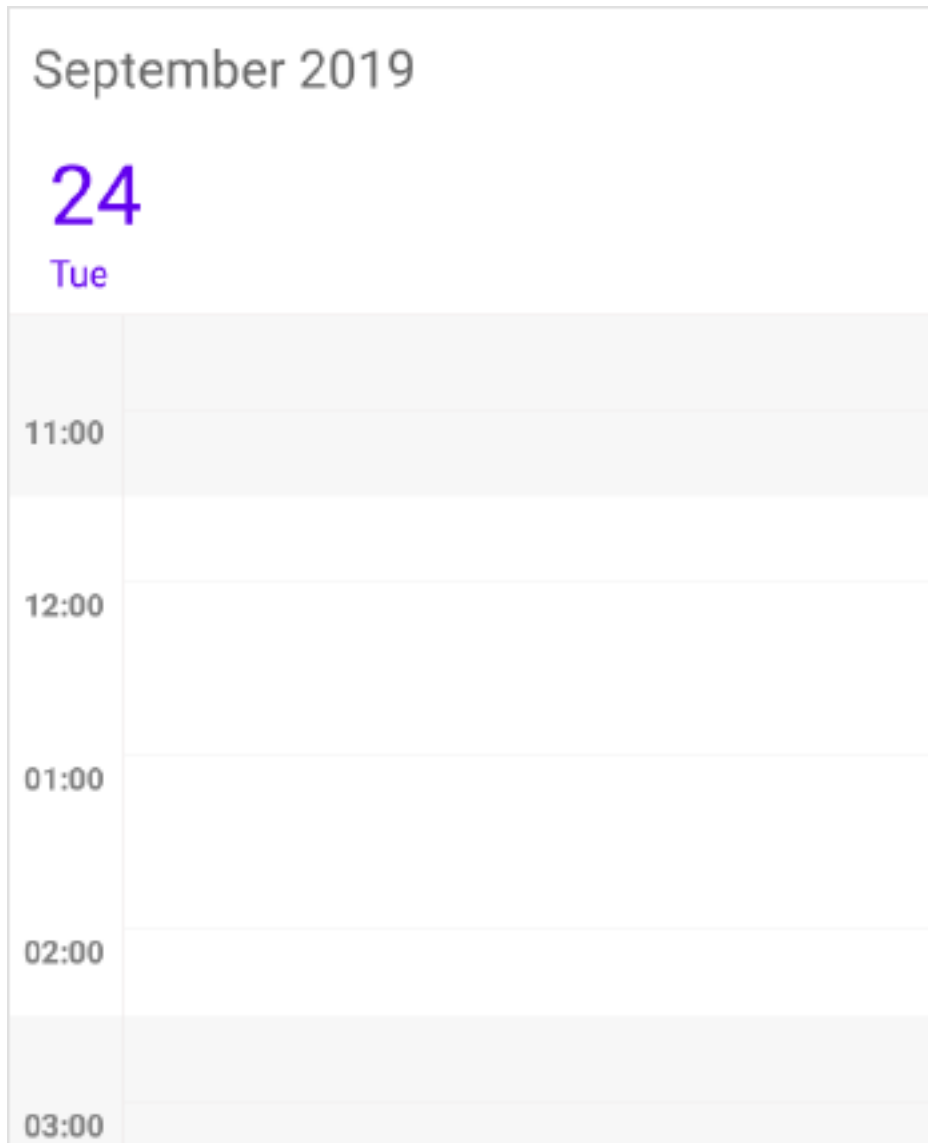

Working hours in **DayView** of Schedule control will be differentiated with non-working hours by separate color. By default, working hours will be between 09 to 18. You can customize the working hours by setting [WorkStartHour](#) and [WorkEndHour](#) properties of [DayViewSettings](#). You can also customize the working hours along with minutes by setting double value which will be converted to time.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView">
  <schedule:SfSchedule.DayViewSettings>
    <!--setting working hours properties -->
    <schedule:DayViewSettings
      WorkStartHour="11.5"
      WorkEndHour="17.5">
      <schedule:DayViewSettings.DayLabelSettings>
        <schedule:DayLabelSettings TimeFormat="hh:mm"/>
      </schedule:DayViewSettings.DayLabelSettings>
    </schedule:DayViewSettings>
  </schedule:SfSchedule.DayViewSettings>
</schedule:SfSchedule>
```

#### C#

```
schedule.ScheduleView = ScheduleView.DayView;
//Create new instance of DayViewSettings
DayViewSettings dayViewSettings = new DayViewSettings();
DayLabelSettings dayLabelSettings = new DayLabelSettings();
dayLabelSettings.TimeFormat = "hh:mm";
dayViewSettings.WorkStartHour = 11.5;
dayViewSettings.WorkEndHour = 14.5;
dayViewSettings.DayLabelSettings = dayLabelSettings;
schedule.DayViewSettings = dayViewSettings;
```

**NOTE**

No need to specify the decimal point values for `WorkStartHour` and `WorkEndHour`, if you don't want to set the minutes.

**Changing StartHour and EndHour**

Default value for `StartHour` and `EndHour` value is 0 to 24 to show all the time slots in `DayView`. You need to set `StartHour` and `EndHour` property of `DayView`, to show only the required time duration for end users. You can also set `StartHour` and `EndHour` in double value which will be converted to time to show required time duration in minutes.

**XML**

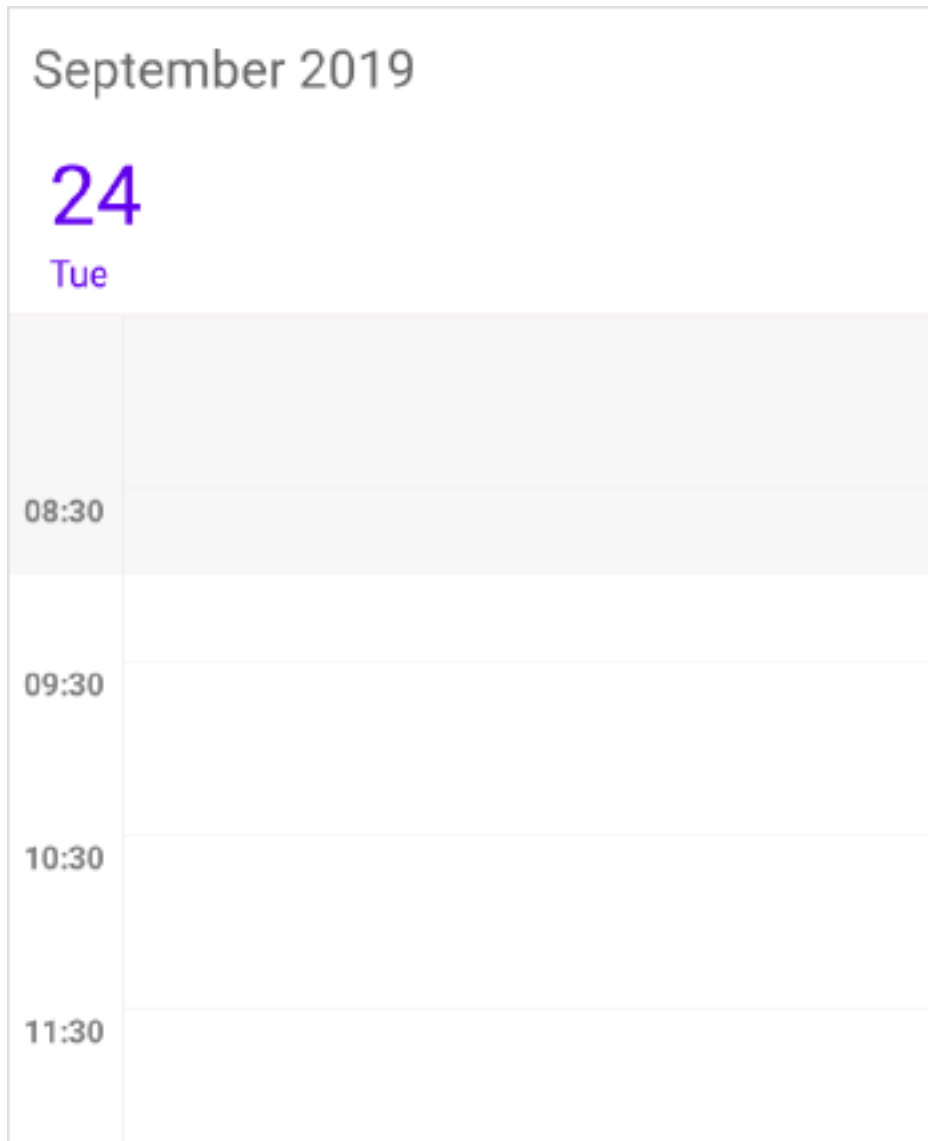

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView">
  <schedule:SfSchedule.DayViewSettings>
    <!--setting working hours properties -->
    <schedule:DayViewSettings
      StartHour="7.5"
```

```
EndHour="18.5">
<schedule:DayViewSettings.DayLabelSettings>
<schedule:DayLabelSettings TimeFormat="hh:mm" />
</schedule:DayViewSettings.DayLabelSettings>
</schedule:DayViewSettings>
</schedule:SfSchedule.DayViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.DayView;
//Create new instance of DayViewSettings
DayViewSettings dayViewSettings = new DayViewSettings();
DayLabelSettings dayLabelSettings = new DayLabelSettings();
dayLabelSettings.TimeFormat = "hh:mm";
dayViewSettings.StartHour = 7.5;
dayViewSettings.EndHour = 18.5;
dayViewSettings.DayLabelSettings = dayLabelSettings;
schedule.DayViewSettings = dayViewSettings;
```

**NOTE**

- **StartHour** must be greater than or equal to 0 and **EndHour** must be lesser than or equal to 24, otherwise **InvalidDataException** will be thrown.
- **EndHour** value must be greater than **StartHour**, otherwise **InvalidDataException** will be thrown.
- Schedule UI such as Appointments and NonAccessibleBlocks which does not fall within the **StartHour** and **EndHour** will not be visible and if it falls partially, it will be clipped.
- No need to specify the decimal point values for **StartHour** and **EndHour**, if you don't want to set the minutes.
- The number of time slots will be calculated based on total minutes of a day and time interval (total minutes of a day ((start hour - end hour) \* 60) / time interval).
- If custom **TimeInterval** is given, then the number of time slots calculated based on given **TimeInterval** should result in integer value (total minutes % **TimeInterval** = 0), otherwise next immediate time interval that result in integer value when divide total minutes of a day will be

considered. For example, if `TimeInterval="135"` (2 Hours 15 minutes) and total minutes = 1440 (24 Hours per day), then `TimeInterval` will be changed to "144" ( $1440 \% 144 = 0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

- If the custom `StartHour` and `EndHour` are given, then the number of time slots calculated based on given `StartHour` and `EndHour` should result in integer value, otherwise next immediate time interval will be considered until the result is integer value. For example, if `StartHour` is 9 (09:00AM), `EndHour` is 18.25 (06:15 PM), `TimeInterval` is 30 minutes, and total minutes = 555 ( $(18.25 - 9) * 60$ ), then the `TimeInterval` will be changed to "37" ( $555 \% 37 = 0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

### Timeslot Appearance

You can customize the appearance of timeslots in `DayView`.

- [Timeslot customization in Work hours](#)
- [Timeslot customization in Non Working hours](#)

#### *Timeslot customization in Work hours*

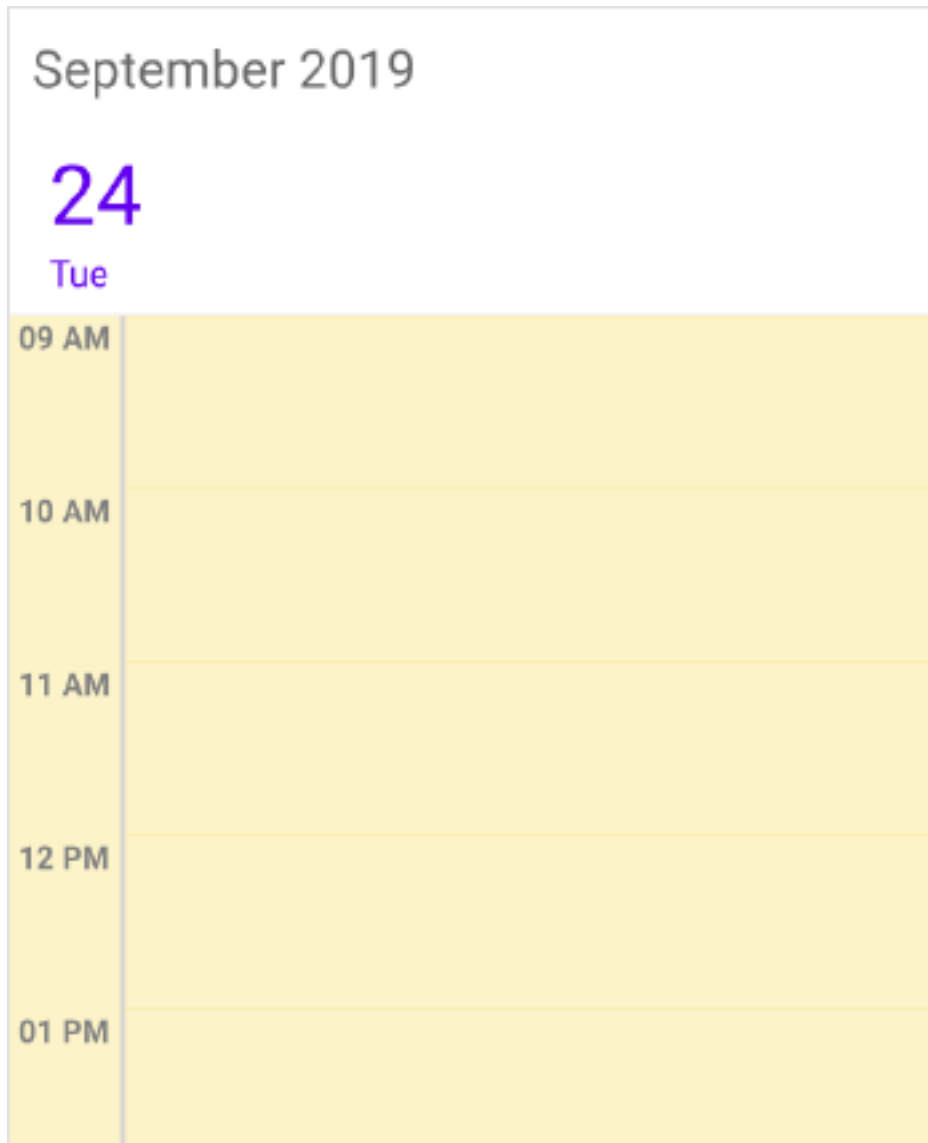

You can customize the appearance of the `WorkingHourTimeslot` by its color using [TimeSlotColor](#), [TimeSlotBorderColor](#), [TimeSlotBorderStrokeWidth](#), [VerticalLineColor](#) and [VerticalLineStrokeWidth](#) properties of `DayViewSettings`.

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView">
  <schedule:SfSchedule.DayViewSettings>
    <!--setting DayView settings properties -->
    <schedule:DayViewSettings
      TimeSlotColor="#fcf3c9"
      TimeSlotBorderColor="#fceb9f"
      TimeSlotBorderStrokeWidth="5"
      VerticalLineColor="LightGray"
      VerticalLineStrokeWidth="5">
    </schedule:DayViewSettings>
  </schedule:SfSchedule.DayViewSettings>
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.DayView;
//Create new instance of DayViewSettings
DayViewSettings dayViewSettings = new DayViewSettings();
dayViewSettings.TimeSlotBorderColor = Color.FromHex("#fceb9f");
dayViewSettings.TimeSlotColor = Color.FromHex("#fcf3c9");
dayViewSettings.TimeSlotBorderStrokeWidth = 5;
dayViewSettings.VerticalLineColor = Color.LightGray;
dayViewSettings.VerticalLineStrokeWidth = 5;
schedule.DayViewSettings = dayViewSettings;
```

#### *Timeslot customization in Non Working hours*

You can customize the appearance of the Non-workingHourTimeslots by its color using [NonWorkingHoursTimeSlotBorderColor](#), [NonWorkingHoursTimeSlotColor](#), [VerticalLineColor](#) and [VerticalLineStrokeWidth](#) properties of `DayViewSettings`.

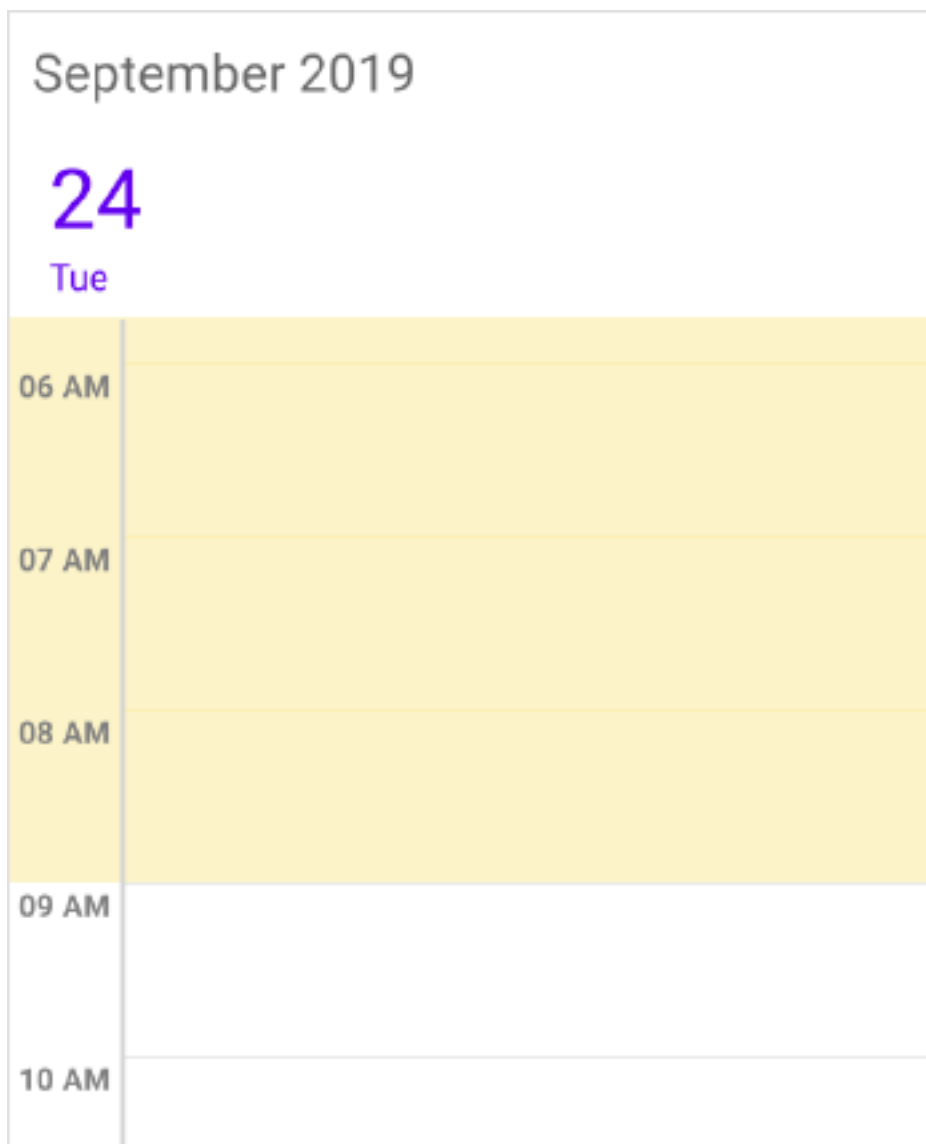

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView">
  <schedule:SfSchedule.DayViewSettings>
    <!--setting Day view settings properties -->
    <schedule:DayViewSettings
      NonWorkingHoursTimeSlotColor="#fcf3c9"
      NonWorkingHoursTimeSlotBorderColor="#fceb9f"
      TimeSlotBorderStrokeWidth="5"
      VerticalLineColor="LightGray"
      VerticalLineStrokeWidth="5">
    </schedule:DayViewSettings>
  </schedule:SfSchedule.DayViewSettings>
```

```
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.DayView;  
//Create new instance of DayViewSettings  
DayViewSettings dayViewSettings = new DayViewSettings();  
dayViewSettings.NonWorkingHoursTimeSlotBorderColor =  
Color.FromHex("#fceb9f");  
dayViewSettings.NonWorkingHoursTimeSlotColor = Color.FromHex("#fcf3c9");  
dayViewSettings.TimeSlotBorderStrokeWidth = 5;  
dayViewSettings.VerticalLineColor = Color.LightGray;  
dayViewSettings.VerticalLineStrokeWidth = 5;  
schedule.DayViewSettings = dayViewSettings;
```

**NOTE**

TimeSlotBorderStrokeWidth, VerticalLineColor and VerticalLineStrokeWidth properties common for both Working hours and Non-Working hour time slot customization.

VerticalLineColor and VerticalLineStrokeWidth properties applicable for Android only in DayView.

### Non-Accessible timeslots

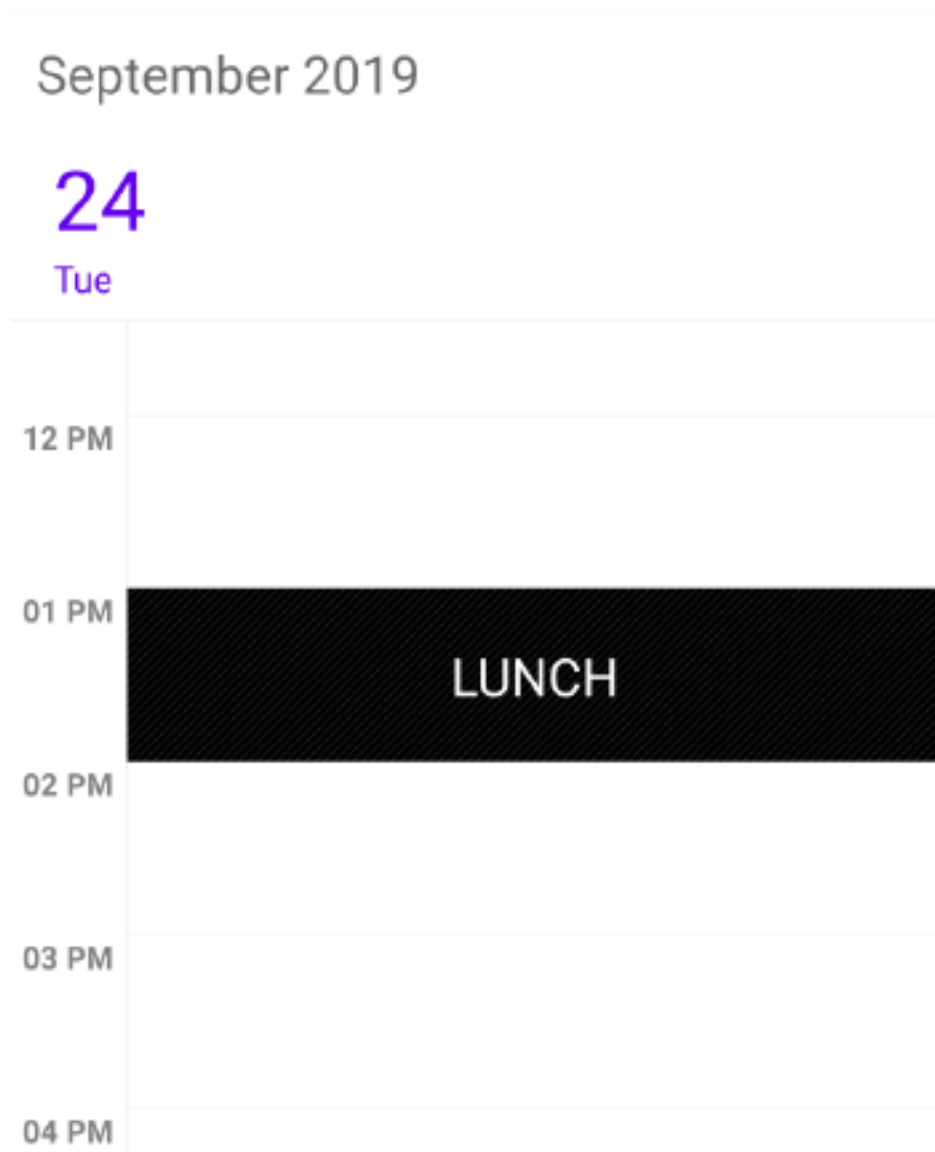

You can restrict or allocate certain timeslot as non-accessible blocks by using [NonAccessibleBlocks](#) of DayViewSettings, so that you can allocate those timeslots for predefined events/activities like Lunch hour using [StartTime](#), [EndTime](#), [Text](#) and [Color](#) properties of [NonAccessibleBlocks](#).

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView">
  <!--setting non-accessing blocks-->
  <schedule:SfSchedule.DayViewSettings>
    <schedule:DayViewSettings>
      <schedule:DayViewSettings.NonAccessibleBlocks>
        <schedule:NonAccessibleBlock
          StartTime="13"
          EndTime="14"
          Text="LUNCH"
          Color="Black" />
      </schedule:DayViewSettings.NonAccessibleBlocks>
    </schedule:DayViewSettings>
  </schedule:SfSchedule.DayViewSettings>
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.DayView;
//Create new instance of NonAccessibleBlock
NonAccessibleBlock nonAccessibleBlock = new NonAccessibleBlock();
//Create new instance of NonAccessibleBlocksCollection
NonAccessibleBlocksCollection nonAccessibleBlocksCollection = new
NonAccessibleBlocksCollection();
DayViewSettings dayViewSettings = new DayViewSettings();
nonAccessibleBlock.StartTime = 13;
nonAccessibleBlock.EndTime = 14;
nonAccessibleBlock.Text = "LUNCH";
nonAccessibleBlock.Color = Color.Black;
nonAccessibleBlocksCollection.Add(nonAccessibleBlock);
dayViewSettings.NonAccessibleBlocks = nonAccessibleBlocksCollection;
schedule.DayViewSettings = dayViewSettings;
```

**NOTE**

Selection and related events will not be working in this blocks.

[Change first day of week](#)

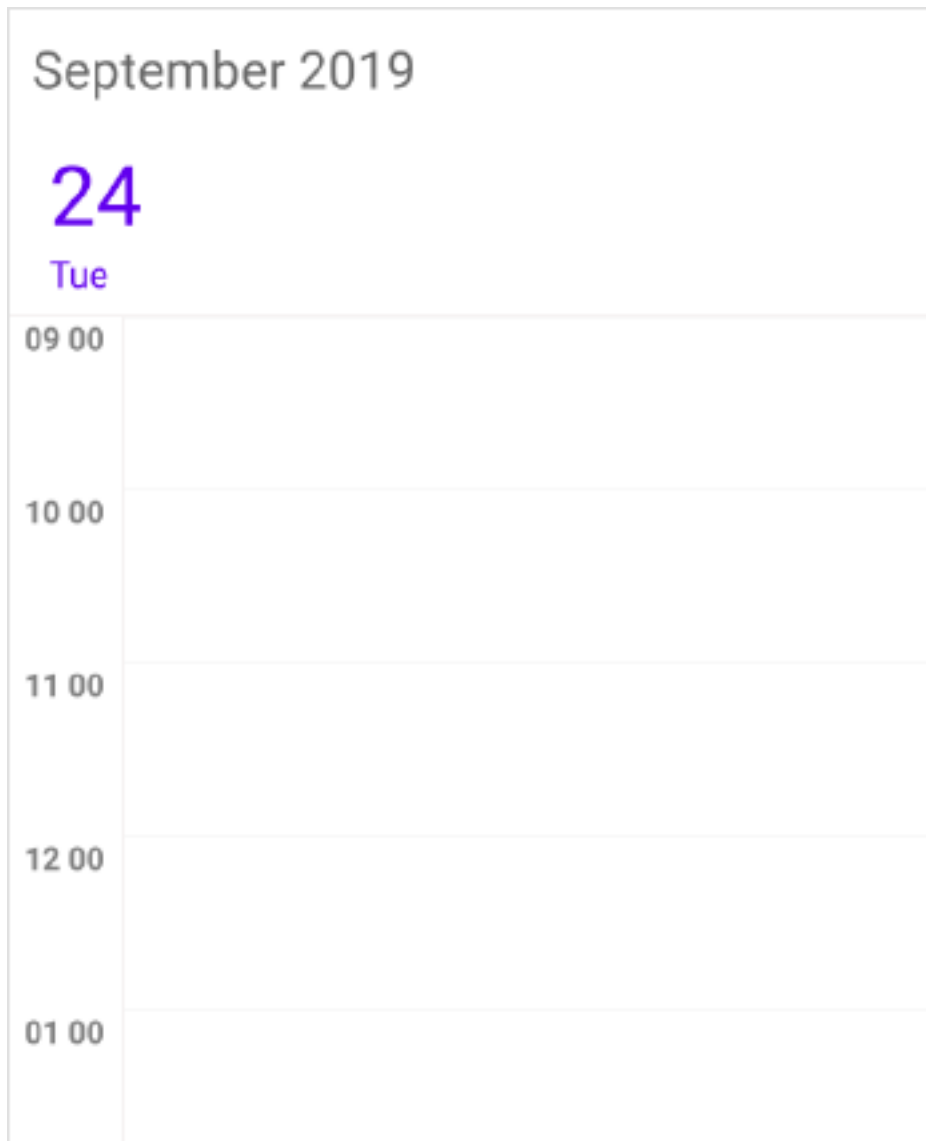

[FirstDayOfWeek](#) of `SfSchedule` is not applicable for `DayView` as it displays only one day.

[Time Label Formatting](#)

You can customize the format for the labels which are mentioning the time, by setting [TimeFormat](#) property of [DayLabelSettings](#) in `DayViewSettings`.

**C#**

```
schedule.ScheduleView = ScheduleView.DayView;  
DayViewSettings dayViewSettings = new DayViewSettings();  
DayLabelSettings dayLabelSettings = new DayLabelSettings();  
dayLabelSettings.TimeFormat = "hh mm";  
dayViewSettings.DayLabelSettings = dayLabelSettings;  
schedule.DayViewSettings = dayViewSettings;
```

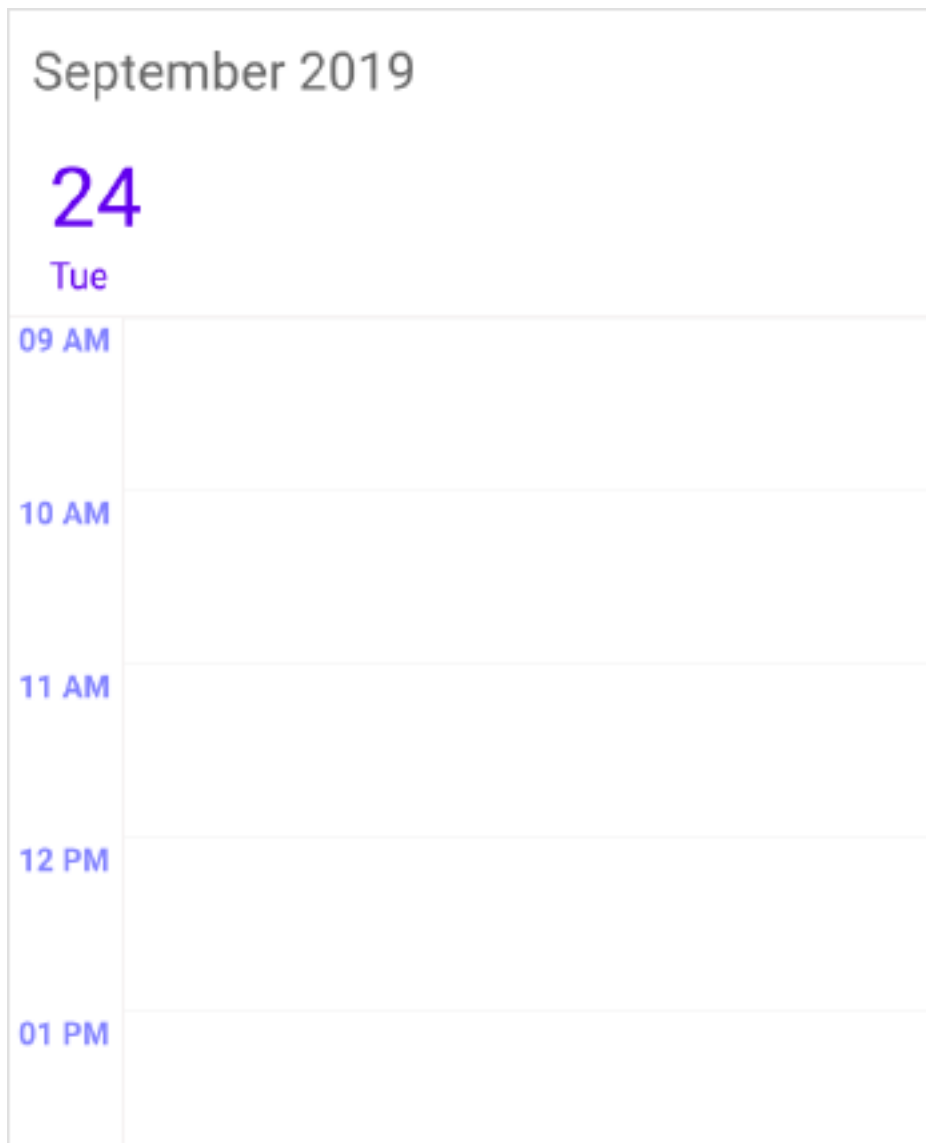

### Time Label Appearance

You can customize the color for the labels which are mentioning the time, by setting [TimeLabelColor](#) property of `DayLabelSettings` in `DayViewSettings`.

### C#

```
schedule.ScheduleView = ScheduleView.DayView;  
//Create new instance of DayViewSettings  
DayViewSettings dayViewSettings = new DayViewSettings();  
//Create new instance of DayLabelSettings  
DayLabelSettings dayLabelSettings = new DayLabelSettings();  
dayLabelSettings.TimeLabelColor = Color.FromHex("#8282ff");  
dayViewSettings.DayLabelSettings = dayLabelSettings;  
schedule.DayViewSettings = dayViewSettings;
```

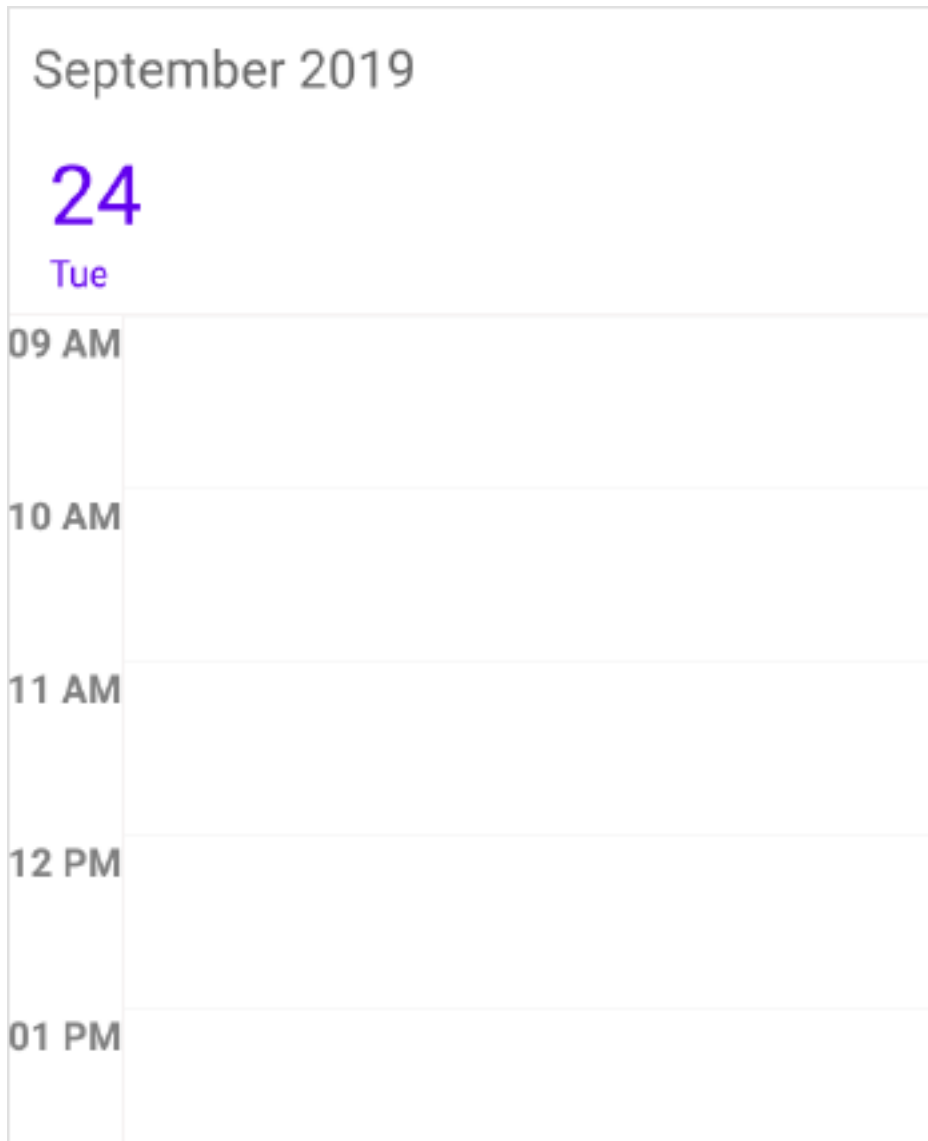

### Time Label Size

You can customize the size of the labels which are mentioning the time, by setting [TimeLabelSize](#) property of `DayLabelSettings` in `DayViewSettings`.

### C#

```
schedule.ScheduleView = ScheduleView.DayView;  
//Create new instance of DayViewSettings  
DayViewSettings dayViewSettings = new DayViewSettings();  
//Create new instance of DayLabelSettings  
DayLabelSettings dayLabelSettings = new DayLabelSettings();  
//Customizing the size of the time label  
dayLabelSettings.TimeLabelSize = 15;  
dayViewSettings.DayLabelSettings = dayLabelSettings;  
schedule.DayViewSettings = dayViewSettings;
```

### Selection

You can customize the default appearance of selection UI in the timeslots.

- [Selection customization using style](#)
- [Selection customization using custom View](#)
- [Programmatic selection](#)

### *Selection customization using style*

You can customize the timeslot selection by by setting the [BackgroundColor](#), [BorderColor](#), [BorderThickness](#), [BorderCornerRadius](#) properties to the [SelectionStyle](#) property of **SfSchedule**.

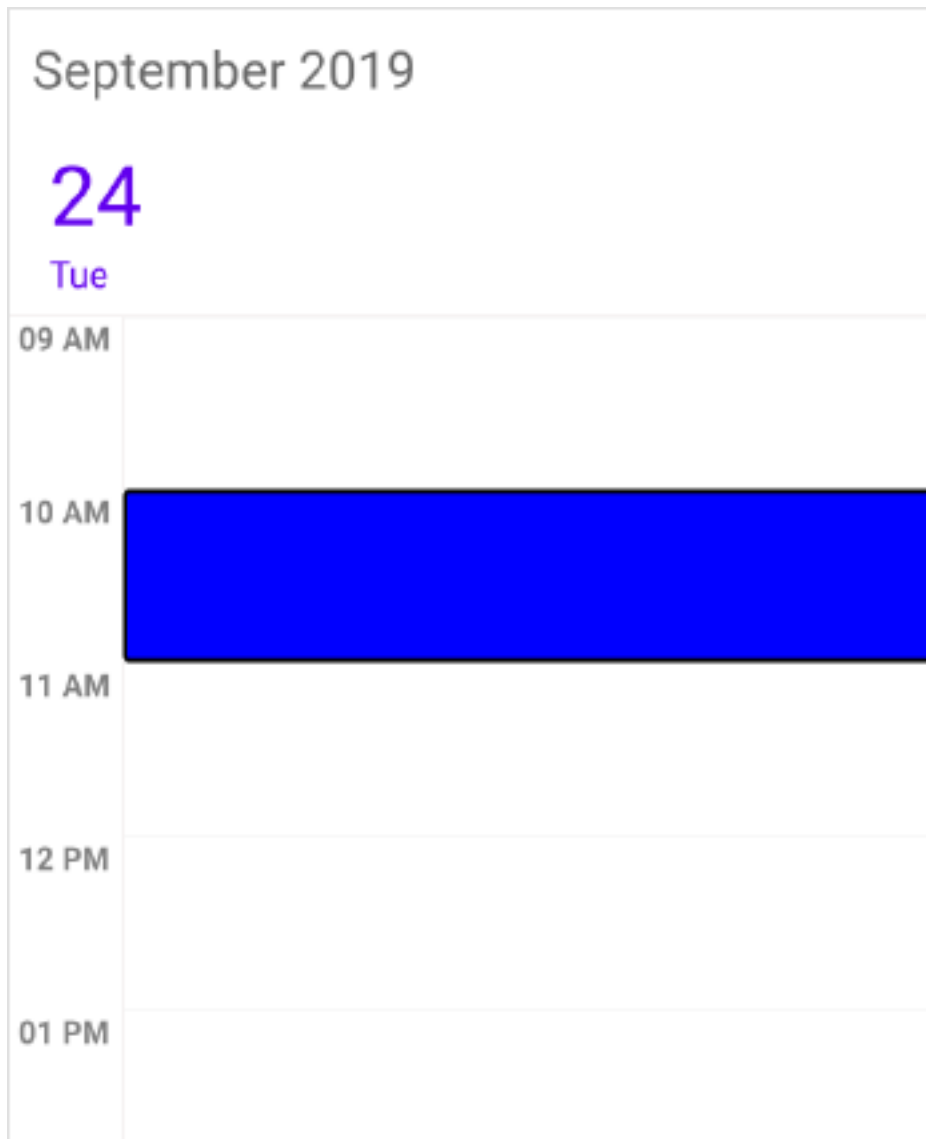

### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView">
  <schedule:SfSchedule.SelectionStyle>
    <schedule:SelectionStyle
      BackgroundColor="Blue"
    </schedule:SelectionStyle>
  </schedule:SfSchedule.SelectionStyle>
</schedule:SfSchedule>
```

```
BorderColor="Black"  
BorderThickness="5"  
BorderCornerRadius="5">  
</schedule:SelectionStyle>  
</schedule:SfSchedule.SelectionStyle>  
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.DayView;  
//Create new instance of SelectionStyle  
SelectionStyle selectionStyle = new SelectionStyle();  
selectionStyle.BackgroundColor = Color.Blue;  
selectionStyle.BorderColor = Color.Black;  
selectionStyle.BorderThickness = 5;  
selectionStyle.BorderCornerRadius = 5;  
schedule.SelectionStyle = selectionStyle;
```

*Selection customization using custom View*

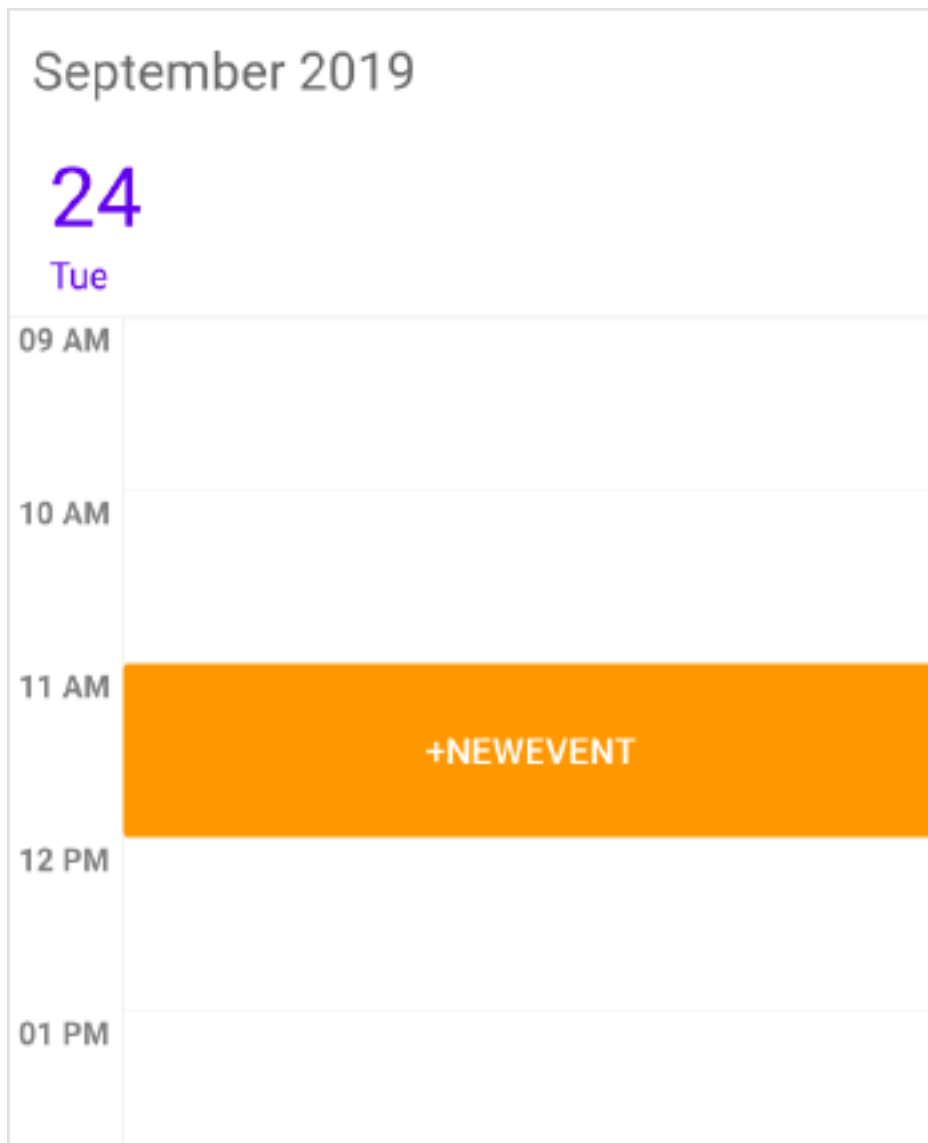

You can replace the default selection UI with your custom view by setting [SelectionView](#) property of SfSchedule.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="DayView">
  <schedule:SfSchedule.SelectionView>
    <Button
      BackgroundColor="#FF9800"
      Text="+NewEvent"
      TextColor="White"/>
  </schedule:SfSchedule.SelectionView>
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.DayView;
//Add the CustomView
Button customView = new Button();
customView.Text = "+NewEvent";
customView.BackgroundColor = Color.FromHex("#FF9800");
customView.TextColor = Color.White;
schedule.SelectionView = customView;
```

#### *Programmatic selection*

You can programmatically select the specific timeslot by setting corresponding date and time value to [SelectedDate](#) property of `SfSchedule`. By default, it is null.

#### **C#**

```
// Setting a date and time to select  
schedule.SelectedDate = new DateTime(2017, 10, 04, 10, 0, 0);
```

You can clear the selection by setting [SelectedDate](#) as null.

#### **C#**

```
// Setting null value to deselect  
schedule.SelectedDate = null;
```

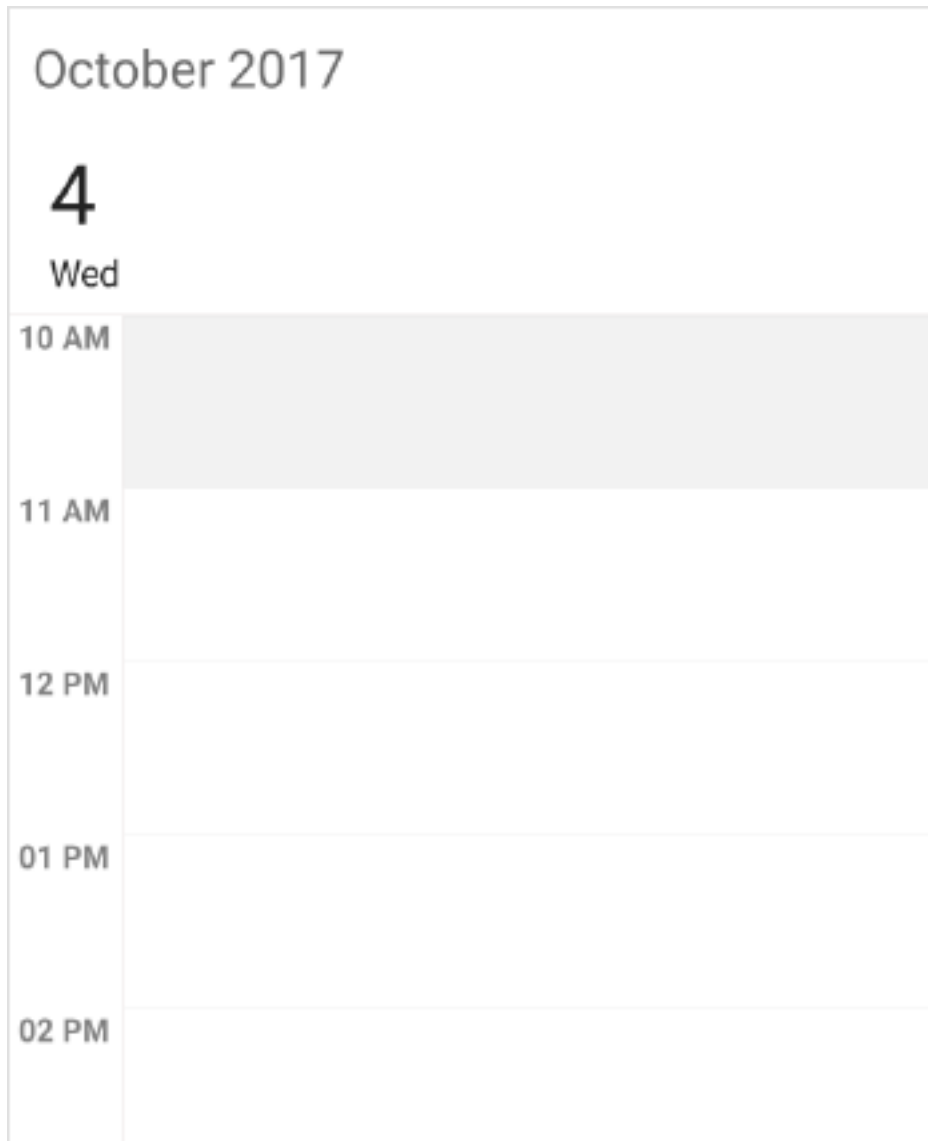

You can download the entire source code of this demo for Xamarin.Forms from here [Date Selection](#)

---

**NOTE**

---

- SfSchedule does not support multiple selection.
- SfSchedule supports two-way binding of SelectedDate property.

### WeekView

WeekView is to view all days of a particular week. Appointments will be arranged based on the dates on the week in respective timeslots.

### ViewHeader Appearance

You can customize the default appearance of view header in [WeekView](#) by using [ViewHeaderStyle](#) property of [SfSchedule](#).

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView ="WeekView">
<schedule:SfSchedule.ViewHeaderStyle>
```

```
<schedule:ViewHeaderStyle
BackgroundColor="#009688"
DayTextColor="#FFFFFF"
DateTextColor="#FFFFFF"
DayFontFamily="Arial"
DateFontFamily="Arial">
</schedule:ViewHeaderStyle>
</schedule:SfSchedule.ViewHeaderStyle>
</schedule:SfSchedule>
```

## C#

```
//Create new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.WeekView;
//Customize the schedule view header
ViewHeaderStyle viewHeaderStyle = new ViewHeaderStyle();
viewHeaderStyle.BackgroundColor = Color.FromHex("#009688");
viewHeaderStyle.DayTextColor = Color.FromHex("#FFFFFF");
viewHeaderStyle.DateTextColor = Color.FromHex("#FFFFFF");
viewHeaderStyle.DayFontFamily = "Arial";
viewHeaderStyle.DateFontFamily = "Arial";
schedule.ViewHeaderStyle = viewHeaderStyle;
```

September 2019

---

**NOTE**

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

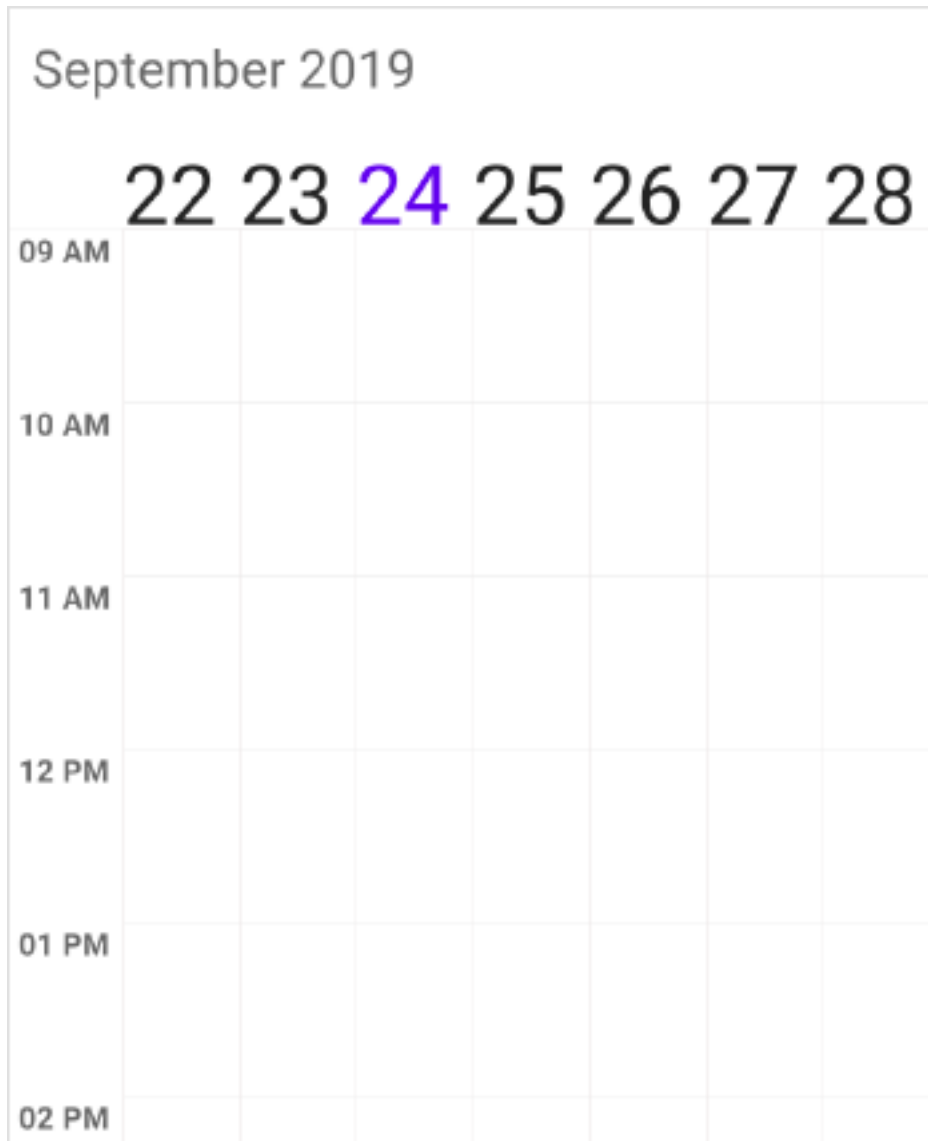

You can customize the height of the ViewHeader in **WeekView** by setting [ViewHeaderHeight](#) property of SfSchedule.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView ="WeekView"
ViewHeaderHeight="50" />
```

**C#**

```
schedule.ScheduleView = ScheduleView.WeekView;
schedule.ViewHeaderHeight = 50;
```

#### *Customize Font Appearance*

you can change the appearance of Font by setting the [DayFontFamily](#) and [DateFontFamily](#) property of [ViewHeaderStyle](#) property in Schedule.

#### **XML**

```
<schedule:ViewHeaderStyle.DayFontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:ViewHeaderStyle.DayFontFamily>
<schedule:ViewHeaderStyle.DateFontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:ViewHeaderStyle.DateFontFamily>
```

#### **C#**

```
viewHeaderStyle.DayFontFamily = Device.OnPlatform("Lobster-Regular",
"Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
viewHeaderStyle.DateFontFamily = Device.OnPlatform("Lobster-Regular",
"Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

September 2019						
22 23 24 25 26 27 28						
Sun Mon Tue Wed Thu Fri Sat						
09 AM						
10 AM						
11 AM						
12 PM						
01 PM						

Refer [this](#) to configure the custom fonts in Xamarin.Forms.

#### *ViewHeader Date Format*

You can customize the date and day format of SfSchedule ViewHeader by using [DateFormat](#) and [DayFormat](#) properties of [WeekLabelSettings](#)

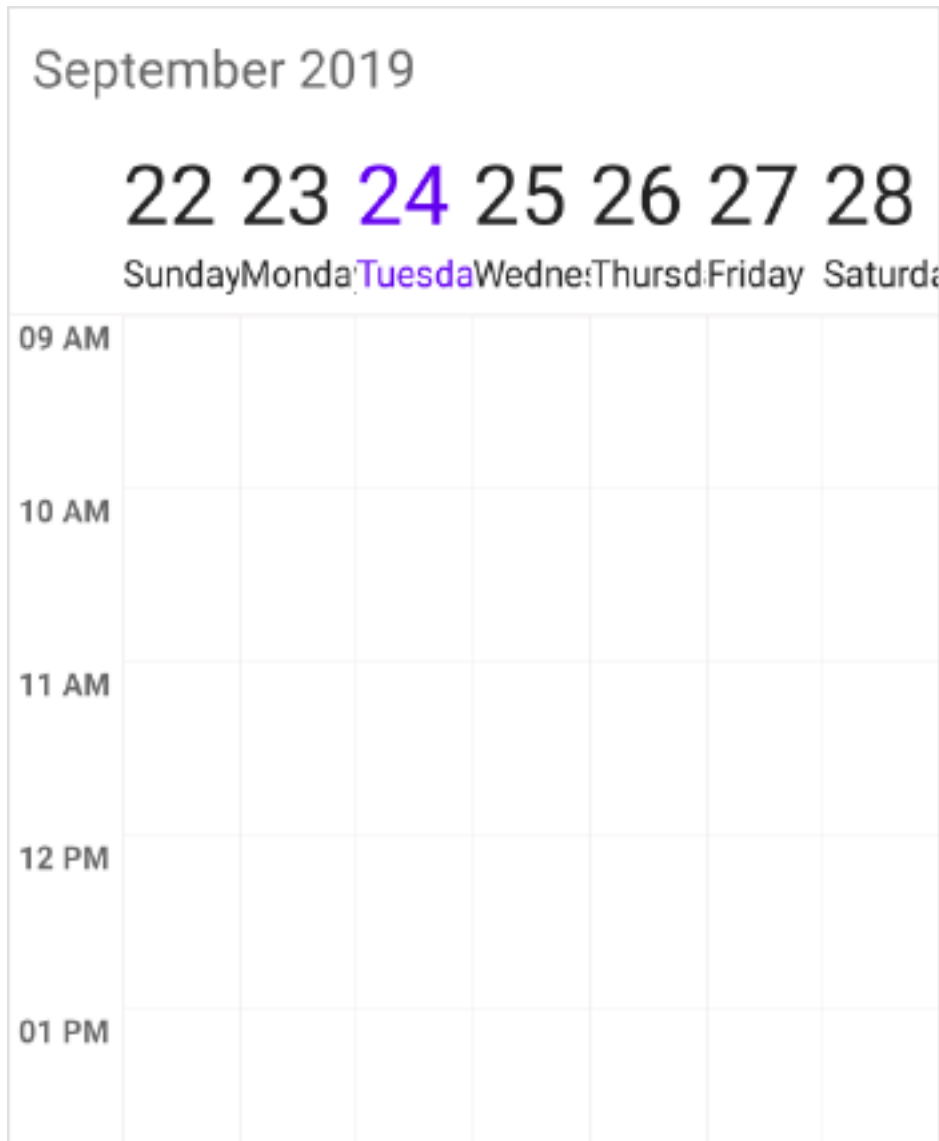

#### **XML**

```
<schedule:SfSchedule>
  <schedule:SfSchedule.WeekViewSettings>
    <schedule:WeekViewSettings>
      <schedule:WeekViewSettings.WeekLabelSettings>
        <schedule:WeekLabelSettings DateFormat="dd">
```

```
<schedule:WeekLabelSettings.DayFormat>
<OnPlatform x:TypeArguments="x:String" iOS="EEEE" Android="EEEE"
WinPhone="dddd" />
</schedule:WeekLabelSettings.DayFormat>
</schedule:WeekLabelSettings>
</schedule:WeekViewSettings.WeekLabelSettings>
</schedule:WeekViewSettings>
</schedule:SfSchedule.WeekViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.WeekView;
//Creating new instance of WeekViewSettings
WeekViewSettings weekViewSettings = new WeekViewSettings();
//Creating new instance of WeekLabelSettings
WeekLabelSettings weekLabelSettings = new WeekLabelSettings();
//Customizing date format
weekLabelSettings.DateFormat = "dd";
weekLabelSettings.DayFormat = Device.OnPlatform("EEEE", "EEEE", "dddd");
weekViewSettings.WeekLabelSettings = weekLabelSettings;
schedule.WeekViewSettings = weekViewSettings;
```

#### *ViewHeader Tapped Event*

You can handle single tap action of ViewHeader by using [ViewHeaderTapped](#) event of **SfSchedule**. This event will be triggered when the ViewHeader is Tapped. This event contains [ViewHeaderTappedEventArgs](#) argument which holds [DateTime](#) details in it.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule"
ScheduleView="WeekView"
ViewHeaderTapped="Handle_ViewHeaderTapped">
</schedule:SfSchedule>
```

#### **C#**

```
//Creating new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.WeekView;
schedule.ViewHeaderTapped += Handle_ViewHeaderTapped;
```

**C#**

```
private void Handle_ViewHeaderTapped(object sender,
ViewHeaderTappedEventArgs e)
{
    var dateTime = e.DateTime;
}
```

## Change Time Interval

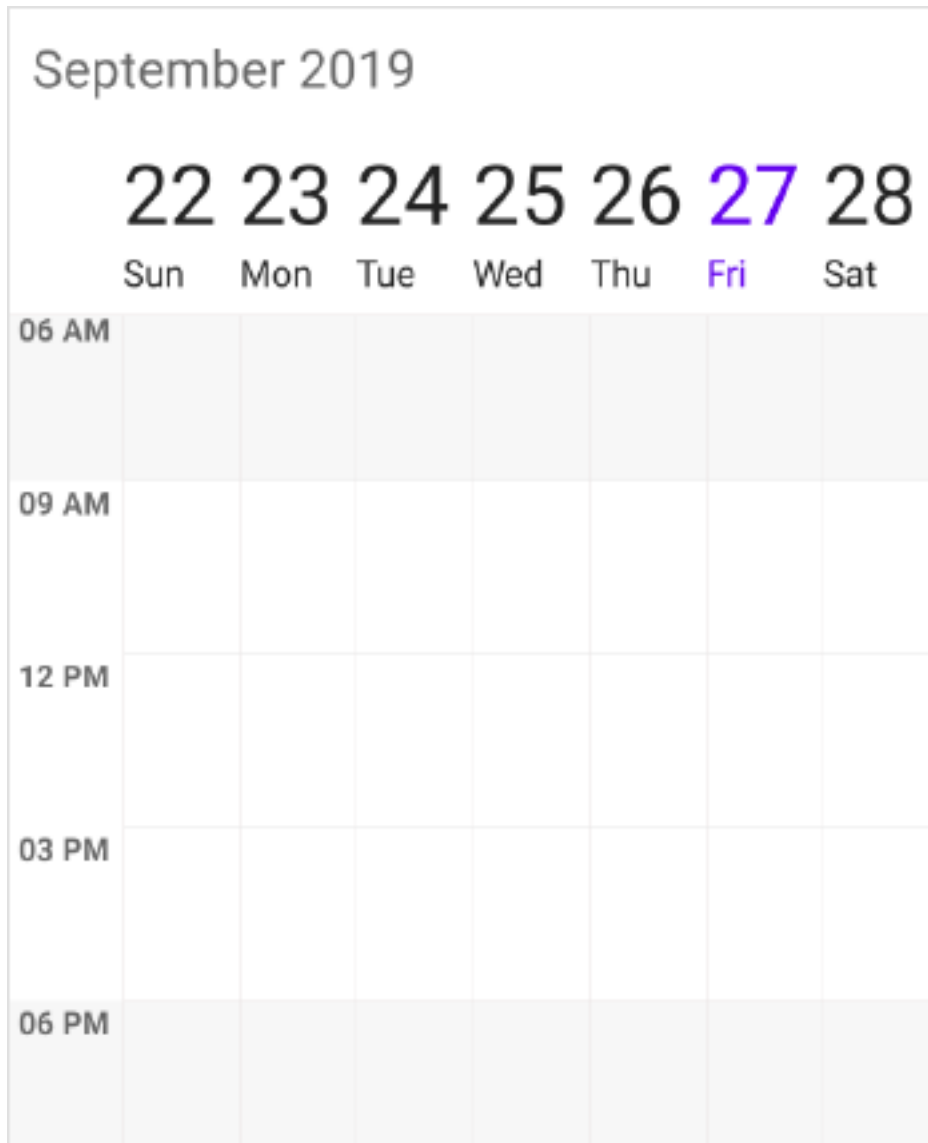

You can customize the interval of timeslots in **WeekView** by setting [TimeInterval](#) property of **SfSchedule**.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView"
TimeInterval="180"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WeekView;
schedule.TimeInterval = 180;
```

**NOTE**

If you modify the `TimeInterval` value (in minutes), you need to change the time labels format by setting the `TimeFormat` value as "hh:mm". By default, `TimeFormat` value is "hh a". You can refer [here](#) for changing `TimeFormat` value.

**Change Time Interval Height**

You can customize the interval height of timeslots in `WeekView` by setting [TimeIntervalHeight](#) property of `SfSchedule`.

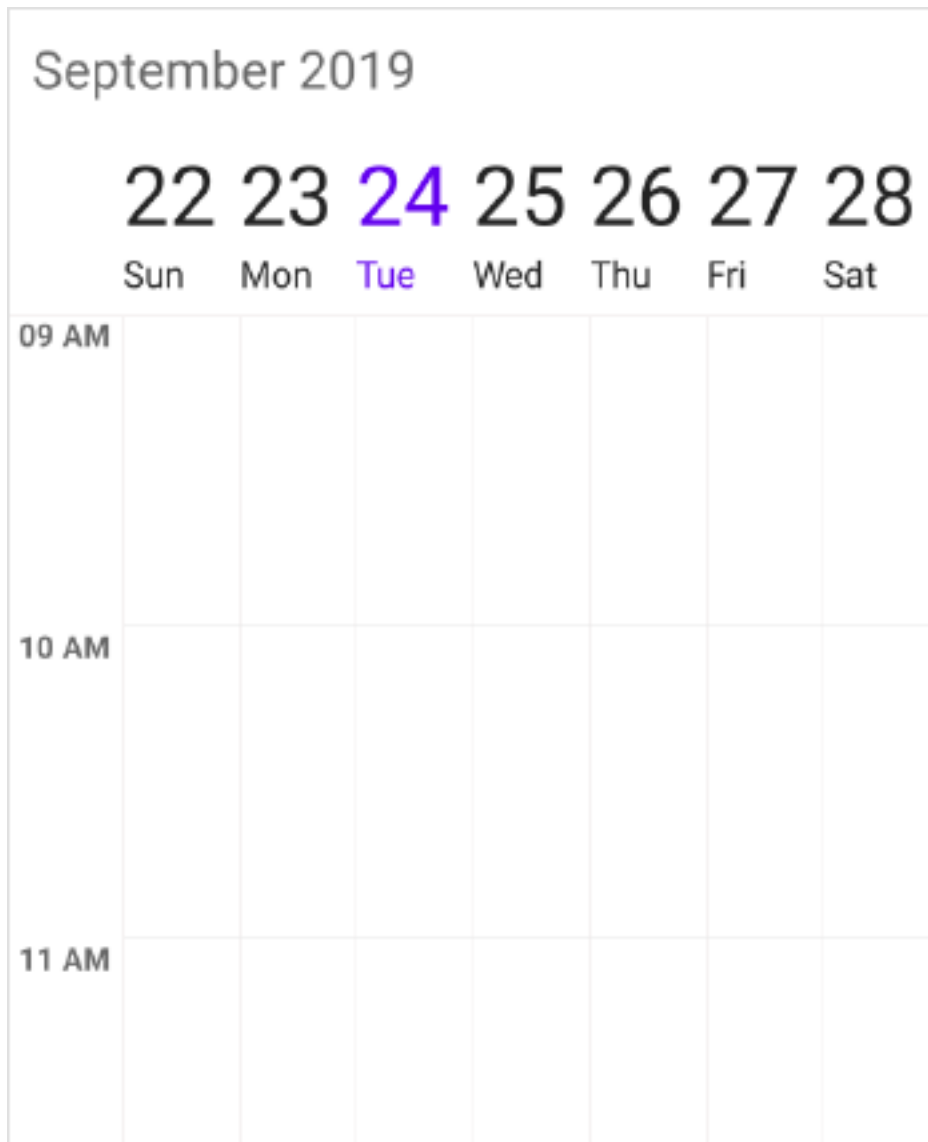

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView"
    TimeIntervalHeight="180"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WeekView;
```

```
schedule.TimeIntervalHeight = 180;
```

#### Full screen scheduler

Schedule time interval height can be adjusted based on screen height by changing the value of `TimeIntervalHeight` property to -1. It will auto-fit to the screen height and width.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView"
TimeIntervalHeight="-1"/>
```

#### C#

```
schedule.ScheduleView = ScheduleView.WeekView;
schedule.TimeIntervalHeight = -1;
```

### Change Working hours

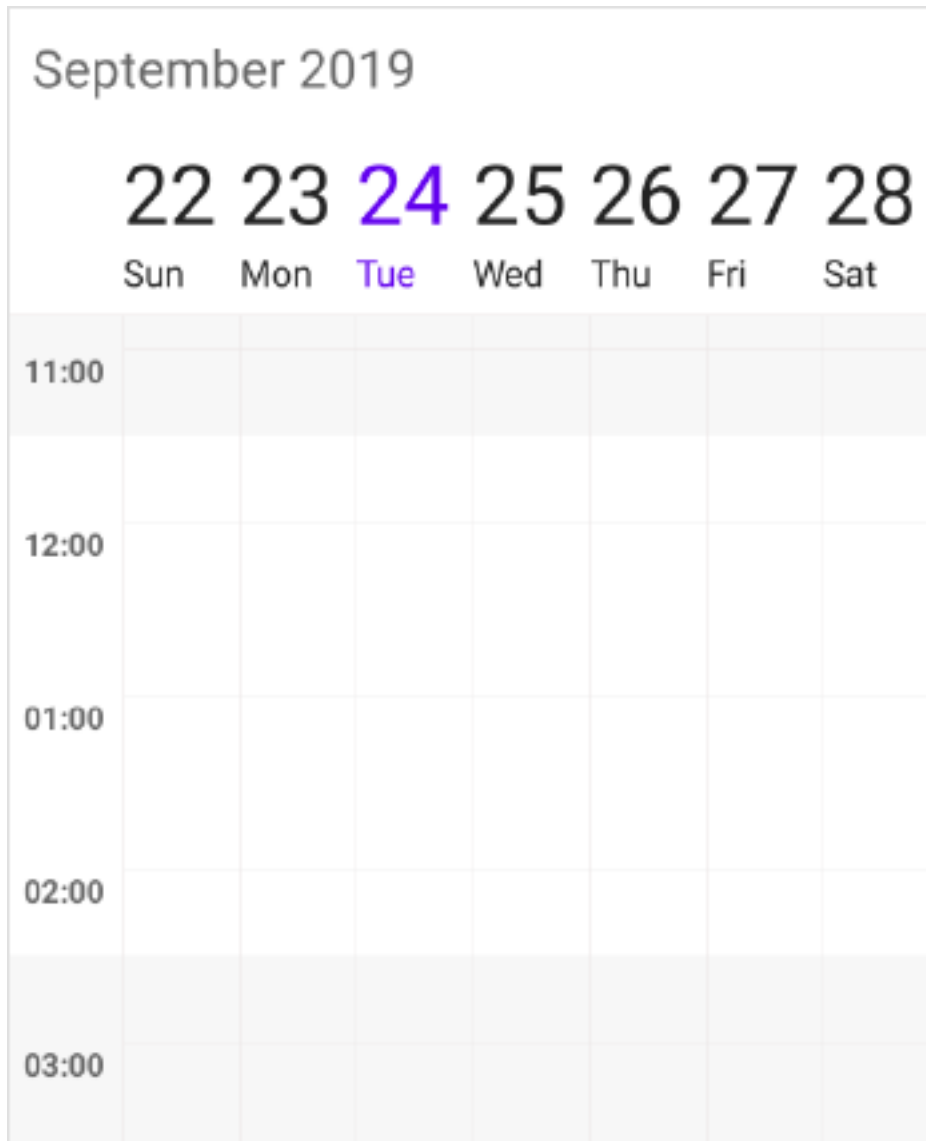

Working hours in **WeekView** of Schedule control will be differentiated with non-working hours by separate color. By default, working hours will be between 09 to 18. You can customize the working hours by setting [WorkStartHour](#) and [WorkEndHour](#) properties of [WeekViewSettings](#). You can also customize the working hours along with minutes by setting double value which will be converted to time.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <schedule:SfSchedule.WeekViewSettings>
    <!--setting working hours properties -->
    <schedule:WeekViewSettings
      WorkStartHour="11.5"
      WorkEndHour="17.5">
      <schedule:WeekViewSettings.WeekLabelSettings>
        <schedule:WeekLabelSettings TimeFormat="hh:mm" />
      </schedule:WeekViewSettings.WeekLabelSettings>
    </schedule:WeekViewSettings>
  </schedule:SfSchedule.WeekViewSettings>
</schedule:SfSchedule>
```

#### C#

```
schedule.ScheduleView = ScheduleView.WeekView;
//Create new instance of WeekViewSettings
WeekViewSettings weekViewSettings = new WeekViewSettings();
WeekLabelSettings weekLabelSettings = new WeekLabelSettings();
weekLabelSettings.TimeFormat = "hh:mm";
weekViewSettings.WorkStartHour = 11.5;
weekViewSettings.WorkEndHour = 14.5;
weekViewSettings.WeekLabelSettings = weekLabelSettings;
schedule.WeekViewSettings = weekViewSettings;
```

**NOTE**

No need to specify the decimal point values for `WorkStartHour` and `WorkEndHour`, if you don't want to set the minutes.

**Changing StartHour and EndHour**

Default value for `StartHour` and `EndHour` value is 0 to 24 to show all the time slots in `WeekView`. You need to set `StartHour` and `EndHour` property of `WeekView`, to show only the required time duration for end users. You can also set `StartHour` and `EndHour` in double value which will be converted to time to show required time duration in minutes.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <schedule:SfSchedule.WeekViewSettings>
    <!--setting working hours properties -->
    <schedule:WeekViewSettings
      StartHour="07.5"
```

```
EndHour="18.5">
<schedule:WeekViewSettings.WeekLabelSettings>
<schedule:WeekLabelSettings TimeFormat="hh:mm" />
</schedule:WeekViewSettings.WeekLabelSettings>
</schedule:WeekViewSettings>
</schedule:SfSchedule.WeekViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.WeekView;
//Create new instance of WeekViewSettings
WeekViewSettings weekViewSettings = new WeekViewSettings();
WeekLabelSettings weekLabelSettings = new
WeekLabelSettings(); weekLabelSettings.TimeFormat = "hh:mm";
weekViewSettings.StartHour = 07.5;
weekViewSettings.EndHour = 18.5;
weekViewSettings.WeekLabelSettings = weekLabelSettings;
schedule.WeekViewSettings = weekViewSettings;
```

September 2019						
22	23	24	25	26	27	28
Sun	Mon	Tue	Wed	Thu	Fri	Sat
08:30						
09:30						
10:30						
11:30						

**NOTE**

- **StartHour** must be greater than or equal to 0 and **EndHour** must be lesser than or equal to 24, otherwise **InvalidDataException** will be thrown.
- **EndHour** value must be greater than **StartHour**, otherwise **InvalidDataException** will be thrown.
- Schedule UI such as Appointments and NonAccessibleBlocks which does not fall within the **StartHour** and **EndHour** will not be visible and if it falls partially, it will be clipped.
- No need to specify the decimal point values for **StartHour** and **EndHour**, if you don't want to set the minutes.
- The number of time slots will be calculated based on total minutes of a day and time interval (total minutes of a day ((start hour - end hour) \* 60) / time interval).
- If custom **TimeInterval** is given, then the number of time slots calculated based on given **TimeInterval** should result in integer value (total minutes % **TimeInterval** = 0), otherwise next immediate time interval that result in integer value when divide total minutes of a day will be

considered. For example, if `TimeInterval="135"` (2 Hours 15 minutes) and total minutes = 1440 (24 Hours per day), then `TimeInterval` will be changed to "144" ( $1440 \% 144 = 0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

- If the custom `StartHour` and `EndHour` are given, then the number of time slots calculated based on given `StartHour` and `EndHour` should result in integer value, otherwise next immediate `TimeInterval` will be considered until the result is integer value. For example, if `StartHour` is 9 (09:00AM), `EndHour` is 18.25 (06:15 PM), `TimeInterval` is 30 minutes, and total minutes = 555 ( $(18.25 - 9) * 60$ ), then the `TimeInterval` will be changed to "37" ( $555 \% 37 = 0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

### Timeslot Appearance

You can customize the appearance of timeslots in `WeekView`.

- [Timeslot customization in Work hours](#)
- [Timeslot customization in Non Working hours](#)

#### *Timeslot customization in Work hours*

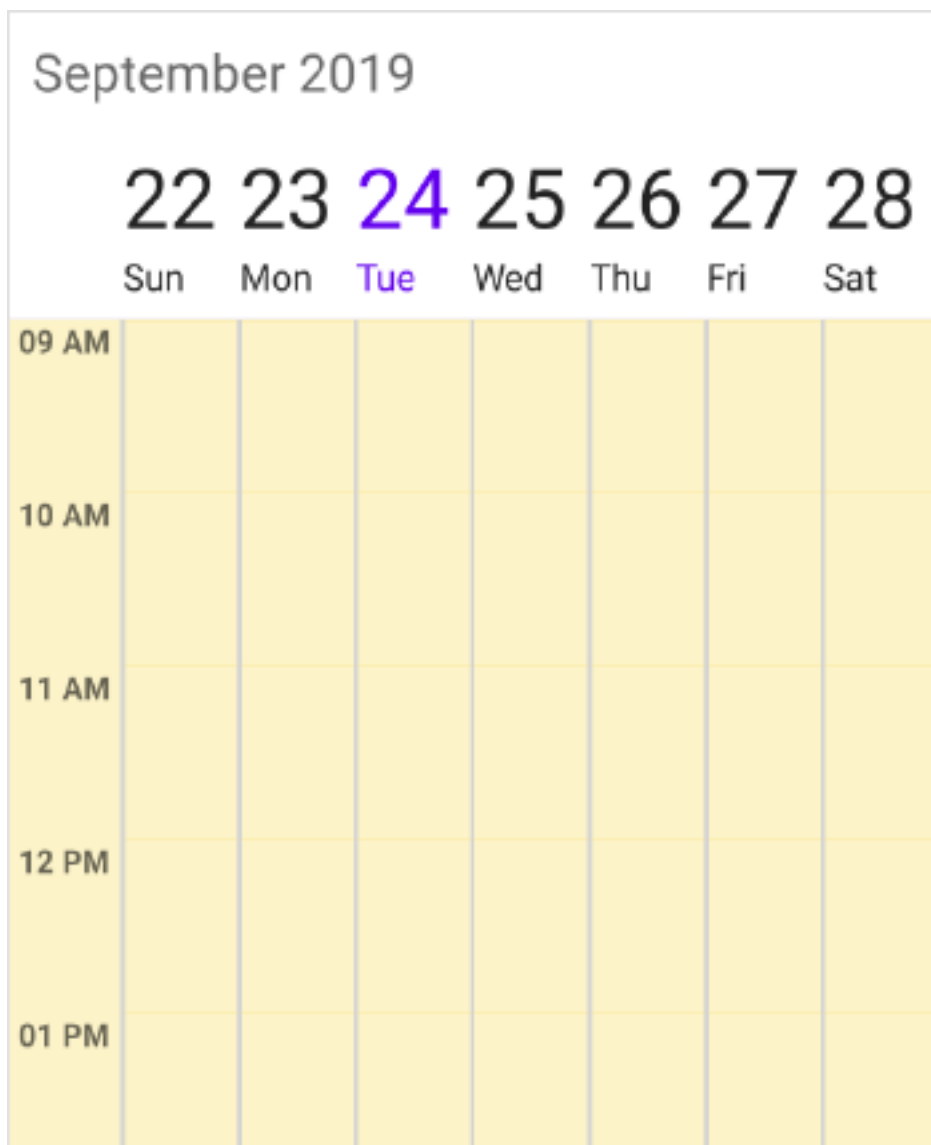

You can customize the appearance of the working hour timeslots by its color using [TimeSlotColor](#), [TimeSlotBorderColor](#), [VerticalLineStrokeWidth](#), [VerticalLineColor](#) and [TimeSlotBorderStrokeWidth](#) properties of `WeekViewSettings`.

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <schedule:SfSchedule.WeekViewSettings>
    <!--setting week view settings properties -->
    <schedule:WeekViewSettings
      TimeSlotColor="#fcf3c9"
      TimeSlotBorderColor="#fceb9f"
      TimeSlotBorderStrokeWidth="5"
      VerticalLineStrokeWidth="5"
      VerticalLineColor="LightGray">
    </schedule:WeekViewSettings>
  </schedule:SfSchedule.WeekViewSettings>
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;
//Create new instance of WeekViewSettings
WeekViewSettings weekViewSettings = new WeekViewSettings();
weekViewSettings.TimeSlotBorderColor = Color.FromHex("#fceb9f");
weekViewSettings.VerticalLineColor = Color.LightGray;
weekViewSettings.TimeSlotColor = Color.FromHex("#fcf3c9");
weekViewSettings.TimeSlotBorderStrokeWidth = 5;
weekViewSettings.VerticalLineStrokeWidth = 5;
schedule.WeekViewSettings = weekViewSettings;
```

#### *Timeslot customization in Non Working hours*

You can customize the appearance of the non-working hour timeslots by its color using [NonWorkingHoursTimeSlotBorderColor](#), [NonWorkingHoursTimeSlotColor](#), [VerticalLineStrokeWidth](#), [VerticalLineColor](#) and [TimeSlotBorderStrokeWidth](#) properties of [WeekViewSettings](#).

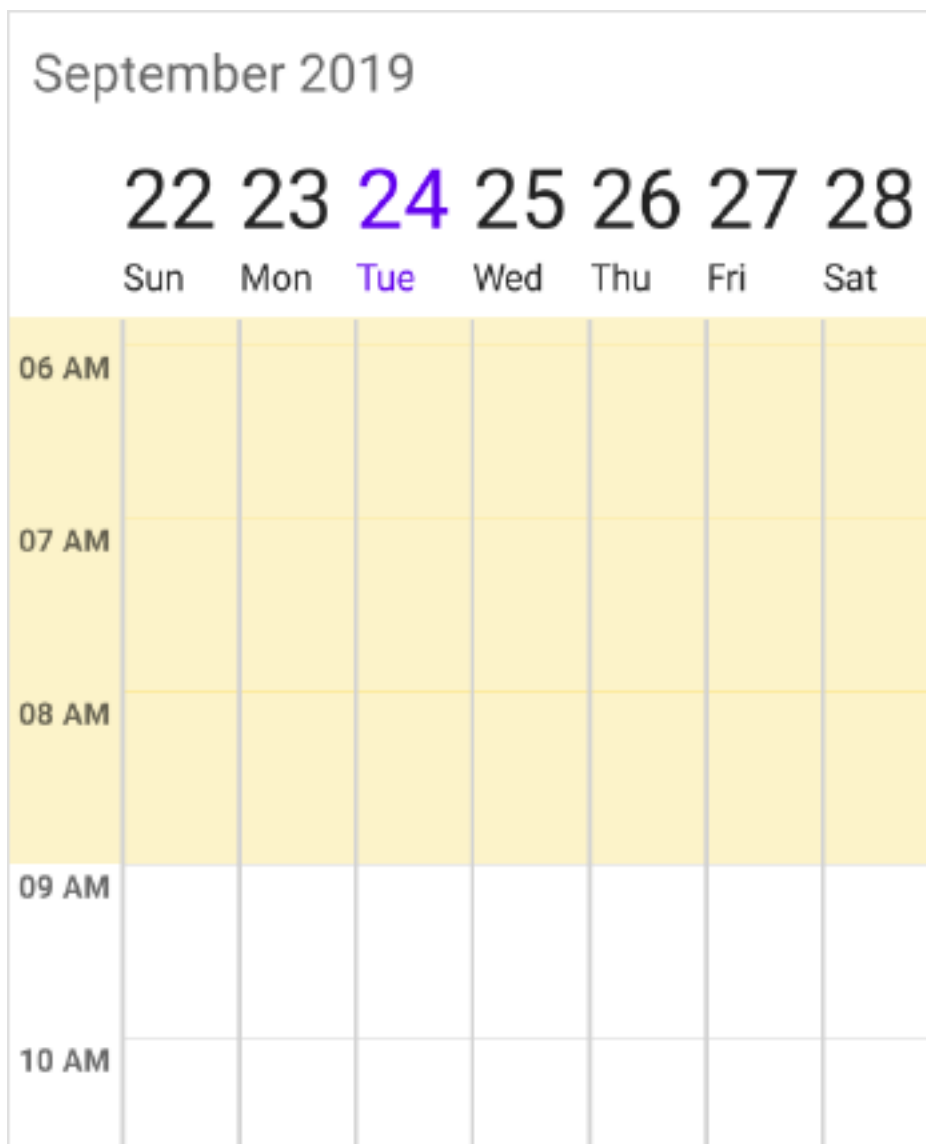

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <schedule:SfSchedule.WeekViewSettings>
    <!--setting week view settings properties -->
    <schedule:WeekViewSettings
      NonWorkingHoursTimeSlotColor="#f3cf3c"
      NonWorkingHoursTimeSlotBorderColor="#fce94f"
      TimeSlotBorderStrokeWidth="5"
      VerticalLineStrokeWidth="5"
      VerticalLineColor="LightGray">
    </schedule:WeekViewSettings>
  </schedule:SfSchedule.WeekViewSettings>
```

```
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WeekView;
//Create new instance of WeekViewSettings
WeekViewSettings weekViewSettings = new WeekViewSettings();
weekViewSettings.NonWorkingHoursTimeSlotBorderColor =
Color.FromHex("#fceb9f");
weekViewSettings.VerticalLineColor = Color.LightGray;
weekViewSettings.NonWorkingHoursTimeSlotColor = Color.FromHex("#fcf3c9");
weekViewSettings.TimeSlotBorderStrokeWidth = 5;
weekViewSettings.VerticalLineStrokeWidth = 5;
schedule.WeekViewSettings = weekViewSettings;
```

**NOTE**

TimeSlotBorderStrokeWidth and VerticalLineStrokeWidth properties are common to both Working hours and Non-Working hour time slot customization.

### Non-Accessible timeslots

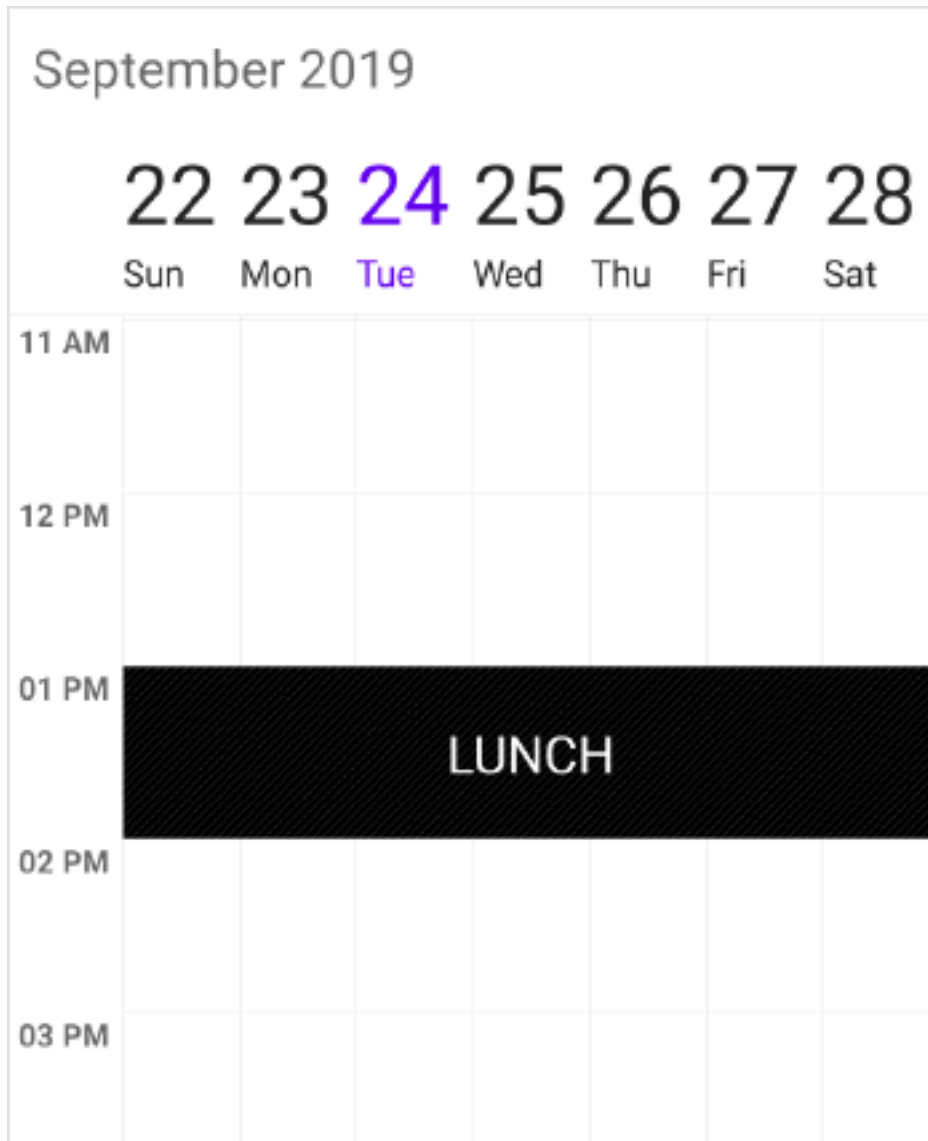

You can restrict or allocate certain timeslot as Non-accessible blocks by using [NonAccessibleBlocks](#) of [WeekViewSettings](#) so that you can allocate those timeslots for predefined events/activities like Lunch hour.

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <!--setting non-accessing blocks-->
  <schedule:SfSchedule.WeekViewSettings>
    <schedule:WeekViewSettings>
      <schedule:WeekViewSettings.NonAccessibleBlocks>
        <schedule:NonAccessibleBlock
          StartTime="13"
          EndTime="14"
          Text="LUNCH"
          Color="Black" />
      </schedule:WeekViewSettings.NonAccessibleBlocks>
    </schedule:WeekViewSettings>
  </schedule:SfSchedule.WeekViewSettings>
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;
//Create new instance of NonAccessibleBlock
NonAccessibleBlock nonAccessibleBlock = new NonAccessibleBlock();
//Create new instance of NonAccessibleBlocksCollection
NonAccessibleBlocksCollection nonAccessibleBlocksCollection = new
NonAccessibleBlocksCollection();
WeekViewSettings weekViewSettings = new WeekViewSettings();
nonAccessibleBlock.StartTime = 13;
nonAccessibleBlock.EndTime = 14;
nonAccessibleBlock.Text = "LUNCH";
nonAccessibleBlock.Color = Color.Black;
nonAccessibleBlocksCollection.Add(nonAccessibleBlock);
weekViewSettings.NonAccessibleBlocks = nonAccessibleBlocksCollection;
schedule.WeekViewSettings = weekViewSettings;
```

**NOTE**

Selection and related events will not be working in this blocks.

Change first day of week

By default, schedule control will be rendered with Sunday as the first day of the week, it can be customized to any day of the week by using [FirstDayOfWeek](#) property of [SfSchedule](#).

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView"
FirstDayOfWeek="3"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WeekView;
schedule.FirstDayOfWeek = 3;
```

September 2019

Tue	Wed	Thu	Fri	Sat	Sun	Mon
09 AM						
10 AM						
11 AM						
12 PM						
01 PM						

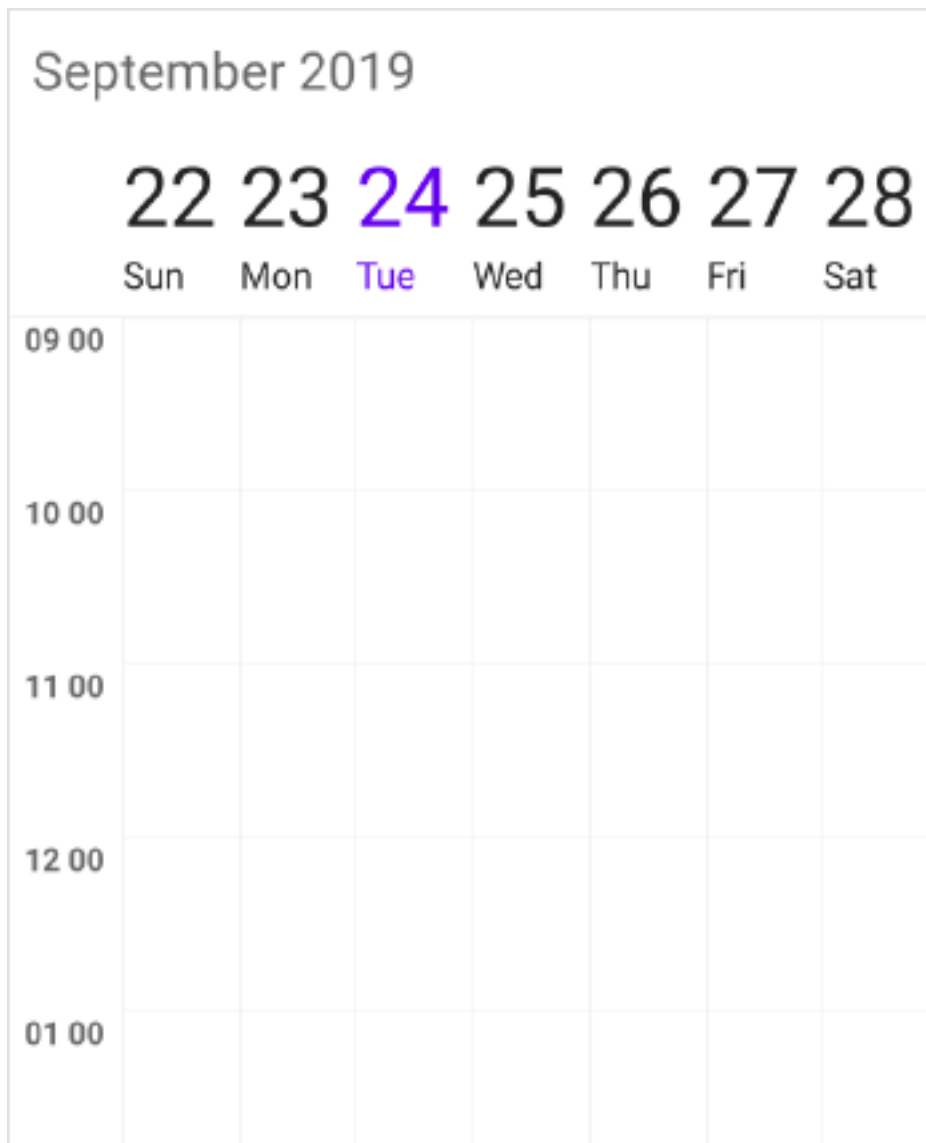

### Time Label Formatting

You can customize the format for the labels which are mentioning the time, by setting [TimeFormat](#) property of [WeekLabelSettings](#) in [WeekViewSettings](#).

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;  
WeekViewSettings weekViewSettings = new WeekViewSettings();  
WeekLabelSettings weekLabelSettings = new WeekLabelSettings();  
weekLabelSettings.TimeFormat = "hh mm";  
weekViewSettings.WeekLabelSettings = weekLabelSettings;  
schedule.WeekViewSettings = weekViewSettings;
```

### Time Label Appearance

You can customize the color for the labels which are mentioning the time, by setting [TimeLabelColor](#) property of [WeekLabelSettings](#) in [WeekViewSettings](#).

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;  
//Create new instance of WeekViewSettings  
WeekViewSettings weekViewSettings = new WeekViewSettings();  
//Create new instance of WeekLabelSettings  
WeekLabelSettings weekLabelSettings = new WeekLabelSettings();  
weekLabelSettings.TimeLabelColor = Color.FromHex("#8282ff");  
weekViewSettings.WeekLabelSettings = weekLabelSettings;  
schedule.WeekViewSettings = weekViewSettings;
```

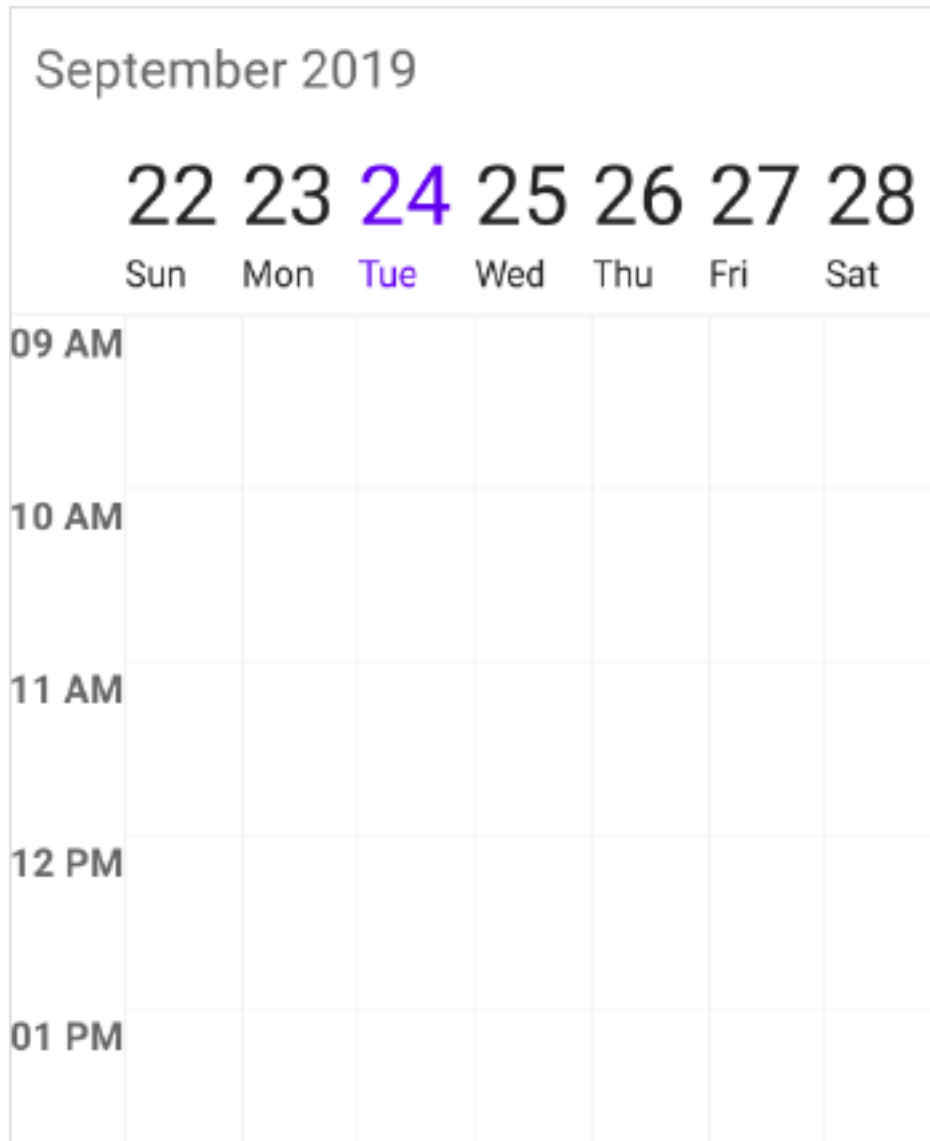

September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
09 AM						
10 AM						
11 AM						
12 PM						
01 PM						

### Time Label Size

You can customize the size of the labels which are mentioning the time, by setting [TimeLabelSize](#) property of `WeekLabelSettings` in `WeekViewSettings`.

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;  
//Create new instance of WeekViewSettings  
WeekViewSettings weekViewSettings = new WeekViewSettings();  
//Create new instance of WeekLabelSettings  
WeekLabelSettings weekLabelSettings = new WeekLabelSettings();  
//Customizing the size of the time label  
weekLabelSettings.TimeLabelSize = 15;  
weekViewSettings.WeekLabelSettings = weekLabelSettings;  
schedule.WeekViewSettings = weekViewSettings;
```

### Selection

You can customize the default appearance of selection UI in the timeslots.

- [Selection customization using style](#)
- [Selection customization using custom View](#)
- [Programmatic selection](#)

### *Selection customization using style*

You can customize the timeslot selection by using [SelectionStyle](#) property of `SfSchedule`.

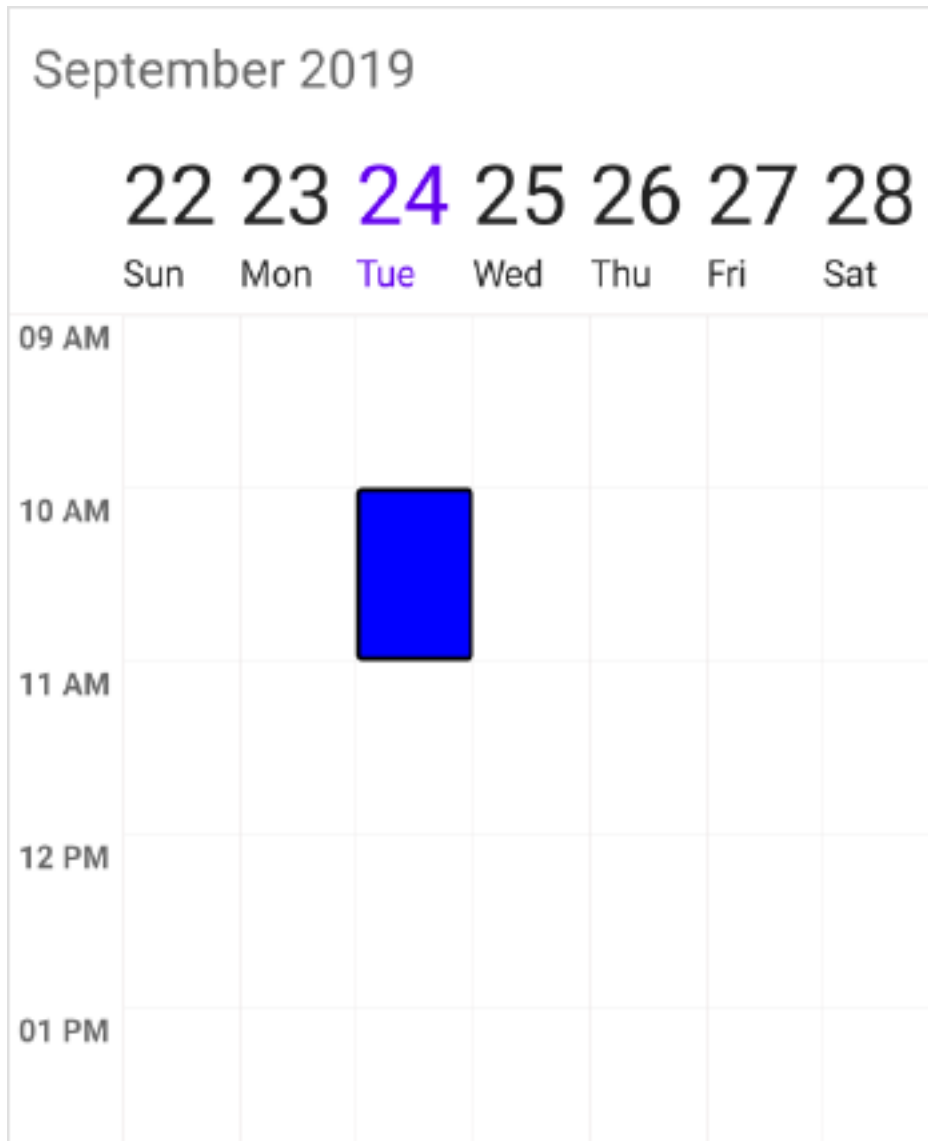

### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <schedule:SfSchedule.SelectionStyle>
    <schedule:SelectionStyle
      BackgroundColor="Blue"
      BorderColor="Black"
    />
  />
</schedule:SfSchedule>
```

```
BorderThickness="5"  
BorderCornerRadius="5">  
</schedule:SelectionStyle>  
</schedule:SfSchedule.SelectionStyle>  
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;  
//Create new instance of SelectionStyle  
SelectionStyle selectionStyle = new SelectionStyle();  
selectionStyle.BackgroundColor = Color.Blue;  
selectionStyle.BorderColor = Color.Black;  
selectionStyle.BorderThickness = 5;  
selectionStyle.BorderCornerRadius = 5;  
schedule.SelectionStyle = selectionStyle;
```

### *Selection customization using custom View*

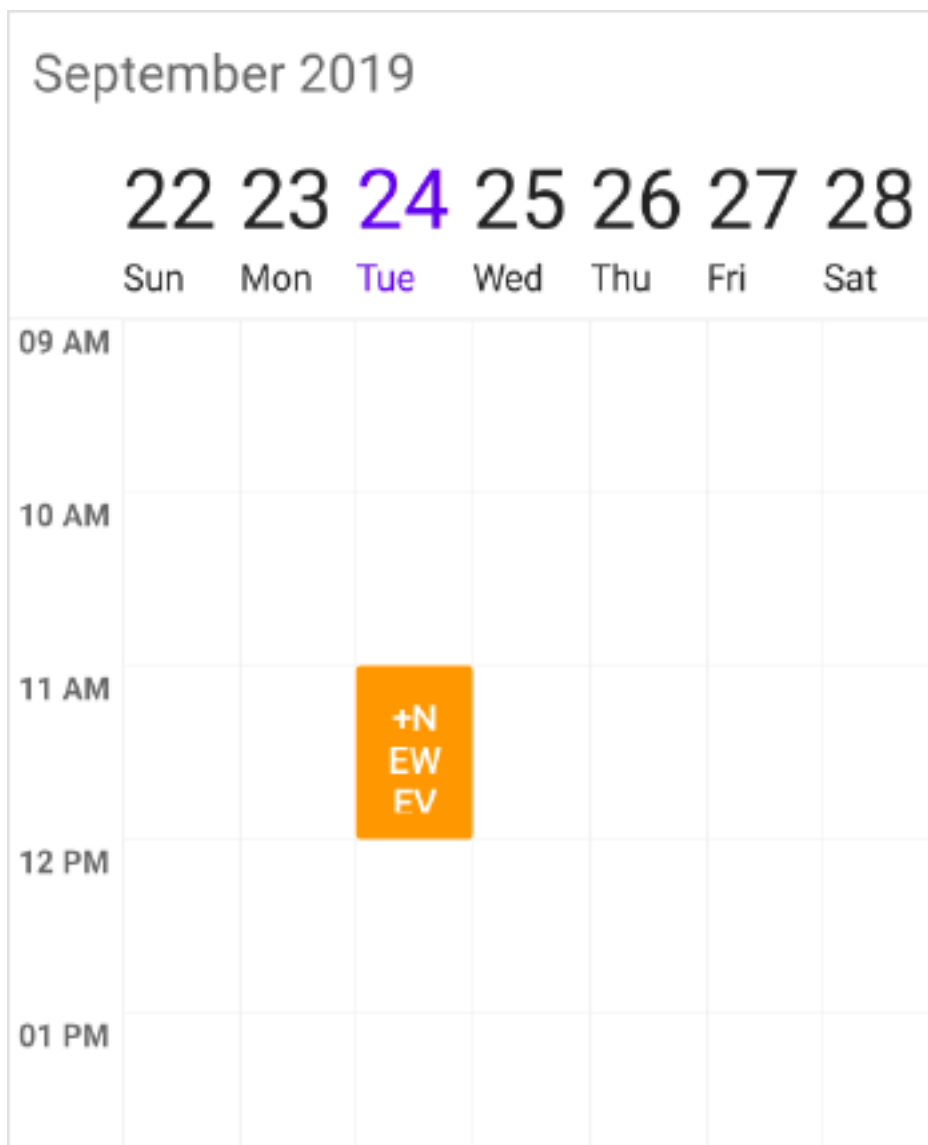

You can replace the default selection UI with your custom view by setting [SelectionView](#) property of SfSchedule.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <schedule:SfSchedule.SelectionView>
    <Button
      BackgroundColor="#FF9800"
      Text="+NewEvent"
      TextColor="White"/>
  </schedule:SfSchedule.SelectionView>
</schedule:SfSchedule>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.WeekView;
//Add the CustomView
Button customView = new Button();
customView.Text = "+NewEvent";
customView.BackgroundColor = Color.FromHex("#FF9800");
customView.TextColor = Color.White;
schedule.SelectionView = customView;
```

#### Programmatic selection

You can programmatically select the specific timeslot by setting corresponding date and time value to [SelectedDate](#) property of [SfSchedule](#). By default, it is null.

#### C#

```
// Setting a date and time to select  
schedule.SelectedDate = new DateTime(2017, 10, 04, 10, 0, 0);
```

You can clear the selection by setting [SelectedDate](#) as null.

#### C#

```
// Setting null value to deselect  
schedule.SelectedDate = null;
```

You can download the entire source code of this demo for Xamarin.Forms from here [Date Selection](#)

**NOTE**

- SfSchedule does not support multiple selection.
- SfSchedule supports two-way binding of SelectedDate property.

October 2017						
	1	2	3	4	5	6
	Sun	Mon	Tue	Wed	Thu	Fri
10 AM						
11 AM						
12 PM						
01 PM						
02 PM						

[WorkWeekView](#)

WorkWeekView is to view only working days of a particular week. By default, Saturday and Sunday are the non-working days. You can be customize it with any days of a Week. Appointments arranged in timeslots based on its duration with respective day of the week.

[ViewHeader Appearance](#)

You can customize the default appearance of view header in [WorkWeekView](#) by using [ViewHeaderStyle](#) property of [SfSchedule](#).

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView ="WorkWeekView">
```

```
<schedule:SfSchedule.ViewHeaderStyle>
<schedule:ViewHeaderStyle
  BackgroundColor="#009688"
  DayTextColor="#FFFFFF"
  DateTextColor="#FFFFFF"
  DayFontFamily="Arial"
  DateFontFamily="Arial">
</schedule:ViewHeaderStyle>
</schedule:SfSchedule.ViewHeaderStyle>
</schedule:SfSchedule>
```

## **C#**

```
//Create new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.WorkWeekView;
//Customize the schedule view header
ViewHeaderStyle viewHeaderStyle = new ViewHeaderStyle();
viewHeaderStyle.BackgroundColor = Color.FromHex("#009688");
viewHeaderStyle.DayTextColor = Color.FromHex("#FFFFFF");
viewHeaderStyle.DateTextColor = Color.FromHex("#FFFFFF");
viewHeaderStyle.DayFontFamily = "Arial";
viewHeaderStyle.DateFontFamily = "Arial";
schedule.ViewHeaderStyle = viewHeaderStyle;
```

11 AM				
12 PM				
01 PM				

**NOTE**

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

You can customize the height of the ViewHeader in **WeekView** by setting [ViewHeaderHeight](#) property of SfSchedule.

**C#**

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
schedule.ViewHeaderHeight = 50;
```

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView"
ViewHeaderHeight="50" />
```

#### *Customize Font Appearance*

you can change the appearance of Font by setting the [DayFontFamily](#) and [DateFontFamily](#) property of [ViewHeaderStyle](#) property in Schedule.

#### **XML**

```
<schedule:ViewHeaderStyle.DayFontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:HeaderStyle.DayFontFamily>
<schedule:ViewHeaderStyle.DateFontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:HeaderStyle.DateFontFamily>
```

#### **C#**

```
viewHeaderStyle.DayFontFamily = Device.OnPlatform("Lobster-Regular",
"Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
viewHeaderStyle.DateFontFamily = Device.OnPlatform("Lobster-Regular",
"Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

	Mon	Tue	Wed	Thu	Fri
09 AM					
10 AM					
11 AM					
12 PM					
01 PM					

Refer [this](#) to configure the custom fonts in Xamarin.Forms.

#### *ViewHeader Date Format*

You can customize the date and day format of SfSchedule ViewHeader by using [DateFormat](#) and [DayFormat](#) properties of [WorkWeekLabelSettings](#).

#### **XML**

```
<schedule:SfSchedule>
  <schedule:SfSchedule.WorkWeekViewSettings>
    <schedule:WorkWeekViewSettings>
      <schedule:WorkWeekViewSettings.WorkWeekLabelSettings>
        <schedule:WorkWeekLabelSettings DateFormat="dd">
```

```
<schedule:WorkWeekLabelSettings.DayFormat>
<OnPlatform x:TypeArguments="x:String" iOS="EEEE" Android="EEEE"
WinPhone="dddd" />
</schedule:WorkWeekLabelSettings.DayFormat>
</schedule:WorkWeekLabelSettings>
</schedule:WorkWeekViewSettings.WorkWeekLabelSettings>
</schedule:WorkWeekViewSettings>
</schedule:SfSchedule.WorkWeekViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
//Creating new instance of WorkWeekViewSettings
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();
//Creating new instance of WorkWeekLabelSettings
WorkWeekLabelSettings workWeekLabelSettings = new WorkWeekLabelSettings();
//Customizing date format
workWeekLabelSettings.DateFormat = "dd";
workWeekLabelSettings.DayFormat = Device.OnPlatform("EEEE", "EEEE", "dddd");
workWeekViewSettings.WorkWeekLabelSettings = workWeekLabelSettings;
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

September 2019					
<div> <div>23</div> <div>24</div> <div>25</div> <div>26</div> <div>27</div> </div> <div> Monday Tuesday Wednesday Thursday Friday </div>					
09 AM					
10 AM					
11 AM					
12 PM					
01 PM					

#### *ViewHeader Tapped Event*

You can handle single tap action of ViewHeader by using [ViewHeaderTapped](#) event of `SfSchedule`. This event will be triggered when the ViewHeader is Tapped. This event contains [ViewHeaderTappedEventArgs](#) argument which holds [DateTime](#) details in it.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule"
ScheduleView="WorkWeekView"
ViewHeaderTapped="Handle_ViewHeaderTapped" >
</schedule:SfSchedule>
```

#### **C#**

```
//Creating new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.WorkWeekView;
schedule.ViewHeaderTapped += Handle_ViewHeaderTapped;
```

**C#**

```
private void Handle_ViewHeaderTapped(object sender,
ViewHeaderTappedEventArgs e)
{
    var dateTime = e.DateTime;
}
```

**Change Time Interval**

You can customize the interval of timeslots in **WorkWeekView** by setting [TimeInterval](#) property of **SfSchedule**.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView"
TimeInterval="180"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
schedule.TimeInterval = 180;
```

September 2019					
	23	24	25	26	27
	Mon	Tue	Wed	Thu	Fri
09 AM					
12 PM					
03 PM					
06 PM					
09 PM					

**NOTE**

If you modify the `TimeInterval` value (in minutes), you need to change the time labels format by setting the `TimeFormat` value as "hh:mm". By default, `TimeFormat` value is "hh a". You can refer [here](#) for changing `TimeFormat` value.

**Change Time Interval Height**

You can customize the interval height of timeslots in `WorkWeekView` by setting `TimeIntervalHeight` property of `SfSchedule`.

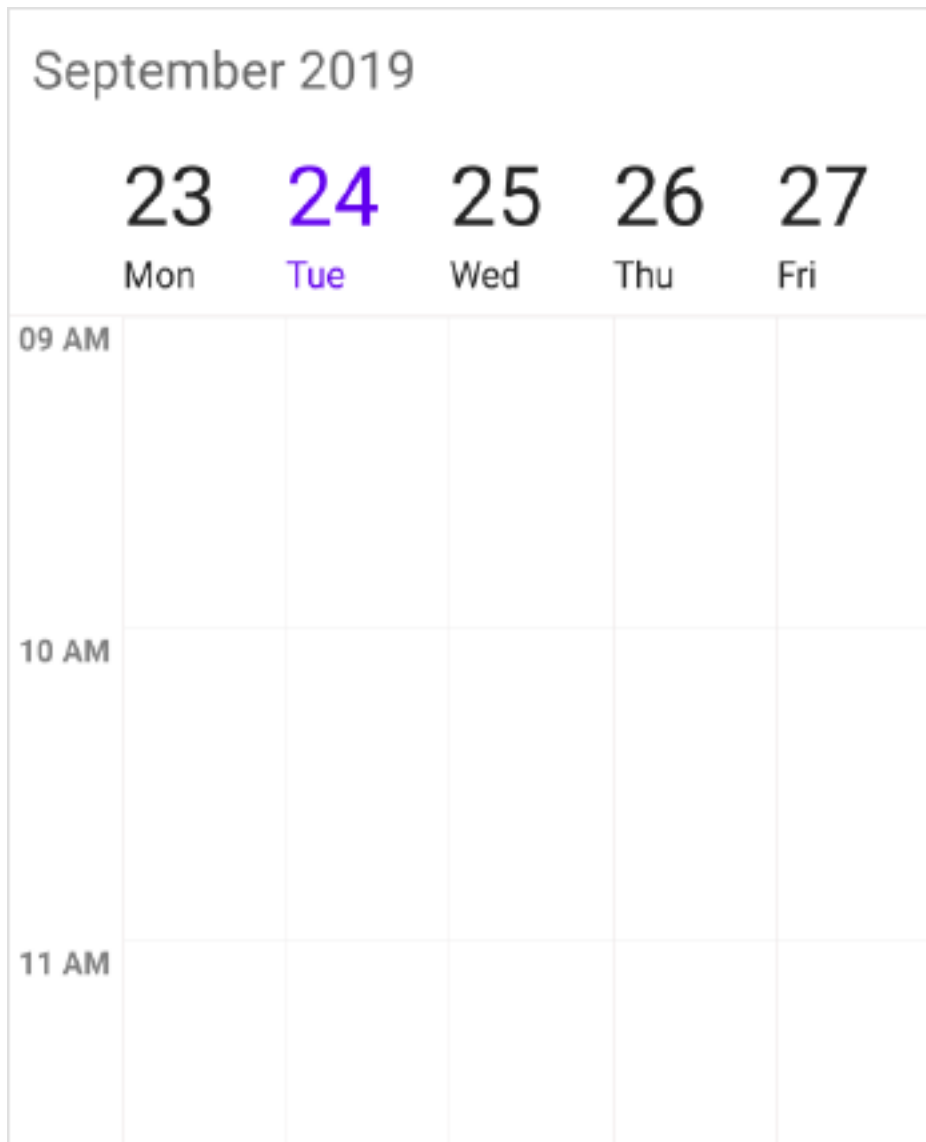

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView"
    TimeIntervalHeight="180"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
```

```
schedule.TimeIntervalHeight = 180;
```

#### *Full screen scheduler*

Schedule time interval height can be adjusted based on screen height by changing the value of `TimeIntervalHeight` property to -1. It will auto-fit to the screen height and width.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView"
TimeIntervalHeight="-1"/>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
schedule.TimeIntervalHeight = -1;
```

### Change Working hours

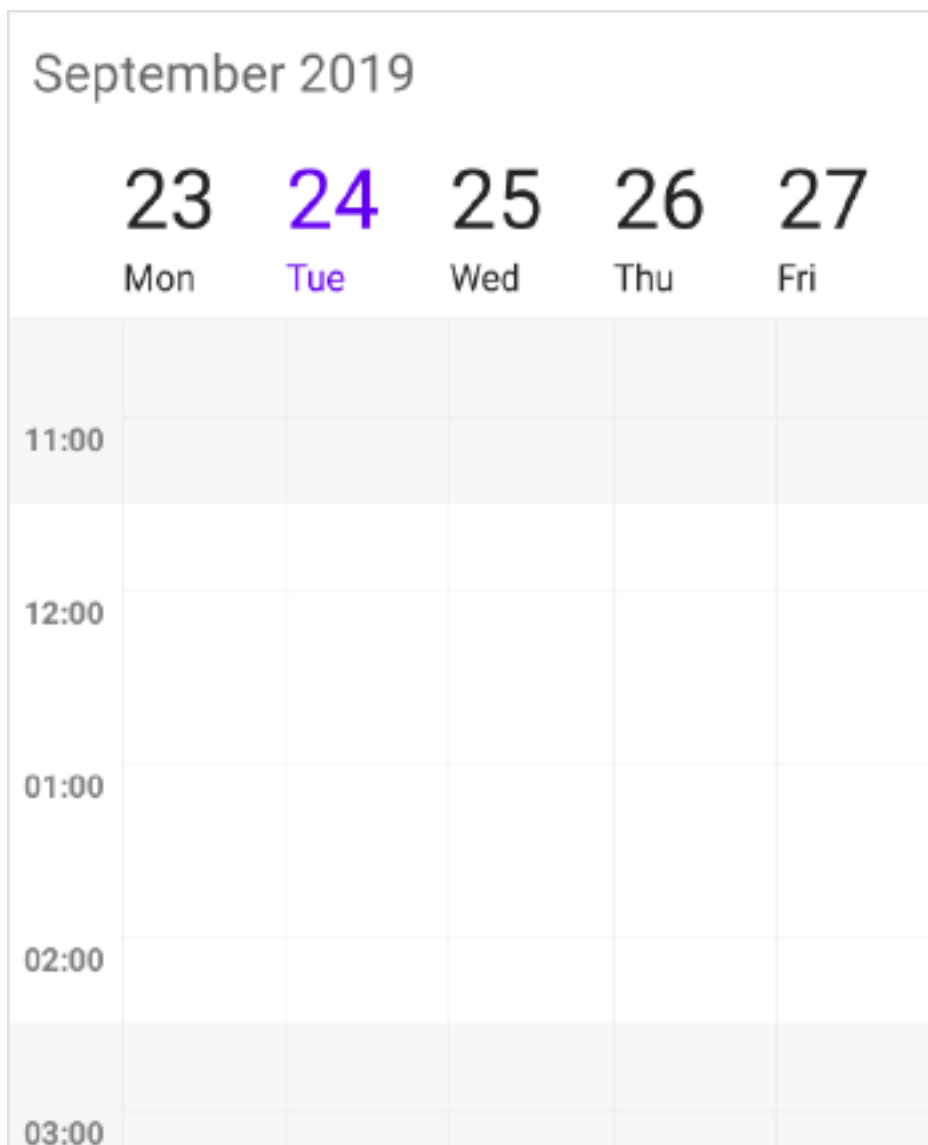

Working hours in **WorkWeekView** of Schedule control will be differentiated with non-working hours by separate color. By default, working hours will be between 09 to 18. You can customize the working hours by setting [WorkStartHour](#) and [WorkEndHour](#) properties of [WorkWeekViewSettings](#). You can also customize the working hours along with minutes by setting double value which will be converted to time.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView">
  <schedule:SfSchedule.WorkWeekViewSettings>
    <!--setting working hours properties -->
    <schedule:WorkWeekViewSettings
      WorkStartHour="11.5"
      WorkEndHour="17.5">
      <schedule:WorkWeekViewSettings.WorkWeekLabelSettings>
        <schedule:WorkWeekLabelSettings TimeFormat="hh:mm" />
      </schedule:WorkWeekViewSettings.WorkWeekLabelSettings>
    </schedule:WorkWeekViewSettings>
  </schedule:SfSchedule.WorkWeekViewSettings>
</schedule:SfSchedule>
```

#### C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
//Create new instance of WorkWeekViewSettings
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();
WorkWeekLabelSettings workWeekLabelSettings = new WorkWeekLabelSettings();
workWeekLabelSettings.TimeFormat = "hh:mm";
workWeekViewSettings.WorkStartHour = 11.5;
workWeekViewSettings.WorkEndHour = 14.5;
workWeekViewSettings.WorkWeekLabelSettings = workWeekLabelSettings;
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

**NOTE**

No need to specify the decimal point values for `WorkStartHour` and `WorkEndHour`, if you don't want to set the minutes.

**Changing StartHour and EndHour**

Default value for `StartHour` and `EndHour` value is 0 to 24 to show all the time slots in `WorkWeekView`. You need to set `StartHour` and `EndHour` property of 'WorkWeekView', to show only the required time duration for end users. You can also set `StartHour` and `EndHour` in double value which will be converted to time to show required time duration in minutes.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView">
  <schedule:SfSchedule.WorkWeekViewSettings>
    <!--setting working hours properties -->
    <schedule:WorkWeekViewSettings
      StartHour ="7.5"
```

```
EndHour ="18.5">
</schedule:WorkWeekViewSettings>
<schedule:WorkWeekViewSettings.WorkWeekLabelSettings>
<schedule:WorkWeekLabelSettings TimeFormat="hh:mm" />
</schedule:WorkWeekViewSettings.WorkWeekLabelSettings>
</schedule:SfSchedule.WorkWeekViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
//Create new instance of WorkWeekViewSettings
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();
WorkWeekLabelSettings workWeekLabelSettings = new WorkWeekLabelSettings();
workWeekLabelSettings.TimeFormat = "hh:mm";
workWeekViewSettings.StartHour = 7.5;
workWeekViewSettings.EndHour = 18.5;
workWeekViewSettings.WorkWeekLabelSettings = workWeekLabelSettings;
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

September 2019					
	23	24	25	26	27
	Mon	Tue	Wed	Thu	Fri
08:30					
09:30					
10:30					
11:30					

**NOTE**

- **StartHour** must be greater than or equal to 0 and **EndHour** must be lesser than or equal to 24, otherwise **InvalidDataException** will be thrown.
- **EndHour** value must be greater than **StartHour**, otherwise **InvalidDataException** will be thrown.
- Schedule UI such as **Appointments** and **NonAccessibleBlocks** which does not fall within the **StartHour** and **EndHour** will not be visible and if it falls partially, it will be clipped.
- No need to specify the decimal point values for **StartHour** and **EndHour**, if you don't want to set the minutes.
- The number of time slots will be calculated based on total minutes of a day and time interval (total minutes of a day ((start hour - end hour) \* 60) / time interval).
- If custom **TimeInterval** is given, then the number of time slots calculated based on given **TimeInterval** should result in integer value (total minutes % **TimeInterval** = 0), otherwise next immediate time interval that result in integer value when divide total minutes of a day will be

considered. For example, if `TimeInterval="135"` (2 Hours 15 minutes) and total minutes = 1440 (24 Hours per day), then `TimeInterval` will be changed to "144" ( $1440 \% 144 = 0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

- If the custom `StartHour` and `EndHour` are given, then the number of time slots calculated based on given `StartHour` and `EndHour` should result in integer value, otherwise next immediate time interval will be considered until the result is integer value. For example, if `StartHour` is 9 (09:00AM), `EndHour` is 18.25 (06:15 PM), `TimeInterval` is 30 minutes, and total minutes = 555 ( $(18.25 - 9) * 60$ ), then the `TimeInterval` will be changed to "37" ( $555 \% 37 = 0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

### Changing NonWorking Days

You can customize the Non-Working days of a week by using [NonWorkingsDays](#) property of `WorkWeekViewSettings`.

#### C#

```
var nonWorkingDays = new ObservableCollection<DayOfWeek>();
nonWorkingDays.Add(DayOfWeek.Monday);
nonWorkingDays.Add(DayOfWeek.Friday);
var workWeekViewSettings = new WorkWeekViewSettings();
workWeekViewSettings.NonWorkingsDays = nonWorkingDays;
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

### Timeslot Appearance

You can customize the appearance of timeslots in `WeekView`.

- [Timeslot customization in Work hours](#)
- [Timeslot customization in Non Working hours](#)

#### *Timeslot customization in Work hours*

You can customize the appearance of the working hour timeslots by its color using [TimeSlotColor](#), [TimeSlotBorderColor](#), [VerticalLineStrokeWidth](#), [VerticalLineColor](#) and [TimeSlotBorderStrokeWidth](#) properties of `WorkWeekViewSettings`.

#### XML

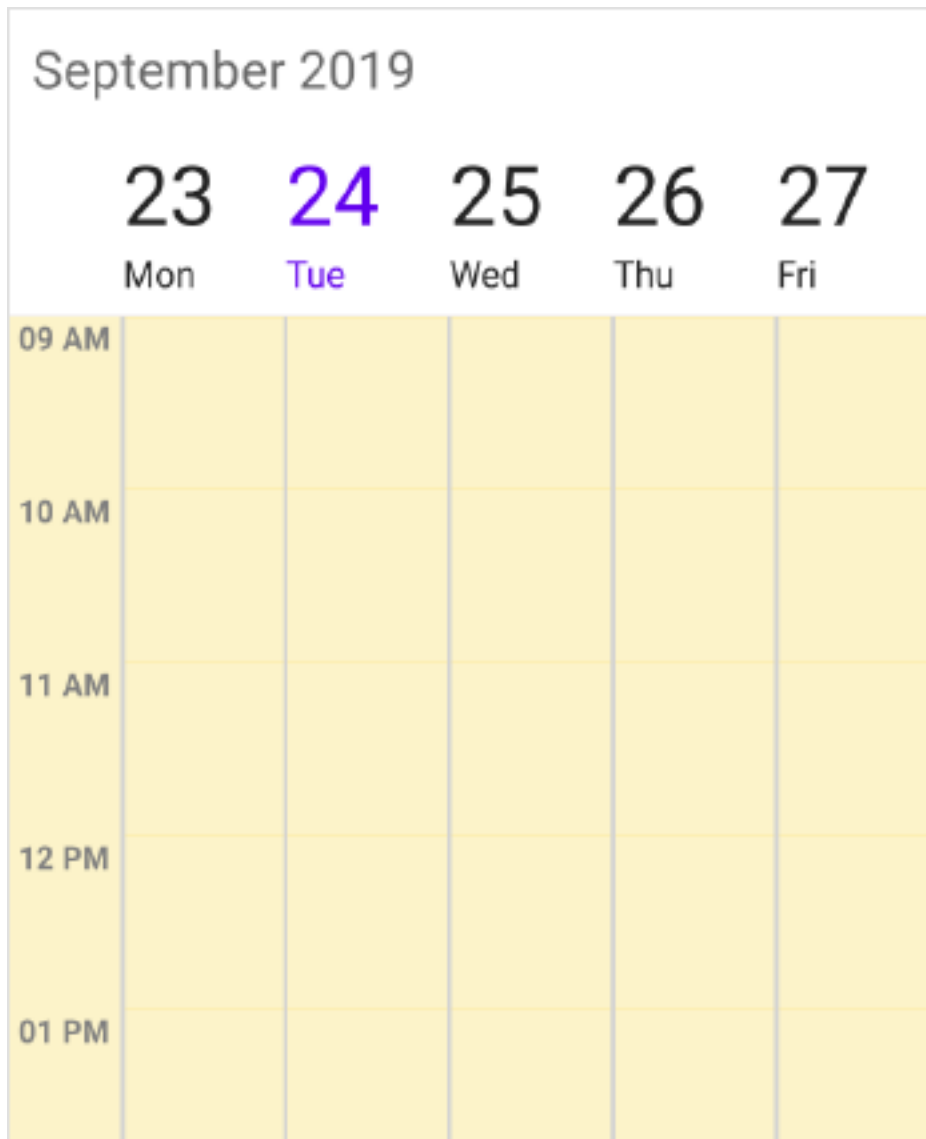

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView">
  <schedule:SfSchedule.WorkWeekViewSettings>
    <!--setting work week view settings properties -->
    <schedule:WorkWeekViewSettings
      TimeSlotColor="#fcf3c9"
      TimeSlotBorderColor="#fceb9f"
      TimeSlotBorderStrokeWidth="5"
      VerticalLineStrokeWidth="5"
      VerticalLineColor="LightGray">
    </schedule:WorkWeekViewSettings>
  </schedule:SfSchedule.WorkWeekViewSettings>
</schedule:SfSchedule>
```

**C#**

```

schedule.ScheduleView = ScheduleView.WorkWeekView;
//Create new instance of WorkWeekViewSettings
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();
workWeekViewSettings.TimeSlotBorderColor = Color.FromHex("#fceb9f") ;
workWeekViewSettings.VerticalLineColor = Color.LightGray;
workWeekViewSettings.TimeSlotColor = Color.FromHex("#fcf3c9");
workWeekViewSettings.TimeSlotBorderStrokeWidth = 5;
workWeekViewSettings.VerticalLineStrokeWidth = 5;
schedule.WorkWeekViewSettings = workWeekViewSettings;

```

*Timeslot customization in Non Working hours*

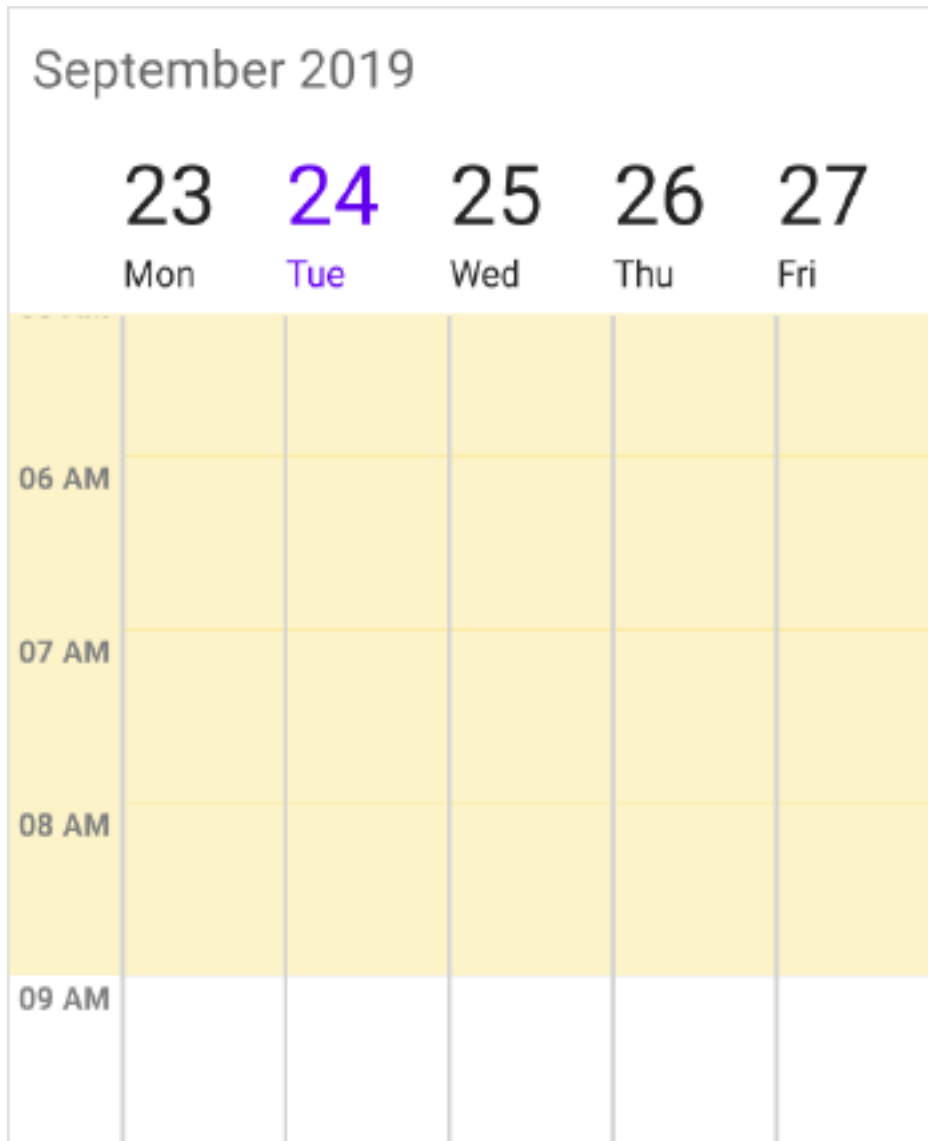

You can customize the appearance of the non-working hour timeslots by its color using [NonWorkingHoursTimeSlotBorderColor](#), [NonWorkingHoursTimeSlotColor](#), [VerticalLineStrokeWidth](#), [VerticalLineColor](#) and [TimeSlotBorderStrokeWidth](#) properties of [WorkWeekViewSettings](#).

## XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView">
<schedule:SfSchedule.WorkWeekViewSettings>
  <!--setting work week view settings properties -->
<schedule:WorkWeekViewSettings
NonWorkingHoursTimeSlotColor="#fcf3c9"
NonWorkingHoursTimeSlotBorderColor="#fceb9f"
TimeSlotBorderStrokeWidth="5"
VerticalLineStrokeWidth="5"
VerticalLineColor="LightGray">
</schedule:WorkWeekViewSettings>
</schedule:SfSchedule.WorkWeekViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
//Create new instance of WorkWeekViewSettings
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();
workWeekViewSettings.NonWorkingHoursTimeSlotBorderColor =
Color.FromHex("#fceb9f") ;
workWeekViewSettings.VerticalLineColor = Color.LightGray;
workWeekViewSettings.NonWorkingHoursTimeSlotColor =
Color.FromHex("#fcf3c9");
workWeekViewSettings.TimeSlotBorderStrokeWidth = 5;
workWeekViewSettings.VerticalLineStrokeWidth = 5;
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

**NOTE**

TimeSlotBorderStrokeWidth and VerticalLineStrokeWidth properties are common to both Working hours and Non-Working hour time slot customization.

**Non-Accessible timeslots**

You can restrict or allocate certain timeslot as Non-accessible blocks by using [NonAccessibleBlocks](#) of `WorkWeekViewSettings` so that you can allocate those timeslots for predefined events/activities like Lunch hour.

**XML**

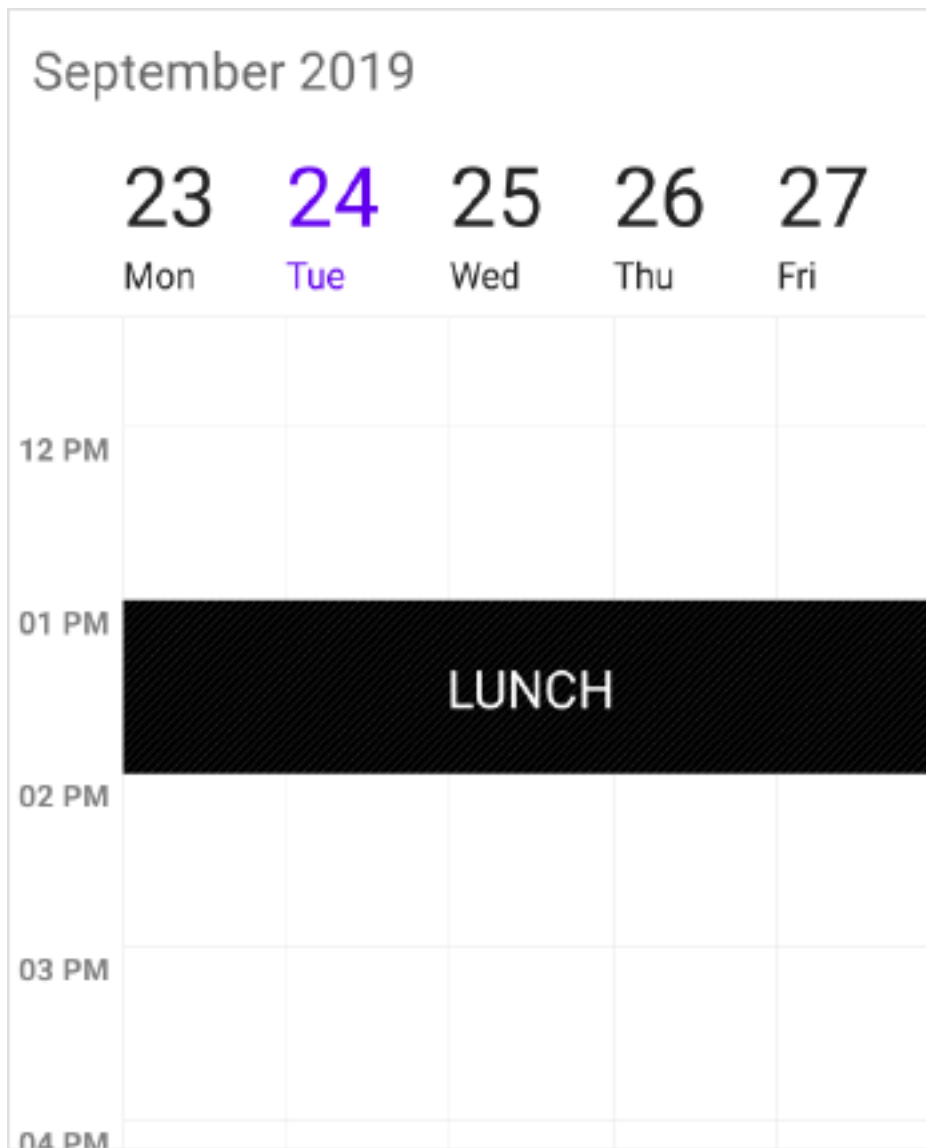

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView">
  <!--setting non-accessing blocks-->
  <schedule:SfSchedule.WorkWeekViewSettings>
    <schedule:WorkWeekViewSettings>
      <schedule:WorkWeekViewSettings.NonAccessibleBlocks>
        <schedule:NonAccessibleBlock
```

```
StartTime="13"  
EndTime="14"  
Text="LUNCH"  
Color="Black" />  
</schedule:WorkWeekViewSettings.NonAccessibleBlocks>  
</schedule:WorkWeekViewSettings>  
</schedule:SfSchedule.WorkWeekViewSettings>  
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;  
//Create new instance of NonAccessibleBlock  
NonAccessibleBlock nonAccessibleBlock = new NonAccessibleBlock();  
//Create new instance of NonAccessibleBlocksCollection  
NonAccessibleBlocksCollection nonAccessibleBlocksCollection = new  
NonAccessibleBlocksCollection();  
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();  
nonAccessibleBlock.StartTime = 13;  
nonAccessibleBlock.EndTime = 14;  
nonAccessibleBlock.Text = "LUNCH";  
nonAccessibleBlock.Color = Color.Black;  
nonAccessibleBlocksCollection.Add(nonAccessibleBlock);  
workWeekViewSettings.NonAccessibleBlocks = nonAccessibleBlocksCollection;  
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

**NOTE**

Selection and related events will not be working in this blocks.

Change first day of week

By default, schedule control will be rendered with Sunday as the first day of the week, it can be customized to any day of the week by using [FirstDayOfWeek](#) property of [SfSchedule](#).

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView"
FirstDayOfWeek="3"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
schedule.FirstDayOfWeek = 3;
```

11 AM					
12 PM					
01 PM					

### Time Label Formatting

You can customize the format for the labels which are mentioning the time, by setting [TimeFormat](#) property of [WorkWeekLabelSettings](#) in [WorkWeekViewSettings](#).

### C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
WorkWeekViewSettings workweekViewSettings = new WorkWeekViewSettings();
WorkWeekLabelSettings workWeekLabelSettings = new WorkWeekLabelSettings();
workWeekLabelSettings.TimeFormat = "hh mm";
workweekViewSettings.WorkWeekLabelSettings = workWeekLabelSettings;
schedule.WorkWeekViewSettings = workweekViewSettings;
```

September 2019					
	23	24	25	26	27
	Mon	Tue	Wed	Thu	Fri
09 00					
10 00					
11 00					
12 00					
01 00					

### Time Label Appearance

You can customize the color for the labels which are mentioning the time, by setting [TimeLabelColor](#) property of `WorkWeekLabelSettings` in `WorkWeekViewSettings`.

### C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
//Create new instance of WorkWeekViewSettings
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();
//Create new instance of WorkWeekLabelSettings
WorkWeekLabelSettings workWeekLabelSettings = new WorkWeekLabelSettings();
workWeekLabelSettings.TimeLabelColor = Color.FromHex("#8282ff");
workWeekViewSettings.WorkWeekLabelSettings = workWeekLabelSettings;
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

	Mon	Tue	Wed	Thu	Fri
09 AM					
10 AM					
11 AM					
12 PM					
01 PM					

### Time Label Size

You can customize the size of the labels which are mentioning the time, by setting [TimeLabelSize](#) property of `WorkWeekLabelSettings` in `WorkWeekViewSettings`.

### C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;  
//Create new instance of WorkWeekViewSettings  
WorkWeekViewSettings workWeekViewSettings = new WorkWeekViewSettings();  
//Create new instance of WorkWeekLabelSettings  
WorkWeekLabelSettings workWeekLabelSettings = new WorkWeekLabelSettings();  
//Customizing the size of the time label  
workWeekLabelSettings.TimeLabelSize = 15;  
workWeekViewSettings.WorkWeekLabelSettings = workWeekLabelSettings;  
schedule.WorkWeekViewSettings = workWeekViewSettings;
```

### Selection

You can customize the default appearance of selection UI in the timeslots.

- [Selection customization using style](#)
- [Selection customization using custom View](#)
- [Programmatic selection](#)

### *Selection customization using style*

You can customize the timeslot selection by using [SelectionStyle](#) property of `SfSchedule`.

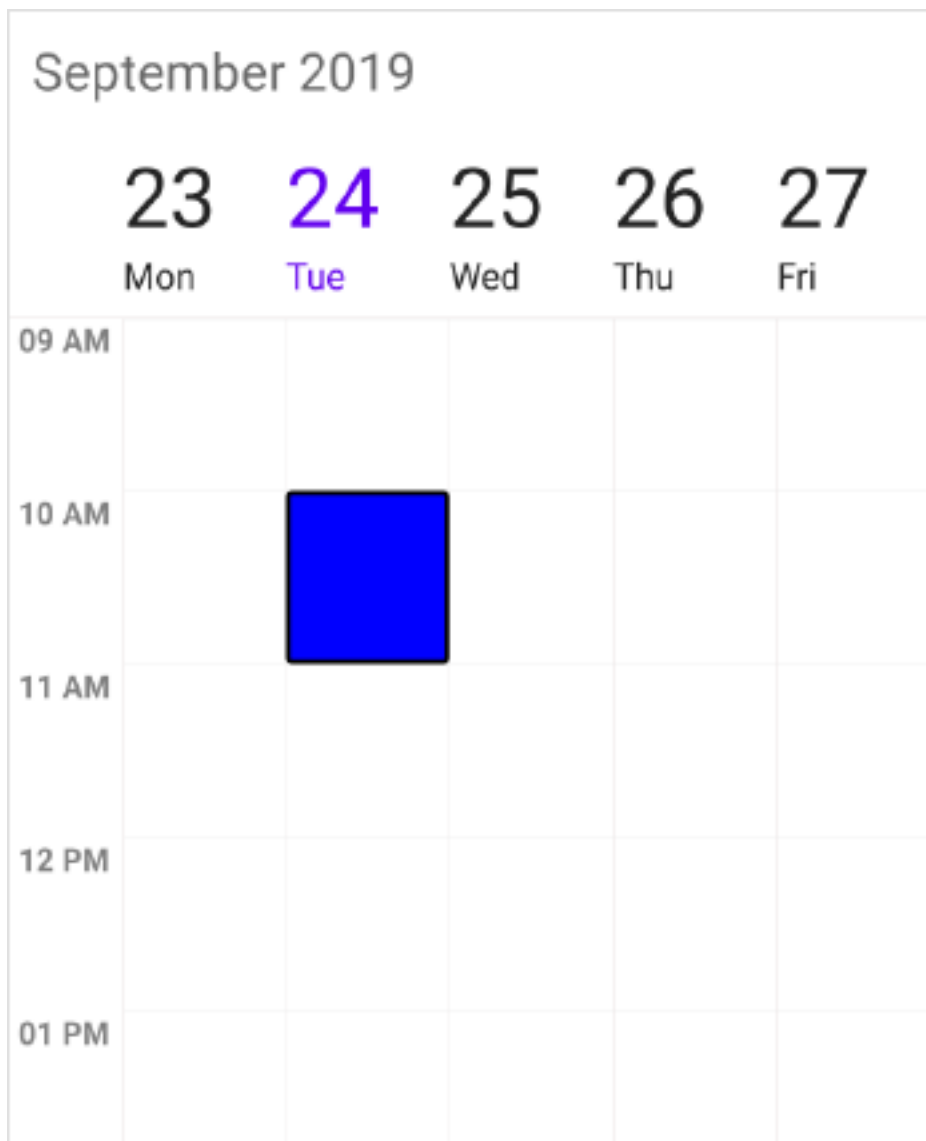

### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView">
  <schedule:SfSchedule.SelectionStyle>
    <schedule:SelectionStyle
      BackgroundColor="Blue"
      BorderColor="Black"
    />
  />
</schedule:SfSchedule>
```

```
BorderThickness="5"  
BorderCornerRadius="5">  
</schedule:SelectionStyle>  
</schedule:SfSchedule.SelectionStyle>  
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.WorkWeekView;  
//Create new instance of SelectionStyle  
SelectionStyle selectionStyle = new SelectionStyle();  
selectionStyle.BackgroundColor = Color.Blue;  
selectionStyle.BorderColor = Color.Black;  
selectionStyle.BorderThickness = 5;  
selectionStyle.BorderCornerRadius = 5;  
schedule.SelectionStyle = selectionStyle;
```

*Selection customization using custom View*

You can replace the default selection UI with your custom view by setting [SelectionView](#) property of SfSchedule.

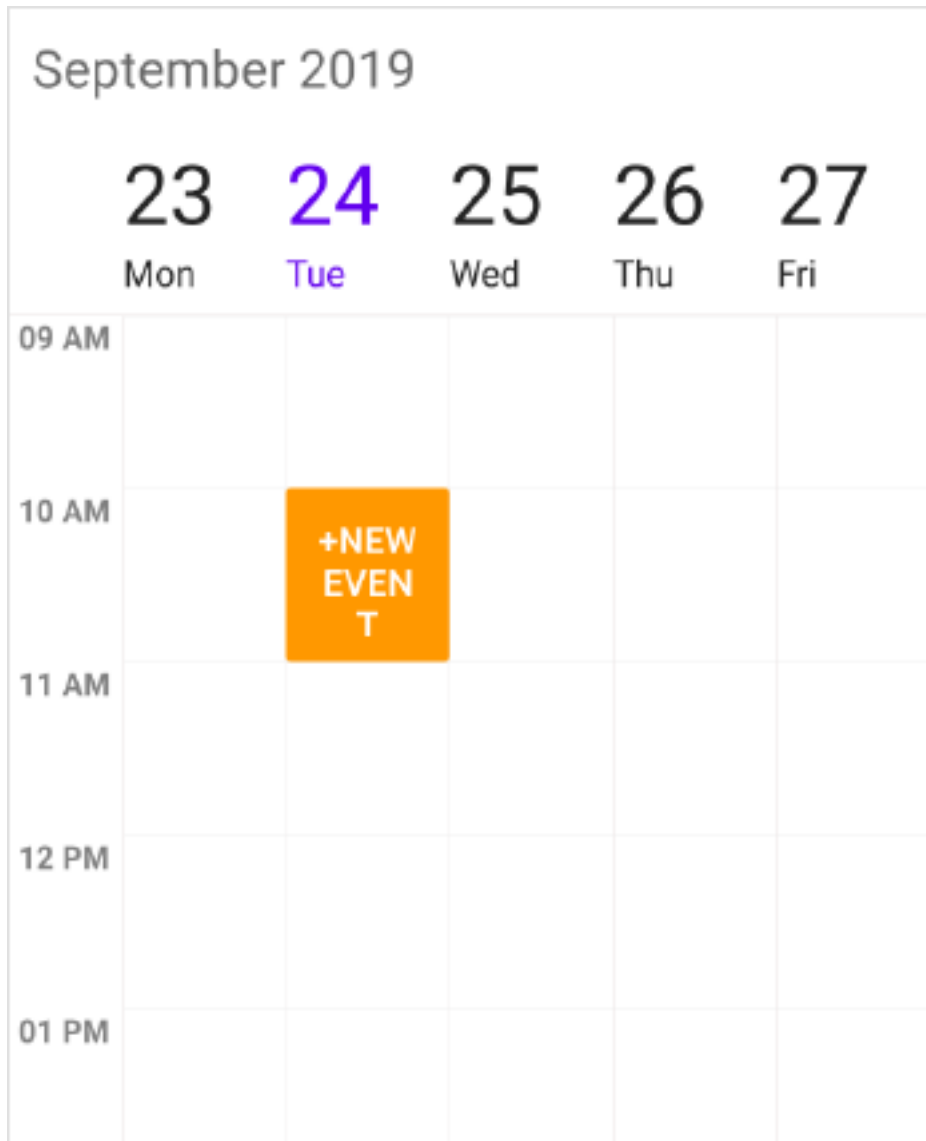

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WorkWeekView">
<schedule:SfSchedule.SelectionView>
<Button
BackgroundColor="#FF9800"
Text="+NewEvent"
TextColor="White"/>
</schedule:SfSchedule.SelectionView>
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.WorkWeekView;
//Add the CustomView
Button customView = new Button();
customView.Text = "+NewEvent";
customView.BackgroundColor = Color.FromHex("#FF9800");
customView.TextColor = Color.White;
schedule.SelectionView = customView;
```

#### *Programmatic selection*

You can programmatically select the specific timeslot by setting corresponding date and time value to [SelectedDate](#) property of `SfSchedule`. By default, it is null.

#### **C#**

```
// Setting a date and time to select  
schedule.SelectedDate = new DateTime(2017, 10, 04, 10, 0, 0);
```

You can clear the selection by setting [SelectedDate](#) as null.

#### **C#**

```
// Setting null value to deselect  
schedule.SelectedDate = null;
```

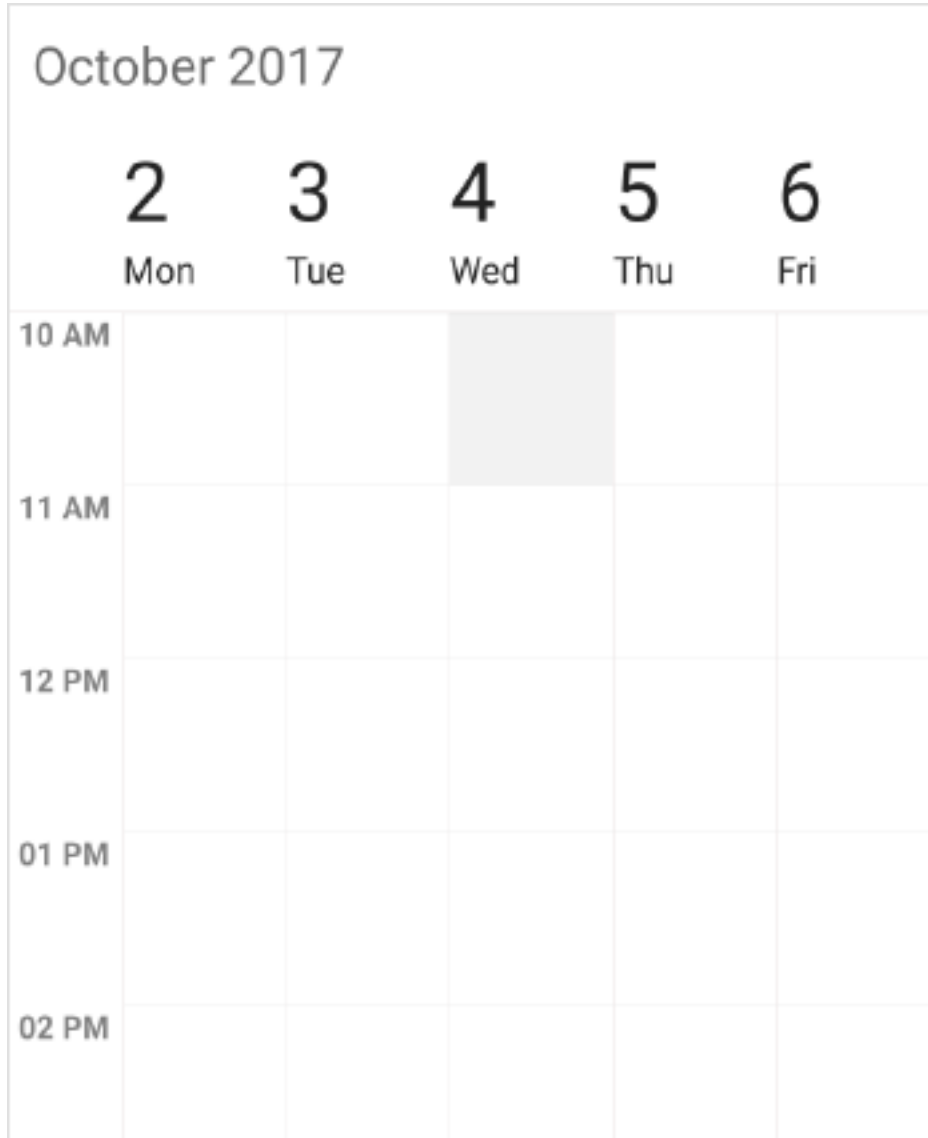

You can download the entire source code of this demo for Xamarin.Forms from here [Date Selection](#)

---

**NOTE**

---

- SfSchedule does not support multiple selection.
- SfSchedule supports two-way binding of SelectedDate property.

### Timeline view

**TimelineView** displays the dates in horizontal time axis with the desired day's count. You can see the past or future dates by scrolling to the right or left. Each view displays events accurately across the time slots with an intuitive drag-and-drop feature. It provides support to highlight the selected region of time slots and handle interaction.

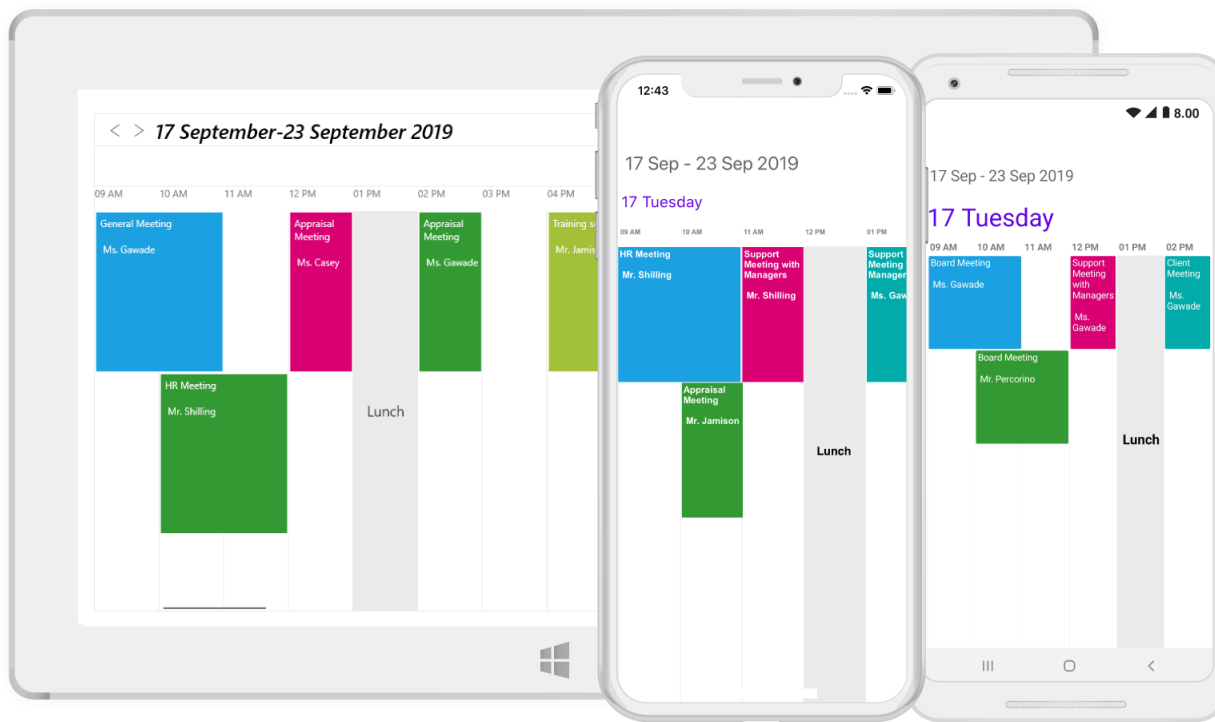

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView"/>
```

### C#

```
schedule.ScheduleView = ScheduleView.TimelineView;
```

You can download the entire source code of this demo for Xamarin.Forms from [here](#).

### Timeline view days count

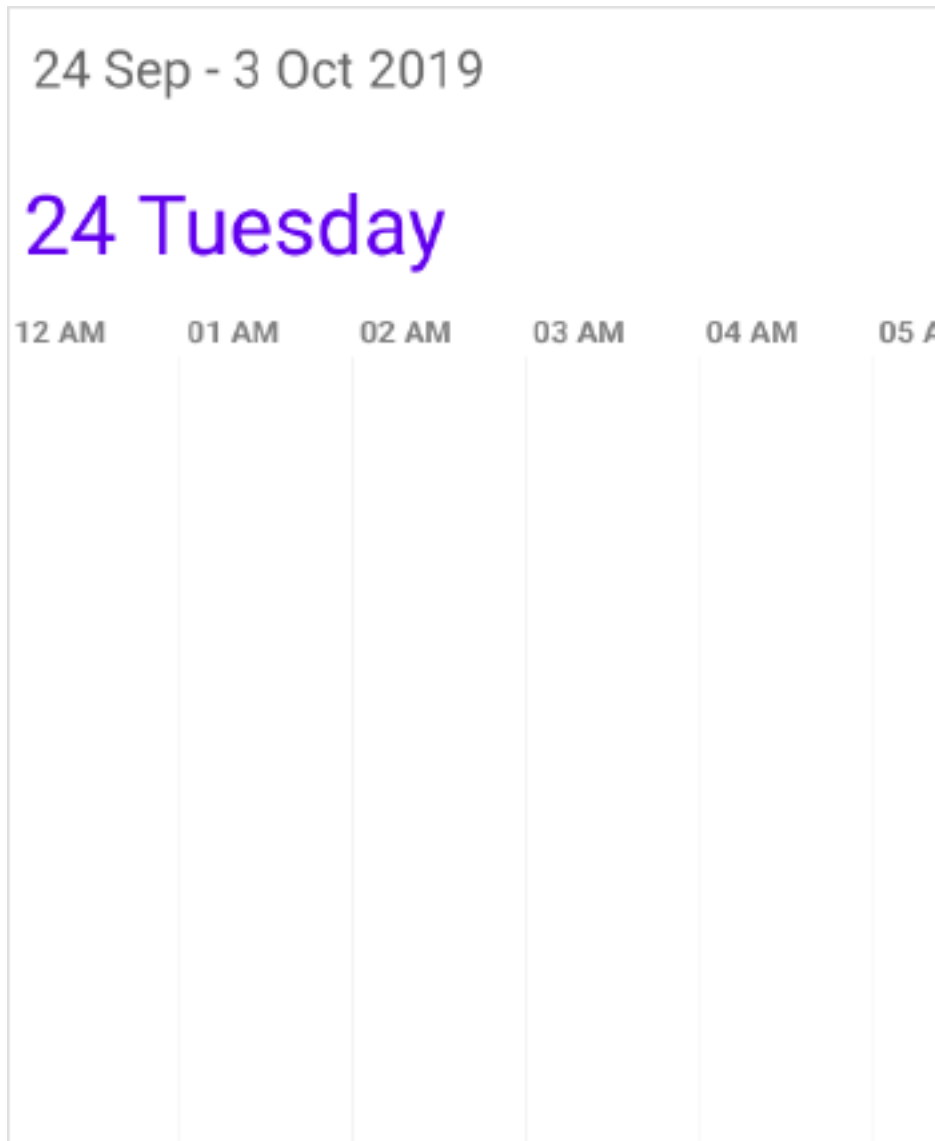

You can customize the number of days in `TimelineView` using the `DaysCount` property of `TimelineViewSettings`. By default, value of the timeline days count is -1, and single day will be visible.

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <syncfusion:SfSchedule.TimelineViewSettings>
    <!--setting days count property-->
    <syncfusion:TimelineViewSettings
      DaysCount="10" />
  </syncfusion:SfSchedule.TimelineViewSettings>
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.TimelineView;
//Creating new instance of TimelineViewSettings
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();
//Customizing days count
timelineViewSettings.DaysCount = 10;
schedule.TimelineViewSettings = timelineViewSettings;
```

Timeline view based on day, week, work week, and month.

You can achieve timeline day, timeline week, timeline work week, and timeline month view with the default value of `DaysCount` by dynamically switching between day, week, work week, and month view to timeline view with respective visible dates.

---

**NOTE**

For other value of `DaysCount`, only timeline view visible dates will be displayed as mentioned days count on dynamic view switching.

Customized working hours

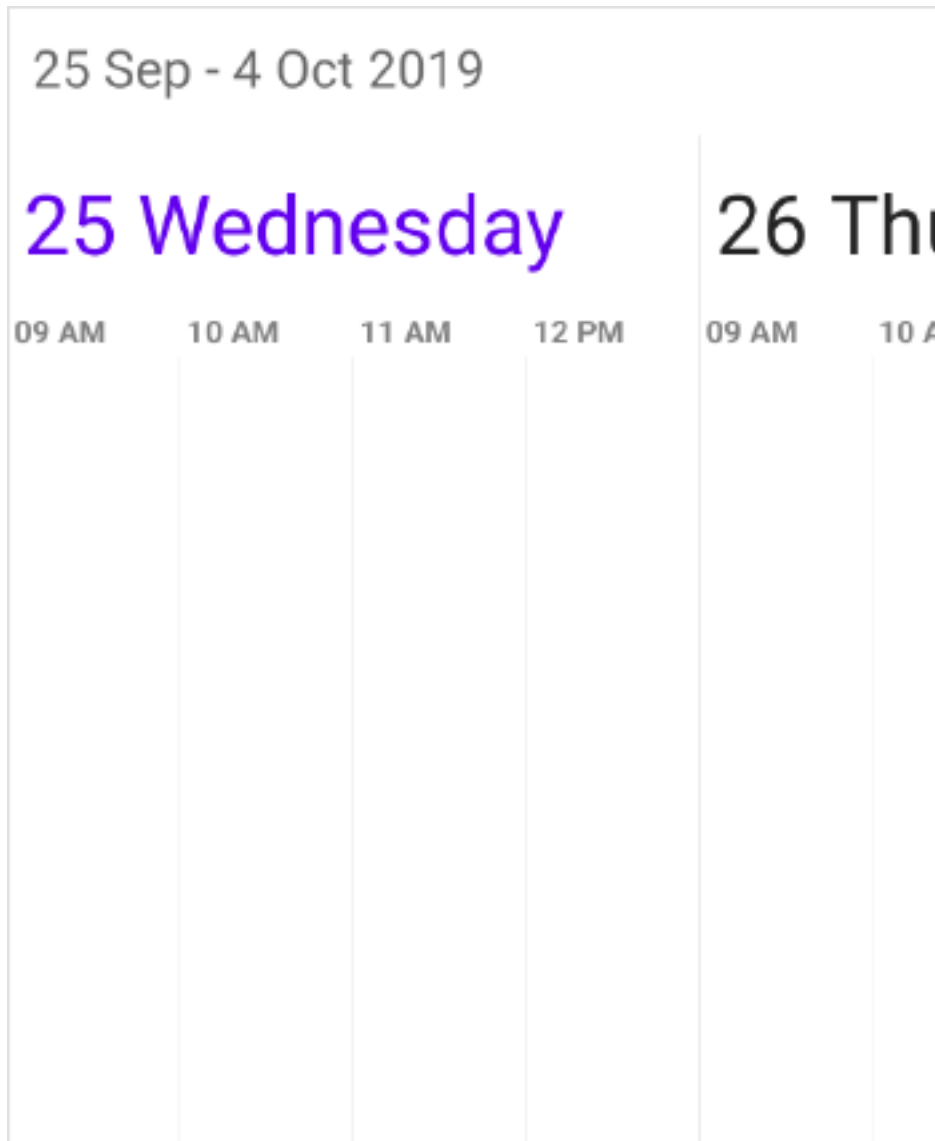

You can customize the `StartHour` and `EndHour` properties of `TimelineView` to show only the required time duration for end users. You can also set `StartHour` and `EndHour` in double value, which will be converted to time to show the required time duration in minutes. The default value for `StartHour` and `EndHour` value is 0 to 24 to show all the time slots in `TimelineView`.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <schedule:SfSchedule.TimelineViewSettings>
    <!--setting visible hours properties-->
    <schedule:TimelineViewSettings
      StartHour="09"
      EndHour="13">
    </schedule:TimelineViewSettings>
  </schedule:SfSchedule.TimelineViewSettings>
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;
//Creating new instance of TimelineViewSettings
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();
timelineViewSettings.StartHour = 09;
timelineViewSettings.EndHour = 13;
schedule.TimelineViewSettings = timelineViewSettings;
```

---

**NOTE**

- **StartHour** must be greater than or equal to 0 and **EndHour** must be lesser than or equal to 24, otherwise **InvalidDataException** will be thrown.
- **EndHour** value must be greater than **StartHour**, otherwise **InvalidDataException** will be thrown.
- Schedule UI such as **Appointments** and **NonAccessibleBlocks** which does not fall within the **StartHour** and **EndHour** will not be visible and if it falls partially, it will be clipped.
- No need to specify the decimal point values for **StartHour** and **EndHour**, if you don't want to set the minutes.
- The number of time slots will be calculated based on total minutes of a day and time interval (total minutes of a day ((start hour - end hour) \* 60) / time interval).
- If custom **TimeInterval** is given, then the number of time slots calculated based on given **TimeInterval** should result in integer value (total minutes % **TimeInterval** = 0), otherwise next immediate time interval that result in integer value when divide total minutes of a day will be

considered. For example, if `TimeInterval="135"` (2 Hours 15 minutes) and total minutes = 1440 (24 Hours per day), then `TimeInterval` will be changed to "144" ( $1440\%144=0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

- If the custom `StartHour` and `EndHour` are given, then the number of time slots calculated based on given `StartHour` and `EndHour` should result in integer value, otherwise next immediate `TimeInterval` will be considered until the result is integer value. For example, if `StartHour` is 9 (09:00AM), `EndHour` is 18.25 (06:15 PM), `TimeInterval` is 30 minutes, and total minutes = 555 ( $(18.25-9)*60$ ), then the `TimeInterval` will be changed to "37" ( $555\%37=0$ ) by considering (total minutes % `TimeInterval` = 0); it will return integer value for time slots rendering.

### Special time regions

You can restrict user interaction such as selection and highlight specific region of time in `TimelineView` by adding `SpecialTimeRegion` in the `SpecialTimeRegions` property of `SfSchedule`. You need to set the `StartHour` and `EndHour` properties of `TimeRegionSettings` to create `SpecialTimeRegion`. You can also set `StartHour` and `EndHour` in double value, which will be converted to time to show the required time duration in minutes. By default, the values of `StartHour` and `EndHour` are 0.

#### Special time region appearance

You can customize the appearance of `SpecialTimeRegion` using the `Color` and `TextColor` properties of `TimeRegionSettings`.

#### Selection restriction in time slots

You can enable/disable the touch interaction of `SpecialTimeRegion` using `CanEdit` property of `TimeRegionSettings`. By default, its value is true.

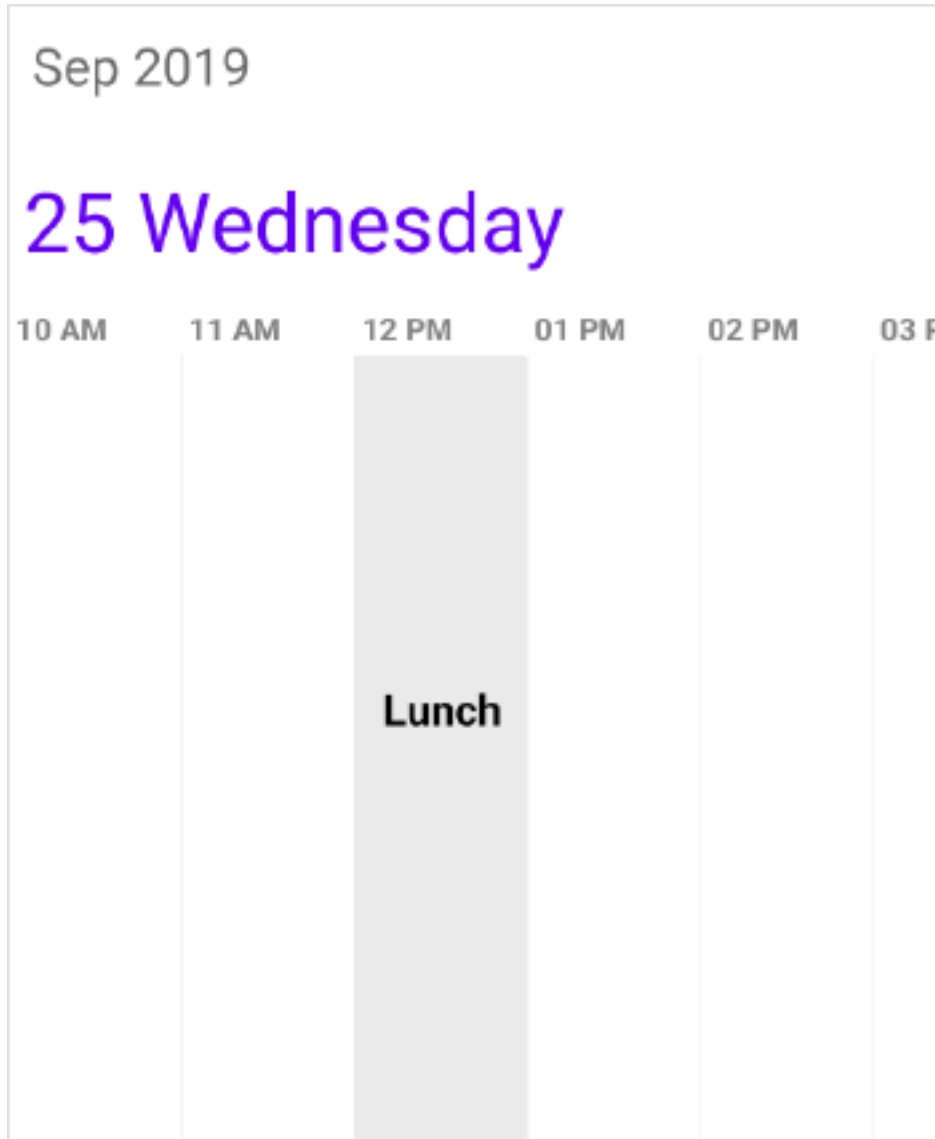

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <!--setting Special time regions property-->
  <schedule:SfSchedule.SpecialTimeRegions>
    <schedule:TimeRegionSettings
      StartHour="12"
      EndHour="13"
      Text="Lunch"
      CanEdit="False"
      Color="#EAEAEA"
      TextColor="Black"/>
    </schedule:SfSchedule.SpecialTimeRegions>
  </schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.TimelineView;
ObservableCollection<TimeRegionSettings> specialTimeRegions = new
ObservableCollection<TimeRegionSettings>();
//Setting Special time regions property
TimeRegionSettings timeRegionSettings = new TimeRegionSettings();
timeRegionSettings.StartHour = 12;
timeRegionSettings.EndHour = 13;
timeRegionSettings.Text = "Lunch";
timeRegionSettings.Color = Color.FromHex("#EAEAEA");
```

```
timeRegionSettings.TextColor = Color.Black;  
timeRegionSettings.CanEdit = false;  
specialTimeRegions.Add(timeRegionSettings);  
schedule.SpecialTimeRegions = specialTimeRegions;
```

#### Time interval

You can customize the interval of time slots in `TimelineView` by setting [TimeInterval](#) property of `SfSchedule`.

#### XML

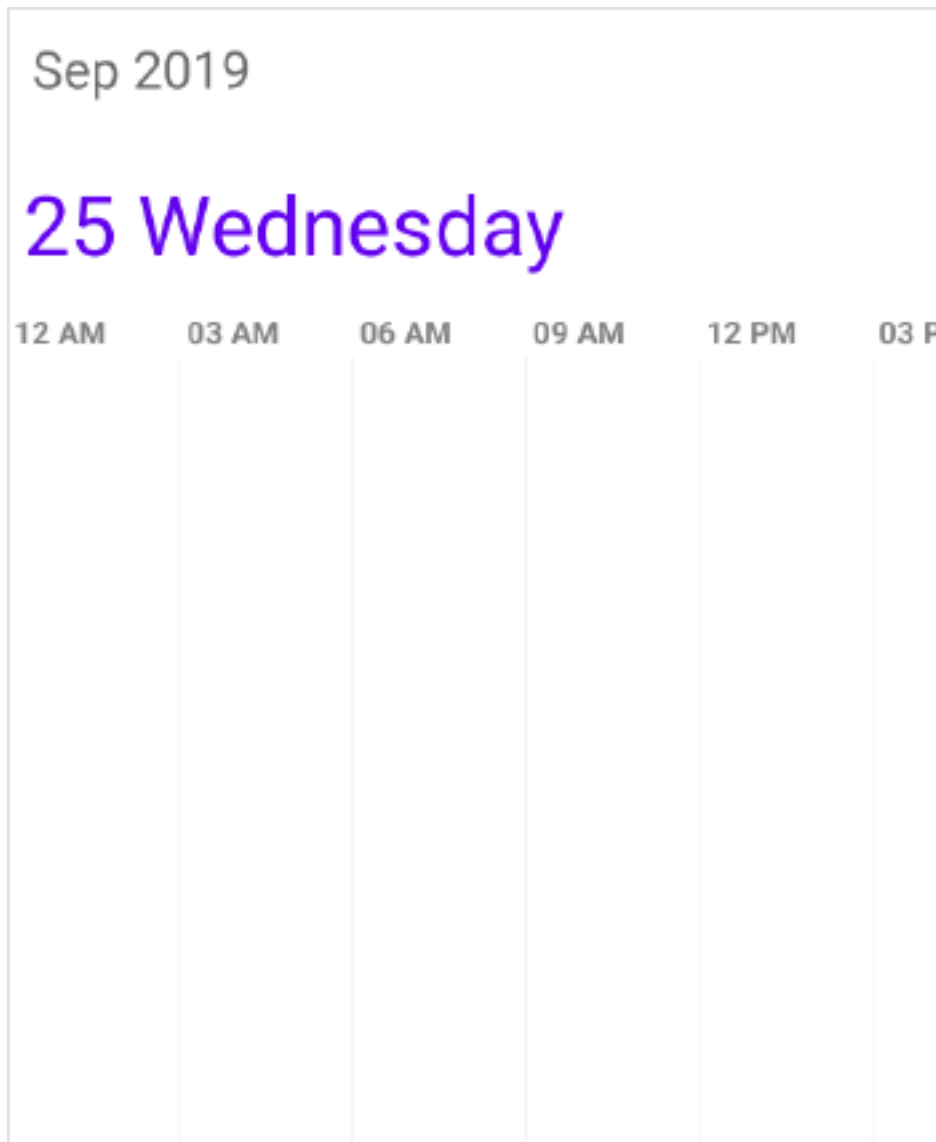

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView"  
TimeInterval="180"/>
```

#### C#

```
schedule.ScheduleView = ScheduleView.TimelineView;
```

```
schedule.TimeInterval = 180;
```

#### NOTE

If you modify the `TimeInterval` value (in minutes), you need to change the time labels format by setting the `TimeFormat` as "hh:mm". By default, `TimeFormat` is "hh a". Refer to this [documentation](#) for changing `TimeFormat` value.

#### Time interval height

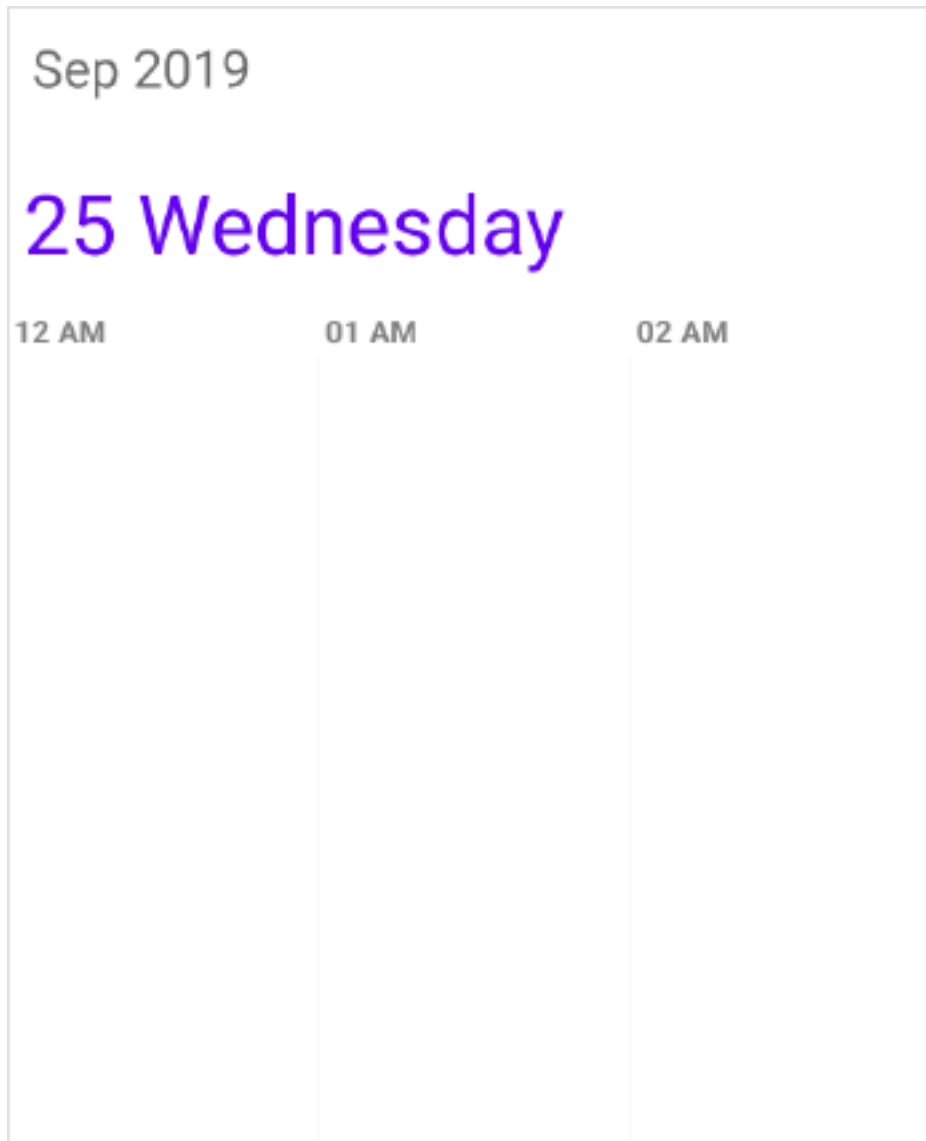

You can customize the interval height of time slots in `TimelineView` by setting the [TimeIntervalHeight](#) property of `SfSchedule`.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView"
    TimeIntervalHeight="180"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;  
schedule.TimeIntervalHeight = 180;
```

*Full screen scheduler*

Schedule time interval height can be adjusted based on screen height by changing the value of `TimeIntervalHeight` property to -1. It will auto-fit to the screen height and width.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView"  
TimeIntervalHeight="-1"/>
```

**C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;
```

```
schedule.TimeIntervalHeight = -1;
```

## NOTE

In Timeline view, If the time slot duration such as `DaysCount`, `StartHour`, or `EndHour` is within the width of the screen, the `TimeIntervalHeight` will automatically be adjusted to the screen, otherwise the `TimeIntervalHeight` will be adjusted to 100 offset value.

### Nonworking days

You can add the non-working days in `TimelineView` using `NonWorkingsDays` property of `TimelineViewSettings`. By default, there is no non-working day in `TimelineView`.

### C#

```
var nonWorkingDays = new ObservableCollection<DayOfWeek>();
nonWorkingDays.Add(DayOfWeek.Monday);
nonWorkingDays.Add(DayOfWeek.Friday);
var timelineViewSettings = new TimelineViewSettings();
timelineViewSettings.NonWorkingsDays = nonWorkingDays;
schedule.TimelineViewSettings = timelineViewSettings;
```

### First day of week

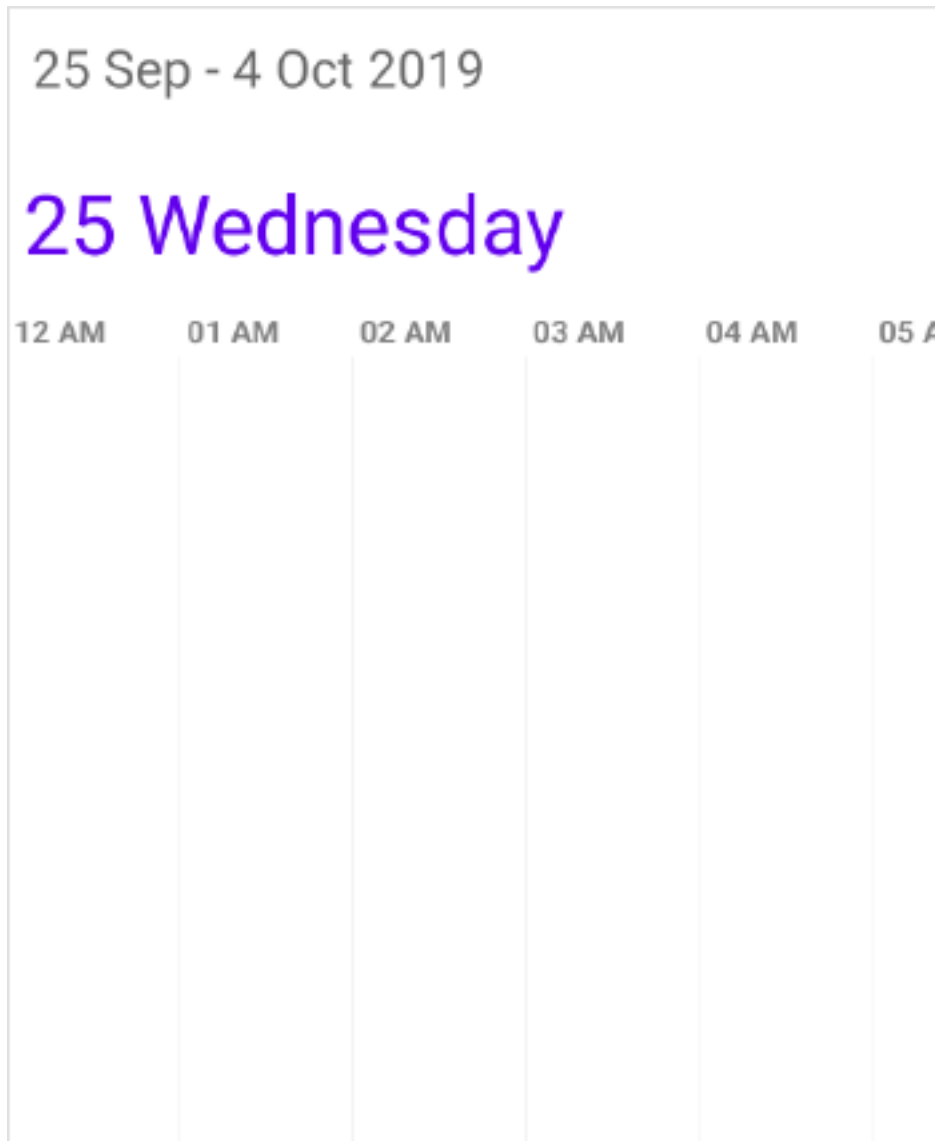

By default, schedule control will be rendered with Sunday as the first day of the week. It can be customized to any day of the week using the `FirstDayOfWeek` property of `SfSchedule`.

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView"
FirstDayOfWeek="3"/>
```

### C#

```
schedule.ScheduleView = ScheduleView.TimelineView;
schedule.FirstDayOfWeek = 3;
```

#### NOTE

In Timeline view, `FirstDayOfWeek` will be applied only when `DayCounts` property of `TimelineViewSettings` is 7.

#### Appointment height

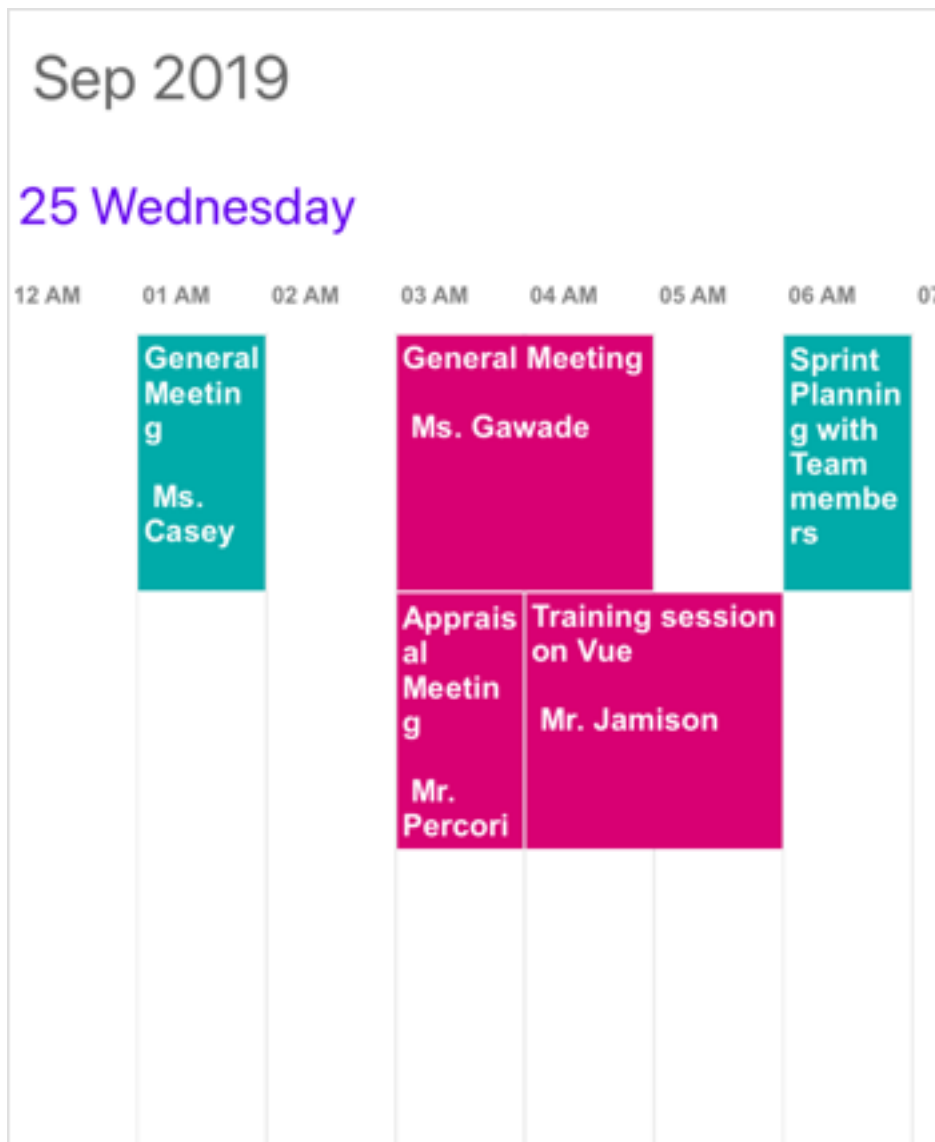

You can customize the height of the appointment in `TimelineView` using the [AppointmentHeight](#) property of `TimelineViewSettings`. By default, its value is 50.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <schedule:SfSchedule.TimelineViewSettings>
    <!--setting appointment height property-->
    <schedule:TimelineViewSettings
      AppointmentHeight="100" />
  </schedule:SfSchedule.TimelineViewSettings>
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;  
//Create new instance of TimelineViewSettings  
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();  
timelineViewSettings.AppointmentHeight = 100;  
schedule.TimelineViewSettings = timelineViewSettings;
```

**NOTE**

When a greater number of appointments is added in the same time slot, appointment height will be calculated automatically without considering the `AppointmentHeight` property to display all the appointment in the view.

### View header tapped event

You can handle single tap action of ViewHeader using the `ViewHeaderTapped` event of `SfSchedule`. This event occurs when the `ViewHeader` is tapped. This event contains `ViewHeaderTappedEventArgs` argument, which holds the details of `DateTime` in it.

#### XML

```
<schedule:SfSchedule x:Name="schedule"
ScheduleView="TimelineView "
ViewHeaderTapped="Handle_ViewHeaderTapped">
</schedule:SfSchedule>
```

#### C#

```
//Creating new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.TimelineView;
schedule.ViewHeaderTapped += OnViewHeaderTapped;
```

#### C#

```
private void OnViewHeaderTapped(object sender, ViewHeaderTappedEventArgs e)
{
    var dateTime = e.DateTime;
}
```

### View header customization

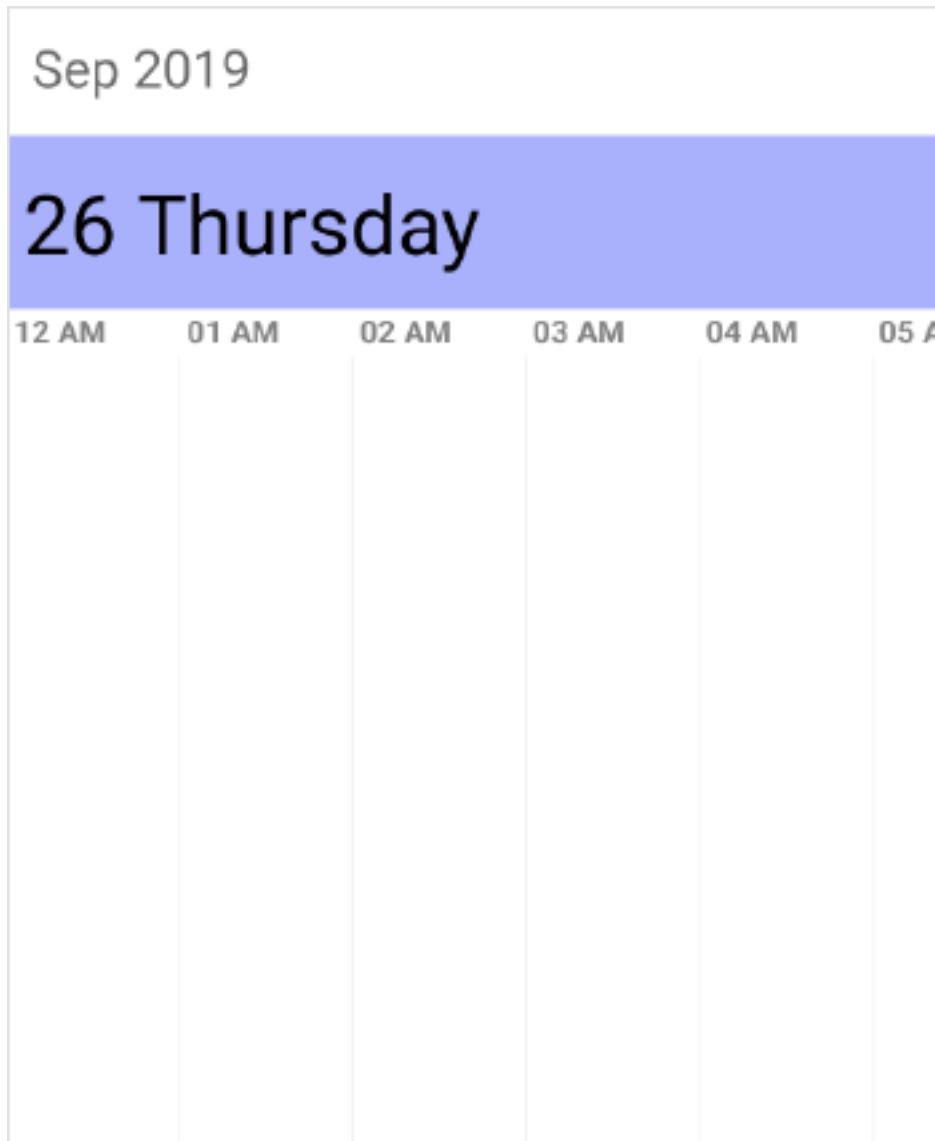

You can customize the default appearance of view header in `TimelineView` by using `ViewHeaderStyle` property of `SfSchedule`.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView =" TimelineView">
<schedule:SfSchedule.ViewHeaderStyle>
<schedule:ViewHeaderStyle
BackgroundColor="#a9b1fc"
DateTextColor="Black"
DateFontFamily="Arial">
</schedule:ViewHeaderStyle>
</schedule:SfSchedule.ViewHeaderStyle>
</schedule:SfSchedule>
```

#### C#

```
//Create new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.TimelineView;
//Customize the schedule view header
ViewHeaderStyle viewHeaderStyle = new ViewHeaderStyle();
viewHeaderStyle.BackgroundColor = Color.FromHex("#a9b1fc");
viewHeaderStyle.DateTextColor = Color.Black;
viewHeaderStyle.DateFontFamily = "Arial";
schedule.ViewHeaderStyle = viewHeaderStyle;
```

**NOTE**

`FontAttributes` and `FontFamily` are native to the platform. Custom font and the font that are not available in the specified platform will not be applied.

You can customize the height of `ViewHeader` in `TimelineView` by setting the [ViewHeaderHeight](#) property of `SfSchedule`.

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView ="TimelineView "  
ViewHeaderHeight="50" />
```

**C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;  
schedule.ViewHeaderHeight = 50;
```

#### *View header date format*

You can customize the date format of `ViewHeader` in `TimelineView` using the [DateFormat](#) property of `TimelineLabelSettings`.

#### **XML**

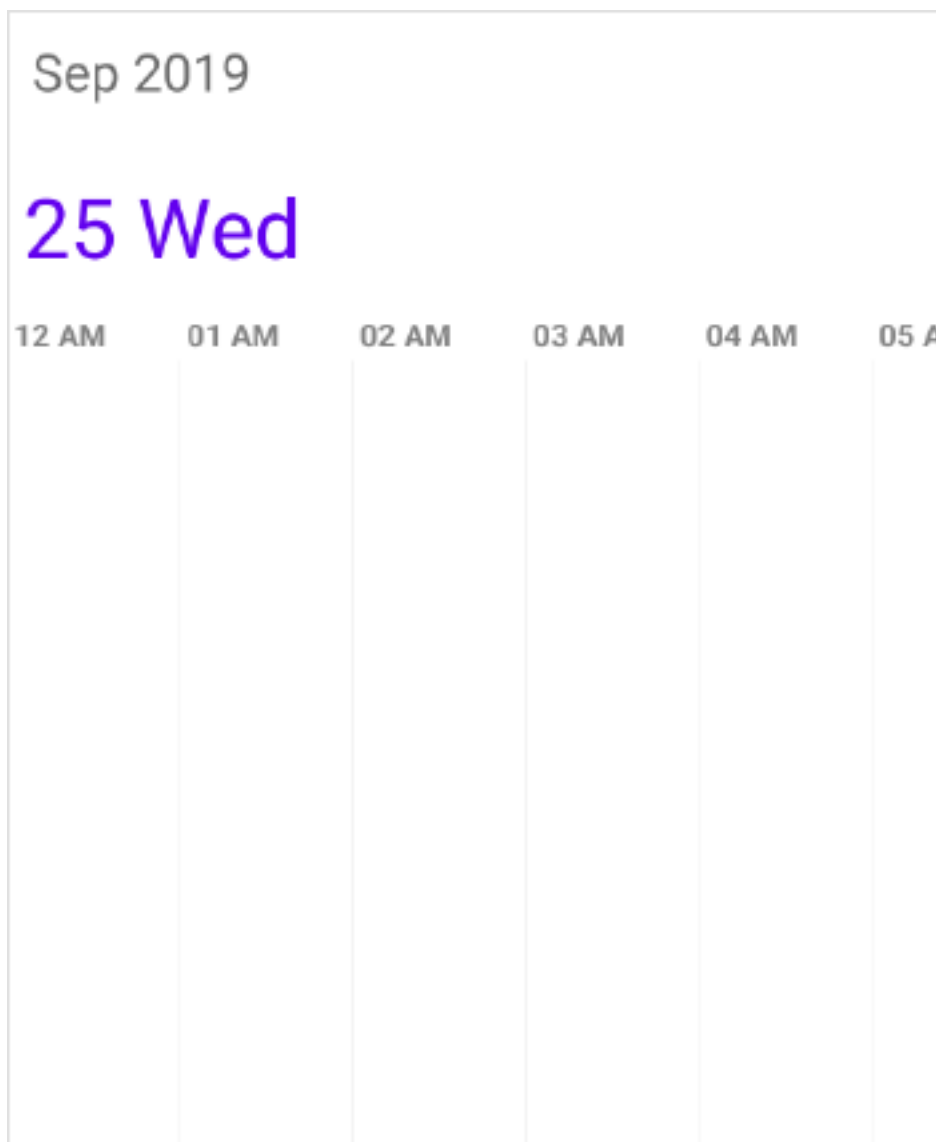

```
<schedule:SfSchedule>
  <schedule:SfSchedule.TimelineViewSettings>
    <schedule:TimelineViewSettings>
      <schedule:TimelineViewSettings.LabelSettings>
        <schedule:TimelineLabelSettings>
          <schedule:TimelineLabelSettings.DateFormat>
            <OnPlatform x:TypeArguments="x:String" iOS="d EEE" Android="d EEE"
WinPhone="%d ddd" />
          </schedule:TimelineLabelSettings.DateFormat>
        </schedule:TimelineLabelSettings>
      </schedule:TimelineViewSettings.LabelSettings>
    </schedule:TimelineViewSettings>
  </schedule:SfSchedule.TimelineViewSettings>
</schedule:SfSchedule>
```

```
</schedule:SfSchedule.TimelineViewSettings>  
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.TimelineView;  
//Creating new instance of TimelineViewSettings  
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();  
//Creating new instance of TimelineLabelSettings  
TimelineLabelSettings labelSettings = new TimelineLabelSettings();  
//Customizing date format  
labelSettings.DateFormat = Device.OnPlatform("d EEE", "d EEE", "%d ddd");  
timelineViewSettings.LabelSettings = labelSettings;  
schedule.TimelineViewSettings = timelineViewSettings;
```

### Timeslot customization

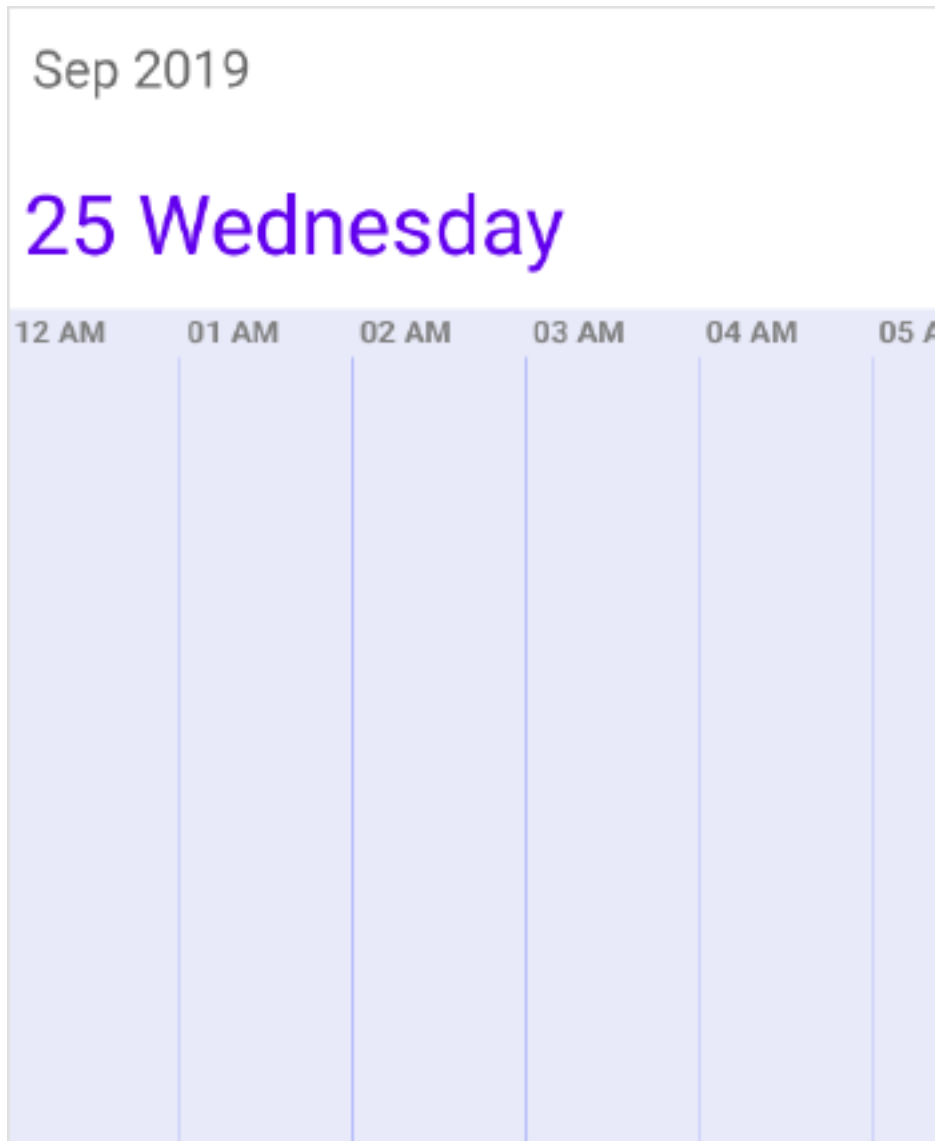

You can customize the appearance of time slots using the [Color](#), [BorderColor](#) and [BorderWidth](#) properties of `TimelineViewSettings`.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <schedule:SfSchedule.TimelineViewSettings>
    <!--setting timeline view settings properties -->
    <schedule:TimelineViewSettings
      Color="#e8eaf9"
      BorderColor="#8490f9"
      BorderWidth="2" />
    </schedule:SfSchedule.TimelineViewSettings>
  </schedule:SfSchedule>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;
//Create new instance of TimelineViewSettings
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();
timelineViewSettings.BorderColor = Color.FromHex("#8490f9");
timelineViewSettings.Color = Color.FromHex("#e8eaf9");
timelineViewSettings.BorderWidth = 2;
schedule.TimelineViewSettings = timelineViewSettings;
```

#### Time label customization

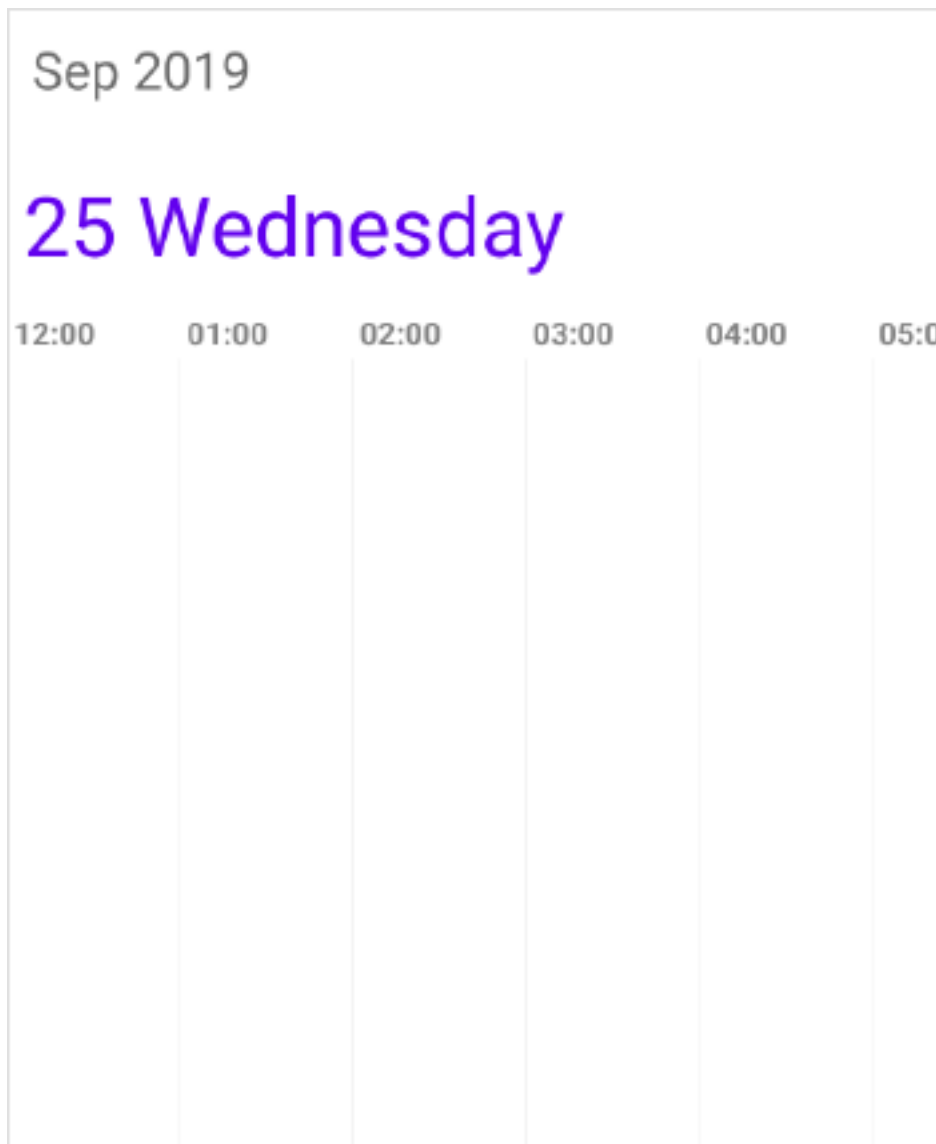

You can customize the format for the labels that mention the time by setting the [TimeFormat](#) property of [LabelSettings](#) in `TimelineViewSettings`.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <schedule:SfSchedule.TimelineViewSettings>
    <!--setting time format property-->
    <schedule:TimelineViewSettings>
      <schedule:TimelineViewSettings.LabelSettings>
        <schedule:TimelineLabelSettings TimeFormat="hh:mm" />
      </schedule:TimelineViewSettings.LabelSettings>
    </schedule:TimelineViewSettings>
  </schedule:SfSchedule.TimelineViewSettings>
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;  
//Creating new instance of TimelineViewSettings  
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();  
TimelineLabelSettings labelSettings = new TimelineLabelSettings();  
labelSettings.TimeFormat = "hh:mm";  
timelineViewSettings.LabelSettings = labelSettings;  
schedule.TimelineViewSettings = timelineViewSettings;
```

*Time label appearance*

You can customize the color for the labels that mention the time by setting the [TimeLabelColor](#) property of [LabelSettings](#) in [TimelineViewSettings](#).

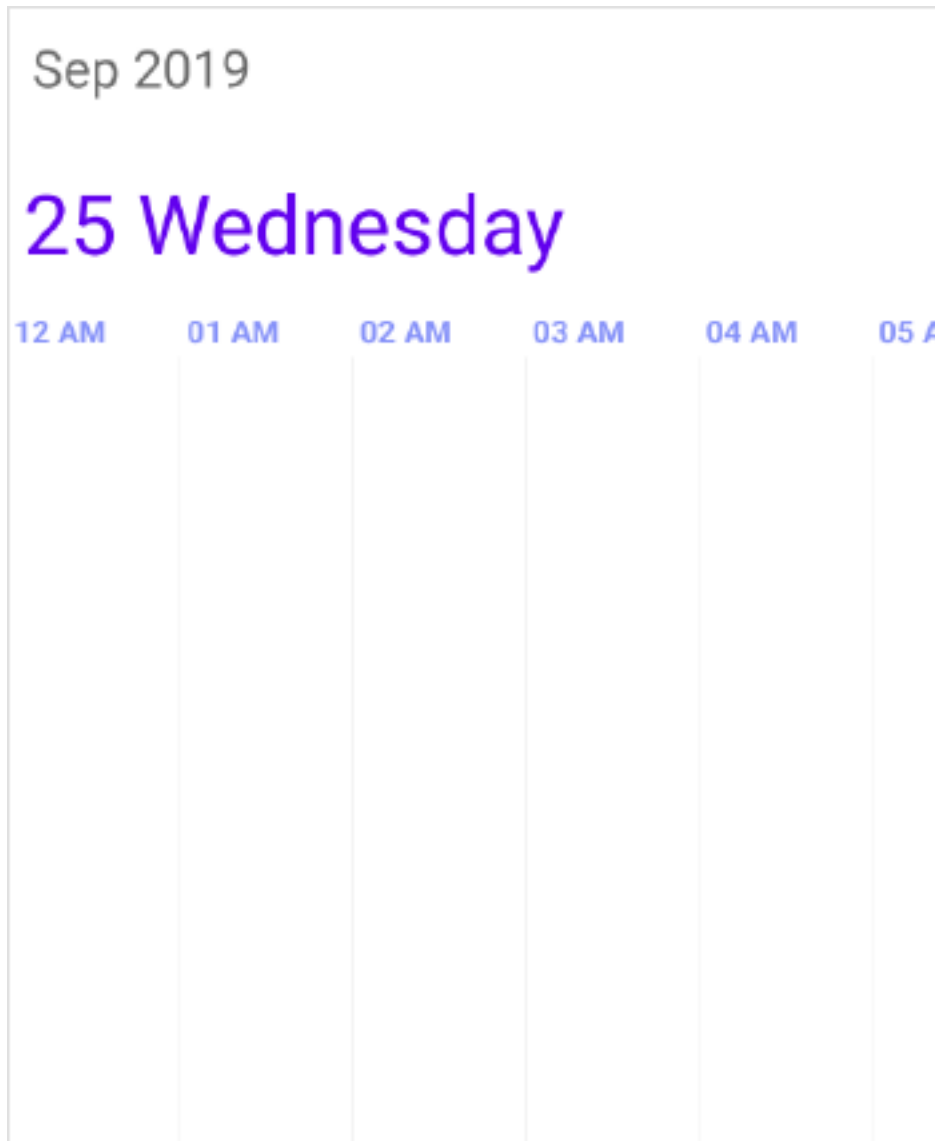

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">  
  <schedule:SfSchedule.TimelineViewSettings>
```

```
<!--setting time format property-->
<schedule:TimelineViewSettings>
<schedule:TimelineViewSettings.LabelSettings>
<schedule:TimelineLabelSettings TimeLabelColor="#8490f9" />
</schedule:TimelineViewSettings.LabelSettings>
</schedule:TimelineViewSettings>
</schedule:SfSchedule.TimelineViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.TimelineView;
//Creating new instance of TimelineViewSettings
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();
TimelineLabelSettings labelSettings = new TimelineLabelSettings();
labelSettings.TimeLabelColor = Color.FromHex("#8490f9");
timelineViewSettings.LabelSettings = labelSettings;
schedule.TimelineViewSettings = timelineViewSettings;
```

#### Time Label size

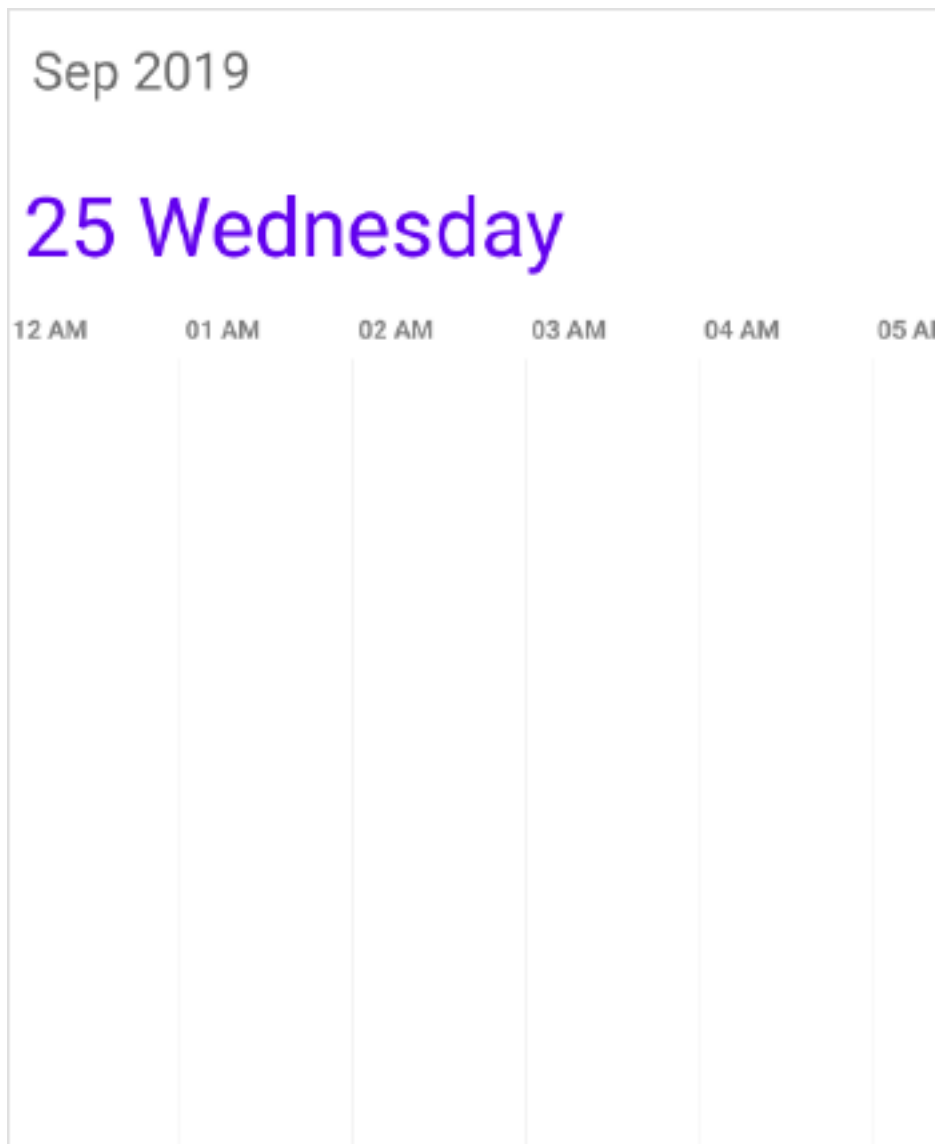

You can customize the size of the labels that mention the time by setting the [TimeLabelSize](#) property of `LabelSettings` in `TimelineViewSettings`.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <schedule:SfSchedule.TimelineViewSettings>
    <!--setting time format property-->
    <schedule:TimelineViewSettings>
      <schedule:TimelineViewSettings.LabelSettings>
        <schedule:TimelineLabelSettings TimeLabelSize="15" />
      </schedule:TimelineViewSettings.LabelSettings>
    </schedule:TimelineViewSettings>
  </schedule:SfSchedule.TimelineViewSettings>
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;  
//Creating new instance of TimelineViewSettings  
TimelineViewSettings timelineViewSettings = new TimelineViewSettings();  
TimelineLabelSettings labelSettings = new TimelineLabelSettings();  
labelSettings.TimeLabelSize = 10;  
timelineViewSettings.LabelSettings = labelSettings;  
schedule.TimelineViewSettings = timelineViewSettings;
```

**Selection**

You can customize the default appearance of selection UI in the timeslots.

- [Selection customization using style](#)
- [Selection customization using custom View](#)
- [Programmatic selection](#)

### *Selection customization using style*

You can customize the timeslot selection by using [SelectionMode](#) property of SfSchedule.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <schedule:SfSchedule.SelectionStyle>
    <schedule:SelectionMode
      BackgroundColor="#8490f9"
      BorderColor="Black"
      BorderThickness="5"
      BorderCornerRadius="5">
    </schedule:SelectionMode>
  </schedule:SfSchedule.SelectionStyle>
</schedule:SfSchedule>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;
//Create new instance of SelectionStyle
SelectionMode selectionStyle = new SelectionStyle();
selectionStyle.BackgroundColor = Color.FromHex("#8490f9");
selectionStyle.BorderColor = Color.Black;
selectionStyle.BorderThickness = 5;
selectionStyle.BorderCornerRadius = 5;
schedule.SelectionStyle = selectionStyle;
```

#### *Selection customization using custom View*

You can replace the default selection UI with your custom view by setting [SelectionView](#) property of SfSchedule.

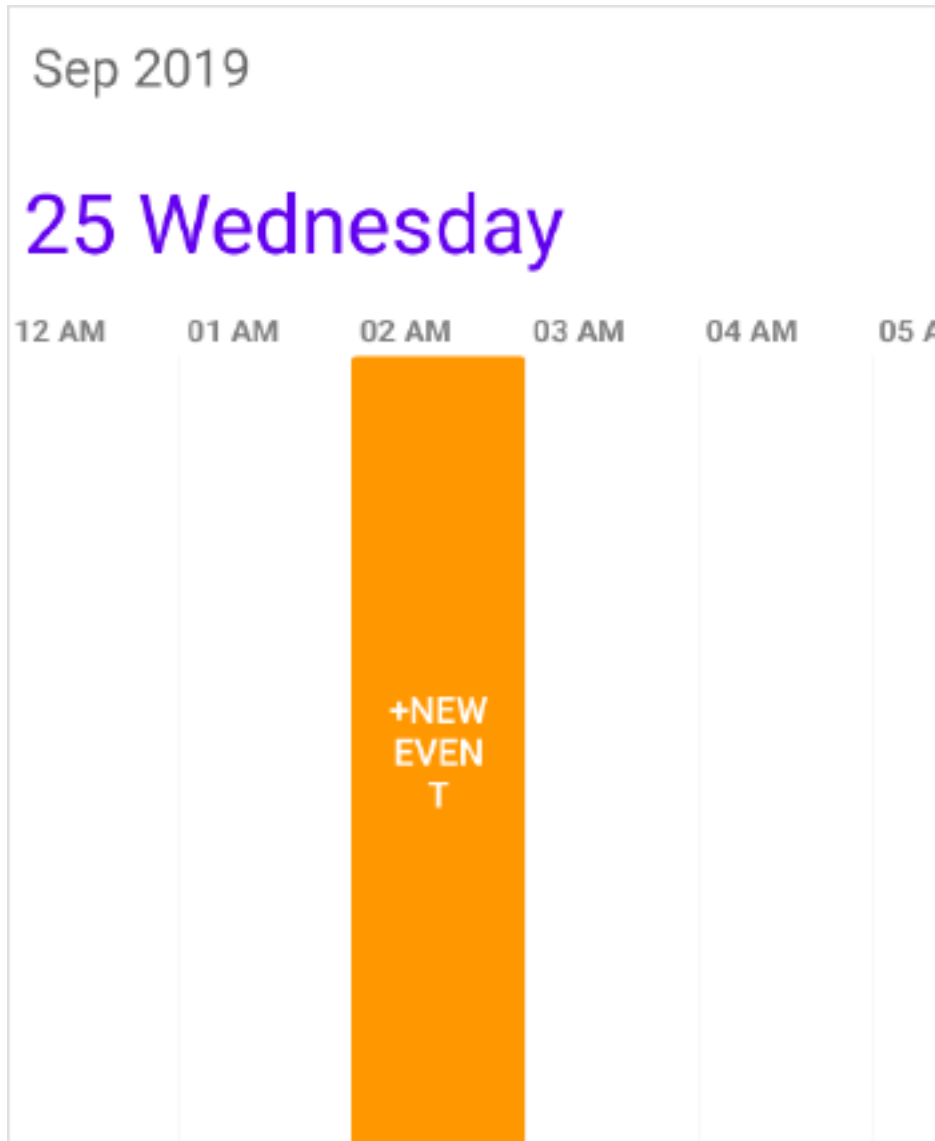

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="TimelineView">
  <schedule:SfSchedule.SelectionView>
    <Button
      BackgroundColor="#FF9800"
      Text="+NewEvent"
      TextColor="White"/>
  </schedule:SfSchedule.SelectionView>
</schedule:SfSchedule>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.TimelineView;
```

```
//Add the CustomView
Button customView = new Button();
customView.Text = "+NewEvent";
customView.BackgroundColor = Color.FromHex("#FF9800");
customView.TextColor = Color.White;
schedule.SelectionView = customView;
```

#### *Programmatic selection*

You can programmatically select the specific timeslot by setting corresponding date and time value to [SelectedDate](#) property of [SfSchedule](#). By default, it is null.

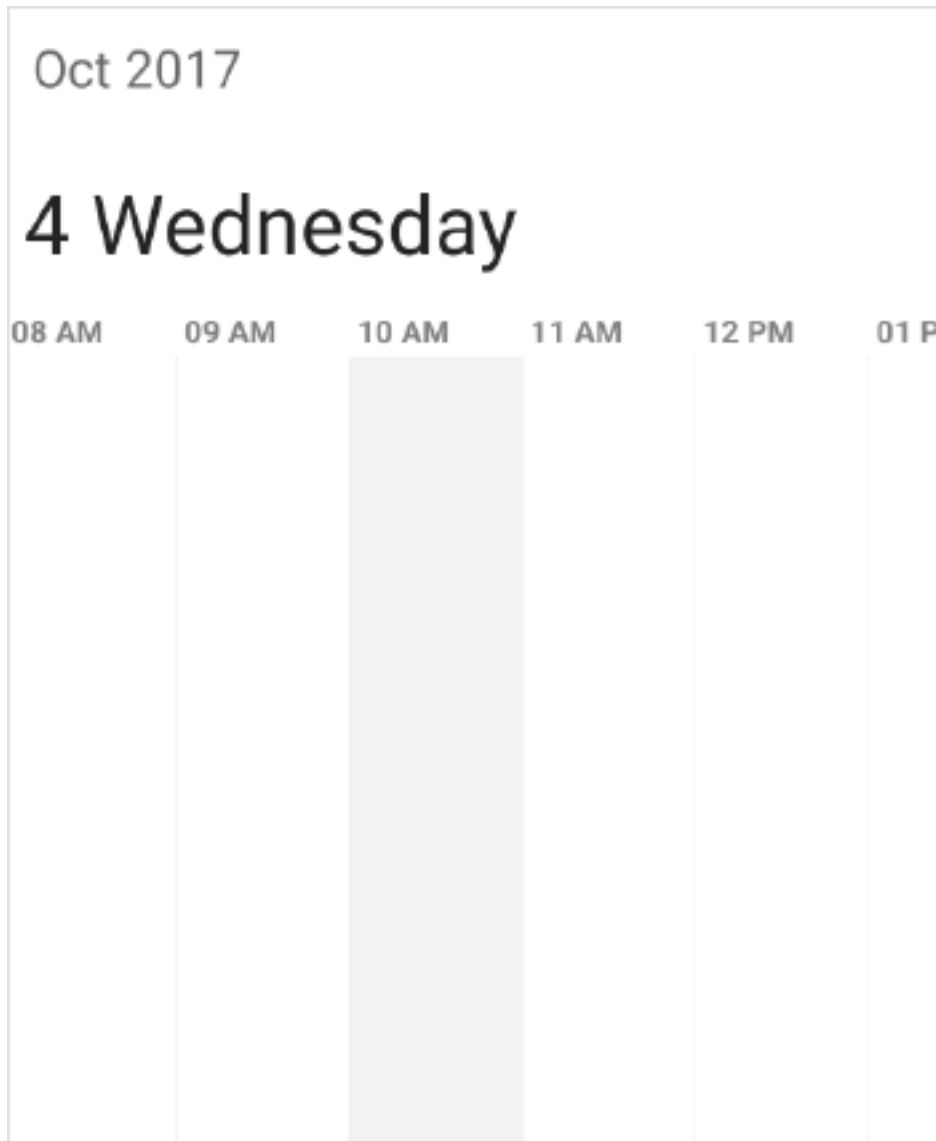

#### **C#**

```
// Setting a date and time to select
schedule.SelectedDate = new DateTime(2017, 10, 04, 10, 0, 0);
```

You can clear the selection by setting [SelectedDate](#) as null.

**C#**

```
// Setting null value to deselect  
schedule.SelectedDate = null;
```

**NOTE**

- SfSchedule does not support multiple selection.

**Month View**

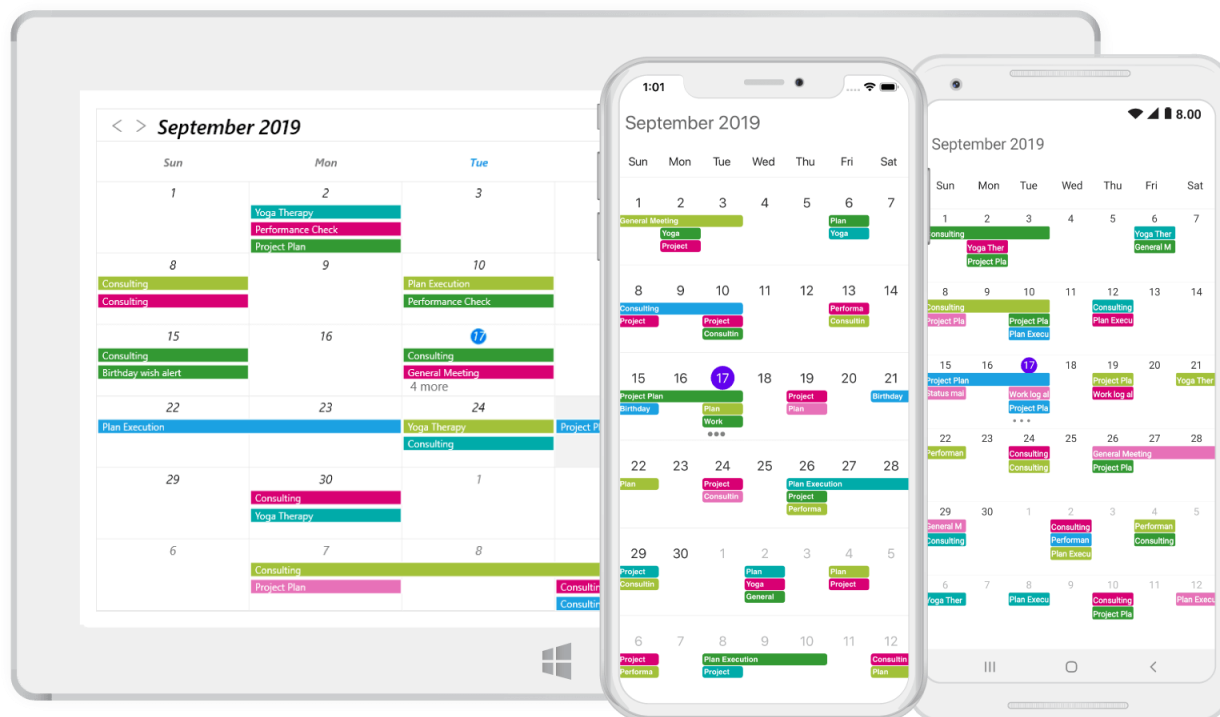

MonthView of SfSchedule used to display entire dates of the specific month, current month will be displayed by default initially. Current date color is differentiated with other dates of the current month, also the color differentiation for dates will be applicable for previous and next month dates.

**XML**

```
<schedule:SfSchedule x:Name="schedule"
ScheduleView="MonthView">
</schedule:SfSchedule>
```

## C#

```
//setting schedule view
schedule.ScheduleView = ScheduleView.MonthView;
```

### Month Appointment indicator

In **MonthView**, appointments are not viewed in the month cell instead appointment indicators are drawn. You can customize the number of appointment indicators displayed in month cell using [AppointmentIndicatorCount](#) property of [MonthViewSettings](#) in **SfSchedule**, by default Appointment indicator count is 3.

## XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
<schedule:SfSchedule.MonthViewSettings>
<schedule:MonthViewSettings
AppointmentIndicatorCount = "2" >
</schedule:MonthViewSettings>
</schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

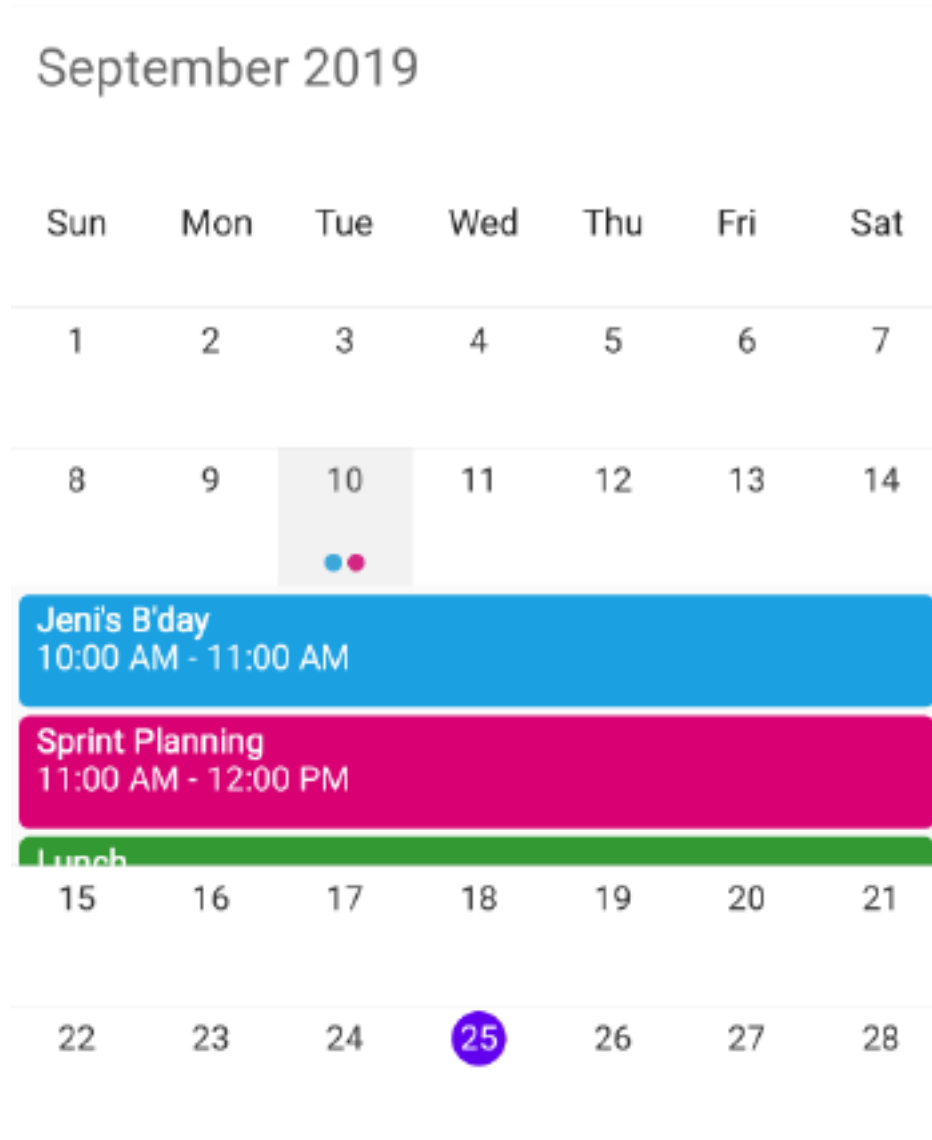

## C#

```
//creating new instance for MonthViewSettings
MonthViewSettings monthViewSettings = new MonthViewSettings();
```

```
monthViewSettings.AppointmentIndicatorCount = 2;
schedule.MonthViewSettings = monthViewSettings;
```

**NOTE**

If appointments count are lesser than the AppointmentIndicatorCount value in the particular day, then according to number of appointments available, indicator will be displayed in the month cell. Maximum number of appointment indicators drawn in the month cell is 6 in android and ios platforms.

**Month Appointment display mode**

You can handle the schedule month view appointment display by using [AppointmentDisplayMode](#) property of `MonthViewSettings`. By default `AppointmentDisplayMode` is set as `Indicator`, using the `AppointmentDisplayMode` you can set the month view appointments display as follows.

**Indicator** - appointment will be denoted as the circle.

**Appointment** - appointment subject will be displayed in month cell.

**None** - appointment will not be displayed.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings
      AppointmentDisplayMode="Appointment" >
    </schedule:MonthViewSettings>
  </schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

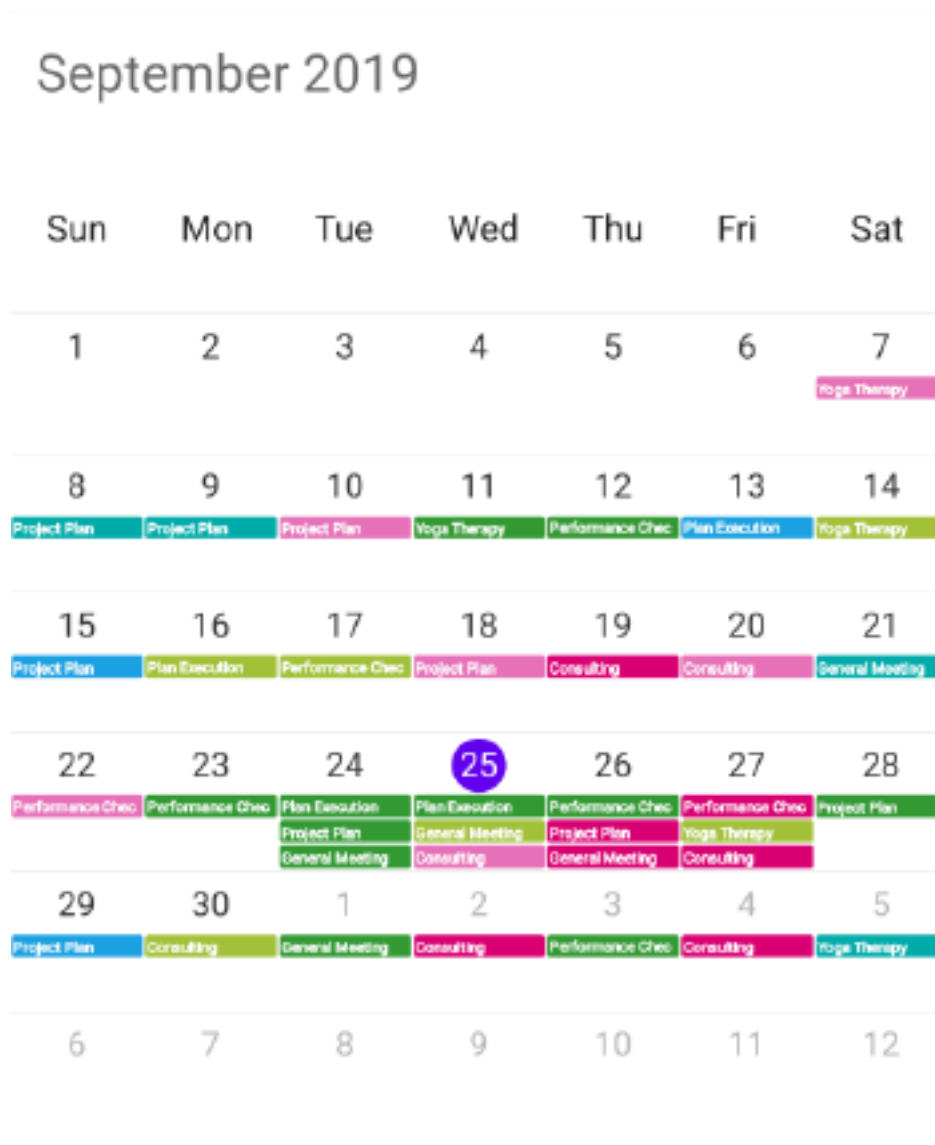

#### **C#**

```
MonthViewSettings monthViewSettings = new MonthViewSettings();
monthViewSettings.AppointmentDisplayMode =
AppointmentDisplayMode.Appointment;
schedule.MonthViewSettings = monthViewSettings;
```

---

#### **NOTE**

**AppointmentDisplayMode.None** is applicable only for XForms UWP and WPF platforms.

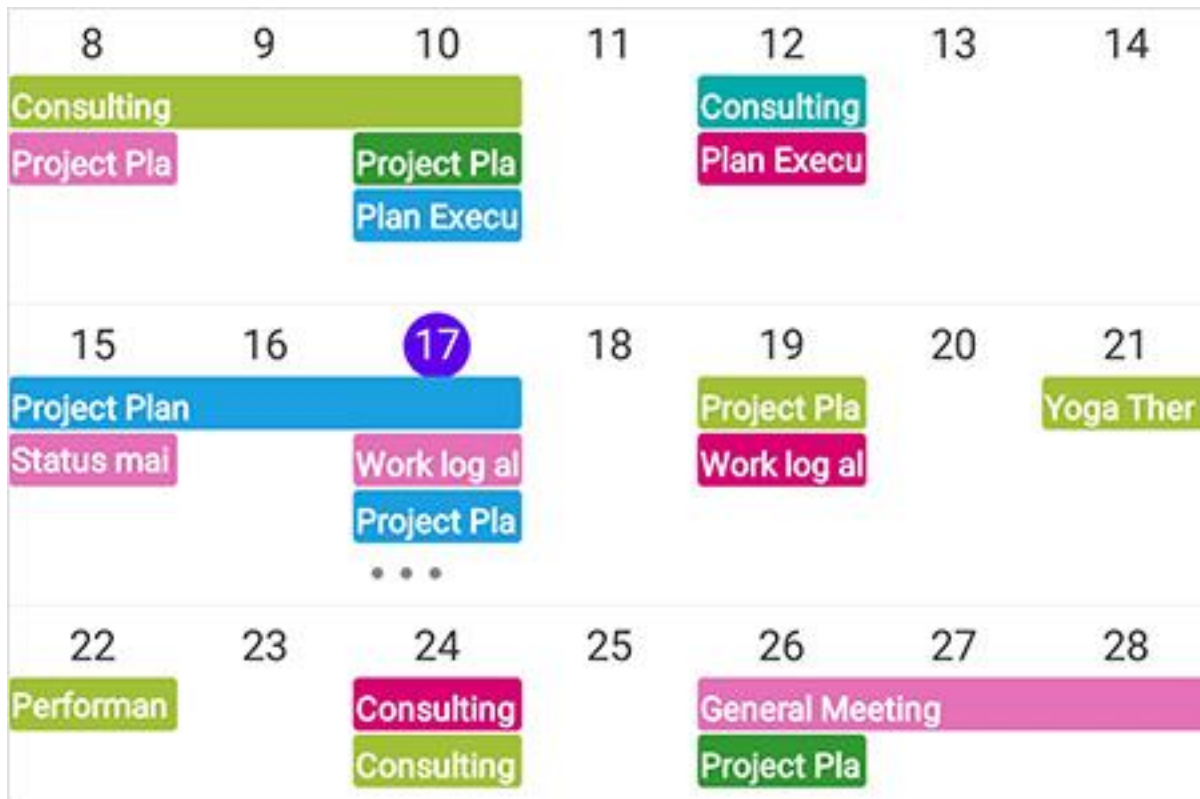

### Month Appointment display count

[AppointmentDisplayCount](#) or [AppointmentIndicatorCount](#) is used to define the maximum number of appointments to be displayed in a month cell in month view. If [AppointmentDisplayCount](#) or [AppointmentIndicatorCount](#) value is 1 and the month cell have more than 1 appointments, single appointment will be displayed and remaining appointments in month cell will be displayed as more appointments.

### NOTE

- The [AppointmentIndicatorCount](#) support is applicable for XForms Android and iOS platforms.
- The [AppointmentDisplayCount](#) support is applicable for XForms UWP and WPF platforms.
- By clicking more option, schedule navigates to the day view by default in XForms UWP and WPF platforms.

#### Disable navigation to DayView

You can disable the navigation to day view by triggering the `CellTappedEvent` and set the argument `CancelNavigation` value as `true`. `IsMoreAppointments` argument is used to determine whether the month cell more appointments count element has been tapped or not while the appointment display mode as Appointment.

#### C#

```
monthViewSettings.AppointmentDisplayCount = 4;
monthViewSettings.AppointmentDisplayMode =
AppointmentDisplayMode.Appointment;
schedule.CellTapped += Schedule_CellTapped;
private void Schedule_CellTapped(object sender, CellTappedEventArgs e)
{
    IsMoreElementTapped = e.IsMoreAppointments;
    e.CancelNavigation = true;
}
```

#### NOTE

`CancelNavigation` and `IsMoreAppointments` arguments applicable only for XForms UWP and WPF platform.

#### Month InlineView

You can use `ShowAppointmentsInline` bool property in `SfSchedule` to enable / disable the month inline view, by setting `ShowAppointmentsInline` property as `true` you can view the Appointments in the specific date.

**XML**

```
<schedule:SfSchedule
x:Name="schedule"
ScheduleView="MonthView"
ShowAppointmentsInline="true">
</schedule:SfSchedule>
```

**C#**

```
schedule.ShowAppointmentsInline = true;
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
<div>Jeni's B'day 10:00 AM - 11:00 AM</div> <div>Meeting 11:00 AM - 12:00 PM</div>						
15	16	17	18	19	20	21
22	23	24	25	26	27	28

**NOTE**

If appointments not there in the selected day, Inline view displays the text as "No Events"

### Agenda View

The Schedule month view displays a divided agenda view which is used to show the selected date's appointments below the month. You can show agenda view by setting [ShowAgendaView](#) property as true.

#### **XML**

```
<schedule:SfSchedule ScheduleView="MonthView">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings ShowAgendaView="true" />
  </schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

#### **C#**

```
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.MonthView;
MonthViewSettings monthViewSettings = new MonthViewSettings();
monthViewSettings.ShowAgendaView = true;
schedule.MonthViewSettings = monthViewSettings;
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

10  
Tue

Jeni's B'day  
10:00:AM - 11:00:AM

Meeting  
11:00:AM - 12:00:PM

### NOTE

- An agenda view displays text as “No Selected Date” until no date is selected.
- If there is no appointment in a selected day, agenda view displays the text as “No Events”.
- If you enable ShowAgendaView and ShowAppointmentsInline properties together, both of the views (Agenda View and Appointment Inline View) will be displayed in schedule month view.

### Agenda View Appearance

You can customize the Agenda view appointment and Selected Date Text by setting [AgendaViewStyle](#) property of MonthViewSettings. Agenda view [DateFontColor](#), [HeaderHeight](#), [DateFormat](#), [DateFontAttributes](#), [DateFontSize](#), [DateFontFamily](#), [TimeFontColor](#), [TimeFontSize](#), [TimeFontAttributes](#), [TimeFontFamily](#), [TimeFormat](#), [SubjectFontColor](#), [SubjectFontSize](#), [SubjectFontFamily](#), [SubjectFontAttributes](#), [BackgroundColor](#) can be customized using AgendaViewStyle properties.

### XML

```

<schedule:SfSchedule ScheduleView="MonthView" x:Name="schedule">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings ShowAgendaView="true">
      <schedule:MonthViewSettings.AgendaViewStyle>
        <schedule:AgendaViewStyle DateFontColor="Purple" HeaderHeight="40"
DateFormat="dd MMMM, yyyy" DateFontAttributes="Bold" DateFontSize="15"
DateFontFamily="Arial" TimeFontColor="Red" TimeFontSize="13"
TimeFontFamily="Arial" TimeFormat="hh a"
TimeFontAttributes="Bold" BackgroundColor="#DEF0DE" SubjectFontColor="Blue"
SubjectFontSize="13" SubjectFontFamily="Arial" SubjectFontAttributes="Bold"
/>
      </schedule:MonthViewSettings.AgendaViewStyle>
    </schedule:MonthViewSettings>
  </schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>

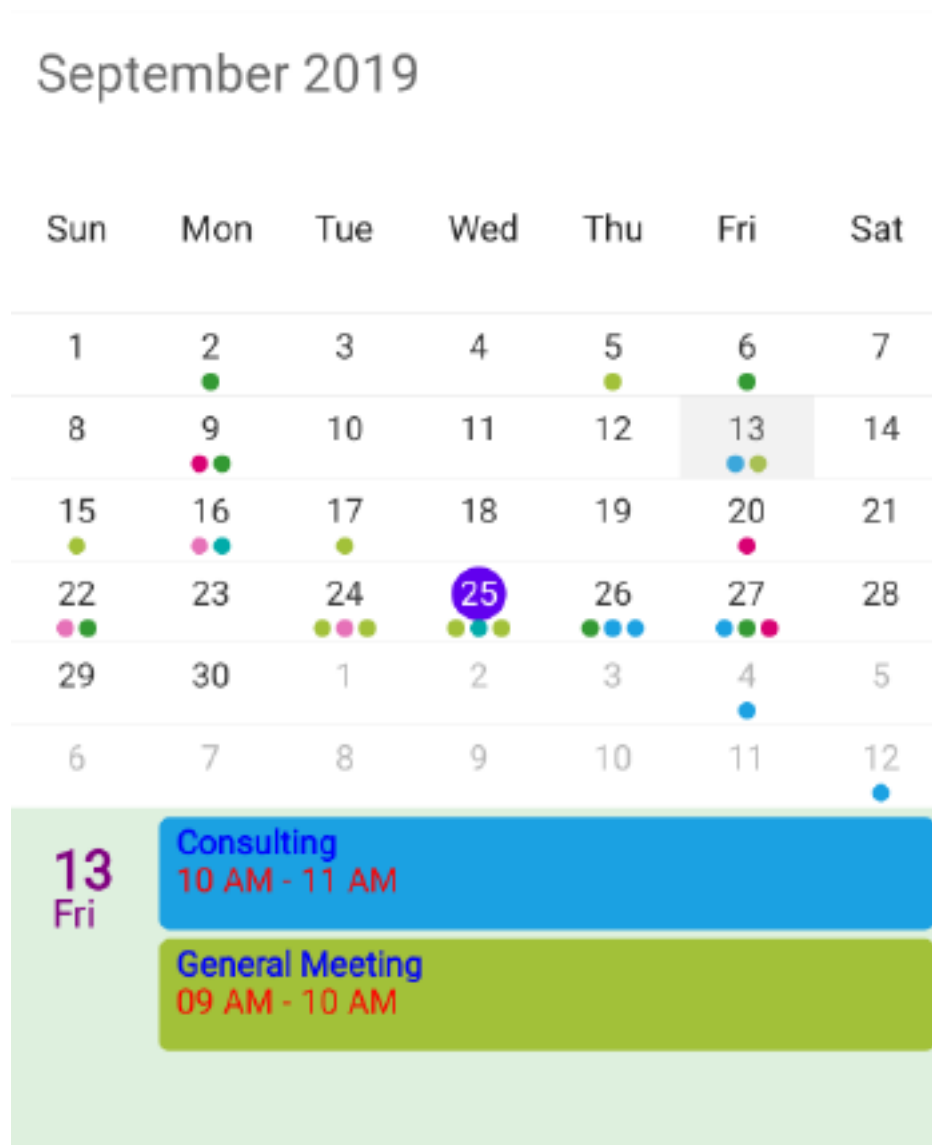

```

**C#**

```

SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.MonthView;
MonthViewSettings monthViewSettings = new MonthViewSettings();
monthViewSettings.ShowAgendaView = true;
schedule.MonthViewSettings = monthViewSettings;
AgendaViewStyle agendaViewStyle = new AgendaViewStyle();
// Customize selected Date Text
agendaViewStyle.DateFontColor = Color.Purple;
agendaViewStyle.HeaderHeight = 40;
agendaViewStyle.DateFormat = "dd MMMM, yyyy";
agendaViewStyle.DateFontAttributes = FontAttributes.Bold;
agendaViewStyle.DateFontSize = 15;
agendaViewStyle.DateFontFamily = "Arial";
// Customize appointment
agendaViewStyle.TimeFontColor = Color.Red;
agendaViewStyle.TimeFontSize = 13;
agendaViewStyle.TimeFontAttributes = FontAttributes.None;
agendaViewStyle.TimeFontFamily = "Arial";
agendaViewStyle.TimeFormat = "hh a";
agendaViewStyle.SubjectFontColor = Color.Blue;
agendaViewStyle.SubjectFontSize = 13;
agendaViewStyle.SubjectFontFamily = "Arial";
agendaViewStyle.SubjectFontAttributes = FontAttributes.None;
agendaViewStyle.BackgroundColor = Color.FromRgb(222, 240, 222);
schedule.MonthViewSettings.AgendaViewStyle = agendaViewStyle;

```

**NOTE**

Agenda View Appearance customization is not applicable for UWP platform.

*Agenda Item Template*

The default appearance of the Appointment can be customized by using the [AgendaItemTemplate](#) property of the `MonthViewSettings`.

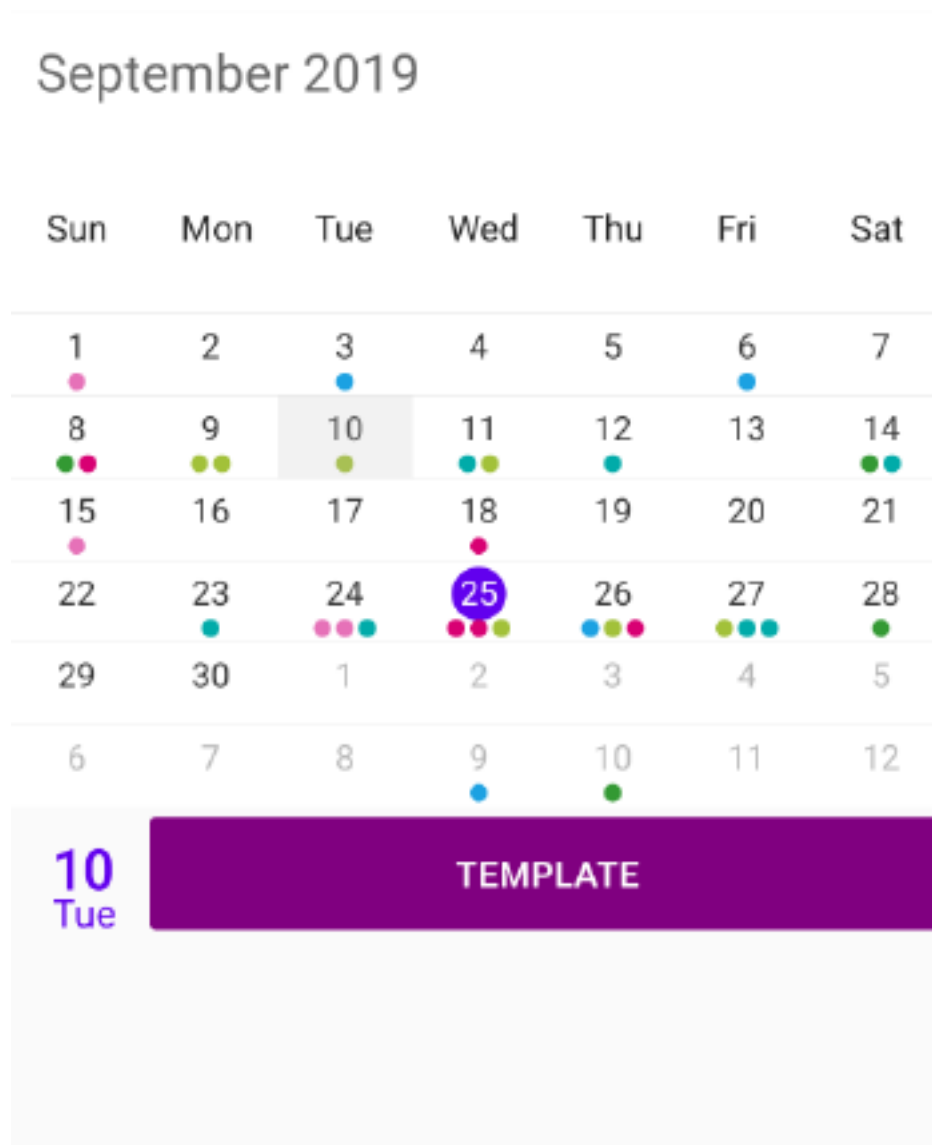

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings ShowAgendaView="True">
      <schedule:MonthViewSettings.AgendaItemTemplate>
        <DataTemplate>
          <Button BackgroundColor="Purple" Text="Template" TextColor="White" />
        </DataTemplate>
      </schedule:MonthViewSettings.AgendaItemTemplate>
    </schedule:MonthViewSettings>
  </schedule:SfSchedule>
```

```
</schedule:SfSchedule.MonthViewSettings>  
</schedule:SfSchedule>
```

### **C#**

```
SfSchedule schedule = new SfSchedule();  
schedule.ScheduleView = ScheduleView.MonthView;  
MonthViewSettings monthViewSettings = new MonthViewSettings();  
monthViewSettings.ShowAgendaView = true;  
monthViewSettings.AgendaItemTemplate = new DataTemplate(() =>  
{  
    return new Button  
    {  
        Text = "Template",  
        TextColor = Color.White,  
        BackgroundColor = Color.Purple  
    };  
});  
schedule.MonthViewSettings = monthViewSettings;
```

**NOTE**

Agenda item template support is not applicable for UWP platform.

### [Agenda View Using Template Selector](#)

AgendaTemplateSelector can be used to choose a DataTemplate at runtime based on the value of a data-bound to agenda appointment property through AgendaiItemTemplate. It lets you choose a different data template for each appointment, customizing the appearance of a particular inline appointment based on certain conditions. DataTemplateSelector for inline appointment includes ScheduleAppointment or custom appointment as object and Schedule as bindable object.

**XML**

```
<ContentPage.Resources>
  <ResourceDictionary>
    <local:AgendaTemplateSelector x:Key="AgendaTemplateSelector" />
  </ResourceDictionary>
</ContentPage.Resources>
```

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings ShowAgendaView="True"
    AgendaItemTemplate="{StaticResource AgendaTemplateSelector}">
  </schedule:MonthViewSettings>
</schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

**C#**

```
public class AgendaTemplateSelector : DataTemplateSelector
{
    public DataTemplate DayAppointmentTemplate { get; set; }
    public DataTemplate AllDayAppointmentTemplate { get; set; }
    public AgendaTemplateSelector()
    {
        DayAppointmentTemplate = new DataTemplate(typeof(DayTemplate));
        AllDayAppointmentTemplate = new DataTemplate(typeof(AllDayTemplate));
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject container)
    {
        var schedule = (container as SfSchedule);
        if (schedule == null) return null;
        if ((item as ScheduleAppointment).IsAllDay)
            return AllDayAppointmentTemplate;
        else
            return DayAppointmentTemplate;
    }
}
```

Used button to display day appointment and all day appointment.

**XML**

```
<?xml version="1.0" encoding="UTF-8"?>
<Button
  xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
  x:Class="SchPreview.DayTemplate"
  HorizontalOptions="FillAndExpand"
  VerticalOptions="FillAndExpand"
  BackgroundColor="{Binding Color}"
  Text="{Binding Subject}"
  FontAttributes="Bold"
  FontSize="15"
  TextColor="White">
</Button>
```

**XML**

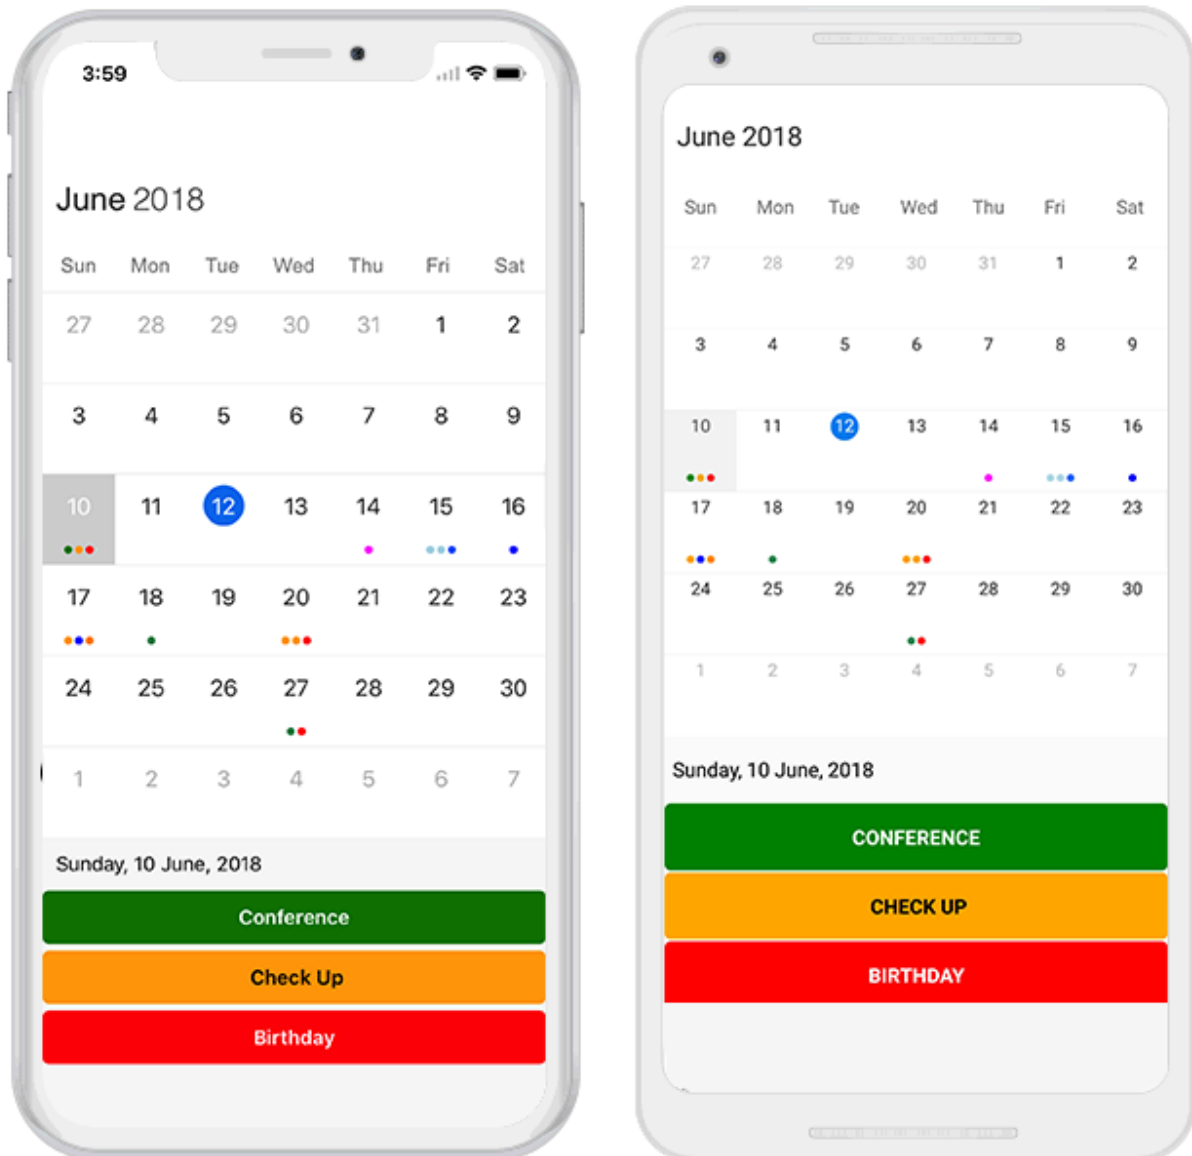

```
<?xml version="1.0" encoding="UTF-8"?>
<Button
  xmlns="http://xamarin.com/schemas/2014/forms"
  xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
```

```

x:Class="SchPreview.AllDayTemplate"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand"
BackgroundColor="{Binding Color}"
Text="{Binding Subject}"
FontAttributes="Bold"
FontSize="15"
TextColor="Black">
</Button>

```

## NOTE

Agenda item template selector support is not applicable for UWP platform.

### Month Navigation direction

MonthView of Schedule can be navigated in both horizontal and vertical direction. You can change the direction of navigation through [MonthNavigationDirection](#) property of [MonthViewSettings](#) in SfSchedule, by default Month navigation direction is [Horizontal](#).

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings
      MonthNavigationDirection="Vertical">
    </schedule:MonthViewSettings>
  </schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

#### C#

```
//creating new instance for MonthViewSettings
MonthViewSettings monthViewSettings = new MonthViewSettings();
//To navigate vertically
monthViewSettings.MonthNavigationDirection =
MonthNavigationDirections.Vertical;
schedule.MonthViewSettings = monthViewSettings;
```

### Restricted days in Month

You can disable the interaction for certain date in Month view by using [BlackoutDates](#) of [MonthViewSettings](#), using this you can allocate / restrict the specific date for predefined events.

#### C#

```
//creating new instance for MonthViewSettings
MonthViewSettings monthViewSettings = new MonthViewSettings();
ObservableCollection<DateTime> blackoutDateCollection = new
ObservableCollection<DateTime>();
DateTime blockedDate1 = DateTime.Now.Date.AddDays(1);
DateTime blockedDate2 = DateTime.Now.Date.AddDays(2);
DateTime blockedDate3 = DateTime.Now.Date.AddDays(3);
DateTime blockedDate4 = DateTime.Now.Date.AddDays(4);
DateTime blockedDate5 = DateTime.Now.Date.AddDays(5);
blackoutDateCollection.Add(blockedDate1);
blackoutDateCollection.Add(blockedDate2);
blackoutDateCollection.Add(blockedDate3);
blackoutDateCollection.Add(blockedDate4);
blackoutDateCollection.Add(blockedDate5);
monthViewSettings.BlackoutDates = blackoutDateCollection;
schedule.MonthViewSettings = monthViewSettings;
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

### First day of Week in Month

You can set First day of week using [FirstDayOfWeek](#) property of `SfSchedule`, by default schedule control will rendered with **Sunday** as the first day of the week.

#### XML

```
<schedule:SfSchedule
x:Name="schedule"
FirstDayOfWeek="3"
ScheduleView="MonthView">
</schedule:SfSchedule>
```

#### C#

```
//setting FirstDayOfWeek
schedule.FirstDayOfWeek = 3; // Tuesday
```

## September 2019

Tue	Wed	Thu	Fri	Sat	Sun	Mon
27	28	29	30	31	1	2
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30
1	2	3	4	5	6	7

### Week Number of the Year in Month

You can display the Week Number of the year in `MonthView` by setting `ShowWeekNumber` property of `MonthViewSettings` as `true`, by default it is `false`.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings
      ShowWeekNumber="true">
    </schedule:MonthViewSettings>
  </schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

#### C#

```
monthViewSettings.ShowWeekNumber = true;
```

## September 2019

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
36	1	2	3	4	5	6	7
37	8	9	10	11	12	13	14
38	15	16	17	18	19	20	21
39	22	23	24	25	26	27	28
40	29	30	1	2	3	4	5
41	6	7	8	9	10	11	12

### Week Number Appearance

You can customize the Week Number appearance by using [WeekNumberStyle](#) property of [MonthViewSettings](#). Week number [BackgroundColor](#), [TextColor](#), [FontFamily](#), [FontSize](#), [FontAttributes](#) can be customized using [WeekNumberStyle](#) properties.

### C#

```
//creating new instance for WeekNumberStyle
WeekNumberStyle weekNumberStyle = new WeekNumberStyle();
weekNumberStyle.FontFamily = "Arial";
weekNumberStyle.FontSize = 15;
weekNumberStyle.FontAttributes = FontAttributes.None;
weekNumberStyle.BackgroundColor = Color.Blue;
weekNumberStyle.TextColor = Color.White;
monthViewSettings.WeekNumberStyle = weekNumberStyle;
```

## September 2019

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
36	1	2	3	4	5	6	7
37	8	9	10	11	12	13	14
38	15	16	17	18	19	20	21
39	22	23	24	25	26	27	28
40	29	30	1	2	3	4	5
41	6	7	8	9	10	11	12

### View Header Appearance

You can customize the View Header appearance by using [ViewHeaderStyle](#) property in SfSchedule. View Header [BackgroundColor](#), [DayTextColor](#) and [DayFontFamily](#) can be customized using [ViewHeaderStyle](#) properties.

### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.ViewHeaderStyle>
    <schedule:ViewHeaderStyle
      BackgroundColor="Blue"
      DayTextColor="White"
      DayFontFamily="Arial">
    </schedule:ViewHeaderStyle>
  </schedule:SfSchedule.ViewHeaderStyle>
</schedule:SfSchedule>
```

**C#**

```
//creating new instance for viewHeaderStyle
ViewHeaderStyle viewHeaderStyle = new ViewHeaderStyle();
viewHeaderStyle.BackgroundColor = Color.Blue;
viewHeaderStyle.DayTextColor = Color.White;
viewHeaderStyle.DayFontFamily = "Arial";
schedule.ViewHeaderStyle = viewHeaderStyle;
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

**NOTE**

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

### *ViewHeader Date Format*

You can customize the date and day format of SfSchedule ViewHeader by using [DateFormat](#) and [DayFormat](#) properties of [MonthLabelSettings](#).

## XML

```
<schedule:SfSchedule>
<schedule:SfSchedule.MonthViewSettings>
<schedule:MonthViewSettings>
<schedule:MonthViewSettings.MonthLabelSettings>
<schedule:MonthLabelSettings DateFormat="dd">
<schedule:MonthLabelSettings.DayFormat>
<OnPlatform x:TypeArguments="x:String"
iOS="EEEE"
Android="EEEE"
WinPhone="dddd" />
</schedule:MonthLabelSettings.DayFormat>
</schedule:MonthLabelSettings>
</schedule:MonthViewSettings.MonthLabelSettings>
</schedule:MonthViewSettings>
</schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

## C#

```
schedule.ScheduleView = ScheduleView.MonthView;
//Creating new instance of MonthViewSettings
MonthViewSettings monthViewSettings = new MonthViewSettings();
//Creating new instance of MonthLabelSettings
MonthLabelSettings monthLabelSettings = new MonthLabelSettings();
//Customizing date format
monthLabelSettings.DateFormat = "dd";
monthLabelSettings.DayFormat = Device.OnPlatform("EEEE", "EEEE", "dddd");
monthViewSettings.MonthLabelSettings = monthLabelSettings;
schedule.MonthViewSettings = monthViewSettings;
```

## September 2019

Sunday Monday Tuesday Wednesday Thursday Friday Saturday

01	02	03	04	05	06	07
08	09	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	01	02	03	04	05
06	07	08	09	10	11	12

### *ViewHeader Tapped Event*

You can handle single tap action of ViewHeader by using [ViewHeaderTapped](#) event of **SfSchedule**. This event will be triggered when the ViewHeader is Tapped. This event contains [ViewHeaderTappedEventArgs](#) argument which holds [DateTime](#) details in it.

### **XML**

```
<schedule:SfSchedule x:Name="schedule"
ScheduleView="MonthView"
ViewHeaderTapped="Handle_ViewHeaderTapped" >
</schedule:SfSchedule>
```

### **C#**

```
//Creating new instance of Schedule
SfSchedule schedule = new SfSchedule();
schedule.ScheduleView = ScheduleView.MonthView;
schedule.ViewHeaderTapped += Handle_ViewHeaderTapped;
```

## C#

```
private void Handle_ViewHeaderTapped(object sender,
ViewHeaderTappedEventArgs e)
{
    var dateTime = e.DateTime;
}
```

### MonthCell Appearance

You can customize the Month view cell in three ways,

- [Customize month cell using style](#)
- [Customize month cell using event](#)
- [Customize month cell with custom UI](#)
- [Customize month cell using DataTemplate](#)
- [Customize month cell using DataTemplateSelector](#)

#### *Customize month cell using style*

By using [MonthCellStyle](#) of [SfSchedule](#) you can customize the month cell properties such as [BackgroundColor](#), [NextMonthBackgroundColor](#), [NextMonthTextColor](#), [PreviousMonthBackgroundColor](#), [PreviousMonthTextColor](#), [TextColor](#), [FontSize](#), [FontAttributes](#), [FontFamily](#), [TodayBackgroundColor](#), [TodayTextColor](#).

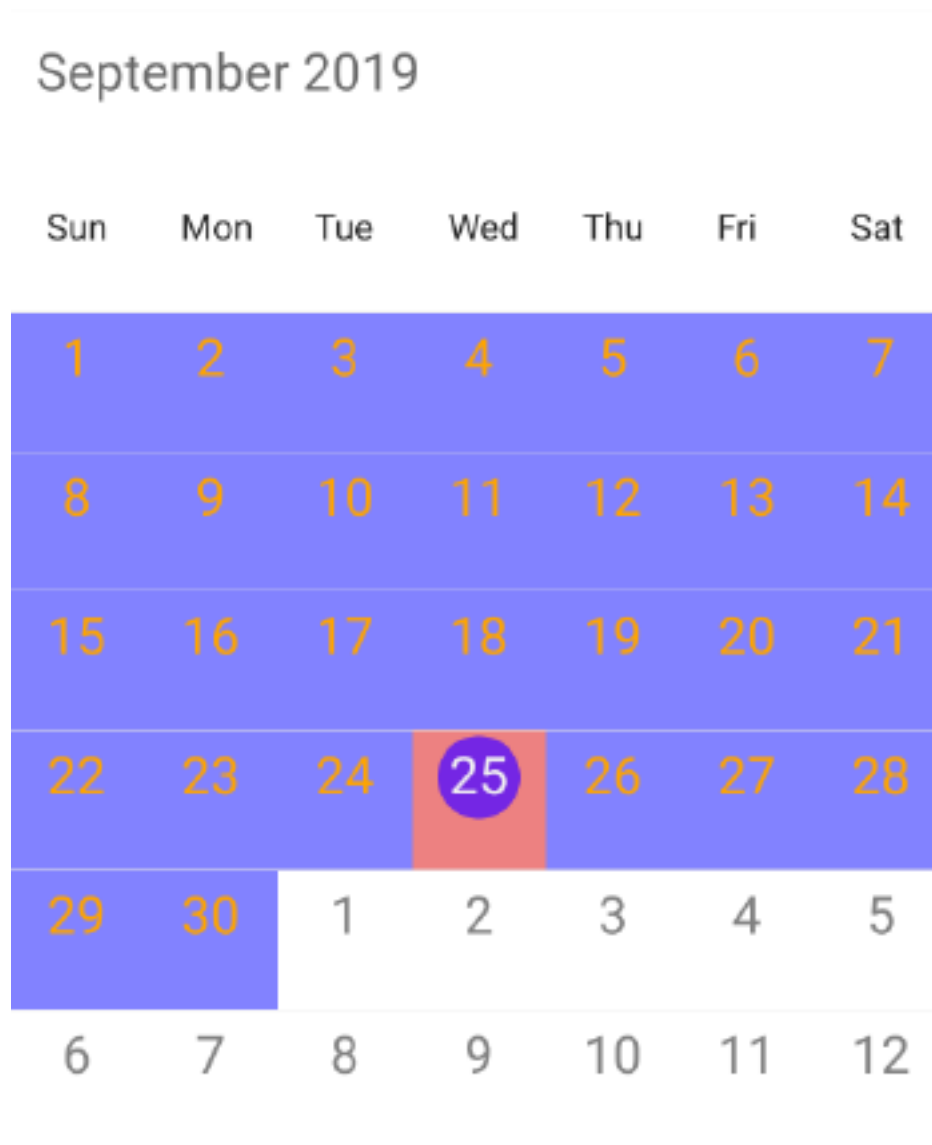

## XML

```
<schedule:SfSchedule.MonthCellStyle>
<schedule:MonthViewCellStyle
    BackgroundColor="#8282ff"
    TextColor="Orange"
    FontSize="20"
    FontFamily = "Arial"
    FontAttributes = "None"
    NextMonthBackgroundColor="Gray"
    NextMonthTextColor="Gray"
    PreviousMonthBackgroundColor="White"
    PreviousMonthTextColor="Gray"
    TodayBackgroundColor="#f97272"
    TodayTextColor="White">
</schedule:MonthViewCellStyle>
</schedule:SfSchedule.MonthCellStyle>
```

## C#

```
//MonthCell Appearance
MonthViewCellStyle monthCellStyle = new MonthViewCellStyle();
monthCellStyle.BackgroundColor = Color.FromHex("#8282ff");
monthCellStyle.NextMonthBackgroundColor = Color.White;
monthCellStyle.NextMonthTextColor = Color.Gray;
monthCellStyle.PreviousMonthBackgroundColor = Color.White;
monthCellStyle.PreviousMonthTextColor = Color.Gray;
monthCellStyle.TextColor = Color.Orange;
monthCellStyle.FontFamily = "Arial";
```

```
monthCellStyle.FontSize = 20;
monthCellStyle.FontAttributes = FontAttributes.None;
monthCellStyle.TodayBackgroundColor = Color.FromHex("#f97272");
monthCellStyle.TodayTextColor = Color.White;
schedule.MonthCellStyle = monthCellStyle;
```

#### Customize month cell using event

By using [OnMonthCellLoadedEvent](#) in `SfSchedule`, you can customize the month cell properties in the run time. In `OnMonthCellLoadedEvent`, arguments such as [cellStyle](#), [appointments](#), [date](#), [view](#) and boolean properties such as [isToday](#), [isNextMonthDate](#), [isPreviousMonthDate](#) and [isBlackOutDate](#) are in the [MonthCellLoadedEventArgs](#).

You can customize the month cell appearance in run time by setting [TextColor](#), [FontSize](#), [FontFamily](#), [FontAttributes](#), and [BackgroundColor](#) properties of `cellStyle` argument in `MonthCellLoadedEventArgs`.

**C#**

```
schedule.OnMonthCellLoadedEvent += Schedule_OnMonthCellLoadedEvent;
...
private void Schedule_OnMonthCellLoadedEvent(object sender,
MonthCellLoadedEventArgs args)
{
    args.cellStyle = new CellStyle();
    if (args.isToday)
    {
        args.cellStyle.BackgroundColor = Color.FromHex("#f97272");
        args.cellStyle.TextColor = Color.White;
        args.cellStyle.FontFamily = "Arial";
        args.cellStyle.FontSize = 25;
    }
    else if (args.isNextMonthDate)
    {
        args.cellStyle.BackgroundColor = Color.White;
        args.cellStyle.TextColor = Color.Gray;
        args.cellStyle.FontFamily = "Arial";
        args.cellStyle.FontSize = 10;
    }
    else if (args.isPreviousMonthDate)
    {
        args.cellStyle.BackgroundColor = Color.White;
        args.cellStyle.TextColor = Color.Gray;
        args.cellStyle.FontFamily = "Arial";
        args.cellStyle.FontSize = 10;
    }
    else
    {
        args.cellStyle.BackgroundColor = Color.FromHex("#8282ff");
        args.cellStyle.TextColor = Color.White;
        args.cellStyle.FontFamily = "Arial";
        args.cellStyle.FontSize = 20;
    }
}
```

## NOTE

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

[Customize month cell with custom UI](#)

You can set the Custom UI for the month cell using [view](#) property of `MonthCellLoadedEventArgs` in the `OnMonthCellLoadedEvent`.

## C#

```
schedule.OnMonthCellLoadedEvent += Schedule_OnMonthCellLoadedEvent;
...
private void Schedule_OnMonthCellLoadedEvent(object sender,
MonthCellLoadedEventArgs args)
{
    Button button = new Button();
    button.Text = args.date.Day.ToString();
    button.BackgroundColor = Color.Blue;
}
```

```
button.TextColor = Color.White;
args.view = button;
if (args.isToday)
{
    button.BackgroundColor = Color.Red;
    button.TextColor = Color.White;
}
}
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

### Customize month cell using DataTemplate

You can customize the default appearance of the month cell by using the [MonthCellTemplate](#) property of `MonthViewSettings`.

### XML

```
<schedule:SfSchedule
    x:Name="schedule" ScheduleView="MonthView">
    <schedule:SfSchedule.MonthViewSettings>
```

```

<schedule:MonthViewSettings>
<schedule:MonthViewSettings.MonthCellTemplate>
<DataTemplate>
<Label BackgroundColor = "Purple" TextColor="White" Text="{Binding Date,
StringFormat='{0:dd}'}"/>
</DataTemplate>
</schedule:MonthViewSettings.MonthCellTemplate>
</schedule:MonthViewSettings>
</schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>

```

September 2019						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
01	02	03	04	05	06	07
08	09	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	01	02	03	04	05
06	07	08	09	10	11	12

#### *Customize month cell using DataTemplateSelector*

You can use `DataTemplateSelector` to choose a `DataTemplate` at runtime based on the value of a data-bound to Schedule month cell through `MonthCellTemplate`. It lets you choose a different data template for each month cell, customizing the appearance of a particular month cell based on certain conditions. `DataTemplateSelector` for month cell includes [MonthCellItem](#) as object item and `Schedule`

as bindable object. **MonthCellItem** consists of following properties, [Date](#), [Appointments](#), [IsLeadingDay](#), [IsTrailingDay](#), [IsBlockOutDay](#).

### XML

```
<ContentPage.Resources>
  <ResourceDictionary>
    <samplelocal:MonthCellDataTemplateSelector
      x:Key="monthCellDataTemplateSelector" />
  </ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
  <schedule:SfSchedule ScheduleView="MonthView" >
    <schedule:SfSchedule.MonthViewSettings>
      <schedule:MonthViewSettings x:Name="monthViewSettings"
        MonthCellTemplate="{StaticResource monthCellDataTemplateSelector}" />
    </schedule:SfSchedule.MonthViewSettings>
  </schedule:SfSchedule>
</ContentPage.Content>
```

### Creating a DataTemplateSelector

#### C#

```
public class MonthCellDataTemplateSelector : DataTemplateSelector
{
    public DataTemplate MonthAppointmentTemplate { get; set; }
    public DataTemplate MonthCellDatesTemplate { get; set; }
    public MonthCellDataTemplateSelector()
    {
        MonthAppointmentTemplate = new
        DataTemplate(typeof(MonthAppointmentTemplate));
        MonthCellDatesTemplate = new DataTemplate(typeof(MonthCellDatesTemplate));
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject
    container)
    {
        var sfSchedule = (container as Syncfusion.SfSchedule.XForms.SfSchedule);
        if (sfSchedule == null) return null;
        if (sfSchedule != null)
        {
            var appointments = (IList)(item as MonthCellItem).Appointments;
            foreach (var appointment in appointments)
            {
                CustomizationViewModel.ScheduleAppointment = appointment as
                ScheduleAppointment;
                return MonthAppointmentTemplate;
            }
            CustomizationViewModel.MonthCellItem = item as MonthCellItem;
            return MonthCellDatesTemplate;
        }
        else
            return null;
    }
}
```

Used Label to display current ,next and previous month cell dates and StackLayout with label and image to denote the month cell with appointments.

### XML

```
<?xml version="1.0" encoding="UTF-8"?>
<!--Label as Template to display month dates-->
<Label xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="MonthCellTemplate_Forms.CurrentViewDatesTemplate"
xmlns:samplelocal="clr-
namespace:MonthCellTemplate_Forms;assembly=MonthCellTemplate_Forms"
BackgroundColor ="Transparent" FontSize="13" TextColor="Black"
Text = "{Binding Date, StringFormat='{0:dd}'}">
<Label.Behaviors>
<samplelocal:MonthCellDateBehavior />
</Label.Behaviors>
</Label>
.....
<?xml version="1.0" encoding="UTF-8"?>
<!--StackLayout with Label and Image as Template to display month cell with
appointment-->
<StackLayout xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="MonthCellTemplate_Forms.MonthAppointmentTemplate"
BackgroundColor="Transparent" Orientation="Vertical"
xmlns:samplelocal="clr-
namespace:MonthCellTemplate_Forms;assembly=MonthCellTemplate_Forms"
VerticalOptions="FillAndExpand" HorizontalOptions="FillAndExpand">
<Label x:Name="label" Text="{Binding Date, StringFormat='{0:dd}'}"
VerticalOptions="FillAndExpand" HorizontalOptions="FillAndExpand">
<Label.FontSize>
<OnPlatform x:TypeArguments="x:Double" iOS="15" Android="13" WinPhone="13"
/>
</Label.FontSize>
</Label>
<Image x:Name="Image" BackgroundColor="Transparent" Margin="15,0,0,0"
HorizontalOptions="Start" VerticalOptions="Start" HeightRequest="40"
WidthRequest="20" >
</Image>
<StackLayout.Behaviors>
<samplelocal:MonthCellCustomViewBehavior />
</StackLayout.Behaviors>
</StackLayout>
```

### C#

```
public class MonthCellDateBehavior : Behavior<Label>
{
    protected override void OnAttachedTo(Label bindable)
    {
        base.OnAttachedTo(bindable);
        if (CustomizationViewModel.MonthCellItem == null)
            return;
        if (CustomizationViewModel.MonthCellItem.IsLeadingDay ||
            CustomizationViewModel.MonthCellItem.IsTrailingDay)
```

```

{
    bindable.TextColor = Color.Gray;
}
else
{
    bindable.TextColor = Color.Black;
}
}
}

```

September 2019						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
01	02	03 	04	05	06	07
08	09	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25 	26 	27	28 
29	30	01	02	03	04	05

#### Getting Inline Appointment details

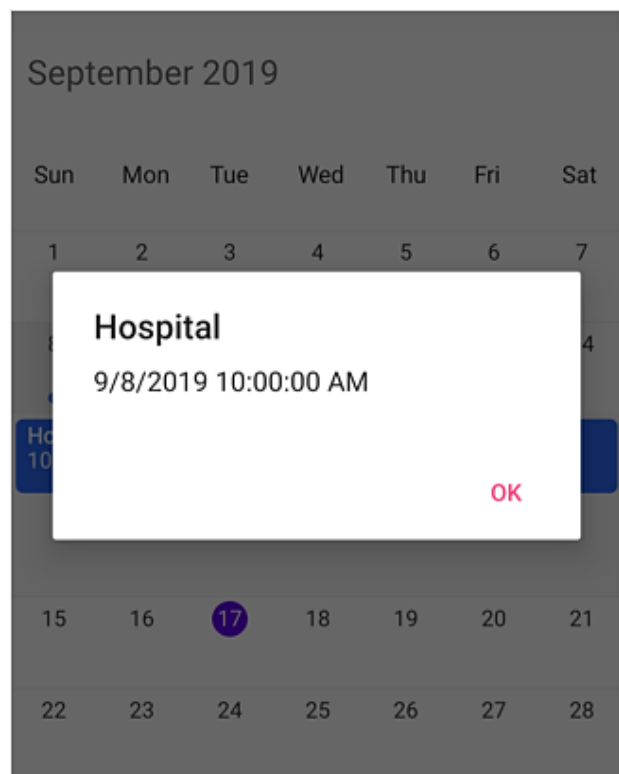

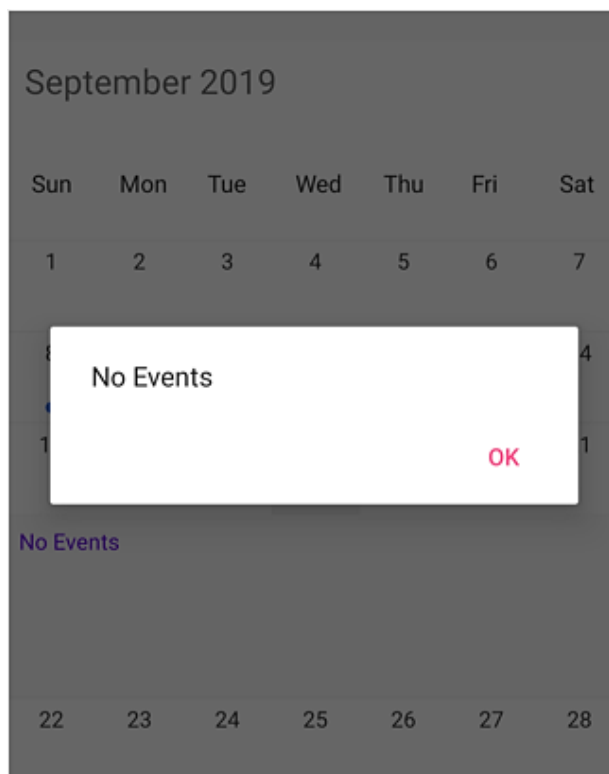

Using [Appointment](#) argument in the [MonthInlineAppointmentTappedEventArgs](#) of [MonthInlineAppointmentTapped](#) event, you can get the Month Inline Appointments details while tapping the specific appointment, and you can get the selected date by using the [selectedDate](#) property. [MonthInlineAppointmentTapped](#) also trigger while tapping the [No Events](#) view in inline. You can do the required functions while tapping the inline appointment using this event.

**C#**

```

schedule.MonthInlineAppointmentTapped +=
Schedule_MonthInlineAppointmentTapped;
...
private void Schedule_MonthInlineAppointmentTapped(object sender,
MonthInlineAppointmentTappedEventArgs args)
{
    if (args.Appointment != null)
    {
        var appointment = (args.Appointment as ScheduleAppointment);
        DisplayAlert(appointment.Subject, appointment.StartTime.ToString(), "ok");
    }
    else
    {
        DisplayAlert("", "No Events", "ok");
    }
}

```

**Note:**

The `MonthInlineAppointmentTapped` is also applicable for `AgendaView`.

**InlineView Appearance**

You can customize the inline view with two ways,

- Using style
- Using custom view

### Using style

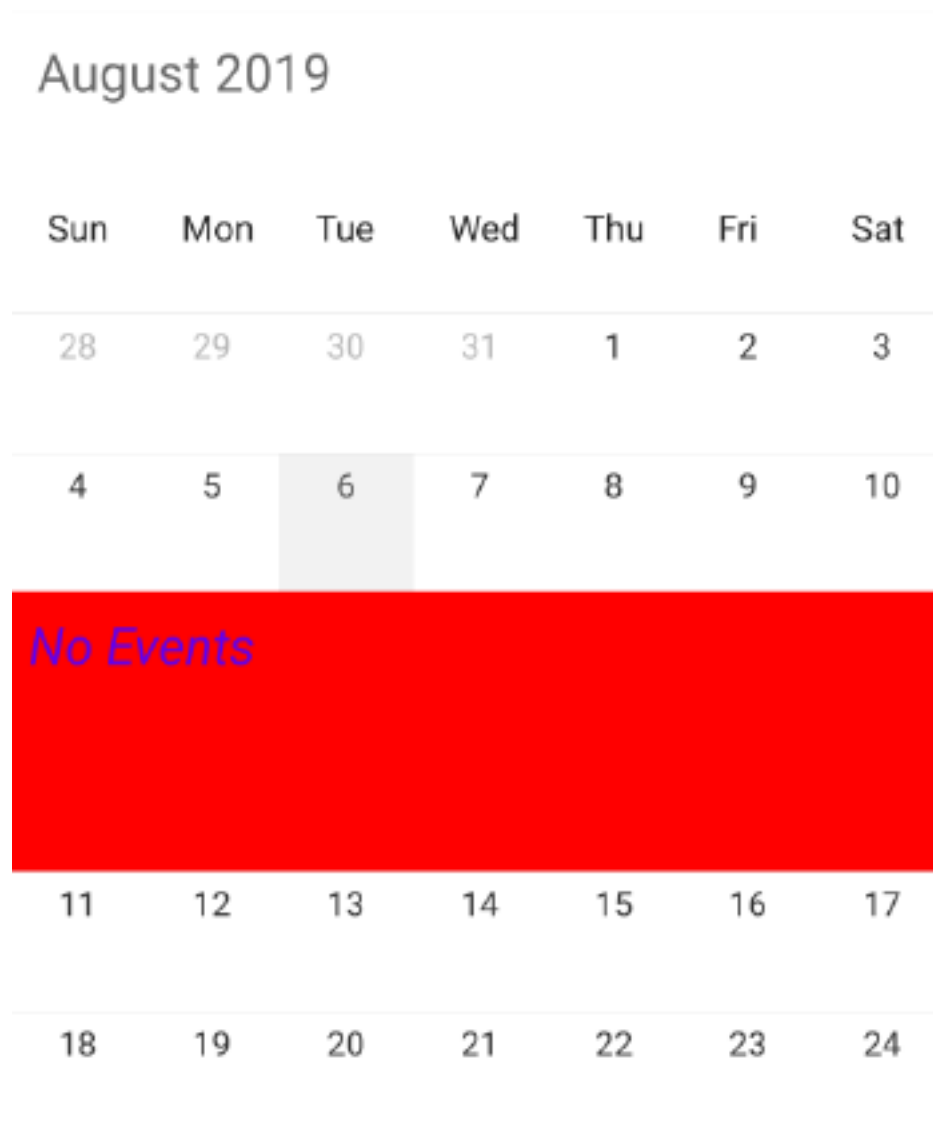

You can customize the month inline view by setting the [MonthInlineViewStyle](#) properties such as [Background](#), [TextColor](#), [FontSize](#), [FontAttributes](#), [FontFamily](#), [TimeTextColor](#), [TimeTextSize](#), and [TimeTextFormat](#) at runtime using [OnMonthInlineLoadedEvent](#) in [SfSchedule](#). By using [OnMonthInlineLoadedEvent](#) you can get arguments such as [monthInlineViewStyle](#), [appointments](#), [selectedDate](#) in the [MonthInlineLoadedEventArgs](#).

### C#

```
schedule.OnMonthInlineLoadedEvent += Schedule_OnMonthInlineLoadedEvent;
...
private void Schedule_OnMonthInlineLoadedEvent(object sender,
MonthInlineLoadedEventArgs args)
{
    var appointments = e.appointments.Cast<ScheduleAppointment>().ToList();
    MonthInlineViewStyle monthInlineViewStyle = new MonthInlineViewStyle();
    if (appointments != null && appointments.Count > 0)
    {
        monthInlineViewStyle.BackgroundColor = Color.AliceBlue;
        monthInlineViewStyle.TextColor = Color.White;
        monthInlineViewStyle.FontSize = 10;
        monthInlineViewStyle.FontAttributes = FontAttributes.None;
        monthInlineViewStyle.FontFamily = "Times New Roman";
        monthInlineViewStyle.TimeTextColor = Color.Yellow;
        monthInlineViewStyle.TimeTextSize = 15;
        monthInlineViewStyle.TimeTextFormat = "hh a";
    }
    else
    {
        // Style to customize the No Events label
        monthInlineViewStyle.BackgroundColor = Color.Red;
        monthInlineViewStyle.FontAttributes = FontAttributes.Italic;
        monthInlineViewStyle.FontFamily = "Times New Roman";
        monthInlineViewStyle.TimeTextColor = Color.White;
        monthInlineViewStyle.TimeTextSize = 20;
    }
    e.monthInlineViewStyle = monthInlineViewStyle;
}
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
<div>Jeni's B'day 10 AM - 11 AM</div> <div>Meeting 11 AM - 12 PM</div> <div>Lunch</div>						
15	16	17	18	19	20	21
22	23	24	25	26	27	28

Get the complete sample for this [here](#).

### NOTE

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

*Using custom view*

You can set custom view for the inline view by using [InlineView](#) property of `Schedule`

### C#

```
SfSchedule schedule = new SfSchedule();
Button button = new Button();
button.BackgroundColor = Color.Red;
button.Text = "No Event";
button.TextColor = Color.White;
schedule.InlineView = button;
```

**XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView"
ShowAppointmentsInline="True">
<schedule:SfSchedule.InlineView>
<Button BackgroundColor="Red" Text="No Events" TextColor="White"/>
</schedule:SfSchedule.InlineView>
</schedule:SfSchedule>
```

## August 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
28	29	30	31	1	2	3
4	5	6	7	8	9	10
NO EVENT						
11	12	13	14	15	16	17
18	19	20	21	22	23	24

**InlineAppointment Appearance**

You can customize the Month inline view Appointment by using [OnMonthInlineAppointmentLoadedEvent](#) in [SfSchedule](#), using [view](#) of [MonthInlineAppointmentLoadedEventArgs](#) argument. You can get the details of Appointment in the [appointment](#) argument.

**C#**

```

schedule.OnMonthInlineAppointmentLoadedEvent +=
Schedule_OnMonthInlineAppointmentLoadedEvent;
...
private void Schedule_OnMonthInlineAppointmentLoadedEvent(object sender,
MonthInlineAppointmentLoadedEventArgs args)
{
    var appointment = (args.appointment as ScheduleAppointment);
    Button button = new Button();
    button.Text = appointment.Subject;
    button.BackgroundColor = Color.Blue;
    button.TextColor = Color.White;
    args.view = button;
}

```

## October 2019

6	7	8	9	10	11	12
PROJECT PLAN						
GENERAL MEETING						
13	14	15	16	17	18	19
20	21	22	23	24	25	26

### NOTE

Inline view customization - There is no support for inline view appointments customization using custom view, TimeTextSize, TimeTextFormat and TimeTextColor properties in XForms UWP.

## Selection

You can customize the default appearance of selection UI in the month cells.

- [Selection text color customization](#)
- [Selection indicator color customization](#)
- [Selection customization using style](#)
- [Selection customization using custom View](#)
- [Programmatic selection](#)

### *Selection text color customization*

Month cell Selection Text Color can be customized using [SelectionTextColor](#) property of `MonthViewSettings`.

## XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.MonthViewSettings>
    <schedule:MonthViewSettings
      SelectionTextColor="Red" >
    </schedule:MonthViewSettings>
  </schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

## C#

```
//creating new instance for MonthViewSettings
MonthViewSettings monthViewSettings = new MonthViewSettings();
monthViewSettings.SelectionTextColor = Color.Red;
schedule.MonthViewSettings = monthViewSettings;
```

September 2019						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

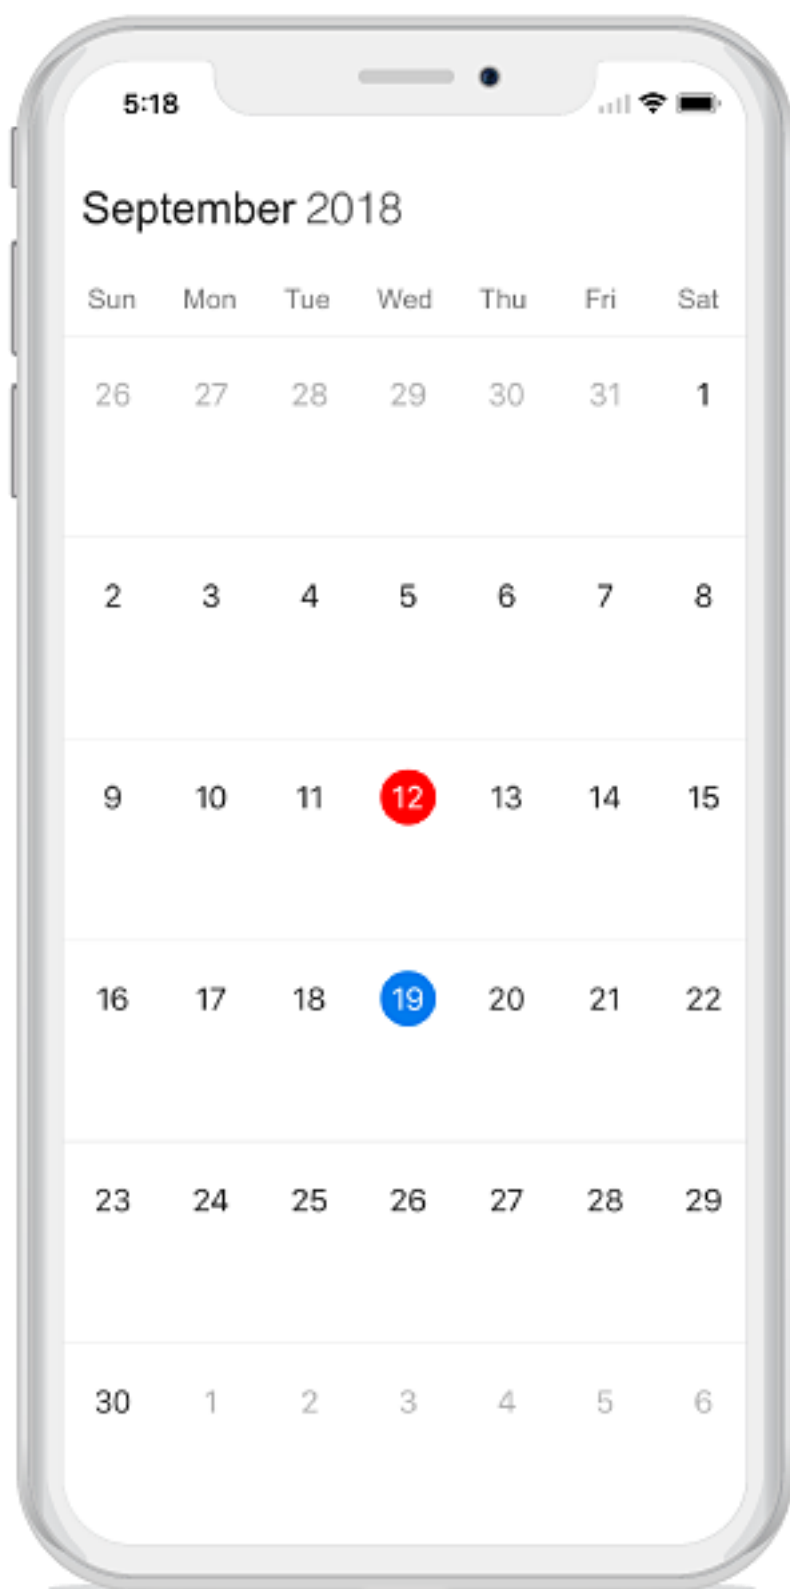

#### Selection indicator color customization

Month cell selection indicator color can be customized using [SelectionIndicatorColor](#) property of `MonthViewSettings` in Xamarin.iOS (Native). You can achieve the same in Xamarin.Forms by setting the required color to `SelectionIndicatorColor` property of the Xamarin.Forms (iOS) project using reflection.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    LoadApplication(new App());
    SfScheduleRenderer.Init();
    // Here ScheduleSamplePage is the Schedule rendered page in PCL
    // FormsSfSchedule is initialized public static SfSchedule in the
    ScheduleSamplePage
}
```

```
ScheduleSamplePage.FormsSfSchedule.SelectionStyle.BackgroundColor =
Color.Transparent;
ScheduleSamplePage.FormsSfSchedule.CellTapped += FormsSchedule_CellTapped;
return base.FinishedLaunching(app, options);
}
private void FormsSchedule_CellTapped(object sender,
Syncfusion.SfSchedule.XForms.CellTappedEventArgs e)
{
    // Gets the field nativeObject from SfSchedule by using reflection
    // GetType() used to get the type of schedule instance
    var fieldInfo = GetField(ScheduleSamplePage.FormsSfSchedule.GetType(),
    "nativeObject");
    // Gets the value of nativeObject field by using reflection
    var fieldInfo = GetField(ScheduleSamplePage.FormsSfSchedule.GetType(),
    "nativeObject");
    var nativeSchedule =
    fieldInfo.GetValue(ScheduleSamplePage.FormsSfSchedule);
    var monthViewSettings = new Syncfusion.SfSchedule.iOS.MonthViewSettings();
    // Setting Month cell selection indicator color
    monthViewSettings.SelectionIndicatorColor = UIColor.Red;
    (nativeSchedule as SfSchedule).MonthViewSettings = monthViewSettings;
}
```

---

**NOTE**

---

This support won't apply for current day indicator, you can use `TodayBackgroundColor` property to customize it.

#### *Selection customization using style*

You can customize the month cell selection by using [SelectionStyle](#) property of `SfSchedule`.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.SelectionStyle>
    <schedule:SelectionStyle
      BackgroundColor="Blue"
      BorderColor="Black"
      BorderThickness="5"
      BorderCornerRadius="5">
    </schedule:SelectionStyle>
  </schedule:SfSchedule.SelectionStyle>
</schedule:SfSchedule>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.MonthView;
//Create new instance of SelectionStyle
SelectionMode selectionStyle = new SelectionStyle();
selectionStyle.BackgroundColor = Color.Blue;
selectionStyle.BorderColor = Color.Black;
selectionStyle.BorderThickness = 5;
selectionStyle.BorderCornerRadius = 5;
schedule.SelectionStyle = selectionStyle;
```

September 2019						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

#### *Selection customization using custom View*

You can replace the default selection UI with your custom view by setting [SelectionView](#) property of SfSchedule.

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="MonthView">
  <schedule:SfSchedule.SelectionView>
    <Button
      BackgroundColor="#FF9800"
      Text="+NewEvent"
      TextColor="White"/>
  </schedule:SfSchedule.SelectionView>
</schedule:SfSchedule>
```

#### **C#**

```
schedule.ScheduleView = ScheduleView.MonthView;
```

```
//Add the CustomView
Button customView = new Button();
customView.Text = "+NewEvent";
customView.BackgroundColor = Color.FromHex("#FF9800");
customView.TextColor = Color.White;
schedule.SelectionView = customView;
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	+NE WE	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

### Programmatic selection

You can programmatically select the specific cell by setting corresponding date to [SelectedDate](#) property of SfSchedule. By default, it is null.

### C#

```
// Setting a date to select
schedule.SelectedDate = new DateTime(2017, 10, 04);
```

You can clear the selection by setting [SelectedDate](#) as null.

**C#**

```
// Setting null value to deselect
schedule.SelectedDate = null;
```

You can download the entire source code of this demo for Xamarin.Forms from here [Date Selection](#)

**NOTE**

- SfSchedule does not support multiple selection.
- SfSchedule supports two-way binding of SelectedDate property.

## October 2017

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	31	1	2	3	4
5	6	7	8	9	10	11

### Today Background Color

You can customize the current date background of SfSchedule by using [TodayBackground](#) property of [MonthViewSettings](#).

**XML**

```
<schedule:SfSchedule ScheduleView="MonthView">
</schedule:SfSchedule.MonthViewSettings>
<schedule:MonthViewSettings TodayBackground="Red" />
</schedule:SfSchedule.MonthViewSettings>
</schedule:SfSchedule>
```

**C#**

```
schedule.ScheduleView = ScheduleView.MonthView;
//Creating new instance of MonthViewSettings
MonthViewSettings monthViewSettings = new MonthViewSettings();
//Customizing background color
monthViewSettings.TodayBackground = Color.Red;
schedule.MonthViewSettings = monthViewSettings;
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

### Custom Font

You can change the appearance of Font by setting the `FontFamily` property to the following classes.

- [ViewHeaderStyle](#) - You can change the appearance of [ViewHeaderStyle](#) by setting the [DayFontFamily](#) and [DateFontFamily](#) properties of `Schedule ViewHeaderStyle`.
- [MonthCellStyle](#) - You can change the appearance of [MonthCellStyle](#) by setting the [FontFamily](#) property of `Schedule MonthCellStyle`.
- [MonthInlineViewStyle](#) - You can change the appearance of [MonthInlineViewStyle](#) by setting the [FontFamily](#) property of `Schedule MonthInlineViewStyle`.
- [WeekNumberStyle](#) - You can change the appearance of [WeekNumber](#) by setting the [FontFamily](#) property of `Schedule WeekNumberStyle`.

### XML

```
<schedule:ViewHeaderStyle.DayFontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:ViewHeaderStyle.DayFontFamily>
```

### C#

```
viewHeaderStyle.DayFontFamily = Device.OnPlatform("Lobster-Regular",
"Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

## September 2019

<i>Sun</i>	<i>Mon</i>	<i>Tue</i>	<i>Wed</i>	<i>Thu</i>	<i>Fri</i>	<i>Sat</i>
1	2	3	4	5	6	7
8	9	10	11	12	13	14

22	23	24	25	26	27	28
29	30	1	2	3	4	5
6	7	8	9	10	11	12

### XML

```
<schedule:MonthCellStyle.FontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:ViewHeaderStyle.FontFamily>
```

### C#

```
monthCellStyle.FontFamily = Device.OnPlatform("Lobster-Regular", "Lobster-
Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6</i>	<i>7</i>
<i>8</i>	<i>9</i>	<i>10</i>	<i>11</i>	<i>12</i>	<i>13</i>	<i>14</i>
<i>15</i>	<i>16</i>	<i>17</i>	<i>18</i>	<i>19</i>	<i>20</i>	<i>21</i>
<i>22</i>	<i>23</i>	<i>24</i>	<b>25</b>	<i>26</i>	<i>27</i>	<i>28</i>
<i>29</i>	<i>30</i>	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>
<i>6</i>	<i>7</i>	<i>8</i>	<i>9</i>	<i>10</i>	<i>11</i>	<i>12</i>

### C#

```

schedule.OnMonthInlineLoadedEvent += Schedule_OnMonthInlineLoadedEvent;
...
private void Schedule_OnMonthInlineLoadedEvent(object sender,
MonthInlineLoadedEventArgs args)
{
    MonthInlineViewStyle monthInlineViewStyle = new MonthInlineViewStyle();
    monthInlineViewStyle.FontFamily = Device.OnPlatform("Lobster-Regular",
    "Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
    args.monthInlineViewStyle = monthInlineViewStyle;
}

```

## September 2019

Sun	Mon	Tue	Wed	Thu	Fri	Sat
1	2	3	4	5	6	7
8	9	10	11	12	13	14
<b>Plan Execution</b> 10:00-11:00 AM - 11:00-12:00 PM						
<b>Plan Execution</b> 09:00-10:00 AM - 10:00-11:00 AM						
15	16	17	18	19	20	21
22	23	24	25	26	27	28

### C#

```
weekNumberStyle.FontFamily = Device.OnPlatform("Lobster=Regular", "Lobster-Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

## September 2019

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
36	1	2	3	4	5	6	7
37	8	9	10	11	12	13	14
38	15	16	17	18	19	20	21
39	22	23	24	25	26	27	28
40	29	30	1	2	3	4	5
41	6	7	8	9	10	11	12

Following steps will explain how to configure the custom fonts.

### *Custom Font Setting in Xamarin.Forms (Android)*

- Add your custom Font (e.g. Lobster-Regular.ttf) to the Assets folder in the Assets folder of the Xamarin.Forms (Android) project.
- Then, use the Custom Font name as FontFamily.

### *Custom Font Setting in Xamarin.Forms (ios)*

- Add your custom Font (e.g. Lobster-Regular.ttf) to the Resources folder of the Xamarin.Forms (iOS) project.
- Edit info.plist and add a key Fonts provided by application (value type should be Array). In item0 of the array enter the name of the FontFamily you added in the Resource folder. (Such as Lobster-Regular.ttf).
- Then, use the Custom Font name as FontFamily.

---

**NOTE**

---

No need to mention .ttf when set the Custom Font in iOS.

*Custom Font Setting in Xamarin.Forms (UWP)*

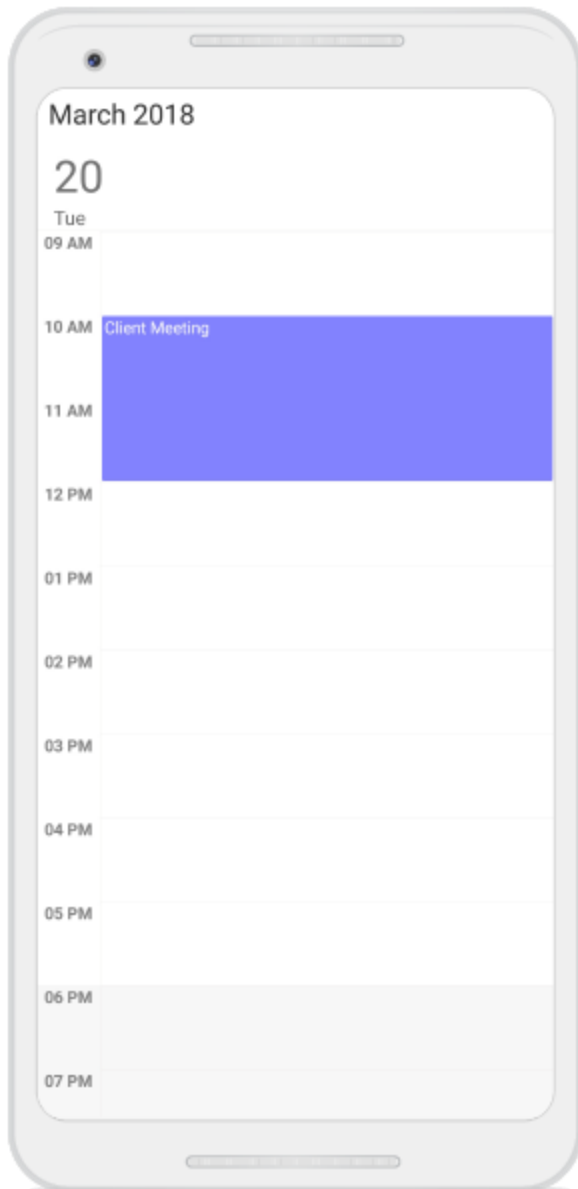

- Add your custom Font (e.g. Lobster-Regular.ttf) to the Assets folder of the Xamarin.Forms (UWP) project.
- Then, use the Custom Font name as FontFamily. When Setting custom font in UWP use the format (FontFamily = "Assets/Lobster-Regular.ttf#Lobster").

## Appointments

[SfSchedule](#) control has a built-in capability to handle the appointment arrangement internally based on the [ScheduleAppointmentCollection](#). [ScheduleAppointment](#) is a class, which holds the details about the appointment to be rendered in schedule.

### C#

```
// Creating an instance for schedule appointment collection
ScheduleAppointmentCollection scheduleAppointmentCollection = new ScheduleAp
pointmentCollection();
//Adding schedule appointment in schedule appointment collection
scheduleAppointmentCollection.Add(new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 05, 08, 10, 0, 0),
    EndTime = new DateTime(2017, 05, 08, 12, 0, 0),
    Subject = "Meeting",
    Location = "Hutchison road",
});
//Adding schedule appointment collection to DataSource of SfSchedule
schedule.DataSource=scheduleAppointmentCollection;
```

### Mapping

Schedule supports full data binding to any type of IEnumerable source. Specify the [ScheduleAppointmentMapping](#) attributes to map the properties in the underlying data source to the schedule appointments.

Property Name	Description
-----	-----
-----	-----
-----	-----

<a href="#">StartTimeMapping</a>   This property is to map the property name of custom class which is equivalent for StartTime of ScheduleAppointment.
--

| [StartTimeZoneMapping](#) | This property is to map the property name of custom class which is equivalent for Start time zone of ScheduleAppointment. |

| [EndTimeMapping](#) | This property is to map the property name of custom class which is equivalent for EndTime of ScheduleAppointment. |

| [EndTimeZoneMapping](#) | This property is to map the property name of custom class which is equivalent for End time zone of ScheduleAppointment. |

| [SubjectMapping](#) | This property is to map the property name of custom class which is equivalent for Subject of ScheduleAppointment. |

| [ColorMapping](#) | This property is to map the property name of custom class which is equivalent for Color of ScheduleAppointment. |

| [IsAllDayMapping](#) | This property is to map the property name of custom class which is equivalent for IsAllDay of ScheduleAppointment. |

| [RecurrenceRuleMapping](#) | This property is to map the property name of custom class which is equivalent for RecurrenceRule of ScheduleAppointment. |

| [NotesMapping](#) | This property is to map the property name of custom class which is equivalent for Notes of ScheduleAppointment. |

| [LocationMapping](#) | This property is to map the property name of custom class which is equivalent for Location of ScheduleAppointment. |

| [IsRecursiveMapping](#) | This property is to map the property name of custom class which is equivalent for IsRecursive of ScheduleAppointment. |

| [MinHeightMapping](#) | This property is to map the property name of custom class which is equivalent for MinHeight of ScheduleAppointment. |

| [ResourceIdsMapping](#) | This property is to map the property name of custom class which is equivalent for ResourceIds of ScheduleAppointment. |

---

**Note:** CustomAppointment class should contain two DateTime fields and a string field as mandatory.

---

#### *Creating custom Appointments*

You can create a custom class `Meeting` with mandatory fields `From`, `To` and `EventName`.

#### **C#**

```
/// <summary>
/// Represents custom data properties.
/// </summary>
public class Meeting
{
    public string EventName { get; set; }
    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public Color Color { get; set; }
}
```

---

**Note:** You can inherit this class from `INotifyPropertyChanged` for dynamic changes in custom data.

---

You can map those properties of `Meeting` class with our `SfSchedule` control by using [AppointmentMapping](#).

#### XML

```
<syncfusion:SfSchedule x:Name="schedule" ScheduleView="DayView" DataSource="{Binding Meetings}">
  <syncfusion:SfSchedule.AppointmentMapping>
    <syncfusion:ScheduleAppointmentMapping
      SubjectMapping="EventName"
      ColorMapping="Color"
      StartTimeMapping="From"
      EndTimeMapping="To">
    </syncfusion:ScheduleAppointmentMapping>
  </syncfusion:SfSchedule.AppointmentMapping>
</syncfusion:SfSchedule>
```

#### C#

```
//Schedule data mapping for custom appointments
ScheduleAppointmentMapping dataMapping = new ScheduleAppointmentMapping();
dataMapping.SubjectMapping = "EventName";
dataMapping.StartTimeMapping = "From";
dataMapping.EndTimeMapping = "To";
dataMapping.ColorMapping = "Color";
schedule.AppointmentMapping = dataMapping;
```

You can schedule meetings for a day by setting `From` and `To` of `Meeting` class. Create meetings of type `ObservableCollection<Meeting>` and assign those appointments collection `Meetings` to the `DataSource` property which is of `IEnumerable` type.

#### C#

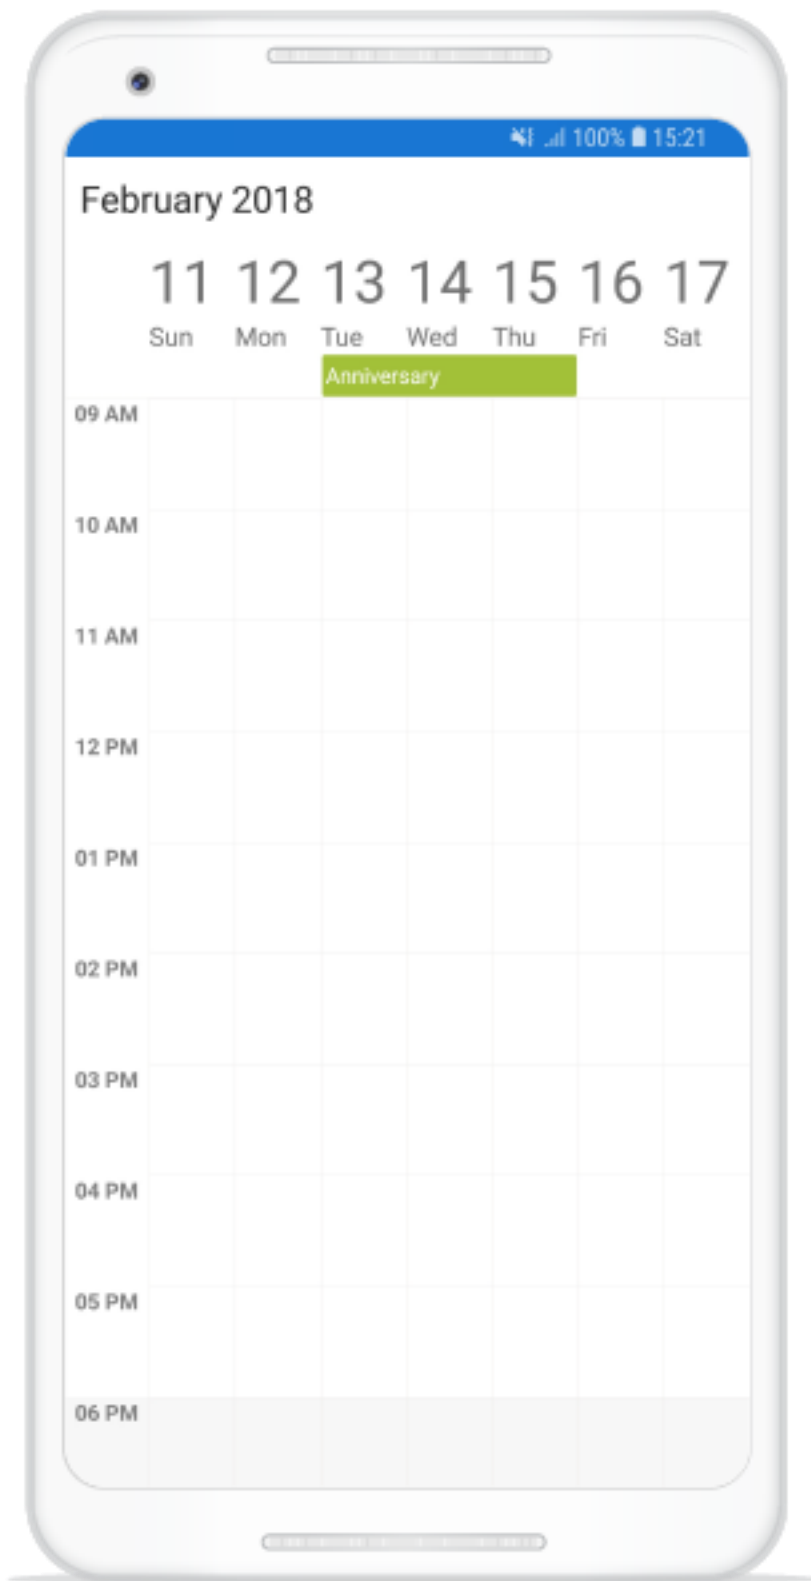

```
// Creating instance for custom appointment class
Meeting meeting = new Meeting();
// Setting start time of an event
meeting.From = new DateTime(2017, 05, 08, 10, 0, 0);
// Setting end time of an event
meeting.To = meeting.From.AddHours(1);
// Setting start time for an event
meeting.EventName = "Anniversary";
// Setting color for an event
meeting.Color = Color.Green;
// Creating instance for collection of custom appointments
var Meetings = new ObservableCollection<Meeting>();
// Adding a custom appointment in CustomAppointmentCollection
Meetings.Add(meeting);
// Adding custom appointments in DataSource of SfSchedule
schedule.DataSource = Meetings;
```

#### Spanned Appointments

Spanned Appointment is an appointment which lasts more than 24 hours. It doesn't block out time slots in `SfSchedule`, it will render in [All-Day appointment](#) panel exclusively.

**C#**

```
public ObservableCollection<Meeting> Meetings { get; set; }  
// Creating instance for collection of custom appointments  
Meetings = new ObservableCollection<Meeting>();  
// Creating instance for custom appointment class  
Meeting meeting = new Meeting();  
// Setting start time of an event  
meeting.From = new DateTime(2017,05,08, 10, 0, 0);  
// Setting end time of an event  
meeting.To = meeting.From.AddDays(2).AddHours(1);  
// Setting start time for an event  
meeting.EventName = "Anniversary";  
// Setting color for an event  
meeting.Color = Color.Green;  
// Adding a custom appointment in CustomAppointmentCollection  
Meetings.Add(meeting);  
//Adding schedule appointment collection to DataSource of SfSchedule  
schedule.DataSource= Meetings ;
```

### All Day Appointments

All-Day appointment is an appointment which is scheduled for a whole day. It can be set by using `IsAllDay` property in the `ScheduleAppointment`.

#### C#

```
// Creating an instance for schedule appointment collection
ScheduleAppointmentCollection scheduleAppointmentCollection = new ScheduleAp
pointmentCollection();
//Adding schedule appointment in schedule appointment collection
scheduleAppointmentCollection.Add(new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 05, 08, 10, 0, 0),
    EndTime = new DateTime(2017, 05, 10, 12, 0, 0),
    Subject = "Meeting",
    Location = "Hutchison road",
    IsAllDay = true
});
//Adding schedule appointment collection to DataSource of SfSchedule
schedule.DataSource=scheduleAppointmentCollection;
```

#### NOTE

Appointment which lasts through an entire day (exact 24 hours) will be considered as all day appointment without setting `IsAllDay` property. For example 06/09/2018 12:00AM to 06/10/2018 12:00AM.

#### All-Day Appointment Panel

All-day appointment and Spanned appointment doesn't block out entire time slot in SfSchedule, rather it will render in separate layout exclusively for all-day appointment. It can be enabled by setting `ShowAllDay` property of `DayViewSettings`, `WeekViewSettings` and `WorkWeekViewSettings` of `DayView`, `WeekView` and `WorkWeekView` respectively.

#### C#

```
schedule.ScheduleView = ScheduleView.WeekView;
WeekViewSettings weekViewSeetings = new WeekViewSettings();
weekViewSeetings.ShowAllDay = true;
schedule.WeekViewSettings = weekViewSeetings;
```

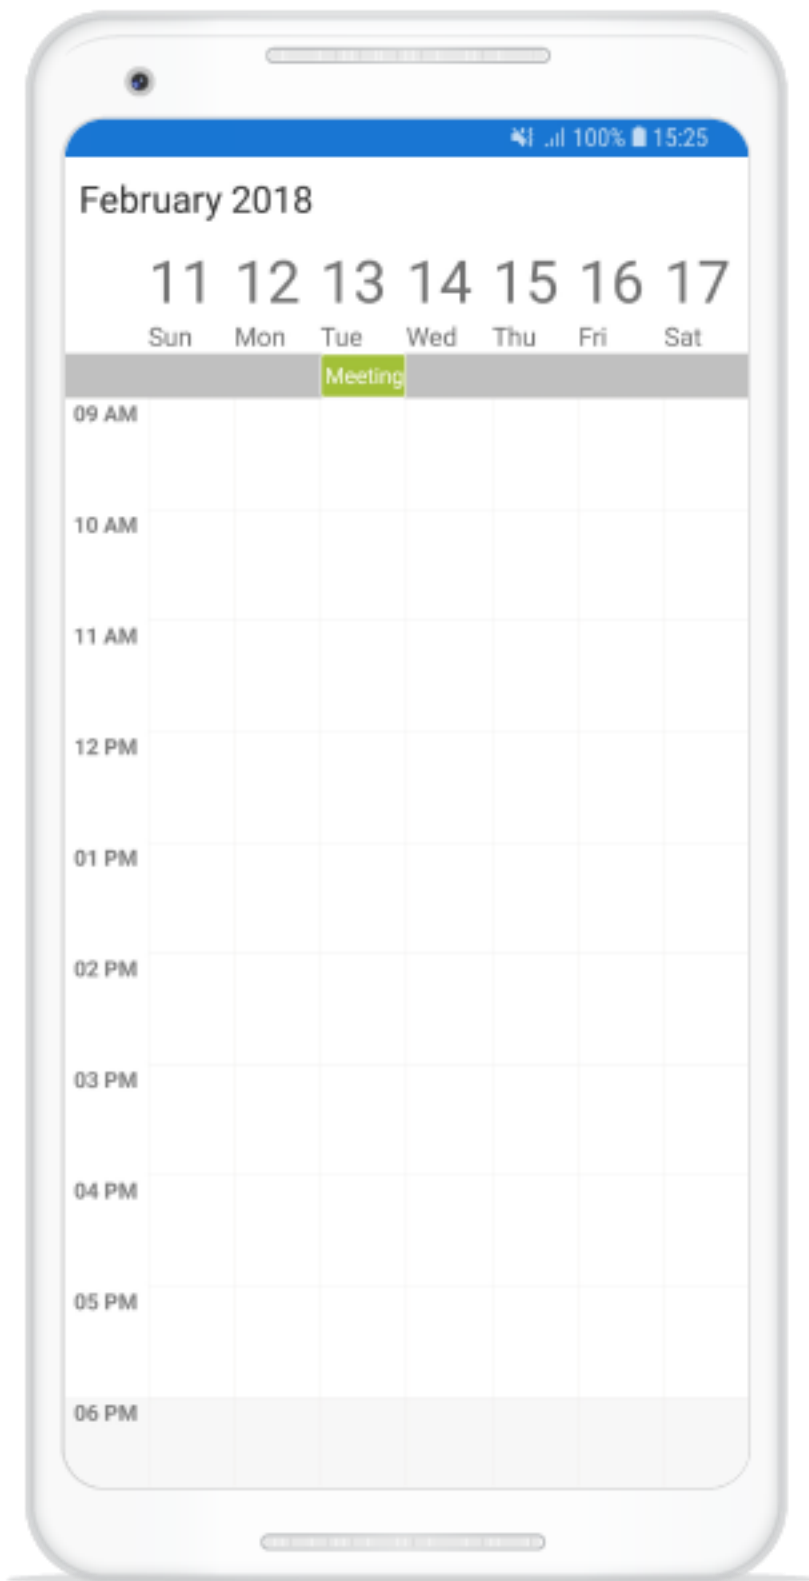

#### NOTE

Appointments which lasts less than 24 hours with different start date and end date will be rendered in time slot.

All-Day panel background can be customized by setting `AllDayAppointmentLayoutColor` of the respective view settings.

#### C#

```
weekViewSeetings.AllDayAppointmentLayoutColor = Color.Silver;
```

### Recurrence Appointment

Recurring appointment on a daily, weekly, monthly, or yearly interval. Recurring appointments can be created by setting **RecurrenceRule** property in Schedule appointments.

#### Recurrence Rule

The **RecurrenceRule** is a string value, that contains the details of the recurrence appointments like repeat type - daily/weekly/monthly/yearly, how many times it needs to be repeated, the interval duration and also the time period to render the appointment, etc.

**RecurrenceRule** has the following properties and based on this property value, the recurrence appointments are rendered in the SfSchedule control with its respective time period.

Property Name	Purpose
<b>FREQ</b>	Maintains the Repeat type value of the appointment. (Example: Daily, Weekly, Monthly, Yearly, Every week day) Example: FREQ=DAILY;INTERVAL=1
<b>INTERVAL</b>	Maintains the interval value of the appointments. For example, when you create the daily appointment at an interval of 2, the appointments are rendered on the days Monday, Wednesday and Friday. (creates the appointment on all days by leaving the interval of one day gap) Example: FREQ=DAILY;INTERVAL=1
<b>COUNT</b>	It holds the appointment's count value. For example, when the recurrence appointment count value is 10, it means 10 appointments are created in the recurrence series. Example: FREQ=DAILY;INTERVAL=1;COUNT=10
<b>UNTIL</b>	This property is used to store the recurrence end date value. For example, when you set the end date of appointment as 6/30/2014, the UNTIL property holds the end date value when the recurrence actually ends. Example: FREQ=DAILY;INTERVAL=1;UNTIL=8/25/2014
<b>BYDAY</b>	It holds the "DAY" values of an appointment to render. For example, when you create the weekly appointment, select the day(s) from the day options (Monday/Tuesday/Wednesday/Thursday/Friday/Saturday/Sunday). When Monday is selected, the first two letters of the selected day "MO" is stored in the "BYDAY" property. When you select multiple days, the values are separated by commas. Example: FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE;COUNT=10
<b>BYMONTHDAY</b>	This property is used to store the date value of the Month while creating the Month recurrence appointment. For example, when you create a Monthly recurrence appointment in the date 3, it means the BYMONTHDAY holds the value 3 and creates the appointment on 3rd day of every month. Example: FREQ=MONTHLY;BYMONTHDAY=3;INTERVAL=1;COUNT=10
<b>BYMONTH</b>	This property is used to store the index value of the selected Month while creating the yearly appointments. For example, when you create the yearly appointment in the Month June, it means the index value for June month is 6 and it is stored in the BYMONTH field. The appointment is created on every 6th month of a year. Example: FREQ=YEARLY;BYMONTHDAY=16;BYMONTH=6;INTERVAL=1;COUNT=10

| BYSETPOS | This property is used to store the index value of the week. For example, when you create the monthly appointment in second week of the month, the index value of the second week (2) is stored in BYSETPOS. Example: FREQ=MONTHLY;BYDAY=MO;BYSETPOS=2;UNTIL=8/11/2014 |

#### *Recurrence Pattern*

Recurrence pattern used in the control are in iCal standard. Schedule control supports all four types of [recurrence patterns](#). You can set the recurrence pattern using [RecurrenceType](#) property of [RecurrenceRule](#).

RecurrenceType	RecurrenceProperties	Description
-----	-----	-----
Daily	<a href="#">Interval</a>	Gets or sets the day interval on which recurrence has to be set.
Weekly	<a href="#">Interval</a>	Gets or sets the day interval on which recurrence has to be set.
	<a href="#">DayOfWeek</a>	Gets or sets the day of week on which recurrence has to be set.
	<a href="#">WeekDays</a>	Gets or sets the <a href="#">day/days</a> in a week on which recurrence has to be set.
	<a href="#">Week</a>	Gets or sets the week of month on which recurrence has to be set.
Monthly	<a href="#">Interval</a>	Gets or sets the day interval on which recurrence has to be set.
	<a href="#">DayOfWeek</a>	Gets or sets the day of week on which recurrence has to be set.
	<a href="#">Week</a>	Gets or sets the week of month on which recurrence has to be set.
	<a href="#">DayOfMonth</a>	Gets or sets the day on which recurrence has to be set for every month.
Yearly	<a href="#">Interval</a>	Gets or sets the day interval on which recurrence has to be set.
	<a href="#">DayOffMonth</a>	Gets or sets the day on which recurrence has to be set for every month.
	<a href="#">DayOfWeek</a>	Gets or sets the day of week on which recurrence has to be set.
	<a href="#">Month</a>	Gets or sets the specific month of year on which recurrence has to be set.
	<a href="#">Week</a>	Gets or sets the week of month on which recurrence has to be set.
Common	<a href="#">RecurrenceRange</a>	Gets or sets the type of the <a href="#">recurrence range</a> for the time limit of recurrence appointment.

	<a href="#">RecurrenceCount</a>   Gets or sets the count for recurring appointment.	
	<a href="#">StartDate</a>   Gets or sets the date to start the recurrence appointment.	
	<a href="#">EndDate</a>   Gets or sets the date to end the recurrence appointment.	

Find the following **RecurrenceRule** possibilities available in the Schedule control while creating the recurrence appointment.

PossibilityType	Description	RecurrenceProperties	Examples
-----------------	-------------	----------------------	----------

-----	-----	-----
-----	-----	-----

Daily	Appointment is created with Ends Never	RecurrenceType = RecurrenceType.Daily, Interval = 1, RecurrenceRange = RecurrenceRange.NoEndDate	FREQ=DAILY; INTERVAL=1
-------	--	--	------------------------

	Appointment is created with Ends After	RecurrenceType = RecurrenceType.Daily, Interval = 1, RecurrenceRange = RecurrenceRange.Count, RecurrenceCount = 15	FREQ=DAILY; INTERVAL=1; COUNT=5
--	--	--	---------------------------------

	Appointment is created with Ends On	RecurrenceType = RecurrenceType.Daily, Interval = 1, RecurrenceRange = RecurrenceRange.EndDate, EndDate = new DateTime(2017, 06, 20)	FREQ=DAILY; INTERVAL=1; UNTIL=06/20/2017
--	-------------------------------------	--	--

	Appointment is created with Every (Interval)	RecurrenceType = RecurrenceType.Daily, Interval = 2, RecurrenceRange = RecurrenceRange.Count, RecurrenceCount = 10	FREQ=DAILY; INTERVAL=2; COUNT=10
--	--	--	----------------------------------

Weekly	Appointment is created with Ends Never	RecurrenceType = RecurrenceType.Weekly, Interval = 1, WeekDays = WeekDays.Monday	WeekDays.Wednesday   WeekDays.Friday, RecurrenceRange = RecurrenceRange.NoEndDate	FREQ=WEEKLY; INTERVAL=1; BYDAY=MO, WE, FR
--------	--	--	---	---

	Appointment is created with Ends After	RecurrenceType = RecurrenceType.Weekly, Interval = 1, WeekDays = WeekDays.Thursday, RecurrenceRange = RecurrenceRange.Count, RecurrenceCount = 10	FREQ=WEEKLY; INTERVAL=1; BYDAY=TH; COUNT=10
--	--	---	---

	Appointment is created with Ends On	RecurrenceType = RecurrenceType.Weekly, Interval = 1, WeekDays = WeekDays.Monday, RecurrenceRange = RecurrenceRange.EndDate, EndDate = new DateTime(2017, 07, 20)	FREQ=WEEKLY; INTERVAL=1; BYDAY=MO; UNTIL=07/20/2017
--	-------------------------------------	---	---

	Appointment is created with selecting multiple day	RecurrenceType = RecurrenceType.Weekly, Interval = 2, WeekDays = WeekDays.Monday   WeekDays.Wednesday   WeekDays.Friday, RecurrenceRange = RecurrenceRange.Count, RecurrenceCount = 10	FREQ=WEEKLY; INTERVAL=2; BYDAY=MO, WE, FR; COUNT=10
--	--	--	---

Every Day	Appointment is created with Ends Never	RecurrenceType = RecurrenceType.Weekly, Interval = 1, WeekDays = WeekDays.Monday   WeekDays.Tuesday   WeekDays.Wednesday   WeekDays.Thursday   WeekDays.Friday , RecurrenceRange = RecurrenceRange.NoEndDate	FREQ=WEEKLY; BYDAY=MO, TU, WE, TH, FR
-----------	--	--	---------------------------------------

	Appointment is created with Ends After	RecurrenceType = RecurrenceType.Weekly, Interval = 1, WeekDays =
--	--	--

WeekDays.Monday | WeekDays.Tuesday | WeekDays.Wednesday | WeekDays.Thursday | WeekDays.Friday  
, RecurrenceRange = RecurrenceRange.Count, RecurrenceCount = 10 | FREQ=WEEKLY; BYDAY=MO, TU,  
WE, TH, FR; COUNT=10 |

| | Appointment is created with Ends On | RecurrenceType = RecurrenceType.Weekly, Interval = 1,

INTERVAL=1; COUNT=10 |

| | Appointment is created with selected date and month Ends On | RecurrenceType =  
RecurrenceType.Yearly, Interval = 1, Month = 12, DayOfMonth = 12, RecurrenceRange =  
RecurrenceRange.EndDate, EndDate = new DateTime(2018, 06, 11) | FREQ=YEARLY; BYMONTHDAY=12;  
BYMONTH=12; INTERVAL=1; UNTIL=06/11/2018 |

*Adding Recurrence Appointment using Recurrence Builder*

Schedule appointment [RecurrenceRule](#) is used to populate the required recurring appointment collection in a specific pattern. **RRULE** can be easily created through **RecurrenceBuilder** engine by using [RRuleGenerator](#) method in schedule.

**C#**

```
// Creating an instance for schedule appointment collection
ScheduleAppointmentCollection scheduleAppointmentCollection = new
ScheduleAppointmentCollection();
//Adding schedule appointment in schedule appointment collection
var scheduleAppointment = new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 05, 08, 10, 0, 0),
    EndTime = new DateTime(2017, 05, 08, 12, 0, 0),
    Subject = "Occurs every alternate day",
};
//Adding schedule appointment in schedule appointment collection
scheduleAppointmentCollection.Add(scheduleAppointment);
//Adding schedule appointment collection to DataSource of SfSchedule
schedule.DataSource=scheduleAppointmentCollection;
// Creating recurrence rule
RecurrenceProperties recurrenceProperties = new RecurrenceProperties();
recurrenceProperties.RecurrenceType = RecurrenceType.Daily;
recurrenceProperties.RecurrenceRange = RecurrenceRange.Count;
recurrenceProperties.Interval = 2;
recurrenceProperties.RecurrenceCount = 10;
scheduleAppointment.RecurrenceRule =
schedule.RRuleGenerator(recurrenceProperties, scheduleAppointment.StartTime,
scheduleAppointment.EndTime);
```

### Creating Custom Recurrence Appointment using Recurrence Builder

For creating custom recurrence appointment you need to create a custom class `Meeting` with mandatory fields `From`, `To`, `EventName` and `RecurrenceRule`.

#### C#

```

/// <summary>
/// Represents custom data properties.
/// </summary>
public class Meeting
{
    public string EventName { get; set; }
    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public Color Color { get; set; }
    public string RecurrenceRule { get; set; }
}

```

**Note:** You can inherit this class from `INotifyPropertyChanged` for dynamic changes in custom data.

You can map those properties of `Meeting` class with our `SfSchedule` control by using `ScheduleAppointmentMapping`.

#### XML

```
<syncfusion:SfSchedule x:Name="schedule" ScheduleView="DayView" DataSource="{Binding Meetings}">
  {Binding Meetings}>
</syncfusion:SfSchedule>
<syncfusion:SfSchedule.AppointmentMapping>
<syncfusion:ScheduleAppointmentMapping
  SubjectMapping="EventName"
  ColorMapping="Color"
  StartTimeMapping="From"
  EndTimeMapping="To"
  RecurrenceRuleMapping="RecurrenceRule">
</syncfusion:ScheduleAppointmentMapping>
</syncfusion:SfSchedule.AppointmentMapping>
</syncfusion:SfSchedule>
```

#### C#

```
// Schedule data mapping for custom appointments
ScheduleAppointmentMapping dataMapping = new ScheduleAppointmentMapping();
dataMapping.SubjectMapping = "EventName";
dataMapping.StartTimeMapping = "From";
dataMapping.EndTimeMapping = "To";
dataMapping.ColorMapping = "Color";
dataMapping.RecurrenceRuleMapping = "RecurrenceRule";
schedule.AppointmentMapping = dataMapping;
```

You can schedule recurring meetings for daily, weekly, monthly, or yearly interval by setting `RecurrenceRule` of `Meeting` class. Create meetings of type `ObservableCollection<Meeting>` and assign those appointments collection `Meetings` to the `DataSource` property which is of `IEnumerable` type.

#### C#

```
// Creating instance for custom appointment class
Meeting meeting = new Meeting();
// Setting start time of an event
meeting.From = new DateTime(2017, 06, 11, 10, 0, 0);
// Setting end time of an event
meeting.To = meeting.From.AddHours(2);
// Setting start time for an event
meeting.EventName = "Client Meeting";
// Setting color for an event
meeting.Color = Color.Green;
// Creating recurrence rule
RecurrenceProperties recurrenceProperties = new RecurrenceProperties();
recurrenceProperties.RecurrenceType = RecurrenceType.Weekly;
recurrenceProperties.RecurrenceRange = RecurrenceRange.Count;
recurrenceProperties.Interval = 1;
recurrenceProperties.WeekDays =
  WeekDays.Monday | WeekDays.Wednesday | WeekDays.Friday;
recurrenceProperties.RecurrenceCount = 10;
```

```

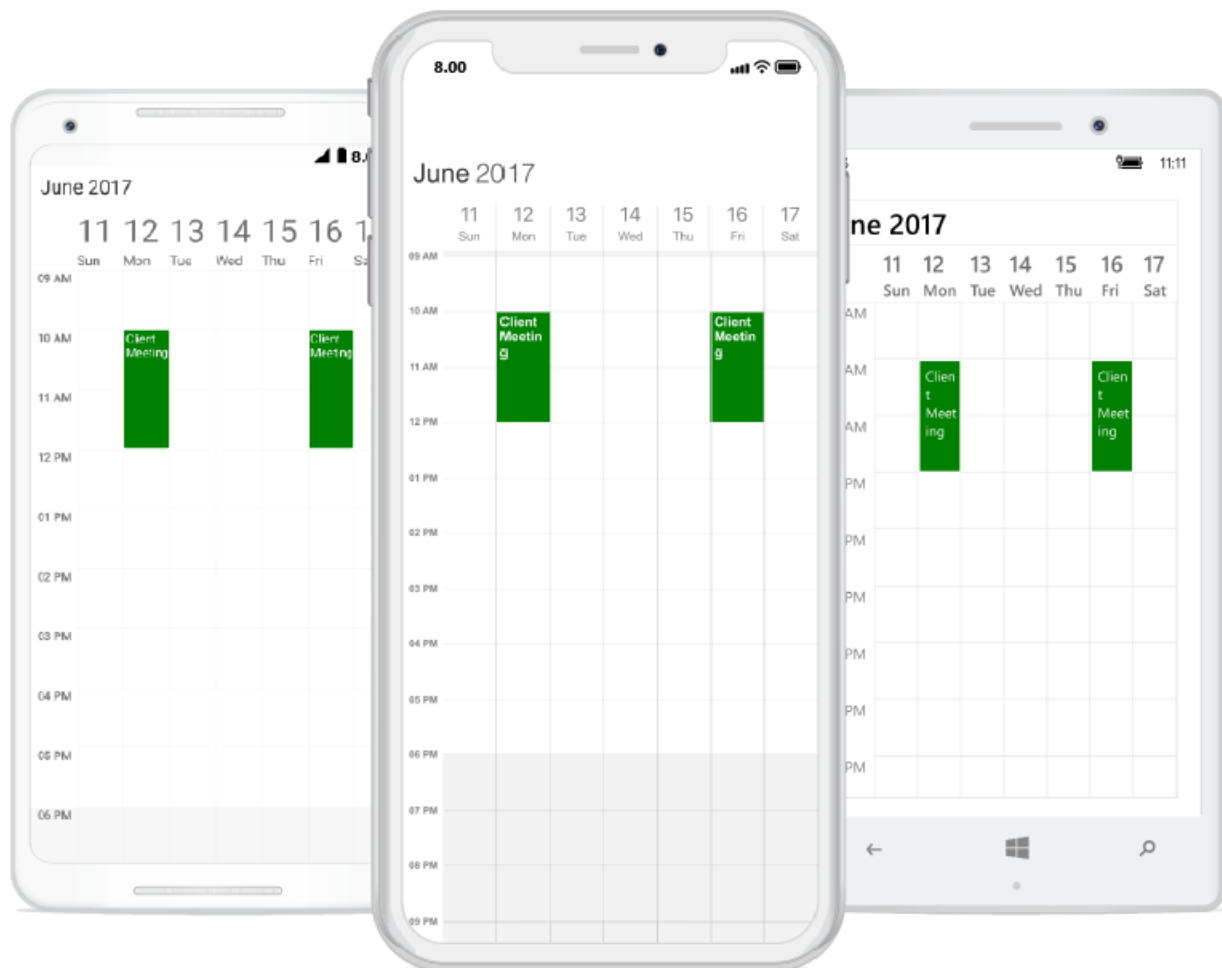

recurrenceProperties.RecurrenceRule =
schedule.RRuleGenerator(recurrenceProperties, meeting.From, Meeting.To);
// Setting recursive rule for an event
meeting.RecurrenceRule = recurrenceProperties.RecurrenceRule;
// Creating instance for collection of custom appointments
var Meetings = new ObservableCollection<Meeting>();
// Adding a custom appointment in CustomAppointmentCollection
Meetings.Add(meeting);
// Adding custom appointments in DataSource of SfSchedule
schedule.DataSource = Meetings;

```

You can download the entire source code of this demo for Xamarin.Forms from [here Recurrence Appointment](#).

## NOTE

In Schedule "Xamarin.Forms UWP", there is no need to set IsRecursive property for recurrence appointments. When a RecurrenceRule is set to schedule appointment, value of IsRecursive property will be set as true automatically for these appointments. So even if IsRecursive is set as false, there will be no effect on recurring appointments.

### *How to get the Recurrence editor field values from RRULE?*

You can get the Recurrence properties from **RRULE** using the [RRuleParser](#) method of **SfSchedule**.

#### **C#**

```
DateTime dateTime = new DateTime(2018, 5, 7, 9, 0, 0);
RecurrenceProperties recurrenceProperties =
schedule.RRuleParser("FREQ=DAILY; INTERVAL=1; COUNT=3", dateTime);
```

Recurrence properties retrieved from above method,

```
recurrenceProperties.RecurrenceType = RecurrenceType.Daily;
```

```
recurrenceProperties.Interval = 1;
```

```
recurrenceProperties.RecurrenceCount = 3;
```

```
recurrenceProperties.RecurrenceRange = RecurrenceRange.Count;
```

### *How to get the occurrences date time list of recurring appointment from RRULE?*

You can get the occurrences date time list of recurring appointment from **RRULE** using the [GetRecurrenceDateTimeCollection](#) method of **SfSchedule**.

#### **C#**

```
DateTime dateTime = new DateTime(2018, 5, 7, 9, 0, 0);
IEnumerable<DateTime> dateCollection =
schedule.GetRecurrenceDateTimeCollection("FREQ=DAILY; INTERVAL=1; COUNT=3",
dateTime);
```

Following occurrence dates can be retrieved from the given **RRULE**,

```
var date0 = 5/7/2018;
```

```
var date1 = 5/8/2018;
```

```
var date2 = 5/9/2018;
```

### *Recurrence Pattern Exceptions*

You can delete or change any recurrence pattern appointment by handling exception dates and exception appointments to that recurring appointment.

#### *Recurrence Exception Dates*

You can delete any occurrence appointment which is exception from the recurrence pattern appointment by adding exception dates to the recurring appointment.

#### *Recurrence Exception appointment*

You can also change any occurrence appointment which is exception from recurrence pattern appointment by adding the recurrence exception appointment in the schedule **DataSource**.

#### *Create recurrence exceptions for schedule appointment*

You can add/remove the recurrence exception appointments and recurrence exception dates to **ScheduleAppointment** by using its property, [RecurrenceExceptionDates](#), [RecurrenceId](#), [ExceptionOccurrenceActualDate](#).

Delete occurrence from recurrence pattern appointment or adding exception dates to recurrence pattern appointment

You can delete any of occurrence which is exception from recurrence pattern appointment by using **RecurrenceExceptionDates** property of **ScheduleAppointment**. The deleted occurrence date will be considered as recurrence exception dates.

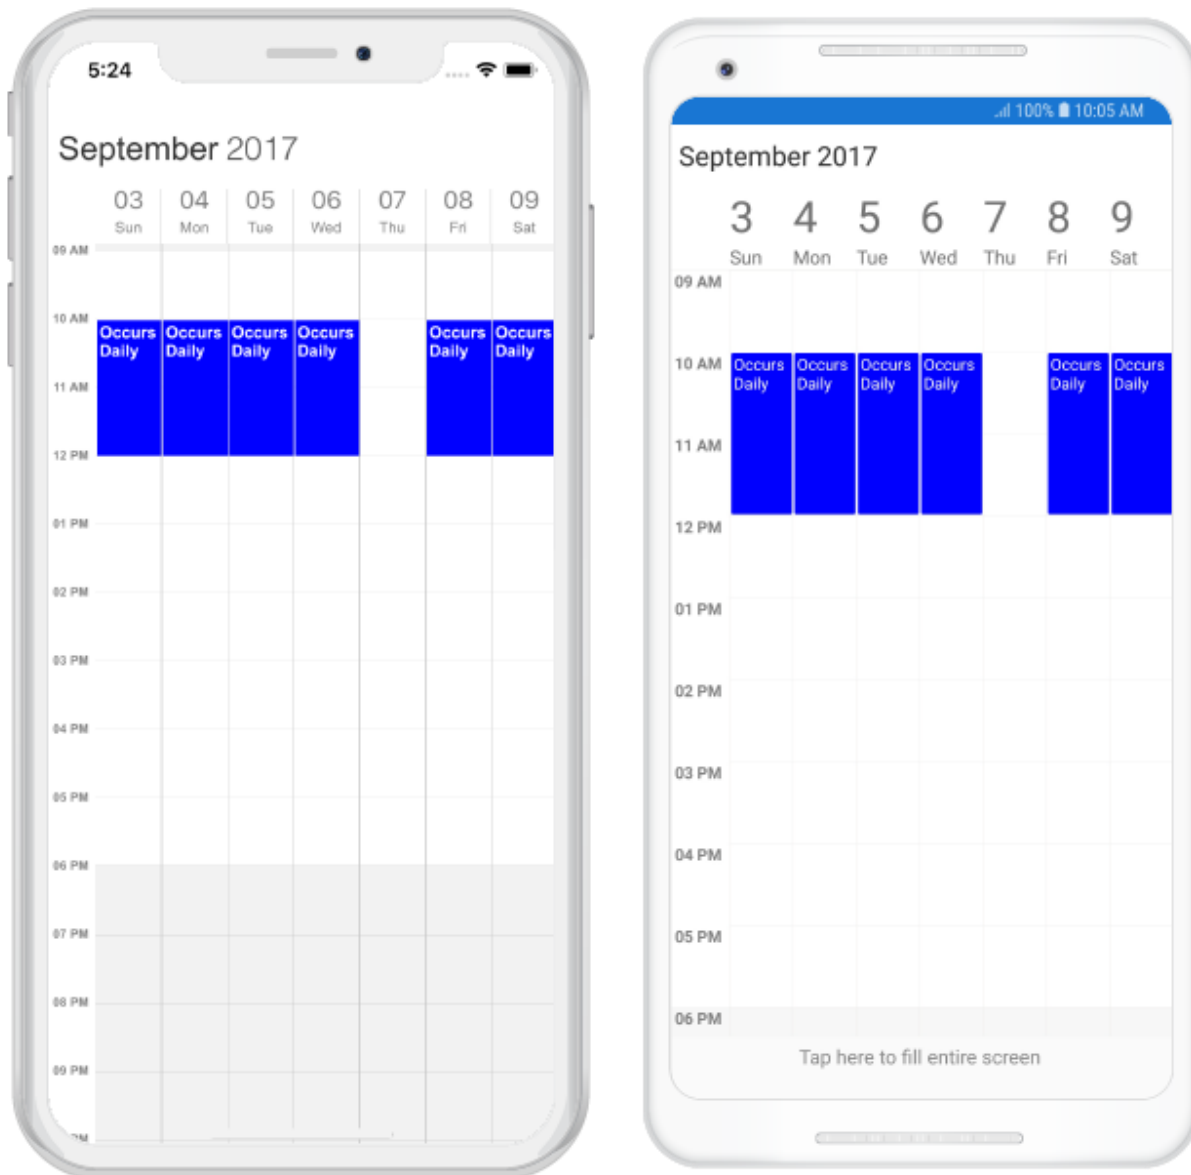

### C#

```
// Create the new exception date.
var exceptionDate = new DateTime(2017, 09, 07);
var recurrenceAppointment = new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 09, 01, 10, 0, 0),
    EndTime = new DateTime(2017, 09, 01, 12, 0, 0),
    Subject = "Occurs Daily",
    Color=Color.Blue
};
// Creating recurrence rule
recurrenceAppointment.RecurrenceRule = "FREQ=DAILY;COUNT=20";
// Add RecurrenceExceptionDates to appointment.
recurrenceAppointment.RecurrenceExceptionDates = new
ObservableCollection<DateTime>()
{
    exceptionDate
};
```

### NOTE

- Exception dates should be Universal Time Coordinates (UTC) time zone.
- You can also update the RecurrenceExceptionDates collection dynamically.

[Delete occurrence from recurrence pattern dynamically or add exception dates to recurrence pattern dynamically](#)

You can also delete any occurrence from the recurrence pattern appointment by adding exception date to the `RecurrenceExceptionDates` collection.

### C#

```
var recurrenceAppointment = scheduleAppointmentCollection[0];
recurrenceAppointment.RecurrenceExceptionDates.Add(new DateTime(2017, 09, 05));
```

[Add deleted occurrence to recurrence pattern dynamically or remove exception dates from recurrence pattern dynamically](#)

You can also add the deleted occurrence to the recurrence pattern appointment by removing exception date from the `RecurrenceExceptionDates` collection.

#### C#

```
var recurrenceAppointment = scheduleAppointmentCollection[0];
recurrenceAppointment.RecurrenceExceptionDates.RemoveAt(0);
```

#### NOTE

If you add the deleted occurrence to the recurrence pattern by removing exception date when any [exception appointment](#) has been created for the mentioned exception date, the respective exception appointment will be deleted by matching with `RecurrenceId` and `ExceptionOccurrenceActualDate` from Schedule `DataSource` and recurrence pattern appointment created for that exception date.

[Add all deleted occurrences to recurrence pattern dynamically or clear exception dates from recurrence pattern dynamically](#)

You can also add all deleted occurrences to the recurrence pattern appointment by clearing the exception dates from the `RecurrenceExceptionDates` collection.

#### C#

```
var recurrenceAppointment = scheduleAppointmentCollection[0];
recurrenceAppointment.RecurrenceExceptionDates.Clear();
```

[Add exception appointment to recurrence pattern](#)

You can change any occurrence appointment which is an exception from the recurrence pattern appointment by using the `RecurrenceId` property which is used to map the exception appointment with recurrence pattern appointment and `ExceptionOccurrenceActualDate` property which is used to mention the actual pattern occurrence date of exception appointment of `ScheduleAppointment`.

You should add the created exception recurrence appointment to the schedule [DataSource](#).

#### C#

```
// Create the new exception date.
var exceptionDate = new DateTime(2017, 09, 07);
var recurrenceAppointment = new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 09, 01, 10, 0, 0),
    EndTime = new DateTime(2017, 09, 01, 12, 0, 0),
    Subject = "Occurs Daily",
    Color = Color.Blue
};
// Creating recurrence rule
recurrenceAppointment.RecurrenceRule = "FREQ=DAILY;COUNT=20";
// Add RecurrenceExceptionDates to appointment.
recurrenceAppointment.RecurrenceExceptionDates = new
ObservableCollection<DateTime>()
{
    exceptionDate
};
```

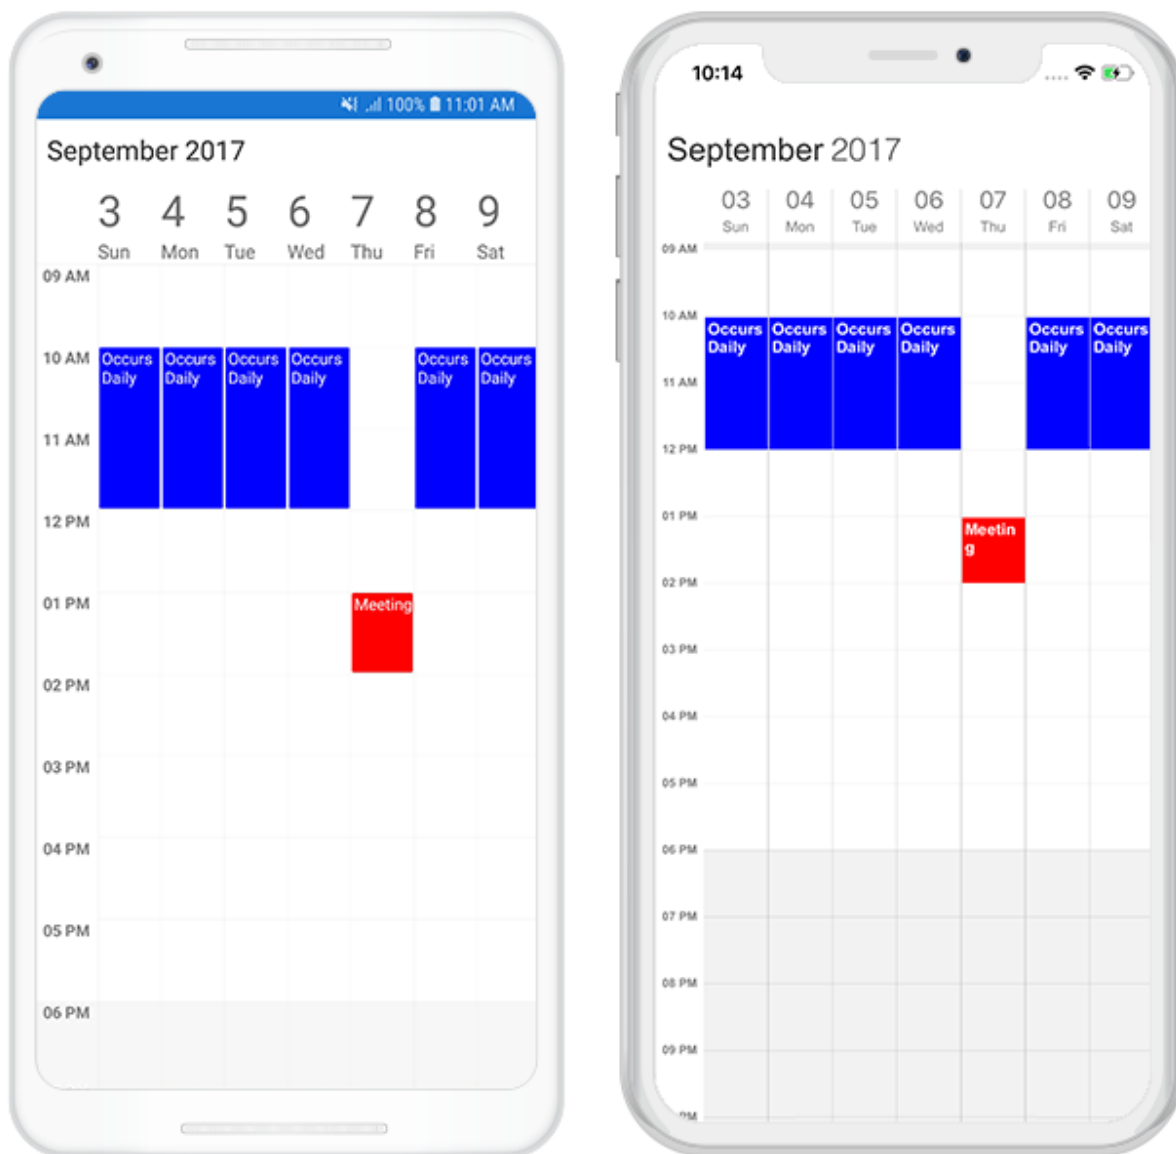

```
// Add exception appointment to the current recurrence pattern
var exceptionAppointment = new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 09, 07, 12, 0, 0),
    EndTime = new DateTime(2017, 09, 07, 14, 0, 0),
    Subject = "Meeting",
    Color = Color.Red,
    // Recurrence Id should be parent appointment object
    RecurrenceId = recurrenceAppointment,
    //Actual occurrence date
    ExceptionOccurrenceActualDate = exceptionDate
};
```

---

**NOTE**

---

- **RecurrenceId** should be a recurrence pattern appointment object.
- Exception appointment should be a normal appointment and should not be created as recurring appointment, since its occurrence is from recurrence pattern.
- **ExceptionOccurrenceActualDate** should be in Universal Time Coordinates (UTC) time zone.

#### Add exception appointment to recurrence pattern dynamically

You can also add exception appointment dynamically for added exception date by adding exception appointment to the schedule `DataSource` which is exception from the recurrence pattern appointment by using the `RecurrenceId` property which is used to map the exception appointment with recurrence pattern appointment and `ExceptionOccurrenceActualDate` property which is used to mention the actual pattern occurrence date of exception appointment of the `ScheduleAppointment` class.

#### C#

```
var recurrenceAppointment = scheduleAppointmentCollection[0];
var exceptionDate = new DateTime(2017, 09, 07);
// Add exception appointment to the current recurrence series
var exceptionAppointment = new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 09, 07, 12, 0, 0),
```

```

EndTime = new DateTime(2017, 09, 07, 14, 0, 0),
Subject = "Meeting",
Color = Color.Red,
RecurrenceId = recurrenceAppointment, // set the parent appointment to
recurrence Id
//Actual occurrence date
ExceptionOccurrenceActualDate = exceptionDate
};
//Adding exception appointment in schedule appointment collection
scheduleAppointmentCollection.Add(exceptionAppointment);

```

## NOTE

- **RecurrenceId** should be a recurrence pattern appointment object.
- Exception appointment should be a normal appointment and should not be created as recurring appointment, since its occurrence from recurrence pattern.
- **ExceptionOccurrenceActualDate** should be in Universal Time Coordinates (UTC) time zone.

[Remove exception appointment from recurrence pattern](#)

You can directly remove the added exception appointment for recurrence pattern by removing it from schedule **DataSource**.

## C#

```

var exceptionAppointment = scheduleAppointmentCollection[1];
//Remove exception appointment from schedule appointment collection
scheduleAppointmentCollection.Remove(exceptionAppointment);

```

You can download the entire source code of this demo for Xamarin.Forms from here [RecurrenceExceptions](#).

[Create recurrence exceptions for custom appointment](#)

You can add/remove the recurrence exception appointments and recurrence exception dates to the CustomAppointment, You can create a custom class Meeting(refer [DataBinding](#)) with mandatory fields **RecurrenceExceptionDates**, **ActualDate**, **RecurrenceId**.

[Delete occurrence from recurrence pattern appointment or adding exception dates to recurrence pattern appointment](#)

You can delete any occurrence which is exception from the recurrence pattern appointment by using the [RecurrenceExceptionDatesMapping](#) property of **ScheduleAppointmentMapping** class which is used to map the exception dates to the schedule recurrence appointment. The deleted occurrence date will be considered as recurrence exception dates.

To add the exception dates in the recurrence series of custom appointment, add the **RecurrenceExceptionDates** property to custom class **Meeting**.

## C#

```

public ObservableCollection<DateTime> RecurrenceExceptionDates { get; set; }
= new ObservableCollection<DateTime>();

```

You should map this custom property `RecurrenceExceptionDates` of custom class with the `RecurrenceExceptionDatesMapping` property of `ScheduleAppointmentMapping` class to map the exception dates to the schedule appointment.

### C#

```
// data mapping for custom appointments.
dataMapping.RecurrenceExceptionDatesMapping = "RecurrenceExceptionDates";
// Create the new exception date.
var exceptionDate = new DateTime(2017, 09, 07);
var recurrenceAppointment = new Meeting()
{
    From = new DateTime(2017, 09, 01, 10, 0, 0),
    To = new DateTime(2017, 09, 01, 12, 0, 0),
    EventName = "Occurs Daily",
    EventColor = Color.Blue
};
// Creating recurrence rule
recurrenceAppointment.RecurrenceRule = "FREQ=DAILY;COUNT=20";
// Add RecurrenceExceptionDates to appointment.
recurrenceAppointment.RecurrenceExceptionDates = new
ObservableCollection<DateTime>()
{
    exceptionDate
};
```

### NOTE

- Exception dates should be in Universal Time Coordinates (UTC) time zone.
- You can also dynamically update the custom property `RecurrenceExceptionDates` collection.

[Delete occurrence from recurrence pattern dynamically or add exception dates to recurrence pattern dynamically](#)

You can also delete any occurrence from the recurrence pattern appointment by adding exception date to the `RecurrenceExceptionDates` custom property collection.

#### C#

```
var recurrenceAppointment = eventCollection[0];
recurrenceAppointment.RecurrenceExceptionDates.Add(new DateTime(2017, 09, 05));
```

[Add deleted occurrence to recurrence pattern dynamically or remove exception dates from recurrence pattern dynamically](#)

You can also add the deleted occurrence to the recurrence pattern appointment by removing exception date from the `RecurrenceExceptionDates` custom property collection.

#### C#

```
var recurrenceAppointment = eventCollection[0];
recurrenceAppointment.RecurrenceExceptionDates.RemoveAt(0);
```

#### NOTE

If you add the deleted occurrence to the recurrence pattern by removing exception date when any [exception appointment](#) has been created for the mentioned exception date, the respective exception appointment will be deleted by matching with `RecurrenceId` and `ActualDate` from the schedule `DataSource` and recurrence pattern appointment created for that exception date.

[Add all deleted occurrence to recurrence pattern dynamically or clear exception dates from recurrence pattern dynamically](#)

You can also add all deleted occurrence to the recurrence pattern appointment by clearing the exception dates from the `RecurrenceExceptionDates` custom property collection.

#### C#

```
var recurrenceAppointment = eventCollection[0];
recurrenceAppointment.RecurrenceExceptionDates.Clear();
```

[Add exception appointment to recurrence pattern](#)

You can change any occurrence appointment which is exception from the recurrence pattern appointment by using the [RecurrenceIdMapping](#) property of `ScheduleAppointmentMapping` class which is used to map the custom exception appointment with schedule recurrence series appointment and [ExceptionOccurrenceActualDateMapping](#) property of `ScheduleAppointmentMapping` class which is used to mention the actual series occurrence date of exception appointment of schedule recurrence appointment.

For adding custom exception appointment to the recurrence series, add the `ActualDate` and `RecurrenceId` properties to custom class `Meeting`.

#### C#

```
public DateTime ActualDate { get; set; }
public object RecurrenceId { get; set; }
```

You should map this custom property `RecurrenceId` of `Meeting` with the `RecurrenceIdMapping` property of `ScheduleAppointmentMapping` class which is used to map the exception appointment with schedule recurrence series appointment `Meeting`.

You should also map this custom property `ActualDate` of `Meeting` with the `ExceptionOccurrenceActualDateMapping` property of `ScheduleAppointmentMapping` class which is used to mention the actual series occurrence date of exception appointment with schedule recurrence appointment.

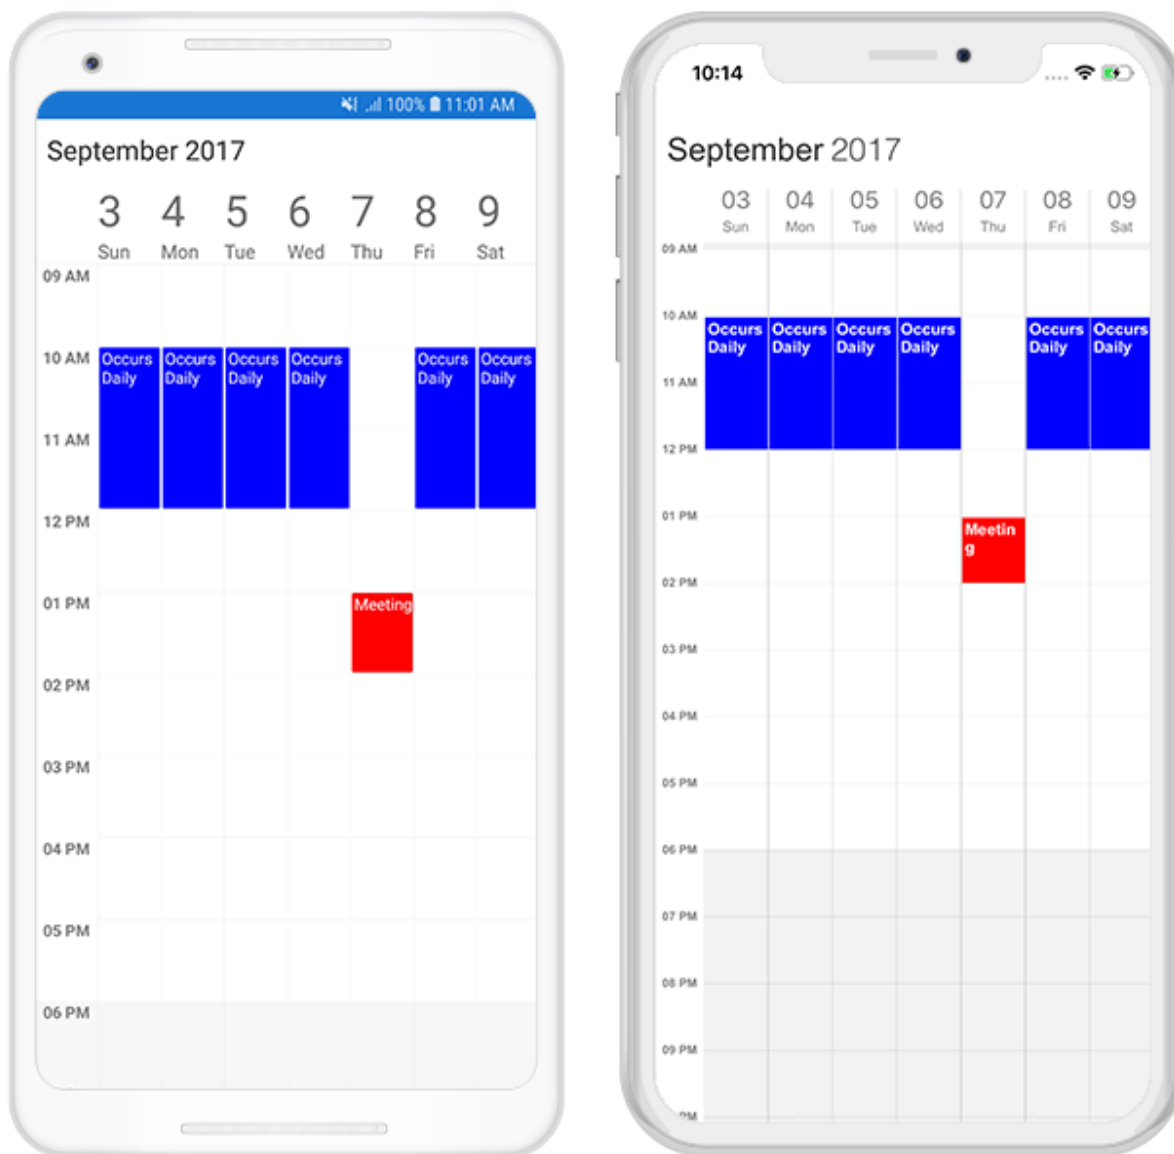

You should add the created exception recurrence appointment to the schedule `DataSource`.

### C#

```
// Create the new exception date.
var exceptionDate = new DateTime(2017, 09, 07);
//Adding schedule appointment in schedule appointment collection
var recurrenceAppointment = new Meeting()
{
    From = new DateTime(2017, 09, 01, 10, 0, 0),
    To = new DateTime(2017, 09, 01, 12, 0, 0),
    EventName = "Occurs Daily",
    EventColor = Color.Blue
};
recurrenceAppointment.RecurrenceRule = "FREQ=DAILY;COUNT=20";
// Add RecurrenceExceptionDates to appointment.
recurrenceAppointment.RecurrenceExceptionDates = new
ObservableCollection<DateTime>()
{
    exceptionDate
};
// Add exception appointment to the current recurrence series
var exceptionAppointment = new Meeting()
{
    From = new DateTime(2017, 09, 07, 12, 0, 0),
    To = new DateTime(2017, 09, 07, 14, 0, 0),
    EventName = "Meeting",
    EventColor = Color.Red,
    RecurrenceID = recurrenceAppointment,
    ActualDate = exceptionDate
};
```

### NOTE

- `RecurrenceId` should be a recurrence pattern appointment object.
- Exception appointment should be a normal appointment and should not be created as recurring appointment, since its occurrence from recurrence pattern.
- `ActualDate` should be in Universal Time Coordinates (UTC) time zone.

#### Add exception appointment to recurrence pattern dynamically

You can also add exception appointment dynamically for added exception date by adding exception appointment to the schedule `DataSource` by using the `RecurrenceIdMapping` property of `ScheduleAppointmentMapping` class which is used to map the custom exception appointment with schedule recurrence series appointment and `ExceptionOccurrenceActualDateMapping` property of the `ScheduleAppointmentMapping` class which is used to mention the actual series occurrence date of exception appointment of schedule recurrence appointment.

#### C#

```
var recurrenceAppointment = eventCollection[0];
var exceptionDate = new DateTime(2017, 09, 07);
// Add exception appointment to the current recurrence series
var exceptionAppointment = new Meeting()
{
```

```

From = new DateTime(2017, 09, 07, 12, 0, 0),
To = new DateTime(2017, 09, 07, 14, 0, 0),
EventName = "Meeting",
EventColor = Color.Red,
RecurrenceID = recurrenceAppointment, // set the parent appointment to
recurrence Id.
//Actual occurrence date
ActualDate = exceptionDate
};
eventCollection.Add(exceptionAppointment);

```

## NOTE

- **RecurrenceId** should be a recurrence pattern appointment object.
- Exception appointment should be a normal appointment and should not be created as recurring appointment, since its occurrence from recurrence pattern.
- **ActualDate** should be in Universal Time Coordinates (UTC) time zone.

### Remove exception appointment from recurrence pattern

You can directly remove the added exception appointment for recurrence pattern by removing from the schedule **DataSource**.

## C#

```

var exceptionAppointment = eventCollection[1];
eventCollection.Remove(exceptionAppointment);

```

You can download the entire source code of this demo for Xamarin.Forms from here [RecurrenceExceptions](#).

### Get visible appointments

You can get the list of visible appointments by using [GetVisibleAppointments](#) method available in schedule. It is applicable for all schedule views.

### Get visible appointments from given date time range

You can get the visible appointments in schedule by passing the start and end **DateTime** range to [GetVisibleAppointments](#) method.

## C#

```

List<ScheduleAppointment> visibleAppointments =
schedule.GetVisibleAppointments(new DateTime(2017, 05, 08, 10, 0, 0), new
DateTime(2017, 05, 12, 10, 0, 0));

```

### Get visible appointments from date time

You can get the visible appointments in schedule by passing **DateTime** to [GetVisibleAppointments](#) method.

## C#

```

List<ScheduleAppointment> visibleAppointments =
schedule.GetVisibleAppointments(new DateTime(2017, 05, 08, 10, 0, 0));

```

---

**NOTE**

---

- You can get the visible appointments after rendering the schedule only.
- The specified start/end Time ranges should lie on schedule current visible dates range.
- `GetVisibleAppointments` method will always returns the `List<ScheduleAppointment>` even if it has a custom appointment collection.

#### Suspend and resume the appointment update

Schedule allows you to suspend and resume the appointment UI update while performing collection changes (Add/Remove/Reset). [SuspendAppointmentUpdate](#) method will suspend appointment UI rendering until you resume it when large number of data added dynamically in schedule `DataSource` to avoid each time updating UI when collection changes. After data added dynamically in schedule, you can call [ResumeAppointmentUpdate](#) to update the appointment UI rendering.

**C#**

```
// Creating an instance for schedule appointment collection
ScheduleAppointmentCollection scheduleAppointmentCollection = new
ScheduleAppointmentCollection();
//Adding schedule appointment in schedule appointment collection
var scheduleAppointment = new ScheduleAppointment()
{
    StartTime = new DateTime(2017, 05, 08, 10, 0, 0),
    EndTime = new DateTime(2017, 05, 08, 12, 0, 0),
    Subject = "Project Discussion",
    Color=Color.Red
};
scheduleAppointmentCollection.Add(scheduleAppointment);
schedule.DataSource = scheduleAppointmentCollection;
//Trigger the visible dates changed event.
schedule.VisibleDatesChangedEvent+= Schedule_VisibleDatesChangedEvent;
private void Schedule_VisibleDatesChangedEvent(object sender,
VisibleDatesChangedEventArgs e)
{
    // Suspends the Appointment Update.
    schedule.SuspendAppointmentUpdate();
    for (int i = 0; i < e.visibleDates.Count; i++)
    {
        var visibleDate = e.visibleDates[i].Date;
        var scheduleAppointment = new ScheduleAppointment()
        {
            StartTime = visibleDate.AddHours(10),
            EndTime = visibleDate.AddHours(12),
            Subject = visibleDate.ToString("dd/MM/yyyy"),
            Color = Color.Red
        };
        scheduleAppointmentCollection.Add(scheduleAppointment);
    }
    // Resumes the Appointment Update.
    schedule.ResumeAppointmentUpdate();
}
```

### Appearance Customization

The default appearance of the appointment can be customized by using the [AppointmentStyle](#) property and [AppointmentLoadedEvent](#). The event and property is used to customize or override the default template of the Appointments.

- [Customize appearance using Style](#)
- [Customize appearance using Event](#)
- [Customize appearance using Custom View](#)
- [Customize appearance using DataTemplate](#)
- [Customize appearance using DataTemplateSelector](#)

#### *Customize appearance using Style*

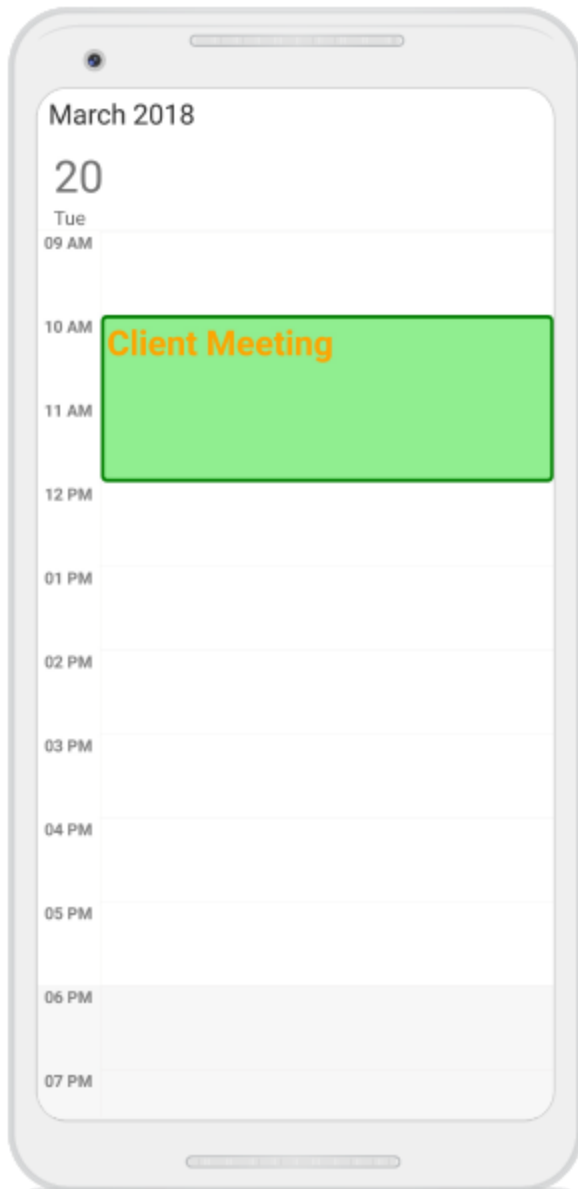

Schedule appointment can be customized by setting appointment style properties such as [TextColor](#), [FontFamily](#), [FontSize](#), [FontAttributes](#), [BorderColor](#), [BorderCornerRadius](#), [BorderWidth](#) to the [AppointmentStyle](#) property of [SfSchedule](#).

#### **XML**

```
<syncfusion:SfSchedule x:Name="schedule" ScheduleView="DayView"
DataSource="{Binding Meetings}">
<syncfusion:SfSchedule.AppointmentStyle>
<syncfusion:AppointmentStyle
BorderWidth="10"
TextColor="Red"
BorderCornerRadius="10"
FontSize = "25"
FontAttributes = "Bold"
FontFamily = "Arial"
BorderColor="Blue">
</syncfusion:AppointmentStyle>
</syncfusion:SfSchedule.AppointmentStyle>
</syncfusion:SfSchedule>
```

#### **C#**

```
//Creating Appointment style
AppointmentStyle appointmentStyle = new AppointmentStyle();
appointmentStyle.TextColor = Color.Red;
appointmentStyle.FontSize = 25;
appointmentStyle.FontAttributes = FontAttributes.Bold;
appointmentStyle.FontFamily = "Arial";
appointmentStyle.BorderColor = Color.Blue;
appointmentStyle.BorderCornerRadius = 12;
appointmentStyle.BorderWidth = 10;
//Setting Appointment Style
schedule.AppointmentStyle = appointmentStyle;
```

#### *Customize appearance using Event*

Schedule appointment can be customized during runtime using [OnAppointmentLoadedEvent](#). `ScheduleAppointment` style can be customized using the `appointmentStyle` property.

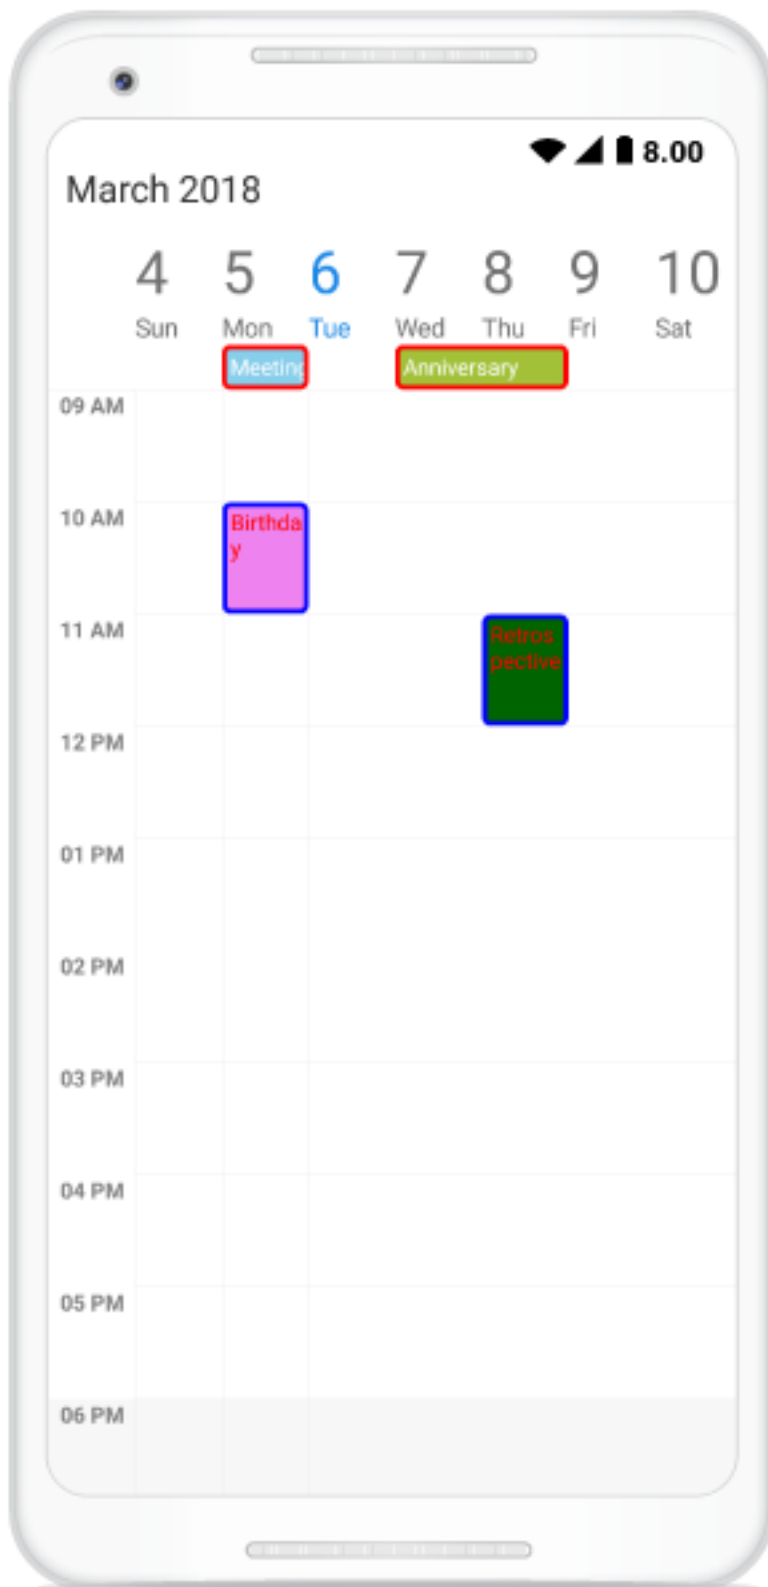

[AppointmentLoadedEventArgs](#) has below properties,

- [appointment](#) – Contains the appointments values.
- [appointmentStyle](#) – Gets and sets the appointments style.
- [view](#) - Sets the Custom UI for Appointments.
- [Bounds](#) – Contains the UI bounds of appointment.

#### **C#**

```
schedule.OnAppointmentLoadedEvent += Schedule_OnAppointmentLoadedEvent;
```

```
...  
private void Schedule_OnAppointmentLoadedEvent(object sender,  
AppointmentLoadedEventArgs args)  
{  
    if (args.appointment != null && (args.appointment as Meeting) != null &&  
        (args.appointment as Meeting).IsAllDay)  
    {  
        args.appointmentStyle.BorderColor = Color.Red;  
        args.appointmentStyle.TextColor = Color.White;  
        args.appointmentStyle.BorderCornerRadius = 12;  
        args.appointmentStyle.BorderWidth = 10;  
    }  
    else  
    {  
        args.appointmentStyle.BorderColor = Color.Blue;  
        args.appointmentStyle.TextColor = Color.Red;  
        args.appointmentStyle.BorderCornerRadius = 12;  
        args.appointmentStyle.BorderWidth = 10;  
    }  
}
```

---

**NOTE**

---

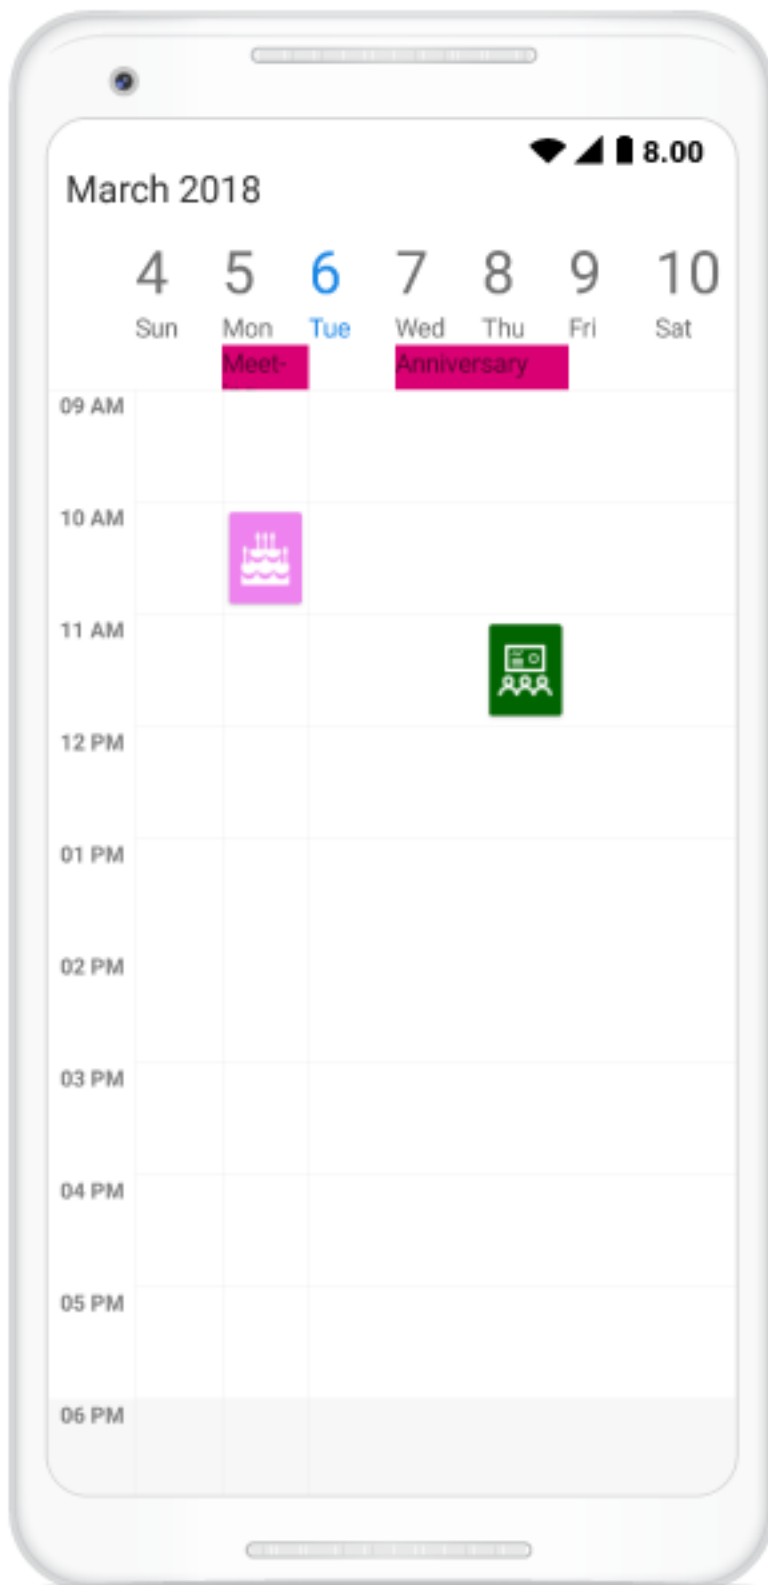

FontAttributes and FontFamily are native to the platform. Custom font and the font which are not available in the specified platform will not be applied.

#### Customize appearance using Custom View

Default appointment UI can be changed using `view` property passed through `AppointmentLoadedEventArgs`.

#### C#

```
schedule.OnAppointmentLoadedEvent += Schedule_OnAppointmentLoadedEvent;
private void Schedule_OnAppointmentLoadedEvent(object sender,
AppointmentLoadedEventArgs args)
{
    if(args.appointment == null || (args.appointment as Meeting) == null)
        return;
    if ((args.appointment as Meeting).IsAllDay)
    {
        Label label = new Label();
        label.BackgroundColor = (args.appointment as Meeting).Color;
        label.Text = (args.appointment as Meeting).EventName;
        args.view = label;
    }
    else if ((args.appointment as Meeting).EventName == "Retrospective" )
    {
        Button button = new Button();
        button.Image = "Meeting.png";
        button.BackgroundColor = (args.appointment as Meeting).EventName;
        args.view = button;
    }
    else
    {
        Button button = new Button();
        button.Image = "Cake.png";
        button.BackgroundColor = (args.appointment as Meeting).EventName;
        args.view = button;
    }
}
```

### Customize appearance using DataTemplate

The default appearance of the Appointment can be customized by using the [AppointmentTemplate](#) property of the Schedule.

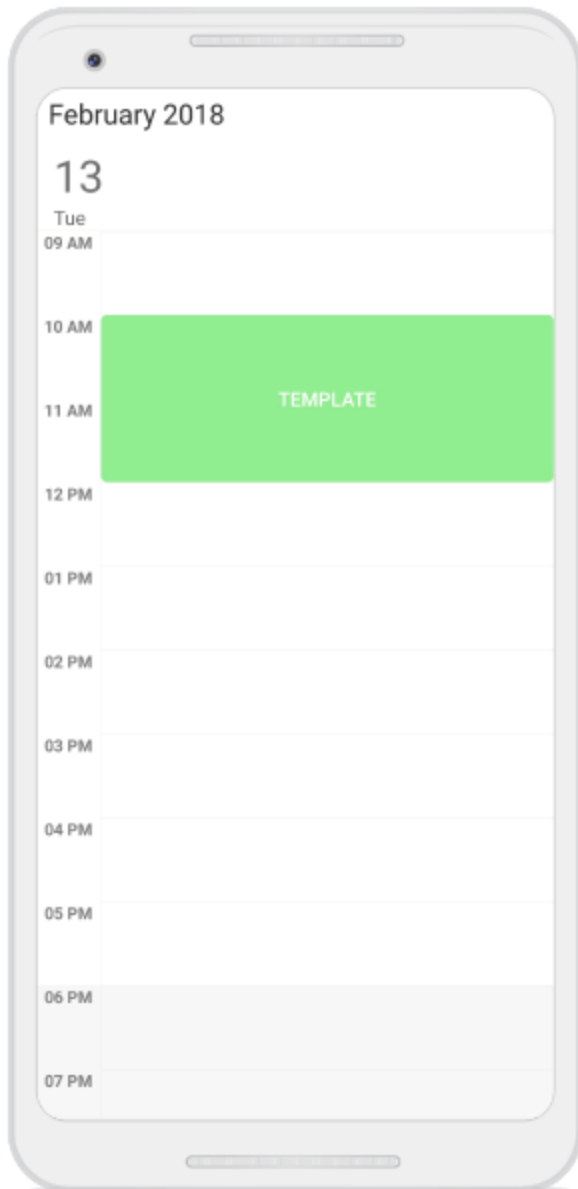

#### **XML**

```
<schedule:SfSchedule
x:Name="schedule"
AppointmentTemplate="{Binding AppointmentTemplate}">
<schedule:SfSchedule.BindingContext>
<samplelocal:DayAppointmentDataTemplate />
</schedule:SfSchedule.BindingContext>
</schedule:SfSchedule>
```

### Creating a DataTemplate

#### **C#**

```
public class DayAppointmentDataTemplate : DataTemplate
{
    public DataTemplate AppointmentTemplate { get; set; }
    public DayAppointmentDataTemplate()
    {
        AppointmentTemplate = new DataTemplate(() =>
        {
            return new Button
            {
                Text = "Template",
                TextColor = Color.White,
                BackgroundColor = Color.LightGreen
            };
        });
    }
}
```

### Customize appearance using DataTemplateSelector

**DataTemplateSelector** can be used to choose a **DataTemplate** at runtime based on the value of a data-bound to Schedule appointment property through **AppointmentTemplate**. It provides multiple DataTemplates to be enabled for Schedule appointments, to customize the appearance of particular Appointment.

#### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<samplelocal:AppointmentDataTemplateSelector
x:Key="appointmentDataTemplateSelector" />
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
```

```
<schedule:SfSchedule
AppointmentTemplate="{StaticResource appointmentDataTemplateSelector}">
<schedule:SfSchedule.BindingContext>
<samplelocal:AppointmentDataTemplateSelector />
</schedule:SfSchedule.BindingContext>
</schedule:SfSchedule>
</ContentPage.Content>
```

### Creating a DataTemplateSelector

#### C#

```
public class AppointmentDataTemplateSelector : DataTemplateSelector
{
    public DataTemplate DayAppointmentTemplate { get; set; }
    public DataTemplate AllDayAppointmentTemplate { get; set; }
    public AppointmentDataTemplateSelector()
    {
        DayAppointmentTemplate = new DataTemplate(typeof(DayAppointmentTemplate));
        AllDayAppointmentTemplate = new
        DataTemplate(typeof(AllDayAppointmentTemplate));
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject
    container)
    {
        if ((item as ScheduleAppointment).IsAllDay)
        return AllDayAppointmentTemplate;
        else
        return DayAppointmentTemplate;
    }
}
```

Used button to display day appointment and Label to display all day appointment.

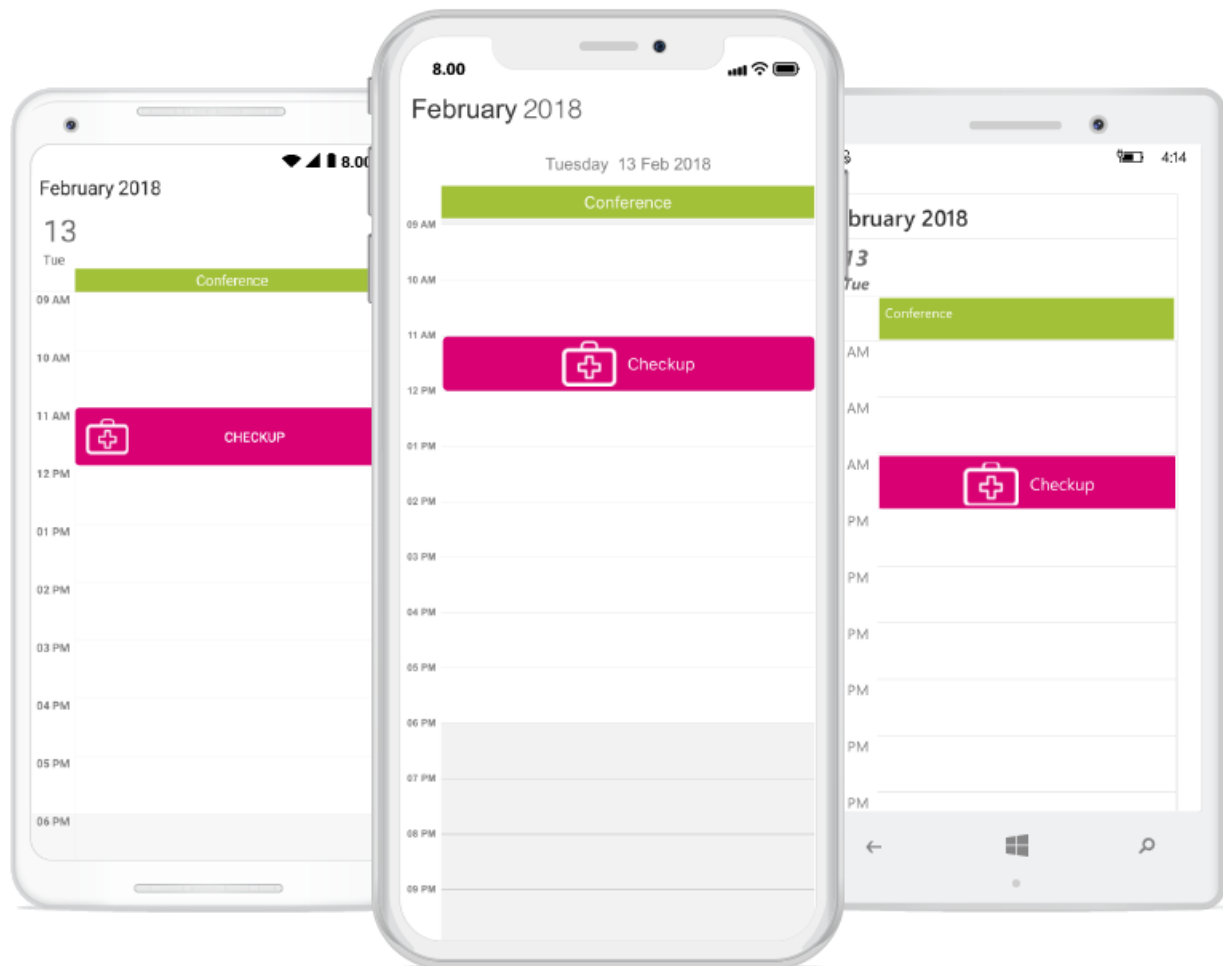

#### XML

```
<?xml version="1.0" encoding="UTF-8"?>
<!--<Button as Template for day Appointment>-->
<Button xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="ScheduleUG.DayAppointmentTemplate"
BackgroundColor="{Binding Color}"
HorizontalOptions="FillAndExpand"
VerticalOptions="FillAndExpand"
Text="{Binding Subject}"
TextColor="White"
Image="{Binding Subject}">
</Button>
.....
<?xml version="1.0" encoding="UTF-8"?>
<!--<Label as Template for all day Appointment>-->
<Label xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="ScheduleUG.AllDayAppointmentTemplate"
BackgroundColor="{Binding Color}"
Text="{Binding Subject}"
HorizontalOptions="FillAndExpand"
```

```

VerticalOptions="CenterAndExpand"
TextColor="White" FontSize="15"
HorizontalTextAlignment="Center"
VerticalTextAlignment="Center">
</Label>

```

### Customize Font Appearance

you can change the appearance of Font by setting the [FontFamily](#) property of [AppointmentStyle](#) property in Schedule.

### XML

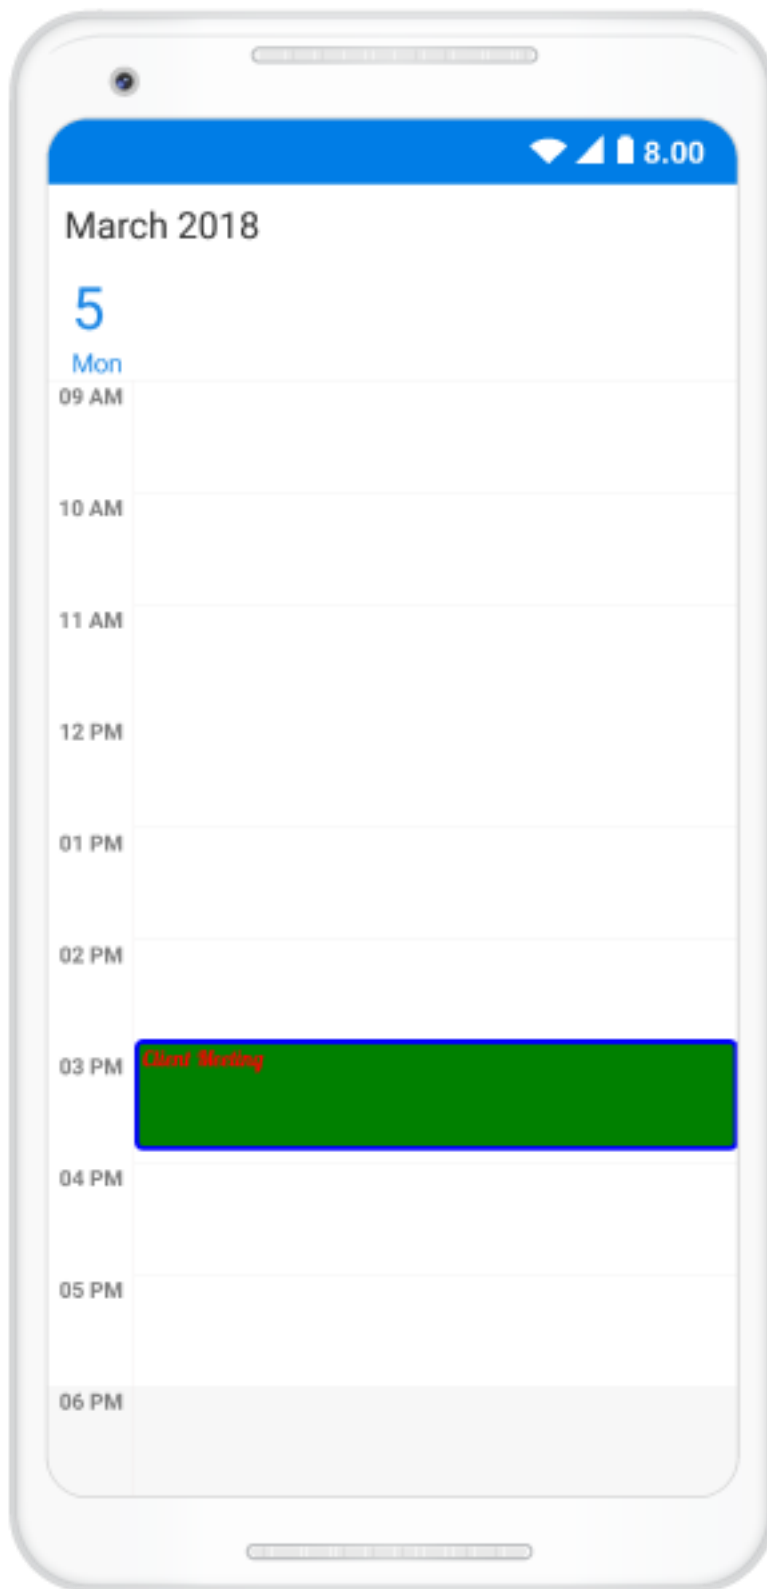

```

<schedule:AppointmentStyle.FontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf" WinPhone="Assets/Lobster-Regular.ttf#Lobster"
/>
</schedule:AppointmentStyle.FontFamily>

```

### C#

```
appointmentStyle.FontFamily = Device.OnPlatform("Lobster-Regular", "Lobster-  
Regular.ttf", "Assets/Lobster-Regular.ttf#Lobster");
```

Refer [this](#) to configure the custom fonts in Xamarin.Forms.

### Selection

Schedule control has built-in events to handle tapped, double tapped and long pressed touch actions.

- [CellTapped](#)
- [CellDoubleTapped](#)
- [CellLongPressed](#)

These events will be triggered while perform respective touch actions in timeslots, month cells and in appointments. All the three events contain the same argument [CellTappedEventArgs](#) which holds selected appointment and date time details in it.

- [Appointment](#) - Contains the selected appointment value when tapped on the appointment. It will be null when tapped on the timeslot. Selected occurrence of a recurring appointment's value will be same as the master appointment, except the date values. So selected occurrence's date can be obtained from the args.DateTime value.
- [Appointments](#) - Contains appointments value of Tapped month cell.
- [DateTime](#) - Contains selected time slot DateTime value.

---

N Occurrences can be handled from tapped event when single occurrence remains unmodified.

---

### C#

```
schedule.CellTapped += Schedule_CellTapped;
schedule.CellDoubleTapped += Schedule_CellDoubleTapped;
schedule.CellLongPressed += Schedule_CellLongPressed;
...
private void Schedule_CellTapped(object sender, CellTappedEventArgs e)
{
}
private void Schedule_CellDoubleTapped(object sender, CellTappedEventArgs e)
{
}
private void Schedule_CellLongPressed(object sender, CellTappedEventArgs e)
{
}
```

### Commands

Schedule commands allow data bindings to make method calls directly to a ViewModel, which supports tapped, double tapped, long pressed touch actions and visible date changed action.

- [CellTappedCommand](#)
- [CellDoubleTappedCommand](#)
- [CellLongPressedCommand](#)
- [VisibleDatesChangedCommand](#)

### XML

```
<schedule:SfSchedule
CellTappedCommand="{Binding ScheduleCellTapped}"
CellDoubleTappedCommand="{Binding ScheduleCellDoubleTapped}"
CellLongPressedCommand="{Binding ScheduleCellLongPressed}"
VisibleDatesChangedCommand="{Binding ScheduleVisibleDatesChanged}">
```

```
<schedule:SfSchedule.BindingContext>
<samplelocal:ScheduleViewModel />
</schedule:SfSchedule.BindingContext>
</schedule:SfSchedule>
```

## C#

```
public class ScheduleViewModel
{
    public ICommand ScheduleCellTapped { get; set; }
    public ICommand ScheduleCellDoubleTapped { get; set; }
    public ICommand ScheduleCellLongPressed { get; set; }
    public ICommand ScheduleVisibleDatesChanged { get; set; }
    public ScheduleViewModel()
    {
        ScheduleCellTapped = new Command<CellTappedEventArgs>(CellTapped);
        ScheduleCellDoubleTapped = new Command<CellTappedEventArgs>(DoubleTapped);
        ScheduleCellLongPressed = new Command<CellTappedEventArgs>(LongPressed);
        ScheduleVisibleDatesChanged = new
        Command<VisibleDatesChangedEventArgs>(VisibleDatesChanged);
    }
    private void CellTapped(CellTappedEventArgs args)
    {
        var selectedDateTime = args.Datetime;
    }
    private void DoubleTapped(CellTappedEventArgs args)
    {
        var selectedDateTime = args.Datetime;
    }
    private void LongPressed(CellTappedEventArgs args)
    {
        var selectedDateTime = args.Datetime;
    }
    private void VisibleDatesChanged(VisibleDatesChangedEventArgs args)
    {
        var visibleDates = args.visibleDates;
    }
}
```

### Selection customization

The default selection of an appointment can be customized by using [SelectionBorderColor](#), [SelectionTextColor](#) properties in [AppointmentStyle](#) property of [SfSchedule](#). The property is used to customize or override the default selection of the appointments.

**Note:** [BorderWidth](#) value must be set to highlight [SelectionBorderColor](#).

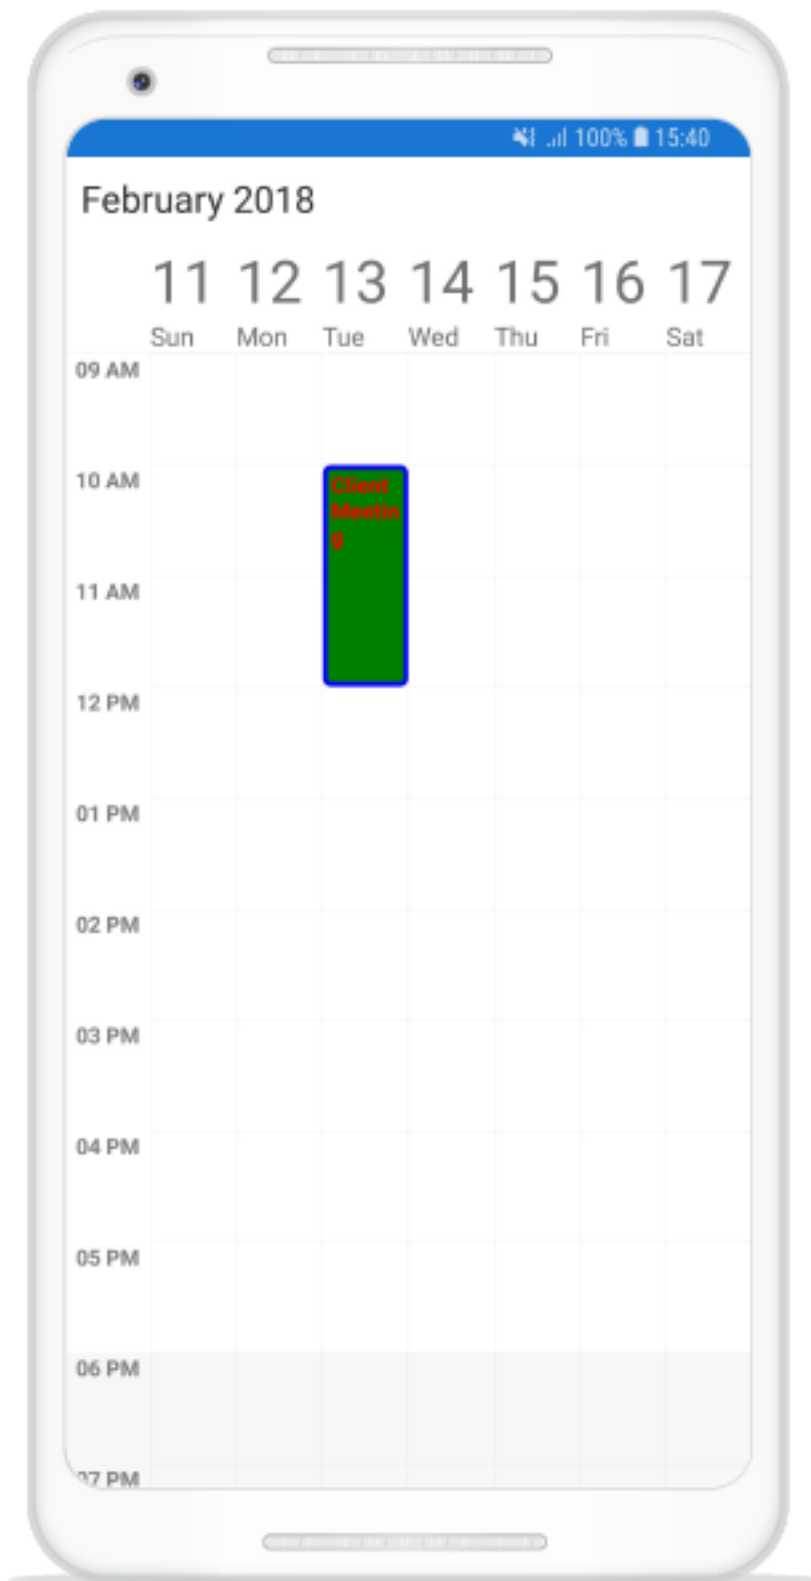

## XML

```
<syncfusion:SfSchedule x:Name="schedule" ScheduleView="DayView"
DataSource="{Binding Meetings}">
<syncfusion:SfSchedule.AppointmentStyle>
<syncfusion:AppointmentStyle
SelectionTextColor="Yellow"
SelectionBorderColor="Yellow">
</syncfusion:AppointmentStyle>
```

```
</syncfusion:SfSchedule.AppointmentStyle>  
</syncfusion:SfSchedule>
```

### **C#**

```
//Creating an appointment style  
AppointmentStyle appointmentStyle = new AppointmentStyle();  
appointmentStyle.SelectionBorderColor = Color.Yellow;  
appointmentStyle.SelectionTextColor = Color.Yellow;  
//Setting an appointment style  
schedule.AppointmentStyle = appointmentStyle;
```

### How to raise schedule events while using custom view for appointments?

You can raise schedule events such as `CellTapped`, `CellDoubleTapped`, `CellLongPressed` by using the `InputTransparent` property of custom view.

#### C#

```
// Raise cell tapped event.
schedule.CellTapped += Schedule_CellTapped;
// Raise Appointment Loaded event.
schedule.OnAppointmentLoadedEvent += Schedule_OnAppointmentLoadedEvent;
...
private void Schedule_OnAppointmentLoadedEvent(object sender,
AppointmentLoadedEventArgs e)
{
    var button = new Button { Text = "CustomView", BackgroundColor = Color.Blue
};
// Set input transparent to `true` to raise schedule inbuilt event.
button.InputTransparent = true;
e.view = button;
}
private void Schedule_CellTapped(object sender, CellTappedEventArgs e)
{
    DisplayAlert("", "Cell Tapping Raised", "ok");
}
```

#### NOTE

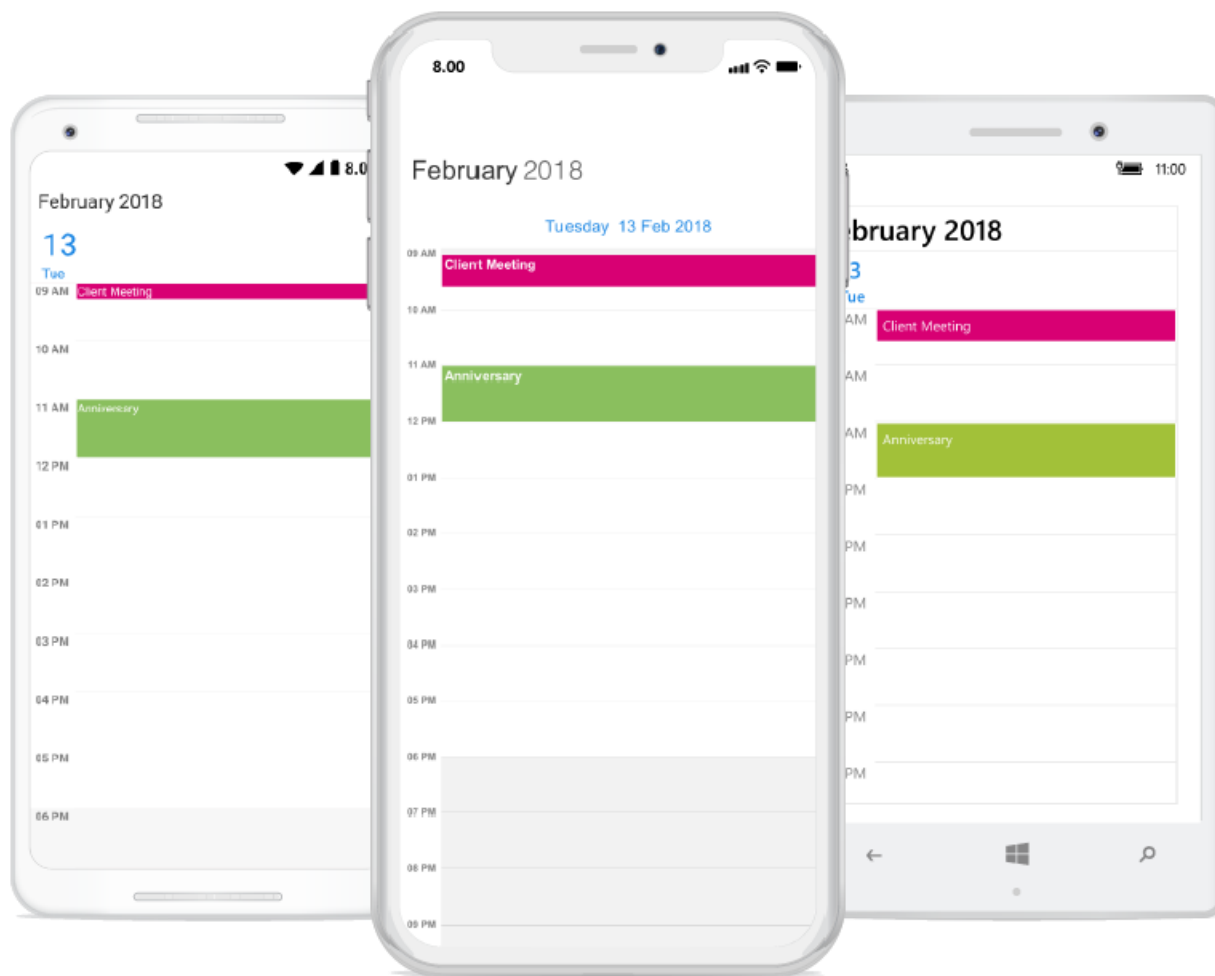

`InputTransparent` default value is false, custom view event will be raised by default.

#### Minimum Appointment Height

`MinHeight` of an appointment is to set an arbitrary height to appointments when it has minimum duration, so that the subject can be readable.

#### C#

```
schedule.ScheduleView = ScheduleView.DayView;
ScheduleAppointmentCollection scheduleAppointmentCollection = new
ScheduleAppointmentCollection();
scheduleAppointmentCollection.Add(new ScheduleAppointment()
{
    StartTime = new DateTime(2018, 2, 13, 09, 0, 0),
    EndTime = new DateTime(2018, 2, 13, 09, 0, 0),
    Subject = "Client Meeting",
    MinHeight = 30,
    Color = Color.FromHex("#FFD80073")
});
scheduleAppointmentCollection.Add(new ScheduleAppointment()
{
    StartTime = new DateTime(2018, 2, 13, 11, 0, 0),
    EndTime = new DateTime(2018, 2, 13, 12, 0, 0),
    Subject = "Anniversary",
    Color = Color.FromHex("#FFA2C139")
});
schedule.DataSource = scheduleAppointmentCollection;
this.Content = schedule;
```

---

**NOTE**

- **MinHeight** value will be set, when the an appointment height (duration) value lesser than MinHeight.
- Appointment height (duration) value will be set, when the appointment height (duration) value greater than **MinHeight**.
- TimeInterval value will be set, when Minimum Height greater than TimeInterval with lesser appointment height (duration).
- **MinHeight** has ScheduleAppointmentMapping Support.
- All day Appointment does not support **MinHeight**.

### Resource view

Resource view displays the resources as discrete views integrated with the scheduler to display appointments in all types of schedule views. It provides an intuitive user interface, which allows users to select single or multiple resources and display the events associated with the selected resources with efficient and effective utilization. Each resource can be assigned to a unique color to more easily identify the resource associated with an appointment.

You can add resources that can be assigned to appointments using the [ScheduleResources](#) property of SfSchedule. You need to set the [Name](#), [Id](#), and [Color](#) properties of [ScheduleResource](#) to create a resource.

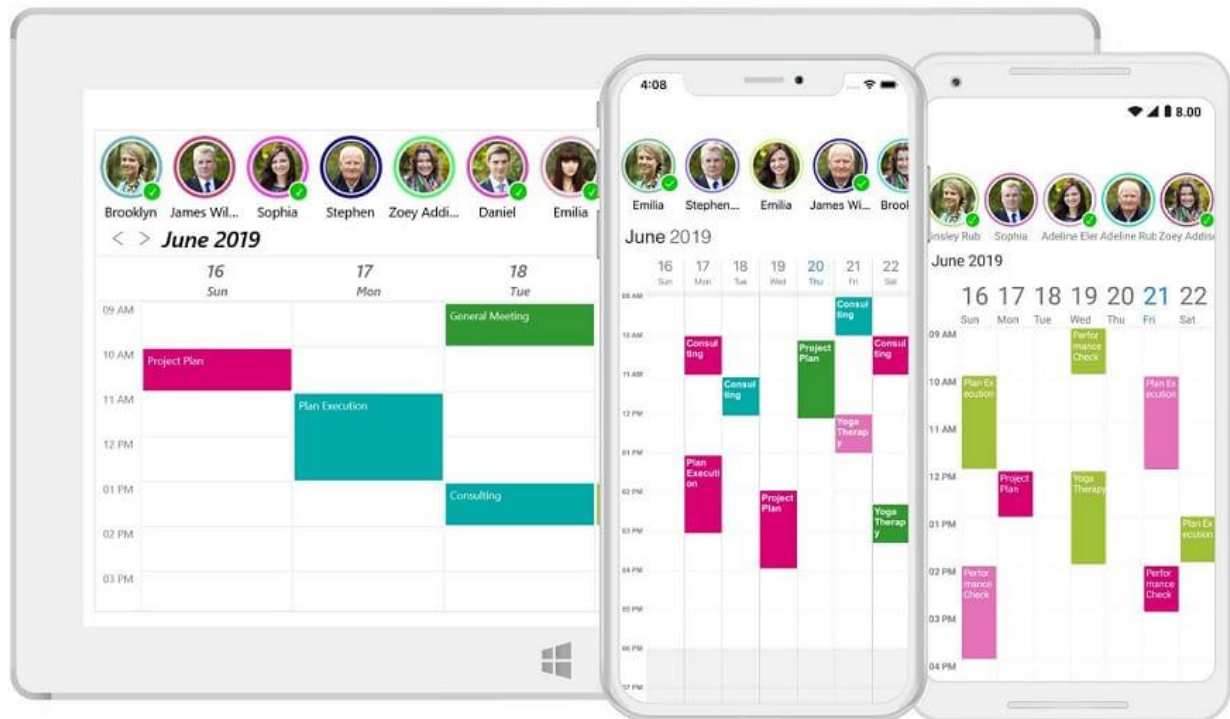

### XML

```
<syncfusion:SfSchedule
x:Name="schedule"
ScheduleView="WeekView"
ShowResourceView="True">
<syncfusion:SfSchedule.ScheduleResources>
<syncfusion:ScheduleResource
Name="Brooklyn"
Id="5601"
Color="#FF3399" />
</syncfusion:SfSchedule.ScheduleResources>
</syncfusion:SfSchedule>
```

### C#

```
// Creating an instance for schedule resource collection.
ObservableCollection<object> resources = new ObservableCollection<object>();
// Adding schedule resource in schedule resource collection.
resources.Add(new ScheduleResource()
{
    Name = "Brooklyn",
    Id = 5601,
    Color = Color.FromHex("#FF3399")
});
// Adding schedule resource collection to schedule resources of SfSchedule.
schedule.ScheduleResources = resources;
```

You can download the custom resource demo for Xamarin.Forms from [here](#).

### Resource view visibility

You can handle the visibility of resource view using the [ShowResourceView](#) bool property of SfSchedule. By default, value of this property is set to false.

### XML

```
<schedule:SfSchedule ScheduleView="WeekView" ShowResourceView="True" />
```

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;
schedule.ShowResourceView = true;
```

### Assigning events for resources

You can associate Resources to the appointments by adding Id of resource in the [ResourceIds](#) property of ScheduleAppointment. Appointments associated with the selected resources will be displayed in the SfSchedule views.

### C#

```
// Creating an instance for schedule appointment collection
ScheduleAppointmentCollection scheduleAppointmentCollection = new
ScheduleAppointmentCollection();
//Adding schedule appointment in schedule appointment collection
scheduleAppointmentCollection.Add(new ScheduleAppointment()
{
    StartTime = new DateTime(2019, 05, 08, 10, 0, 0),
    EndTime = new DateTime(2019, 05, 08, 12, 0, 0),
    Subject = "Meeting",
    Location = "Hutchison road",
```

```

ResourceIds = new ObservableCollection<object> { 5601, 5602 }
});
//Adding schedule appointment collection to DataSource of SfSchedule
schedule.DataSource = scheduleAppointmentCollection;

```

### Assigning custom events to resources

You can associate resources to the custom appointments using the equivalent field of **ResourceIds** in custom appointment class.

### Creating custom events

You can create a custom class **Event** with mandatory fields **From**, **To**, **EventName**, and **Resources**.

### C#

```

/// <summary>
/// Represents custom data properties.
/// </summary>
public class Event
{
    public string EventName { get; set; }
    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public Color Color { get; set; }
    public ObservableCollection<object> Resources { get; set; }
}

```

### NOTE

You can inherit this class from **INotifyPropertyChanged** for dynamic changes in custom data.

You can map the properties of **Meeting** class with our **SfSchedule** control using **ScheduleAppointmentMapping**.

### XML

```

<syncfusion:SfSchedule x:Name="schedule" ScheduleView="DayView"
DataSource="{Binding Meetings}">
<syncfusion:SfSchedule.AppointmentMapping>
<syncfusion:ScheduleAppointmentMapping
SubjectMapping="EventName"
ColorMapping="Color"
StartTimeMapping="From"
EndTimeMapping="To"
ResourceIdsMapping="Resources">
</syncfusion:ScheduleAppointmentMapping>
</syncfusion:SfSchedule.AppointmentMapping>
</syncfusion:SfSchedule>

```

### C#

```

// Schedule data mapping for custom appointments.
ScheduleAppointmentMapping dataMapping = new ScheduleAppointmentMapping();
dataMapping.SubjectMapping = "EventName";
dataMapping.StartTimeMapping = "From";
dataMapping.EndTimeMapping = "To";

```

```
dataMapping.ColorMapping = "Color";
dataMapping.ResourceIdsMapping = "Resources";
schedule.AppointmentMapping = dataMapping;
```

You can associate resources to the custom events by adding **Id** of resource in the **Resources** property of custom appointment class.

### C#

```
// Creating an instance for custom appointment class.
Meeting meeting = new Meeting();
meeting.From = new DateTime(2017, 06, 11, 10, 0, 0);
meeting.To = meeting.From.AddHours(2);
meeting.EventName = "Client Meeting";
meeting.Color = Color.Green;
// Setting resources for an event.
meeting.Resources = new ObservableCollection<object> () {5601, 5604};
```

### NOTE

- You can also associate custom resources to the appointments by using the equivalent field of resource **Id** in custom resource class.
- All appointments will be displayed when the **ShowResourceView** property is set to false.
- If an appointment is mapped to a single resource, it will be displayed in resource **Color**. If an appointment is mapped to multiple resources, it will be displayed in the default appointment **Color**.

### Mapping

Schedule supports full data binding to any type of **IEnumerable** source. Specify the [ResourceMapping](#) attribute to map the properties in the underlying data source to the schedule resource.

Property Name	Description
<a href="#">Name</a>	Maps the property name of custom class, which is equivalent to Name in ScheduleResource.
<a href="#">Id</a>	Maps the property name of custom class, which is equivalent to Id in ScheduleResource.
<a href="#">Image</a>	Maps the property name of custom class, which is equivalent to Image in ScheduleResource.
<a href="#">Color</a>	Maps the property name of custom class, which is equivalent to Color in ScheduleResource.

### NOTE

Custom resource class should contain a mandatory field for resource **Id**.

#### Creating a custom resource

You can create a custom class **Employee** with required fields such as **Name**, **Id**, **Color**, and **DisplayPicture**.

### C#

```

/// <summary>
/// Represents custom data properties.
/// </summary>
public class Employee
{
    public string Name { get; set; }
    public object Id { get; set; }
    public Color Color { get; set; }
    public string DisplayPicture { get; set; }
}

```

## NOTE

You can inherit this class from `INotifyPropertyChanged` for dynamic changes in custom data.

You can map the properties of `Employee` class with our `SfSchedule` control using `ResourceMapping`.

## XML

```

<schedule:SfSchedule ScheduleView="WeekView" ShowResourceView="True">
  <schedule:SfSchedule.ResourceMapping>
    <schedule:ResourceMapping Name="Name"
      Id="Id"
      Color="Color"
      Image="DisplayPicture"/>
  </schedule:SfSchedule.ResourceMapping>
</schedule:SfSchedule>

```

## C#

```

// Creating an instance for resource mapping.
ResourceMapping resourceMapping = new ResourceMapping();
// Mapping the custom data fields.
resourceMapping.Name = "Name";
resourceMapping.Id = "Id";
resourceMapping.Color = "Color";
resourceMapping.Image = "DisplayPicture";
schedule.ResourceMapping = resourceMapping;

```

You can create a resource by setting `Id`, `Name`, `Color` and `DisplayPicture` of the `Employee` class.

Create resources of type `ObservableCollection<Employee>` and assign this resource collection to the `ScheduleResources` property of `SfSchedule`.

## C#

```

public ObservableCollection<object> Employees { get; set; }
// Creating an instance for collection of custom resources.
Employees = new ObservableCollection<object>();
// Creating an instance for custom appointment class.
Employee employee = new Employee();
employee.Name = "Kinsley Elena";
employee.Id = 5601;
employee.Color = Color.FromHex("#FFE671B8");
employee.DisplayPicture = "KinsleyElena.png";
// Adding a custom resource in custom resource collection.

```

```
Employees.Add(employee);  
// Adding a custom resource collection to schedule resources.  
schedule.ScheduleResources = Employees;
```

### Selection mode

The SfSchedule control provides support to select single or multiple resources using the [SelectionMode](#) property of [ResourceViewSettings](#) in SfSchedule.

### XML

```
<schedule:SfSchedule ScheduleView="WeekView" ShowResourceView="True">  
  <schedule:SfSchedule.ResourceViewSettings>  
    <schedule:ResourceViewSettings SelectionMode="Multiple"/>  
  </schedule:SfSchedule.ResourceViewSettings>  
</schedule:SfSchedule>
```

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;  
schedule.ShowResourceView = true;  
ResourceViewSettings resourceViewSettings = new ResourceViewSettings();  
resourceViewSettings.SelectionMode = SelectionMode.Multiple;  
schedule.ResourceViewSettings = resourceViewSettings;
```

### Programmatic resource selection

You can programmatically select single or multiple resources by adding resources to the [SelectedResources](#) property of `SfSchedule`.

### C#

```
// Creating an instance for collection of selected resources.
ObservableCollection<object> selectedResources = new
ObservableCollection<object>();
// Adding selected resource in resource collection from the resources.
selectedResources.Add(resources.FirstOrDefault(resource => (resource as
ScheduleResource).Id.ToString() == "5601"));
selectedResources.Add(resources.FirstOrDefault(resource => (resource as
ScheduleResource).Id.ToString() == "5604"));
```

```
selectedResources.Add(resources.FirstOrDefault(resource => (resource as  
ScheduleResource).Id.ToString() == "5608"));  
// Adding selected resource collection to the selected resources of  
SfSchedule.  
schedule.SelectedResources = selectedResources;
```

You can clear the selection by removing the resource from `SelectedResources` or by setting `SelectedResources` to null.

### C#

```
var selectedResource = selectedResources.FirstOrDefault(resource =>  
(resource as ScheduleResource).Id.ToString() == "5604");  
// Removing selected resource in selected resources of SfSchedule.  
schedule.SelectedResources.Remove(selectedResource);
```

### Changing resource view height

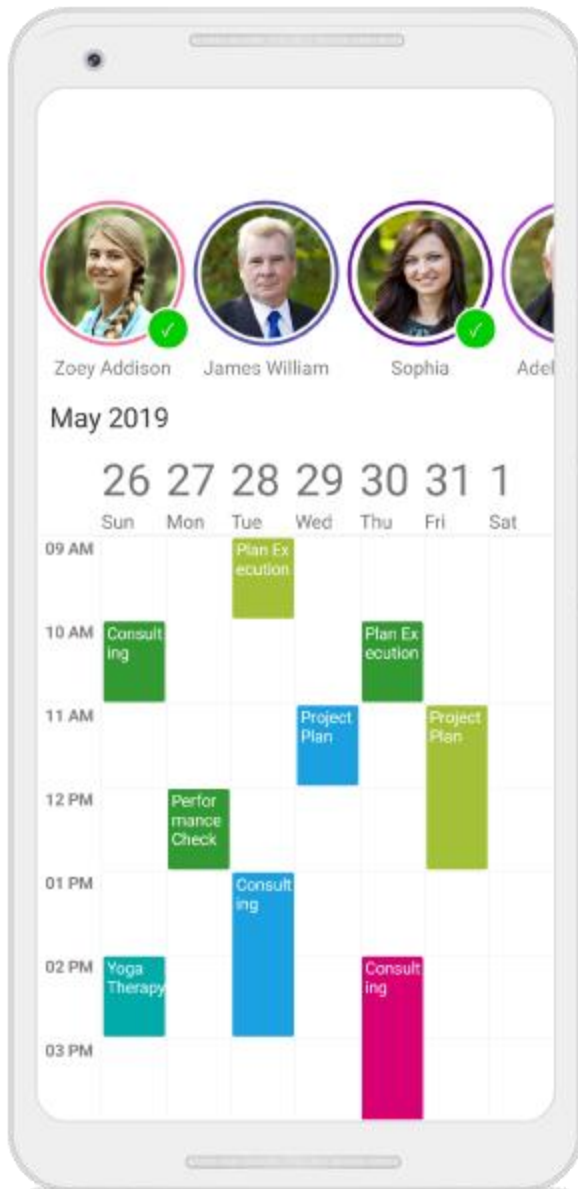

You can customize the height of the resource view using the [ResourceViewHeight](#) property of `SfSchedule`.

### XML

```
<schedule:SfSchedule ScheduleView="WeekView"  
ShowResourceView="True"  
ResourceViewHeight="200" />
```

### C#

```
schedule.ScheduleView = ScheduleView.WeekView;  
schedule.ShowResourceView = true;  
schedule.ResourceViewHeight = 200;
```

### Visible resource count

You can customize the number of visible resources in the current view using the [VisibleResourceCount](#) property of `ResourceViewSettings` in `SfSchedule`. By default, value of this property is set to -1.

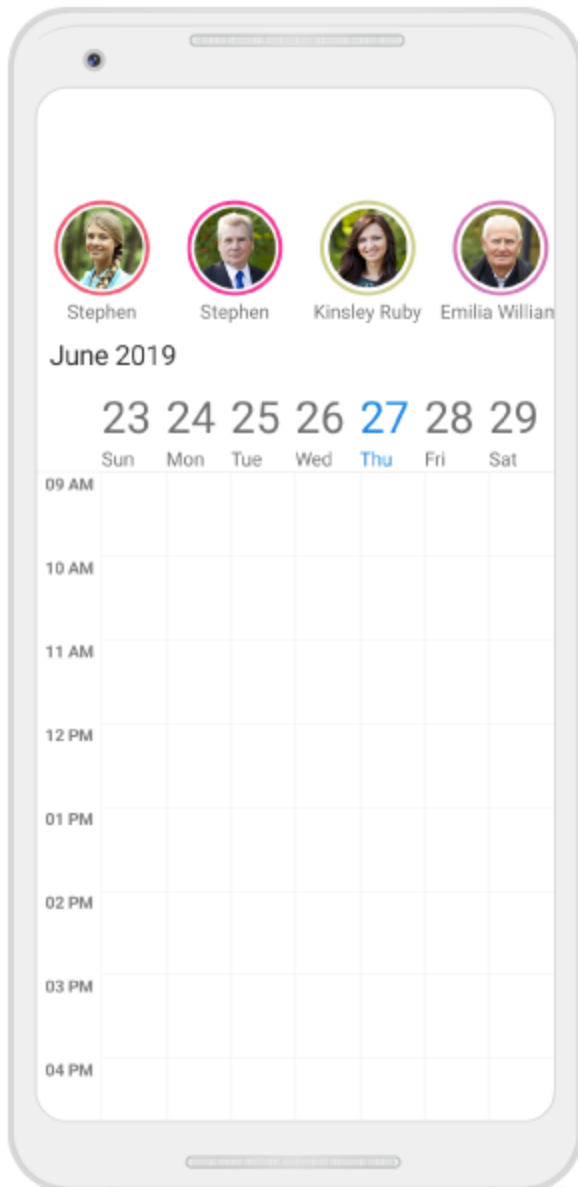

### XML

```
<schedule:SfSchedule ScheduleView="WeekView" ShowResourceView="True">
  <schedule:SfSchedule.ResourceViewSettings>
    <schedule:ResourceViewSettings>
      <schedule:ResourceViewSettings.VisibleResourceCount>
        <OnPlatform x:TypeArguments="x:Int32"
          iOS="5"
          Android="4"
          WinPhone="10" />
      </schedule:ResourceViewSettings.VisibleResourceCount>
    </schedule:ResourceViewSettings>
  </schedule:SfSchedule.ResourceViewSettings>
</schedule:SfSchedule>
```

```
</schedule:ResourceViewSettings>  
</schedule:SfSchedule.ResourceViewSettings>  
</schedule:SfSchedule>
```

## C#

```
ResourceViewSettings resourceViewSettings = new ResourceViewSettings();  
resourceViewSettings.VisibleResourceCount = Device.OnPlatform(5, 10, 5);  
schedule.ResourceViewSettings = resourceViewSettings;
```

### Resource item tapped event

You can handle the single tap action of resource view using the [ResourceItemTapped](#) event of [SfSchedule](#). This event occurs when a resource item is tapped. This event contains

[ResourceItemTappedEventArgs](#) argument, which holds the details of [SelectedResource](#) and [SelectedResources](#) in it.

### C#

```
schedule.ResourceItemTapped += OnResourceItemTapped;
...
private void OnResourceItemTapped(object sender, ResourceItemTappedEventArgs
e)
{
}
```

## Customization

### *Changing resource name label text color*

You can customize the text color of the resource name using the [DisplayLabelTextColor](#) property of [ResourceViewSettings](#) in [SfSchedule](#).

### XML

```
<schedule:SfSchedule ScheduleView="WeekView" ShowResourceView="True">
<schedule:SfSchedule.ResourceViewSettings>
<schedule:ResourceViewSettings DisplayLabelTextColor="#8490f9" />
</schedule:SfSchedule.ResourceViewSettings>
</schedule:SfSchedule>
```

### C#

```
ResourceViewSettings resourceViewSettings = new ResourceViewSettings();
resourceViewSettings.DisplayLabelTextColor = Color.FromHex("#8490f9");
schedule.ResourceViewSettings = resourceViewSettings;
```

### *Data template*

The default appearance of the resource can be customized using the [ResourceItemTemplate](#) property of the schedule. You can handle the default touch action such as selection of resource item using the [InputTransparent](#) property of the [Xamarin.Forms.VisualElement](#).

### XML

```
<schedule:SfSchedule x:Name="schedule"
ResourceItemTemplate="{Binding ResourceTemplate}">
<schedule:SfSchedule.BindingContext>
<samplelocal:ResourceDataTemplate />
</schedule:SfSchedule.BindingContext>
</schedule:SfSchedule>
```

### *Creating a DataTemplate*

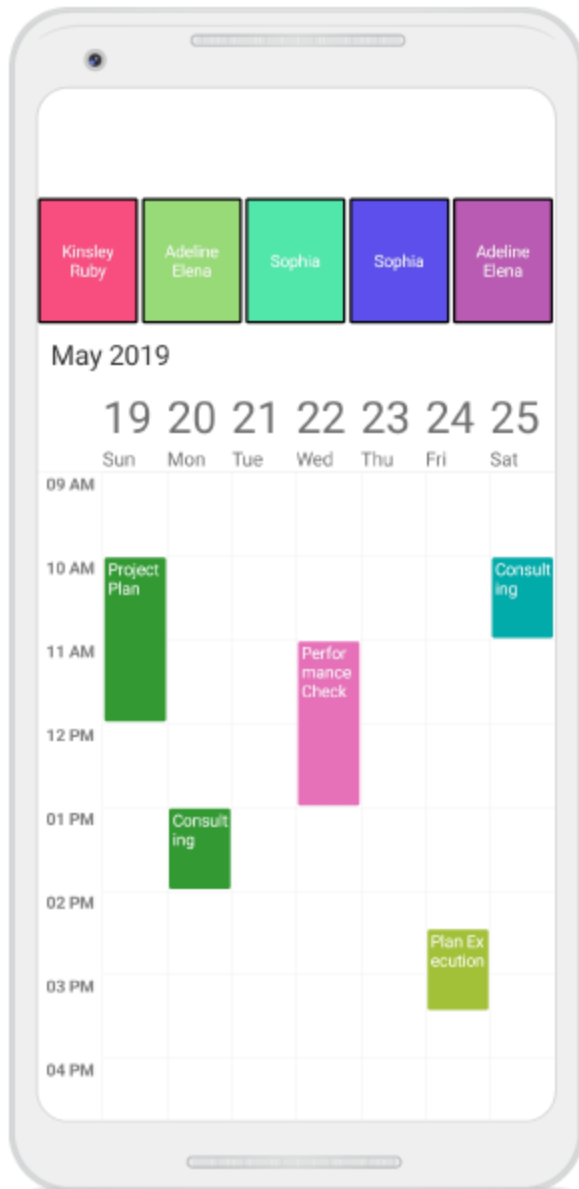

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<Button xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="ScheduleSample.ResourceTemplate"
Text="{Binding Name}"
TextColor="White"
```

```
FontSize="15"  
BackgroundColor="{Binding Color}"  
BorderColor="Black"  
BorderWidth="2">  
</Button>
```

## **C#**

```
public class ResourceDataTemplate : DataTemplate  
{  
    public DataTemplate ResourceTemplate { get; set; }  
    public ResourceDataTemplate()  
    {  
        ResourceTemplate = new DataTemplate(() =>  
        {  
            return new ResourceTemplate();  
        });  
    }  
}
```

### Template selector

`DataTemplateSelector` can be used to choose a `DataTemplate` at run time based on the value of data bound to the `ScheduleResource` property through `ResourceItemTemplate`. It provides multiple `DataTemplates` to be enabled for schedule resources to customize the appearance of a particular resource item. You can handle the default touch action such as selection of a resource item using the `InputTransparent` property of the `Xamarin.Forms.VisualElement`.

### XML

```
<ContentPage.Resources>
  <ResourceDictionary>
    <local:ResourceTemplateSelector x:Key="resourceDataTemplateSelector"/>
  </ResourceDictionary>
</ContentPage.Resources>
```

```
<ContentPage.Content>
<schedule:SfSchedule x:Name="schedule"
ScheduleView="WeekView"
ShowResourceView="True"
ResourceItemTemplate="{StaticResource resourceDataTemplateSelector}"/>
</ContentPage.Content>
```

### Creating a DataTemplateSelector

#### C#

```
public class ResourceTemplateSelector : DataTemplateSelector
{
    public DataTemplate AvailabelResourceTemplate { get; set; }
    public DataTemplate UnavailableResourceTemplate { get; set; }
    public ResourceTemplateSelector()
    {
        AvailabelResourceTemplate = new
        DataTemplate(typeof(AvailabelResourceTemplate));
        UnavailableResourceTemplate = new
        DataTemplate(typeof(UnavailableResourceTemplate));
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject
    container)
    {
        if ((item as ScheduleResource).Id.ToString() == "5601" ||
        (item as ScheduleResource).Id.ToString() == "5604")
        return UnavailableResourceTemplate;
        else
        return AvailabelResourceTemplate;
    }
}
```

Used button to display the resources

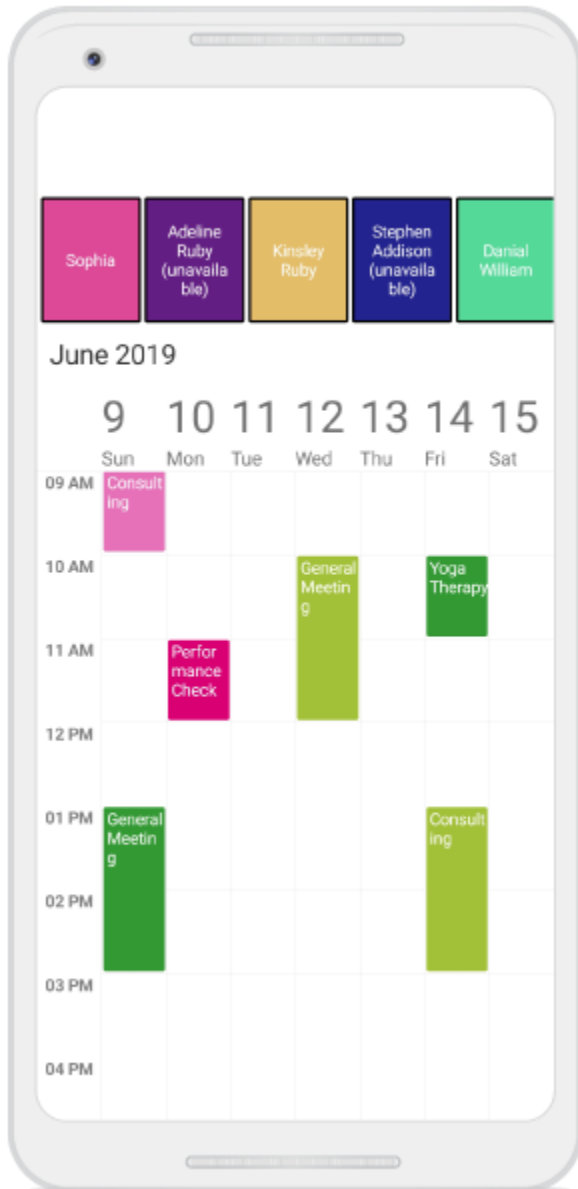

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<Button xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="ScheduleSample.AvailabelResourceTemplate"
Text="{Binding Name}"
TextColor="White"
FontSize="15"
BackgroundColor="{Binding Color}"
BorderColor="Black"
BorderWidth="2">
</Button>
.....
<?xml version="1.0" encoding="utf-8" ?>
<Button xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="ScheduleSample.UnavailableResource"
Text="{Binding Name, StringFormat= '\{0\} (unavailable)'}"
TextColor="White"
FontSize="15"
BackgroundColor="{Binding Color}"
```

```

BorderColor="Black"
BorderWidth="2">
</Button>

```

You can download the template selector demo for Xamarin.Forms from [here](#).

### Appointment Drag and Drop

Appointments can be rescheduled using the drag and drop operation. To perform drag-and-drop operations within the schedule, enable the [AllowAppointmentDrag](#) property of `SfSchedule`.

#### XML

```

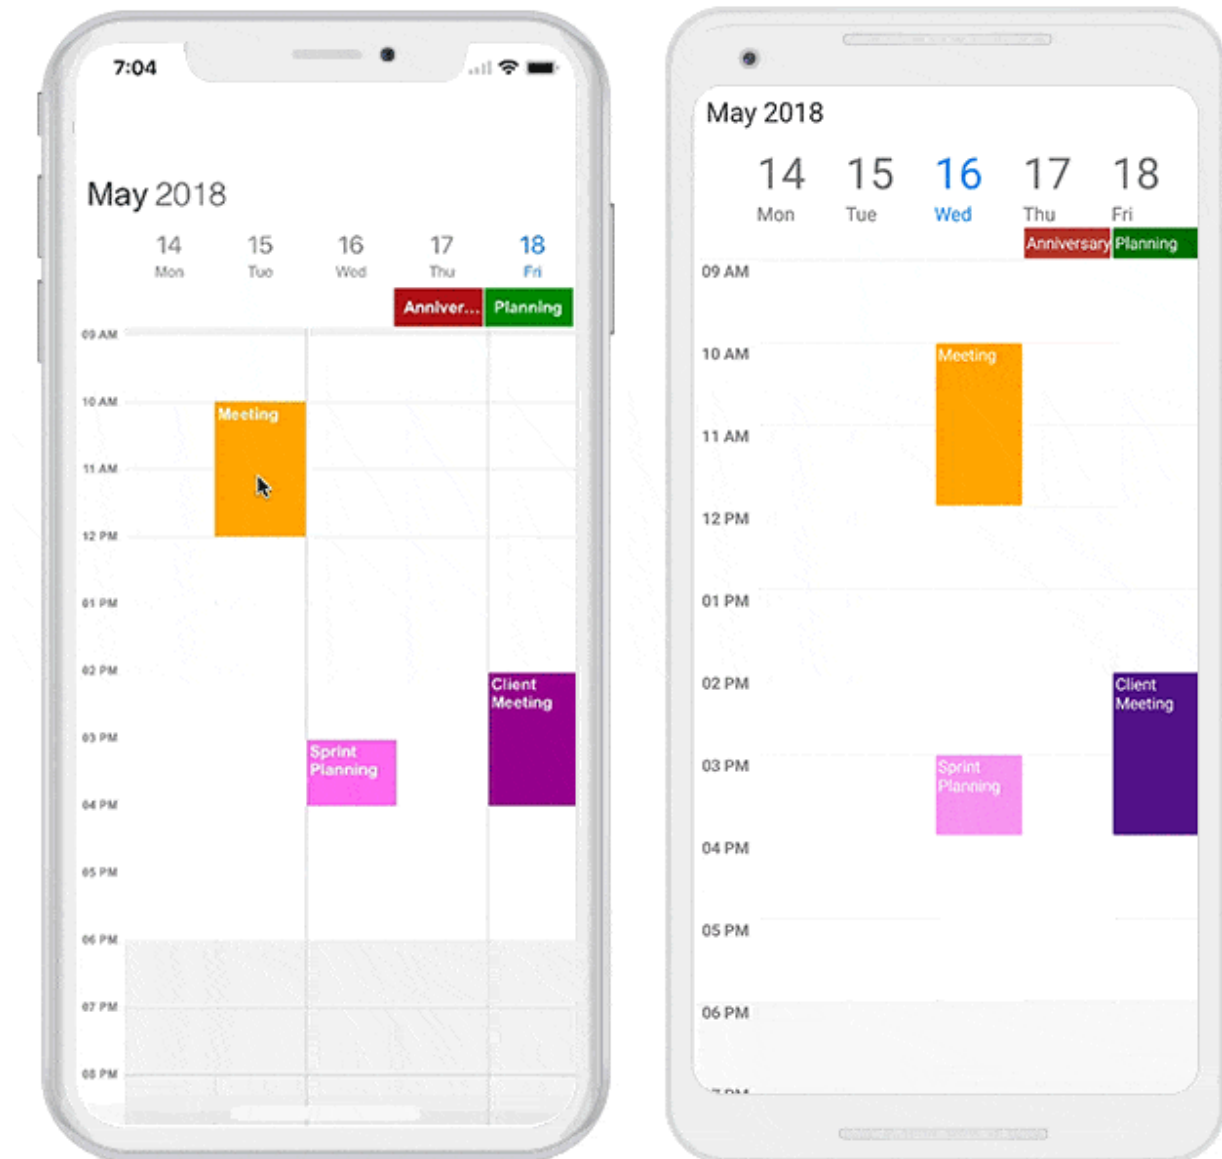

<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView"
AllowAppointmentDrag="true">

```

```
</schedule:SfSchedule>
```

### C#

```
schedule.AllowAppointmentDrag = true;
```

### Handle dragging based on the appointment

Using [AppointmentDragStarting](#) event, you can get the appointment details and handle whether the appointment can be draggable or not. This event will be triggered when the appointment is started dragging. The [AppointmentDragStartingEventArgs](#) argument contains the following properties.

[Appointment](#) - Gets the dragged appointment details.

[Cancel](#)- Appointment dragging can be handled (enable/disable) using this boolean property.

**C#**

```
schedule.AppointmentDragStarting += Schedule_AppointmentDragStarting;
...
private void Schedule_AppointmentDragStarting(object sender,
AppointmentDragStartingEventArgs e)
{
    var appointment = e.Appointment;
    e.Cancel = false;
}
```

*Disabling dragging when the appointment is AllDay appointment*

Using Cancel property in the AppointmentDragStartingEventArgs argument of Schedule AppointmentDragStarting event, you can enable/disable the appointment dragging based on the requirement. In the below code, appointment dragging is disabled when the appointment is AllDay appointment.

**C#**

```
schedule.AppointmentDragStarting += Schedule_AppointmentDragStarting;
...
private void Schedule_AppointmentDragStarting(object sender,
AppointmentDragStartingEventArgs e)
{
    var appointment = e.Appointment as ScheduleAppointment;
    if (appointment.IsAllDay)
    {
        e.Cancel = true;
    }
}
```

*Get the dragging appointment position*

Using [AppointmentDragOver](#) event, you can get the dragging appointment details, position and time of the particular location. The event will be continuously triggered when the appointment is being dragged. The [AppointmentDragEventArgs](#) argument contains the following properties.

[Appointment](#) - Gets the details of the appointment to be dropped.

[DraggingPoint](#)- Gets the dragging point (X, Y) of the appointment in Schedule.

[DraggingTime](#)- Gets the dragging time of the appointment in Schedule

**C#**

```
schedule.AppointmentDragOver += Schedule_AppointmentDragOver;
...
private void Schedule_AppointmentDragOver(object sender,
AppointmentDragEventArgs e)
{
    var appointment = e.Appointment;
    var draggingPoint = e.DraggingPoint;
    var draggingTime = e.DraggingTime;
}
```

### *Displaying alert while dragging appointment over the blocked time slots*

Using `draggingPoint` and `draggingTime` properties in the `AppointmentDragEventArgs` of `Schedule AppointmentDragOver` event you can get the current position and time of dragging appointment. In the below code, Indicating the message while dragging over the `Schedule NonAccessibleBlock`.

#### **C#**

```
schedule.AppointmentDragOver += Schedule_AppointmentDragOver;
...
private void Schedule_AppointmentDragOver(object sender,
AppointmentDragEventArgs e)
{
    //// checking whether dragging appointment time within NonAccessibleBlock
    if (schedule.WorkWeekViewSettings.NonAccessibleBlocks[0].StartTime ==
        e.DraggingTime.Hour ||
        (schedule.WorkWeekViewSettings.NonAccessibleBlocks[0].StartTime - 1 ==
         e.DraggingTime.Hour && e.DraggingTime.Minute > 0))
    {
        label.Text = "Cannot be moved to blocked time slots";
    }
}
```

### Handle appointment dropping

Using `AppointmentDrop` event you can get the dropping appointment details, position, time and you can handle whether the appointment can be dropped to the specific position or not. This event will trigger after dropping the appointment. The `AppointmentDropEventArgs` argument contains the following properties.

[Appointment](#) - Gets the details of the appointment to be dropped.

[Cancel](#)- Appointment dropping can be handled (enable / disable) using this Boolean property.

[DropTime](#)- Gets the dropped time of the appointment in Schedule

#### **C#**

```
schedule.AppointmentDrop += Schedule_AppointmentDrop;
...
private void Schedule_AppointmentDrop(object sender,
AppointmentDropEventArgs e)
{
    var appointment = e.Appointment;
    e.Cancel = false;
    var dropTime = e.DropTime;
}
```

### *Disabling dropping when dropping appointment within the Non-Accessible region*

Using `Cancel` property in the `AppointmentDropEventArgs` argument of `Schedule AppointmentDrop` event, you can enable/disable the appointment dropping based on the requirement. In the below code, appointment dropping is disabled while dropping in the Non-Accessible block region.

#### **C#**

```
schedule.AppointmentDrop += Schedule_AppointmentDrop;
...
```

```
private void Schedule_AppointmentDrop(object sender,
AppointmentDropEventArgs e)
{
    //// checking whether dropping appointment time within NonAccessibleBlock
    if (schedule.WorkWeekViewSettings.NonAccessibleBlocks[0].StartTime ==
e.DropTime.Hour ||
(schedule.WorkWeekViewSettings.NonAccessibleBlocks[0].StartTime - 1 ==
e.DropTime.Hour && e.DropTime.Minute > 0))
    {
        e.Cancel = true;
    }
}
```

### Customizing the Drag and Drop environment

Using [DragDropSettings](#) property of schedule, you can handle the behavior of drag and drop in Schedule.

#### XML

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
<schedule:SfSchedule.DragDropSettings>
<schedule:DragDropSettings AllowNavigate="true" AllowScroll="true"
ShowTimeIndicator="true">
</schedule:DragDropSettings>
</schedule:SfSchedule.DragDropSettings>
</schedule:SfSchedule>
```

#### C#

```
DragDropSettings dragDropSettings = new DragDropSettings();
dragDropSettings.AllowNavigate = true;
dragDropSettings.AllowScroll = true;
var timeSpan = new TimeSpan(0, 0, 0, 1, 0);
dragDropSettings.AutoNavigationDelay = timeSpan;
dragDropSettings.ShowTimeIndicator = true;
dragDropSettings.TimeIndicatorStyle = timeIndicatorStyle;
schedule.DragDropSettings = dragDropSettings;
```

### Disabling navigation when dragging appointment

Using [AllowNavigate](#) boolean property can handle the Appointment dragging, whether navigate to next/previous view or not while dragging the appointment to the endpoint of the current view in Schedule. Default value of the [AllowNavigate](#) property is true and Schedule will navigate to next/previous view when dragging the appointment the endpoint of the current view.

#### C#

```
dragDropSettings.AllowNavigate = false;
```

### Handling navigation delay while holding dragged appointment

Using [AutoNavigationDelay](#) [TimeSpan](#) property can handle the navigation time when navigating to next/previous view while holding the dragged appointment.

#### C#

```
var timeSpan = new TimeSpan(0, 0, 0, 1, 0);
```

```
dragDropSettings.AutoNavigationDelay = TimeSpan;
```

#### *Disabling scroll when dragging appointment*

Using [AllowScroll](#) boolean property can handle the Appointment dragging, whether scroll (below/above) the Schedule or not while dragging the appointment to the endpoint of the current view in Schedule.

Default value of the [AllowScroll](#) property is true.

#### **C#**

```
dragDropSettings.AllowScroll = false;
```

#### *Disabling dragging time indicator*

[ShowTimeIndicator](#) - Using this boolean property can handle the time indicator whether it should visible or not, which shows the dragged appointment current position time in time text slots. Default value of the [ShowTimeIndicator](#) property is true.

#### **C#**

```
dragDropSettings.ShowTimeIndicator = false;
```

Customize appearance of dragging Time Indicator

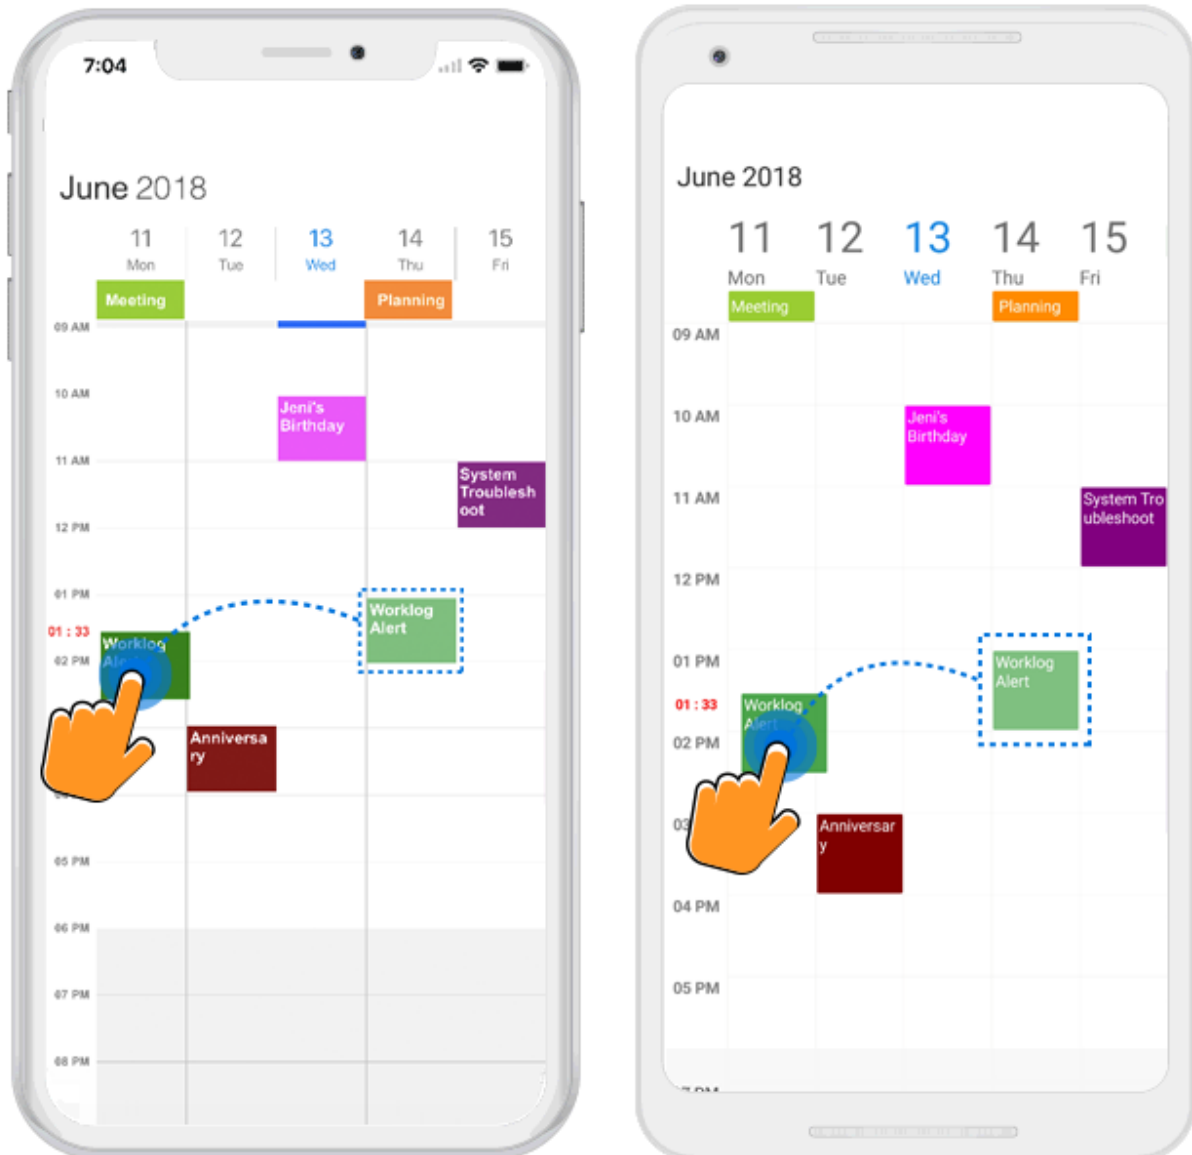

Using [TimeIndicatorStyle](#) property can handle the time indicator style which contains [TextColor](#), [TextSize](#) and [TextFormat](#).

#### **XML**

```
<schedule:SfSchedule x:Name="schedule" ScheduleView="WeekView">
  <schedule:SfSchedule.DragDropSettings>
    <schedule:DragDropSettings>
      <schedule:DragDropSettings.TimeIndicatorStyle>
        <schedule:TimeIndicatorStyle TextColor="Red" TextSize="13"
          TextFormat="hh:mm">
        </schedule:TimeIndicatorStyle>
      </schedule:DragDropSettings.TimeIndicatorStyle>
    </schedule:DragDropSettings>
  </schedule:SfSchedule.DragDropSettings>
</schedule:SfSchedule>
```

#### **C#**

```
TimeIndicatorStyle timeIndicatorStyle = new TimeIndicatorStyle();
timeIndicatorStyle.TextColor = Color.Red;
timeIndicatorStyle.TextSize = 15;
timeIndicatorStyle.TextFormat = "hh : mm";
dragDropSettings.TimeIndicatorStyle = timeIndicatorStyle;
```

## Notes

- While dropping appointment to **AllDay** panel from time slots, appointment start and end time will change to 12.00 AM.
- While dropping appointment to time slots from **AllDay** panel, appointment duration will change as one (1) hour from the dropped time.
- Doesn't support control to control drag and drop.

## Time Zone

Schedule allows you create appointments in various time zones and display them in users' time zone or any other time zone. You can use a time zone in the following four different ways:

- Create appointments in different time zones

- Display appointments based on the client's time zone
- Display appointments based on schedule time zone
- Display appointments at the same time everywhere regardless of client's time zone

We have added the following Time Zone's for the respective countries to cover all the time zone regions, you can use any of the time zone's from the following list for schedule time zone.

Time Zone	Region	UTC Offset
Samoa Standard Time	Pacific/Apia	UTC - 13:00
Dateline Standard Time	Etc/GMT+12	UTC - 12:00
UTC-11	Pacific/Midway	UTC - 11:00

### Create appointments in different time zones

You can create appointments at different time zones using the [StartTimeZone](#) and [EndTimeZone](#) properties of [ScheduleAppointment](#). An appointment's start time and end time are calculated based on the given time zone information for the start time and end time. You can set different time zones to the [StartTimeZone](#) and [EndTimeZone](#) properties.

You can use the [StartTime](#) and [EndTime](#) properties of [ScheduleAppointment](#) to get the exact start time and end time of an appointment. By using the [ActualStartTime](#) and [ActualEndTime](#) properties, you can get exact appointment rendering time.

### C#

```
appointment.StartTimeZone = "India Standard Time";
appointment.EndTimeZone = "India Standard Time";
```

```
DateTime exactStartTime = appointment.StartTime;  
DateTime exactEndTime = appointment.EndTime;
```

## NOTE

- If the recurring appointment is converted to another time zone, then the whole sequence will be recalculated according to the new time zone information.
- If you create an all-day appointment, its start time and end time will be set to 12 A.M. and 12 A.M. by default, so time zone is not applicable for all-day appointments.
- Schedule supports daylight saving time.
- The time zone support is applicable for custom appointments too, so you need to map the corresponding property.
- You can use `TimeZone` for custom appointments by mapping the [StartTimeZoneMapping](#) and [EndTimeZoneMapping](#) custom properties of [ScheduleAppointmentMapping](#).

### Display Appointments based on client's time zone

You can display the appointments based on the client's local time zone in schedule. For example, consider a scenario that you are in North Carolina and you want to set up a meeting at 10 A.M. on North Carolina time. You have colleagues in London and Chennai, and they also need to participate. The time for this meeting will be 3 P.M. (15:00) in London and 5.30 A.M. in Chennai. When you each view your calendar, you need to see the appointment displayed relative to your local time zones 5.30 A.M., 10 A.M., and 3 P.M., respectively. It can be achieved by setting schedule time zone to default (it will consider your device's local time zone as schedule time zone) and appointment's time zone to `Eastern Standard Time (North Carolina)` [as you are in North Carolina and its time zone is Eastern Standard Time].

### Display appointments based on schedule time zone

You can set specific time zone to schedule using the `TimeZone` property of schedule. On this scenario, the appointments will be displayed in UTC time when the `StartTimeZone` and `EndTimeZone` properties of `ScheduleAppointment` are set to null. The appointments will be displayed in UTC time based on the given schedule time zone.

## XML

```
<syncfusion:SfSchedule  
  x:Name="schedule"  
  TimeZone="GMT Standard Time">  
</schedule:SfSchedule>
```

## C#

```
schedule.TimeZone = "GMT Standard Time";
```

### Display appointments at same time everywhere regardless of client's time zone

You can display appointments at the same time everywhere without considering the time zone when you set the `TimeZone` property of schedule, the `StartTimeZone`, and `EndTimeZone` properties of `ScheduleAppointment` to null. The appointments will be displayed based on the given `StartTime` and `EndTime` of appointment everywhere without considering the time zone.

### Updating StartTime and EndTime after drag and drop appointment based on Time Zone.

After rescheduling an appointment using **drag and drop**, appointment's start and end time value will be updated based on schedule time zone and appointment's time zone.

For an example, consider, your local time zone is **India Standard Time**, if you drag an appointment from 9 AM and drop this on 1 PM and the schedule's **TimeZone** is not set and the appointment's **StartTimeZone** and **EndTimeZone** has set as **AUS Central Standard Time (Darwin)** then appointment's start time and end time value will be converted from Local time zone to appointment time zone and the appointment's start time will be saved at 9 AM,

if you set schedule's **TimeZone** as **AUS Central Standard Time (Darwin)** and the appointment's **StartTimeZone** and **EndTimeZone** as **Central Standard Time (Mexico)** then the appointment's start time and end time value has converted from schedule's time zone to appointment time zone and the appointment's start time will be saved at 3.30 AM of next day,

if you set schedule's **TimeZone** as **AUS Central Standard Time (Darwin)** and appointment's time zone was not set then the appointment's start time and end time value converted from schedule time zone to UTC time zone and the appointment's start time will be saved at 10.30 PM.

## Date Navigations

### Enabling Navigation

By default, Schedule views can be moved backwards and forwards using touch swipe gesture. This navigation gesture can be enabled or disabled by setting [EnableNavigation](#) property of **SfSchedule**. By default, it is enabled.

### XML

```
<schedule:SfSchedule EnableNavigation="False"/>
```

### C#

```
//disabling navigation gesture
schedule.EnableNavigation = false;
```

### Programmatically change to specific dates

Visible dates can be moved to specific date using [NavigateTo](#) method and [MoveToDate](#) property available in **SfSchedule**. It will move to any specific date if the schedule view is Day View, similarly it will move to the specific week if it is week view and to specific month if it is month view

### C#

```
//using NavigateTo
DateTime currentDate = DateTime.Now;
DateTime SpecificDate = new DateTime(currentDate.Year - 5, currentDate.Month - 3, currentDate.Day, 0, 0, 0);
Schedule.NavigateTo(SpecificDate);
//using MoveToDate
DateTime currentDate = DateTime.Now;
DateTime SpecificDate = new DateTime(currentDate.Year - 5, currentDate.Month - 3, currentDate.Day, 0, 0, 0);
Schedule.MoveToDate = SpecificDate;
```

---

**NOTE**

---

The specified date should lie between `MinDisplayDate` and `MaxDisplayDate`, if the specified date is greater than `MaxDisplayDate` then the view moved to `MaxDisplayDate` similarly if the specified date is lesser than the `MinDisplayDate` then the view moved to `MinDisplayDate`.

[Programmatically change to adjacent dates.](#)

By default the date can be navigated to next and previous view using touch gesture, by swiping the control in right to left and left to right direction. The view can be also changed programmatically using [Forward](#) and [Backward](#) method available in `SfSchedule`.

- Forward \* Backward

#### [Forward](#)

You can use the `Forward` method for viewing the next immediate visible dates in the `SfSchedule`. It will move to next month if the schedule view is month, similarly it will move to next week for week view and next day for day view.

#### **C#**

```
//Viewing next immediate visible dates  
schedule.Forward();
```

---

**NOTE**

---

Date can be navigated until it reaches the Min Max date.

#### [Backward](#)

You can use the `Backward` method for viewing the previous immediate visible dates in the `SfSchedule`. It will move to previous month if the schedule view is month, similarly it will move to previous week for week view and previous day for day view.

#### **C#**

```
//Viewing previous immediate visible dates  
schedule.Backward();
```

---

**NOTE**

---

Date can be navigated until it reaches the Min Max date.

#### [Range for visible dates](#)

Visible dates can be restricted between certain range of dates, using [MinDisplayDate](#) and [MaxDisplayDate](#) property in `SfSchedule`. It is applicable in all the schedule views.

#### [Minimum Display Date](#)

`MinDisplayDate` will restrict date navigations features of `Backward`, `MoveToDate` and also can't swipe the control using touch gesture beyond the min max date range. Thus, Inline and selection feature in month view will work only within the min max date range.

#### **C#**

```
int monthRange = 2; DateTime currentDate = DateTime.Now;  
//setting minimum display date
```

```
DateTime minDate = new DateTime(currentDate.Year, currentDate.Month -
monthRange, currentDate.Day, 10, 0, 0);
schedule.MinDisplayDate = minDate;
```

### Maximum Display Date

**MaxDisplayDate** will restrict date navigations features of **Forward**, **MoveToDate** and also can't swipe the control using touch gesture beyond the max date range. Thus, Inline and selection in month view will work only within the max date range.

### C#

```
int monthRange = 2; DateTime currentDate = DateTime.Now;
//setting maximum display date
DateTime maxDate = new DateTime(currentDate.Year, currentDate.Month +
monthRange, currentDate.Day, 10, 0, 0);
schedule.MaxDisplayDate = maxDate;
```

### VisibleDatesChanged event

You can get the visible dates of the Schedule using [VisibleDatesChangedEvent](#) in **SfSchedule**. It is applicable in all the schedule views. The event handler receives an argument of type [VisibleDatesChangedEventArgs](#) containing [visibleDates](#) and [Schedule](#).

### C#

```
schedule.VisibleDatesChangedEvent += Schedule_VisibleDatesChangedEvent;
.....
private void Schedule_VisibleDatesChangedEvent(object sender,
VisibleDatesChangedEventArgs e)
{
var visibleDates = e.visibleDates;
var Schedule = e.Schedule;
}
```

**VisibleDatesChangedEvent** will be triggered when view is swiped back or forth and also when schedule view is switched dynamically.

You can add appointments on demand based on the visible date range in this event by setting **DataSource** property to schedule in the **VisibleDatesChangedEvent**.

### C#

```
private void Schedule_VisibleDatesChangedEvent(object sender,
VisibleDatesChangedEventArgs e)
{
schedule.DataSource = scheduleAppointmentCollection;
}
```

You can also move to specific time of the day or current time of day when view is swiped by setting specific time in **MoveToDate** property in the **VisibleDatesChanged** event. Such that when the schedule view is swiped, it moves to the mentioned time.

### C#

```
schedule.VisibleDatesChangedEvent += Schedule_VisibleDatesChangedEvent;
```

```
...
private void Schedule_VisibleDatesChangedEvent(object sender,
VisibleDatesChangedEventArgs e)
{
    var date = DateTime.Now;
    var formatDate = e.visibleDates[0];
    schedule.MoveToDate = new DateTime(formatDate.Year, formatDate.Month,
formatDate.Day, date.Hour, date.Minute, date.Second);
}
```

## Localization

Schedule control is available with complete localization support. Localization can be specified by setting the [Locale](#) property of SfSchedule. In the format of **Language code**.

### Change default control language

Based on the **Locale** specified the strings in the control such as Date, time, days are localized accordingly.

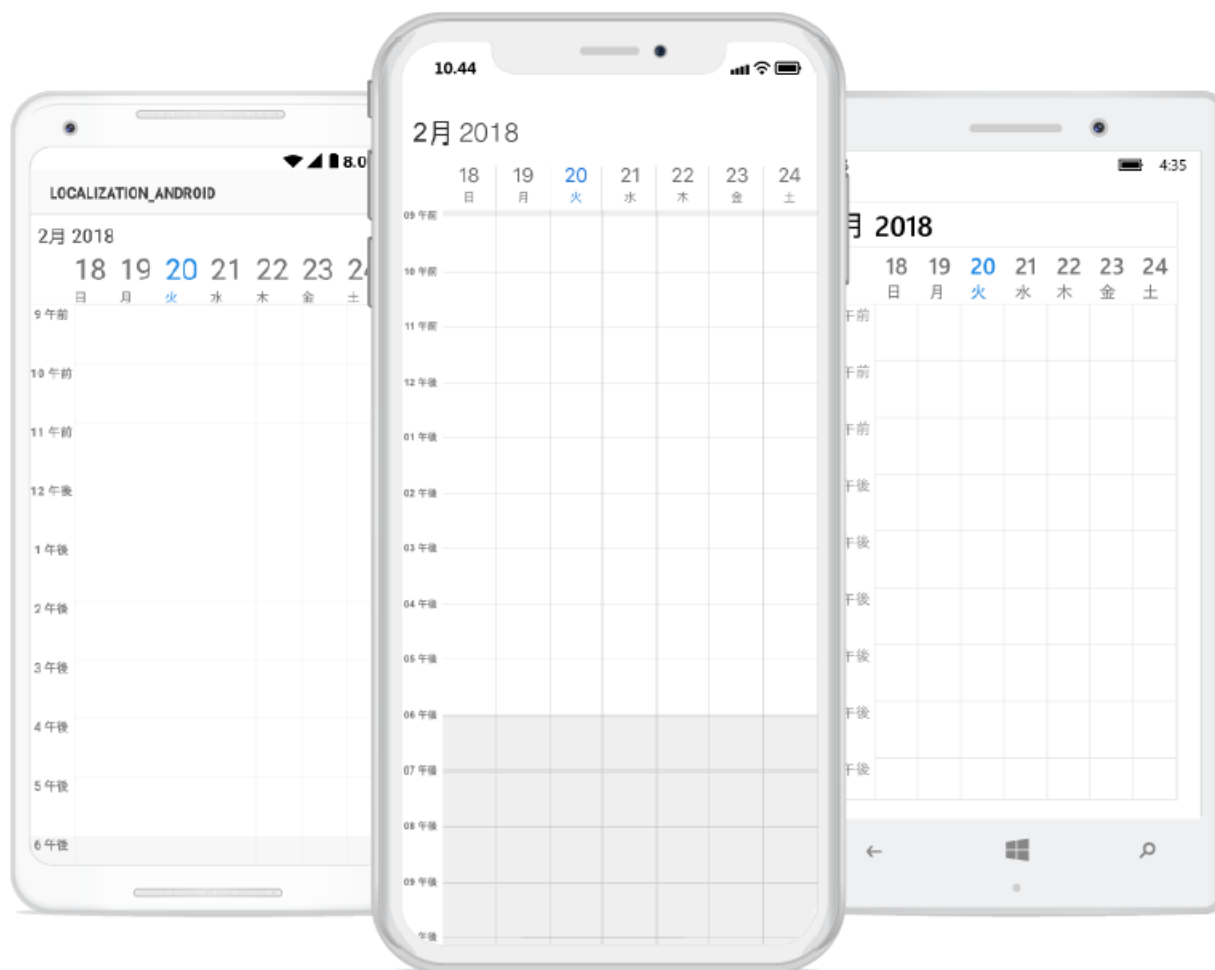

By default, schedule control is available with en locale, which is English.

### XML

```
<schedule:SfSchedule
x:Name="schedule"
ScheduleView="WeekView"
Locale="ja">
</schedule:SfSchedule>
```

### C#

```
//creating new instance for schedule
SfSchedule schedule = new SfSchedule();
//setting schedule view
schedule.ScheduleView = ScheduleView.WeekView;
//setting locale for the control
schedule.Locale = "ja";
```

Change custom texts in the control.

You can localize the custom strings used in the schedule control. For that you need to configure it for each platform separately.

*Localizing custom text in Android renderer.* Localizing custom text in iOS renderer. \* Localizing custom text in UWP renderer.

You can download the entire source code of this demo for Xamarin.Forms from here [Localization](#).

*Localizing custom text in Android renderer.*

You can localize custom text available in the control by adding equivalent localized string in the string.xml file.

### XML

```
<resources>
<string name="No_Appointments">Aucun événement</string>
<string name="No_SelectedDate">Aucune date sélectionnée</string>
<string name="No_Resources">Aucune ressource</string>
</resources>
```

Android can select and load resources from different directories, based on the current device configuration and locale, refer [here](#). For an example, if an application requires multiple languages you can follow the below steps.

The procedure for creating strings.xml files is as follows:

*Translate the strings.xml file to each language.* Create new folders under resource as values-ar, values-de, values-en and values-fr (The original values folder already exists). \* Place the translated strings.xml files in the respective folders.

---

**NOTE**

The corresponding Locale values folder updates only when the device language changes.

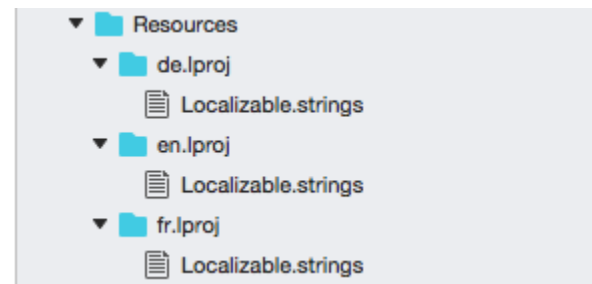

[Localizing custom text in iOS renderer.](#)

You can localize custom text available in the control by adding equivalent localized string in the Localizable.strings file, refer [here](#).

If an application requires multiple languages you can follow the below steps:

*Translate the Localizable.Strings file to each language.* Create new .lproj folders under resource as en.lproj, fr.lproj, de.lproj. \* Place the Localizable.Strings file in the respective .lproj folders.

---

**NOTE**

The corresponding <Language>.lproj folder updates only when the device language changes.

[Localizing custom text in UWP renderer.](#)

You can localize custom text available in the control by adding equivalent localized string in the Resources(.resw) file.

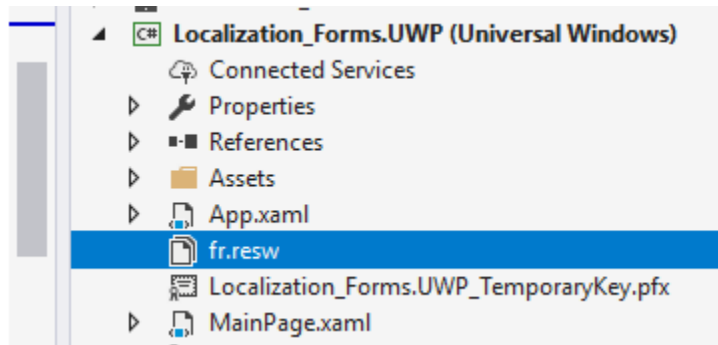

---

**NOTE**

Here Resources(.resw) file name should be match with the given locale language code.

The procedure for creating Resources(.resw) file is as follows:

\* Create Resources(.resw) file in sample with C# culture standard name for example fr , de-DE and so.

\* Translate the custom string used in schedule to respective localized culture.

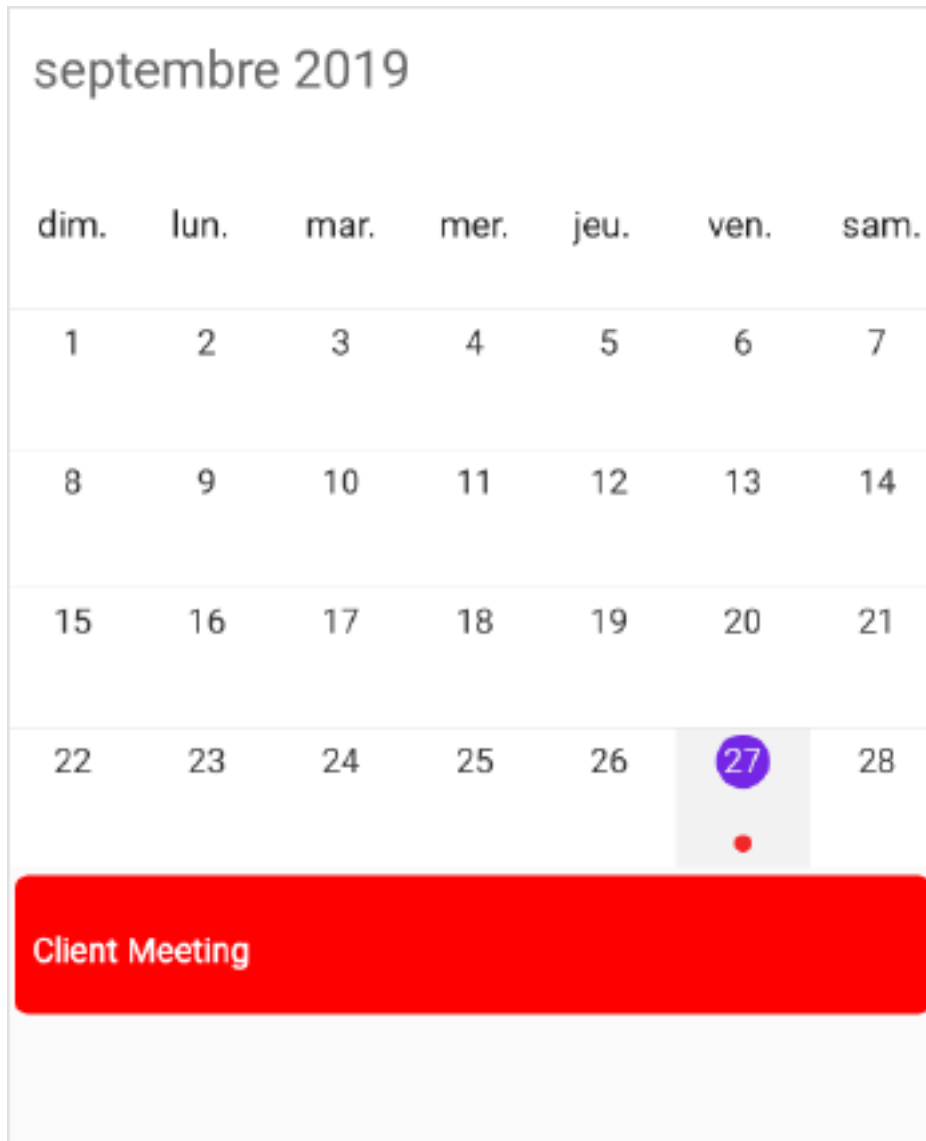

### Localizing custom strings from PCL

You can localize the custom strings (No SelectedDate, No Events, and No Resources) used in the schedule control from PCL. It can be achieved by providing the custom strings to the specific language resx file and handling the required culture with the locale using DependencyService instead of device language. Create a new resource manager based on the resources, and set it to the [Manager](#) property of [ScheduleResourceManager](#). In the following code, French has been set as Schedule locale as well as custom strings.

### C#

```
// Here ScheduleSample is a sample name.
ScheduleResourceManager.Manager = new
ResourceManager("ScheduleSample.Resources.Syncfusion.SfSchedule.Forms",
GetType().GetTypeInfo().Assembly);
if (schedule.Locale == "fr")
{
    if (Device.RuntimePlatform == Device.iOS || Device.RuntimePlatform ==
Device.Android)
    {
        DependencyService.Get<ILocalize>().SetLocale(new CultureInfo("fr"));
    }
    else
    {
        CultureInfo.DefaultThreadCurrentCulture = new CultureInfo("fr");
    }
}
```

You can download the entire source code of this demo for Xamarin.Forms from here [LocaleFromPCL](#).

#### *Adding resx file*

You need to add the required resx files under the Resources folder in the PCL project and the filename should be `Syncfusion.SfSchedule.Forms.LanguageCode.resx`.

Example: For French, `Syncfusion.SfSchedule.Forms.fr.resx`

Now, set the Build Action as `EmbeddedResource` for `Syncfusion.SfSchedule.Forms.fr.resx` file and Build Action as `Compile` for `Syncfusion.SfSchedule.Forms.fr.Designer.cs` file.

#### **XML**

```
<data name="NoEvents" xml:space="preserve">
<value>Pas d'événements</value>
</data>
<data name="NoSelectedDate" xml:space="preserve">
```

```
<value>Aucune date sélectionnée</value>
</data>
<data name="NoResources" xml:space="preserve">
<value>Aucune ressource</value>
</data>
```

#### *Adding ILocalize interface in PCL*

You need to add the ILocalize interface to convert the platform-specific locales to a value supported in .NET cultures in the PCL project.

#### **C#**

```
namespace ScheduleLocale
{
    public interface ILocalize
    {
        CultureInfo GetCurrentCultureInfo();
        void SetLocale(CultureInfo cultureInfo);
    }
    public class PlatformCulture
    {
        public PlatformCulture(string platformCultureString)
        {
            if (String.IsNullOrEmpty(platformCultureString))
                throw new ArgumentException("Expected culture identifier",
                    "platformCultureString");
            PlatformString = platformCultureString.Replace("_", "-");
            var dashIndex = PlatformString.IndexOf("-", StringComparison.Ordinal);
            if (dashIndex > 0)
            {
                var parts = PlatformString.Split('-');
                LanguageCode = parts[0];
                LocaleCode = parts[1];
            }
            else
            {
                LanguageCode = PlatformString;
                LocaleCode = "";
            }
        }
        public string PlatformString { get; private set; }
        public string LanguageCode { get; private set; }
        public string LocaleCode { get; private set; }
        public override string ToString()
        {
            return PlatformString;
        }
    }
}
```

#### *Adding Localize class in Android and iOS project inheriting from ILocalize*

You need to add the Localize class in Android and iOS project by inheriting from ILocalize. You can get the CultureInfo and set the same to Schedule Locale by using `GetCurrentCultureInfo` and `SetLocale`.

Localize class for Android project,

**C#**

```

using System.Globalization;
using System.Threading;
[assembly: Xamarin.Forms.Dependency(typeof(ScheduleLocale.Droid.Localize))]
namespace ScheduleLocale.Droid
{
    public class Localize : ILocalize
    {
        public void SetLocale(CultureInfo cultureInfo)
        {
            Thread.CurrentThread.CurrentCulture = cultureInfo;
            Thread.CurrentThread.CurrentUICulture = cultureInfo;
        }
        public CultureInfo GetCurrentCultureInfo()
        {
            var netLanguage = "en";
            var androidLocale = Java.Util.Locale.Default;
            netLanguage = AndroidToDotnetLanguage(androidLocale.ToString().Replace("_",
            "-"));
            CultureInfo cultureInfo = null;
            try
            {
                cultureInfo = new CultureInfo(netLanguage);
            }
            catch
            {
                try
                {
                    var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
                    cultureInfo = new CultureInfo(fallback);
                }
                catch
                {
                    cultureInfo = new CultureInfo("en");
                }
            }
            return cultureInfo;
        }
        private string AndroidToDotnetLanguage(string androidLanguage)
        {
            var netLanguage = androidLanguage;
            switch (androidLanguage)
            {
                case "ms-BN": // "Malaysian (Brunei)" not supported .NET culture
                case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
                case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
                    netLanguage = "ms"; // closest supported
                    break;
                case "in-ID": // "Indonesian (Indonesia)" has different code in .NET
                    netLanguage = "id-ID"; // correct code for .NET
                    break;
                case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
                    culture
                    netLanguage = "de-CH"; // closest supported
                    break;
            }
        }
    }
}

```

```

return netLanguage;
}
private string ToDotnetFallbackLanguage(PlatformCulture platformCulture)
{
var netLanguage = platformCulture.LanguageCode; // use the first part of the
identifier (two chars, usually);
switch (platformCulture.LanguageCode)
{
case "gsw":
netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
break;
}
return netLanguage;
}
}
}

```

Localize class for iOS project,

### **C#**

```

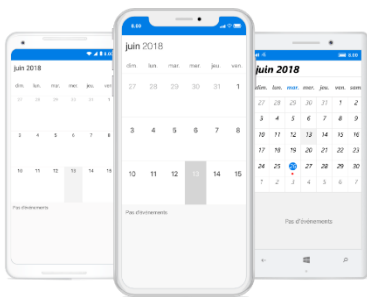

using System.Globalization;
using System.Threading;
using Foundation;
[assembly: Xamarin.Forms.Dependency(typeof(ScheduleLocale.iOS.Localize))]
namespace ScheduleLocale.iOS
{
public class Localize : ILocalize
{
public void SetLocale(CultureInfo cultureInfo)
{
Thread.CurrentThread.CurrentCulture = cultureInfo;
Thread.CurrentThread.CurrentUICulture = cultureInfo;
}
public CultureInfo GetCurrentCultureInfo()
{
var netLanguage = "en";
if (NSLocale.PreferredLanguages.Length > 0)
{
var pref = NSLocale.PreferredLanguages[0];
netLanguage = iOSToDotnetLanguage(pref);
}
CultureInfo cultureInfo = null;
try
{
cultureInfo = new CultureInfo(netLanguage);
}
catch
{
try
{
var fallback = ToDotnetFallbackLanguage(new PlatformCulture(netLanguage));
cultureInfo = new CultureInfo(fallback);
}
catch
{
}
}
}
}

```

```

cultureInfo = new CultureInfo("en");
}
}
return cultureInfo;
}
private string iOSToDotnetLanguage(string iOSLanguage)
{
    var netLanguage = iOSLanguage;
    switch (iOSLanguage)
    {
        case "ms-MY": // "Malaysian (Malaysia)" not supported .NET culture
        case "ms-SG": // "Malaysian (Singapore)" not supported .NET culture
            netLanguage = "ms"; // closest supported
            break;
        case "gsw-CH": // "Schwiizertüütsch (Swiss German)" not supported .NET
            culture
            netLanguage = "de-CH"; // closest supported
            break;
    }
    return netLanguage;
}
private string ToDotnetFallbackLanguage(PlatformCulture platCulture)
{
    var netLanguage = platCulture.LanguageCode; // use the first part of the
    identifier (two chars, usually);
    switch (platCulture.LanguageCode)
    {
        case "pt":
            netLanguage = "pt-PT"; // fallback to Portuguese (Portugal)
            break;
        case "gsw":
            netLanguage = "de-CH"; // equivalent to German (Switzerland) for this app
            break;
    }
    return netLanguage;
}
}
}
}

```

## NOTE

For UWP project, no sample level changes required.

## Right to left(RTL)

SfSchedule supports to change the layout direction of the control in the right-to-left direction by setting the [FlowDirection](#) to `RightToLeft` or by changing the device language.

### XML

```
<schedule:SfSchedule FlowDirection="RightToLeft">
</schedule:SfSchedule>
```

### C#

```
schedule.FlowDirection = FlowDirection.RightToLeft;
```

### Note

For implementing the `FlowDirection` in the control, Xamarin.Forms package version must be 3.0 and above. Please refer [RightToLeft](#) to get more details about `RightToLeft` flow direction in Xamarin.Forms.

### Android

For Android, add `android:supportsRtl="true"` in your application tag of `AndroidManifest.xml` file, and make sure your `MinSDKVersion` is 17+. By changing the device language / enabling the device's Force RTL layout can achieve the `RightToLeft` layout direction in Schedule.

### XML

```
<manifest ... >
<uses-sdk android:minSdkVersion="17" ... />
<application ... android:supportsRtl="true">
</application>
</manifest>
```

### iOS

For iOS, add the `RightToLeft` language in the `CFBundleLocalizations` section of your `Info.plist` file, and make sure you're targeting iOS 9+.

### XML

```
<resources>
<key>CFBundleDevelopmentRegion</key>
<string>en</string>
<key>CFBundleLocalizations</key>
<array>
<string>en</string>
<string>ar</string>
</array>
</resources>
```

Localization native development region	String en
▼ Localizations	Array (2 items)
	String en
	String ar

### UWP

For UWP, you need to set `FlowDirection` to `RightToLeft` in the `MainPage.cs` file of the `UWP` project.

### C#

```
public MainPage ()
{
    ...
    this.FlowDirection = FlowDirection.RightToLeft;
    LoadApplication (new App ());
    ...
}
```

### Theming

Theming is a set of resources which are used to provide the consistency look for schedule.

You can modify the default appearance of schedule using this support. By default schedule have default theme resources and it's located in `Syncfusion.Xamarin.Core` assembly. You need to merge them in your application's resource to apply the theme.

In the below code you can see the default color and key value for the default resources.

### XML

```
<!--DayViewSettings-->

<Color x:Key="SfScheduleMonthAgendaViewDateFontColor">#707070</Color>
<!--TimeIndicatorStyle-->
<Color x:Key="SfScheduleTimeIndicatorTextColor">#6D25E8</Color>

```

You can apply the default theme (light theme) or customized theme to schedule.

Default theme (light theme)

You need to apply the syncfusion theme dictionaries in your application to view the default theme (light theme).

#### XML

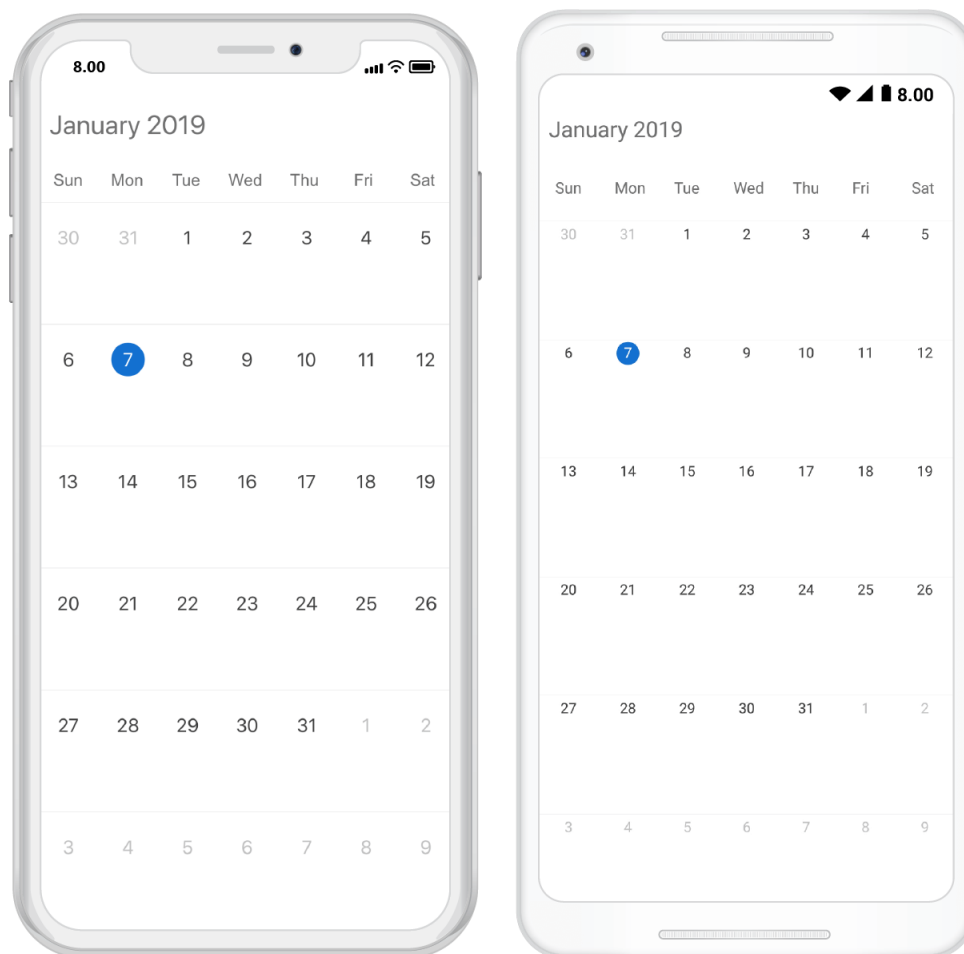

```
<?xml version="1.0" encoding="utf-8"?>
```

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" xmlns:local="clr-
namespace:ScheduleTheme" x:Class="ScheduleTheme.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfSchedule.XForms;assembly=Syncfusion.SfSchedule.XForms
"
xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms">
<ContentPage.Resources>
<syncTheme:SyncfusionThemeDictionary>
<syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
<syncTheme:LightTheme x:Name="LightTheme" />
</syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
</syncTheme:SyncfusionThemeDictionary>
</ContentPage.Resources>
<syncfusion:SfSchedule x:Name="schedule">
</syncfusion:SfSchedule>
</ContentPage>

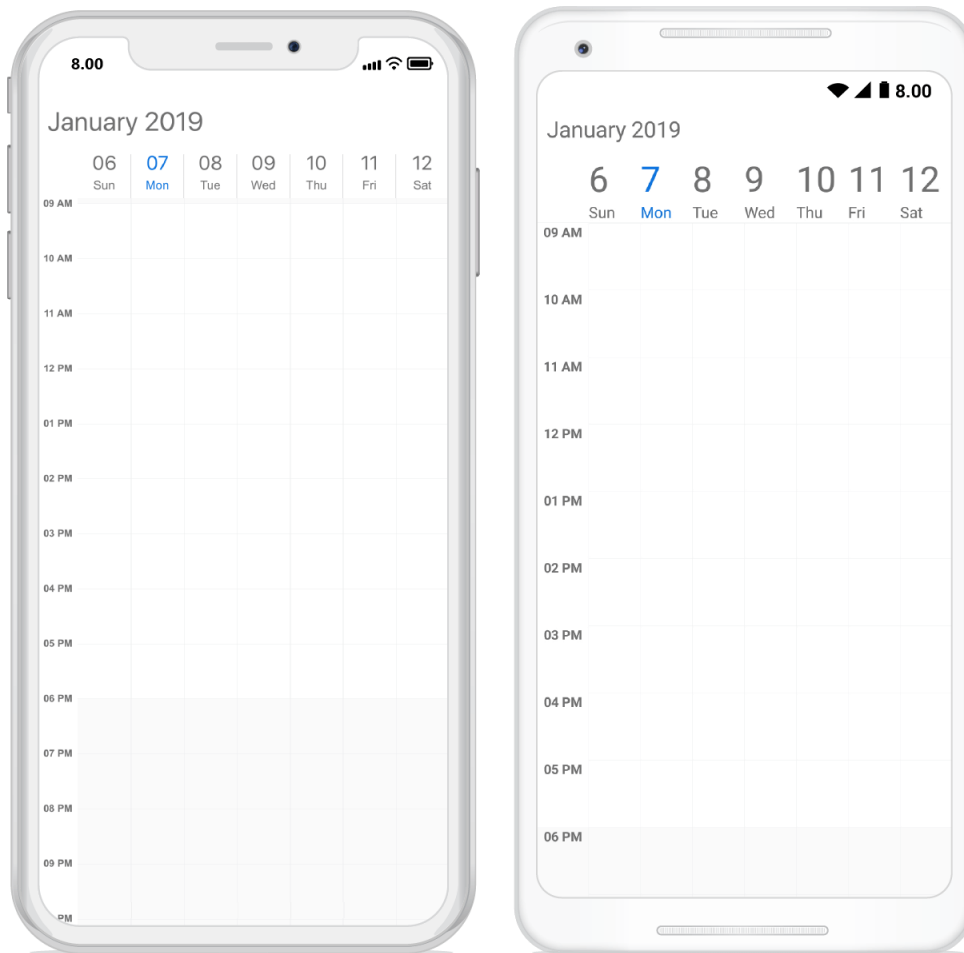

```

### Customizing the default theme

You can customize the default theme by overriding the existing key and set the new value.

#### XML

```
<?xml version="1.0" encoding="utf-8"?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml" xmlns:local="clr-
namespace:ScheduleTheme" x:Class="ScheduleTheme.MainPage"
xmlns:syncfusion="clr-
namespace:Syncfusion.SfSchedule.XForms;assembly=Syncfusion.SfSchedule.XForms
"
xmlns:syncTheme="clr-
namespace:Syncfusion.XForms.Themes;assembly=Syncfusion.Core.XForms">
<ContentPage.Resources>
<syncTheme:SyncfusionThemeDictionary>
<syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
<syncTheme:LightTheme x:Name="LightTheme" />
<syncfusion:SfScheduleStyles />
<ResourceDictionary>
<Color x:Key="SfScheduleHeaderTextColor">Red</Color>
<Color x:Key="SfScheduleViewHeaderDayTextColor">Blue</Color>
<Color x:Key="SfScheduleViewHeaderDateTextColor">Blue</Color>
```

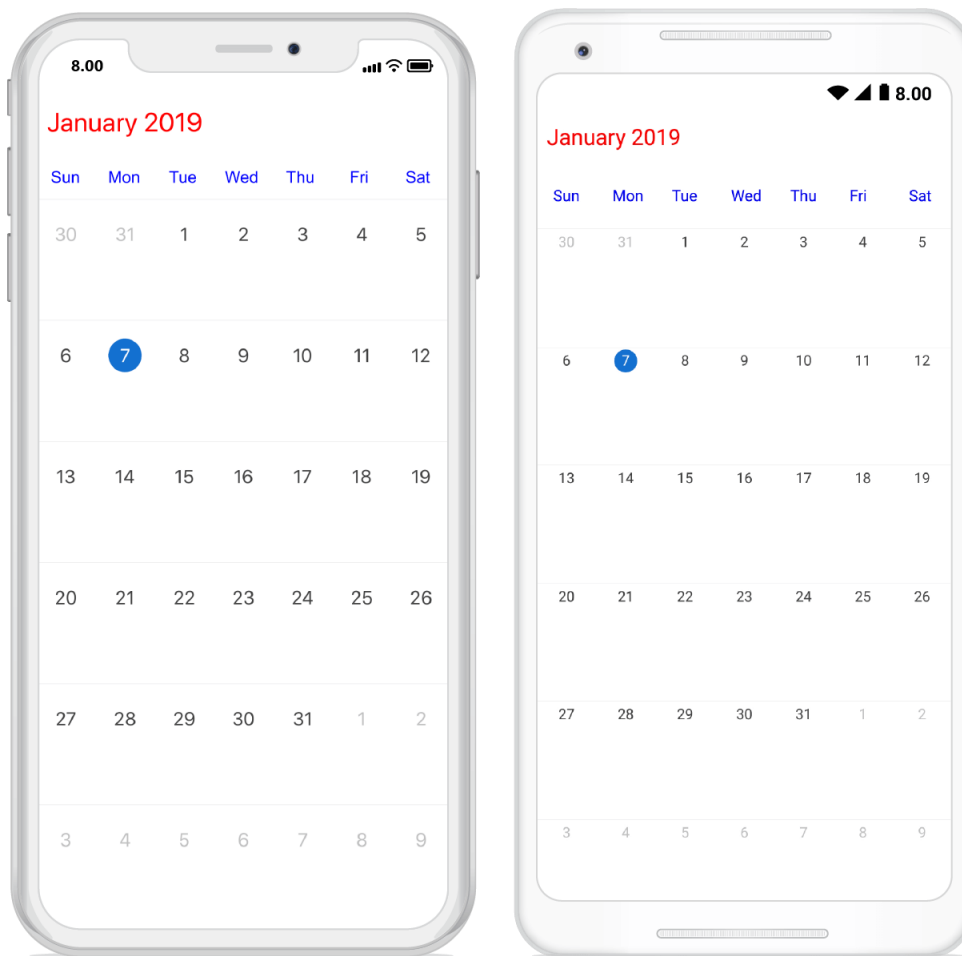

```
</ResourceDictionary>
</syncTheme:SyncfusionThemeDictionary.MergedDictionaries>
</syncTheme:SyncfusionThemeDictionary>
</ContentPage.Resources>
<syncfusion:SfSchedule x:Name="schedule">
</syncfusion:SfSchedule>
</ContentPage>
```

---

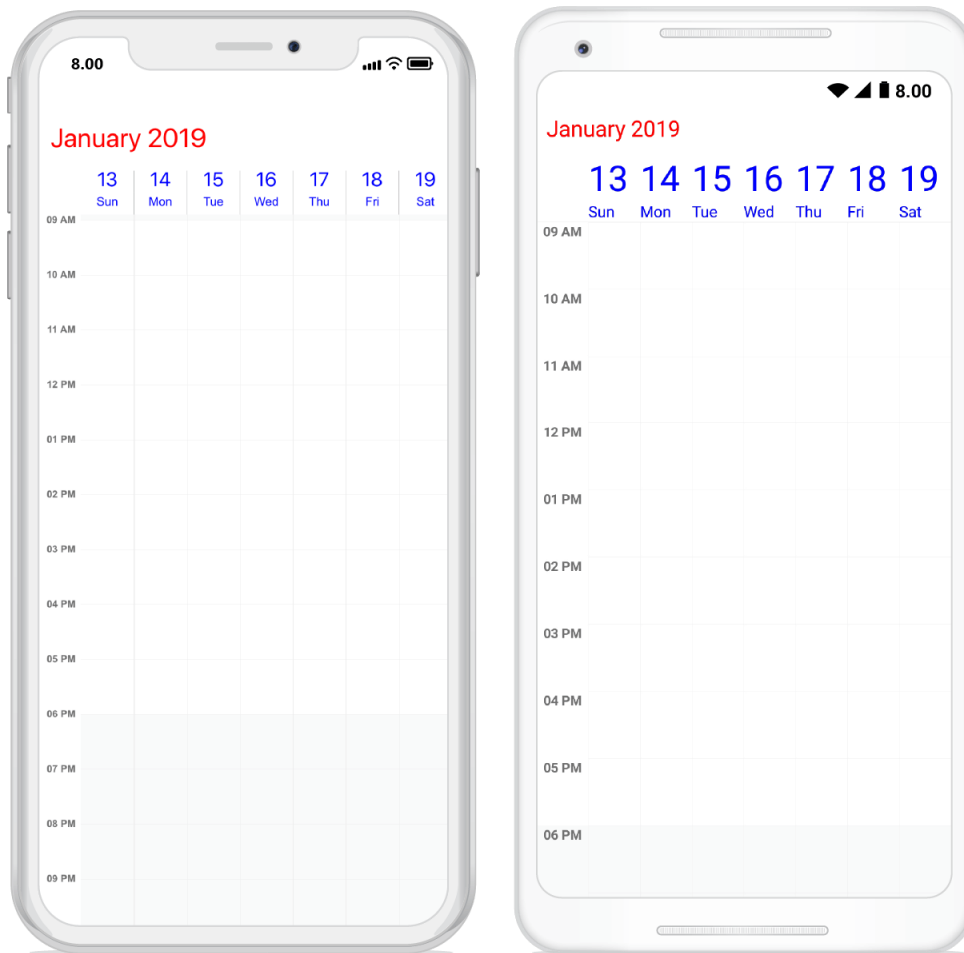

**NOTE**

Xamarin.Forms version should be above 3 while customize the default theme.

### AutomationId

The **SfSchedule** control has built-in **AutomationId** for inner elements. Please find the following table of Automation IDs for inner elements. To keep unique **AutomationId**, these inner elements' AutomationIds are updated based on the control's **AutomationId**. For example, if you set **SfSchedule AutomationId** as **SfSchedule.AutomationId = EventScheduler**, then the Automation framework will interact with the month header as **EventSchedulerAugust 2019**. The following screenshots denote the AutomationIds for inner elements.

### Month view

View	AutomationId Format	Example
MonthCell	dd/MMMM/yyyy	01/July/2019

## SfSegmentedControl

### Overview

The segmented control for Xamarin.Forms provides a simple way to choose from a linear set of two or more segments, each of which functions as a mutually exclusive button.

### Key Features

- Supports displaying the segments with text, font icons, or both.
- Supports scrolling and aligning the segments equally within the available space.
- Populates the segments from a collection of strings and views along with the objects of built-in classes.
- Supports customizing text and other UI elements.

### Getting Started

This section provides an overview for working with the segmented control for Xamarin.Forms. Walk through the entire process of creating a real-world application with the SfSegmentedControl.

### Assembly deployment

After installing the Essential Studio for Xamarin, find all the required assemblies in installation folders, {Syncfusion Essential Studio Installed location}\Essential Studio\16.2.0.41\Xamarin\lib}.

E.g., C:\Program Files (x86)\Syncfusion\Essential Studio\16.2.0.41\Xamarin\lib

---

**Note:** Assemblies can be found in an unzipped package location in Mac.

---

### Adding SfSegmentedControl reference

You can add SfSegmentedControl reference using one of the following methods:

#### Method 1: Adding SfSegmentedControl reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons). To add SfSegmentedControl to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Buttons](https://www.nuget.org/packages/Syncfusion.Xamarin.Buttons), and then install it.

![Adding SfSegmentedControl reference from NuGet](images/getting-started/Adding SfSegmentedControl reference.png)

**Note:**

- Install the same version of SfSegmentedControl NuGet in all the projects.
- In addition, you need to install the [Syncfusion.Xamarin.Buttons.WPF]() package for Xamarin.Forms WPF platform only.

#### Method 2: Adding SfSegmentedControl reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfSegmentedControl control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfSegmentedControl assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Buttons.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll

UWP	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.WPF.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### Launching the SfSegmentedControl on each platform

To use the segmented control inside an application, each platform application must initialize the segmented control renderer. This initialization steps vary from platform to platform, and it is discussed in the following sections:

##### *Android and UWP*

The Android and UWP launches the SfSegmentedControl without any initialization, and it is enough to only initialize the Xamarin.Forms Framework to launch the application.

**Note:** If you are adding the references from toolbox, this step is not needed.

##### *iOS*

To launch the segmented control in iOS, call the SfSegmentedControlRenderer.Init() in the FinishedLaunching overridden method of the AppDelegate class after the Xamarin.Forms Framework has been initialized and before the LoadApplication is called, as demonstrated in the following code example.

##### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.XForms.iOS.Buttons.SfSegmentedControlRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

##### *ReleaseMode issue in UWP platform*

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

The above problem can be resolved by initializing the SfSegmentedControl assemblies in `App.xaml.cs` in UWP project as like in below code snippet.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.Buttons.SfSegmentedControlRenderer()).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

#### *Additional step for WPF*

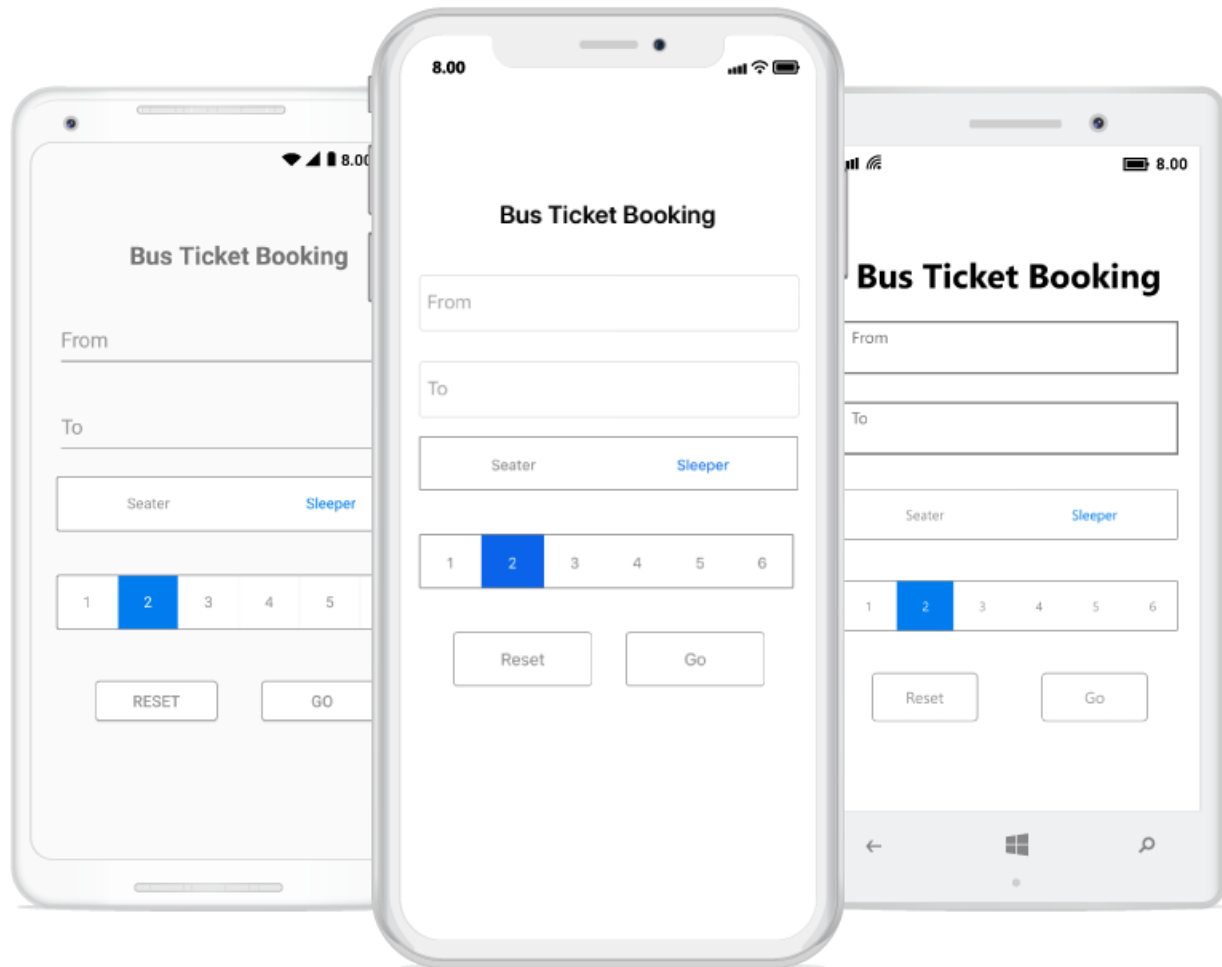

To launch the segmented control in WPF, call the `SfSegmentedControlRenderer.Init()` method in the `MainWindow` constructor of the `MainWindow` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

#### C#

```
public partial class MainWindow : FormsApplicationPage
{
    public MainWindow()
    {
        InitializeComponent();
        Forms.Init();
        Syncfusion.XForms.WPF.Buttons.SfSegmentedControlRenderer.Init();
        LoadApplication(new App());
    }
}
```

#### Creating an application with segmented control.

This section explains how to create a bus ticket booking module by using syncfusion segmented control. The control can be configured entirely in C# code or by using XAML markup. The following screenshot illustrates the output of Segmented control on iOS, Android and UWP devices.

### Creating a project

Create a new BlankApp (Xamarin.Forms.Portable) application in Visual Studio for Xamarin.Forms.

### Adding SfSegmentedControl in Xamarin.Forms

Add the required assembly references to the PCL and renderer projects as discussed in the [Assembly deployment section](#).

Import the control namespace as shown in the following code.

#### XML

```
xmlns:buttons="clr-namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
```

#### C#

```
using Syncfusion.XForms.Buttons;
```

Set the control to content in `ContentPage`.

#### XML

```
<? xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns = "http://xamarin.com/schemas/2014/forms"

namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<buttons:SfSegmentedControl />
</ContentPage.Content>
</ContentPage>
```

**C#**

```
using Syncfusion.XForms.Buttons;
using Xamarin.Forms;
namespace GettingStarted
{
    public partial class MainPage : ContentPage
    {
        private SfSegmentedControl segmentedControl;
        public MainPage()
        {
            InitializeComponent();
            segmentedControl = new SfSegmentedControl();
            this.Content = segmentedControl;
        }
    }
}
```

*Adding supportive views to the application.*

For the completeness of the ticket booking application, few framework controls are added to the application, to get the data from the user.

ViewModel class for the Entry which we have used in our View.

**C#**

```
using Syncfusion.XForms.Buttons;
using System;
using System.Collections.ObjectModel;
using System.ComponentModel;
using System.Runtime.CompilerServices;
using Xamarin.Forms;
namespace SegmentGettingStarted
{
    class ViewModel : INotifyPropertyChanged
    {
        private string fromText="";
        public string FromText
        {
            get { return fromText; }
            set { fromText = value; NotifyPropertyChanged("FromText"); }
        }
        private string toText = "";
        public string ToText
        {

```

```

get { return toText; }
set { toText = value; NotifyPropertyChanged("ToText"); }
}
public ViewModel()
{
}
public event PropertyChangedEventHandler PropertyChanged;
private void NotifyPropertyChanged([CallerMemberName] String propertyName =
    "")
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
    }
}
}
}
}

```

View can be created by the following code snippet.

#### XML

```

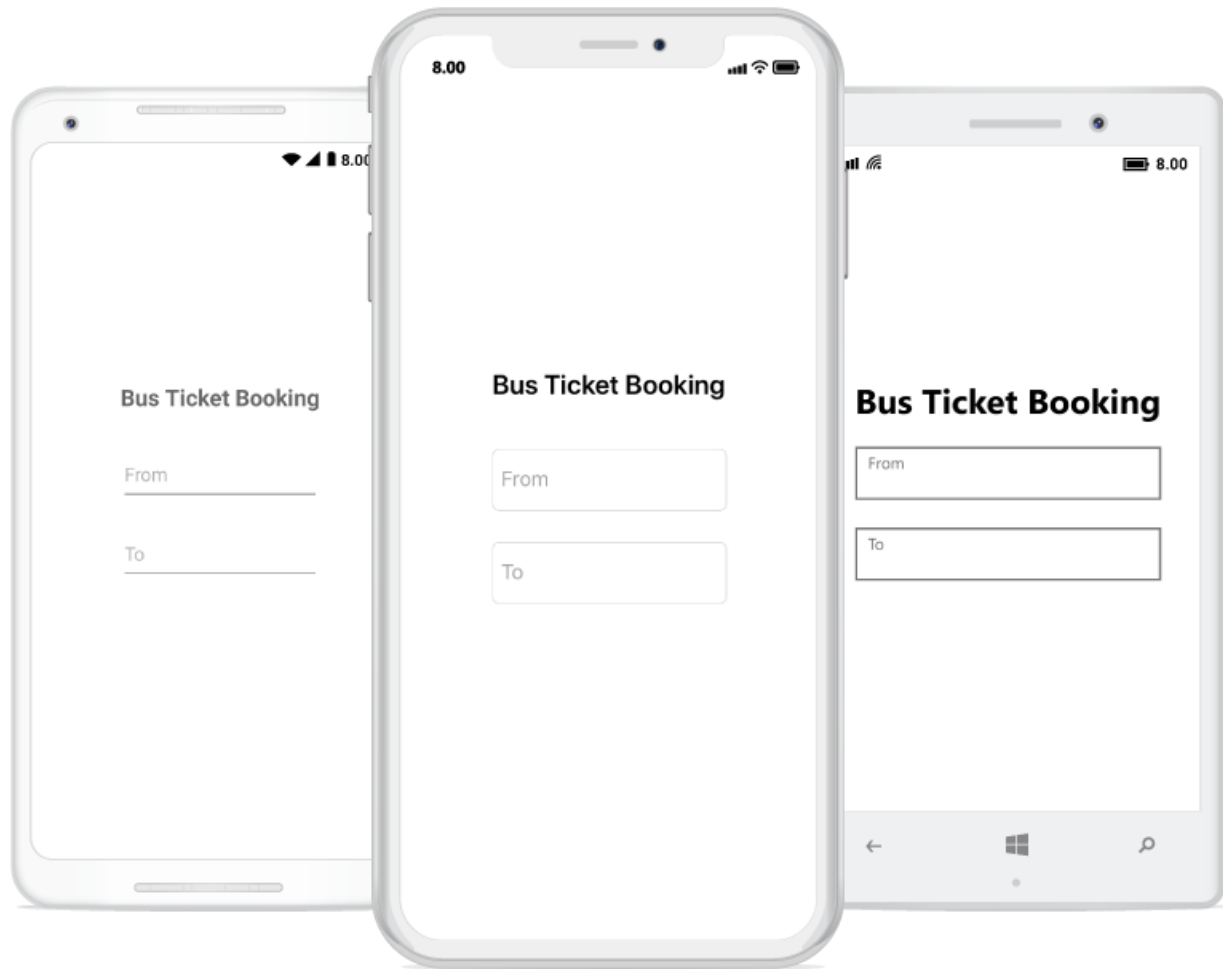

<? xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns = "http://xamarin.com/schemas/2014/forms"

        {
            InitializeComponent();
            stack = new StackLayout();
            viewModel = new ViewModel();
            stack.HorizontalOptions = LayoutOptions.Center;
            stack.VerticalOptions = LayoutOptions.Center;
            stack.Padding = new Thickness(20, 0, 20, 0);
            //Label to denote the header part of application
            headerLabel = new Label();
            headerLabel.Text = "Bus Ticket Booking";
            headerLabel.FontAttributes = FontAttributes.Bold;
            headerLabel.HeightRequest = 50;
            headerLabel.FontSize = Device.GetNamedSize(NamedSize.Large, typeof(Label));
            headerLabel.HorizontalOptions = LayoutOptions.Center;
            headerLabel.VerticalOptions = LayoutOptions.Center;
            //Entry to enter the origin location
            fromEntry = new Entry();
            fromEntry.Placeholder = "From";
            fromEntry.Text = viewModel.FromText;
            fromEntry.HeightRequest = 50;
            fromEntry.Margin = new Thickness(0, 10, 0, 10);
            //Entry to enter the destination location
            toEntry = new Entry();
            toEntry.Placeholder = "To";
            toEntry.Text = viewModel.ToText;
            toEntry.HeightRequest = 50;
            toEntry.Margin = new Thickness(0, 10, 0, 10);
            stack.Children.Add(headerLabel);
            stack.Children.Add(fromEntry);
            stack.Children.Add(toEntry);
            this.Content = stack;
        }
    }
}
```

### Adding data/Items to SfSegmentedControl

We can add the data inside the segmented control in 3 different ways.

1. String data
2. SfSegmentItem
3. Custom View

Items inside the segmented control can be added through the `ItemsSource` property of `SfSegmentedControl`, which holds the collection/list of items.

#### Adding data as a String

With the help of `Xamarin.Forms` `System.Collections.Generic` we can add string data as `ItemsSource` to `SfSegmentedControl`.

#### C#

```
using Syncfusion.XForms.Buttons;  
using System;  
using System.Collections.ObjectModel;  
using System.ComponentModel;  
using System.Runtime.CompilerServices;
```

```

using Xamarin.Forms;
namespace SegmentGettingStarted
{
    class ViewModel : INotifyPropertyChanged
    {
        private string fromText="";
        public string FromText
        {
            get { return fromText; }
            set { fromText = value; NotifyPropertyChanged("FromText"); }
        }
        private string toText = "";
        public string ToText
        {
            get { return toText; }
            set { toText = value; NotifyPropertyChanged("ToText"); }
        }
        public ViewModel()
        {
        }
        public event PropertyChangedEventHandler PropertyChanged;
        private void NotifyPropertyChanged([CallerMemberName] String propertyName =
            "")
        {
            if (PropertyChanged != null)
            {
                PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
            }
        }
    }
}

```

## XML

```

<? xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns = "http://xamarin.com/schemas/2014/forms"

<x:String>5</x:String>
<x:String>6</x:String>
</segmentCollection:List>
</buttons:SfSegmentedControl>
</StackLayout>
</ContentPage>

```

## C#

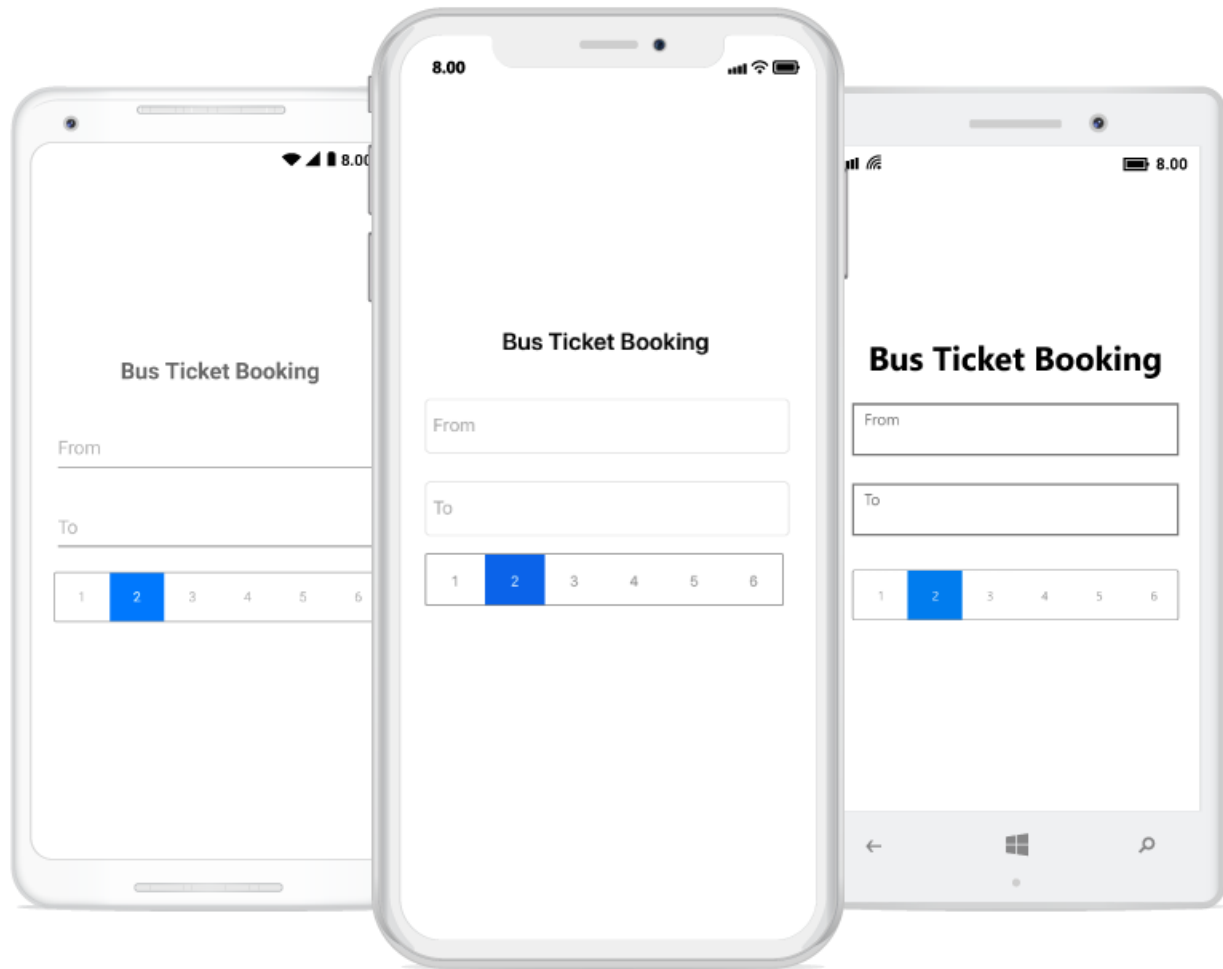

```

using Syncfusion.XForms.Buttons;
using System.Collections.Generic;
using Xamarin.Forms;
namespace SegmentGettingStarted
{
public partial class MainPage : ContentPage
{
SfSegmentedControl segmentedControl;
StackLayout stack;
ViewModel viewModel;
Label headerLabel;
Entry fromEntry, toEntry;
public MainPage()
{
InitializeComponent();
stack = new StackLayout();
viewModel = new ViewModel();
stack.HorizontalOptions = LayoutOptions.Center;
stack.VerticalOptions = LayoutOptions.Center;
stack.Padding = new Thickness(20, 0, 20, 0);
//Label to denote the header part of application
headerLabel = new Label();
}
}

```

```
headerLabel.Text = "Bus Ticket Booking";
headerLabel.FontAttributes = FontAttributes.Bold;
headerLabel.HeightRequest = 50;
headerLabel.FontSize = Device.GetNamedSize(NamedSize.Large, typeof(Label));
headerLabel.HorizontalOptions = LayoutOptions.Center;
headerLabel.VerticalOptions = LayoutOptions.Center;
//Entry to enter the origin location
fromEntry = new Entry();
fromEntry.Placeholder = "From";
fromEntry.Text = viewModel.FromText;
fromEntry.HeightRequest = 50;
fromEntry.Margin = new Thickness(0, 10, 0, 10);
//Entry to enter the destination location
toEntry = new Entry();
toEntry.Placeholder = "To";
toEntry.Text = viewModel.ToText;
toEntry.HeightRequest = 50;
toEntry.Margin = new Thickness(0, 10, 0, 10);
//Adding item to the SegmentedControl as String
segmentedControl = new SfSegmentedControl();
segmentedControl.SelectionTextColor = Color.White;
segmentedControl.HeightRequest = 80;
segmentedControl.Color = Color.Transparent;
segmentedControl.BorderColor = Color.FromHex("#929292");
segmentedControl.FontColor = Color.FromHex("#929292");
segmentedControl.SelectedIndex = 1;
segmentedControl.BackgroundColor = Color.Transparent;
segmentedControl.VisibleSegmentsCount = 6;
segmentedControl.DisplayMode = SegmentDisplayMode.Text;
List<string> list = new List<string>
{
    "1", "2", "3", "4", "5", "6"
};
segmentedControl.ItemsSource = list;
stack.Children.Add(headerLabel);
stack.Children.Add(fromEntry);
stack.Children.Add(toEntry);
stack.Children.Add(segmentedControl);
this.Content = stack;
}
}
}
```

### *Adding data as a SfSegmentItem*

By using **SfSegmentItem** class, we can add data inside the segmented control.

In ViewModel add the below given code to get the respective items in SfSegmentedControl.

#### **C#**

```
using Syncfusion.XForms.Buttons;
using System;
using System.Collections.ObjectModel;
using System.ComponentModel;
using System.Runtime.CompilerServices;
using Xamarin.Forms;
namespace SegmentGettingStarted
{
    class ViewModel : INotifyPropertyChanged
    {
        private string fromText="";
        public string FromText
        {
            get { return fromText; }
            set { fromText = value; NotifyPropertyChanged("FromText"); }
        }
    }
}
```

```

private string toText = "";
public string ToText
{
    get { return toText; }
    set { toText = value; NotifyPropertyChanged("ToText"); }
}
public ViewModel()
{
    itemCollection = new ObservableCollection<SfSegmentItem>
    {
        new SfSegmentItem() { Text = "Seater"},
        new SfSegmentItem() { Text = "Sleeper"},
    };
}
public event PropertyChangedEventHandler PropertyChanged;
private void NotifyPropertyChanged([CallerMemberName] String propertyName =
    "")
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
    }
}
private ObservableCollection<SfSegmentItem> itemCollection = new
    ObservableCollection<SfSegmentItem>();
public ObservableCollection<SfSegmentItem> ItemCollection
{
    get { return itemCollection; }
    set { itemCollection = value; }
}
}

```

## XML

}
}
}
```

#### *Adding data as Custom View.*

We can add any custom view to the segmented control

In ViewModel add the below given code to get the respective items/collection in SfSegmentedControl.

#### **C#**

```
using Syncfusion.XForms.Buttons;
```

```

using System;
using System.Collections.ObjectModel;
using System.ComponentModel;
using System.Runtime.CompilerServices;
using Xamarin.Forms;
namespace SegmentGettingStarted
{
    class ViewModel : INotifyPropertyChanged
    {
        private string fromText="";
        public string FromText
        {
            get { return fromText; }
            set { fromText = value; NotifyPropertyChanged("FromText"); }
        }
        private string toText = "";
        public string ToText
        {
            get { return toText; }
            set { toText = value; NotifyPropertyChanged("ToText"); }
        }
        public ViewModel()
        {
            itemCollection = new ObservableCollection<SfSegmentItem>
            {
                new SfSegmentItem() { Text = "Seater"},
                new SfSegmentItem() { Text = "Sleeper"},
            };
            ViewCollection = new ObservableCollection<View>
            {
                ResetViewButton,
                GoViewButton
            };
        }
        public event PropertyChangedEventHandler PropertyChanged;
        private void NotifyPropertyChanged([CallerMemberName] String propertyName =
            "")
        {
            if (PropertyChanged != null)
            {
                PropertyChanged(this, new PropertyChangedEventArgs(propertyName));
            }
        }

    public partial class MainPage : ContentPage
    {

```

```
SfSegmentedControl segmentedControl, segment, segmentView;
StackLayout stack;
ViewModel viewModel;
Label headerLabel;
Entry fromEntry, toEntry;
public MainPage()
{
    InitializeComponent();
    stack = new StackLayout();
    viewModel = new ViewModel();
    stack.HorizontalOptions = LayoutOptions.Center;
    stack.VerticalOptions = LayoutOptions.Center;
    stack.Padding = new Thickness(20, 0, 20, 0);
    //Label to denote the header part of application
    headerLabel = new Label();
    headerLabel.Text = "Bus Ticket Booking";
    headerLabel.FontAttributes = FontAttributes.Bold;
    headerLabel.HeightRequest = 50;
    headerLabel.FontSize = Device.GetNamedSize(NamedSize.Large, typeof(Label));
    headerLabel.HorizontalOptions = LayoutOptions.Center;
    headerLabel.VerticalOptions = LayoutOptions.Center;
    //Entry to enter the origin location
    fromEntry = new Entry();
    fromEntry.Placeholder = "From";
    fromEntry.Text = viewModel.FromText;
    fromEntry.HeightRequest = 50;
    fromEntry.Margin = new Thickness(0, 10, 0, 10);
    //Entry to enter the destination location
    toEntry = new Entry();
    toEntry.Placeholder = "To";
    toEntry.Text = viewModel.ToText;
    toEntry.HeightRequest = 50;
    toEntry.Margin = new Thickness(0, 10, 0, 10);
    //Adding item to the segmented control as String
    segmentedControl = new SfSegmentedControl();
    segmentedControl.SelectionTextColor = Color.White;
    segmentedControl.HeightRequest = 80;
    segmentedControl.Color = Color.Transparent;
    segmentedControl.BorderColor = Color.FromHex("#929292");
    segmentedControl.FontColor = Color.FromHex("#929292");
    segmentedControl.SelectedIndex = 1;
    segmentedControl.BackgroundColor = Color.Transparent;
    segmentedControl.VisibleSegmentsCount = 6;
    segmentedControl.DisplayMode = SegmentDisplayMode.Text;
    List<string> list = new List<string>
    {
        "1", "2", "3", "4", "5", "6"
    };
    segmentedControl.ItemsSource = list;
    //Adding item to segmented control as SegmentItem
    segment = new SfSegmentedControl();
    segment.SelectionTextColor = Color.FromHex("#007CEE");
    segment.VisibleSegmentsCount = 2;
    segment.Color = Color.White;
    segment.BorderColor = Color.FromHex("#929292");
    segment.SelectedIndex = 1;
    segment.FontColor = Color.FromHex("#929292");
```

```
segment.BackgroundColor = Color.Transparent;
segment.BindingContext = viewModel;
segment.ItemsSource = viewModel.ItemCollection;
SelectionIndicatorSettings select = new SelectionIndicatorSettings();
select.Color = Color.White;
segment.SelectionIndicatorSettings = select;
//Adding item to the segmented control as View
segmentView = new SfSegmentedControl();
segmentView.BindingContext = viewModel;
segmentView.ItemsSource = viewModel.ViewCollection;
segmentView.BorderColor = Color.Transparent;
segmentView.HeightRequest = 80;
segmentView.HorizontalOptions = LayoutOptions.Center;
segmentView.VisibleSegmentsCount = 2;
segmentView.Color = Color.Transparent;
segmentView.SegmentPadding = 30;
SelectionIndicatorSettings selectionIndicator = new
SelectionIndicatorSettings();
selectionIndicator.Color = Color.Transparent;
selectionIndicator.Position = SelectionIndicatorPosition.Fill;
selectionIndicator.StrokeThickness = 10;
segmentView.SelectionIndicatorSettings = selectionIndicator;
stack.Children.Add(headerLabel);
stack.Children.Add(fromEntry);
stack.Children.Add(toEntry);
stack.Children.Add(segment);
stack.Children.Add(segmentedControl);
stack.Children.Add(segmentView);
this.Content = stack;
}
}
}
```

### Customizing segmented control appearance

*Share space equally to all the items.*

To share the Item space equally to segmented control, set the number of segment item that has to be visible on the available screen width and that can be distributed in the available space through the `VisibleSegmentsCount` property of `SfSegmentedControl`.

#### XML

```
<buttons:SfSegmentedControl VisibleSegmentsCount="5">
```

#### C#

```
SegmentedControl.VisibleSegmentsCount = 5;
```

### Display Mode

We can change the appearance of the segmented control by using the `DisplayMode` property of `SfSegmentedControl`. We can set the `DisplayMode` to either Image or Text or ImageWithText.

#### XML

```
<buttons:SfSegmentedControl DisplayMode="Text"/>
```

**C#**

```
SegmentedControl.DisplayMode = SegmentDisplayMode.Text;
```

**Customizing selection indicator appearance**

The Selection indicator can be used to indicate the selected index of the segmented control. It can be customized with the built-in APIs that are available in the `SelectionIndicatorSettings` property of `SfSegmentedControl`.

To know more about customizing selection indicator refer this [feature link](#)

**Handle click events**

`SfSegmentedControl` has `SelectionChanged` event, using this we can perform operation based on our needs.

**XML**

```
<buttons:SfSegmentedControl
x:Name="SegmentedControl"
SelectionChanged="SegmentedControl_SelectionChanged" />
```

**C#**

```
SegmentedControl.SelectionChanged += SegmentedControl_SelectionChanged;
```

**C#**

```
private void SegmentedControl_SelectionChanged(object sender,
Syncfusion.XForms.Buttons.SelectionChangedEventArgs e)
{
    var currentValue = e.Index; //To get the value of current selected index.
}
```

**Note:** For custom view user need to handle click event manually for the view which have been used.

eg. For Button we have to use its "Click" event.

The below given code can be included on the Custom view viewModel to get the click event output.

**C#**

```
public ViewModel()
{
    ResetViewButton.Clicked += ResetViewButton_Clicked;
    GoViewButton.Clicked += GoViewButton_Clicked;
}
private void GoViewButton_Clicked(object sender, EventArgs e)
{
    if (FromText == "")
    {
        SendMessgae("Please enter your origin city.");
    }
    else if (ToText == "")
```

```

{
    SendMessage("Please enter your destination city.");
}
else
    SendMessage("Your ticket has been booked.");
}
private void ResetViewButton_Clicked(object sender, EventArgs e)
{
    FromText = "";
    ToText = "";
    Application.Current.MainPage.DisplayAlert("Status", "Fields has been
    refreshed", null, "Ok");
}
internal void SendMessage(string message)
{
    Application.Current.MainPage.DisplayAlert(message, null, "Ok");
}

```

Note: Getting started sample can be downloaded from this [link](#)

### Populating data source

The segmented control can be populated from a collection of strings, views, or a collection of objects in a built-in class.

#### String collection

The segmented control provides the collection of strings as a data source.

#### XML

```

Namespace:
xmlns:sys="clr-namespace:System.Collections.Generic;assembly=netstandard"
...
<ContentPage.Content>
<buttons:SfSegmentedControl
VisibleSegmentsCount="3"
SelectedIndex="2"
BorderColor="#3F3F3F"
FontColor="Black"
Color="Transparent"
SelectionTextColor="#02A0AE">
<sys:List x:TypeArguments="x:String">
<x:String>Formals</x:String>
<x:String>Casuals</x:String>
<x:String>Trendy</x:String>
</sys:List>
</buttons:SfSegmentedControl>
</ContentPage.Content>

```

#### C#

```

SfSegmentedControl segmentedControl = new SfSegmentedControl();
List<string> clothList = new List<string>
{
    "Formals", "Casuals", "Trendy"
};
segmentedControl.ItemsSource = clothList;

```

```
segmentedControl.Color = Color.Transparent;
segmentedControl.VisibleSegmentsCount = 3;
segmentedControl.SelectedIndex = 2;
segmentedControl.BorderColor = Color.FromHex("#3F3F3F");
segmentedControl.FontColor = Color.Black;
segmentedControl.SelectionTextColor = Color.FromHex("#02A0AE");
this.Content = segmentedControl;
```

### Segment items

The segmented control customizes the text or icons, or use other built-in customization options available for the segments. Segment item collections can also be used.

The items inside the ItemsSource can be added in the code behind as below.

### C#

```
public class ViewModel
{
    public ObservableCollection<SfSegmentItem> SegmentItems { get; set; }
    public ViewModel()
    {
        SegmentItems = new ObservableCollection<SfSegmentItem>
        {
            new SfSegmentItem() { Text="XS", FontColor=Color.FromHex("#3F3F3F") },
            new SfSegmentItem() { Text="S", FontColor=Color.FromHex("#3F3F3F") },
            new SfSegmentItem() { Text="M", FontColor=Color.FromHex("#3F3F3F") },
            new SfSegmentItem() { Text="L", FontColor=Color.FromHex("#3F3F3F") },
            new SfSegmentItem() { Text="XL", FontColor=Color.FromHex("#3F3F3F") },
        };
    }
}
```

### XML

```
<ContentPage.Content>
<buttons:SfSegmentedControl
    CornerRadius="20"
    BorderColor="#2C7BBC"
    SelectionTextColor="White"
    Color="White"
    FontColor="#3F3F3F"
    VisibleSegmentsCount="5"
    ItemsSource="{Binding SegmentItems}">
    <buttons:SfSegmentedControl.BindingContext>
    <local:ViewModel/>
    </buttons:SfSegmentedControl.BindingContext>
</buttons:SfSegmentedControl>
```

```
</ContentPage.Content>
```

**C#**

```
SfSegmentedControl segmentedControl = new SfSegmentedControl();
segmentedControl.BindingContext = new ViewModel();
segmentedControl.SetBinding(SfSegmentedControl.ItemsSourceProperty,
"SegmentItems");
segmentedControl.CornerRadius = 20;
segmentedControl.Color = Color.White;
segmentedControl.VisibleSegmentsCount = 5;
segmentedControl.BorderColor = Color.FromHex("#2C7BBC");
segmentedControl.FontColor = Color.FromHex("#3F3F3F");
segmentedControl.SelectionTextColor = Color.White;
this.Content = segmentedControl;
```

## Custom views

Custom views or images can be added as segments in the segmented control.

The items inside the ItemsSource can be added in the code behind as below.

**C#**

```
public class ViewModel
{
    public ObservableCollection<View> ViewItems { get; set; }
    private Button ResetViewButton = new Button
    {
        Text = "Reset",
        TextColor = Color.FromHex("#979797"),
        BackgroundColor = Color.White,
        BorderColor = Color.FromHex("#979797"),
        BorderWidth = 1,
        HeightRequest = 50,
        VerticalOptions = LayoutOptions.Center
    };
    private Button GoViewButton = new Button
    {
        Text = "Go",
        TextColor = Color.FromHex("#979797"),
        BackgroundColor = Color.White,
        BorderColor = Color.FromHex("#979797"),
        BorderWidth = 1,
        HeightRequest = 50,
        VerticalOptions = LayoutOptions.Center
    };
    public ViewModel()
```

```
{
ViewItems = new ObservableCollection<View>
{
ResetViewButton,
GoViewButton
};
}
}
```

**XML**

```
<buttons:SfSegmentedControl
BorderColor="Transparent"
HeightRequest="80"
HorizontalOptions="Center"
x:Name="segmentedControl"
VisibleSegmentsCount="2"
Color="Transparent"
ItemsSource="{Binding ViewItems}"
SegmentPadding="30">
<buttons:SfSegmentedControl.BindingContext>
<local:ViewModel/>
</buttons:SfSegmentedControl.BindingContext>
<buttons:SfSegmentedControl.SelectionIndicatorSettings>
<buttons:SelectionIndicatorSettings Color="Transparent"/>
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
</buttons:SfSegmentedControl>
```

**C#**

```
SfSegmentedControl segmentedControl = new SfSegmentedControl();
segmentedControl.BindingContext = new ViewModel();
segmentedControl.SetBinding(SfSegmentedControl.ItemsSourceProperty,
"ViewItems");
segmentedControl.BorderColor = Color.Transparent;
segmentedControl.HeightRequest = 80;
segmentedControl.HorizontalOptions = LayoutOptions.Center;
segmentedControl.VisibleSegmentsCount = 2;
segmentedControl.Color = Color.Transparent;
segmentedControl.SegmentPadding = 30;
segmentedControl.SelectionIndicatorSettings = new
SelectionIndicatorSettings()
{
Color = Color.Transparent,
Position = SelectionIndicatorPosition.Fill,
StrokeThickness = 10
};
```

## Selection changed

The selection changed event occurs when there is a change from one segment item to another in the segmented control. It can be handled by two ways.

### User interface

When users navigate from one item to another, selection is changed, so that the `SelectedIndex` value is updated to the new index of the item. The segmented control provides the `SelectionChanged` event, which is triggered when the selection is changed with the `SelectionChangedEventArgs`.

**Index** - Gets the current index value of the selected item.

### XML

```
<buttons:SfSegmentedControl x:Name = "segmentedControl"
    SelectionChanged="Handle_SelectionChanged"/>
```

### C#

```
segmentedControl.SelectionChanged += Handle_SelectionChanged;
void Handle_SelectionChanged(object sender, SelectionChangedEventArgs e)
{
    segmentedControl.BorderColor = UIColor.Red;
}
```

## Selected Index through programmatically.

Users can set the default value programmatically for the selection to be placed. The selection is updated based on the index value given for the `SelectedIndex`.

### XML

```
<buttons:SfSegmentedControl SelectedIndex="2"/>
```

### C#

```
segmentedControl.SelectedIndex = 2;
```

## Display mode

Depending on application, different scenarios may require for effective communication. The segmented control supports these three options: icons, text, or a combination of both.

### Text

Items populated in the segmented control will be displayed as text by default.

Add the following namespace for loading data collection in string.

### XML

```
xmlns:segmentCollection="clr-
namespace:System.Collections.Generic;assembly=netstandard"
```

### XML

```
<buttons:SfSegmentedControl
x:Name="segmentedControl"
Margin="10,0"
CornerRadius="15"
SegmentHeight="50"
BorderColor="Transparent"
SelectedIndex="1"
Color="#048EAC"
FontSize="22"
DisplayMode="Text"
VisibleSegmentsCount="3"
FontColor="FFFFFF"
SelectionTextColor="#048EAC"
VerticalOptions="Center"
HorizontalOptions="Center">
<segmentCollection:List x:TypeArguments="x:String">
<x:String>Day</x:String>
<x:String>Week</x:String>
<x:String>Month</x:String>
</segmentCollection:List>
</buttons:SfSegmentedControl>
```

### C#

```
public partial class SegmentedControlSample : ContentPage
{
    SfSegmentedControl segmentedControl;
    public SegmentedControlSample()
    {
        InitializeComponent();
        segmentedControl = new SfSegmentedControl();
    }
}
```

```

List<String> periodsList = new List<String>
{
    "Day", "Week", "Month"
};
segmentedControl.ItemsSource = periodsList;
segmentedControl.DisplayMode = SegmentDisplayMode.Text;
segmentedControl.Color = Color.FromHex("#048EAC");
segmentedControl.SegmentHeight= 50;
segmentedControl.VisibleSegmentsCount = 3;
segmentedControl.CornerRadius = 15;
segmentedControl.HeightRequest = 50;
segmentedControl.SelectedIndex = 1;
segmentedControl.BorderColor = Color.Transparent;
segmentedControl.FontColor = Color.FromHex("#FFFFFF");
segmentedControl.FontSize = 22;
segmentedControl.VerticalOptions = LayoutOptions.Center;
segmentedControl.HorizontalOptions = LayoutOptions.Center;
segmentedControl.SelectionTextColor = Color.FromHex("#048EAC");
this.Content = segmentedControl;
}
}

```

### Image

Items populated in the segmented control will be displayed as icons.

The data source of the segmented control can be set as follows.

### C#

```

public class ViewModel : INotifyPropertyChanged
{
    private ObservableCollection<SfSegmentItem> imageCollection = new
    ObservableCollection<SfSegmentItem>();
    public ObservableCollection<SfSegmentItem> ImageCollection
    {
        get { return imageCollection; }
        set { imageCollection = value; }
    }
    public ViewModel()
    {
        ImageCollection = new ObservableCollection<SfSegmentItem>
        {
            new SfSegmentItem() { IconFont = "6", FontIconFontColor=Color.FromHex("#FFFFFF"), FontColor=Color.FromHex("#FFFFFF") },
            new SfSegmentItem() { IconFont = "6", FontIconFontColor=Color.FromHex("#FFFFFF"), FontColor=Color.FromHex("#FFFFFF") },
            new SfSegmentItem() { IconFont = "6", FontIconFontColor=Color.FromHex("#FFFFFF"), FontColor=Color.FromHex("#FFFFFF") },
        }
    }
}

```

```
};
}
}
```

**XML**

```
<buttons:SfSegmentedControl
x:Name="segmentedControl"
DisplayMode="Image"
SelectedIndex="1"
ItemsSource="{Binding ImageCollection}"
VisibleSegmentsCount="3"
SelectionTextColor="#FFFFFF"
/>
```

**C#**

```
public partial class SegmentedControlSample : ContentPage
{
    private ViewModel viewModel = new ViewModel();
    SfSegmentedControl segmentedControl;
    public SegmentedControlSample()
    {
        segmentedControl = new SfSegmentedControl();
        segmentedControl.BindingContext = viewModel;
        segmentedControl.ItemsSource = viewModel.ImageCollection;
        segmentedControl.DisplayMode = SegmentDisplayMode.Image;
        segmentedControl.SelectedIndex = 1;
        segmentedControl.VisibleSegmentsCount = 3;
        segmentedControl.SelectionTextColor = Color.FromHex("#FFFFFF");
        this.Content = segmentedControl;
    }
}
```

**Image with text**

Items populated in the segmented control will be displayed as icons with text.

The data source of the segmented control can be set as follows.

**C#**

```
public class ViewModel : INotifyPropertyChanged
{
    private ObservableCollection<SfSegmentItem> imageTextCollection = new
    ObservableCollection<SfSegmentItem>();
    public ObservableCollection<SfSegmentItem> ImageTextCollection
```

```

{
    get { return imageTextCollection; }
    set { imageTextCollection = value; }
}
public ViewModel()
{
    Image_textCollection = new ObservableCollection<SfSegmentItem>
    {
        new SfSegmentItem() { IconFont = "6", FontIconFontColor=Color.FromHex("#FFFFFF"), FontColor=Color.FromHex("#FFFFFF"), Text = "Day"},
        new SfSegmentItem() { IconFont = "6", FontIconFontColor=Color.FromHex("#FFFFFF"), FontColor=Color.FromHex("#FFFFFF"), Text = "Week"},
        new SfSegmentItem() { IconFont = "6", FontIconFontColor=Color.FromHex("#FFFFFF"), FontColor=Color.FromHex("#FFFFFF"), Text = "Month"
    };
}
}
}

```

**XML**

```

<buttons:SfSegmentedControl
x:Name="segmentedControl"
Margin="10,0"
CornerRadius="15"
SelectedIndex="1"
SelectedIndex="1"
ItemsSource = "{Binding ImageTextCollection}"
DisplayMode="ImageWithText"
VisibleSegmentsCount="3"
FontIconFontFamily = "segment.ttf"
/>

```

**C#**

```

public partial class SegmentedControlSample : ContentPage
{
    private ViewModel viewModel = new ViewModel();
    private SfSegmentedControl segmentedControl;
    public SegmentedControlSample()
    {
        segmentedControl = new SfSegmentedControl();
        segmentedControl.BindingContext = viewModel;
        segmentedControl.ItemsSource = viewModel.ImageTextCollection;
        segmentedControl.DisplayMode = SegmentDisplayMode.ImageWithText;
        segmentedControl.SelectedIndex = 1;
        segmentedControl.VisibleSegmentsCount = 3;
        segmentedControl.SelectionTextColor = Color.FromHex("#FFFFFF");
        segmentedControl.FontIconFontFamily = "segment.ttf";
        this.Content = segmentedControl;
    }
}

```

### How to set the font icons using ttf file?

You can refer this [link](#) for getting the font icons. Add the font file to your application by using the following steps for each platform:

#### Adding font file for iOS

1. Add the font family inside **Resource** folder iOS project.
2. Add the font file with the following build action: **BundleResource**.
3. Update the **Info.plist** file (fonts that are provided by application, UIAppFonts, or key).

#### Adding font file for Android

Add the font file to the **Assets** folder in the application project, and set the following build action: **AndroidAsset**.

#### Adding font file for UWP

Add the font family inside the application project of UWP.

**Note:** For iOS alone, FontFamily property is declared without succeeding with .ttf and for android and UWP platform font family name is defined followed by .ttf.

#### XML

```
FontIconFontFamily = "segment"
```

#### C#

```
segmentedControl.FontIconFontFamily = "segment";
```

### Indicating the selected item

The segmented control indicates the selected item by differentiating it with text color of the item or using selection strip.

#### Selection text color

You can change the text color of the selected item to desired color. The selected item's text color can be customized using the **SelectionTextColor** property.

#### XML

```
<buttons:SfSegmentedControl SelectionTextColor="#02A0AE"/>
```

#### C#

```
segmentedControl.SelectionTextColor = Color.FromHex("#02A0AE");
```

### Selection strip

A selection strip is used to indicate the selected item in the segmented control. The selection strip can be customized in many forms.

#### Position

The position of the selection indicator can be customized in different ways.

#### Top

The selection strip can be displayed as a line with customizable color and thickness. It can be positioned at the top of an item.

#### XML

```
<buttons:SfSegmentedControl.SelectionIndicatorSettings>  
<buttons:SelectionIndicatorSettings  
Position="Top">  
</buttons:SelectionIndicatorSettings>  
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
```

#### C#

```
SelectionIndicatorSettings selectionIndicator = new  
SelectionIndicatorSettings();  
selectionIndicator.Position = Position.Top;  
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

#### Bottom

Like top placement, selection strip can be customized by its color and thickness and can be positioned at the bottom of an item.

#### XML

```
<buttons:SfSegmentedControl.SelectionIndicatorSettings>  
<buttons:SelectionIndicatorSettings  
Position="Bottom">  
</buttons:SelectionIndicatorSettings>  
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
```

### C#

```
SelectionIndicatorSettings selectionIndicator = new  
SelectionIndicatorSettings();  
selectionIndicator.Position = Position.Bottom;  
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

### Fill

The selection strip can be placed over a segment item to indicate the selection. You can customize its color to highlight the item.

### XML

```
<buttons:SfSegmentedControl.SelectionIndicatorSettings>  
<buttons:SelectionIndicatorSettings  
Position="Fill">  
</buttons:SelectionIndicatorSettings>  
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
```

### C#

```
SelectionIndicatorSettings selectionIndicator = new  
SelectionIndicatorSettings();  
selectionIndicator.Position = Position.Fill;  
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

### Border

The selection strip can be set as a border to highlight the selected item.

### XML

```
<buttons:SfSegmentedControl.SelectionIndicatorSettings>  
<buttons:SelectionIndicatorSettings  
Position="Border">  
</buttons:SelectionIndicatorSettings>  
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
```

## C#

```
SelectionIndicatorSettings selectionIndicator = new  
SelectionIndicatorSettings();  
selectionIndicator.Position = Position.Border;  
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

## Color

The background color of the selection strip can be customized using the **Color** property of **SelectionIndicatorSettings**.

## XML

```
<buttons:SfSegmentedControl.SelectionIndicatorSettings>  
<buttons:SelectionIndicatorSettings  
Color="#2C7BBC">  
</buttons:SelectionIndicatorSettings>  
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
```

## C#

```
SelectionIndicatorSettings selectionIndicator = new  
SelectionIndicatorSettings();  
selectionIndicator.Color = Color.FromHex("#2C7BBC");  
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

## Thickness

The border thickness of the selection strip can be customized using the **Thickness** property of **SelectionIndicatorSettings**.

## XML

```
<buttons:SfSegmentedControl.SelectionIndicatorSettings>  
<buttons:SelectionIndicatorSettings  
StrokeThickness="10">  
</buttons:SelectionIndicatorSettings>
```

```
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
```

### C#

```
SelectionIndicatorSettings selectionIndicator = new
SelectionIndicatorSettings();
selectionIndicator.StrokeThickness = 10;
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

### Handling multiple segments

The segmented control handles segmented items with space distributed for the items in two ways. When the available space in the segmented control is not equally distributed, the items beyond the edges of the control can be viewed by scrolling the panel.

### Visible segment counts

The segmented control displays items for view based on the count that is given for

**VisibleSegmentCount**.

### XML

```
<buttons:SfSegmentedControl
SegmentHeight="20"
VisibleSegmentsCount="4"
SelectedIndex="2"
FontColor="Black"
Color="Transparent"
DisplayMode = "Text"
SelectionTextColor="#02A0AE">
<segmentCollection:List x:TypeArguments="x:String">
<x:String>Item1</x:String>
<x:String>Item2</x:String>
<x:String>Item3</x:String>
<x:String>Item4</x:String>
<x:String>Item5</x:String>
<x:String>Item6</x:String>
<x:String>Item7</x:String>
<x:String>Item8</x:String>
<x:String>Item9</x:String>
</segmentCollection:List>
</buttons:SfSegmentedControl>
```

### C#

```
public partial class SegmentedControlSample : ContentPage
{
    SfSegmentedControl segmentedControl;
    public SegmentedControlSample()
    {
        InitializeComponent();
        segmentedControl = new SfSegmentedControl();
        List<String> itemsList = new List<String>
        {
            "Item1", "Item2", "Item3", "Item4", "Item5", "Item6", "Item7", "Item8", "Item9"
        };
    }
}
```

```
segmentedControl.ItemsSource = itemsList;  
segmentedControl.Color = Color.Transparent;  
segmentedControl.VisibleSegmentsCount = 4;  
segmentedControl.SelectedIndex = 2;  
segmentedControl.FontColor = Color.Black;  
segmentedControl.SelectionTextColor = Color.FromHex("#02A0AE");  
this.Content = segmentedControl;  
}  
}
```

### Segment width

Users can use the `SegmentWidth` property to display the segmented items within the given width instead `VisibleSegmentCount`.

#### XML

```
<buttons:SfSegmentedControl SegmentWidth = "80"/>
```

#### C#

```
segmentedControl.SegmentWidth = 80;
```

### Customization

The segmented control supports customizing segment color, text color, icon size, selection color, and more. This control also supports enabling the segments to fit your application's theme. It can be customized in the following areas.

#### Text appearance

The text inside the segmented control can be customized by its font size, color, and its font family.

#### Font family

You can customize the font family of the segmented item using the `FontFamily` property.

#### XML

```
<buttons:SfSegmentedControl>  
  <buttons:SfSegmentedControl.FontFamily>  
  <OnPlatform x:TypeArguments="x:String">  
    <On Platform="iOS" Value="Helvetica" />  
    <On Platform="Android" Value="Roboto" />  
    <On Platform="UWP" Value="Helvetica" />  
  </OnPlatform>  
</FontFamily>  
</SfSegmentedControl>
```

```
</OnPlatform>
</buttons:SfSegmentedControl.FontFamily>
</buttons:SfSegmentedControl >
```

### C#

```
segmentedControl.FontFamily = Device.RuntimePlatform == Device.iOS ?
"Helvetica" :
Device.RuntimePlatform == Device.Android ? "Roboto" : "Helvetica";
```

#### Font color

You can customize the text color of the segmented item using the **FontColor** property.

### XML

```
<buttons:SfSegmentedControl FontColor="Red" />
```

### C#

```
segmentedControl.SelectionTextColor = Color.Red;
```

#### Font size

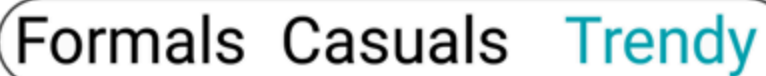

You can change the text size of the segmented item using the **FontSize** property.

### XML

```
<buttons:SfSegmentedControl FontSize="20" />
```

### C#

```
segmentedControl.FontSize = 20;
```

### Border

You can customize the border by their color and thickness.

#### Border color

You can customize the border color of all the items in the segmented control.

#### XML

```
<buttons:SfSegmentedControl BorderColor="Red" />
```

#### C#

```
segmentedControl.BorderColor = Color.Red;
```

#### Border thickness

You can customize the width of the border using the `BorderThickness` property.

#### XML

```
<buttons:SfSegmentedControl BorderThickness="5" />
```

#### C#

```
segmentedControl.BorderThickness = 5;
```

### Padding

The segmented control handles padding between the items.

### Segment padding

Spacing between the segmented items in the control can be customized using the `SegmentPadding`.

### XML

```
<buttons:SfSegmentedControl SegmentPadding="15" />
```

### C#

```
segmentedControl.SegmentPadding = 15;
```

### Corner radius

The segmented control provides corner radius support for the segmented items and strip.

### Item radius

The segmented control customizes the corner radius for each segmented item.

### XML

```
<buttons:SfSegmentedControl SegmentCornerRadius="15" />
```

### C#

```
segmentedControl.SegmentCornerRadius = 15;
```

#### Selection strip radius

The segmented control customizes corner radius for selection strip using the `CornerRadius` inside the `SelectionIndicatorSetting` class.

#### XML

```
<buttons:SfSegmentedControl>
  <buttons:SfSegmentedControl.SelectionIndicatorSettings>
    <buttons:SelectionIndicatorSettings
      CornerRadius="15">
    </buttons:SelectionIndicatorSettings>
  </buttons:SfSegmentedControl.SelectionIndicatorSettings>
</buttons:SfSegmentedControl>
```

#### C#

```
SelectionIndicatorSettings selectionIndicator = new
SelectionIndicatorSettings();
selectionIndicator.CnerRadius = 15;
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

#### Control radius

The segmented control also handles corner radius for border line of the whole control.

#### XML

```
<buttons:SfSegmentedControl CornerRadius="15" />
```

#### C#

```
segmentedControl.CnerRadius = 15;
```

### Color

The segmented control allows users to customize the background color of the segmented items and background color of the control.

### Item color

You can customize the background color of each segmented item using the `Color` property in the `SelectionIndicatorSettings` class.

### XML

```
<buttons:SfSegmentedControl.SelectionIndicatorSettings>  
<buttons:SelectionIndicatorSettings  
Color="#FF355088">  
</buttons:SelectionIndicatorSettings>  
</buttons:SfSegmentedControl.SelectionIndicatorSettings>
```

### C#

```
SelectionIndicatorSettings selectionIndicator = new  
SelectionIndicatorSettings();  
selectionIndicator.Color = Color.FromHex("#FF355088");  
segmentedControl.SelectionIndicatorSettings = selectionIndicator;
```

### Control color

You can customize the background color of the control by setting value for the `Color` property.

### XML

```
<buttons:SfSegmentedControl Color="#02A0AE" />
```

### C#

```
segmentedControl.Color = Color.FromHex("#02A0AE");
```

Formals

Casuals

Trendy

### Scrolling in segmented control programmatically

The SegmentedControl allows programmatic scrolling based on index and item using the `ScrollTo` methods mentioned as follows.

#### *ScrollTo(index, scrollToPosition)*

This method is used to scroll the segment item based on given index and `[ScrollToPosition]()` value.

#### **C#**

```
segmentedControl.ScrollTo(5,
    Syncfusion.XForms.Buttons.ScrollToPosition.Start);
```

#### *ScrollTo(item, scrollToPosition)*

This method is used to scroll the segment item based on the given data or `SfSegmentItem` and `[ScrollToPosition]()` value.

#### **C#**

```
segmentedControl.ScrollTo(viewModel.Items[5],
    Syncfusion.XForms.Buttons.ScrollToPosition.Start);
```

### AutomationId

The segmented control supports automating each segment item in control using the `AutomationId` property. The `AutomationId` value given for control will be appended with each segment item's text value, and it can be used for writing automation scripts. The following code snippet explains how to set `AutomationId` value to the segmented control.

#### **XML**

```
<syncfusion:SfSegmentedControl AutomationId="SegmentedControl1"
    ItemsSource="{Binding Segments}" />
```

#### **C#**

```
ViewModel viewModel = new ViewModel();
SfSegmentedControl sfSegmented = new SfSegmentedControl();
sfSegmented.AutomationId = "SegmentedControl1";
sfSegmented.ItemsSource = viewModel.Segments;
public class ViewModel
```

```
{
public ObservableCollection<SfSegmentItem> Segments { get; set; }
public ViewModel()
{
Segments = new ObservableCollection<SfSegmentItem>();
Segments.Add(new SfSegmentItem() { Text = "Max" });
Segments.Add(new SfSegmentItem() { Text = "Roger" });
Segments.Add(new SfSegmentItem() { Text = "Evans" });
Segments.Add(new SfSegmentItem() { Text = "John" });
Segments.Add(new SfSegmentItem() { Text = "Peter" });
Segments.Add(new SfSegmentItem() { Text = "Mike" });
}
}
```

The following table shows that the AutomationId value is set to each segment item in control for the above code snippet.

Segment item	AutomationId
Max	SegmentedControl1_Max
Roger	SegmentedControl1_Roger
Evans	SegmentedControl1_Evans
John	SegmentedControl1_John
Peter	SegmentedControl1_Peter
Mike	SegmentedControl1_Mike

## How to

### Clear the default selection in SfSegmentedControl

The SfSegmentedControl provides support to clear the default selection on segments by setting the value of **SelectedIndex** as negative or beyond the collection count.

**Note:** By default, it selects the 0th indexed item.

### XML

```
Namespace:
xmlns:sys="clr-namespace:System.Collections.Generic;assembly=netstandard"
...
<buttons:SfSegmentedControl
SelectedIndex="-1"
BorderColor="#3F3F3F"
FontColor="Black"
HorizontalOptions="Center"
VerticalOptions="Center"
SegmentHeight="32"
CornerRadius="20"
VisibleSegmentsCount="3">
<buttons:SfSegmentedControl.ItemsSource>
<sys:List x:TypeArguments="x:String">
```

```
<x:String>Formal</x:String>
<x:String>Casual</x:String>
<x:String>Trendy</x:String>
</sys:List>
</buttons:SfSegmentedControl.ItemsSource>
</buttons:SfSegmentedControl>
```

## C#

```
SfSegmentedControl segmentedControl = new SfSegmentedControl()
{
    SelectedIndex = -1,
    BorderColor = Color.FromHex("#3F3F3F"),
    FontColor = Color.Black,
    HorizontalOptions = LayoutOptions.Center,
    VerticalOptions = LayoutOptions.Center,
    SegmentHeight = 32,
    CornerRadius = 20,
    VisibleSegmentsCount = 3,
};
segmentedControl.ItemsSource = new List<String>()
{
    "Formal", "Casual", "Trendy"
};
```

## Autoscrolling the selected segment item

Auto scrolling for selected item change can be enabled by setting the value of `[AutoScrollSelectedItem]()` property to true. You can set the scroll position of segment item using the `[ScrollToPosition]()` property. The default value for `[AutoScrollSelectedItem]()` is false, and the default value for `[ScrollToPosition]()` is `[MakeVisible]()`. The following options are available in `[ScrollToPosition]()`:

- `[MakeVisible]()` - Scrolls to the selected segment item to make it visible in the control. If the item is already visible, scrolling will not occur.
- `[Start]()` - Scrolls to the selected segment item at the start of the control.
- `[Center]()` - Scrolls to the selected segment item at the center of the control.
- `[End]()` - Scrolls to selected segment item at the end of the control.

## XML

```
<buttons:SfSegmentedControl x:Name = "segmentedControl" SelectedIndex="5"
AutoScrollSelectedItem="True" ScrollToPosition="Center"/>
```

## C#

```
segmentedControl.SelectedIndex = 5;  
segmentedControl.AutoScrollSelectedItem = true;  
segmentedControl.ScrollToPosition =  
Syncfusion.XForms.Buttons.ScrollToPosition.Center;
```

# SfShimmer

## Overview

The SfShimmer control can be used to improve the responsiveness of an application by showing a modern shimmer effect when data is being loaded in the background. This control comes with six built-in shimmer types.

## Key features

- Supports custom shimmer types.
- Provides shimmer effects from multiple directions.
- Supports shimmer color and shimmer wave color customization.

## Getting Started

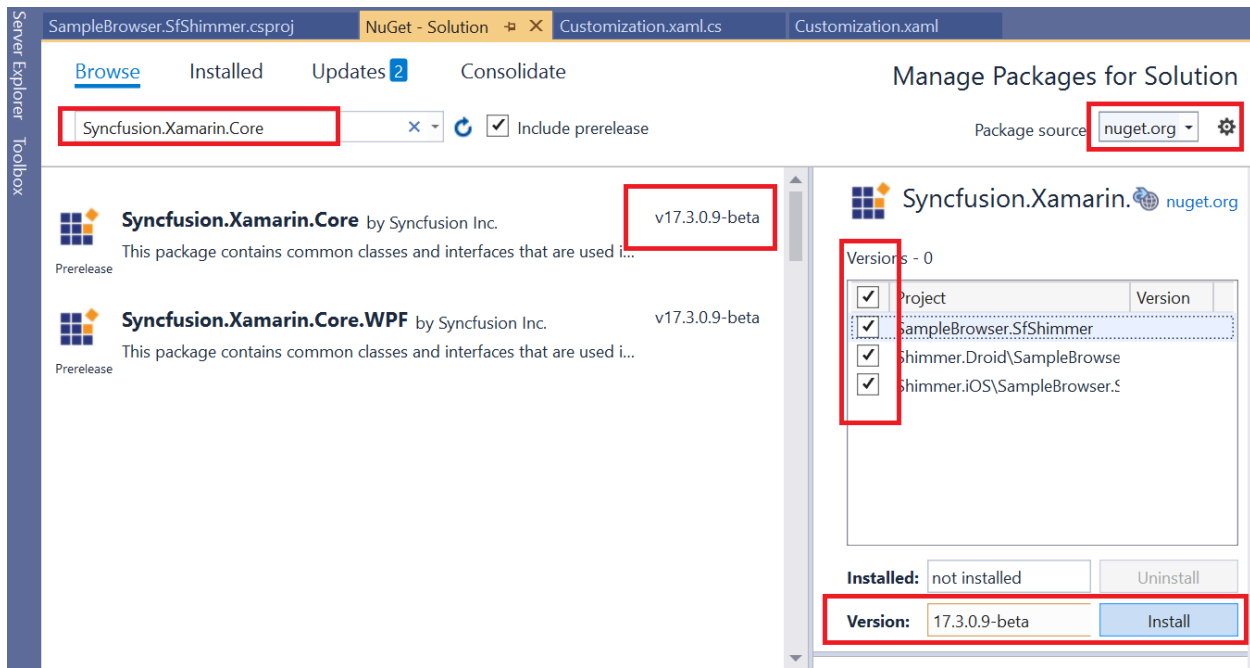

This section explains the steps required to configure the shimmer.

### Adding SfShimmer reference

You can add SfShimmer reference using one of the following methods:

#### Method 1: Adding SfShimmer reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.Core). To add SfShimmer to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Core](https://www.nuget.org/packages/Syncfusion.Xamarin.Core), and then install it.

**Note:** SfShimmer supports for Android and iOS.

### Method 2: Adding SfShimmer reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfShimmer control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfShimmer assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you will have to include a license key in your projects. Refer to [Syncfusion license key](#) to learn about registering Syncfusion license key in your Xamarin application to use our components.

### Launching an application on each platform with SfShimmer

To use the shimmer inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and are discussed in the following sections:

---

**Note:** If you are adding the references from toolbox, the following steps are not needed.

---

#### iOS

To launch the shimmer in iOS, call the `SfShimmerRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    SfShimmerRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### Android

Android platform does not require any additional configuration to render the shimmer control.

#### Initializing shimmer

Import the [SfShimmer](#) control namespace in respective page as demonstrated in the following code sample.

#### XML

```
xmlns:shimmer="clr-namespace:Syncfusion.XForms.Shimmer;assembly=Syncfusion.Core.XForms"
```

#### C#

```
using Syncfusion.XForms.Shimmer;
```

Then initialize shimmer as shown below,

#### XML

```
<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="Fill"
IsLoaded="{Binding IsLoaded}">
<shimmer:SfShimmer.Content>
<StackLayout>
<Label Text="Content is loaded!" HorizontalOptions="CenterAndExpand"
VerticalOptions="CenterAndExpand"/>
</StackLayout>
</shimmer:SfShimmer.Content>
</shimmer:SfShimmer>
```

#### C#

```
SfShimmer shimmer = new SfShimmer();
shimmer.VerticalOptions = LayoutOptions.Fill;
shimmer.SetBinding(SfShimmer.IsLoadedProperty, "IsLoaded");
var stackLayout = new StackLayout();
var label = new Label();
label.Text = "Content is loaded!";
label.HorizontalOptions = LayoutOptions.CenterAndExpand;
label.VerticalOptions = LayoutOptions.CenterAndExpand;
stackLayout.Children.Add(label);
shimmer.Content = stackLayout;
```

**Note:** The SfShimmer has different shimmer types. The default shimmer type is **Persona**.

#### Loading shimmer content

By enabling the [IsLoaded](#) property of [SfShimmer](#), shimmer content is loaded.

#### XML

```
<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="FillAndExpand" IsLoaded="true">
  <shimmer:SfShimmer.Content>
    <StackLayout>
      <Label Text="Content is loaded!"/>
    </StackLayout>
  </shimmer:SfShimmer.Content>
</shimmer:SfShimmer>
```

#### C#

```
shimmer = new SfShimmer()
{
    IsLoaded = true,
    VerticalOptions = LayoutOptions.FillAndExpand,
    Content = new Label
    {
        Text = "Content is loaded!"
    }
}
```

```
};  
this.Content = shimmer;
```

## Shimmer Types

### Built-in types

The following different built-in shimmer types are available in Shimmer:

- Persona
- Profile
- Article
- Video
- Feed
- Shopping

You can use the built-in shimmer types by setting the [Type](#) of [SfShimmer](#).

### XML

```
<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="FillAndExpand"  
Type="Profile">  
  <shimmer:SfShimmer.Content>  
    <StackLayout>  
      <Label Text="Content is loaded!" HorizontalOptions="CenterAndExpand"  
VerticalOptions="CenterAndExpand"/>  
    </StackLayout>  
  </shimmer:SfShimmer.Content>  
</shimmer:SfShimmer>
```

### C#

```
shimmer = new SfShimmer()  
{  
    Type = ShimmerTypes.Profile,  
    VerticalOptions = LayoutOptions.FillAndExpand,  
    Content = new Label  
    {  
        Text = "Content is loaded!"  
    }  
};  
this.Content = shimmer;
```

### Custom view

You can customize the shimmer using your own view using the [CustomView](#) property of [SfShimmer](#).

### XML

```
<shimmer:SfShimmer.CustomView>
  <Grid
    x:Name="customView"
    Padding="10" ColumnSpacing="15" RowSpacing="15"
    HorizontalOptions="FillAndExpand"
    VerticalOptions="Center">
    <Grid.ColumnDefinitions>
      <ColumnDefinition Width="Auto" />
      <ColumnDefinition Width="*" />
    </Grid.ColumnDefinitions>
    <Grid.RowDefinitions>
      <RowDefinition Height="*" />
      <RowDefinition Height="*" />
    </Grid.RowDefinitions>
    <border:SfBorder Grid.RowSpan="2"
      BackgroundColor="{Binding Color,Source={x:Reference shimmer}}"
      BorderColor="Transparent"
      CornerRadius="40"
      HeightRequest="70"
      VerticalOptions="Center"
      WidthRequest="70">
    </border:SfBorder>
    <border:SfBorder Grid.Row="0" Grid.Column="1"
      BackgroundColor="{Binding Color,Source={x:Reference shimmer}}"
      BorderColor="Transparent"
      HeightRequest="30"
      VerticalOptions="Center" />
    <border:SfBorder Grid.Row="1" Grid.Column="1"
      BackgroundColor="{Binding Color,Source={x:Reference shimmer}}"
      BorderColor="Transparent"
```

```
HeightRequest="30"  
VerticalOptions="Center" />  
</Grid>  
</shimmer:SfShimmer.CustomView>
```

## C#

```
var grid = new Grid  
{  
    Padding = 10,  
    ColumnSpacing = 15,  
    RowSpacing = 15,  
    HorizontalOptions = LayoutOptions.FillAndExpand,  
    VerticalOptions = LayoutOptions.Center,  
    ColumnDefinitions = new ColumnDefinitionCollection()  
    {  
        new ColumnDefinition { Width = GridLength.Auto },  
        new ColumnDefinition { Width = GridLength.Star }  
    },  
    RowDefinitions = new RowDefinitionCollection()  
    {  
        new RowDefinition { Height = GridLength.Auto },  
        new RowDefinition { Height = GridLength.Auto }  
    }  
};  
var imageBorder = new SfBorder  
{  
    BorderColor = Color.Transparent,  
    CornerRadius = 40,  
    HeightRequest = 70,  
    WidthRequest = 70,  
    VerticalOptions = LayoutOptions.Center  
};  
imageBorder.SetBinding(SfBorder.BackgroundColorProperty, new Binding {  
    Source = shimmer, Path = "Color" });  
var nameBorder = new SfBorder  
{  
    BorderColor = Color.Transparent,  
    HeightRequest = 30,  
    VerticalOptions = LayoutOptions.Center  
};  
nameBorder.SetBinding(SfBorder.BackgroundColorProperty, new Binding { Source  
= shimmer, Path = "Color" });  
var description = new SfBorder  
{  
    BorderColor = Color.Transparent,  
    HeightRequest = 30,  
    VerticalOptions = LayoutOptions.Center  
};  
description.SetBinding(SfBorder.BackgroundColorProperty, new Binding {  
    Source = shimmer, Path = "Color" });  
grid.Children.Add(imageBorder, 0, 0);  
Grid.SetRowSpan(imageBorder, 2);  
grid.Children.Add(nameBorder, 1, 0);  
grid.Children.Add(description, 1, 1);  
shimmer.CustomView = grid;
```

---

**Note:** Currently, [CustomView](#) will support only in Android.

---

### Customization of Shimmer

The Shimmer control supports options to customize the wave color, shimmer color, wave direction, wave animation duration, and more. This section explains how to customize the shimmer control.

#### WaveDirection

The [WaveDirection](#) property of [SfShimmer](#) is used to change the direction of shimmer wave. The following different wave directions are available in [SfShimmer](#):

- Default
- LeftToRight
- TopToBottom
- RightToLeft
- BottomToTop

#### XML

```
<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="FillAndExpand"
WaveDirection="LeftToRight">
  <shimmer:SfShimmer.Content>
    <StackLayout>
      <Label Text="Content is loaded!"/>
    </StackLayout>
  </shimmer:SfShimmer.Content>
</shimmer:SfShimmer>
```

#### C#

```
shimmer = new SfShimmer()
{
    WaveDirection = WaveDirection.LeftToRight,
    VerticalOptions = LayoutOptions.FillAndExpand,
    Content = new Label
    {
        Text = "Content is loaded!"
    }
}
```

```

}
};
this.Content = shimmer;

```

### Color

The [Color](#) property of [SfShimmer](#) is used to customize the color of shimmer.

### XML

```

<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="FillAndExpand"
Color="#F4E2EE">
<shimmer:SfShimmer.Content>
<StackLayout>
<Label Text="Content is loaded!"/>
</StackLayout>
</shimmer:SfShimmer.Content>
</shimmer:SfShimmer>

```

### C#

```

shimmer = new SfShimmer()
{
Color = Color.FromHex("#F4E2EE"),
VerticalOptions = LayoutOptions.FillAndExpand,
Content = new Label
{
Text = "Content is loaded!"
}
};
this.Content = shimmer;

```

### WaveColor

The [WaveColor](#) property of [SfShimmer](#) is used to customize the color of wave.

### XML

```

<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="FillAndExpand"
WaveColor="#B8D4F2">
<shimmer:SfShimmer.Content>
<StackLayout>
<Label Text="Content is loaded!"/>

```

```

</StackLayout>
</shimmer:SfShimmer.Content>
</shimmer:SfShimmer>

```

## C#

```

shimmer = new SfShimmer()
{
    WaveColor = Color.FromHex("#B8D4F2"),
    VerticalOptions = LayoutOptions.FillAndExpand,
    Content = new Label
    {
        Text = "Content is loaded!"
    }
};
this.Content = shimmer;

```

## WaveWidth

The [WaveWidth](#) property of [SfShimmer](#) is used to customize the width of wave.

## XML

```

<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="FillAndExpand"
WaveColor="#B8D4F2" WaveWidth="100">
<shimmer:SfShimmer.Content>
<StackLayout>
<Label Text="Content is loaded!"/>
</StackLayout>
</shimmer:SfShimmer.Content>
</shimmer:SfShimmer>

```

## C#

```

shimmer = new SfShimmer()
{
    WaveWidth = 100,
    WaveColor = Color.FromHex("#B8D4F2"),
    VerticalOptions = LayoutOptions.FillAndExpand,
    Content = new Label
    {
        Text = "Content is loaded!"
    }
};
this.Content = shimmer;

```

### AnimationDuration

You can control the duration of wave animation using the [AnimationDuration](#) property of [SfShimmer](#). The default value of [AnimationDuration](#) is 1000 ms.

### XML

```
<shimmer:SfShimmer x:Name="shimmer" VerticalOptions="FillAndExpand"
AnimationDuration="2000">
  <shimmer:SfShimmer.Content>
    <StackLayout>
      <Label Text="Content is loaded!"/>
    </StackLayout>
  </shimmer:SfShimmer.Content>
</shimmer:SfShimmer>
```

### C#

```
shimmer = new SfShimmer()
{
    AnimationDuration = 2000,
    VerticalOptions = LayoutOptions.FillAndExpand,
    Content = new Label
    {
        Text = "Content is loaded!"
    }
};
this.Content = shimmer;
```

## SfSparkline

### Overview

Essential Sparkline for Xamarin.Forms is a very small chart, typically drawn without axes or coordinates. It presents the general shape of data's in a simple and highly condensed way.

### Key features

- Data Binding support
- Range Band support
- Supports 4 different types of sparkline.
- Marker support for line and area sparkline.
- Empty point support.

### Getting Started

This section explains you the steps required to populate the Sparkline with data.

#### Adding SfSparkline reference

You can add SfSparkline reference using one of the following methods:

##### Method 1: Adding SfSparkline reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfSparkline). To add SfSparkline to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfSparkline](https://www.nuget.org/packages/Syncfusion.Xamarin.SfSparkline), and then install it.

!{Adding SfSparkline reference from NuGet}{Getting-Started-image/Adding SfSparkline reference.png}

**Note:** Install the same version of SfSparkline NuGet in all the projects.

##### Method 2: Adding SfSparkline reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfSparkline control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

##### Method 3: Adding SfSparkline assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfSparkline.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfSparkline.Android.dll Syncfusion.SfSparkline.XForms.Android.dll

	Syncfusion.SfSparkline.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfSparkline.iOS.dll Syncfusion.SfSparkline.XForms.iOS.dll Syncfusion.SfSparkline.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfSparkline.UWP.dll Syncfusion.SfSparkline.XForms.UWP.dll Syncfusion.SfSparkline.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### Launching an application on each platform with SfSparkline.

To use the SfSparkline control inside an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the SfSparkline in iOS, call the `SfSparklineRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework has been initialized and before the `LoadApplication` is called, as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.SfSparkline.XForms.iOS.SfSparklineRenderer.Init ();
    LoadApplication (new App ());
    ...
}
```

### Universal Windows Platform (UWP)

You need to initialize the sparkline view assemblies in App.xaml.cs in UWP project as demonstrated in the following code samples. This is required to deploy the application with sparkline in Release mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    // Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfSparkline.XForms.UWP.SfSparkline
    Renderer).GetTypeInfo().Assembly);
    // Replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Android

The Android platform does not require any additional configuration to render the sparkline.

#### Initialize view model

Now, let us define a simple data model that represents a data point in [SfSparkline](#).

#### C#

```
public class Model
{
    public double Performance { get; set; }
}
```

Next, create a view model class and initialize a list of `Model` objects as shown below,

#### C#

```
public class ViewModel
{
    public List<Model> Data { get; set; }
    public ViewModel()
    {
        Data = new List<Model>()
        {
            new Model { Performance = 3000 },
            new Model { Performance = 5000 },
            new Model { Performance = -3000 },
            new Model { Performance = -4000 },
            new Model { Performance = 2000 },
            new Model { Performance = 3000 }
        };
    }
}
```

Set the `ViewModel` instance as the `BindingContext` of your Page; this is done to bind properties of `ViewModel` to [SfSparkline](#).

**Note:** Add namespace of `ViewModel` class in your XAML page if you prefer to set `BindingContext` in XAML.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
x:Class="SparklineDemo.MainPage"
xmlns:sparkline="clr-
namespace:Syncfusion.SfSparkline.XForms;assembly=Syncfusion.SfSparkline.XFor
ms"
xmlns:local="clr-namespace:SparklineDemo">
<ContentPage.BindingContext>
<local:ViewModel></local:ViewModel>
</ContentPage.BindingContext>
</ContentPage>
```

### C#

```
this.BindingContext = new ViewModel();
```

Populate Sparkline with data

Import the [SfSparkline](#) namespace as shown below in your respective page,

### XML

```
xmlns:sparkline="clr-
namespace:Syncfusion.SfSparkline.XForms;assembly=Syncfusion.SfSparkline.XFor
ms"
```

### C#

```
using Syncfusion.SfSparkline.XForms;
```

Bind the Data property of the above `ViewModel` to the [SfSparkline.ItemsSource](#) property as shown below.

**Note:** You need to set `YBindingPath` property, so that [SfSparkline](#) would fetch values from the respective property in the data model to plot the Sparkline.

### XML

```
<sparkline:SfLineSparkline ItemsSource="{Binding Data}"
YBindingPath="Performance">
</sparkline:SfLineSparkline >
```

### C#

```
SfLineSparkline lineSparkline = new SfLineSparkline();
lineSparkline.YBindingPath = "Performance";
lineSparkline.SetBinding(SfSparklineBase.ItemsSourceProperty, "Data");
```

You can find the complete getting started sample from this [link](#).

## Sparkline Types

### Line Sparkline

[SfLineSparkline](#) is used for identifying patterns and trends in the data such as seasonal effects, large changes and turning points over a period of time.

- [StrokeWidth](#) - used to change the stroke width of the sparkline.
- [StrokeColor](#) - used to change the stroke color of the sparkline.
- [MinimumYValue](#) - used to set the minimum value of the y-axis in sparkline.
- [MaximumYValue](#) - used to set the maximum value of the y-axis in sparkline.

The following code is used to create the [SfLineSparkline](#).

### XML

```
<sparkline:SfLineSparkline ItemsSource = "{Binding Data}"  
YBindingPath = "Performance">  
</sparkline:SfLineSparkline>
```

### C#

```
SfLineSparkline lineSparkline = new SfLineSparkline()  
{  
    ItemsSource = viewModel.Data,
```

```
YBindingPath = "Performance"
};
```

### Column Sparkline

[SfColumnSparkline](#) is very similar to a line sparkline in the sense that it is designed to show different values of two or more subjects but instead of using lines it is using horizontal and vertical bars that represent a different value.

- [StrokeWidth](#) - used to change the stroke width of the sparkline.
- [StrokeColor](#) - used to change the stroke color of the sparkline.
- [MinimumYValue](#) - used to set the minimum value of the y-axis in sparkline.
- [MaximumYValue](#) - used to set the maximum value of the y-axis in sparkline.
- [Color](#) - used to change the interior color of the column.

The following code is used to create the [SfColumnSparkline](#).

#### XML

```
<sparkline:SfColumnSparkline ItemsSource = "{Binding Data}"
YBindingPath = "Performance">
</sparkline:SfColumnSparkline>
```

#### C#

```
SfColumnSparkline columnSparkline = new SfColumnSparkline()
{
    ItemsSource = viewModel.Data,
    YBindingPath = "Performance"
};
```

### Area Sparkline

[SfAreaSparkline](#) is used to emphasize a change in values. This is primarily used when the magnitude of the trend is to be communicated rather than individual data values.

- [StrokeWidth](#) - used to change the stroke width of the sparkline.
- [StrokeColor](#) - used to change the stroke color of the sparkline.
- [MinimumYValue](#) - used to set the minimum value of the y-axis in sparkline.
- [MaximumYValue](#) - used to set the maximum value of the y-axis in sparkline.
- [Color](#) - used to change the color of interior area.

The following code is used to create the [SfAreaSparkline](#).

#### XML

```
<sparkline:SfAreaSparkline ItemsSource = "{Binding Data}"  
YBindingPath = "Performance">  
</sparkline:SfAreaSparkline>
```

#### C#

```
SfAreaSparkline areaSparkline = new SfAreaSparkline()  
{  
    ItemsSource = viewModel.Data,  
    YBindingPath = "Performance"  
};
```

### WinLoss Sparkline

[SfWinLossSparkline](#) is used to show whether each value is positive or negative visualizing a Win/Loss scenario. You can use the following properties to customize the appearance.

- [StrokeWidth](#) - used to change the stroke width of the sparkline.
- [StrokeColor](#) - used to change the stroke color of the sparkline.
- [MinimumYValue](#) - used to set the minimum value of the y-axis in sparkline.
- [MaximumYValue](#) - used to set the maximum value of the y-axis in sparkline.
- [Color](#) - used to change the interior color of the positive columns.
- [NeutralPointColor](#) - used to change the interior color of the neutral columns.

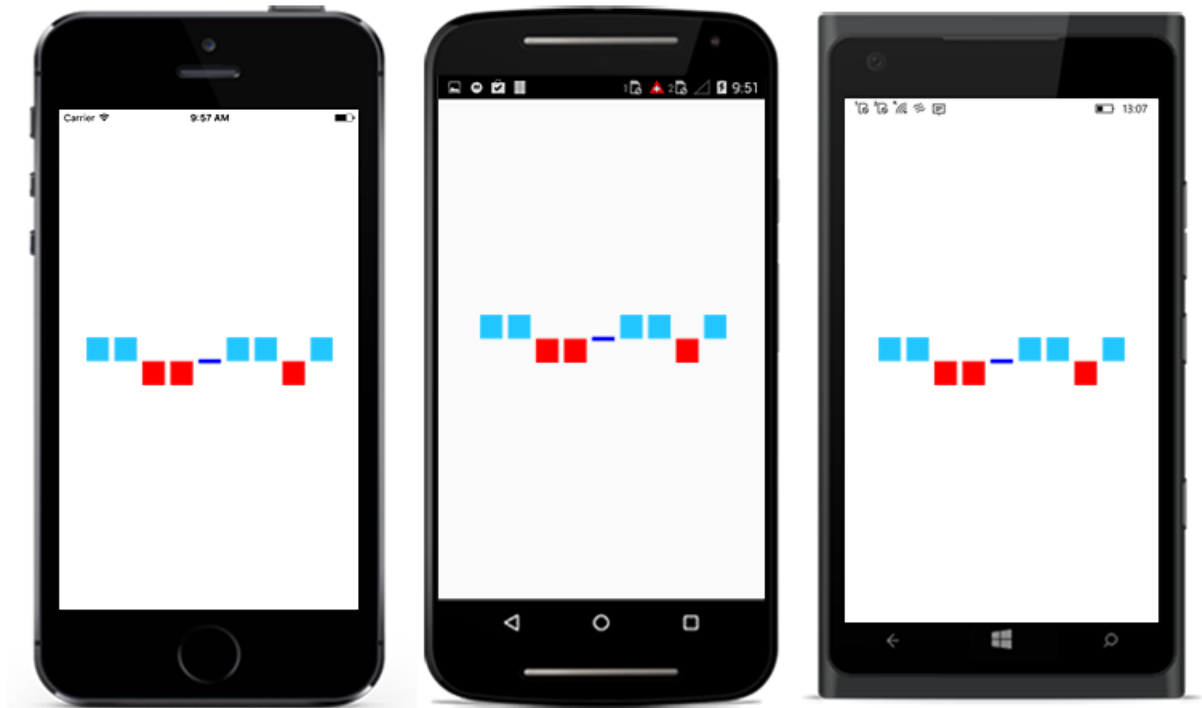

The following code is used to create the [SfWinLossSparkline](#).

#### XML

```
<sparkline:SfWinLossSparkline ItemsSource = "{Binding Data}"
YBindingPath = "Performance">
</sparkline:SfWinLossSparkline >
```

#### C#

```
SfWinLossSparkline winLossSparkline = new SfWinLossSparkline()
{
    ItemsSource = viewModel.Data,
    YBindingPath = "Performance"
};
```

## Range Band

This feature is used to highlight a particular region in the sparkline along Y axis.

- [RangeBandStart](#) - used to configure the start range band value in Y axis.
- [RangeBandEnd](#) - used to configure the end range band values in Y axis.
- [RangeBandColor](#) - used to change the color for range band.

## XML

```
<sparkline:SfLineSparkline ItemsSource="{Binding Data}"
YBindingPath="Performance"
RangeBandStart="4000"
RangeBandEnd="1000"
RangeBandColor="Green">
</sparkline:SfLineSparkline>
```

## C#

```
SfLineSparkline lineSparkline = new SfLineSparkline()
{
    YBindingPath = "Performance",
    ItemsSource = viewModel.Data,
    RangeBandStart = 4000,
    RangeBandEnd = 1000,
    RangeBandColor = Color.FromRgba(0, 255, 0, 100)
};
```

## Markers

[Markers](#) are used to highlight the data point in [SfLineSparkline](#) and [SfAreaSparkline](#). You can use the following properties to customize the appearance.

- [IsVisible](#) - used to change the visibility of the marker.
- [Width](#) - used to change the width of the marker.
- [Height](#) - used to change the height of the marker.
- [Color](#) - used to change the color of the marker.

## XML

```
<sparkline:SfLineSparkline ItemsSource="{Binding Data}"
YBindingPath="Performance">
  <sparkline:SfLineSparkline.Marker>
    <sparkline:MarkerBase IsVisible="True"
Width="15"
Height="15"/>
  </sparkline:SfLineSparkline.Marker>
</sparkline:SfLineSparkline>
```

## C#

```
SfLineSparkline lineSparkline = new SfLineSparkline()
{
    YBindingPath = "Performance",
    ItemsSource = viewModel.Data,
    Marker = new MarkerBase()
    {
        IsVisible = true,
        Width = 15,
```

```
Height = 15
}
};
```

### Customize data points

Color of the first, last, high, low and negative data points can be customized using the following properties.

- [FirstPointColor](#) - used to change the first point color of the sparkline.
- [LastPointColor](#) - used to change the last point color of the sparkline.
- [HighPointColor](#) - used to change the high point color of the sparkline.
- [LowPointColor](#) - used to change the low point color of the sparkline.
- [NegativePointsColor](#) - used to change the negative point color of the sparkline.

**Note:** [NegativePointsColor](#) is applicable for [SfColumnSparkline](#) and [SfWinLossSparkline](#) alone.

Code snippet to customize the markers

#### XML

```
<sparkline:SfLineSparkline ItemsSource = "{Binding Data}"
YBindingPath = "Performance"
FirstPointColor="Green"
LastPointColor="Blue"
HighPointColor="Purple"
LowPointColor="Red">
<sparkline:SfLineSparkline.Marker>
<sparkline:MarkerBase IsVisible="True"
Width= "15"
Height= "15"/>
```

```
</sparkline:SfLineSparkline.Marker>  
</sparkline:SfLineSparkline>
```

### C#

```
SfLineSparkline lineSparkline = new SfLineSparkline()  
{  
    YBindingPath = "Performance",  
    ItemsSource = viewModel.Data,  
    Marker = new MarkerBase()  
    {  
        IsVisible = true,  
        Width = 15,  
        Height = 15  
    },  
    FirstPointColor = Color.Green,  
    LastPointColor = Color.Blue,  
    HighPointColor = Color.Purple,  
    LowPointColor = Color.Red  
};
```

Code snippet to customize the segments

### XML

```
<sparkline:SfColumnSparkline ItemsSource="{Binding Data}"  
    YBindingPath="Performance"  
    FirstPointColor="Green"  
    LastPointColor="Purple"  
    HighPointColor="Maroon"  
    LowPointColor="Blue"
```

```
NegativePointsColor="Red">  
</sparkline:SfColumnSparkline>
```

## C#

```
SfColumnSparkline columnSparkline = new SfColumnSparkline()  
{  
    YBindingPath = "Performance",  
    ItemsSource = viewModel.Data,  
    FirstPointColor = Color.Green,  
    LastPointColor = Color.Purple,  
    HighPointColor = Color.Maroon,  
    LowPointColor = Color.Blue,  
    NegativePointsColor = Color.Red  
};
```

## Sparkline Axis

Axis of the sparkline can be configured and customized using following properties. This feature is applicable for all the sparkline types except [SfWinLossSparkline](#).

- [IsVisible](#) - used to change the visibility of the axis.
- [StrokeColor](#) - used to change the color of the axis.
- [StrokeWidth](#) - used to change the width of the axis.
- [AxisOrigin](#) - used to change the origin (positive or negative) of the axis.

## XML

```
<sparkline:SfLineSparkline ItemsSource="{Binding Data}"  
    YBindingPath="Performance">
```

```
<sparkline:SfLineSparkline.Axis>  
<sparkline:SparklineAxis IsVisible="true"  
StrokeColor="Red"/>  
</sparkline:SfLineSparkline.Axis>  
</sparkline:SfLineSparkline>
```

## C#

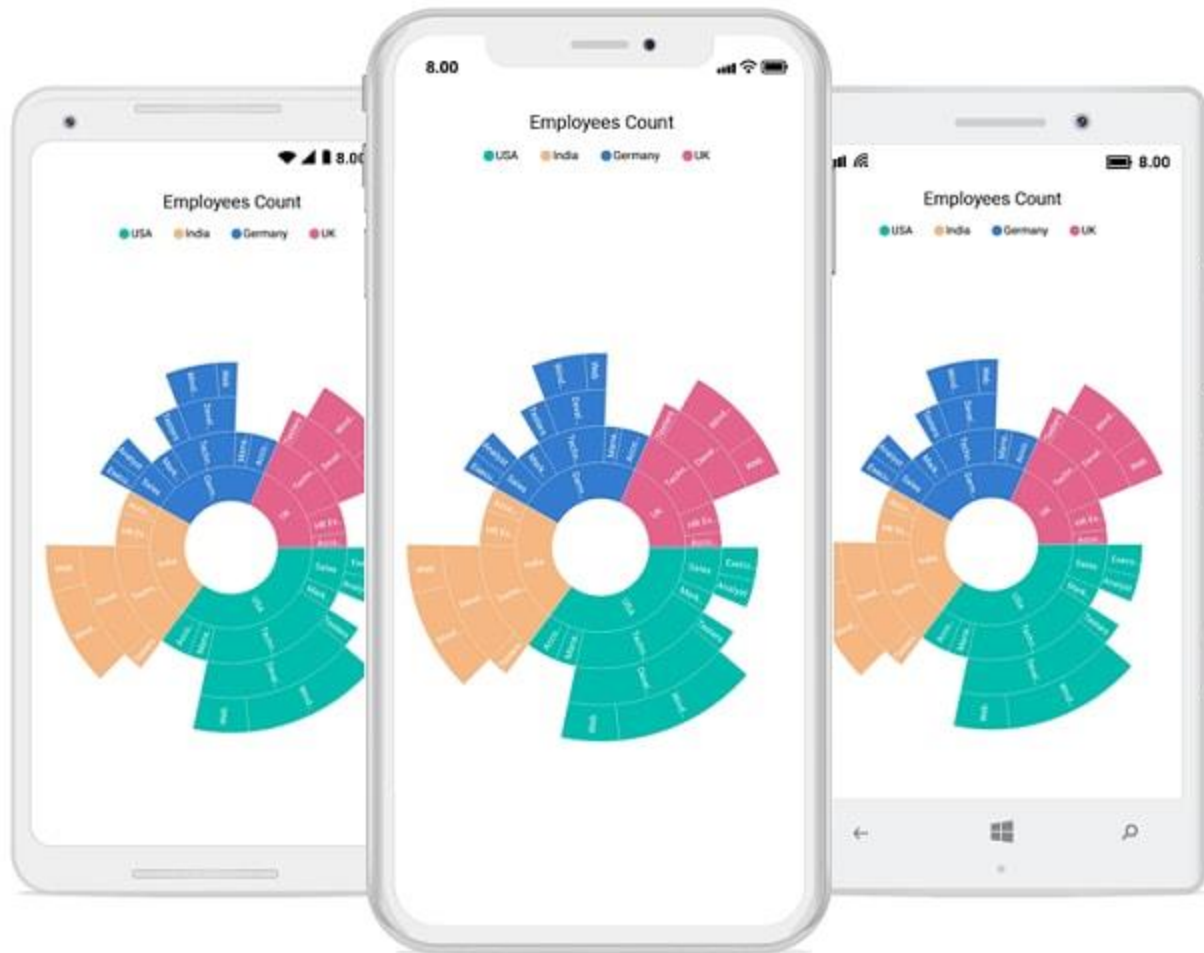

```
SfLineSparkline lineSparkline = new SfLineSparkline()  
{  
    YBindingPath = "Performance",  
    ItemsSource = viewModel.Data,  
    Axis = new SparklineAxis()  
    {  
        IsVisible = true,  
        StrokeColor = Color.Red,  
    }  
};
```

## SfSunburstChart

### Overview

The sunburst chart is used for visualizing hierarchical data. The circle at the center represents the root level of hierarchy, and the outer circles represent the higher levels of hierarchy.

### Key features

- Visualizes hierarchical data.
- Supports data labels for better readability.
- Supports legends with toggle selection.
- Supports palette.
- Supports drill-down feature that allows you to explore each level of hierarchy in detail.
- Provides interactive selection support that allows you to select or highlight the segments in the hierarchy with the following selection modes, such as Child, Group, Parent and Single.
- Supports animation.
- Supports tooltip to provide more information about the segments.

### Getting Started

This section explains the steps required to configure the [SfSunburstChart](#) and populate it with data, data labels, legends, and title. This section covers only the minimal features that needed to get started with the sunburst chart.

#### Adding SfSunburstChart reference

You can add SfSunburstChart reference using one of the following methods:

### Method 1: Adding SfSunburstChart reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfSunburstChart to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfSunburstChart](#), and then install it.

!{Adding SfSunburstChart reference from NuGet}(Getting-Started\_images/Adding SfSunburstChart reference.png)

---

**Note:** Install the same version of SfSunburstChart NuGet in all the projects.

---

### Method 2: Adding SfSunburstChart reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfSunburstChart control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfSunburstChart assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfSunburstChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfSunburstChart.Android.dll Syncfusion.SfSunburstChart.XForms.Android.dll Syncfusion.SfSunburstChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfSunburstChart.iOS.dll Syncfusion.SfSunburstChart.XForms.iOS.dll Syncfusion.SfSunburstChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfSunburstChart.UWP.dll Syncfusion.SfSunburstChart.XForms.UWP.dll Syncfusion.SfSunburstChart.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license](#)

[key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching an application on each platform with SfSunburstChart.

To use the SfSunburstChart control inside an application, each platform requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, this step is not needed.

#### iOS

To launch the SfSunburstChart in iOS, call the `SfSunburstChartRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` Framework has been initialized and before the `LoadApplication` is called, as demonstrated in the following code example.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.SfSunburstChart.XForms.iOS.SfSunburstChartRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### Universal Windows Platform (UWP)

You need to initialize the sunburst view assemblies in `App.xaml.cs` in UWP project as demonstrated in the following code samples. This is required to deploy the application with sunburst in Release mode in UWP platform.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    // Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.SfSunburstChart.XForms.UWP.SfSunburstChartRenderer).GetTypeInfo().Assembly);
    // Replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

#### Android

The Android platform does not require any additional configuration to render the sunburst.

### Initialize sunburst chart

Import the [SfSunburstChart](#) namespace as shown as follows.

#### XML

```
xmlns:sunburst="clr-
namespace:Syncfusion.SfSunburstChart.XForms;assembly=Syncfusion.SfSunburstCh
art.XForms"
```

#### C#

```
using Syncfusion.SfSunburstChart.XForms;
```

Then, initialize an empty sunburst chart as shown as follows.

#### XML

```
<sunburst:SfSunburstChart>
</sunburst:SfSunburstChart>
```

#### C#

```
SfSunburstChart sunburst = new SfSunburstChart();
this.Content = sunburst;
```

### Initialize view model

In this section, data in the following table is used for demonstration.

Country	Job description	Job group	Job role	Employees count
United States	Sales	Executive		50
United States	Sales	Analyst		40
United States	Marketing			40
United States	Technical	Testers		35
United States	Technical	Developers	Windows	175
United States	Technical	Developers	Web	70
United States	Management			40
United States	Accounts			60
India	Technical	Testers		33
India	Technical	Developers	Windows	125
India	Technical	Developers	Web	60
India	HR Executives			70
India	Accounts			45

Germany	Sales	Executive		30
Germany	Sales	Analyst		40
Germany	Marketing			50
Germany	Technical	Testers		40
Germany	Technical	Developers	Windows	65
Germany	Technical	Developers	Web	27
Germany	Management			33
Germany	Accounts			55
UK	Technical	Testers		25
UK	Technical	Developers	Windows	96
UK	Technical	Developers	Web	55
UK	HR executives			60
UK	Accounts			30

Define a data model that represents the above data in [SfSunburstChart](#).

### C#

```
public class SunburstModel
{
    public string JobDescription { get; set; }
    public string JobGroup { get; set; }
    public string JobRole { get; set; }
    public double EmployeesCount { get; set; }
    public string Country { get; set; }
}
```

Then, create a view model class, and initialize a list of SunburstModel objects as follows.

### C#

```
public class SunburstViewModel
{
    public ObservableCollection<SunburstModel> DataSource { get; set; }
    public SunburstViewModel()
    {
        this.DataSource = new ObservableCollection<SunburstModel>
        {
            new SunburstModel { Country = "USA", JobDescription = "Sales",
                                JobGroup="Executive", EmployeesCount = 50 },
            new SunburstModel { Country = "USA", JobDescription = "Sales", JobGroup =
                                "Analyst", EmployeesCount = 40 },
            new SunburstModel { Country = "USA", JobDescription = "Marketing",
                                EmployeesCount = 40 },
        }
    }
}
```

```

new SunburstModel { Country = "USA", JobDescription = "Technical", JobGroup
= "Testers", EmployeesCount = 35 },
new SunburstModel { Country = "USA", JobDescription = "Technical", JobGroup
= "Developers", JobRole = "Windows", EmployeesCount = 175 },
new SunburstModel { Country = "USA", JobDescription = "Technical", JobGroup
= "Developers", JobRole = "Web", EmployeesCount = 70 },
new SunburstModel { Country = "USA", JobDescription = "Management",
EmployeesCount = 40 },
new SunburstModel { Country = "USA", JobDescription = "Accounts",
EmployeesCount = 60 },
new SunburstModel { Country = "India", JobDescription = "Technical",
JobGroup = "Testers", EmployeesCount = 33 },
new SunburstModel { Country = "India", JobDescription = "Technical",
JobGroup = "Developers", JobRole = "Windows", EmployeesCount = 125 },
new SunburstModel { Country = "India", JobDescription = "Technical",
JobGroup = "Developers", JobRole = "Web", EmployeesCount = 60 },
new SunburstModel { Country = "India", JobDescription = "HR Executives",
EmployeesCount = 70 },
new SunburstModel { Country = "India", JobDescription = "Accounts",
EmployeesCount = 45 },
new SunburstModel { Country = "Germany", JobDescription = "Sales", JobGroup
= "Executive", EmployeesCount = 30 },
new SunburstModel { Country = "Germany", JobDescription = "Sales", JobGroup
= "Analyst", EmployeesCount = 40 },
new SunburstModel { Country = "Germany", JobDescription = "Marketing",
EmployeesCount = 50 },
new SunburstModel { Country = "Germany", JobDescription = "Technical",
JobGroup = "Testers", EmployeesCount = 40 },
new SunburstModel { Country = "Germany", JobDescription = "Technical",
JobGroup = "Developers", JobRole = "Windows", EmployeesCount = 65 },
new SunburstModel { Country = "Germany", JobDescription = "Technical",
JobGroup = "Developers", JobRole = "Web", EmployeesCount = 27 },
new SunburstModel { Country = "Germany", JobDescription = "Management",
EmployeesCount = 33 },
new SunburstModel { Country = "Germany", JobDescription = "Accounts",
EmployeesCount = 55 },
new SunburstModel { Country = "UK", JobDescription = "Technical", JobGroup =
"Testers", EmployeesCount = 25 },
new SunburstModel { Country = "UK", JobDescription = "Technical", JobGroup =
"Developers", JobRole = "Windows", EmployeesCount = 96 },
new SunburstModel { Country = "UK", JobDescription = "Technical", JobGroup =
"Developers", JobRole = "Web", EmployeesCount = 55 },
new SunburstModel { Country = "UK", JobDescription = "HR Executives",
EmployeesCount = 60 },
new SunburstModel { Country = "UK", JobDescription = "Accounts",
EmployeesCount = 30 }
};
}
}

```

Set the `SunburstViewModel` instance as the `BindingContext` of your page to bind the properties of `SunburstViewModel` to [SfSunburstChart](#).

**Note:** Add the namespace of `SunburstViewModel` class in your XAML page if you set the `BindingContext` in XAML.

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:SunburstDemo"
xmlns:sunburst="clr-
namespace:Syncfusion.SfSunburstChart.XForms;assembly=Syncfusion.SfSunburstCh
art.XForms"
x:Class="SunburstDemo.MainPage">
<ContentPage.BindingContext>
<local:SunburstViewModel></local:SunburstViewModel>
</ContentPage.BindingContext>
</ContentPage>
```

**C#**

```
this.BindingContext = new SunburstViewModel();
```

Populate sunburst chart with data

Bind the DataSource property of the above SunburstViewModel to the [ItemsSource](#) property.

Then, add the [SunburstHierarchicalLevel](#) to [Levels](#) collection. Each hierarchy level is formed based on the property specified in [GroupMemberPath](#) property, and each arc segment size is calculated using the [ValueMemberPath](#) property.

**XML**

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount">
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
</sunburst:SfSunburstChart>
```

**C#**

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
this.Content = sunburstChart;
```

### Add title

You can add title to the sunburst chart to provide information to users about the data being plotted in the chart. You can set title using the [SfSunburstChart.Title](#) property.

### XML

```
<sunburst:SfSunburstChart>
<sunburst:SfSunburstChart.Title>
<sunburst:SunburstChartTitle x:Name="title" Text="Employees
Count"></sunburst:SunburstChartTitle>
</sunburst:SfSunburstChart.Title>
</sunburst:SfSunburstChart>
```

### C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.Title = new SunburstChartTitle();
sunburstChart.Title.Text = "Employees Count";
this.Content = sunburstChart;
```

## Employees Count

### Add legend

You can enable legend using the [SfSunburstChart.Legend](#) property.

#### XML

```
<sunburst:SfSunburstChart>
  <sunburst:SfSunburstChart.Legend>
    <sunburst:SunburstChartLegend x:Name="legend" IsVisible="True" >
    </sunburst:SunburstChartLegend>
  </sunburst:SfSunburstChart.Legend>
</sunburst:SfSunburstChart>
```

#### C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.Legend = new SunburstChartLegend();
sunburstChart.Legend.IsVisible = true;
this.Content = sunburstChart;
```

#### Add data labels

You can add data labels to improve the readability of the sunburst chart. Data labels can be added using the [SfSunburstChart.DataLabel](#) property.

#### XML

```
<sunburst:SfSunburstChart>
  <sunburst:SfSunburstChart.DataLabel>
    <sunburst:SunburstChartDataLabel x:Name="dataLabel" ShowLabel="True">
    </sunburst:SunburstChartDataLabel>
  </sunburst:SfSunburstChart.DataLabel>
</sunburst:SfSunburstChart>
```

#### C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.DataLabel = new SunburstChartDataLabel();
sunburstChart.DataLabel.ShowLabel = true;
this.Content = sunburstChart;
```

Below snippet is the complete code for generating the final output.

#### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount">
  <sunburst:SfSunburstChart.Levels>
    <sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
    <sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
    <sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
    <sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
  </sunburst:SfSunburstChart.Levels>
  <sunburst:SfSunburstChart.Title>
    <sunburst:SunburstChartTitle x:Name="title" Text="Employees Count"
    ></sunburst:SunburstChartTitle>
  </sunburst:SfSunburstChart.Title>
  <sunburst:SfSunburstChart.Legend>
    <sunburst:SunburstChartLegend x:Name="legend" IsVisible="True" >
    </sunburst:SunburstChartLegend>
  </sunburst:SfSunburstChart.Legend>
  <sunburst:SfSunburstChart.DataLabel>
    <sunburst:SunburstChartDataLabel x:Name="dataLabel"
    ShowLabel="True"></sunburst:SunburstChartDataLabel>
```

```
</sunburst:SfSunburstChart.DataLabel>  
</sunburst:SfSunburstChart>
```

## C#

```
this.BindingContext = new SunburstViewModel();  
SfSunburstChart sunburstChart = new SfSunburstChart();  
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");  
sunburstChart.ValueMemberPath = "EmployeesCount";  
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =  
"Country" });  
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =  
"JobDescription" });  
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =  
"JobGroup" });  
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =  
"JobRole" });  
sunburstChart.Title = new SunburstChartTitle();  
sunburstChart.Title.Text = "Employees Count";  
sunburstChart.Legend = new SunburstChartLegend();  
sunburstChart.Legend.IsVisible = true;  
sunburstChart.DataLabel = new SunburstChartDataLabel();  
sunburstChart.DataLabel.ShowLabel = true;  
this.Content = sunburstChart;
```

The following screenshot depicts the final output.

You can find the complete getting started sample from this [link](#).

## Levels

The sunburst chart is used to display hierarchical data. More than one hierarchical data can be added to the [Levels](#) collection of the sunburst chart. Each level of the hierarchy is represented by a circle.

The following code shows how to add hierarchical levels in the Levels collection.

### XML

```
<sunburst:SfSunburstChart.Levels>
  <sunburst:SunburstHierarchicalLevel />
</sunburst:SfSunburstChart.Levels>
```

### C#

```
SunburstHierarchicalLevel level = new SunburstHierarchicalLevel();
sunburstChart.Levels.Add(level);
```

### Group member path

The [GroupMemberPath](#) is a string property that is used to map the group category value in the sunburst [ItemsSource](#).

The following code shows how to map the group member path.

#### XML

```
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Level1"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Level2"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Level3"/>
</sunburst:SfSunburstChart.Levels>
```

#### C#

```
SunburstHierarchicalLevel level1 = new SunburstHierarchicalLevel();
level1.GroupMemberPath = "Level1";
SunburstHierarchicalLevel level2 = new SunburstHierarchicalLevel();
level2.GroupMemberPath = "Level2";
SunburstHierarchicalLevel level3 = new SunburstHierarchicalLevel();
level3.GroupMemberPath = "Level3";
sunburstChart.Levels.Add(level1);
sunburstChart.Levels.Add(level2);
sunburstChart.Levels.Add(level3);
```

The following code specifies the levels for data model specified in the getting started section.

#### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount">
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
</sunburst:SfSunburstChart>
```

#### C#

```
SfSunburstChart sunburst = new SfSunburstChart();
sunburst.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburst.ValueMemberPath = "EmployeesCount";
sunburst.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburst.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburst.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburst.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
this.Content = sunburstChart;
```

### Legend

Legends are used to represent the first level (i.e root level) of categories in the sunburst chart.

The following code explains how to initialize the legends.

#### XML

```
<sunburst:SfSunburstChart.Legend>  
<sunburst:SunburstChartLegend>  
</sunburst:SunburstChartLegend>  
</sunburst:SfSunburstChart.Legend>
```

#### C#

```
SunburstChartLegend legend = new SunburstChartLegend();  
sunburstChart.Legend = legend;
```

### Visibility

The visibility of legends can be controlled using the [IsVisible](#) property.

The following code shows how to control the visibility of legend.

**XML**

```
<sunburst:SfSunburstChart.Legend>
<sunburst:SunburstChartLegend IsVisible="True" >
</sunburst:SunburstChartLegend>
</sunburst:SfSunburstChart.Legend>
```

**C#**

```
SunburstChartLegend legend = new SunburstChartLegend();
legend.IsVisible = true;
sunburstChart.Legend = legend;
```

**Position**

Legends can be docked at the top, right, left, or bottom position using the [LegendPosition](#) property.

The following code shows customizing the legend position.

**XML**

```
<sunburst:SfSunburstChart.Legend>
<sunburst:SunburstChartLegend x:Name="legend" IsVisible="True"
LegendPosition="Left" >
```

```
</sunburst:SunburstChartLegend>
</sunburst:SfSunburstChart.Legend>
```

**C#**

```
SunburstChartLegend legend = new SunburstChartLegend();
legend.IsVisible = true;
legend.LegendPosition = SunburstDockPosition.Left;
sunburstChart.Legend = legend;
```

**Legend icon types**

Legend icon shapes can be customized using the [IconType](#) property. The IconType property provides several predefined shapes. The default legend icon type is circle.

The following predefined shapes are available in the IconType property:

- Circle
- Cross
- Diamond
- Pentagon
- Rectangle

- Triangle.

**XML**

```
<sunburst:SfSunburstChart.Legend>
<sunburst:SunburstChartLegend x:Name="legend" IsVisible="True"
IconType="Diamond" >
</sunburst:SunburstChartLegend>
</sunburst:SfSunburstChart.Legend>
```

**C#**

```
SunburstChartLegend legend = new SunburstChartLegend();
legend.IsVisible = true;
legend.IconType = SunburstLegendIcon.Diamond;
sunburstChart.Legend = legend;
```

**Icon size customization**

The size of the legend icon can be customized using the [IconHeight](#) and [IconWidth](#) properties.

**XML**

```

<sunburst:SfSunburstChart.Legend>
<sunburst:SunburstChartLegend x:Name="legend" IsVisible="True"
IconHeight="15"
IconWidth="15" IconType="Diamond">
</sunburst:SunburstChartLegend>
</sunburst:SfSunburstChart.Legend>

```

## C#

```

SunburstChartLegend legend = new SunburstChartLegend();
legend.IsVisible = true;
legend.IconType = SunburstLegendIcon.Diamond;
legend.IconHeight = 15;
legend.IconWidth = 15;
sunburstChart.Legend = legend;

```

## Label style

Legend label can be customized using the following properties available in [LabelStyle](#):

- [TextColor](#): Customizes the text color of the label.
- [FontSize](#): Customizes the font size of the label.

- [FontAttributes](#): Customizes the font attributes such as Bold or Italic.
- [Margin](#): Sets the specified margin for legend labels.
- [FontFamily](#): Sets the specified font family for labels.

### XML

```
<sunburst:SfSunburstChart.Legend>
<sunburst:SunburstChartLegend x:Name="legend" IsVisible="True" >
<sunburst:SunburstChartLegend.LabelStyle>
<sunburst:SunburstLegendLabelStyle x:Name="legendStyle"
FontAttributes="Italic" FontSize="14" Margin="5"
TextColor="Red" ></sunburst:SunburstLegendLabelStyle>
</sunburst:SunburstChartLegend.LabelStyle>
</sunburst:SunburstChartLegend>
</sunburst:SfSunburstChart.Legend>
```

### C#

```
sunburstChart.Legend = new SunburstChartLegend();
sunburstChart.Legend.IsVisible = true;
SunburstLegendLabelStyle labelStyle = new SunburstLegendLabelStyle();
labelStyle.FontAttributes = FontAttributes.Italic;
labelStyle.FontSize = 14;
labelStyle.TextColor = Color.Red;
labelStyle.Margin = new Thickness(5);
sunburstChart.Legend.LabelStyle = labelStyle;
```

### Item margin

Margin can be set to individual legend items using the [ItemMargin](#) property.

### XML

```
<sunburst:SfSunburstChart.Legend>
<sunburst:SunburstChartLegend x:Name="legend" IsVisible="True"
ItemMargin="3" >
</sunburst:SunburstChartLegend>
</sunburst:SfSunburstChart.Legend>
```

### C#

```
SunburstChartLegend legend = new SunburstChartLegend();
legend.IsVisible = true;
legend.ItemMargin = new Thickness(3, 3, 3, 3);
sunburstChart.Legend = legend;
```

Toggle selection

Sunburst segments can also be selected via legends.

### XML

```
<sunburst:SfSunburstChart.Legend>
<sunburst:SunburstChartLegend x:Name="legend" IsVisible="True" >
</sunburst:SunburstChartLegend>
</sunburst:SfSunburstChart.Legend>
<sunburst:SfSunburstChart.SelectionSettings>
<sunburst:SelectionSettings EnableSelection="True"
SelectionDisplayMode="HighlightByStrokeColor">
</sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>
```

### C#

```
SunburstChartLegend legend = new SunburstChartLegend();
legend.IsVisible = true;
sunburstChart.Legend = legend;
SelectionSettings selection = new SelectionSettings();
selection.EnableSelection = true;
```

```
selection.SelectionDisplayMode =
SelectionDisplayMode.HighlightByStrokeColor;
sunburstChart.SelectionSettings = selection;
```

## Data label

Data labels are used to display information about segments. Data labels are enabled and disabled using the [ShowLabel](#) property. The default value of the ShowLabel property is true.

The following code explains how to initialize data labels.

### XML

```
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
```

### C#

```
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
```

### Overflow Mode

When the data labels are large in size, they will overlap each other. To avoid overlapping, trim or hide the data labels using the [OverflowMode](#) property.

### Trim

The following code shows trimming the data labels.

### XML

```
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel" OverflowMode="Trim"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
```

### C#

```
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
label.OverflowMode = SunburstLabelOverflowMode.Trim;
sunburstChart.DataLabel = label;
```

### Hide

The following code shows hiding the data labels.

### XML

```
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel" ShowLabel="True"
OverflowMode="Hide"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
```

### C#

```
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
label.OverflowMode = SunburstLabelOverflowMode.Hide;
sunburstChart.DataLabel = label;
```

### Rotation Mode

The view of data labels can be customized using the [RotationMode](#) property. Data labels can be rotated to a angle for better readability. By default, the rotation mode is angle.

### Angle

The following code shows rotating a data label to an angle.

### XML

```
<sunburst:SfSunburstChart.DataLabel>
  <sunburst:SunburstChartDataLabel x:Name="dataLabel" RotationMode="Angle"
  ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
```

### C#

```
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
label.RotationMode = SunburstLabelRotationMode.Angle;
sunburstChart.DataLabel = label;
```

### Normal

The following code shows normal mode of data labels.

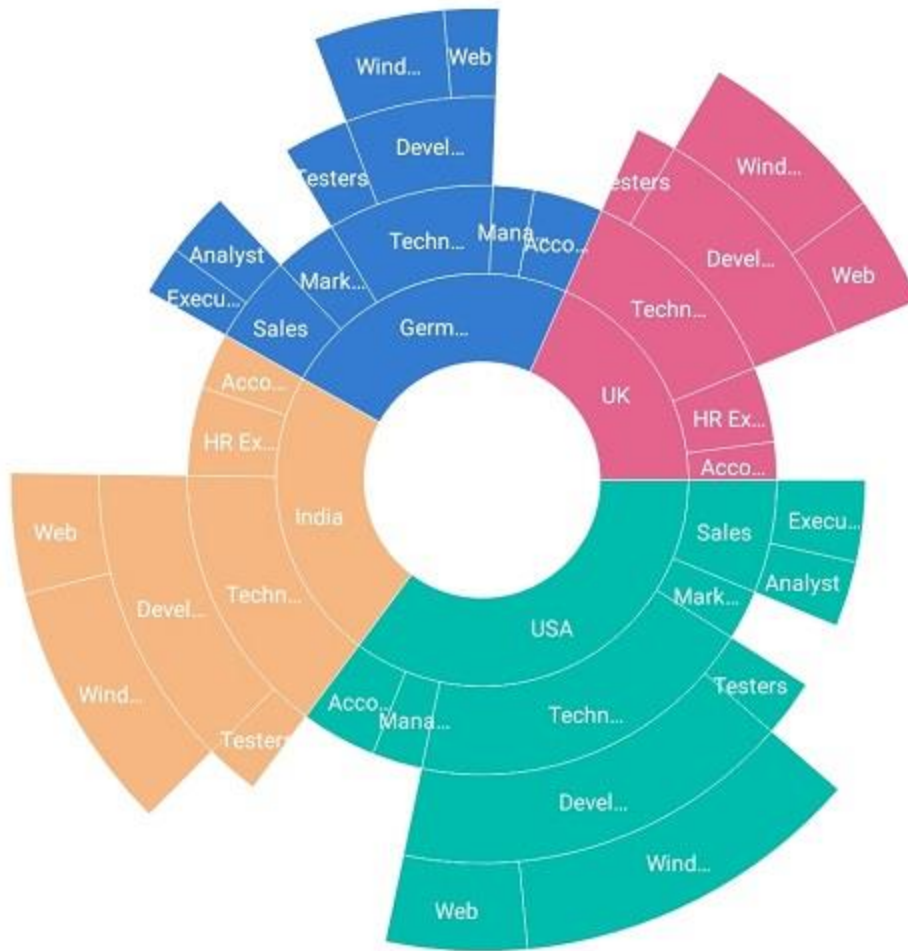

### XML

```
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel" RotationMode="Normal"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
```

### C#

```
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
label.RotationMode = SunburstLabelRotationMode.Normal;
sunburstChart.DataLabel = label;
```

### Customization

Data labels can be customized using the following properties.

- [TextColor](#) : Text color of the label can be changed.
- [FontSize](#) : Data label font size can be modified.
- [FontAttributes](#) : Font attributes such as bold or italic can be used.
- [FontFamily](#) : This modifies the font family of the labels.

### XML

```
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel" ShowLabel="True"
FontAttributes="Bold"
FontSize="10" TextColor="Red" FontFamily="ArialMT">
</sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
```

### C#

```
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
```

```
label.TextColor = Color.Red;
label.FontSize = 10;
label.FontAttributes = FontAttributes.Bold;
label.FontFamily = "ArialMT";
sunburstChart.DataLabel = label;
```

### Label text color

Data label text color will change automatically based on the color of the segments. Whatever be the color of the segments, text color of the label will change accordingly for better readability.

In the following code **Pineapple** palette is applied, hence data label takes the color based on the color of the segments.

### XML

```
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel" ShowLabel="True" >
</sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
<sunburst:SfSunburstChart.ColorModel>
<sunburst:SunburstChartColorModel Palette="Pineapple">
</sunburst:SunburstChartColorModel>
```

```
</sunburst:SfSunburstChart.ColorModel>
```

### C#

```
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
SunburstChartColorModel colorModel = new SunburstChartColorModel();
colorModel.Palette = SunburstColorPalette.Pineapple;
sunburstChart.ColorModel = colorModel;
```

In the below image, first segment's data label is in black and others in white.

### Drill-down

The drill-down provides better visualization of hierarchy. Large set of data can be virtualized into minimal views. Each level of the segments can be drilled down. The sunburst chart provides animation along with the drill-down support. Toolbar will be enabled on drill-down that helps in performing zoom back and reset operations. The drill-down can be enabled or disabled using the [Enable](#) property in the drill-down settings.

**Information:** Double tapping the segment performs the drill-down operation.

The following code shows enabling the [DrilldownSettings](#).

#### XML

```
<sunburst:SfSunburstChart.DrilldownSettings>
<sunburst:DrilldownSettings Enable="True"></sunburst:DrilldownSettings>
</sunburst:SfSunburstChart.DrilldownSettings>
```

#### C#

```
DrilldownSettings drilldownSettings = new DrilldownSettings();
drilldownSettings.Enable = true;
sunburstChart.DrilldownSettings = drilldownSettings;
```

#### Positioning Toolbar

Toolbar can be positioned anywhere on the chart by specifying the [OffsetX](#) and [OffsetY](#) values. The offset values range from 0 to 1.

#### XML

```
<sunburst:SfSunburstChart.DrilldownSettings>
<sunburst:DrilldownSettings OffsetX="0.5" OffsetY="0"></sunburst:DrilldownSettings>
</sunburst:SfSunburstChart.DrilldownSettings>
```

```
Enable="True"></sunburst:DrilldownSettings>
</sunburst:SfSunburstChart.DrilldownSettings>
```

## C#

```
DrilldownSettings drilldownSettings = new DrilldownSettings();
drilldownSettings.Enable = true;
drilldownSettings.OffsetX = 0.5;
drilldownSettings.OffsetY = 0;
sunburstChart.DrilldownSettings = drilldownSettings;
```

## Toolbar alignment

The vertical and the horizontal alignments of the toolbar can be customized using the [ToolbarVerticalAlignment](#) and [ToolbarHorizontalAlignment](#) properties, respectively.

Both the alignment properties has the following enum types:

- Center: Toolbar takes the specified offset value as the center of the toolbar and get positioned.
- End: Toolbar takes the specified offset value as the start of the toolbar and get positioned.
- Start: Toolbar takes the specified offset value as the end of the toolbar and get positioned.

The following code shows the toolbar alignment.

#### XML

```
<sunburst:SfSunburstChart.DrilldownSettings>  
<sunburst:DrilldownSettings OffsetX="0.5" OffsetY="0.5" Enable="True"  
ToolbarHorizontalAlignment="Center"  
ToolbarVerticalAlignment="Center">  
</sunburst:DrilldownSettings>  
</sunburst:SfSunburstChart.DrilldownSettings>
```

#### C#

```
DrilldownSettings drilldownSettings = new DrilldownSettings();  
drilldownSettings.Enable = true;  
drilldownSettings.OffsetX = 0.5;  
drilldownSettings.OffsetY = 0.5;  
drilldownSettings.ToolbarHorizontalAlignment = ToolbarAlignment.Center;  
drilldownSettings.ToolbarVerticalAlignment = ToolbarAlignment.Center;  
sunburstChart.DrilldownSettings = drilldownSettings;
```

## Selection

The sunburst chart provides support to select or highlight the segments. Selection can be enabled with the help of [EnableSelection](#) property.

### Selection type

The [SelectionType](#) property allows you to select a segment based on the following categories:

- Child: Highlights the selected segment along with its children in all levels.
- Group: Highlights the entire group of the selected segment in a hierarchy.
- Parent: Highlights the parent of the selected segment in the hierarchy.
- Single: Highlights the selected segment alone.

The following code shows the **Child** selection type.

### XML

```
<sunburst:SfSunburstChart.SelectionSettings>  
<sunburst:SelectionSettings Opacity="0.5" EnableSelection="True"  
SelectionType="Child"></sunburst:SelectionSettings>  
</sunburst:SfSunburstChart.SelectionSettings>
```

### C#

```
SelectionSettings selection = new SelectionSettings();  
selection.Opacity = 0.5;  
selection.EnableSelection = true;  
selection.SelectionType = SelectionType.Child;  
sunburstChart.SelectionSettings = selection;
```

The following code shows the **Group** selection type.

#### XML

```
<sunburst:SfSunburstChart.SelectionSettings>
<sunburst:SelectionSettings Opacity="0.5" EnableSelection="True"
SelectionType="Group"></sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>
```

#### C#

```
SelectionSettings selection = new SelectionSettings();
selection.Opacity = 0.5;
selection.EnableSelection = true;
selection.SelectionType = SelectionType.Group;
sunburstChart.SelectionSettings = selection;
```

The following code shows the **Parent** selection type.

#### XML

```
<sunburst:SfSunburstChart.SelectionSettings>
<sunburst:SelectionSettings Opacity="0.5" EnableSelection="True"
SelectionType="Parent"></sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>
```

#### C#

```
SelectionSettings selection = new SelectionSettings();
selection.Opacity = 0.5;
selection.EnableSelection = true;
selection.SelectionType = SelectionType.Parent;
sunburstChart.SelectionSettings = selection;
```

The following code shows the **Single** selection type.

#### XML

```
<sunburst:SfSunburstChart.SelectionSettings>
<sunburst:SelectionSettings Opacity="0.5" EnableSelection="True"
SelectionType="Single"></sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>
```

#### C#

```
SelectionSettings selection = new SelectionSettings();
selection.Opacity = 0.5;
selection.EnableSelection = true;
selection.SelectionType = SelectionType.Single;
sunburstChart.SelectionSettings = selection;
```

### Selection display mode

The [SelectionDisplayMode](#) property provides the following selection options to highlight the segments:

- By stroke
- By Color
- By opacity

### Opacity

This mode highlights the selected segment with the opacity specified in the [Opacity](#) property.

### XML

```
<sunburst:SfSunburstChart.SelectionSettings>
<sunburst:SelectionSettings Opacity="0.5" EnableSelection="True"
SelectionDisplayMode="HighlightByOpacity"
SelectionType="Group"></sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>
```

### C#

```
SelectionSettings selection = new SelectionSettings();
```

```

selection.EnableSelection = true;
selection.Opacity = 0.5;
selection.SelectionDisplayMode = SelectionDisplayMode.HighlightByOpacity;
selection.SelectionType = SelectionType.Group;
sunburstChart.SelectionSettings = selection;

```

### Color

This mode highlights the selected segment using the brush specified in the [SelectionBrush](#) property.

### XML

```

<sunburst:SfSunburstChart.SelectionSettings>
  <sunburst:SelectionSettings EnableSelection="True" SelectionBrush="Black"
    SelectionDisplayMode="HighlightByColor"
    SelectionType="Group"></sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>

```

### C#

```

SelectionSettings selection = new SelectionSettings();
selection.EnableSelection = true;
selection.SelectionDisplayMode = SelectionDisplayMode.HighlightByColor;

```

```
selection.SelectionBrush = Color.Black;
selection.SelectionType = SelectionType.Group;
sunburstChart.SelectionSettings = selection;
```

### Stroke

This mode highlights the selected segment by applying stroke to it. The color and thickness of the stroke can be customized using the [SelectionStrokeBrush](#) and [SelectionStrokeWidth](#) properties.

### XML

```
<sunburst:SfSunburstChart.SelectionSettings>
  <sunburst:SelectionSettings EnableSelection="True"
    SelectionStrokeBrush="Black"
    SelectionDisplayMode="HighlightByStrokeColor"
    SelectionType="Group"></sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>
```

### C#

```
SelectionSettings selection = new SelectionSettings();
selection.EnableSelection = true;
```

```

selection.SelectionDisplayMode =
SelectionDisplayMode.HighlightByStrokeColor;
selection.SelectionStrokeBrush = Color.Black;
selection.SelectionType = SelectionType.Group;
sunburstChart.SelectionSettings = selection;

```

## Events

### *Selection Changed*

This event occurs whenever you select the segment. You can get the [SelectedSegment](#) and [IsSelected](#) properties details as argument from [SelectionChangedEventArgs](#) handler.

### XML

```

<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount"
SelectionChanged="SunburstChart_SelectionChanged">
<sunburst:SfSunburstChart.SelectionSettings>
<sunburst:SelectionSettings EnableSelection="True"
SelectionDisplayMode="HighlightByStrokeColor"
SelectionType="Single"></sunburst:SelectionSettings>
</sunburst:SfSunburstChart.SelectionSettings>

```

```
</sunburst:SfSunburstChart>
<StackLayout x:Name="stackLayout" IsVisible="false" Orientation="Vertical"
Spacing="0" Opacity="0.5" BackgroundColor="Black"
Grid.Row="1" Padding="10" HorizontalOptions="Center" VerticalOptions="End" >
<Label x:Name="countryLabel" FontSize="12" TextColor="White"/>
<Label x:Name="populationLabel" FontSize="12" TextColor="White"/>
</StackLayout>
```

## C#

```
private void SunburstChart_SelectionChanged(object sender,
SelectionChangedEventArgs e)
{
    if (e.SelectedSegment != null)
    {
        stackLayout.IsVisible = true;
        if (!e.IsSelected)
        {
            stackLayout.IsVisible = false;
        }
        if (e.SelectedSegment.CurrentLevel == 0)
        {
            countryLabel.Text = "Country : " + e.SelectedSegment.Category;
            populationLabel.Text = "Employees Count : " + e.SelectedSegment.Value;
        }
        else if (e.SelectedSegment.CurrentLevel == 1)
        {
            countryLabel.Text = "JobDescription : " + e.SelectedSegment.Category;
            populationLabel.Text = "Employees Count : " + e.SelectedSegment.Value;
        }
        else if (e.SelectedSegment.CurrentLevel == 2)
        {
            countryLabel.Text = "JobGroup : " + e.SelectedSegment.Category;
            populationLabel.Text = "Employees Count : " + e.SelectedSegment.Value;
        }
        else
        {
            countryLabel.Text = "JobRole : " + e.SelectedSegment.Category;
            populationLabel.Text = "Employees Count : " + e.SelectedSegment.Value;
        }
    }
}
```

## Tooltip

Tooltip provides additional information about the segments in the sunburst chart. Tooltip is displayed by tapping the segment. By default, tooltip displays the corresponding segment's category and value. To enable the tooltip, set the [ShowTooltip](#) property to true.

The following code shows enabling the tooltip.

### XML

```
<sunburst:SfSunburstChart.TooltipSettings>
  <sunburst:SunburstTooltipSettings
    ShowTooltip="True"></sunburst:SunburstTooltipSettings>
</sunburst:SfSunburstChart.TooltipSettings>
```

### C#

```
SunburstTooltipSettings tooltipSettings = new SunburstTooltipSettings();
tooltipSettings.ShowTooltip = true;
sunburstChart.TooltipSettings = tooltipSettings;
```

### Customization

The appearance of the tooltip can be customized using the following properties:

- [TextColor](#): Customizes the text color of the tooltip.
- [BackgroundColor](#): Customizes the background color of the tooltip.
- [BorderColor](#): Customizes the border color of the tooltip.
- [BorderWidth](#): Customizes the border width of the tooltip.
- [Duration](#): Specifies the duration of the tooltip to be displayed.

The following code shows all the above customizations.

### XML

```
<sunburst:SfSunburstChart.TooltipSettings>
<sunburst:SunburstTooltipSettings ShowTooltip="True" TextColor="White"
BackgroundColor="Green" BorderColor="Black" BorderWidth="1"
Duration="2000" ></sunburst:SunburstTooltipSettings>
</sunburst:SfSunburstChart.TooltipSettings>
```

### C#

```
SunburstTooltipSettings tooltipSettings = new SunburstTooltipSettings();
tooltipSettings.ShowTooltip = true;
tooltipSettings.TextColor = Color.White;
tooltipSettings.BackgroundColor = Color.Green;
tooltipSettings.BorderColor = Color.Black;
tooltipSettings.BorderWidth = 1;
tooltipSettings.Duration = 2000;
sunburstChart.TooltipSettings = tooltipSettings;
```

### Font customization

The font size can be customized using the [FontSize](#) property of tooltip.

### XML

```
<sunburst:SfSunburstChart.TooltipSettings>
<sunburst:SunburstTooltipSettings ShowTooltip="True" FontSize="20" />
</sunburst:SfSunburstChart.TooltipSettings>
```

### C#

```
SunburstTooltipSettings tooltipSettings = new SunburstTooltipSettings();
tooltipSettings.ShowTooltip = true;
```

```
tooltipSettings.FontSize = 20;
sunburstChart.TooltipSettings = tooltipSettings;
```

### Custom template

The sunburst chart provides options to design your own template for tooltip using the [TooltipTemplate](#) property.

### XML

```
<sunburst:SfSunburstChart.TooltipSettings>
  <sunburst:SunburstTooltipSettings ShowTooltip="True">
    <sunburst:SunburstTooltipSettings.TooltipTemplate>
      <DataTemplate>
        <StackLayout Orientation="Vertical">
          <StackLayout Orientation="Horizontal">
            <Label Text="Country : " TextColor="White"/>
            <Label Text="{Binding Category}" TextColor="White"/>
          </StackLayout>
          <StackLayout Orientation="Horizontal">
            <Label Text="Count : " TextColor="White"/>
            <Label Text="{Binding Value}" TextColor="White"/>
          </StackLayout>
        </StackLayout>
      </DataTemplate>
    </sunburst:SunburstTooltipSettings.TooltipTemplate>
  </sunburst:SunburstTooltipSettings>
</sunburst:SfSunburstChart.TooltipSettings>
```

**C#**

```
SunburstTooltipSettings tooltipSettings = new SunburstTooltipSettings();
tooltipSettings.ShowTooltip = true;
DataTemplate template = new DataTemplate(() =>
{
    StackLayout stack = new StackLayout() { Orientation =
    StackOrientation.Vertical };
    StackLayout categoryLayout = new StackLayout() { Orientation =
    StackOrientation.Horizontal };
    Label label = new Label() { Text = "Country :" };
    label.TextColor = Color.White;
    Label category = new Label();
    category.TextColor = Color.White;
    category.SetBinding(Label.TextProperty, "Category");
    categoryLayout.Children.Add(label);
    categoryLayout.Children.Add(category);
    StackLayout valueLayout = new StackLayout() { Orientation =
    StackOrientation.Horizontal };
    Label label1 = new Label() { Text = "Count :" };
    label1.TextColor = Color.White;
    Label value = new Label();
    value.TextColor = Color.White;
    value.SetBinding(Label.TextProperty, "Value");
    valueLayout.Children.Add(label1);
    valueLayout.Children.Add(value);
    stack.Children.Add(categoryLayout);
    stack.Children.Add(valueLayout);
    return stack;
});
tooltipSettings.TooltipTemplate = template;
sunburstChart.TooltipSettings = tooltipSettings;
```

## Animation

The sunburst chart provides animation on loading and whenever the item source changes. Animation can be enabled by setting the [EnableAnimation](#) property to true.

The following code shows enabling animation.

### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount" EnableAnimation="True">
</sunburst:SfSunburstChart>
```

### C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.EnableAnimation = true;
this.Content = sunburstChart;
```

## Duration

Animation duration can be controlled using the [AnimationDuration](#) property.

### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}" AnimationDuration="2"
ValueMemberPath="EmployeesCount" EnableAnimation="True">
</sunburst:SfSunburstChart>
```

### C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.EnableAnimation = true;
sunburstChart.AnimationDuration = 2;
this.Content = sunburstChart;
```

Below snippet is the complete code for generating the following output.

### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}" AnimationDuration="2"
ValueMemberPath="EmployeesCount" EnableAnimation="True">
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
</sunburst:SfSunburstChart>
```

### C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.EnableAnimation = true;
sunburstChart.AnimationDuration = 2;
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
```

```
this.Content = sunburstChart;
```

The following screenshot depicts animation of the sunburst chart with the specified duration.

## Customization

The sunburst chart provides various customizing and styling options to enrich the application.

### Palettes

The sunburst chart provides options to apply different kinds of palettes using the [ColorModel](#).

The following palettes are available in the sunburst chart:

- Metro
- Natural
- Pineapple

- TomatoSpectrum
- Custom

The following code shows applying the TomatoSpectrum [Palette](#).

#### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount" >
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
<sunburst:SfSunburstChart.ColorModel>
<sunburst:SunburstChartColorModel
Palette="TomatoSpectrum"></sunburst:SunburstChartColorModel>
</sunburst:SfSunburstChart.ColorModel>
</sunburst:SfSunburstChart>
```

#### C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
SunburstChartColorModel colorModel = new SunburstChartColorModel();
colorModel.Palette = SunburstColorPalette.TomatoSpectrum;
sunburstChart.ColorModel = colorModel;
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
this.Content = sunburstChart;
```

### Angle

The start angle and end angle of the sunburst chart can be adjusted by using the [StartAngle](#) and [EndAngle](#) properties.

### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount" StartAngle="180" EndAngle="360">
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
</sunburst:SfSunburstChart>
```

### C#

```

SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.StartAngle = 180;
sunburstChart.EndAngle = 360;
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
this.Content = sunburstChart;

```

### Radius

The sunburst chart allows you to customize the radius by using the [Radius](#) property. The default value of this property is 0.9, and the value ranges from 0 to 1.

### XML

```

<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount" Radius="0.6">
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>

```

```
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
</sunburst:SfSunburstChart>
```

## C#

```
SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.Radius = 0.6;
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
this.Content = sunburstChart;
```

### Inner radius

The sunburst chart allows you to customize the inner radius using the [InnerRadius](#) property. The default value of this property is 0.2, and the value ranges from 0 to 1.

### XML

```
<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount" InnerRadius="0.5">
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
</sunburst:SfSunburstChart>
```

### C#

```

SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.InnerRadius = 0.5;
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
this.Content = sunburstChart;

```

### Stroke customization

Stroke color and stroke width of the sunburst chart can be customized using [StrokeColor](#) and [StrokeWidth](#) properties respectively.

### XML

```

<sunburst:SfSunburstChart x:Name="sunburstChart" ItemsSource="{Binding
DataSource}"
ValueMemberPath="EmployeesCount" StrokeColor="Black" StrokeWidth="2">
<sunburst:SfSunburstChart.Levels>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="Country"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobDescription"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobGroup"/>
<sunburst:SunburstHierarchicalLevel GroupMemberPath="JobRole"/>
</sunburst:SfSunburstChart.Levels>
<sunburst:SfSunburstChart.DataLabel>
<sunburst:SunburstChartDataLabel x:Name="dataLabel"
ShowLabel="True"></sunburst:SunburstChartDataLabel>
</sunburst:SfSunburstChart.DataLabel>
</sunburst:SfSunburstChart>

```

**C#**

```

SfSunburstChart sunburstChart = new SfSunburstChart();
sunburstChart.SetBinding(SfSunburstChart.ItemsSourceProperty, "DataSource");
sunburstChart.ValueMemberPath = "EmployeesCount";
sunburstChart.StrokeColor = Color.Black;
sunburstChart.StrokeWidth = 2;
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"Country" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobDescription" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobGroup" });
sunburstChart.Levels.Add(new SunburstHierarchicalLevel() { GroupMemberPath =
"JobRole" });
SunburstChartDataLabel label = new SunburstChartDataLabel();
label.ShowLabel = true;
sunburstChart.DataLabel = label;
this.Content = sunburstChart;

```

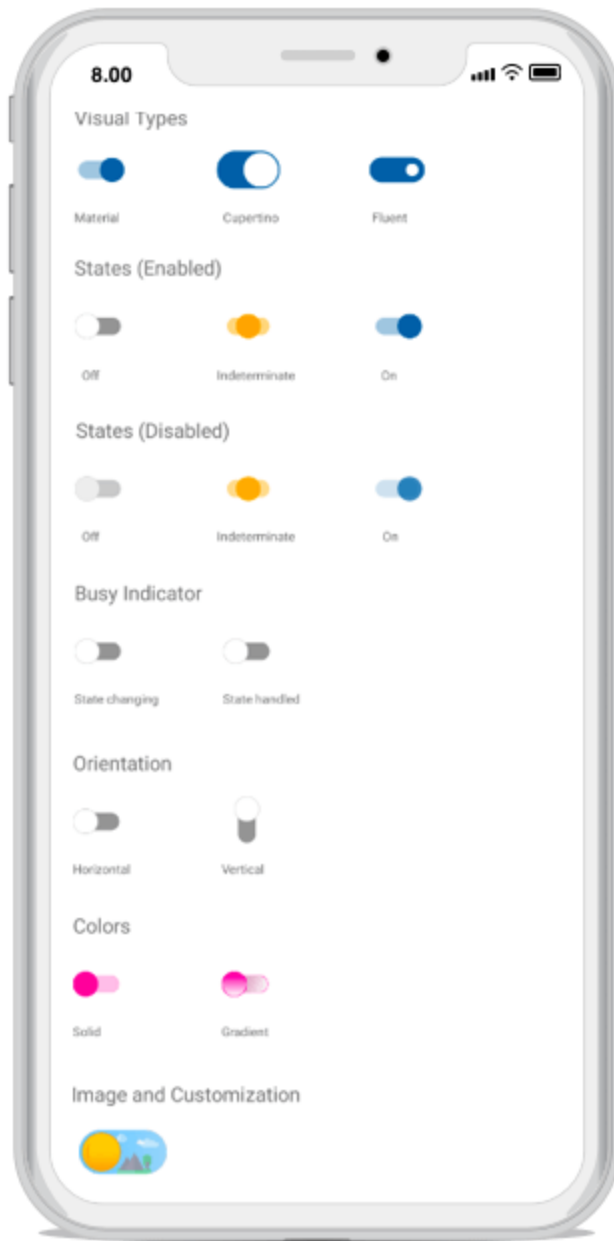

## SfSwitch

### SfSwitch

#### Overview

Essential SfSwitch for Xamarin.Forms provides an efficient way to select between the states based on the toggled value.

### Key features

- Provides support for inbuilt visual types like Material, Cupertino or fluent type.
- Customizable visual based on device platforms.
- Provides options to visualize indeterminate state.
- Performs async action with busy indicator.
- Supports horizontal and vertical orientation.
- Allows you to add the images to enhance the look and feel.

## Getting Started

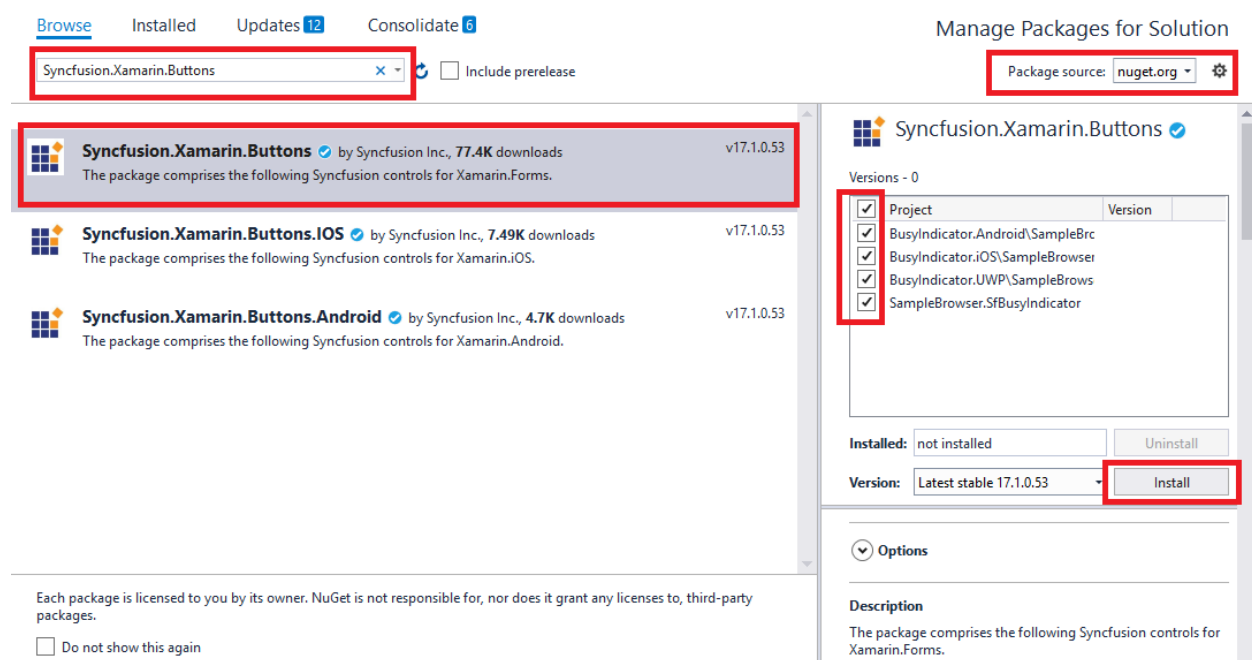

This section explains you the steps to add the SfSwitch control with basic functionalities in Xamarin.Forms.

### Adding SfSwitch reference

You can add SfSwitch reference using one of the below methods.

#### Method 1: Adding SfSwitch reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfSwitch to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Core](#), and then install it.

#### Method 2: Adding SfSwitch reference from toolbox

Syncfusion provides Xamarin Toolbox. Using this toolbox, you can drag the SfSwitch control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfSwitch assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Buttons.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.Android.dll Syncfusion.Core.XForms.dll

	Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Buttons.XForms.dll Syncfusion.Buttons.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

#### Launching an application on each platform with SfSwitch

To use the SfSwitch inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and is discussed in the following sections:

**Note:** If you are adding the references from toolbox, below steps are not needed.

#### iOS

To launch the switch in iOS, call the `SfSwitchRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms framework initialization and before the `LoadApplication` method is called as demonstrated in the following code sample:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    Syncfusion.XForms.iOS.Buttons.SfSwitchRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

**Note:** If you are adding the references from toolbox, this step is not needed.

#### Universal Windows Platform (UWP)

To deploy the switch in Release mode, you need to initialize the button assemblies in App.xaml.cs in UWP project as shown in the below code snippets.

### **C#**

```
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    .....
    rootFrame.NavigationFailed += OnNavigationFailed;
    // Add using System.Reflection;
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies that your app uses.
    assembliesToInclude.Add(typeof(SfBorderRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    .....
}
```

### **Android**

The Android platform does not require any additional configuration to render the chart.

#### Initializing SfSwitch

Import the Button namespace as shown below in your respective Page,

### **XML**

```
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.Buttons;assembly=Syncfusion.Buttons.XForms"
```

### **C#**

```
using Syncfusion.XForms.Buttons;
```

Then initialize the switch control as shown below using the code example.

### **XML**

```
<syncfusion:SfSwitch />
```

### **C#**

```
SfSwitch sfSwitch = new SfSwitch();
```

ANDROID

iOS

UWP

### Performing an action based on state

You can switch between the states. When the state is changed the `StateChanging` and `StateChanged` event will be triggered where you can perform an action based on the current state. The `StateChanging` event allows you to cancel moving to a new state.

The following code example displays a message box when switched to off state when work is completed.

#### XML

```
<syncfusion:SfSwitch StateChanged="SfSwitch_StateChanged" />
```

#### C#

```
sfSwitch.StateChanged += SfSwitch_StateChanged;
```

#### C#

```
private void SfSwitch_StateChanged(object sender,
SwitchStateChangedEventArgs e)
{
    DisplayAlert("Message", "SUCCESS", "OK");
}
```

You can find the complete getting started sample from this [link](#).

### Visual Types

SfSwitch supports customization using built-in visual types. The visual types based on device platform are listed as follows.

- Android – Material
- iOS – Cupertino
- Windows – Fluent

### Default

This is the default value set for visual type.

ANDROID

iOS

UWP

---

**Note:** If you set default, the visual type will be internally changed based on the device platform.

---

### Material

Material visual type brings the appearance based on material guidelines. The following code example demonstrates how to define material visual type.

#### XML

```
<syncfusion:SfSwitch VisualType="Material" />
```

#### C#

```
SfSwitch sfSwitch=new SfSwitch();  
sfSwitch.VisualType = VisualType.Material;
```

### Cupertino

Cupertino visual type brings the appearance based on Cupertino guidelines. The following code example demonstrates how to define Cupertino visual type.

#### XML

```
<syncfusion:SfSwitch VisualType="Cupertino" />
```

#### C#

```
SfSwitch sfSwitch=new SfSwitch();  
sfSwitch.VisualType = VisualType.Cupertino;
```

### Fluent

Fluent visual type brings the appearance based on Fluent guidelines. The following code example demonstrates how to define Fluent visual type.

#### XML

```
<syncfusion:SfSwitch VisualType="Fluent" />
```

#### C#

```
SfSwitch sfSwitch=new SfSwitch();  
sfSwitch.VisualType = VisualType.Fluent;
```

### Custom

Custom type will allow you to customize the control, where you can handle the size, colors, images etc. of the control. Refer to this [documentation](#).

### States

Switch allows you to configure the states as explained in the following sections.

#### On

You can switch to on state by tapping the switch button or by setting a value as demonstrated in the following code example.

#### XML

```
<syncfusion:SfSwitch IsOn="True" />
```

#### C#

```
SfSwitch sfSwitch=new SfSwitch();
```

```
sfSwitch.IsOn=true;
```

ANDROID

iOS

UWP

### Off

This is the default state. You can switch to off state by tapping the switch button or by defining as demonstrated in the following code example.

#### XML

```
<syncfusion:SfSwitch IsOn="False" />
```

#### C#

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.IsOn = false;
```

ANDROID

iOS

UWP

### Indeterminate

The indeterminate state can be enabled when you need to display the work progress. The following code example demonstrates how to load the switch in indeterminate state by setting the IsOn property to null.

#### XML

```
<syncfusion:SfSwitch IsOn="{x:Null}" AllowIndeterminateState="True" />
```

#### C#

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.IsOn = null;  
sfSwitch.AllowIndeterminateState = true;
```

ANDROID

iOS

UWP

---

**Note:** By default, the switch control has only two states: on and off.

---

#### Disabled On

You can switch to disabled on state by setting the `IsOn` property as true and `IsEnabled` property as false.

#### XML

```
<syncfusion:SfSwitch IsOn="True" IsEnabled="False" />
```

#### C#

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.IsOn = true;  
sfSwitch.IsEnabled = false;
```

ANDROID

iOS

UWP

#### Disabled Off

You can switch to disabled off state by setting the `IsOn` property as false and `IsEnabled` property as false.

#### XML

```
<syncfusion:SfSwitch IsOn="False" IsEnabled="False" />
```

#### C#

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.IsOn = false;
```

```
sfSwitch.IsEnabled = false;
```

ANDROID

iOS

UWP

### Disabled Indeterminate

The disabled indeterminate state can be enabled when you need to display the work progress. The below code example demonstrates loading the switch in disabled indeterminate state by setting `IsOn` property value as null and `IsEnabled` property as false.

#### XML

```
<syncfusion:SfSwitch AllowIndeterminateState="True" IsOn="{x:Null}"  
IsEnabled="False"/>
```

#### C#

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.AllowIndeterminateState = true;  
sfSwitch.IsOn = null;  
sfSwitch.IsEnabled = false;
```

ANDROID

iOS

UWP

### Orientation

The switch control provides options to change the default orientation.

#### Horizontal

By default, it is displayed horizontally. You can also define the orientation as demonstrated in the following code example.

#### XML

```
<syncfusion:SfSwitch Orientation="Horizontal" />
```

**C#**

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.Orientation = SwitchOrientation.Horizontal;
```

**ANDROID****iOS****UWP****Vertical**

To view the switch control vertically, you can define the vertical orientation as demonstrated in the following code example.

**XML**

```
<syncfusion:SfSwitch Orientation="Vertical" />
```

**C#**

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.Orientation = SwitchOrientation.Vertical;
```

**ANDROID****iOS****UWP****Customization with visual states**

The switch control provides options to customize the color based on states. The following code example demonstrates how to customize the switch control.

**Solid colors**

The following properties are used to apply solid colors to the thumb, track, border, and busy indicator, respectively:

- ThumbColor: Represents the color for the thumb.
- ThumbBorderColor: Represents the border color for the thumb.
- TrackBorderColor: Represents the color for the border of the track.
- TrackColor: Represents the color for the track.

### XML

```
<syncfusion:SfSwitch VisualType="Custom">
  <VisualStateManager.VisualStateGroups>
    <VisualStateGroup x:Name="CommonStates">
      <VisualState x:Name="On">
        <VisualState.Setters>
          <Setter Property="SwitchSettings">
            <Setter.Value>
              <syncfusion:DefaultSwitchSettings x:TypeArguments="syncfusion:OnState"
                ThumbBorderColor="DarkCyan" ThumbColor="Aqua"
                TrackBorderColor="Green" TrackColor="GreenYellow"
                BusyIndicatorColor="Coral" />
            </Setter.Value>
          </Setter>
        </VisualState.Setters>
      </VisualState>
      <VisualState x:Name="Off">
        <VisualState.Setters>
          <Setter Property="SwitchSettings">
            <Setter.Value>
              <syncfusion:DefaultSwitchSettings x:TypeArguments="syncfusion:OffState"
                ThumbBorderColor="DarkCyan" ThumbColor="Aqua"
                TrackBorderColor="Green" TrackColor="GreenYellow" />
            </Setter.Value>
          </Setter>
        </VisualState.Setters>
      </VisualState>
      <VisualState x:Name="Indeterminate">
        <VisualState.Setters>
          <Setter Property="SwitchSettings">
            <Setter.Value>
              <syncfusion:DefaultSwitchSettings
                x:TypeArguments="syncfusion:IndeterminateState"
                ThumbBorderColor="DarkCyan" TrackBorderColor="Green"
                ThumbColor="Aqua" TrackColor="GreenYellow" />
            </Setter.Value>
          </Setter>

## Gradients

You can also specify a range of colors in thumb and track using ThumbGradient and TrackGradient as demonstrates in the following code example.

### XML

```
<syncfusion:SfSwitch VisualType="Custom" >
  <VisualStateManager.VisualStateGroups>
    <VisualStateGroup x:Name="CommonStates">
      <VisualState x:Name="On">
        <VisualState.Setters>
          <Setter Property="SwitchSettings">
            <Setter.Value>
              <syncfusion:DefaultSwitchSettings x:TypeArguments="syncfusion:OnState">
                <syncfusion:DefaultSwitchSettings.ThumbGradient>
                  <graphics:SfLinearGradientBrush>
                    <graphics:SfLinearGradientBrush.GradientStops>
                      <graphics:GradientStopCollection>
                        <graphics:SfGradientStop Color="White" Offset="0"></graphics:SfGradientStop>
                        <graphics:SfGradientStop Color="LightSkyBlue"
                          Offset="0.5"></graphics:SfGradientStop>
                        <graphics:SfGradientStop Color="White" Offset="1"></graphics:SfGradientStop>
                      </graphics:GradientStopCollection>
                    </graphics:SfLinearGradientBrush.GradientStops>
                  </graphics:SfLinearGradientBrush>
                </syncfusion:DefaultSwitchSettings.ThumbGradient>
                <syncfusion:DefaultSwitchSettings.TrackGradient>
                  <graphics:SfLinearGradientBrush>
                    <graphics:SfLinearGradientBrush.GradientStops>
                      <graphics:GradientStopCollection>
                        <graphics:SfGradientStop Color="White" Offset="0"></graphics:SfGradientStop>
                        <graphics:SfGradientStop Color="LightCoral"
                          Offset="0.25"></graphics:SfGradientStop>
                        <graphics:SfGradientStop Color="Red" Offset="0.5"></graphics:SfGradientStop>
                        <graphics:SfGradientStop Color="LightSalmon"
                          Offset="0.75"></graphics:SfGradientStop>
                      </graphics:GradientStopCollection>
                    </graphics:SfLinearGradientBrush.GradientStops>
                  </graphics:SfLinearGradientBrush>
                </syncfusion:DefaultSwitchSettings.TrackGradient>
              </syncfusion:DefaultSwitchSettings>
            </Setter.Value>
          </Setter>
        </VisualState.Setters>
      </VisualState>
    </VisualStateGroup>
  </VisualStateManager.VisualStateGroups>
</syncfusion:SfSwitch>
```

### C#

```
SfSwitch sfSwitch = new SfSwitch();
sfSwitch.VisualType = VisualType.Custom;
DefaultSwitchSettings<OnState> defaultSwitch = new
DefaultSwitchSettings<OnState>();
SfLinearGradientBrush sfLinearGradientBrush = new SfLinearGradientBrush();
```

```
GradientStopCollection sfGradientStops = new GradientStopCollection();
SfGradientStop sfGradientStop = new SfGradientStop();
sfGradientStop.Color = Color.White;
sfGradientStop.Offset = 0;
sfGradientStops.Add(sfGradientStop);
SfGradientStop sfGradientStop1 = new SfGradientStop();
sfGradientStop1.Color = Color.LightSkyBlue;
sfGradientStop1.Offset = 0.5;
sfGradientStops.Add(sfGradientStop1);
SfGradientStop sfGradientStop2 = new SfGradientStop();
sfGradientStop2.Color = Color.White;
sfGradientStop2.Offset = 1;
sfGradientStops.Add(sfGradientStop2);
sfLinearGradientBrush.GradientStops = sfGradientStops;
defaultSwitch.ThumbGradient = sfLinearGradientBrush;
SfLinearGradientBrush sfLinearGradientBrush1 = new SfLinearGradientBrush();
GradientStopCollection sfGradientStops1 = new GradientStopCollection();
SfGradientStop sfGradientStop3 = new SfGradientStop();
sfGradientStop3.Color = Color.White;
sfGradientStop3.Offset = 0;
sfGradientStops1.Add(sfGradientStop3);
SfGradientStop sfGradientStop4 = new SfGradientStop();
sfGradientStop4.Color = Color.LightCoral;
sfGradientStop4.Offset = 0.25;
sfGradientStops1.Add(sfGradientStop4);
SfGradientStop sfGradientStop5 = new SfGradientStop();
sfGradientStop5.Color = Color.Red;
sfGradientStop5.Offset = 0.5;
sfGradientStops1.Add(sfGradientStop5);
SfGradientStop sfGradientStop6 = new SfGradientStop();
sfGradientStop6.Color = Color.LightSalmon;
sfGradientStop6.Offset = 0.75;
sfGradientStops1.Add(sfGradientStop6);
sfLinearGradientBrush1.GradientStops = sfGradientStops1;
defaultSwitch.TrackGradient = sfLinearGradientBrush1;
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState onState = new VisualState
{
    Name = "On"
};
onState.Setters.Add(new Setter { Property = SfSwitch.SwitchSettingsProperty,
    Value = defaultSwitch });
commonStateGroup.States.Add(onState);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(sfSwitch, visualStateGroupList);
this.Content = sfSwitch;
```

**Note:** Here ThumbGradient and TrackGradient are type of SfLinearGradientBrush, So You can apply SfLinearGradientBrush or SfRadialGradientBrush on it. This SfLinearGradientBrush is available in [Syncfusion.Xamarin.Core](https://nuget.org/packages/Syncfusion.Xamarin.Core) from [nuget.org](https://nuget.org). To know more about gradient view refer this [link](#).

### Sizing

In the switch control, sizing of the thumb and the track can be controlled using the following properties:

- TrackCornerRadius: Represents a double value to create curved corner.
- TrackBorderWidth: Represents a double value for defining the track border width.
- TrackWidthRequest: Represents a double value for defining the track width.
- TrackHeightRequest: Represents double value for defining the track height.
- ThumbBorderWidth: Represents a double value for defining the thumb border width.
- ThumbCornerRadius: Represents a double value to create curved corner.
- ThumbHeightRequest: Represents double value for defining the thumb height.
- ThumbWidthRequest: Represents double value for defining the thumb width.

The following code example demonstrates how to customize the size of the track and thumb.

### XML

```
<syncfusion:SfSwitch VisualType="Custom" >
  <VisualStateManager.VisualStateGroups>
    <VisualStateGroup x:Name="CommonStates">
      <VisualState x:Name="On">
        <VisualState.Setters>
          <Setter Property="SwitchSettings">
            <Setter.Value>
              <syncfusion:DefaultSwitchSettings x:TypeArguments="syncfusion:OnState"
                ThumbBorderWidth="2" TrackBorderWidth="2"
                TrackHeightRequest="25" TrackWidthRequest="75" TrackCornerRadius="4"
                ThumbCornerRadius="4" ThumbHeightRequest="10" ThumbWidthRequest="10">
            </syncfusion:DefaultSwitchSettings>
          </Setter.Value>
        </Setter>
      </VisualState.Setters>
    </VisualState>
    <VisualState x:Name="Off">

VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState onState = new VisualState
{
    Name = "On"
};
onState.Setters.Add(new Setter { Property = SfSwitch.SwitchSettingsProperty,
Value = defaultSwitch });
VisualState offState = new VisualState
{
    Name = "Off"
};
offState.Setters.Add(new Setter { Property =
SfSwitch.SwitchSettingsProperty, Value = defaultSwitch1 });
commonStateGroup.States.Add(onState);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(sfSwitch, visualStateGroupList);
this.Content = sfSwitch;

```

### Images

Images can also be added to enhance the visual appearance. The following properties are used to add the images:

- `TrackImageSource`: Represents the image source for the track.
- `ThumbImageSource`: Represents the image source for thumb.

The following code example demonstrates how to customize the image.

### XML

```
<syncfusion:SfSwitch IsOn="False" HorizontalOptions="Center"
VisualType="Custom">
  <VisualStateManager.VisualStateGroups>

### Limitation

Since the Visual State Manger (internally) is handled in our control, applying Visual State Manger thorough style (as dynamic resource) does not work.

### How to

#### Show busy indicator to perform async action

The busy indicator indicates users that something is on progress in the background. For instance, some data is being fetched from the back end. Here, when users about to switch the state, the StateChanging event occurs, and users can set the `IsBusy` property to true to show busy indicator and perform fetching

the data from the server. After fetching the data, the `IsOn` property will be set to true or false based on validation. After validation, the `IsBusy` property is set to false.

### XML

```
<syncfusion:SfSwitch x:Name="sfSwitch" StateChanging="State_StateChanging"/>
```

### C#

```
SfSwitch sfSwitch = new SfSwitch();
sfSwitch.StateChanged += State_StateChanging;
```

### C#

```
private async void State_StateChanging(object sender,
SwitchStateChangingEventArgs e)
{
    this.sfSwitch.IsBusy = true;
    await Task.Delay(2500);
    this.sfSwitch.IsOn = ValidateInternetConnection();
    this.sfSwitch.IsBusy = false;
}
private bool ValidateInternetConnection()
{
    Random randomValue = new Random();
    if (randomValue.Next() % 2 == 0)
    {
        return false;
    }
    return true;
}
```

                BusyIndicatorColor="Red" />
            </Setter.Value>
          </Setter>
        </VisualState.Setters>
      </VisualState>
    </VisualStateGroup>
  </VisualStateManager.VisualStateGroups>
</syncfusion:SfSwitch>
```

#### C#

```
SfSwitch sfSwitch = new SfSwitch();
sfSwitch.VisualType = VisualType.Custom;
sfSwitch.IsBusy = true;
DefaultSwitchSettings<OnState> defaultSwitch = new
DefaultSwitchSettings<OnState>();
defaultSwitch.BusyIndicatorColor = Color.Red;
DefaultSwitchSettings<OffState> defaultSwitch1 = new
DefaultSwitchSettings<OffState>();
```

```

defaultSwitch1.BusyIndicatorColor = Color.Red;
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState onState = new VisualState
{
    Name = "On"
};
onState.Setters.Add(new Setter { Property = SfSwitch.SwitchSettingsProperty,
    Value = defaultSwitch1 });
VisualState offState = new VisualState
{
    Name = "Off"
};
offState.Setters.Add(new Setter { Property =
    SfSwitch.SwitchSettingsProperty, Value = defaultSwitch1 });
commonStateGroup.States.Add(onState);
commonStateGroup.States.Add(offState);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(sfSwitch, visualStateGroupList);
this.Content = sfSwitch;

```

ANDROID

iOS

UWP

Set all state in same look

All state can be customized in same look by setting the same state for all switch settings.

#### XML

```

<syncfusion:SfSwitch VisualType="Custom" >
<VisualStateManager.VisualStateGroups>
<VisualStateGroup x:Name="CommonStates">
<VisualState x:Name="On">
<VisualState.Setters>
<Setter Property="SwitchSettings">
<Setter.Value>
<syncfusion:DefaultSwitchSettings x:TypeArguments="syncfusion:OnState" />
</Setter.Value>
</Setter>
</VisualState.Setters>
</VisualState>
<VisualState x:Name="Off">
<VisualState.Setters>
<Setter Property="SwitchSettings">
<Setter.Value>
<syncfusion:DefaultSwitchSettings x:TypeArguments="syncfusion:OnState" />
</Setter.Value>

```

```

</Setter>
</VisualState.Setters>
</VisualState>
</VisualStateGroup>
</VisualStateManager.VisualStateGroups>
</syncfusion:SfSwitch>

```

## C#

```

SfSwitch sfSwitch = new SfSwitch();
sfSwitch.VisualType = VisualType.Custom;
DefaultSwitchSettings<OnState> defaultSwitch = new
DefaultSwitchSettings<OnState>();
DefaultSwitchSettings<OnState> defaultSwitch1 = new
DefaultSwitchSettings<OnState>();
VisualStateGroupList visualStateGroupList = new VisualStateGroupList();
VisualStateGroup commonStateGroup = new VisualStateGroup();
VisualState onState = new VisualState
{
    Name = "On"
};
onState.Setters.Add(new Setter { Property = SfSwitch.SwitchSettingsProperty,
    Value = defaultSwitch });
VisualState offState = new VisualState
{
    Name = "Off"
};
offState.Setters.Add(new Setter { Property =
    SfSwitch.SwitchSettingsProperty, Value = defaultSwitch1 });
commonStateGroup.States.Add(onState);
commonStateGroup.States.Add(offState);
visualStateGroupList.Add(commonStateGroup);
VisualStateManager.SetVisualStateGroups(sfSwitch, visualStateGroupList);
this.Content = sfSwitch;

```

ANDROID

iOS

UWP

### Set RTL to switch control

Switch supports to change the layout direction of the control in the right-to-left direction by setting the `FlowDirection` to `RightToLeft`.

The device direction takes when we set the `FlowDirection` as `MatchParent`.

*Setting right to left*

#### XML

```
<syncfusion:SfSwitch FlowDirection="RightToLeft" >  
</syncfusion:SfSwitch>
```

#### C#

```
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.FlowDirection = FlowDirection.RightToLeft;  
this.Content = sfSwitch;
```

ANDROID

iOS

UWP

*Setting match parent*

#### XML

```
<Grid FlowDirection="RightToLeft">  
<syncfusion:SfSwitch FlowDirection="MatchParent" />  
</Grid>
```

#### C#

```
Grid grid = new Grid();  
grid.FlowDirection = FlowDirection.RightToLeft;  
SfSwitch sfSwitch = new SfSwitch();  
sfSwitch.FlowDirection = FlowDirection.MatchParent;  
grid.Children.Add(sfSwitch);  
this.Content = grid;
```

ANDROID

iOS

UWP

Get default color of the switches in all three state.

The following table illustrate the default color of the switches in all three state.

#### Material

Elements	State	Colors
Thumb Color	On	Accent
Thumb Color	Off	#FFFFFF
Thumb Color	Indeterminate	Accent
Thumb Color	Disabled On	Accent with 0.4 opacity
Thumb Color	Disabled Off	#FFFFFF
Thumb Color	Disabled Indeterminate	Accent with 0.4 opacity
Thumb Border Color	On	Accent
Thumb Border Color	Off	LightGray
Thumb Border Color	Indeterminate	Accent
Thumb Border Color	Disabled On	Accent with 0.4 opacity
Thumb Border Color	Disabled Off	#DADADA
Thumb Border Color	Disabled Indeterminate	Accent with 0.4 opacity
Track Color	On	Accent with 0.2 opacity
Track Color	Off	#949494
Track Color	Indeterminate	#CACACA
Track Color	Disabled On	Accent with 0.2 opacity
Track Color	Disabled Off	#E0E0E0

Busy Indicator Color	DisabledIndeterminate	#00BFFF

### AutomationId

The SfSwitch control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the SfSwitch control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's **AutomationId**.

For example, if you set SfSwitch's **AutomationId** as "Turn on Night mode", then the automation framework will interact the SfSwitch as "Turn on Night mode Track".

When you enable the Indeterminate state, then the Automation framework will interact the Off state as "Turn on Night mode Off Track", Indeterminate state as "Turn on Night mode Indeterminate Track" and the On state as "Turn on Night mode On Track".

**Note:** AutomationId support works on Android only.

———— Turn on Night mode Track

## SfTabView

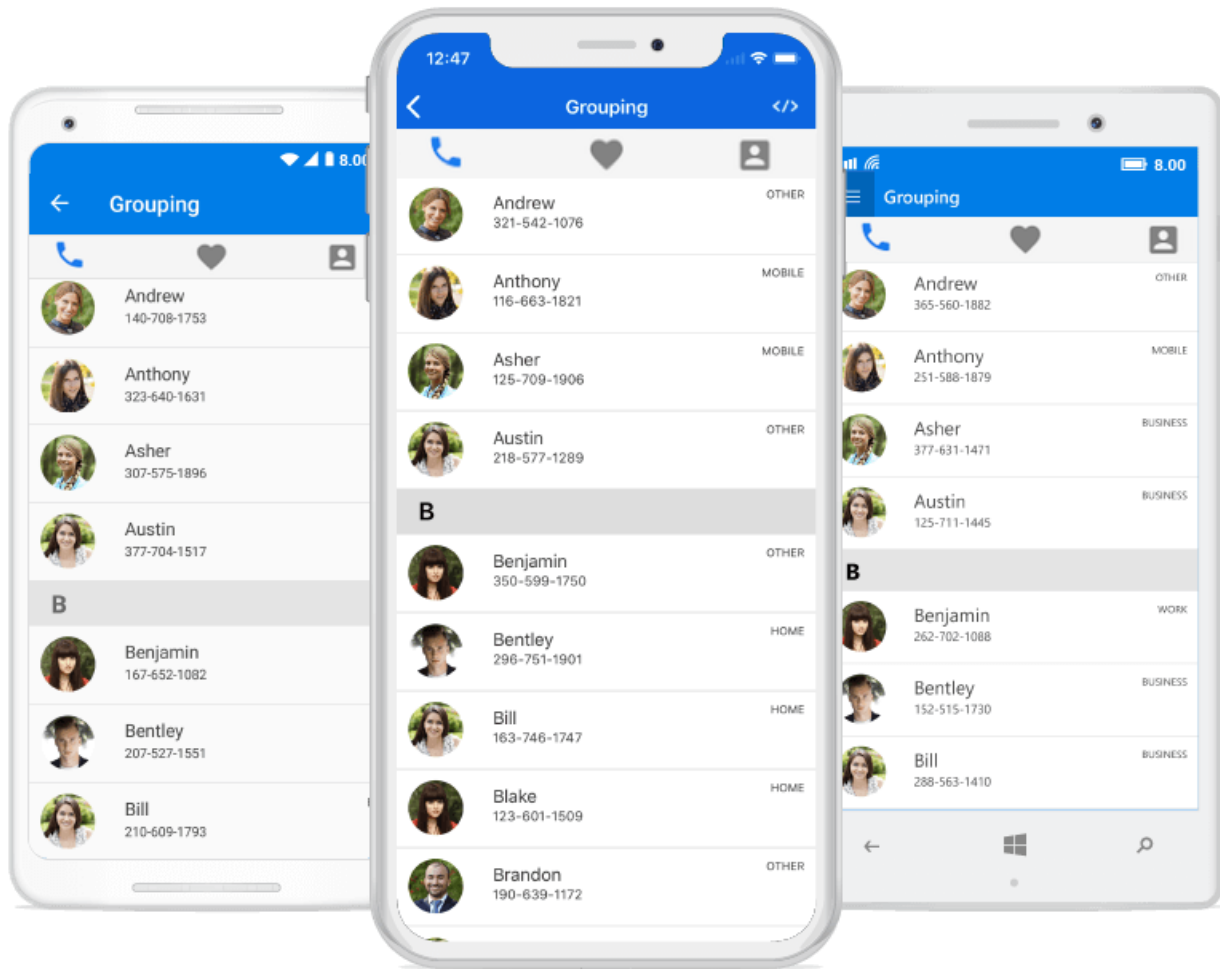

### Overview

The tab view control is available in Xamarin.Forms, Xamarin.Android, Xamarin.iOS and Xamarin.UWP. It helps you to create the customizable features that are used to explore and switch among the different views. The key features of tab view control in Xamarin.Forms, Xamarin.Android, Xamarin.iOS and Xamarin.UWP are given as follows.

## Key features

- Tab header type with text, font icons, and no header.
- Scrollable content and header.
- Top and bottom placements of header.
- Layout option for overflow tabs.

## Getting Started

This section provides an overview for working with the tab view control for Xamarin.Forms. Walk through the entire process of creating a real-world application with the tab view.

### Assembly deployment

After installing the Essential Studio for Xamarin, find all the required assemblies in installation folders, {Syncfusion Essential Studio Installed location}\Essential Studio\16.1.0.24\Xamarin\lib}.

E.g., C:\Program Files (x86)\Syncfusion\Essential Studio\16.1.0.24\Xamarin\lib

**Note:** In Mac, assemblies can be found in unzipped package location.

### Adding SfTabView reference

You can add SfTabView reference using one of the following methods:

**Method 1: Adding SfTabView reference from nuget.org**

Syncfusion Xamarin components are available in [nuget.org](https://www.syncfusion.com/nuget-packages). To add SfTabView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfTabView](https://www.syncfusion.com/nuget-packages), and then install it.

![[Adding SfTabView reference from NuGet]](images/Getting-Started/Adding SfTabView reference.png)

**Note:** Install the same version of SfTabView NuGet in all the projects.

**Method 2: Adding SfTabView reference from toolbox**

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfTabView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

**Method 3: Adding SfTabView assemblies manually from the installed location**

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfTabView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfTabView.XForms.dll Syncfusion.SfTabView.XForms.Android.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfTabView.XForms.dll Syncfusion.SfTabView.XForms.iOS.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfTabView.XForms.dll Syncfusion.SfTabView.XForms.UWP.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

### Launching the tab view on each platform

To use the tab view inside an application, each platform application must initialize the tab view renderer. This initialization steps vary from platform to platform, and it is discussed in the following sections:

#### *Android and UWP*

Android launches the tab view without any initialization, and it is enough to only initialize the Xamarin.Forms Framework to launch the application.

---

**Note:** If you are adding the references from toolbox, this step is not needed.

---

#### *iOS*

To launch the tab view in iOS, call the `SfTabViewRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework has been initialized and before the `LoadApplication` is called, as demonstrated in the following code example.

#### **C#**

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    Syncfusion.XForms.iOS.TabView.SfTabViewRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### *ReleaseMode issue in UWP platform*

There is a known Framework issue in UWP platform. The custom controls will not render when deployed the application in **Release Mode**.

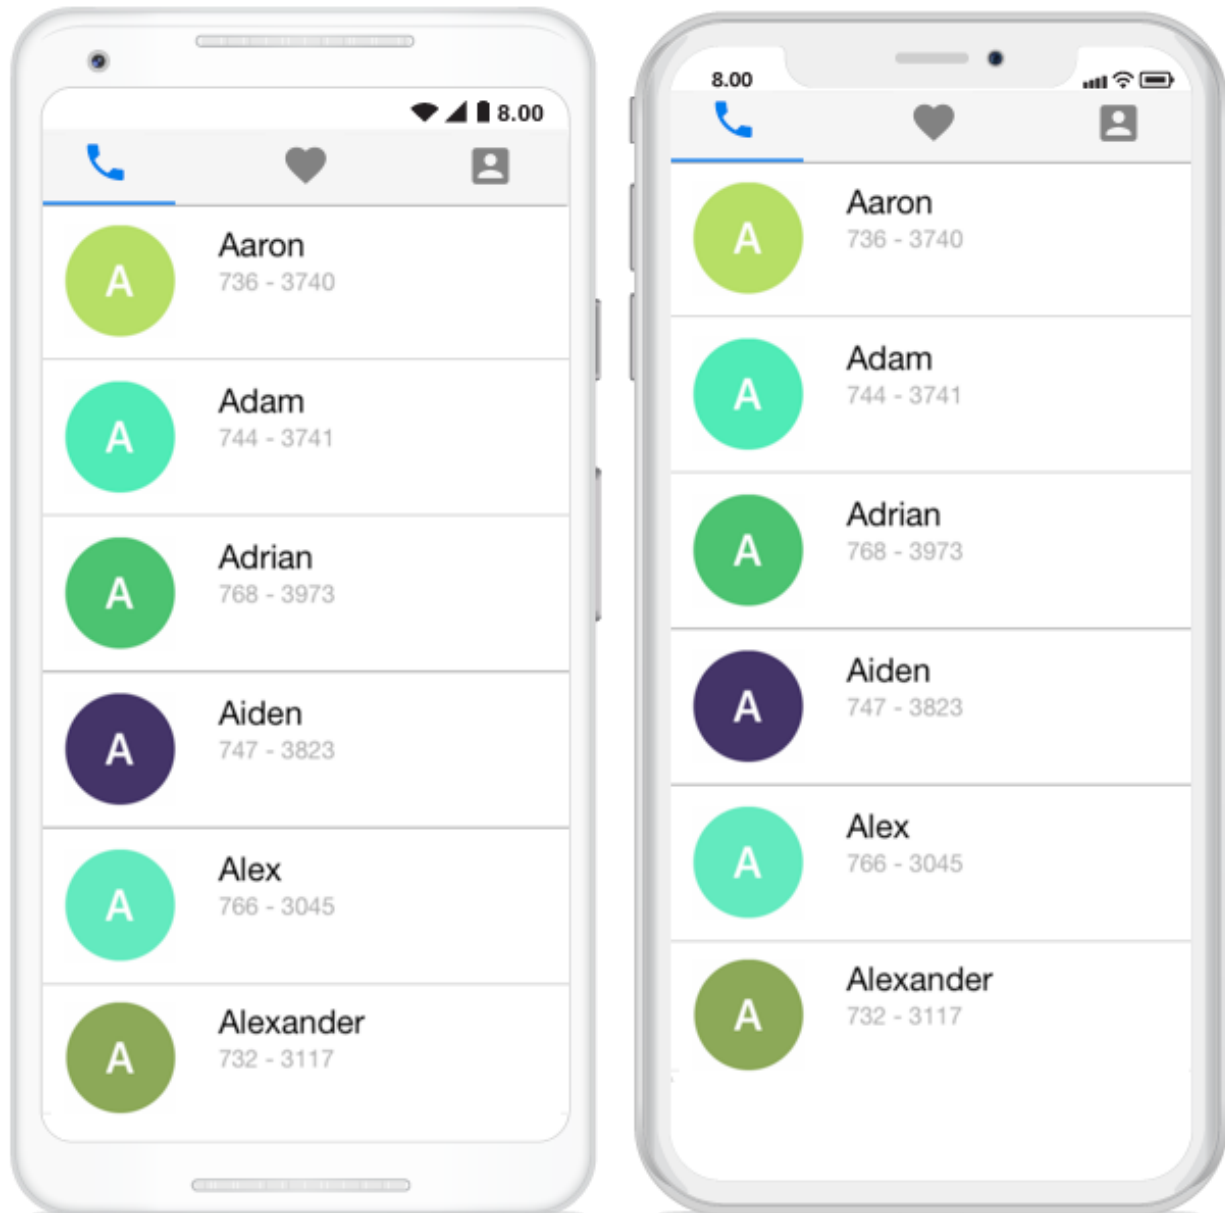

The above problem can be resolved by initializing the SfTabView assemblies in `App.xaml.cs` in UWP project as like in below code snippet.

#### **C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(Syncfusion.XForms.UWP.TabView.SfTabViewRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

### Create a simple tab view

This section explains how to create a tab view and configure it. The control can be configured entirely in C# code or by using XAML markup. The following screenshot illustrates the output of tab view on iOS, Android and UWP devices.

### Creating the project

Create a new BlankApp (Xamarin.Forms.Portable) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding SfTabView in Xamarin.Forms

Add the required assembly references to the PCL and renderer projects as discussed in the Assembly deployment section.

Import the control namespace as shown in the following code.

#### XML

```
xmlns:tabView="clr-  
namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"
```

#### C#

```
using Syncfusion.XForms.TabView;
```

Set the control to content in `ContentPage`.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:tabView="clr-  
namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"  
x:Class="TabViewAutomationSample.TabViewAutomationSample">  
<ContentPage.Content>  
<tabView:SfTabView/>  
</ContentPage.Content>  
</ContentPage>
```

#### C#

```
using Syncfusion.XForms.TabView;  
using Xamarin.Forms;  
namespace GettingStarted  
{  
    public partial class MainPage : ContentPage  
    {  
        private SfTabView tabView;  
        public MainPage()  
        {  
            InitializeComponent();  
            tabView = new SfTabView();  
            this.Content = tabView;  
        }  
    }  
}
```

### Populating tab items

Tab items can be configured in tab view through the `Items` property of `SfTabView`, which holds the collection of `SfTabItem` through `TabItemsCollection`.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:tabView="clr-  
namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"  
x:Class="TabViewAutomationSample.TabViewAutomationSample">
```

```

<ContentPage.Content>
<tabView:SfTabView BackgroundColor="Aqua">
<tabView:SfTabItem Title="Call">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Red" x:Name="AllContactsGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Favorites">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Green" x:Name="FavoritesGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Contacts">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Blue" x:Name="ContactsGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.XForms.TabView;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace TabViewAutomationSample
{
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class TabView : ContentPage
{
SfTabView tabView;
public TabView ()
{
InitializeComponent ();
var tabView = new SfTabView();
Grid allContactsGrid = new Grid {BackgroundColor = Color.Red};
Grid favoritesGrid = new Grid {BackgroundColor = Color.Green};
Grid contactsGrid = new Grid {BackgroundColor = Color.Blue};
var tabItems = new TabItemCollection
{
new SfTabItem()
{
Title = "Calls",
Content = allContactsGrid
},
new SfTabItem()
{
Title = "Favorites",
Content = favoritesGrid
},
new SfTabItem()
{
Title = "Contacts",
Content = contactsGrid
}
}
}
}

```

```
};
tabView.Items = tabItems;
this.Content = tabView;
}
}
}
```

### Adding ListView in tab view

UseCase Sample with Contacts Information stored as a ListView in TabView Control

Create a view model class with the **ContactsInfo** collection property, which is initialized with required number of data objects.

### C#

```
public class ContactInfo
{
    public string Name { get; set; }
    public long Number { get; set; }
}

public class ContactsViewModel : INotifyPropertyChanged
{
    private ObservableCollection<ContactInfo> contactList;
    public event PropertyChangedEventHandler PropertyChanged;
    public ObservableCollection<ContactInfo> ContactList
    {
        get { return contactList; }
        set { contactList = value; }
    }
    public ContactsViewModel()
    {
        ContactList = new ObservableCollection<ContactInfo>();
        ContactList.Add(new ContactInfo { Name = "Aaron", Number = 7363750 });
        ContactList.Add(new ContactInfo { Name = "Adam", Number = 723250 });
        ContactList.Add(new ContactInfo { Name = "Adrian", Number = 7239121 });
        ContactList.Add(new ContactInfo { Name = "Alwin", Number = 2329823 });
        ContactList.Add(new ContactInfo { Name = "Alex", Number = 8013481 });
        ContactList.Add(new ContactInfo { Name = "Alexander", Number = 7872329 });
        ContactList.Add(new ContactInfo { Name = "Barry", Number = 7317750 });
    }
}
```

### Binding data to list view

Bind the items source of the **ListView**, and set the required appearance in its **ItemTemplate** property in which the list view can be hosted within the content region of tab item.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:TabViewAutomationSample"
xmlns:tabView="clr-namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"
x:Class="TabViewAutomationSample.XAMARIN_22272">
<ContentPage.Content>
<tabView:SfTabView BackgroundColor="#f6f6f6" x:Name="tabView">
```

```
<tabView:SfTabItem Title="{Binding Title1}">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="White" x:Name="AllContactsGrid" >
<ListView x:Name="ContactListView"
ItemsSource="{Binding ContactList}"
RowHeight="75">
<ListView.BindingContext>
<local:ContactsViewModel />
</ListView.BindingContext>
<ListView.ItemTemplate>
<DataTemplate>
<ViewCell>
<StackLayout Orientation="Vertical" Margin="30,0,0,0">
<Label
Text="{Binding Name}"
FontSize="24" />
<Label
Text="{Binding Number}"
FontSize="20"
TextColor="LightSlateGray" />
</StackLayout>
</ViewCell>
</DataTemplate>
</ListView.ItemTemplate>
</ListView>
</Grid>
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Favorites">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Green" x:Name="FavouritesGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Contacts">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Blue" x:Name="ContactsGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>
```

Similarly, content region for other tabs also can be configured.

### Swiping

By default, both the vertical swiping for list view and horizontal swiping for tab view will work. If it is not required, it can be customized by using the `EnableSwiping` property of `SfTabView`.

Note: Getting started sample can be downloaded from [this link](#).

### Tab Items

Tab items can be configured in tab view through the `Items` property of `SfTabView`, which holds the collection of `SfTabItem` through `TabItemsCollection`.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:tabView="clr-
namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"
x:Class="TabViewAutomationSample.TabViewAutomationSample">
  <ContentPage.Content>
    <tabView:SfTabView BackgroundColor="White">
      <tabView:SfTabItem Title="Call">
        <tabView:SfTabItem.Content>
          <Grid BackgroundColor="Gray" x:Name="AllContactsGrid" />
        </tabView:SfTabItem.Content>
      </tabView:SfTabItem>
      <tabView:SfTabItem Title="Favorites">
        <tabView:SfTabItem.Content>
          <Grid BackgroundColor="Green" x:Name="FavoritesGrid" />
        </tabView:SfTabItem.Content>
      </tabView:SfTabItem>
      <tabView:SfTabItem Title="Contacts">
```

```
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Blue" x:Name="ContactsGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.TabView;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace TabViewAutomationSample
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class TabView : ContentPage
    {
        SfTabView tabView;
        public TabView ()
        {
            InitializeComponent ();
            var tabView = new SfTabView();
            var allContactsGrid = new Grid {BackgroundColor = Color.Gray};
            var favoritesGrid = new Grid {BackgroundColor = Color.Green};
            var contactsGrid = new Grid {BackgroundColor = Color.Blue};
            var tabItems = new TabItemCollection
            {
                new SfTabItem()
                {
                    Title = "Calls",
                    Content = allContactsGrid
                },
                new SfTabItem()
                {
                    Title = "Favorites",
                    Content = favoritesGrid
                },
                new SfTabItem()
                {
                    Title = "Contacts",
                    Content = contactsGrid
                }
            };
            tabView.Items = tabItems;
            this.Content = tabView;
        }
    }
}
```

### Share the header space equally

To share the header space to the tabs equally, set the number of tabs that can be distributed in the available space though the `VisibleHeaderCount` of `SfTabView`.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:tabView="clr-
namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"
x:Class="TabViewAutomationSample.TabViewAutomationSample">
  <ContentPage.Content>
    <tabView:SfTabView BackgroundColor="White" VisibleHeaderCount="3">
      <tabView:SfTabItem Title="Call">
        <tabView:SfTabItem.Content>
          <Grid BackgroundColor="Gray" x:Name="AllContactsGrid" />
        </tabView:SfTabItem.Content>
      </tabView:SfTabItem>
      <tabView:SfTabItem Title="Favorites">
        <tabView:SfTabItem.Content>
          <Grid BackgroundColor="Green" x:Name="FavoritesGrid" />
        </tabView:SfTabItem.Content>
      </tabView:SfTabItem>
      <tabView:SfTabItem Title="Contacts">
        <tabView:SfTabItem.Content>
          <Grid BackgroundColor="Blue" x:Name="ContactsGrid" />
        </tabView:SfTabItem.Content>
      </tabView:SfTabItem>
      <tabView:SfTabItem Title="Email">
        <tabView:SfTabItem.Content>
          <Grid BackgroundColor="Olive" x:Name="EmailGrid" />
        </tabView:SfTabItem.Content>
      </tabView:SfTabItem>
    </tabView:SfTabView>
  </ContentPage.Content>
</ContentPage>
```

```
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>
```

## C#

```
using Syncfusion.XForms.TabView;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace TabViewAutomationSample
{
    [XamlCompilation(XamlCompilationOptions.Compile)]

this.Content = tabView;
tabView.BackgroundColor = Color.Aqua;
tabView.OverflowMode = OverflowMode.DropDown;
this.Content = tabView;
}
}
```

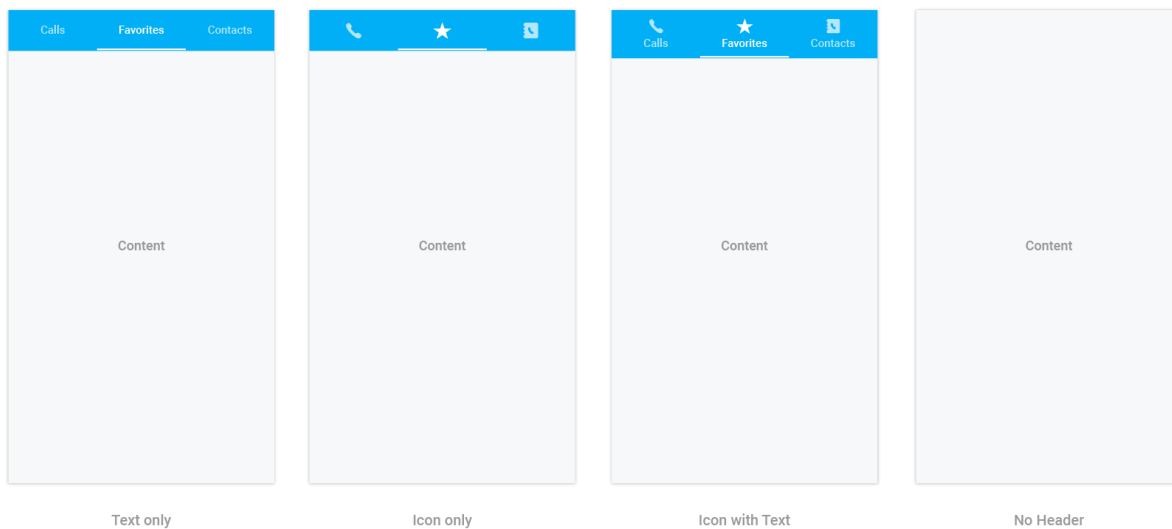

```
}
```

## Display Type

By default, the tab view control displays the title of each tab item. It can be changed to any of the following types:

- Text only
- Image only
- Image with text
- No header

The tab view can be changed by setting the `DisplayMode` property of `SfTabView`.

## XML

<tabView:SfTabItem.Content>
<Grid BackgroundColor="Navy" x:Name="EmailGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Alternative">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Blue" x:Name="AlternativeGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>

```

## C#

```

using Syncfusion.XForms.TabView;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace TabView
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class TabView : ContentPage
    {
        SfTabView tabView;
        public TabView ()
        {
            InitializeComponent ();
            tabView = new SfTabView();
            var allContactsGrid = new Grid { BackgroundColor = Color.Red };
            var favoritesGrid = new Grid { BackgroundColor = Color.Green };
            var contactsGrid = new Grid { BackgroundColor = Color.Blue };
            var overflowButtonSettings = new OverflowButtonSettings();
            overflowButtonSettings.BackgroundColor = Color.Yellow;
            overflowButtonSettings.DisplayMode = OverflowButtonDisplayMode.Text;
            overflowButtonSettings.Title = "OverFlow";
            overflowButtonSettings.TitleFontSize = 10;
            overflowButtonSettings.TitleFontColor = Color.Blue;
            tabView.OverflowButtonSettings = overflowButtonSettings;
        }
    }
}

```

```
tabView.EnableSwiping = false;
tabView.DisplayMode = TabDisplayMode.ImageWithText;
var tabItems = new TabItemCollection
{
    new SfTabItem()
    {
        Title = "Calls",
        Content = allContactsGrid,
        SelectionColor = Color.Aqua
    },
    new SfTabItem()
    {
        Title = "Favorites",
        Content = favoritesGrid
    },
    new SfTabItem()
    {
        Title = "Contacts",
        Content = contactsGrid
    },
    new SfTabItem()
    {
        Title = "Location",
        Content = contactsGrid
    },
    new SfTabItem()
    {
        Title = "Email",
        Content = contactsGrid
    },
    new SfTabItem()
    {
        Title = "Alternative",
        Content = contactsGrid
    }
};
tabView.Items = tabItems;
tabView.BackgroundColor = Color.Aqua;
tabView.OverflowMode = OverflowMode.DropDown;
this.Content = tabView;
}
```

The "no header" type can be used when the header is not needed for the tab view control. So, the content space will be occupied to the entire available height.

---

**Note:** Image appearance in the header can be achieved through font icons.

---

How to change the selection color for text and font icons?

The selected index can be differentiated by setting the `SelectionColor` property of `SfTabItem`.

}
}
}
```

How to set and customize the font icons' appearance in the header?

You can refer this [link](#) for getting the font icons. Add the font file to your application by using the following steps for each platform:

#### Adding font file for iOS

1. Add the font family inside **Resource** folder iOS project.
2. Add the font file with the following build action: **BundleResource**.
3. Update the **Info.plist** file (fonts that are provided by application, UIAppFonts, or key).

#### Adding font file for Android

Add the font file to the **Assets** folder in the application project, and set the following build action: **AndroidAsset**.

#### Adding font file for UWP

Add the font family inside the application project of UWP.

**Note:** For iOS alone, FontFamily property is declared without succeeding with .ttf and for android and UWP platform font family name is defined followed by .ttf.

#### Setting font file for font icons

tabView.BackgroundColor = Color.Aqua;
tabView.OverflowMode = OverflowMode.DropDown;
this.Content = tabView;
}
}
```

You can refer this [link](#) for the simple sample defining the tab view items with font icons.

### Selection Indicator Strip

The selection indicator strip can be used to indicate the selected index of the tab view control. It can be customized with the built-in APIs that are available in the `SelectionIndicatorSettings` property of `SfTabView`.

The selection indicator can be positioned below the title or above the title, or else it can be filled in the entire selected header space.

</ContentPage>

```

## C#

```

using Syncfusion.XForms.TabView;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace TabView
{
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class TabView : ContentPage
{
SfTabView tabView;
public TabView ()
{
InitializeComponent ();
tabView = new SfTabView();
var allContactsGrid = new Grid { BackgroundColor = Color.Red };
var favoritesGrid = new Grid { BackgroundColor = Color.Blue };
var contactsGrid = new Grid { BackgroundColor = Color.Green };
var alternativeGrid = new Grid { BackgroundColor = Color.Olive };
var selectionIndicatorSettings = new SelectionIndicatorSettings();
selectionIndicatorSettings.Color = Color.Red;
selectionIndicatorSettings.Position = SelectionIndicatorPosition.Top;
selectionIndicatorSettings.StrokeThickness = 10;
tabView.SelectionIndicatorSettings = selectionIndicatorSettings;
tabView.TabHeaderPosition = TabHeaderPosition.Bottom;
tabView.OverflowMode = OverflowMode.DropDown;
var tabItems = new TabItemCollection
{
new SfTabItem()
{
Title = "CEO",
Content = allContactsGrid
},
new SfTabItem()
{
Title = "Patients",
Content = favoritesGrid
},
new SfTabItem()
{
Title = "Staff",
Content = contactsGrid
}
}
}
}

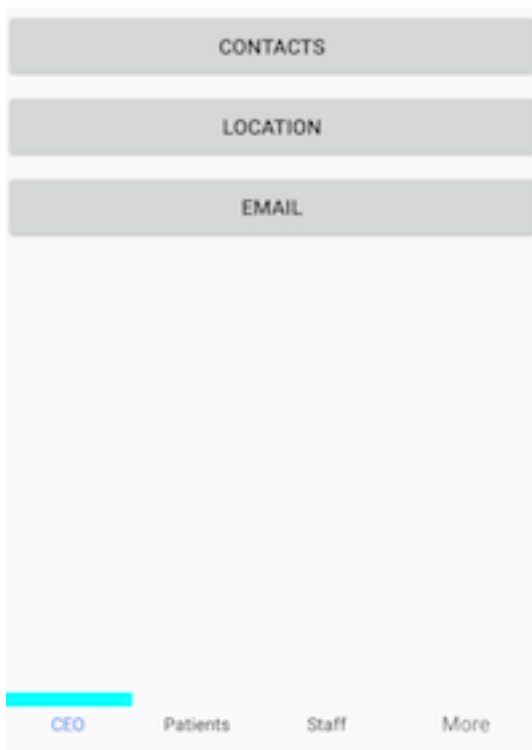

```

```

    }
    new SfTabItem()
    {
        Title = "Alternative",
        Content = alternativeGrid
    }
    };
    tabView.Items = tabItems;
    this.Content = tabView;
    }
    }
    }

```

**Note:** Stroke thickness will not be applicable when the selection indicator's position is set to "Fill".

### Positioning of header

Tab headers can be positioned either above the content or below the content. This can be done by setting the `TabHeaderPosition` property of `SfTabView`.

### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:tabView="clr-
namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"
x:Class="TabView.TabView">
<ContentPage.Content>
<tabView:SfTabView VisibleHeaderCount="3"
TabHeaderPosition="Bottom"
OverflowMode="DropDown">
<tabView:SfTabItem Title="CEO">

```

```

<tabView:SfTabItem.Content>
<StackLayout>
<Grid BackgroundColor="Green"/>
<Button Text="Contacts" WidthRequest="300" />
<Button Text="Location" WidthRequest="300" />
<Button Text="Email" WidthRequest="300" />
</StackLayout>
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Patients">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Blue" x:Name="FavoritesGrid"/>
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Staff">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Green" x:Name="ContactsGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Alternative">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Olive" x:Name="AlternativeGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>

```

## C#

```

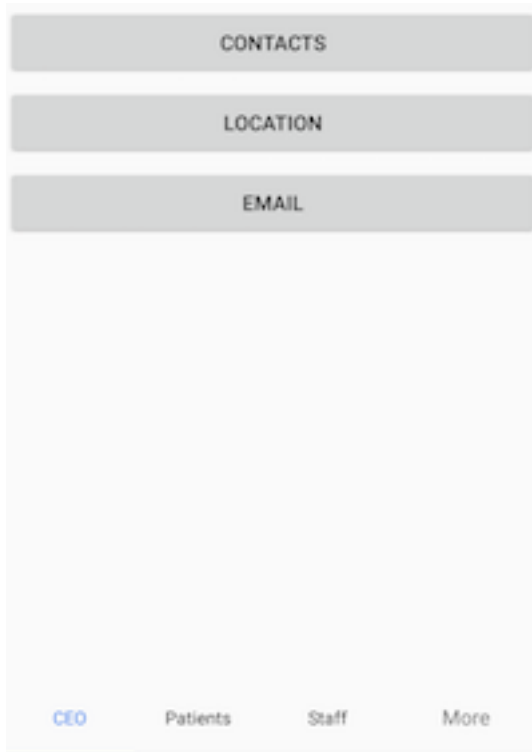

using Syncfusion.XForms.TabView;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace TabView
{
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class TabView : ContentPage
{
SfTabView tabView;
public TabView ()
{
InitializeComponent ();
tabView = new SfTabView();
var allContactsGrid = new Grid { BackgroundColor = Color.Red };
var favoritesGrid = new Grid { BackgroundColor = Color.Blue };
var contactsGrid = new Grid { BackgroundColor = Color.Green };
var alternativeGrid = new Grid { BackgroundColor = Color.Olive };
tabView.TabHeaderPosition = TabHeaderPosition.Bottom;
tabView.OverflowMode = OverflowMode.DropDown;
var tabItems = new TabItemCollection
{
new SfTabItem()
{
Title = "CEO",
Content = allContactsGrid
},

```

```
new SfTabItem()
{
    Title = "Patients",
    Content = favoritesGrid
},
new SfTabItem()
{
    Title = "Staff",
    Content = contactsGrid
}
new SfTabItem()
{
    Title = "Alternative",
    Content = alternativeGrid
}
};
tabView.Items = tabItems;
this.Content = tabView;
}
}
```

When the header is not needed, set the `DisplayMode` property of `SfTabView` to `NoHeader`.

### Handling overflow tabs

When you have large number of tabs, by default, the scroller will be enabled to view the overflow of headers, if needed. It can be selected from the pop-up by setting the `OverflowMode` property of `SfTabView` to `DropDown`.

### XML

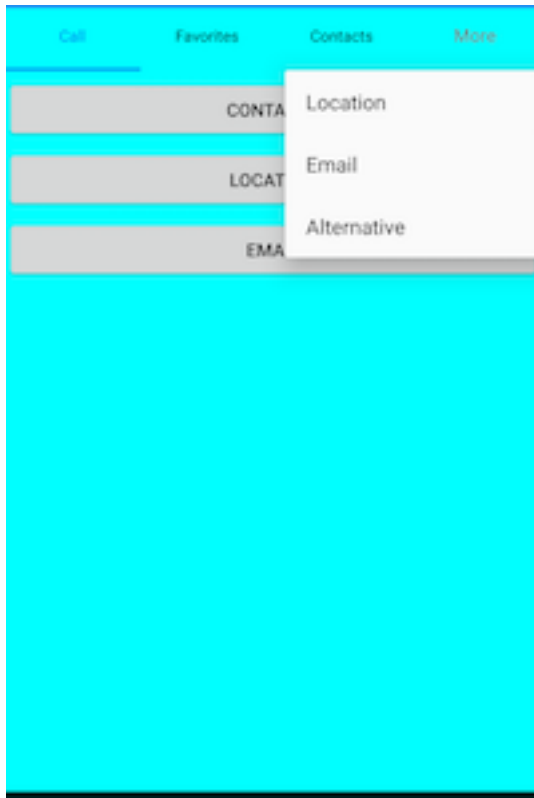

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"

</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>
```

## C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using Syncfusion.XForms.TabView;
using Xamarin.Forms;
```

```
using Xamarin.Forms.Xaml;
namespace TabView
{
    [XamlCompilation(XamlCompilationOptions.Compile)]
    public partial class TabView : ContentPage
    {
        SfTabView tabView;
        public TabView ()
        {
            InitializeComponent ();
            tabView = new SfTabView();
            var allContactsGrid = new Grid { BackgroundColor = Color.Red };
            var favoritesGrid = new Grid { BackgroundColor = Color.Green };
            var contactsGrid = new Grid { BackgroundColor = Color.Blue };
            var tabItems = new TabItemCollection
            {
                new SfTabItem()
                {
                    Title = "Calls",
                    Content = allContactsGrid
                },
                new SfTabItem()
                {
                    Title = "Favorites",
                    Content = favoritesGrid
                },
                new SfTabItem()
                {
                    Title = "Contacts",
                    Content = contactsGrid
                },
                new SfTabItem()
                {
                    Title = "Location",
                    Content = contactsGrid
                },
                new SfTabItem()
                {
                    Title = "Email",
                    Content = contactsGrid
                },
                new SfTabItem()
                {
                    Title = "Alternative",
                    Content = contactsGrid
                }
            };
            tabView.Items = tabItems;
            tabView.BackgroundColor = Color.Aqua;
            tabView.OverflowMode = OverflowMode.DropDown;
            this.Content = tabView;
        }
    }
}
```

By selecting the drop-down option for tab view control, The “Overflow button” (or “More button”) will be added to the header. When you click this button, a pop-up will be displayed to navigate the other indices.

**Note:** The pop-up will display the text value and title value of the respective tab item.

How to customize the more button?

Appearance of the text can be customized through the APIs that are available on the `OverflowButtonSettings` property of `SfTabView`. This property has APIs to customize the both text and font icons available in the more button.

    },
    new SfTabItem()
    {
        Title = "Alternative",
        Content = contactsGrid
    }
};
tabView.Items = tabItems;
tabView.BackgroundColor = Color.Aqua;
tabView.OverflowMode = OverflowMode.DropDown;
this.Content = tabView;
}
```

### Custom Header

When built-in view is not needed, it can be overridden by adding custom views to the header in tabs. The tab view header can be customized by adding different views such as image, button, and label inside the header content. The following code sample demonstrates how to customize the header content as needed.

**Note:** The selection indicator setting properties will not work when using custom header.

            var tabItems = new TabItemCollection
            {
                new SfTabItem()
                {
                    HeaderContent = button,

```

```

Content = allContactsGrid,
SelectionColor = Color.Red
},
new SfTabItem()
{
    Title = "Favorites",
    Content = favoritesGrid
},
new SfTabItem()
{
    Title = "Contacts",
    Content = contactsGrid
}
};
tabView.Items = tabItems;
tabView.BackgroundColor = Color.Aqua;
this.Content = tabView;
}
void Handle_Clicked(object sender, System.EventArgs e)
{
}
}
}
}

```

The following code sample demonstrates customizing the header by adding image and label as the header content of the tab view.

### XML

```

```

How to handle the events for custom view with tab view

When you use the button or similar control with the clicked event, it can be handled directly and set to the `SelectedIndex` property to navigate the clicked view.

#### C#

```
private void Button_Clicked(object sender, System.EventArgs e)
{
    tabView.SelectedIndex = 0;
}
```

**Note:** If the click event is not available, it can be achieved by setting the `TapGestureRecognizer` to the custom view.

#### Image Source

The `ImageSource` property customizes the icon image of `SfTabView` by adding a custom image.

#### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:tabView="clr-
namespace:Syncfusion.XForms.TabView;assembly=Syncfusion.SfTabView.XForms"

<Grid BackgroundColor="Blue" x:Name="ContactsGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Email" ImageSource="notifications.png">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="Olive" x:Name="EmailGrid" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</ContentPage.Content>
</ContentPage>

```

**C#**

```

using Syncfusion.XForms.TabView;
using Xamarin.Forms;
using Xamarin.Forms.Xaml;
namespace TabViewAutomationSample
{
[XamlCompilation(XamlCompilationOptions.Compile)]
public partial class TabView : ContentPage
{
SfTabView tabView;
public TabView ()
{
InitializeComponent ();
var tabView = new SfTabView();
var allContactsGrid = new Grid { BackgroundColor = Color.Red };
var favoritesGrid = new Grid { BackgroundColor = Color.Green };
var contactsGrid = new Grid { BackgroundColor = Color.Blue };
var emailGrid = new Grid { BackgroundColor = Color.Blue };
var tabItems = new TabItemCollection
{
new SfTabItem()
{
Title = "Calls",
Content = allContactsGrid,
ImageSource = "phone.png"
},
new SfTabItem()
{
Title = "Favorites",
Content = favoritesGrid,
ImageSource = "home.png"
}
}
}
}

```

```
},  
new SfTabItem()  
{  
    Title = "Contacts",  
    Content = contactsGrid,  
    ImageSource = "review.png"  
},  
new SfTabItem()  
{  
    Title = "Email",  
    Content = EmailGrid,  
    ImageSource = "notification.png"  
}  
};  
tabView.Items = tabItems;  
this.Content = tabView;  
}  
}
```

## Nested Tab Items

Nested Tab items can be configured in tab view through the `Items` property of `SfTabView`, which holds the nested collection of `SfTabItem` through `TabItemsCollection`.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
    xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

## C#

```

using System;
using System.Collections.Generic;
using System.Globalization;
using Syncfusion.XForms.TabView;
using Xamarin.Forms;
namespace TabViewAutomationSample
{
    public partial class SBNestedTab : ContentPage
    {
        public SBNestedTab()
        {
            InitializeComponent();
        }
    }
    public class CustomViewConverter : IValueConverter
    {
        public object Convert(object value, Type targetType, object parameter,
            CultureInfo culture)
        {
            if (Device.RuntimePlatform == "Android")
            {
                if (parameter != null && parameter is string)
                {
                    return "NestedTab.ttf#" + parameter.ToString();
                }
            }
        }
    }
}

```

```

else
{
    return "NestedTab.ttf";
}
}
else if (Device.RuntimePlatform == "iOS")
{
    return "NestedTab";
}
else
{
    return "/Assets/Fonts/NestedTab.ttf#NestedTab";
}
}
public object ConvertBack(object value, Type targetType, object parameter,
    CultureInfo culture)
{
    throw new NotImplementedException();
}
}
public class CustomFrame : Frame
{
}
}

```

### CenterButtonSettings

This section explains how to create and customize The Xamarin.Forms SfTabView CenterButton. To enable CenterButton, set the **OverflowMode** of Xamarin.Forms SfTabView to **CenterButton**.

### XML

```
<tabView:SfTabView OverflowMode="CenterButton"
x:Name="tabView">
</tabView:SfTabView>
```

**C#**

```
public MainPage()
{
    InitializeComponent();
    SfTabView tabView = new SfTabView();
    tabView.OverflowMode = OverflowMode.CenterButton;
    this.Content = tabView;
}
```

## Customize CenterButtonSettings

We can customize the CenterButton using the properties of CenterButtonSetting. The following properties are used to customize the view of CenterButton BackgroundColor, BorderColor, BorderThickness, Height, Title, TitleFontAttributes, TitleFontColor, TitleFontSize, Width.

**XML**

```
<tabView:SfTabView.CenterButtonSettings>
<tabView:CenterButtonSettings Height="80" Width="100"
Title="Center Button" TitleFontColor="Green"
TitleFontAttributes="Bold">
</tabView:CenterButtonSettings>
</tabView:SfTabView.CenterButtonSettings>
```

**C#**

```
public MainPage()
{
    InitializeComponent();
    var centerButton = tabView.CenterButtonSettings;
    centerButton.Height = 80;
    centerButton.Width = 100;
    centerButton.Title = "Center Button";
    centerButton.TitleFontAttributes = FontAttributes.Bold;
    centerButton.TitleFontColor = Color.Green;
}
```

## CenterButtonTapped event

When CenterButton is tapped, the CenterButtonTapped event occurs. Using this event we can set alert message.

**XML**

```
<tabView:SfTabView CenterButtonTapped="TabView_CenterButtonTapped">
</tabView:SfTabView>
```

**C#**

```
public MainPage()
```

```
{
InitializeComponent();
tabView.CenterButtonTapped += TabView_CenterButtonTapped;
}
private void TabView_CenterButtonTapped(object sender, EventArgs e)
{
DisplayAlert("Message", "CenterButton Clicked", "Ok");
}
```

### Custom CenterButton

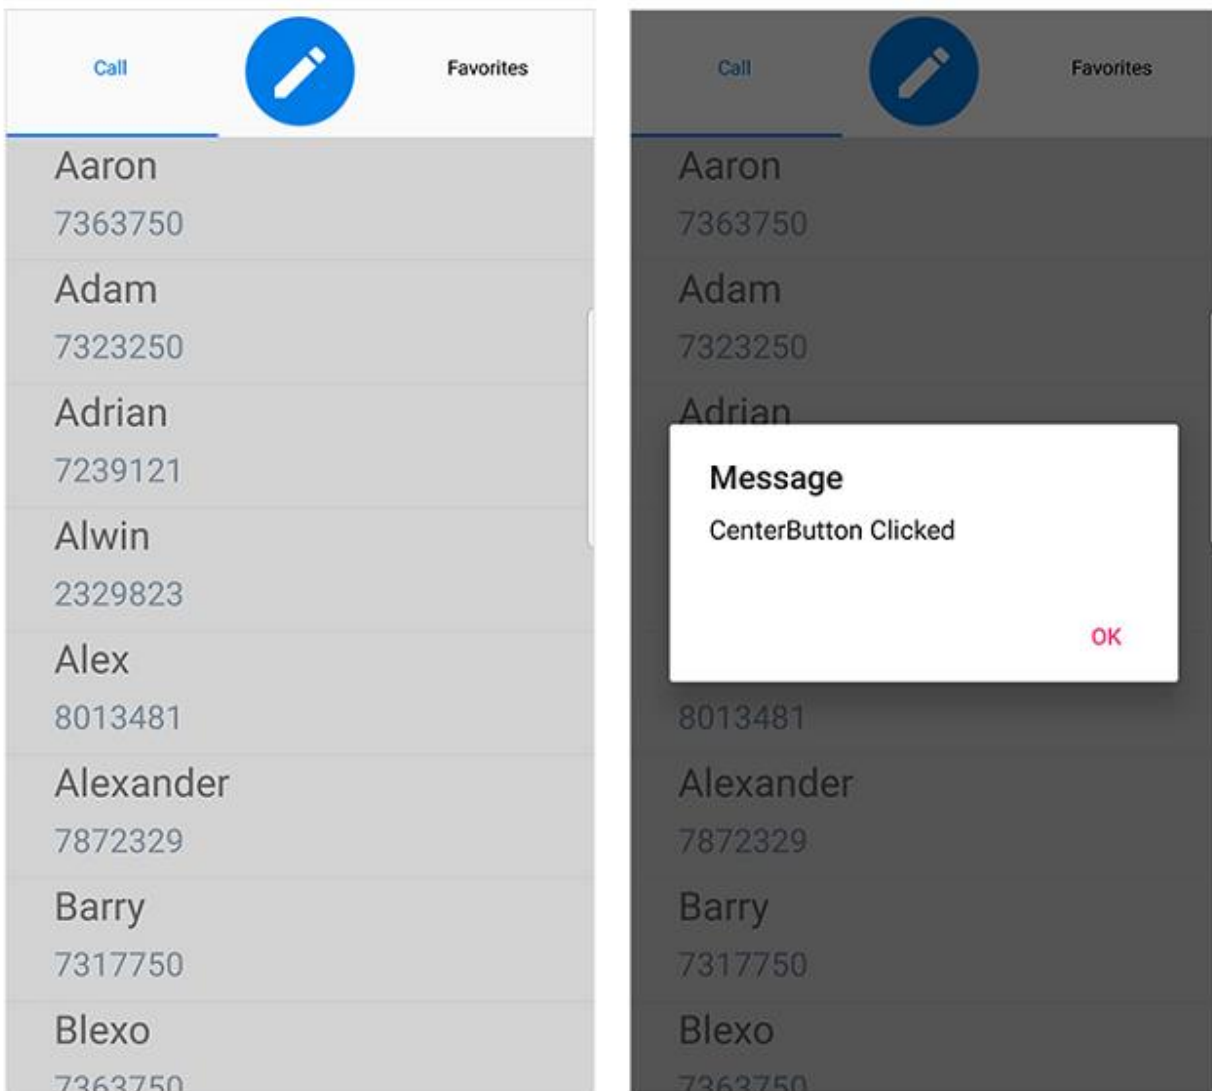

When built-in view is not needed, it can be overridden by adding custom views to the CenterButtonView. The CenterButton view can be customized by adding images, labels, buttons inside the CenterButtonView. Refer the following code sample to know about customizing the view of CenterButton.

### XML

```
<tabView:SfTabView.CenterButtonView>
<Grid>
<Image Source="Compose.png"
Aspect="AspectFill"
VerticalOptions="CenterAndExpand"
HorizontalOptions="CenterAndExpand">
<Image.GestureRecognizers>
<TapGestureRecognizer Tapped="TapGestureRecognizer_Tapped" />
</Image.GestureRecognizers>
</Image>
</Grid>
</tabView:SfTabView.CenterButtonView>
```

### C#

```
public MainPage()
{
InitializeComponent();
-----
Grid customCenterButtonGrid = new Grid();
Image image = new Image();
TapGestureRecognizer tapGestureRecognizer = new TapGestureRecognizer();
image.Source = ImageSource.FromFile("Compose.png");
image.Aspect = Aspect.AspectFill;
image.VerticalOptions = LayoutOptions.CenterAndExpand;
image.HorizontalOptions = LayoutOptions.CenterAndExpand;
tapGestureRecognizer.Tapped += TapGestureRecognizer_Tapped; ;
image.GestureRecognizers.Add(tapGestureRecognizer);
customCenterButtonGrid.Children.Add(image);
tabView.CenterButtonView = customCenterButtonGrid;
-----
}
private void TapGestureRecognizer_Tapped(object sender, EventArgs e)
{
DisplayAlert("Message", "CenterButton Clicked", "Ok");
}
```

Please find the sample from the following [Sample](#).

### TabItemTapped

Whenever the TabItem is tapped, the **TabItemTapped** event will occur. Using this event, you can Modify the selected Tab Item properties.

### XML

```
<ContentPage.Content>
  <StackLayout>
    <tabView:SfTabView x:Name="tabView" VerticalOptions="FillAndExpand"
      TabItemTapped="TabView_TabItemTapped"
      VisibleHeaderCount="3">
      <tabView:SfTabItem Title="Call">
        <tabView:SfTabItem.Content>
          <Grid BackgroundColor="LightGreen" />
        </tabView:SfTabItem.Content>
      </tabView:SfTabItem>
    </tabView:SfTabView>
  </StackLayout>
</ContentPage.Content>
```

```
<tabView:SfTabItem Title="Favorites">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="LightBlue"/>
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
<tabView:SfTabItem Title="Contacts">
<tabView:SfTabItem.Content>
<Grid BackgroundColor="LightGreen" />
</tabView:SfTabItem.Content>
</tabView:SfTabItem>
</tabView:SfTabView>
</StackLayout>
</ContentPage.Content>
```

## C#

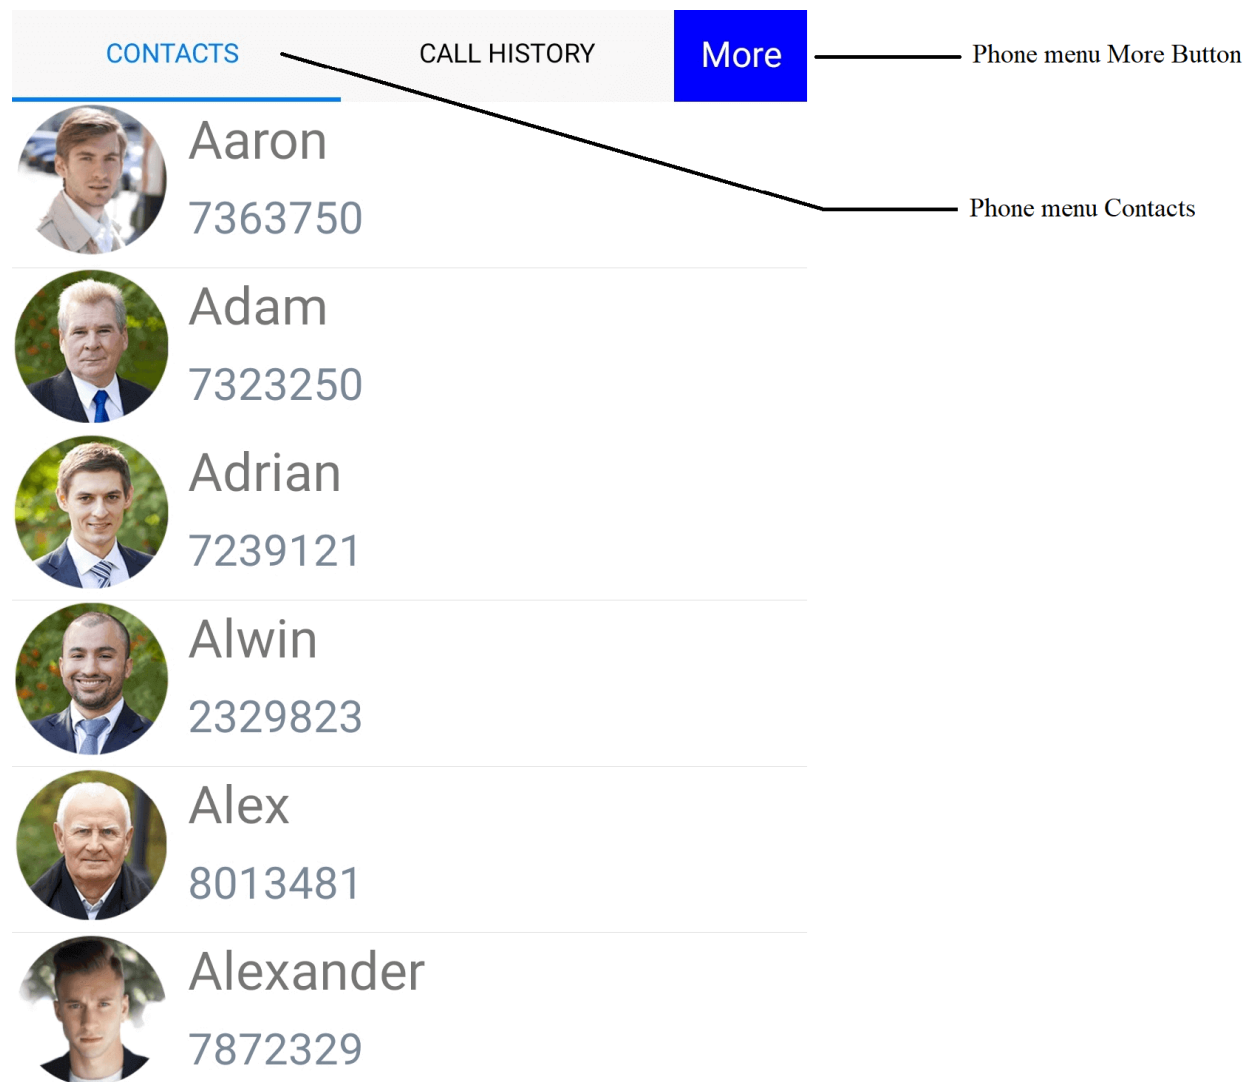

```
public MainPage ()
{
    InitializeComponent();
    tabView.TabItemTapped += TabView_TabItemTapped;
}

private void TabView_TabItemTapped(object sender,
Syncfusion.XForms.TabView.TabItemTappedEventArgs e)
{
    DisplayAlert("TabViewItemTapped", e.TabItem.Title + " Item Tapped", "Ok");
}
```

## AutomationId

The SfTabView control has built-in **AutomationId** for inner elements. The **AutomationId** API allows the automation framework to find and interact with the inner elements of the SfTabView control. To keep unique AutomationId, these inner elements' AutomationIds are updated based on the control's **AutomationId**.

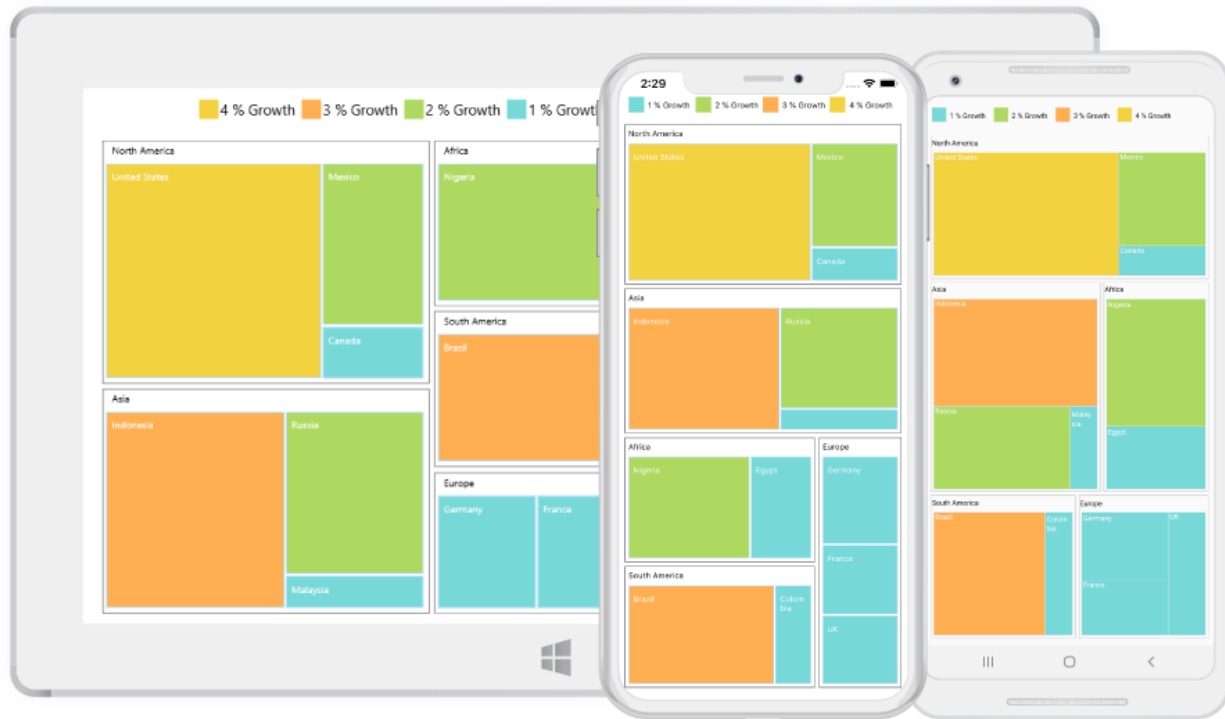

For example, if you set SfTabView's **AutomationId** as "Phone menu", then the Automation framework will interact with the More button as "Phone menu More Button". The following screenshot illustrates the AutomationIds of inner elements. The Automation framework will also interact with the Center Button and the element's inside the tab item content with the element's AutomationId.

## SfTreeMap

### Overview

The TreeMap control for Xamarin.Forms provides a simple yet effective way to visualize flat or hierarchical data as clustered rectangles with a specific weighted attribute determining the size of the rectangle.

### Key features

- **Levels** - Define the levels of various flat data and hierarchical data collections.
- **Layouts** - Determine the visual representation of nodes belonging to all the levels in TreeMap using the layouts such as Squarified, SliceAndDiceAuto, SliceAndDiceHorizontal, and SliceAndDiceVertical.
- **Visualization for colors** - Customize the colors of the leaf nodes in TreeMap.
- **Tooltip** - Provides additional information about the leaf nodes.
- **Selection** - Allows you select or highlight specific leaf nodes.
- **Legends** - Help you relate data with the leaf nodes.
- **DataLabels** - Show group path information on the leaf node with Trim, Wrap, and Hide options.

### Getting Started

This section explains the steps required to configure the TreeMap control in a real-time scenario and provides a walk-through on some of the customization features available in the TreeMap control.

#### Adding SfTreeMap reference

You can add SfTreeMap reference using one of the following methods:

##### Method 1: Adding SfTreeMap reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfTreeMap). To add SfTreeMap to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfTreeMap](https://www.nuget.org/packages/Syncfusion.Xamarin.SfTreeMap), and then install it.

![Adding SfTreeMap reference from NuGet](Getting-Started\_images/Adding SfTreeMap reference.png)

**Note:** Install the same version of SfTreeMap NuGet in all the projects.

##### Method 2: Adding SfTreeMap reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfTreeMap control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

### Method 3: Adding SfTreeMap assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfTreeMap.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.SfTreeMap.Android.dll Syncfusion.SfTreeMap.XForms.Android.dll Syncfusion.SfTreeMap.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.SfTreeMap.iOS.dll Syncfusion.SfTreeMap.XForms.iOS.dll Syncfusion.SfTreeMap.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.SfTreeMap.UWP.dll Syncfusion.SfTreeMap.XForms.UWP.dll Syncfusion.SfTreeMap.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

**Note:** Currently an additional step is required for UWP project. You need to create an instance of the TreeMap custom renderer. If you are adding the references from toolbox, this step is not needed.

Create an instance of SfTreeMapRenderer in the MainPage constructor of the UWP project as demonstrated in the following code sample.

### C#

```
public MainPage ()
{
```

```
new SfTreeMapRenderer ();  
...  
}
```

Create an instance of `SfTreeMapRenderer` in the `FinishedLaunching` overridden method of `AppDelegate` class in the iOS Project as demonstrated in the following code sample.

### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary  
options)  
{  
...  
new SfTreeMapRenderer ();  
...  
}
```

### Initializing TreeMap

The Treemap control can be configured entirely in C# or using XAML markup.

The first step is to create a `TreeMap` object.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>  
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"  
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"  
xmlns:treemap="clr-  
namespace:Syncfusion.SfTreeMap.XForms;assembly=Syncfusion.SfTreeMap.XForms"  
x:Class="TreeMap.Page3">  
  <ContentPage.Content>  
    <treemap:SfTreeMap></treemap:SfTreeMap>  
  </ContentPage.Content>  
</ContentPage>
```

### C#

```
public Page3 ()  
{  
  InitializeComponent ();  
  SfTreeMap treeMap = new SfTreeMap();  
  this.Content = treeMap;  
}
```

### Populating TreeMap items

The Treemap items can be populated in two ways using the following properties:

- `DataSource`
- `Items`

Using the `DataSource` property, you can bind the tree map data collection to it. To render leaf nodes for underlying data, levels and leaf item settings have to be specified; it is explained in detail in the [Levels](#)

section.

### XML

```
<ContentPage.BindingContext>
<local:PopulationViewModel></local:PopulationViewModel>
</ContentPage.BindingContext>
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}" WeightValuePath="Population">
<treemap:SfTreeMap.LeafItemSettings>
<treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
>
</treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
<treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
GroupGap =" 5" ShowHeader = "true">
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
</treemap:SfTreeMap>
```

### C#

```
public class PopulationViewModel
{
    public PopulationViewModel()
    {
        this.PopulationDetails = new ObservableCollection<PopulationDetail>();
        PopulationDetails.Add(new PopulationDetail() { Continent = "Asia", Country =
"Indonesia", Growth = 3, Population = 237641326 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "Asia", Country =
"Russia", Growth = 2, Population = 152518015 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "Asia", Country =
"Malaysia", Growth = 1, Population = 29672000 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "North America",
Country = "United States", Growth = 4, Population = 315645000 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "North America",
Country = "Mexico", Growth = 2, Population = 112336538 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "North America",
Country = "Canada", Growth = 1, Population = 35056064 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "South America",
Country = "Colombia", Growth = 1, Population = 47000000 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "South America",
Country = "Brazil", Growth = 3, Population = 193946886 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "Africa", Country
= "Nigeria", Growth = 2, Population = 170901000 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "Africa", Country
= "Egypt", Growth = 1, Population = 83661000 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "Europe", Country
= "Germany", Growth = 1, Population = 81993000 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "Europe", Country
= "France", Growth = 1, Population = 65605000 });
        PopulationDetails.Add(new PopulationDetail() { Continent = "Europe", Country
= "UK", Growth = 1, Population = 63181775 });
    }
    public ObservableCollection<PopulationDetail> PopulationDetails
{
}
```

```

get;
set;
}
}
public class PopulationDetail
{
    public string Continent { get; set; }
    public string Country { get; set; }
    public double Growth { get; set; }
    public double Population { get; set; }
}

```

The [Items](#) property accepts a collection of TreeMapItems as input. You can bind tree map items to the Items collection as demonstrated in the following code sample.

### XML

```

<ContentPage.BindingContext>
<local:DataModel></local:DataModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<treemap:SfTreeMap x:Name="treeMap" Items="{Binding
TreeMapItems}"></treemap:SfTreeMap>
</ContentPage.Content>

```

### C#

```

SfTreeMap treeMap = new SfTreeMap();
DataModel model = new DataModel();
treeMap.Items = model.TreeMapItems;
public class DataModel : BindableObject
{
    public static readonly BindableProperty TreeMapItemsProperty =
        BindableProperty.Create<DataModel, ObservableCollection<TreeMapItem>>(p =>
            p.TreeMapItems, null, BindingMode.TwoWay, null, null, null, null);
    public ObservableCollection<TreeMapItem> TreeMapItems
    {
        get { return
            (ObservableCollection<TreeMapItem>)GetValue(TreeMapItemsProperty); }
        set { SetValue(TreeMapItemsProperty, value); }
    }
    public DataModel()
    {
        this.TreeMapItems = new ObservableCollection<TreeMapItem>();
        TreeMapItems.Add(new TreeMapItem() { Label = "Indonesia", ColorWeight = 3,
            Weight = 237641326 });
        TreeMapItems.Add(new TreeMapItem() { Label = "Russia", ColorWeight = 2,
            Weight = 152518015 });
        TreeMapItems.Add(new TreeMapItem() { Label = "United States", ColorWeight =
            4, Weight = 315645000 });
        TreeMapItems.Add(new TreeMapItem() { Label = "Mexico", ColorWeight = 2,
            Weight = 112336538 });
        TreeMapItems.Add(new TreeMapItem() { Label = "Nigeria", ColorWeight = 2,
            Weight = 170901000 });
        TreeMapItems.Add(new TreeMapItem() { Label = "Egypt", ColorWeight = 1,
            Weight = 83661000 });
    }
}

```

```

TreeMapItems.Add(new TreeMapItem() { Label = "Germany", ColorWeight = 1,
Weight = 81993000 });
TreeMapItems.Add(new TreeMapItem() { Label = "France", ColorWeight = 1,
Weight = 65605000 });
TreeMapItems.Add(new TreeMapItem() { Label = "UK", ColorWeight = 1, Weight =
63181775 });
}
}

```

### Grouping TreeMap items using levels

You can group TreeMapItems using the following two types of levels:

- TreeMap Flat Level
- TreeMap Hierarchical Level

The [Levels](#) are explained in detail in the [TreeMapLevels](#) section.

### Customizing the appearance of TreeMap by range

You can differentiate the nodes based on their values and colors using [RangeColorMapping](#). You can define the color value range using the [From](#) and [To](#) properties in [Range](#). The values of [From](#) and [To](#) properties depend on underlying data bound to the [ColorValuePath](#) property.

#### XML

```

<treemap:SfTreeMap.LeafItemColorMapping>
<treemap:RangeColorMapping>
<treemap:RangeColorMapping.Ranges>
<treemap:Range LegendLabel = "1 % Growth" From = "0" To = "1" Color =
"#77D8D8" />
<treemap:Range LegendLabel = "2 % Growth" From = "0" To = "2" Color =
"#AED960" />
<treemap:Range LegendLabel = "3 % Growth" From = "0" To = "3" Color =
"#FFAF51" />
<treemap:Range LegendLabel = "4 % Growth" From = "0" To = "4" Color =
"#F3D240" />
</treemap:RangeColorMapping.Ranges>
</treemap:RangeColorMapping>
</treemap:SfTreeMap.LeafItemColorMapping>

```

#### C#

```

...
ObservableCollection<Range> ranges = new ObservableCollection<Range>();
ranges.Add(new Range() { LegendLabel="1 % Growth", From = 0, To = 1, Color =
Color.FromHex("#77D8D8") });
ranges.Add(new Range() { LegendLabel = "2 % Growth", From = 0, To = 2, Color
= Color.FromHex("#AED960") });
ranges.Add(new Range() { LegendLabel = "3 % Growth", From = 0, To = 3, Color
= Color.FromHex("#FFAF51") });
ranges.Add(new Range() { LegendLabel = "4 % Growth", From = 0, To = 4, Color
= Color.FromHex("#F3D240") });
treeMap.LeafItemColorMapping = new RangeColorMapping () { Ranges = ranges };

```

### LeafItemSetting

You can customize the tree map leaf nodes using [LeafItemSettings](#).

#### XML

```
<treemap:SfTreeMap.LeafItemSettings>
<treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
>
</treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
```

#### C#

```
...
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
```

### Enabling legends

The color value of leaf nodes can be tracked using tree map legend. The legend support is applicable only for the TreeMap whose leaf nodes are colored using RangeColorMapping. Set the value of [ShowLegend](#) property to "True" to make legends visible.

### Labels for legends

You can customize the labels of legend items using the [LegendLabel](#) property in RangeColorMapping.

#### XML

```
<treemap:SfTreeMap.LegendSettings>
<treemap:LegendSettings ShowLegend="True" Size="700,45">
</treemap:LegendSettings>
</treemap:SfTreeMap.LegendSettings>
```

#### C#

```
...
LegendSettings legendSettings = new LegendSettings();
legendSettings.ShowLegend = true;
legendSettings.Size = new Size(700, 45);
treeMap.LegendSettings = legendSettings;
```

The following code sample helps you reproduce the output.

#### XML

```
<ContentPage.BindingContext>
<local:PopulationViewModel></local:PopulationViewModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth" LayoutType="Squarified"
ShowTooltip="True">
```

```

<treemap:SfTreeMap.LeafItemSettings>
<treemap:LeafItemSettings OverflowMode="Wrap" Gap="2" BorderColor="#A9D9F7"
LabelPath="Country" >
</treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
<treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
GroupGap = " 5" ShowHeader = "true">
<treemap:TreeMapFlatLevel.HeaderStyle>
<treemap:Style Color= "Black"/>
</treemap:TreeMapFlatLevel.HeaderStyle>
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
<treemap:SfTreeMap.LegendSettings>
<treemap:LegendSettings ShowLegend="True" Size="700,45">
<treemap:LegendSettings.LabelStyle>
<treemap:Style Color="Black"></treemap:Style>
</treemap:LegendSettings.LabelStyle>
</treemap:LegendSettings>
</treemap:SfTreeMap.LegendSettings>
<treemap:SfTreeMap.LeafItemColorMapping>
<treemap:RangeColorMapping>
<treemap:RangeColorMapping.Ranges>
<treemap:Range LegendLabel = "1 % Growth" From = "0" To = "1" Color =
"#77D8D8" />
<treemap:Range LegendLabel = "2 % Growth" From = "0" To = "2" Color =
"#AED960" />
<treemap:Range LegendLabel = "3 % Growth" From = "0" To = "3" Color =
"#FFAF51" />
<treemap:Range LegendLabel = "4 % Growth" From = "0" To = "4" Color =
"#F3D240" />
</treemap:RangeColorMapping.Ranges>
</treemap:RangeColorMapping>
</treemap:SfTreeMap.LeafItemColorMapping>
</treemap:SfTreeMap>
</ContentPage.Content>

```

## C#

```

PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
treeMap.LayoutType = LayoutTypes.Squarified;
treeMap.ShowTooltip = true;
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.OverflowMode = LabelOverflowMode.Wrap;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;

```

```
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
LegendSettings legendSettings = new LegendSettings();
legendSettings.ShowLegend = true;
legendSettings.Size = new Size(700, 45);
legendSettings.LabelStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color
= Color.Black };
treeMap.LegendSettings = legendSettings;
RangeColorMapping rangeColorMapping = new RangeColorMapping();
Range range1 = new Range();
range1.From = 0;
range1.To = 1;
range1.Color = Color.FromHex("#77D8D8");
range1.LegendLabel = "1 % Growth";
Range range2 = new Range();
range2.From = 0;
range2.To = 2;
range2.Color = Color.FromHex("#AED960");
range2.LegendLabel = "2 % Growth";
Range range3 = new Range();
range3.From = 0;
range3.To = 3;
range3.Color = Color.FromHex("#FFAF51");
range3.LegendLabel = "3 % Growth";
Range range4 = new Range();
range4.From = 0;
range4.To = 4;
range4.Color = Color.FromHex("#F3D240");
range4.LegendLabel = "4 % Growth";
rangeColorMapping.Ranges.Add(range1);
rangeColorMapping.Ranges.Add(range2);
rangeColorMapping.Ranges.Add(range3);
rangeColorMapping.Ranges.Add(range4);
treeMap.LeafItemColorMapping = rangeColorMapping;
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;
```

You can find the complete getting-started sample in the following link: [Getting-started sample](#).

The following screenshot illustrates the output of SfTreeMap.

## DataBinding

The TreeMap control supports data binding, and it can be achieved using the [DataSource](#) property.

The [DataSource](#) property accepts a collection of values as input. The following code sample demonstrates how to bind a flat collection as data source to TreeMap.

### XML

```
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}" WeightValuePath="Population" ColorValuePath="Growth">
  <treemap:SfTreeMap.LeafItemSettings>
    <treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
    >
    </treemap:LeafItemSettings>
  </treemap:SfTreeMap.LeafItemSettings>
  <treemap:SfTreeMap.Levels>
    <treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
    GroupGap =" 5" ShowHeader = "true">
    </treemap:TreeMapFlatLevel>
  </treemap:SfTreeMap.Levels>
</treemap:SfTreeMap>
```

### C#

```
public class PopulationViewModel
{
    public PopulationViewModel()
    {
        this.PopulationDetails = new ObservableCollection<PopulationDetail>();
        PopulationDetails.Add(new PopulationDetail() { Continent = "Asia", Country =
        "Indonesia", Growth = 3, Population = 237641326 });
    }
}
```

```

PopulationDetails.Add(new PopulationDetail() { Continent = "Asia", Country =
"Russia", Growth = 2, Population = 152518015 });
PopulationDetails.Add(new PopulationDetail() { Continent = "Asia", Country =
"Malaysia", Growth = 1, Population = 29672000 });
PopulationDetails.Add(new PopulationDetail() { Continent = "North America",
Country = "United States", Growth = 4, Population = 315645000 });
PopulationDetails.Add(new PopulationDetail() { Continent = "North America",
Country = "Mexico", Growth = 2, Population = 112336538 });
PopulationDetails.Add(new PopulationDetail() { Continent = "North America",
Country = "Canada", Growth = 1, Population = 35056064 });
PopulationDetails.Add(new PopulationDetail() { Continent = "South America",
Country = "Colombia", Growth = 1, Population = 47000000 });
PopulationDetails.Add(new PopulationDetail() { Continent = "South America",
Country = "Brazil", Growth = 3, Population = 193946886 });
PopulationDetails.Add(new PopulationDetail() { Continent = "Africa", Country =
"Nigeria", Growth = 2, Population = 170901000 });
PopulationDetails.Add(new PopulationDetail() { Continent = "Africa", Country =
"Egypt", Growth = 1, Population = 83661000 });
PopulationDetails.Add(new PopulationDetail() { Continent = "Europe", Country =
"Germany", Growth = 1, Population = 81993000 });
PopulationDetails.Add(new PopulationDetail() { Continent = "Europe", Country =
"France", Growth = 1, Population = 65605000 });
PopulationDetails.Add(new PopulationDetail() { Continent = "Europe", Country =
"UK", Growth = 1, Population = 63181775 });
}
public ObservableCollection<PopulationDetail> PopulationDetails
{
    get;
    set;
}
public class PopulationDetail
{
    public string Continent { get; set; }
    public string Country { get; set; }
    public double Growth { get; set; }
    public double Population { get; set; }
}

```

## TreeMap Levels

The levels of tree map can be categorized into the following two types:

- Flat level
- Hierarchical level

### Flat Level

#### GroupPath

You can use the [GroupPath](#) property for every flat level in the TreeMap control. It is a path to a field on the source object that serves as “Group” for the level specified. You can group the data based on the [GroupPath](#) property. When [GroupPath](#) is not specified, the items will not be grouped, and the data will be displayed in the order specified in [DataSource](#).

### GroupGap

You can use the [GroupGap](#) property to separate items from every flat level and differentiate the levels mentioned in the TreeMap control.

### XML

```
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}" WeightValuePath="Population" ColorValuePath="Growth">
  <treemap:SfTreeMap.LeafItemSettings>
    <treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
    >
  </treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
  <treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
  GroupGap =" 5" ShowHeader = "true">
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
<treemap:SfTreeMap.LegendSettings>
  <treemap:LegendSettings ShowLegend="True" Size="700,45">
  <treemap:LegendSettings.LabelStyle>
  <treemap:Style Color="Black"></treemap:Style>
  </treemap:LegendSettings.LabelStyle>
  </treemap:LegendSettings>
</treemap:SfTreeMap.LegendSettings>
<treemap:SfTreeMap.LeafItemColorMapping>
  <treemap:RangeColorMapping>
  <treemap:RangeColorMapping.Ranges>
  <treemap:Range LegendLabel = "1 % Growth" From = "0" To = "1" Color =
  "#77D8D8" />
  <treemap:Range LegendLabel = "2 % Growth" From = "0" To = "2" Color =
  "#AED960" />
  <treemap:Range LegendLabel = "3 % Growth" From = "0" To = "3" Color =
  "#FFAF51" />
  <treemap:Range LegendLabel = "4 % Growth" From = "0" To = "4" Color =
  "#F3D240" />
  </treemap:RangeColorMapping.Ranges>
  </treemap:RangeColorMapping>
  </treemap:SfTreeMap.LeafItemColorMapping>
</treemap:SfTreeMap>
```

### C#

```
PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.DataSource = viewModel.PopulationDetails;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
```

```
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
treeMap.Levels.Add(flatLevel);
LegendSettings legendSettings = new LegendSettings();
legendSettings.ShowLegend = true;
legendSettings.Size = new Size(700, 45);
legendSettings.LabelStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color
= Color.Black };
treeMap.LegendSettings = legendSettings;
RangeColorMapping rangeColorMapping = new RangeColorMapping();
Range range1 = new Range();
range1.From = 0;
range1.To = 1;
range1.Color = Color.FromHex("#77D8D8");
range1.LegendLabel = "1 % Growth";
Range range2 = new Range();
range2.From = 0;
range2.To = 2;
range2.Color = Color.FromHex("#AED960");
range2.LegendLabel = "2 % Growth";
Range range3 = new Range();
range3.From = 0;
range3.To = 3;
range3.Color = Color.FromHex("#FFAF51");
range3.LegendLabel = "3 % Growth";
Range range4 = new Range();
range4.From = 0;
range4.To = 4;
range4.Color = Color.FromHex("#F3D240");
range4.LegendLabel = "4 % Growth";
rangeColorMapping.Ranges.Add(range1);
rangeColorMapping.Ranges.Add(range2);
rangeColorMapping.Ranges.Add(range3);
rangeColorMapping.Ranges.Add(range4);
treeMap.LeafItemColorMapping = rangeColorMapping;
this.Content = treeMap;
```

### Hierarchical Level

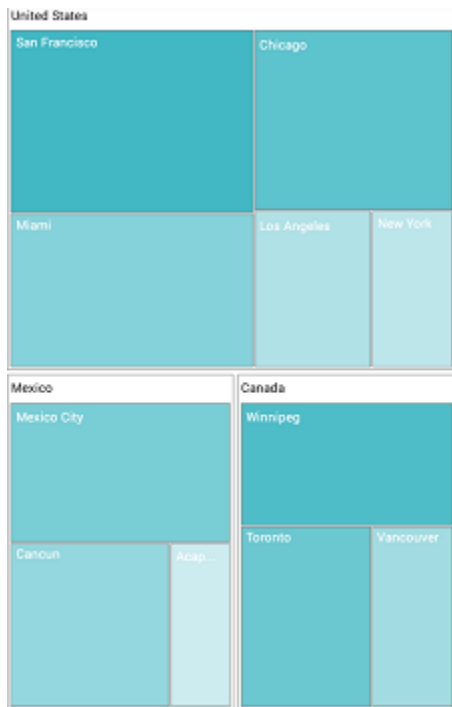

Hierarchical level is used to define levels for hierarchical data collection that contains tree-structured data.

### XML

```
<ContentPage.BindingContext>
<local:CountrySalesCollection></local:CountrySalesCollection>
</ContentPage.BindingContext>
<treemap:SfTreeMap x:Name="TreeMap" HorizontalOptions="FillAndExpand"
DataSource="{Binding CountrySales}"
VerticalOptions="FillAndExpand" WeightValuePath="Sales"
ColorValuePath="Expense" BackgroundColor="White" >
<treemap:SfTreeMap.LeafItemSettings>
<treemap:LeafItemSettings LabelPath="Name"/>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.LeafItemColorMapping>
<treemap:DesaturationColorMapping Color="#41B8C4" From="1" To=" 0.2"/>
</treemap:SfTreeMap.LeafItemColorMapping>
<treemap:SfTreeMap.Levels>
<treemap:TreeMapHierarchicalLevel ChildPadding="4" ChildBackground="White"
ShowHeader = "true" HeaderHeight = "20"
HeaderPath = "Name" ChildPath = "RegionalSales" >
<treemap:TreeMapHierarchicalLevel.HeaderStyle>
<treemap:Style Color= "Black"/>
</treemap:TreeMapHierarchicalLevel.HeaderStyle>
</treemap:TreeMapHierarchicalLevel>
</treemap:SfTreeMap.Levels>
</treemap:SfTreeMap>
```

### C#

```
SfTreeMap tree = new SfTreeMap ();
tree.WeightValuePath = "Sales";
tree.DataSource = new CountrySalesCollection ();
public CountrySalesCollection()
{
    this.Add(new CountrySale() { Name = "United States", Sales = 98456, Expense = 87000 });
    this.Add(new CountrySale() { Name = "Canada", Sales = 43523, Expense = 40000 });
    this.Add(new CountrySale() { Name = "Mexico", Sales = 45634, Expense = 46000 });
    this[0].RegionalSales.Add(new RegionSale() { Country = "United States", Name = "New York", Sales = 2353, Expense = 2000 });
    this[0].RegionalSales.Add(new RegionSale() { Country = "United States", Name = "Los Angeles", Sales = 3453, Expense = 3000 });
    this[0].RegionalSales.Add(new RegionSale() { Country = "United States", Name = "San Francisco", Sales = 8456, Expense = 8000 });
    this[0].RegionalSales.Add(new RegionSale() { Country = "United States", Name = "Chicago", Sales = 6785, Expense = 7000 });
    this[0].RegionalSales.Add(new RegionSale() { Country = "United States", Name = "Miami", Sales = 7045, Expense = 6000 });
    this[1].RegionalSales.Add(new RegionSale() { Country = "Canada", Name = "Toronto", Sales = 7045, Expense = 7000 });
    this[1].RegionalSales.Add(new RegionSale() { Country = "Canada", Name = "Vancouver", Sales = 4352, Expense = 4000 });
    this[1].RegionalSales.Add(new RegionSale() { Country = "Canada", Name = "Winnipeg", Sales = 7843, Expense = 7500 });
    this[2].RegionalSales.Add(new RegionSale() { Country = "Mexico", Name = "Mexico City", Sales = 7843, Expense = 6500 });
    this[2].RegionalSales.Add(new RegionSale() { Country = "Mexico", Name = "Cancun", Sales = 6683, Expense = 6000 });
    this[2].RegionalSales.Add(new RegionSale() { Country = "Mexico", Name = "Acapulco", Sales = 2454, Expense = 2000 });
}
```

## Layout

You can decide the visual representation of nodes belonging to all the TreeMap levels using the [LayoutType](#) property of TreeMap.

The following four different types of layouts available in TreeMap:

- Squarified
- SliceAndDiceAuto
- SliceAndDiceHorizontal
- SliceAndDiceVertical

## Squarified

The **Squarified** layout creates rectangles with best aspect ratio.

## XML

```
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth"
LayoutType="Squarified">
  <treemap:SfTreeMap.LeafItemSettings>
    <treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
    >
  </treemap:LeafItemSettings>
  <treemap:SfTreeMap.Levels>
    <treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
    GroupGap = " 5" ShowHeader = "true">
    <treemap:TreeMapFlatLevel.HeaderStyle>
    <treemap:Style Color= "Black"/>
    </treemap:TreeMapFlatLevel.HeaderStyle>
```

```

</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
</treemap:SfTreeMap>

```

## C#

```

PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
treeMap.LayoutType = LayoutTypes.Squarified;
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;

```

## SliceAndDiceAuto

The **SliceAndDiceAuto** layout creates rectangles with high aspect ratio and displays them sorted both horizontally and vertically.

**XML**

```

<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth"
LayoutType="SliceAndDiceAuto">
  <treemap:SfTreeMap.LeafItemSettings>
  <treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
  >
  </treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
<treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
GroupGap =" 5" ShowHeader = "true">
  <treemap:TreeMapFlatLevel.HeaderStyle>
  <treemap:Style Color= "Black"/>
  </treemap:TreeMapFlatLevel.HeaderStyle>
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
</treemap:SfTreeMap>

```

**C#**

```

PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
treeMap.LayoutType = LayoutTypes.SliceAndDiceAuto;
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;

```

### SliceAndDiceHorizontal

The **SliceAndDiceHorizontal** layout creates rectangles with high aspect ratio and displays them sorted horizontally.

### XML

```
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth"
LayoutType="SliceAndDiceHorizontal">
  <treemap:SfTreeMap.LeafItemSettings>
    <treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
    >
  </treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
  <treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
  GroupGap = " 5" ShowHeader = "true">
    <treemap:TreeMapFlatLevel.HeaderStyle>
      <treemap:Style Color= "Black"/>
    </treemap:TreeMapFlatLevel.HeaderStyle>
  </treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
</treemap:SfTreeMap>
```

### C#

```
PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
```

```

treeMap.LayoutType = LayoutTypes.SliceAndDiceHorizontal;
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;

```

### SliceAndDiceVertical

The **SliceAndDiceVertical** layout creates rectangles with high aspect ratio and displays them sorted vertically.

### XML

```

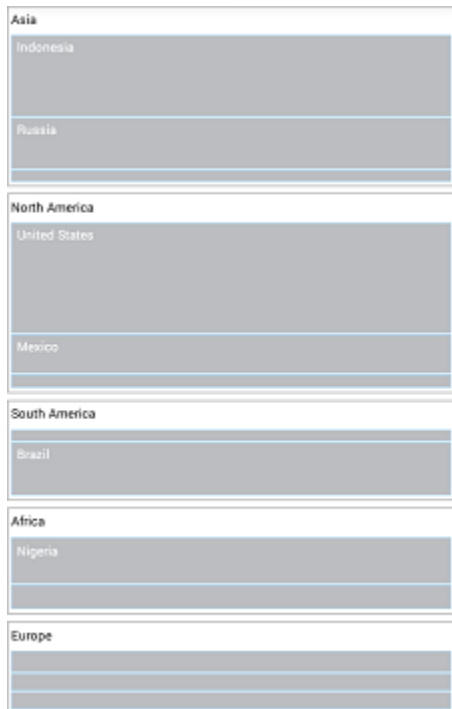

<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth"
LayoutType="SliceAndDiceVertical">
<treemap:SfTreeMap.LeafItemSettings>
<treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
>
</treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>

```

```
<treemap:SfTreeMap.Levels>
<treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
GroupGap =" 5" ShowHeader = "true">
<treemap:TreeMapFlatLevel.HeaderStyle>
<treemap:Style Color= "Black"/>
</treemap:TreeMapFlatLevel.HeaderStyle>
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
</treemap:SfTreeMap>
```

## C#

```
PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
treeMap.LayoutType = LayoutTypes.SliceAndDiceVertical;
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;
```

## Customization

The TreeMap control supports color customization to determine the exact combination of colors for the tree nodes displayed and provides tooltip support to display additional information of TreeMap data.

### Color

You can customize the colors of leaf nodes using the [ColorMapping](#) support.

The [ColorMapping](#) is categorized into the following three different types:

- UniColorMapping
- RangeColorMapping
- DesaturationColorMapping

### UniColorMapping

You can color all the leaf nodes with the same color by setting value to the [Color](#) property of [UniColorMapping](#).

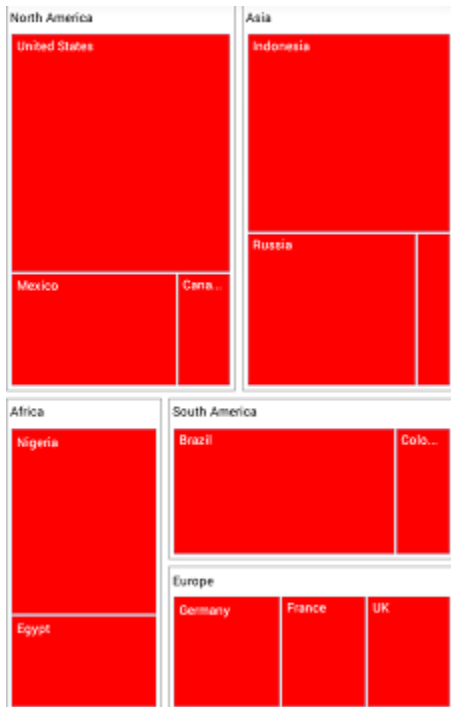

### XML

```
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth"
LayoutType="Squarified">
  <treemap:SfTreeMap.LeafItemSettings>
    <treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
    >
  </treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
  <treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
  GroupGap =" 5" ShowHeader = "true">
```

```
<treemap:TreeMapFlatLevel.HeaderStyle>
<treemap:Style Color= "Black"/>
</treemap:TreeMapFlatLevel.HeaderStyle>
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
<treemap:SfTreeMap.LeafItemColorMapping>
<treemap:UniColorMapping Color="Red"></treemap:UniColorMapping>
</treemap:SfTreeMap.LeafItemColorMapping>
</treemap:SfTreeMap>
```

## C#

```
PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
UniColorMapping uniColorMapping = new UniColorMapping();
uniColorMapping.Color = Color.Red;
treeMap.LeafItemColorMapping = uniColorMapping;
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;
```

### RangeColorMapping

You can group the leaf nodes based on the range of color values of data. You can set a unique color for every range. To achieve this, specify the [To](#) and [From](#) values as range bound, and specify the [Color](#) value to fill the leaf nodes of particular range using the [RangeColorMapping](#) property of [TreeMap](#). You must specify value to [ColorValuePath](#) since the ranges [From](#) and [To](#) depend on the under bound value of [ColorValuePath](#).

### XML

```
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth" LayoutType="Squarified"
ShowTooltip="True">
  <treemap:SfTreeMap.LeafItemSettings>
    <treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
    >
  </treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
  <treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
  GroupGap =" 5" ShowHeader = "true">
    <treemap:TreeMapFlatLevel.HeaderStyle>
      <treemap:Style Color= "Black"/>
    </treemap:TreeMapFlatLevel.HeaderStyle>
  </treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
<treemap:SfTreeMap.LegendSettings>
  <treemap:LegendSettings ShowLegend="True" Size="700,45">
    <treemap:LegendSettings.LabelStyle>
      <treemap:Style Color="Black"></treemap:Style>
    </treemap:LegendSettings.LabelStyle>
  </treemap:LegendSettings>
</treemap:SfTreeMap>
```

```

</treemap:SfTreeMap.LegendSettings>
<treemap:SfTreeMap.LeafItemColorMapping>
<treemap:RangeColorMapping>
<treemap:RangeColorMapping.Ranges>
<treemap:Range LegendLabel = "1 % Growth" From = "0" To = "1" Color =
"#77D8D8" />
<treemap:Range LegendLabel = "2 % Growth" From = "0" To = "2" Color =
"#AED960" />
<treemap:Range LegendLabel = "3 % Growth" From = "0" To = "3" Color =
"#FFAF51" />
<treemap:Range LegendLabel = "4 % Growth" From = "0" To = "4" Color =
"#F3D240" />
</treemap:RangeColorMapping.Ranges>
</treemap:RangeColorMapping>
</treemap:SfTreeMap.LeafItemColorMapping>
</treemap:SfTreeMap>

```

## C#

```

PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
LegendSettings legendSettings = new LegendSettings();
legendSettings.ShowLegend = true;
legendSettings.Size = new Size(700, 45);
legendSettings.LabelStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color
= Color.Black };
treeMap.LegendSettings = legendSettings;
RangeColorMapping rangeColorMapping = new RangeColorMapping();
Range range1 = new Range();
range1.From = 0;
range1.To = 1;
range1.Color = Color.FromHex("#77D8D8");
range1.LegendLabel = "1 % Growth";
Range range2 = new Range();
range2.From = 0;
range2.To = 2;
range2.Color = Color.FromHex("#AED960");
range2.LegendLabel = "2 % Growth";
Range range3 = new Range();
range3.From = 0;

```

```

range3.To = 3;
range3.Color = Color.FromHex("#FFAF51");
range3.LegendLabel = "3 % Growth";
Range range4 = new Range();
range4.From = 0;
range4.To = 4;
range4.Color = Color.FromHex("#F3D240");
range4.LegendLabel = "4 % Growth";
rangeColorMapping.Ranges.Add(range1);
rangeColorMapping.Ranges.Add(range2);
rangeColorMapping.Ranges.Add(range3);
rangeColorMapping.Ranges.Add(range4);
treeMap.LeafItemColorMapping = rangeColorMapping;
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;

```

### DesaturationColorMapping

You can differentiate all the leaf nodes using the [DesaturationColorMapping](#) property of TreeMap. Differentiation can be achieved even though the same color is applied for all the leaf nodes by varying the opacity of the leaf nodes based on the [Color](#) value specified in the color value range using the [RangeMinimum](#) and [RangeMaximum](#) values of data collection. You can also bind the opacity range by setting the [From](#) and [To](#) properties of [DesaturationColorMapping](#).

### XML

```

<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth" LayoutType="Squarified"
ShowTooltip="True">
<treemap:SfTreeMap.LeafItemSettings>
<treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
>

```

```

</treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
<treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
GroupGap =" 5" ShowHeader = "true">
<treemap:TreeMapFlatLevel.HeaderStyle>
<treemap:Style Color= "Black"/>
</treemap:TreeMapFlatLevel.HeaderStyle>
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
<treemap:SfTreeMap.LegendSettings>
<treemap:LegendSettings ShowLegend="True" Size="700,45">
<treemap:LegendSettings.LabelStyle>
<treemap:Style Color="Black"></treemap:Style>
</treemap:LegendSettings.LabelStyle>
</treemap:LegendSettings>
</treemap:SfTreeMap.LegendSettings>
<treemap:SfTreeMap.LeafItemColorMapping>
<treemap:DesaturationColorMapping From="1" To="0.1" Color="#41B8C4"/>
</treemap:SfTreeMap.LeafItemColorMapping>
</treemap:SfTreeMap>

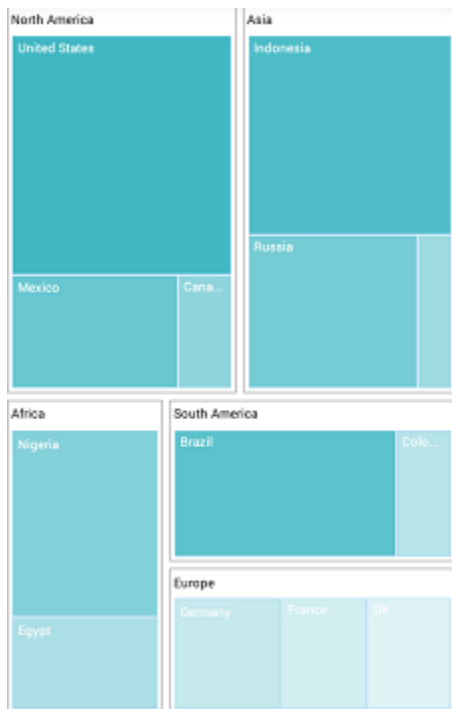

```

## C#

```

PopulationViewModel viewModel = new PopulationViewModel();
SfTreeMap treeMap = new SfTreeMap();
treeMap.BackgroundColor = Color.White;
treeMap.ColorValuePath = "Growth";
treeMap.WeightValuePath = "Population";
LeafItemSettings leafSetting = new LeafItemSettings();
leafSetting.Gap = 2;
leafSetting.BorderColor = Color.FromHex("#A9D9F7");
leafSetting.LabelPath = "Country";
treeMap.LeafItemSettings = leafSetting;

flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
LegendSettings legendSettings = new LegendSettings();
legendSettings.ShowLegend = true;
legendSettings.Size = new Size(700, 45);
legendSettings.LabelStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color
= Color.Black };
treeMap.LegendSettings = legendSettings;
DesaturationColorMapping desaturationColor = new DesaturationColorMapping();
desaturationColor.From = 1;
desaturationColor.To = 0.2;
desaturationColor.Color = Color.FromHex("#41B8C4");
treeMap.LeafItemColorMapping = desaturationColor;
treeMap.DataSource = viewModel.PopulationDetails;
this.Content = treeMap;

```

### Tooltip

You can enable the tooltip support for TreeMap by setting the [ShowTooltip](#) property to true. By default, it takes the property of bound object that is referenced in [GroupPath](#) and displays its content when the corresponding node is tapped.

### Tooltip customization

You can customize the tooltip to show more details by specifying [TooltipTemplate](#) to tooltip.

### XML

```

<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}"
WeightValuePath="Population" ColorValuePath="Growth" LayoutType="Squarified"

```

### Selection

The TreeMap control provides selection support, which allows you to select the tree map items. The selection can be enabled by setting the [HighlightOnSelection](#) property to true in TreeMap. You can specify the highlight color and border width using the [HighlightColor](#) and [HighlightBorderWidth](#) properties, respectively.

### XML

```
<treemap:SfTreeMap x:Name="treeMap" DataSource="{Binding
PopulationDetails}" HighlightOnSelection="True"
HighlightBorderWidth="8" HighlightColor="Red"
WeightValuePath="Population" ColorValuePath="Growth" LayoutType="Squarified"
>
<treemap:SfTreeMap.LeafItemSettings>
<treemap:LeafItemSettings Gap="2" BorderColor="#A9D9F7" LabelPath="Country"
>
</treemap:LeafItemSettings>
</treemap:SfTreeMap.LeafItemSettings>
<treemap:SfTreeMap.Levels>
<treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
GroupGap = " 5" ShowHeader = "true">
<treemap:TreeMapFlatLevel.HeaderStyle>
<treemap:Style Color= "Black"/>
</treemap:TreeMapFlatLevel.HeaderStyle>
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
<treemap:SfTreeMap.LegendSettings>
<treemap:LegendSettings ShowLegend="True" Size="700,45">
<treemap:LegendSettings.LabelStyle>
<treemap:Style Color="Black"></treemap:Style>
</treemap:LegendSettings.LabelStyle>
</treemap:LegendSettings>
```

```

</treemap:SfTreeMap.LegendSettings>
<treemap:SfTreeMap.LeafItemColorMapping>
<treemap:RangeColorMapping>
<treemap:RangeColorMapping.Ranges>
<treemap:Range LegendLabel = "1 % Growth" From = "0" To = "1" Color =
"#77D8D8" />
<treemap:Range LegendLabel = "2 % Growth" From = "0" To = "2" Color =

        }
    }
}

```

## TreeMap Elements

The TreeMap contains the following elements:

- Legends

- Headers
- Labels

### Legend

You can set the color value of leaf nodes using the [LegendSettings](#) property. This legend is appropriate only for the tree map whose leaf nodes are colored using [RangeColorMapping](#).

The visibility of legend can be enabled by setting the [ShowLegend](#) property to true.

#### *TreeMap legends*

You can set the size of legend icons by setting the [IconSize](#) property of `LegendSettings` in `TreeMap`.

#### *Labels for legends*

You can customize the labels of the legend items using the [LegendLabel](#) property of [RangeColorMapping](#).

### XML

```
<treemap:SfTreeMap.LegendSettings>  
<treemap:LegendSettings ShowLegend="True" Size="700,45">  
<treemap:LegendSettings.LabelStyle>  
<treemap:Style Color="Black"></treemap:Style>  
</treemap:LegendSettings.LabelStyle>  
</treemap:LegendSettings>  
</treemap:SfTreeMap.LegendSettings>
```

### C#

```
LegendSettings legendSettings = new LegendSettings();  
legendSettings.ShowLegend = true;  
legendSettings.Size = new Size(700, 45);  
legendSettings.LabelStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color  
= Color.Black };  
treeMap.LegendSettings = legendSettings;
```

## Header

You can set headers for each level by setting the [ShowHeader](#) property of each **TreeMap** level. The [HeaderHeight](#) property helps you set the height of header, and the [GroupPath](#) value determines the header value.

## XML

```
<treemap:SfTreeMap.Levels>
<treemap:TreeMapFlatLevel HeaderHeight="20" GroupPath = "Continent"
GroupGap =" 5" ShowHeader = "true">
<treemap:TreeMapFlatLevel.HeaderStyle>
<treemap:Style Color= "Black"/>
</treemap:TreeMapFlatLevel.HeaderStyle>
</treemap:TreeMapFlatLevel>
</treemap:SfTreeMap.Levels>
```

## C#

```
TreeMapFlatLevel flatLevel = new TreeMapFlatLevel();
flatLevel.HeaderHeight = 20;
flatLevel.GroupPath = "Continent";
flatLevel.GroupGap = 5;
flatLevel.ShowHeader = true;
flatLevel.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
treeMap.Levels.Add(flatLevel);
```

### Data labels

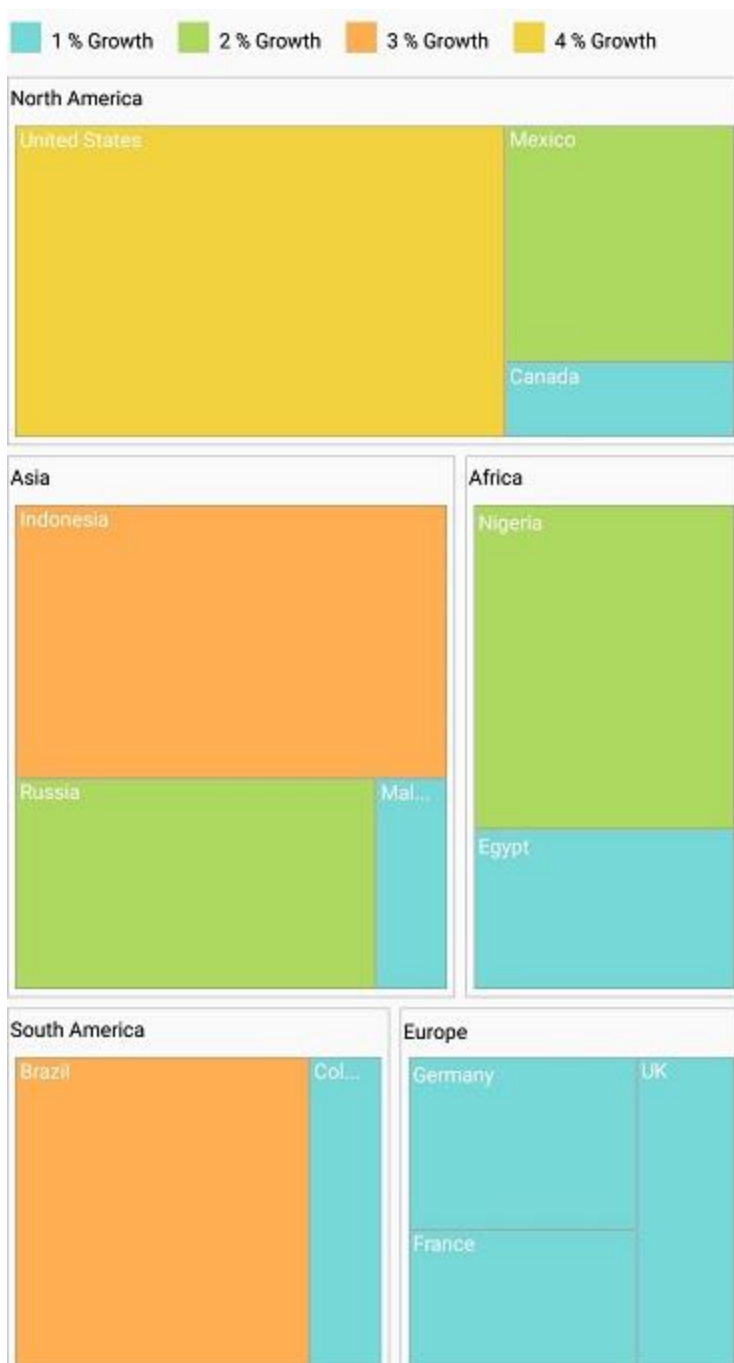

The [ShowLabels](#) property is used to enable or disable the labels in leaf nodes. The [LabelPath](#) property allows you to set values to labels.

### XML

```
<treeMap:SfTreeMap.LeafItemSettings>
  <treeMap:LeafItemSettings LabelPath="Country" ShowLabels="True">
  </treeMap:LeafItemSettings>
</treeMap:SfTreeMap.LeafItemSettings>
```

### C#

```
treeMap.LeafItemSettings.ShowLabels = true;
treeMap.LeafItemSettings.LabelPath = "Country";
```

*Avoid overlap in data labels*

The [OverflowMode](#) property aligns data labels within leaf node boundaries using the `Trim`, `Wrap`, and `Hide` options. The default value of the `OverflowMode` property is `Trim`.

`Trim`

You can trim the data labels inside the leaf node boundaries using the `Trim` option.

**XML**

```
<treeMap:SfTreeMap.LeafItemSettings>
<treeMap:LeafItemSettings LabelPath="Country" OverflowMode="Trim">
```

```
</treeMap:LeafItemSettings>
</treeMap:SfTreeMap.LeafItemSettings>
```

**C#**

```
treeMap.LeafItemSettings.OverflowMode = LabelOverflowMode.Trim;
```

**Wrap**

You can wrap the data labels inside the leaf node boundaries using the `Wrap` option.

**XML**

```
<treeMap:SfTreeMap.LeafItemSettings>
<treeMap:LeafItemSettings LabelPath="Country" OverflowMode="Wrap">
</treeMap:LeafItemSettings>
</treeMap:SfTreeMap.LeafItemSettings>
```

**C#**

```
treeMap.LeafItemSettings.OverflowMode = LabelOverflowMode.Wrap;
```

### Hide

You can hide the data labels inside the leaf node boundaries using the **Hide** option.

#### **XML**

```
<treeMap:SfTreeMap.LeafItemSettings>  
<treeMap:LeafItemSettings LabelPath="Country" OverflowMode="Hide">  
</treeMap:LeafItemSettings>  
</treeMap:SfTreeMap.LeafItemSettings>
```

#### **C#**

```
treeMap.LeafItemSettings.OverflowMode = LabelOverflowMode.Hide;
```

### Customize data labels

You can customize the data labels using the [LabelStyle](#) property of `LeafItemSettings`. The font color, font size, font attribute, and font family can be customized using the `Color`, `FontSize`, `FontAttributes`, and `FontFamily` properties.

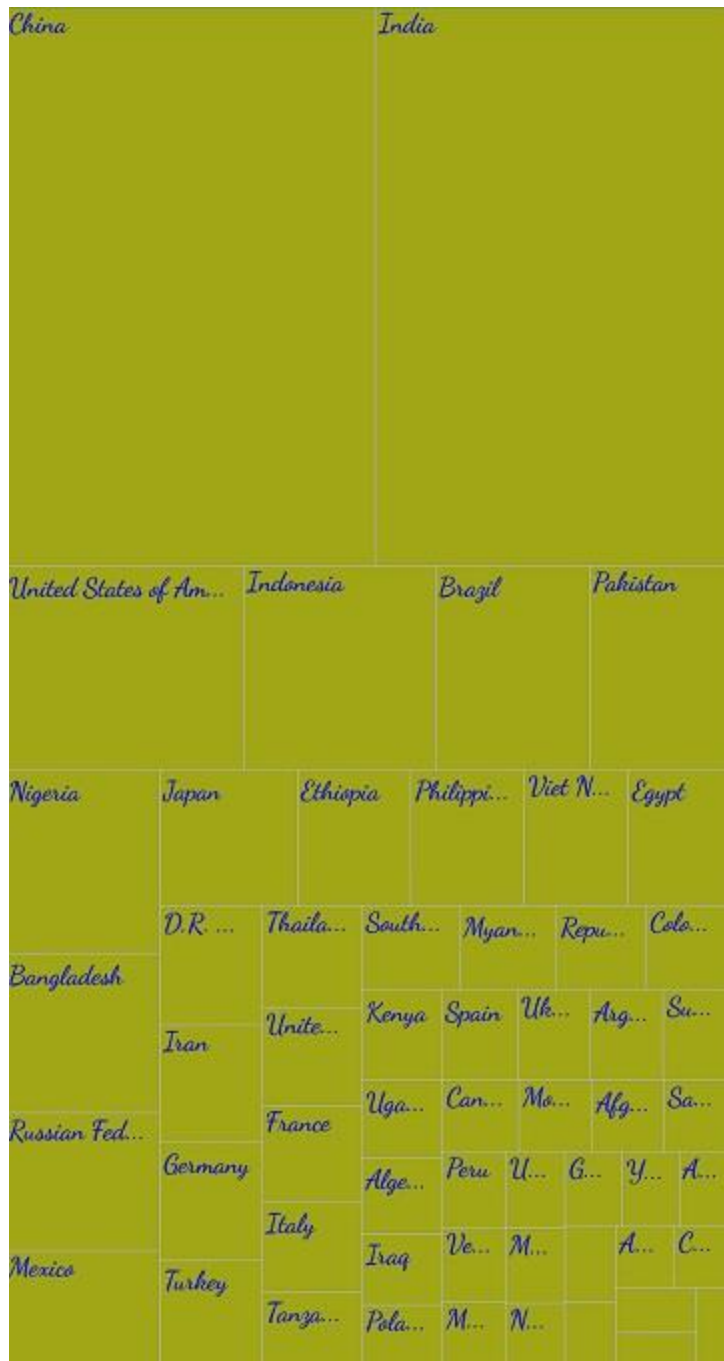

### XML

```
<treeMap:SfTreeMap.LeafItemSettings>
<treeMap:LeafItemSettings LabelPath="Country" OverflowMode="Trim">
<treeMap:LeafItemSettings.LabelStyle>
<treeMap:Style Color="Blue" FontSize="15" FontAttributes="Bold">
```

```
<treeMap:Style.FontFamily>  
<OnPlatform x:TypeArguments="x:String" iOS="Chalkduster" Android="cursive"  
WinPhone="Chiller" />  
</treeMap:Style.FontFamily>  
</treeMap:Style>  
</treeMap:LeafItemSettings.LabelStyle>  
</treeMap:LeafItemSettings>  
</treeMap:SfTreeMap.LeafItemSettings>
```

## C#

```
treeMap.LeafItemSettings.LabelStyle.FontSize = 15;  
treeMap.LeafItemSettings.LabelStyle.FontAttributes = FontAttributes.Bold;  
treeMap.LeafItemSettings.LabelStyle.FontFamily = Device.RuntimePlatform ==  
Device.iOS ? "Chalkduster" : Device.RuntimePlatform == Device.Android ?  
"cursive" : "Chiller";  
treeMap.LeafItemSettings.LabelStyle.Color = Color.Blue;
```

## TreeMap Events

### ItemSelected

The [ItemSelected](#) event occurs when an item is selected. The selected leaf node underlying data item and IsSelected boolean property will be passed as arguments to ItemSelectedEventArgs. The IsSelected property indicates whether the item has been selected.

Set the [HighlightOnSelection](#) property to true to use the `ItemSelected` event.

### XML

```
<Grid>
```

```
<treemap:SfTreeMap x:Name="treemap" DataSource="{Binding
PopulationDetails}" WeightValuePath="Population"
ColorValuePath="Growth" ItemSelected="Treemap_ItemSelected"
HighlightOnSelection="True">
</treemap:SfTreeMap>
</Grid>
```

**C#**

```
public MainPage()
{
    InitializeComponent();
    treemap.ItemSelected += Treemap_ItemSelected;
    treemap.HighlightOnSelection = true;
}
private void Treemap_ItemSelected(object sender, TreeMapSelectedEventArgs e)
{
    var selectedItem = (e.Item as PopulationViewModel);
    bool setSelection = e.IsSelected;
}
```

**Drilldown**

The drilldown feature provides better visualization of hierarchy. A large set of data can be virtualized into minimal views. Each level of items can be drilled down. TreeMap provides animation along with the drilldown support. The drilldown header will be enabled when you perform drilldown in TreeMap, and this header helps in performing zoom out operation (i.e., drill up one level).

The drilldown feature can be enabled or disabled using the **EnableDrilldown** property in TreeMap. The drilldown operation can be performed for both flat level and hierarchy level.

---

**Information:** Tap either the item or the item header to perform the drilldown operation after enabling the EnableDrilldown property.

---

Icons will be displayed at the left of the header to indicate whether the item can be further drilled or not. The plus icon indicates the drilldown operation, and the minus icon indicates the drill up operation.

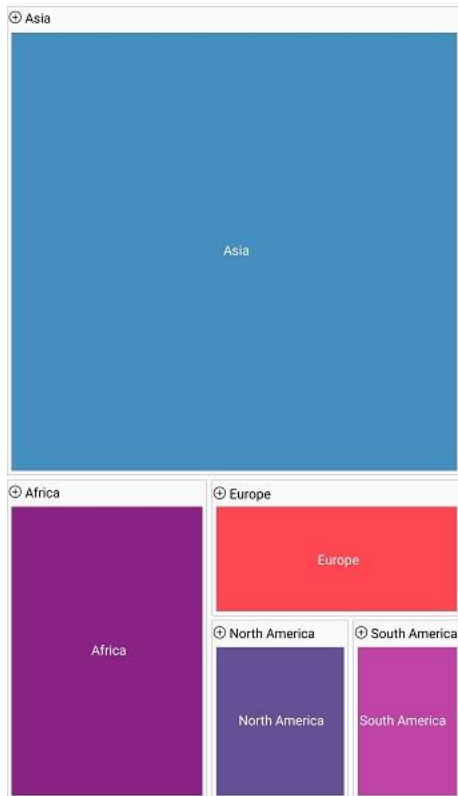

The following code snippet demonstrates how to enable the drilldown operation.

**XML**

```
<treeMap:SfTreeMap EnableDrilldown="True" >
```

**C#**

```
SfTreeMap map = new SfTreeMap();
map.EnableDrilldown = true;
```

### Header customization

The drilldown header used for zoom out (i.e., drill up one level) operation can be customized by setting style using the `DrilldownHeaderStyle` property in `TreeMap`. This property provides similar customization option as of the `TreeMap` level header.

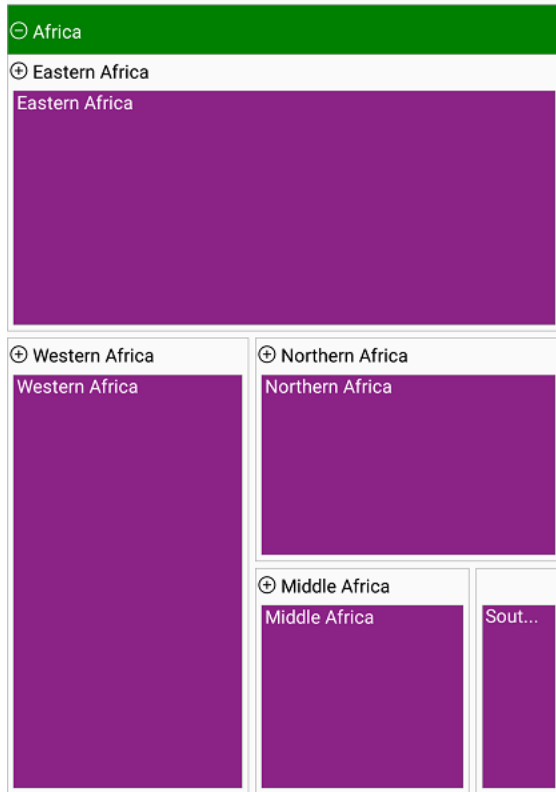

The following code snippet demonstrates how to define the drilldown header style.

### XML

```
<treeMap:SfTreeMap.DrilldownHeaderStyle>
  <treeMap:Style Color="White" BackgroundColor="Green"></treeMap:Style>
</treeMap:SfTreeMap.DrilldownHeaderStyle>
```

### C#

```
SfTreeMap map = new SfTreeMap();
map.DrilldownHeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.White, BackgroundColor = Color.Green };
```

The following code snippet is the complete code for drilldown.

#### XML

```
<treeMap:SfTreeMap Grid.Row="1" DataSource="{Binding PopulationDetails}"
EnableDrilldown="True" x:Name="treeMap"
WeightValuePath="Population" ColorValuePath="Population" ShowTooltip="True"
>
<treeMap:SfTreeMap.DrilldownHeaderStyle>
<treeMap:Style Color="Black" BackgroundColor="Green"></treeMap:Style>
</treeMap:SfTreeMap.DrilldownHeaderStyle>
<treeMap:SfTreeMap.LeafItemSettings>
<treeMap:LeafItemSettings LabelPath="Region"></treeMap:LeafItemSettings>
</treeMap:SfTreeMap.LeafItemSettings>
<treeMap:SfTreeMap.Levels>
<treeMap:TreeMapFlatLevel GroupPath="Continent">
<treeMap:TreeMapFlatLevel.HeaderStyle>
<treeMap:Style Color="Black"/>
</treeMap:TreeMapFlatLevel.HeaderStyle>
</treeMap:TreeMapFlatLevel>
<treeMap:TreeMapFlatLevel GroupPath="States">
<treeMap:TreeMapFlatLevel.HeaderStyle>
<treeMap:Style Color="Black"/>
</treeMap:TreeMapFlatLevel.HeaderStyle>
</treeMap:TreeMapFlatLevel>
</treeMap:SfTreeMap.Levels>
<treeMap:SfTreeMap.LeafItemColorMapping>
<treeMap:PaletteColorMapping>
<treeMap:PaletteColorMapping.Colors>
<Color>#C044A5</Color>
```

```
<Color>#665197</Color>
<Color>#FF4652</Color>
<Color>#8B2286</Color>
<Color>#448FC0</Color>
</treeMap:PaletteColorMapping.Colors>
</treeMap:PaletteColorMapping>
</treeMap:SfTreeMap.LeafItemColorMapping>
</treeMap:SfTreeMap>
```

## C#

```
DrilldownViewModel viewModel = new DrilldownViewModel();
SfTreeMap map = new SfTreeMap();
map.WeightValuePath = "Population";
map.ColorValuePath = "Population";
map.LeafItemSettings.LabelPath = "Region";
TreeMapFlatLevel level = new TreeMapFlatLevel();
level.GroupPath = "Continent";
level.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
map.Levels.Add(level);
TreeMapFlatLevel level1 = new TreeMapFlatLevel();
level1.GroupPath = "States";
level1.HeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
map.Levels.Add(level1);
PaletteColorMapping colorMapping = new PaletteColorMapping();
colorMapping.Colors.Add(Color.FromHex("#C044A5"));
colorMapping.Colors.Add(Color.FromHex("#665197"));
colorMapping.Colors.Add(Color.FromHex("#FF4652"));
colorMapping.Colors.Add(Color.FromHex("#8B2286"));
colorMapping.Colors.Add(Color.FromHex("#448FC0"));
map.LeafItemColorMapping = colorMapping;
map.DrilldownHeaderStyle = new Syncfusion.SfTreeMap.XForms.Style() { Color =
Color.Black };
map.DataSource = viewModel.PopulationDetails;
map.EnableDrilldown = true;
map.ShowTooltip = true;
this.Content = map;
```

The following is the model data used for the above drilldown example.

### C#

```
public class DrilldownModel
{
    public string Continent { get; set; }
    public string States { get; set; }
    public string Region { get; set; }
    public double Population { get; set; }
}
```

### C#

```
public class DrilldownViewModel
{
    public ObservableCollection<DrilldownModel> PopulationDetails
    {
        get;
        set;
    }

## SfTreeView

### SfTreeView

The Syncfusion TreeView for Xamarin.Forms is a data-oriented control that displays data in a hierarchical structure with expanding and collapsing nodes. It is commonly used to illustrate a folder structure, or nested relationships in an application.

## Key features

- Optimized view reusing strategy for enhanced performance.
- Binding and unbound mode - Support for binding hierarchical data or add unbound tree nodes.
- Selection - Support for selection with different selection modes and keyboard navigation.
- Templating - Provides complete UI customization through template and template selectors.

## Getting Started

This section provides a quick overview for getting started with the TreeView for Xamarin.Forms. Walk through the entire process of creating an app with TreeView.

### Assembly Deployment

After installing Essential Studio for Xamarin, you can find all the required assemblies in the {Syncfusion Essential Studio Installed location}\Essential Studio\{{ site.releaseversion }}\Xamarin\lib installation folder.

Eg: C:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Xamarin\lib

Refer [control dependencies](#) section to get the list of assemblies or NuGet package needs to be added as reference to use the TreeView control in any application.

---

**Note:** Assemblies can be found in an unzipped package location in Mac.

---

#### Adding SfTreeView reference

You can add SfTreeView reference using one of the following methods:

##### Method 1: Adding SfTreeView reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://www.nuget.org/packages/Syncfusion.Xamarin.SfTreeView). To add SfTreeView to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.SfTreeView](https://www.nuget.org/packages/Syncfusion.Xamarin.SfTreeView), and then install it.

![Adding SfTreeView reference from NuGet](TreeView\_images/Adding SfTreeView reference.png)

---

**Note:** Install the same version of SfTreeView NuGet in all the projects.

---

##### Method 2: Adding SfTreeView reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfTreeView control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

##### Method 3: Adding SfTreeView assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location: {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.SfTreeView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.GridCommon.Portable.dll Syncfusion.SfTreeView.XForms.Android.dll Syncfusion.SfTreeView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.GridCommon.Portable.dll Syncfusion.SfTreeView.XForms.iOS.dll Syncfusion.SfTreeView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.GridCommon.Portable.dll Syncfusion.SfTreeView.XForms.UWP.dll Syncfusion.SfTreeView.XForms.dll Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

---

---

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching the TreeView on Each Platform

To use this control inside an application, each platform application must initialize the TreeView renderer. This initialization step varies from platform to platform, and is discussed in the following sections:

#### Android

The Android launches the TreeView without any initialization and is enough to only initialize the Xamarin.Forms Framework to launch the application.

---

**Note:** After adding the reference, an additional step is required to initialize the renderer for iOS and UWP projects. If you are adding the references from toolbox, this step is not needed.

---

#### iOS

To launch the TreeView in iOS, call the `SfTreeViewRenderer.Init()` in the `FinishedLaunching` overridden method of the `AppDelegate` class after the Xamarin.Forms Framework initialization, and before the `LoadApplication` is called as demonstrated in the following code example:

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    ...
    global::Xamarin.Forms.Forms.Init ();
    SfTreeViewRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### Universal Windows Platform (UWP)

To launch the TreeView in UWP, call the `SfTreeViewRenderer.Init()` in the `MainPage` constructor before the `LoadApplication` is called as demonstrated in the following code example:

#### C#

```
public MainPage ()
{
    ...
    SfTreeViewRenderer.Init();
    LoadApplication (new App ());
    ...
}
```

#### ReleaseMode Issue in UWP Platform

The known Framework issue in UWP platform is the custom controls will not render when deployed the application in **Release Mode**.

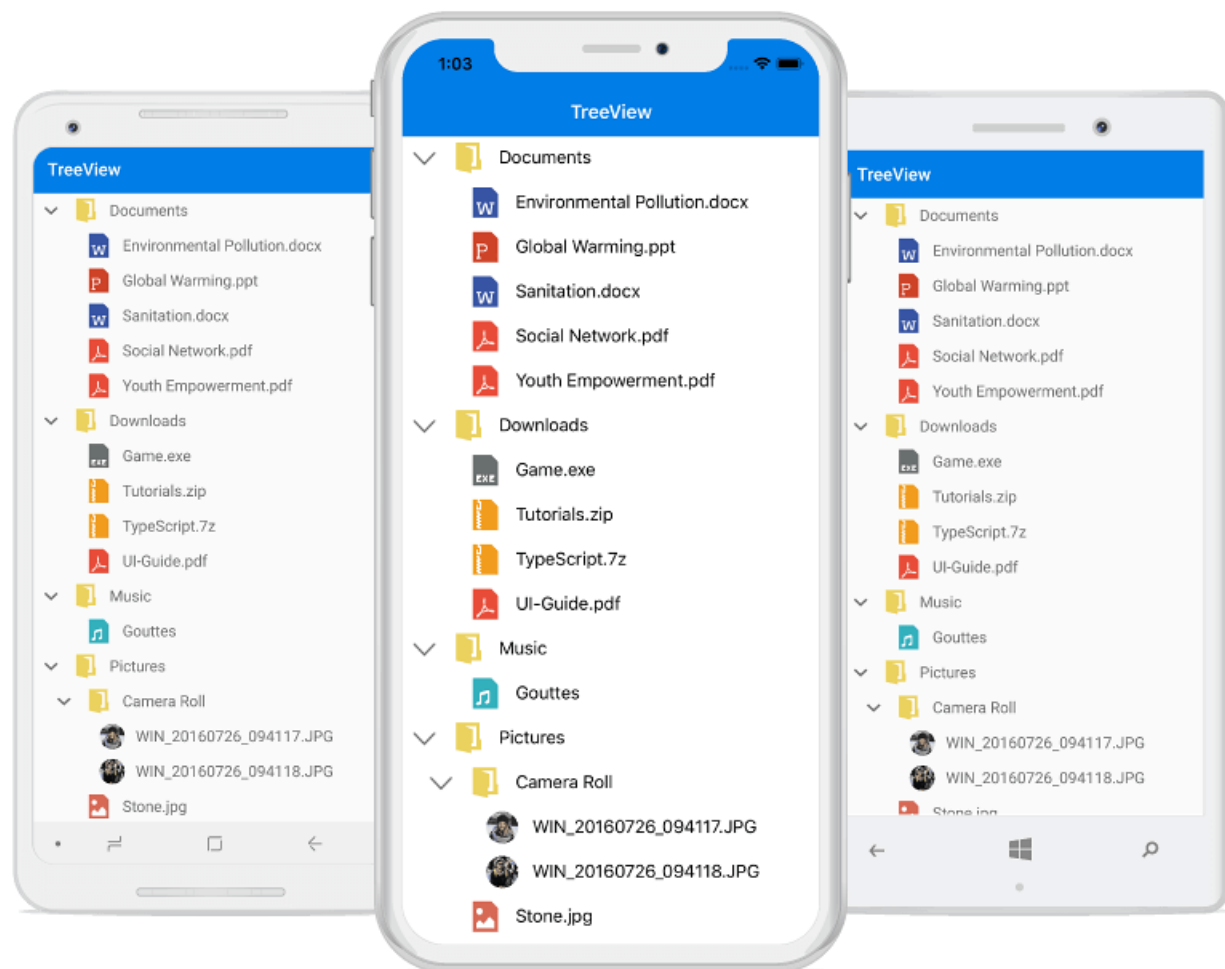

The above problem can be resolved by initializing the TreeView assemblies in `App.xaml.cs` in UWP project as in the following code snippet:

**C#**

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    rootFrame.NavigationFailed += OnNavigationFailed;
    // you'll need to add `using System.Reflection;`
    List<Assembly> assembliesToInclude = new List<Assembly>();
    //Now, add all the assemblies your app uses
    assembliesToInclude.Add(typeof(SfTreeViewRenderer).GetTypeInfo().Assembly);
    // replaces Xamarin.Forms.Forms.Init(e);
    Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    ...
}
```

**Create a tree view**

This section explains how to create a TreeView and configure it. The TreeView control can be configured entirely in C# code, or by using XAML markup. This is how the control will look like on iOS, Android, and Windows devices.

In this walk through, you will create a new application with the TreeView that includes the following topics:

- [Creating the project](#)
- [Adding tree view in Xamarin.Forms](#)
- [Populating Nodes without data source - Unbound Mode](#)
- [Creating Data Model](#)
- [Bind to a hierarchical data source - Bound Mode](#)
- [Creating hierarchical Data Model](#)
- [Bind to a Hierarchy Property Descriptors data source - Bound Mode](#)
- [Defining a template to expander and content view](#)
- [Interacting with a tree view](#)
- [Selection](#)

### Creating the Project

Create a new blank ([Xamarin.Forms.NET Standard](#)) application in Xamarin Studio or Visual Studio for Xamarin.Forms.

### Adding the tree view in Xamarin.Forms

1. Add the required assembly references to the corresponding projects as discussed in the [Assembly deployment](#) section.
2. Import the SfTreeView control namespace Syncfusion.XForms.TreeView.
3. Set the TreeView control to the ContentPage.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<syncfusion:SfTreeView x:Name="treeView" />
</ContentPage>
```

### C#

```
using Syncfusion.XForms.TreeView;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfTreeView treeView;
        public App()
        {
            treeView = new SfTreeView();
            MainPage = new ContentPage { Content = treeView };
        }
    }
}
```

```
}
```

### Populating Nodes without data source - Unbound Mode

You can create and manage the [TreeViewNode](#) objects by yourself to display the data in a hierarchical view. To create a tree view, you use a [TreeView](#) control and a hierarchy of [TreeViewNode](#) objects. You create the node hierarchy by adding one or more root nodes to the TreeView control's [Nodes](#) collection. Each [TreeViewNode](#) can then have more nodes added to its Children collection. You can nest tree view nodes to whatever depth you require.

---

### Important

[ItemsSource](#) is an alternative mechanism to [Nodes](#) for putting content into the TreeView control. You cannot set both [ItemsSource](#) and [Nodes](#) at the same time. When you use [ItemsSource](#), nodes created for you internally, but you cannot access them from [Nodes](#) property.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView">
<syncfusion:SfTreeView.Nodes>
<treeviewengine:TreeViewNode Content="Australia">
<treeviewengine:TreeViewNode.ChildNodes>
<treeviewengine:TreeViewNode Content="New South Wales">
<treeviewengine:TreeViewNode.ChildNodes>
<treeviewengine:TreeViewNode Content="Sydney"/>
</treeviewengine:TreeViewNode.ChildNodes>
</treeviewengine:TreeViewNode>
</treeviewengine:TreeViewNode.ChildNodes>
</treeviewengine:TreeViewNode>
<treeviewengine:TreeViewNode Content="United States of America">
<treeviewengine:TreeViewNode.ChildNodes>
<treeviewengine:TreeViewNode Content="New York"/>
<treeviewengine:TreeViewNode Content="California">
<treeviewengine:TreeViewNode.ChildNodes>
<treeviewengine:TreeViewNode Content="San Francisco"/>
</treeviewengine:TreeViewNode.ChildNodes>
</treeviewengine:TreeViewNode>
</treeviewengine:TreeViewNode.ChildNodes>
</treeviewengine:TreeViewNode>
</syncfusion:SfTreeView.Nodes>
</syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>
```

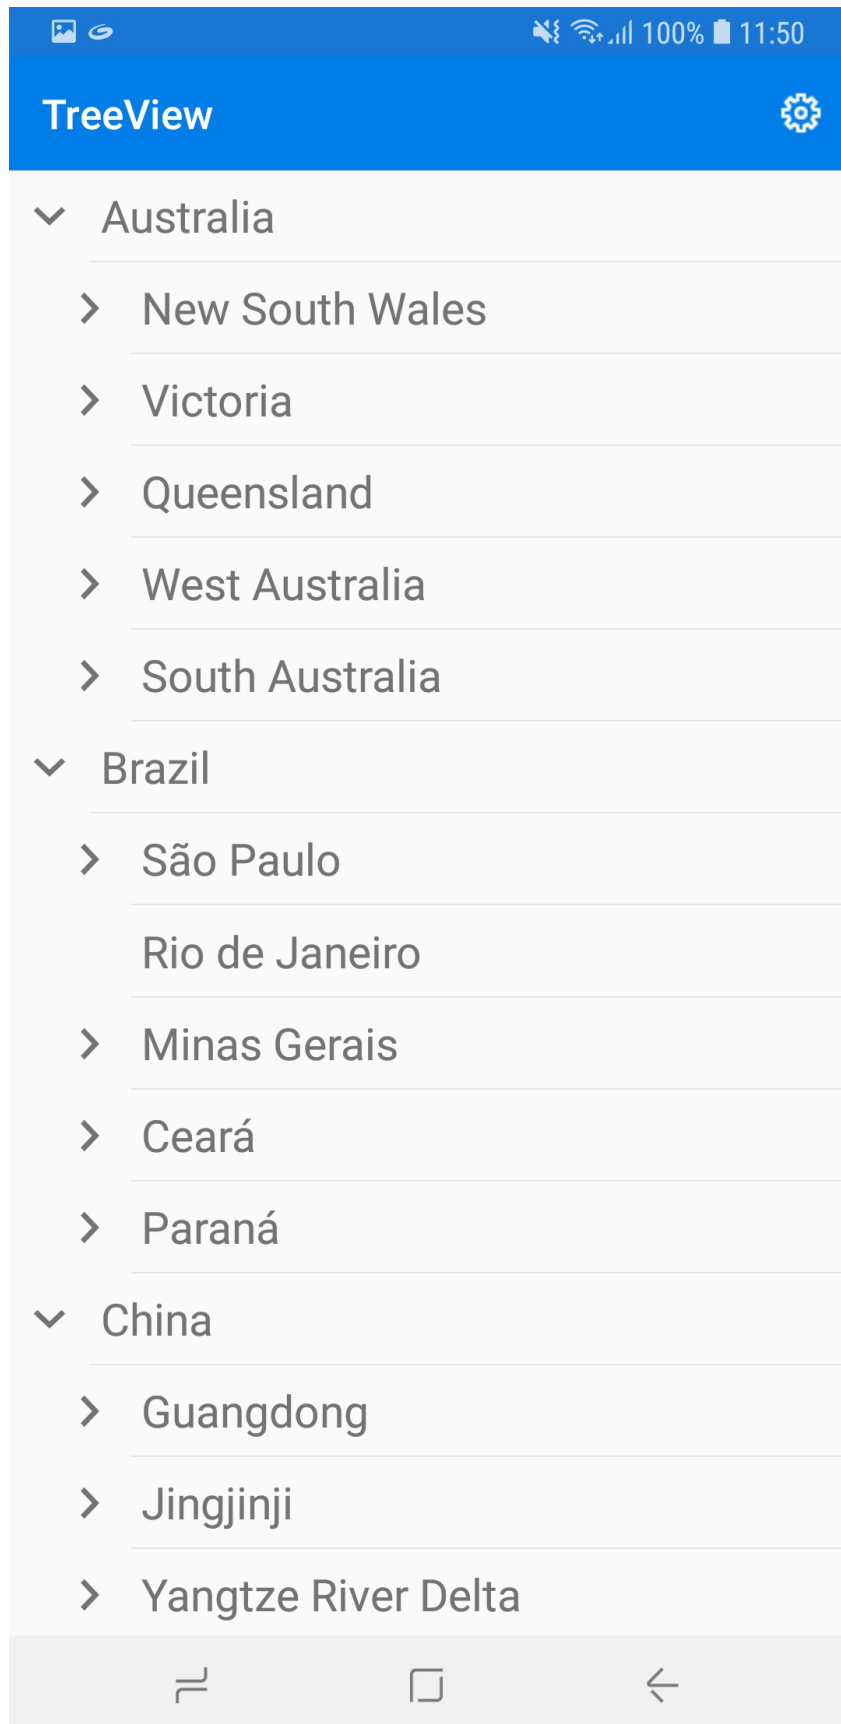

### C#

```
using Syncfusion.TreeView.Engine;
using Syncfusion.XForms.TreeView;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfTreeView treeView;
        public App()
        {
            treeView = new SfTreeView();
            var australia = new TreeViewNode() { Content = "Australia" };
            var _NSW = new TreeViewNode() { Content = "New South Wales" };
            var Sydney = new TreeViewNode() { Content = "Sydney" };
            australia.ChildNodes.Add(_NSW);
            _NSW.ChildNodes.Add(Sydney);
            var usa = new TreeViewNode() { Content = "United States of America" };
            var newYork = new TreeViewNode() { Content = "New York," };
            var California = new TreeViewNode() { Content = "California" };
            var SanFrancisco = new TreeViewNode() { Content = "San Francisco" };
            usa.ChildNodes.Add(newYork);
            usa.ChildNodes.Add(California);
            California.ChildNodes.Add(SanFrancisco);
            treeView.Nodes.Add(australia);
            treeView.Nodes.Add(usa);
            MainPage = new ContentPage { Content = treeView };
        }
    }
}
```

Now, run the application to render the below output:

You can also download the entire source code of this demo from [here](#).

### Creating Data Model for the tree view

Create a data model to bind it to the control.

Create a simple data source as shown in the following code example in a new class file, and save it as FileManager.cs file:

#### C#

```
public class FileManager : INotifyPropertyChanged
{
    private string fileName;
    private ImageSource imageIcon;
    private ObservableCollection<FileManager> subFiles;
    public ObservableCollection<FileManager> SubFiles
    {
        get { return subFiles; }
        set
        {
            subFiles = value;
            RaisedOnPropertyChanged("SubFiles");
        }
    }
    public string ItemName
    {
        get { return fileName; }
        set
        {
            fileName = value;
            RaisedOnPropertyChanged("FolderName");
        }
    }
    public ImageSource ImageIcon
    {
        get { return imageIcon; }
        set
        {
            imageIcon = value;
            RaisedOnPropertyChanged("ImageIcon");
        }
    }
    public event PropertyChangedEventHandler PropertyChanged;
    public void RaisedOnPropertyChanged(string _PropertyName)
    {
        if (PropertyChanged != null)
        {
            PropertyChanged(this, new PropertyChangedEventArgs(_PropertyName));
        }
    }
}
```

---

**Note:** If you want your data model to respond to property changes, then implement `INotifyPropertyChanged` interface in your model class.

---

Create a model repository class with ImageNodeInfo collection property initialized with required number of data objects in a new class file as shown in the following code example, and save it as FileManagerViewModel.cs file:

**C#**

```
public class FileManagerViewModel
{
    private ObservableCollection<FileManager> imageNodeInfo;
    public FileManagerViewModel()
    {
        GenerateSource();
    }
    public ObservableCollection<FileManager> ImageNodeInfo
    {
        get { return imageNodeInfo; }
        set { this.imageNodeInfo = value; }
    }
    private void GenerateSource()
    {
        var nodeImageInfo = new ObservableCollection<FileManager>();
        Assembly assembly = typeof(GettingStated).GetTypeInfo().Assembly;
        var doc = new FileManager() { ItemName = "Documents", ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",
        assembly) };
        var download = new FileManager() { ItemName = "Downloads", ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",
        assembly) };
        var mp3 = new FileManager() { ItemName = "Music", ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",
        assembly) };
        var pictures = new FileManager() { ItemName = "Pictures", ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",
        assembly) };
        var video = new FileManager() { ItemName = "Videos", ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",
        assembly) };
        var pollution = new FileManager() { ItemName = "Environmental
        Pollution.docx", ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_word.png",
        assembly) };
        var globalWarming = new FileManager() { ItemName = "Global Warming.ppt",
        ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_ppt.png",
        assembly) };
        var sanitation = new FileManager() { ItemName = "Sanitation.docx", ImageIcon
        = ImageSource.FromResource("GettingStartedBound.Icons.treeview_word.png",
        assembly) };
        var socialNetwork = new FileManager() { ItemName = "Social Network.pdf",
        ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_pdf.png",
        assembly) };
        var youthEmpower = new FileManager() { ItemName = "Youth Empowerment.pdf",
        ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_pdf.png",
        assembly) };
        var games = new FileManager() { ItemName = "Game.exe", ImageIcon =
        ImageSource.FromResource("GettingStartedBound.Icons.treeview_exe.png",
        assembly) };
```

```
var tutorials = new FileManager() { ItemName = "Tutorials.zip", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_zip.png",
assembly) };
var TypeScript = new FileManager() { ItemName = "TypeScript.7z", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_zip.png",
assembly) };
var uiGuide = new FileManager() { ItemName = "UI-Guide.pdf", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_pdf.png",
assembly) };
var song = new FileManager() { ItemName = "Goutiest", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_mp3.png",
assembly) };
var camera = new FileManager() { ItemName = "Camera Roll", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",
assembly) };
var stone = new FileManager() { ItemName = "Stone.jpg", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_png.png",
assembly) };
var wind = new FileManager() { ItemName = "Wind.jpg", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_png.png",
assembly) };
var img0 = new FileManager() { ItemName = "WIN_20160726_094117.JPG",
    ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_img0.png",
assembly) };
var img1 = new FileManager() { ItemName = "WIN_20160726_094118.JPG",
    ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_img1.png",
assembly) };
var video1 = new FileManager() { ItemName = "Naturals.mp4", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_video.png",
assembly) };
var video2 = new FileManager() { ItemName = "Wild.mpg", ImageIcon =
    ImageSource.FromResource("GettingStartedBound.Icons.treeview_video.png",
assembly) };
doc.SubFiles = new ObservableCollection<FileManager>
{
    pollution,
    globalWarming,
    sanitation,
    socialNetwork,
    youthEmpower
};
download.SubFiles = new ObservableCollection<FileManager>
{
    games,
    tutorials,
    TypeScript,
    uiGuide
};
mp3.SubFiles = new ObservableCollection<FileManager>
{
    song
};
pictures.SubFiles = new ObservableCollection<FileManager>
{
    camera,
```

```

stone,
wind
};
camera.SubFiles = new ObservableCollection<FileManager>
{
img0,
img1
};
video.SubFiles = new ObservableCollection<FileManager>
{
video1,
video2
};
nodeImageInfo.Add(doc);
nodeImageInfo.Add(download);
nodeImageInfo.Add(mp3);
nodeImageInfo.Add(pictures);
nodeImageInfo.Add(video);
imageNodeInfo = nodeImageInfo;
}
}

```

### Bind to a hierarchical data source - Bound Mode

You can create a tree view by binding the [ItemsSource](#) to a hierarchical data source. To create a tree view using data binding, set a hierarchical collection to the `ItemsSource` property. Then in the [ItemTemplate](#) and [ExpanderTemplate](#), set the child items collection to the `ItemsSource` property.

### Important

`ItemsSource` is an alternative mechanism to [Nodes](#) for putting content into the TreeView control. You cannot set both `ItemsSource` and `Nodes` at the same time. When you use `ItemsSource`, nodes created for you internally, but you cannot access them from `Nodes` property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<ContentPage.BindingContext>
<local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView" ChildPropertyName="SubFiles"
ItemsSource="{Binding ImageNodeInfo}">
</syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>

```

**C#**

```
SfTreeView treeView = new SfTreeView();
FileManagerViewModel viewModel = new FileManagerViewModel ();
treeView.ItemsSource = viewModel.ImageNodeInfo;
MainPage = new ContentPage { Content = treeView };
```

## Creating hierarchical Data Model for tree view

Create an hierarchical data model to bind it to the control.

Create a simple hierarchical data source as shown in the following code example in a new class file, and save it as FileManager.cs file.

**C#**

```
public class Folder : INotifyPropertyChanged
{
    private string fileName;
    private ImageSource imageIcon;
    private ObservableCollection<File> files;
    public Folder()
    {
    }
    public ObservableCollection<File> Files
    {
        get { return files; }
        set
        {
            files = value;
            RaisedOnPropertyChanged("SubFiles");
        }
    }
    public string FileName
    {
        get { return fileName; }
        set
        {
            fileName = value;
            RaisedOnPropertyChanged("FileName");
        }
    }
    public ImageSource ImageIcon
    {
        get { return imageIcon; }
        set
        {
            imageIcon = value;
            RaisedOnPropertyChanged("ImageIcon");
        }
    }
    public event PropertyChangedEventHandler PropertyChanged;
    public void RaisedOnPropertyChanged(string _PropertyName)
    {
        if (PropertyChanged != null)
        {
            PropertyChanged(this, new PropertyChangedEventArgs( _PropertyName));
        }
    }
}
```

```
}
}
}
public class File : INotifyPropertyChanged
{
    private string fileName;
    private ImageSource imageIcon;
    private ObservableCollection<SubFile> subFiles;
    public File()
    {
    }
    public ObservableCollection<SubFile> SubFiles
    {
        get { return subFiles; }
        set
        {
            subFiles = value;
            RaisedOnPropertyChanged("SubFiles");
        }
    }
    public string FileName
    {
        get { return fileName; }
        set
        {
            fileName = value;
            RaisedOnPropertyChanged("FileName");
        }
    }
    public ImageSource ImageIcon
    {
        get { return imageIcon; }
        set
        {
            imageIcon = value;
            RaisedOnPropertyChanged("ImageIcon");
        }
    }
    public event PropertyChangedEventHandler PropertyChanged;
    public void RaisedOnPropertyChanged(string _PropertyName)
    {
        if (PropertyChanged != null)
        {
            PropertyChanged(this, new PropertyChangedEventArgs(_PropertyName));
        }
    }
}
public class SubFile : INotifyPropertyChanged
{
    private string fileName;
    private ImageSource imageIcon;
    public SubFile()
    {
    }
    public string FileName
    {
        get { return fileName; }
```

```

set
{
    fileName = value;
    RaisedOnPropertyChanged("FolderName");
}
}
public ImageSource ImageIcon
{
    get { return imageIcon; }
    set
    {
        imageIcon = value;
        RaisedOnPropertyChanged("ImageIcon");
    }
}
public event PropertyChangedEventHandler PropertyChanged;
public void RaisedOnPropertyChanged(string _PropertyName)
{
    if (PropertyChanged != null)
    {
        PropertyChanged(this, new PropertyChangedEventArgs(_PropertyName));
    }
}
}

```

**Note:** If you need your hierarchical data model to respond to property changes, then implement the `INotifyPropertyChanged` interface in your model class.

Create a model repository class with `ImageNodeInfo` collection property initialized with required number of data objects in a new class file as shown in the following code example, and save it as `FileManagerViewModel.cs` file:

### C#

```

public class FileManagerViewModel
{
    public ObservableCollection<Folder> Folders { get; set; }
    public ObservableCollection<File> Files { get; set; }
    public ObservableCollection<SubFile> SubFiles { get; set; }
    public FileManagerViewModel()
    {
        this.Folders = GetFiles();
    }
    private ObservableCollection<Folder> GetFiles()
    {
        var nodeImageInfo = new ObservableCollection<Folder>();
        Assembly assembly = typeof(NodeWithImage).GetTypeInfo().Assembly;
        var doc = new Folder() { FileName = "Documents", ImageIcon =
            ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treeview_folder.png", assembly) };
        var download = new Folder() { FileName = "Downloads", ImageIcon =
            ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treeview_folder.png", assembly) };
        var mp3 = new Folder() { FileName = "Music", ImageIcon =
            ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treeview_folder.png", assembly) };
    }
}

```

```
var pictures = new Folder() { FileName = "Pictures", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_folder.png", assembly) };
var video = new Folder() { FileName = "Videos", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_folder.png", assembly) };
var pollution = new File() { FileName = "Environmental Pollution.docx",
    ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_word.png", assembly) };
var globalWarming = new File() { FileName = "Global Warming.ppt", ImageIcon
    =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_ppt.png", assembly) };
var sanitation = new File() { FileName = "Sanitation.docx", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_word.png", assembly) };
var socialNetwork = new File() { FileName = "Social Network.pdf", ImageIcon
    =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_pdf.png", assembly) };
var youthEmpower = new File() { FileName = "Youth Empowerment.pdf",
    ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_pdf.png", assembly) };
var games = new File() { FileName = "Game.exe", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_exe.png", assembly) };
var tutorials = new File() { FileName = "Tutorials.zip", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_zip.png", assembly) };
var typeScript = new File() { FileName = "TypeScript.7z", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_zip.png", assembly) };
var uiGuide = new File() { FileName = "UI-Guide.pdf", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_pdf.png", assembly) };
var song = new File() { FileName = "Gouttes", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_mp3.png", assembly) };
var camera = new File() { FileName = "Camera Roll", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_folder.png", assembly) };
var stone = new File() { FileName = "Stone.jpg", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_png.png", assembly) };
var wind = new File() { FileName = "Wind.jpg", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_png.png", assembly) };
var img0 = new SubFile() { FileName = "WIN_20160726_094117.JPG", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_img0.png", assembly) };
var img1 = new SubFile() { FileName = "WIN_20160726_094118.JPG", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treev
    iew_img1.png", assembly) };
```

```
var video1 = new File() { FileName = "Naturals.mp4", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treeview_video.png", assembly) };
var video2 = new File() { FileName = "Wild.mpeg", ImageIcon =
    ImageSource.FromResource("SampleBrowser.SfTreeView.Icons.NodeWithImage.treeview_video.png", assembly) };
doc.Files = new ObservableCollection<File>
{
    pollution,
    globalWarming,
    sanitation,
    socialNetwork,
    youthEmpower
};
download.Files = new ObservableCollection<File>
{
    games,
    tutorials,
    typeScript,
    uiGuide
};
mp3.Files = new ObservableCollection<File>
{
    song
};
pictures.Files = new ObservableCollection<File>
{
    camera,
    stone,
    wind
};
camera.SubFiles = new ObservableCollection<SubFile>
{
    img0,
    img1
};
video.Files = new ObservableCollection<File>
{
    video1,
    video2
};
nodeImageInfo.Add(doc);
nodeImageInfo.Add(download);
nodeImageInfo.Add(mp3);
nodeImageInfo.Add(pictures);
nodeImageInfo.Add(video);
return nodeImageInfo;
}
```

### Bind to a Hierarchy Property Descriptors data source - Bound mode

You can create a tree view by binding the [ItemsSource](#) to a hierarchy property descriptors data source. To create a tree view using hierarchical data binding, set a hierarchical collection to the [ItemsSource](#) property, and then set the [TargetType](#) and [ChildPropertyName](#) property values in [HierarchyPropertyDescriptor](#)s.

---

## Important

---

**ItemsSource** is an alternative mechanism to [Nodes](#) for adding content into the TreeView control. You cannot set both **ItemsSource** and **Nodes** at the same time. When you use **ItemsSource**, nodes are created internally, but you cannot access them from the **Nodes** property.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<ContentPage.BindingContext>
<local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView" ItemsSource="{Binding
ImageNodeInfo}">
<sfTreeView:SfTreeView.HierarchyPropertyDescriptors>
<treeviewengine:HierarchyPropertyDescriptor TargetType="{x:Type
local:Folder}" ChildPropertyName="Files"/>
<treeviewengine:HierarchyPropertyDescriptor TargetType="{x:Type local:File}"
ChildPropertyName="SubFiles"/>
</sfTreeView:SfTreeView.HierarchyPropertyDescriptors>
</syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>
```

## C#

```
SfTreeView treeView = new SfTreeView();
FileManagerViewModel viewModel = new FileManagerViewModel ();
treeView.ItemsSource = viewModel.ImageNodeInfo;
MainPage = new ContentPage { Content = treeView };
```

## Defining a template to expander and content view

By defining the [ExpanderTemplate](#) and [ItemTemplate](#) properties, a custom user interface (UI) can be created to display the data items for both expander and content view. It is applicable for both Unbound mode and Bound mode data items.

---

**Note:** By default, the binding context for each tree view item will be the data model object for Bound Mode and [TreeViewNode](#) for Unbound Mode. However, you can change the binding context for tree view items in Bound Mode as [TreeViewNode](#) by defining the [ItemTemplateContextType](#) enumeration to [Node](#), which is applicable for both [ExpanderTemplate](#) and [ItemTemplate](#) properties.

---

The following code example demonstrates how to customize your content view using the [ItemTemplate](#) and [ExpanderTemplate](#) property in both XAML and C#.

## XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<ContentPage.BindingContext>
<local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView" ItemsSource="{Binding
ImageNodeInfo}">
<syncfusion:SfTreeView.ItemTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<Grid x:Name="grid" RowSpacing="0" BackgroundColor="Transparent">
<Grid Padding="5,5,5,5">
<Image Source="{Binding ImageIcon}" VerticalOptions="Center"
HorizontalOptions="Center" HeightRequest="35"
WidthRequest="35"/>
</Grid>
<Grid Grid.Column="1" RowSpacing="1" Padding="1,0,0,0"
VerticalOptions="Center">
<Label LineBreakMode="NoWrap" Text="{Binding ItemName}"
VerticalTextAlignment="Center"/>
</Grid>
</Grid>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfTreeView.ItemTemplate>
<syncfusion:SfTreeView.ExpanderTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<Image IsVisible="{Binding HasChildNodes,Converter={StaticResource
IconVisibleConverter}}"
Source="{ Binding IsExpanded,Converter={StaticResource
ExpanderIconConverter}}"
VerticalOptions="Center" HorizontalOptions="Center"/>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfTreeView.ExpanderTemplate>
</syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>

```

## C#

```

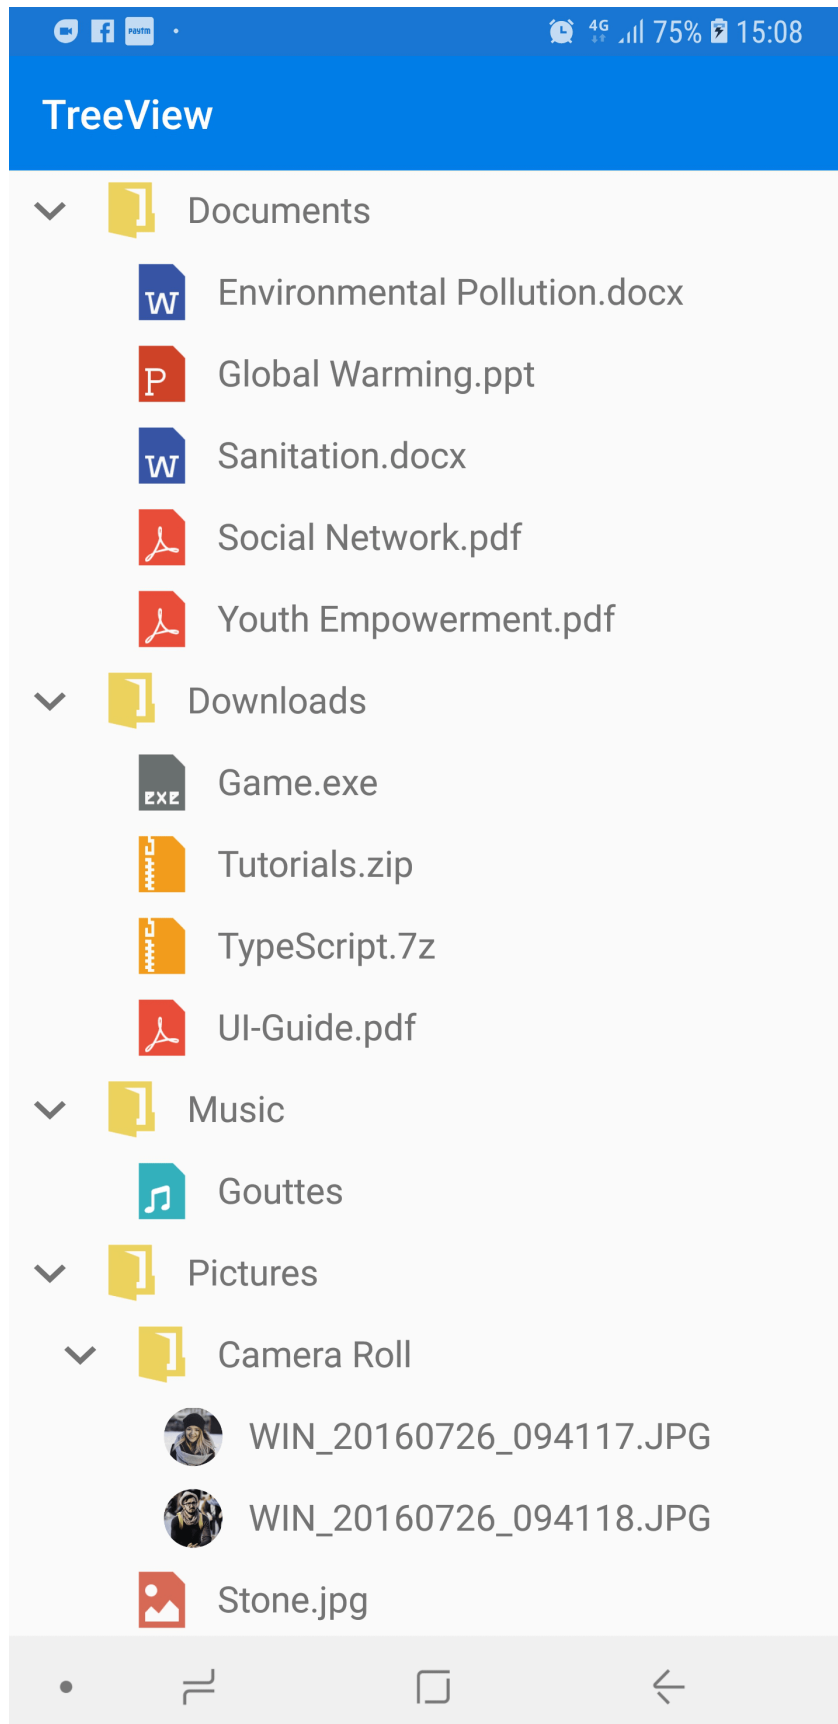

SfTreeView treeView = new SfTreeView();
FileManagerViewModel viewModel = new FileManagerViewModel ();

```

```
treeView.ItemsSource = viewModel.ImageNodeInfo;
treeView.ItemTemplateContextType = ItemTemplateContextType.Node;
treeView.ItemTemplate = new DataTemplate(() =>
{
    var grid = new Grid();
    var imageIcon = new Image();
    imageIcon.SetBinding(Image.SourceProperty, new
Binding("Content.ImageIcon"));
    var itemName = new Label { FontSize = 15 };
    itemName.SetBinding(Label.TextProperty, new Binding("Content.ItemName"));
    grid.Children.Add(imageIcon);
    grid.Children.Add(itemName, 1, 0);
    return grid;
});
treeView.ExpanderTemplate = new DataTemplate(()=>
{
    var grid = new Grid();
    var expanderIcon = new Image();
    imageIcon.SetBinding(Image.SourceProperty, new Binding("IsExpanded"));
})
MainPage = new ContentPage { Content = treeView };
```

Now, run the application to render the similar output:

You can also download the entire source code of this demo from [here](#).

### Interacting with a tree view

The **TreeView** allows you to expand and collapse the nodes either by user interaction on the nodes or by programmatically. The expanding and collapsing interactions can be handled with the help of [NodeCollapsing](#) and [NodeExpanding](#) events.

You can define how the nodes to be expanded while loading the **TreeView** by using [AutoExpandMode](#) property. Also, the **TreeView** allows you to set the restrictions whether expanding and collapsing of nodes can be performed only by tapping in expander view or in both expander view and content view by using [ExpandActionTarget](#) property.

**Note:** [AutoExpandMode](#) property is only applicable for bound mode. For Unbound mode you need to set [IsExpanded](#) property to **true** while creating the nodes, to be in expanded state while loading the **TreeView**.

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<syncfusion:SfTreeView x:Name="treeView" AutoExpandMode="AllNodesExpanded"
ExpandActionTarget="Node"/>
</ContentPage>
```

### C#

```
using Syncfusion.XForms.TreeView;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfTreeView treeView;
        public App()
        {
            treeView = new SfTreeView();
            treeView.AutoExpandMode = AutoExpandMode.AllNodesExpanded;
            treeView.ExpandActionTarget = ExpandActionTarget.Node;
            MainPage = new ContentPage { Content = treeView; }
        }
    }
}
```

### Selection

The **TreeView** allows selecting the item by setting the [SelectionMode](#) property. Set the [SelectionMode](#) property to single, single-deselect, multiple, extended and none based on the requirements. Informations about the selected item can be tracked using the [SelectedItem](#), [CurrentItem](#) and [SelectedItems](#) properties. Also, **TreeView** provides key board navigation support in UWP platform.

It also allows changing the selection highlight color by using the [SelectionBackgroundColor](#) property. Additionally, for unbound mode, you can change the selection foreground color of the text by using the [SelectionForegroundColor](#) property.

The selection operations can be handled with the help of [SelectionChanging](#) and [SelectionChanged](#).

### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted;assembly=GettingStarted"
x:Class="GettingStarted.MainPage">
<syncfusion:SfTreeView x:Name="treeView" SelectionMode="Single"
SelectionBackgroundColor="#E4E4E4" SelectionForegroundColor="#D3D3D3"/>
</ContentPage>
```

### C#

```
using Syncfusion.XForms.TreeView;
using Xamarin.Forms;
namespace GettingStarted
{
    public class App : Application
    {
        SfTreeView treeView;
        public App()
        {
            treeView = new SfTreeView();
            treeView.SelectionMode = SelectionMode.Single;
            treeView.SelectionBackgroundColor = Color.FromHex("#E4E4E4");
            treeView.SelectionForegroundColor = Color.FromHex("#D3D3D3");
            MainPage = new ContentPage { Content = treeView; }
        }
    }
}
```

## Data Population

TreeView can be populated either with the data source by using a [ItemsSource](#) property or by creating and adding the [TreeViewNode](#) in hierarchical structure to [Nodes](#) property.

### Populating Nodes by data binding - Bound Mode

[Nodes](#) can be populated in bound mode includes following steps.

- [Create hierarchical data model](#)
- [Bind data model to treeview](#)

To update the collection changes in UI, it is necessary to define [NotificationSubscriptionMode](#) to Treeview as CollectionChanged /PropertyChanged.

`NotificationSubscriptionMode` enum has following members:

- **CollectionChange** - Updates its tree structure when child items collection gets changed.
- **PropertyChange** - Updates its ChildItems when associated collection property gets changed.
- **None** - It is a default mode and it doesn't reflect collection/property changes in UI.

To decide how to populate the nodes, it is necessary to set this [NodePopulationMode](#) API to Treeview.

The **NodePopulationMode** API has following enum values:

- **OnDemand** - Populate the child nodes only when parent nodes is expanded. It is the default value.
- **Instant** - Populates all the child nodes when Treeview control is initially loaded.

#### *Create Data Model for treeview*

Create a simple data source as shown in the following code example in a new class file, and save it as **FileManager.cs** file:

#### **C#**

```
//FileManager.cs
public class FileManager : INotifyPropertyChanged
{
    private string fileName;
    private ImageSource imageIcon;
    private ObservableCollection<FileManager> subFiles;
    public ObservableCollection<FileManager> SubFiles
    {
        get { return subFiles; }
        set
        {
            subFiles = value;
            RaisedOnPropertyChanged("SubFiles");
        }
    }
    public string ItemName
    {
        get { return fileName; }
        set
        {
            fileName = value;
            RaisedOnPropertyChanged("FolderName");
        }
    }
    public ImageSource ImageIcon
    {
        get { return imageIcon; }
        set
        {
            imageIcon = value;
            RaisedOnPropertyChanged("ImageIcon");
        }
    }
    public event PropertyChangedEventHandler PropertyChanged;
    public void RaisedOnPropertyChanged(string _PropertyName)
    {
        if (PropertyChanged != null)
    }
```

```
{  
    PropertyChanged(this, new PropertyChangedEventArgs(_PropertyName));  
}  
}  
}
```

Create a model repository class with ImageNodeInfo collection property initialized with required number of data objects in a new class file as shown in the following code example, and save it as FileManagerViewModel.cs file:

### C#

```
public class FileManagerViewModel  
{  
    private ObservableCollection<FileManager> imageNodeInfo;  
    public FileManagerViewModel()  
    {  
        GenerateSource();  
    }  
    public ObservableCollection<FileManager> ImageNodeInfo  
    {  
        get { return imageNodeInfo; }  
        set { this.imageNodeInfo = value; }  
    }  
    private void GenerateSource()  
    {  
        var nodeImageInfo = new ObservableCollection<FileManager>();  
        Assembly assembly = typeof(GettingStated).GetTypeInfo().Assembly;  
        var doc = new FileManager() { ItemName = "Documents", ImageIcon =  
            ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",  
            assembly) };  
        var download = new FileManager() { ItemName = "Downloads", ImageIcon =  
            ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",  
            assembly) };  
        var mp3 = new FileManager() { ItemName = "Music", ImageIcon =  
            ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",  
            assembly) };  
        var pictures = new FileManager() { ItemName = "Pictures", ImageIcon =  
            ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",  
            assembly) };  
        var video = new FileManager() { ItemName = "Videos", ImageIcon =  
            ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",  
            assembly) };  
        var pollution = new FileManager() { ItemName = "Environmental  
Pollution.docx", ImageIcon =  
            ImageSource.FromResource("GettingStartedBound.Icons.treeview_word.png",  
            assembly) };  
        var globalWarming = new FileManager() { ItemName = "Global Warming.ppt",  
            ImageIcon =  
            ImageSource.FromResource("GettingStartedBound.Icons.treeview_ppt.png",  
            assembly) };  
        var sanitation = new FileManager() { ItemName = "Sanitation.docx", ImageIcon  
            = ImageSource.FromResource("GettingStartedBound.Icons.treeview_word.png",  
            assembly) };  
        var socialNetwork = new FileManager() { ItemName = "Social Network.pdf",  
            ImageIcon =
```

```
ImageSource.FromResource("GettingStartedBound.Icons.treeview_pdf.png",
assembly) };
var youthEmpower = new FileManager() { ItemName = "Youth Empowerment.pdf",
ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_pdf.png",
assembly) };
var games = new FileManager() { ItemName = "Game.exe", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_exe.png",
assembly) };
var tutorials = new FileManager() { ItemName = "Tutorials.zip", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_zip.png",
assembly) };
var TypeScript = new FileManager() { ItemName = "TypeScript.7z", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_zip.png",
assembly) };
var uiGuide = new FileManager() { ItemName = "UI-Guide.pdf", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_pdf.png",
assembly) };
var song = new FileManager() { ItemName = "Goutiest", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_mp3.png",
assembly) };
var camera = new FileManager() { ItemName = "Camera Roll", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_folder.png",
assembly) };
var stone = new FileManager() { ItemName = "Stone.jpg", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_png.png",
assembly) };
var wind = new FileManager() { ItemName = "Wind.jpg", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_png.png",
assembly) };
var img0 = new FileManager() { ItemName = "WIN_20160726_094117.JPG",
ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_img0.png",
assembly) };
var img1 = new FileManager() { ItemName = "WIN_20160726_094118.JPG",
ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_img1.png",
assembly) };
var video1 = new FileManager() { ItemName = "Naturals.mp4", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_video.png",
assembly) };
var video2 = new FileManager() { ItemName = "Wild.mpg", ImageIcon =
ImageSource.FromResource("GettingStartedBound.Icons.treeview_video.png",
assembly) };
doc.SubFiles = new ObservableCollection<FileManager>
{
pollution,
globalWarming,
sanitation,
socialNetwork,
youthEmpower
};
download.SubFiles = new ObservableCollection<FileManager>
{
games,
tutorials,
TypeScript,
```

```

uiGuide
};
mp3.SubFiles = new ObservableCollection<FileManager>
{
    song
};
pictures.SubFiles = new ObservableCollection<FileManager>
{
    camera,
    stone,
    wind
};
camera.SubFiles = new ObservableCollection<FileManager>
{
    img0,
    img1
};
video.SubFiles = new ObservableCollection<FileManager>
{
    video1,
    video2
};
nodeImageInfo.Add(doc);
nodeImageInfo.Add(download);
nodeImageInfo.Add(mp3);
nodeImageInfo.Add(pictures);
nodeImageInfo.Add(video);
imageNodeInfo = nodeImageInfo;
}
}

```

#### *Bind to hierarchical datasource*

To create a tree view using data binding, set a hierarchical data collection to the [ItemsSource](#) property. And set the child object name to the [ChildPropertyName](#) property.

#### **XML**

```

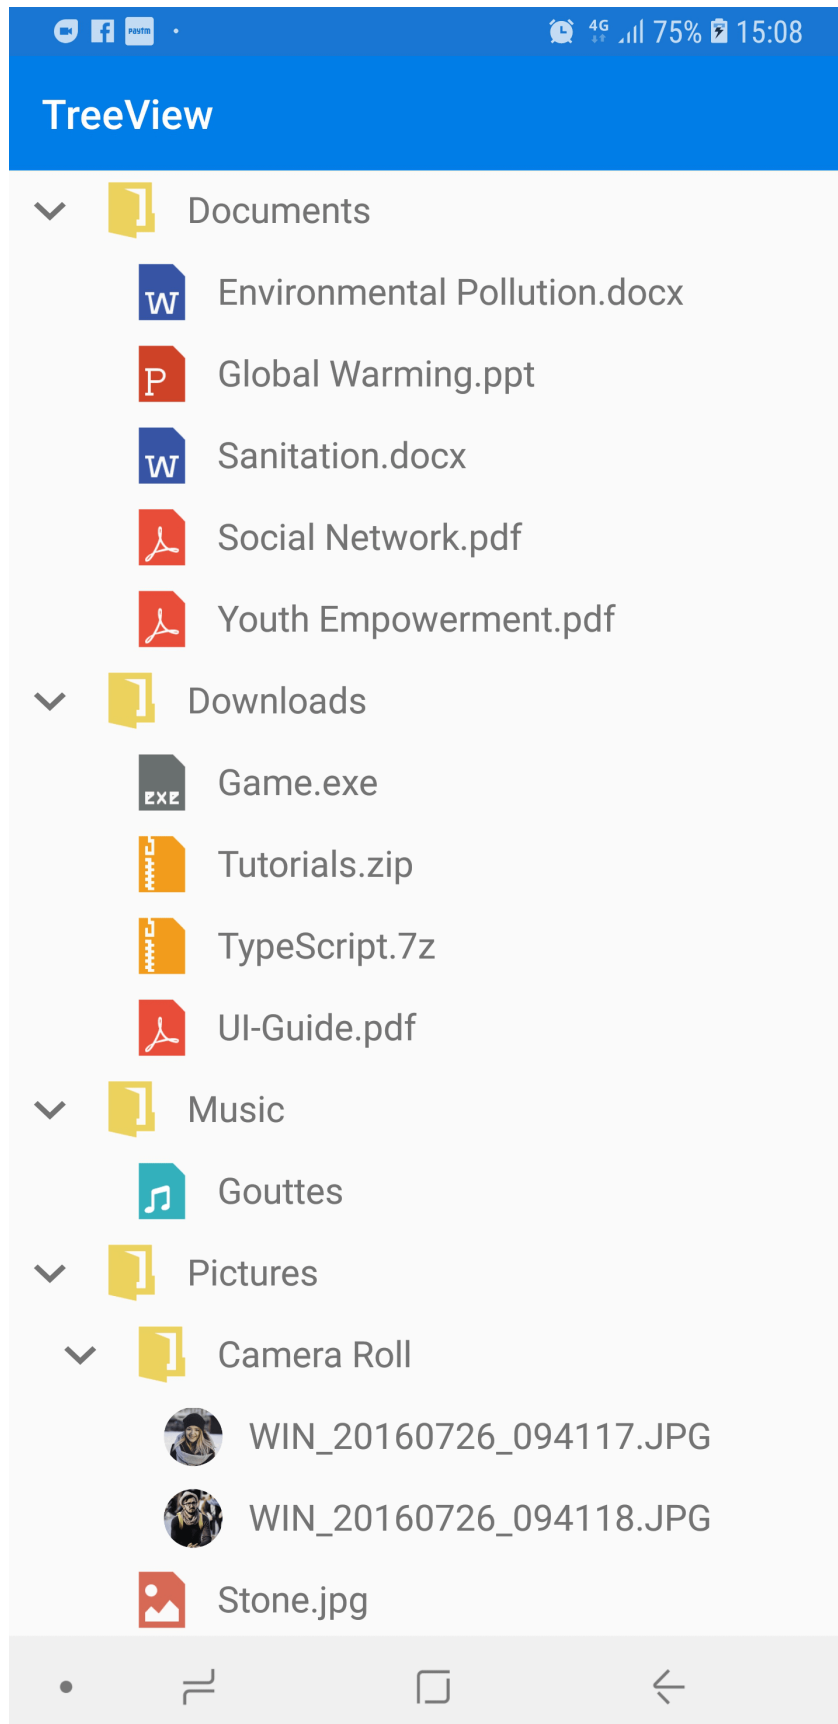

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
x:Class="GettingStarted.MainPage">
<ContentPage.BindingContext>
<local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView"
ChildPropertyName="SubFiles"
ItemsSource="{Binding ImageNodeInfo}"/>
</syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>

```

#### **C#**

```
SfTreeView treeView = new SfTreeView();  
FileManagerViewModel viewModel = new FileManagerViewModel ();  
treeView.ChildPropertyName = "SubFiles";  
treeView.ItemsSource = viewModel.ImageNodeInfo;  
MainPage = new ContentPage { Content = treeView };
```

You can also download the entire source code of this demo from [here](#).

### Populating Nodes without data binding - Unbound Mode

You can create and manage the [TreeViewNode](#) objects by yourself to display the data in a hierarchical view. Create the node hierarchy by adding one or more root nodes to the [Nodes](#) collection. Each [TreeViewNode](#) can then have more nodes added to its Children collection. You can nest tree view nodes to whatever depth you require.

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms">
  <ContentPage.Content>
    <syncfusion:SfTreeView x:Name="treeView">
      <syncfusion:SfTreeView.Nodes>
        <treeviewengine:TreeViewNode Content="Australia">
          <treeviewengine:TreeViewNode.ChildNodes>
            <treeviewengine:TreeViewNode Content="New South Wales">
              <treeviewengine:TreeViewNode.ChildNodes>
                <treeviewengine:TreeViewNode Content="Sydney"/>
              </treeviewengine:TreeViewNode.ChildNodes>
            </treeviewengine:TreeViewNode>
          </treeviewengine:TreeViewNode.ChildNodes>
        </treeviewengine:TreeViewNode>
        <treeviewengine:TreeViewNode Content="United States of America">
          <treeviewengine:TreeViewNode.ChildNodes>
            <treeviewengine:TreeViewNode Content="New York"/>
            <treeviewengine:TreeViewNode Content="California">
              <treeviewengine:TreeViewNode.ChildNodes>
                <treeviewengine:TreeViewNode Content="San Francisco"/>
              </treeviewengine:TreeViewNode.ChildNodes>
            </treeviewengine:TreeViewNode>
          </treeviewengine:TreeViewNode.ChildNodes>
        </treeviewengine:TreeViewNode>
      </syncfusion:SfTreeView.Nodes>
    </syncfusion:SfTreeView>
  </ContentPage.Content>
</ContentPage>
```

#### C#

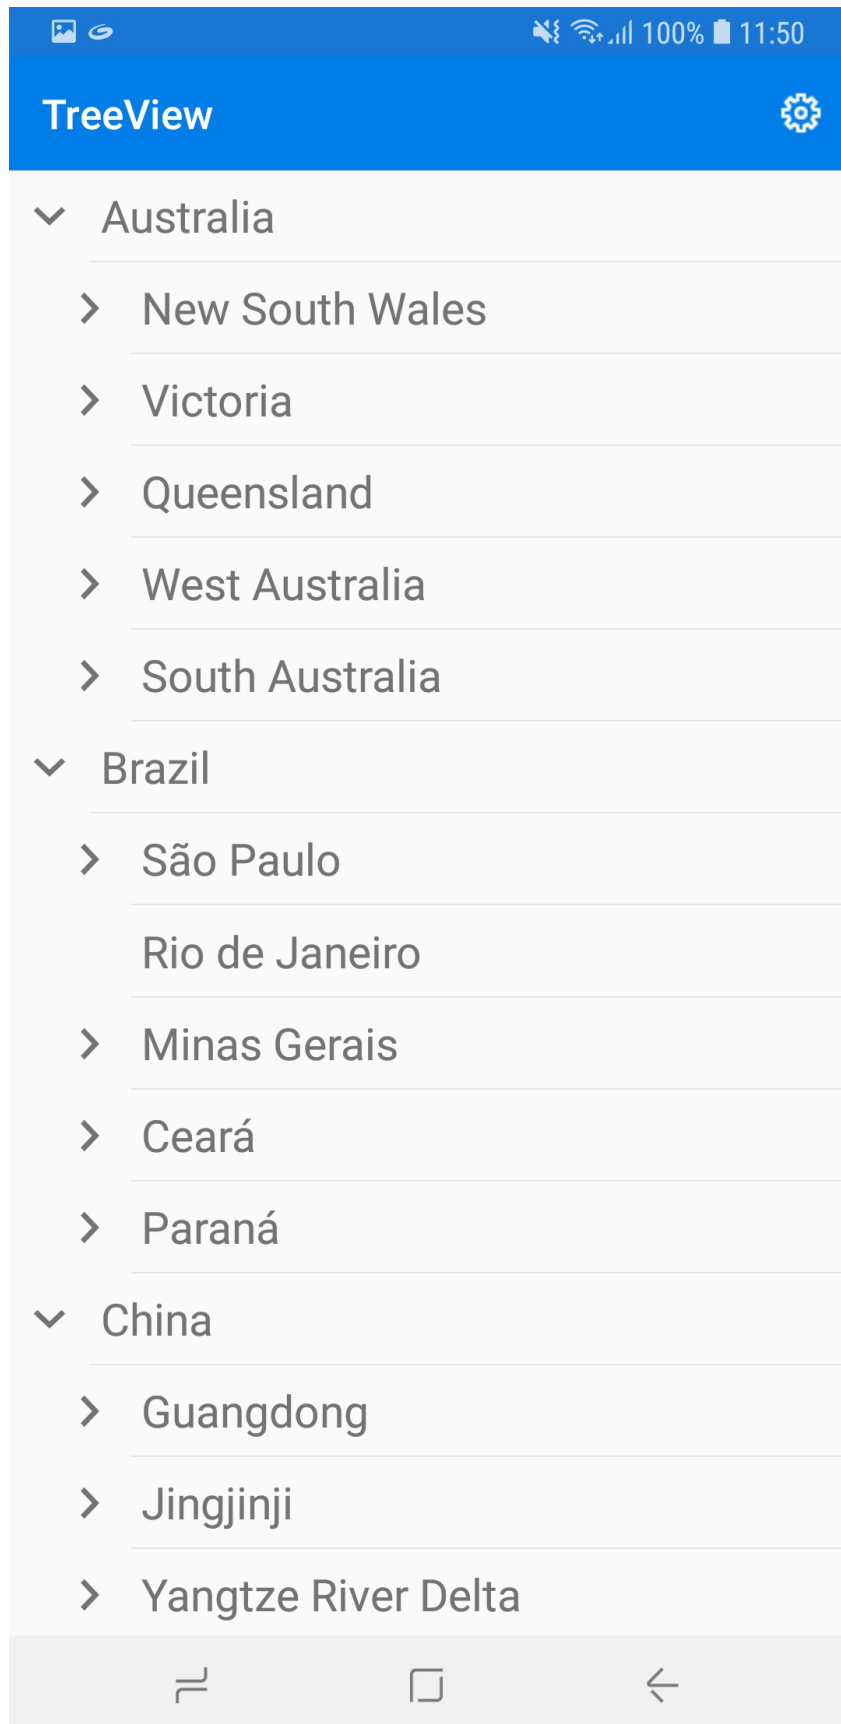

```
public class App : Application
{
    SfTreeView treeView;
    public App()
    {
        treeView = new SfTreeView();
        var australia = new TreeViewNode() { Content = "Australia" };
        var _NSW = new TreeViewNode() { Content = "New South Wales" };
        var _Sydney = new TreeViewNode() { Content = "Sydney" };
        australia.Children.Add(_NSW);
        _NSW.Children.Add(_Sydney);
        var usa = new TreeViewNode() { Content = "United States of America" };
        var newYork = new TreeViewNode() { Content = "New York," };
        var california = new TreeViewNode() { Content = "California" };
    }
}
```

```
var SanFrancisco = new TreeViewNode() { Content = "San Francisco" };  
usa.ChildNodes.Add(newYork);  
usa.ChildNodes.Add(_California);  
_California.ChildNodes.Add(SanFrancisco);  
treeView.Nodes.Add(australia);  
treeView.Nodes.Add(usa);  
MainPage = new ContentPage { Content = treeView};  
}  
}
```

Now, run the application to render the below output:

You can also download the entire source code of this demo from [here](#).

## Appearance

The TreeView allows customizing appearance of the underlying data, and provides different functionalities to the end-user.

## ItemTemplate

A template can be used to present the data in a way that makes sense for the application by using different controls.

The TreeView allows you to customize the appearance of content view and expander view by setting the [ItemTemplate](#) and [ExpanderTemplate](#) properties.

## XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage">
  <ContentPage.BindingContext>
    <local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
  </ContentPage.BindingContext>
  <ContentPage.Content>
    <syncfusion:SfTreeView x:Name="treeView"
      ChildPropertyName="SubFiles"
      ItemsSource="{Binding ImageNodeInfo}"/>
    <syncfusion:SfTreeView.ItemTemplate>
      <DataTemplate>
        <Grid Padding="5,0,0,0">
          <Label Text="{Binding ItemName}"
            VerticalTextAlignment="Center"/>
        </Grid>
      </DataTemplate>
    </syncfusion:SfTreeView.ItemTemplate>
  </syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>
```

## C#

```
public class MainPage : ContentPage
{
    SfTreeView treeView;
    public MainPage()
    {
        treeView = new SfTreeView();
        FileManagerViewModel viewModel = new FileManagerViewModel ();
        treeView.ChildPropertyName = "SubFiles";
        treeView.ItemsSource = viewModel.ImageNodeInfo;
        treeView.ItemTemplate = new DataTemplate(() => {
            var grid = new Grid ();
            var itemName = new Label;
            itemName.SetBinding(Label.TextProperty, new Binding("ItemName"));
            grid.Children.Add(itemName);
            return grid;
        });
    }
}
```

```

    });
}
}

```

### BindingContext for ItemTemplate

By default, the binding context of tree view item will be the data model object for Bound Mode and [TreeNode](#) for Unbound Mode.

For Bound Mode, you can change the binding context of the treeview items by using [ItemTemplateContextType](#) property.

### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStartedBound"
x:Class="GettingStarted.MainPage">
  <ContentPage.BindingContext>
  <local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
</ContentPage.BindingContext>
  <ContentPage.Content>
  <syncfusion:SfTreeView x:Name="treeView"
  ItemTemplateContextType="Node"
  ChildPropertyName="SubFiles"
  ItemsSource="{Binding ImageNodeInfo}"/>
  <syncfusion:SfTreeView.ItemTemplate>
  <DataTemplate>
  <Grid Padding="5,0,0,0">
  <Label Text="{Binding Content.ItemName}"
  VerticalTextAlignment="Center"/>
  </Grid>
  </DataTemplate>
  </syncfusion:SfTreeView.ItemTemplate>
  </syncfusion:SfTreeView>
  </ContentPage.Content>
</ContentPage>

```

### C#

```

public class MainPage : ContentPage
{
    SfTreeView treeView;
    public MainPage()
    {
        treeView = new SfTreeView();
        FileManagerViewModel viewModel = new FileManagerViewModel ();
        treeView.ChildPropertyName = "SubFiles";
        treeView.ItemTemplateContextType = ItemTemplateContextType.Node;
        treeView.ItemsSource = viewModel.ImageNodeInfo;
        treeView.ItemTemplate = new DataTemplate(() => {
            var grid = new Grid ();
            var itemName = new Label;

```

```

itemName.SetBinding(Label.TextProperty, new Binding("Content.ItemName"));
grid.Children.Add(itemName);
return grid;
});
}
}

```

Similarly, you can customize the expander view by using `ExpanderTemplate` property like above example.

### ItemTemplate Selector

The TreeView allows you to customize the appearance of each item with different templates based on specific constraints by using the [DataTemplateSelector](#). You can choose a [DataTemplate](#) for each item at runtime based on the value of data-bound property using `DataTemplateSelector`.

#### Create a data template selector

Create custom class that inherits from `DataTemplateSelector`, and override the `OnSelectTemplate` method to return the [DataTemplate](#) for that item. At runtime, the TreeView invokes the `OnSelectTemplate` method for each item and passes the data object as parameter.

Create different templates and by using `DataTemplateSelector`, load those templates using `OnSelectTemplate` based on requirements.

### C#

```

public class ItemTemplateSelector : DataTemplateSelector
{
    public DataTemplate Template1 { get; set; }
    public DataTemplate Template2 { get; set; }
    public ItemTemplateSelector()
    {
        this.Template1 = new DataTemplate(typeof(Template1));
        this.Template2 = new DataTemplate(typeof(Template2));
    }
    protected override DataTemplate OnSelectTemplate(object item, BindableObject container)
    {
        var treeviewNode = item as TreeViewNode;
        if (treeviewNode == null)
            return null;
        if (treeviewNode.Level == 0)
            return Template1;
        else
            return Template2;
    }
}

```

#### Applying a data template selector

Assign custom [DataTemplateSelector](#) to the [ItemTemplate](#) either in XAML or C#.

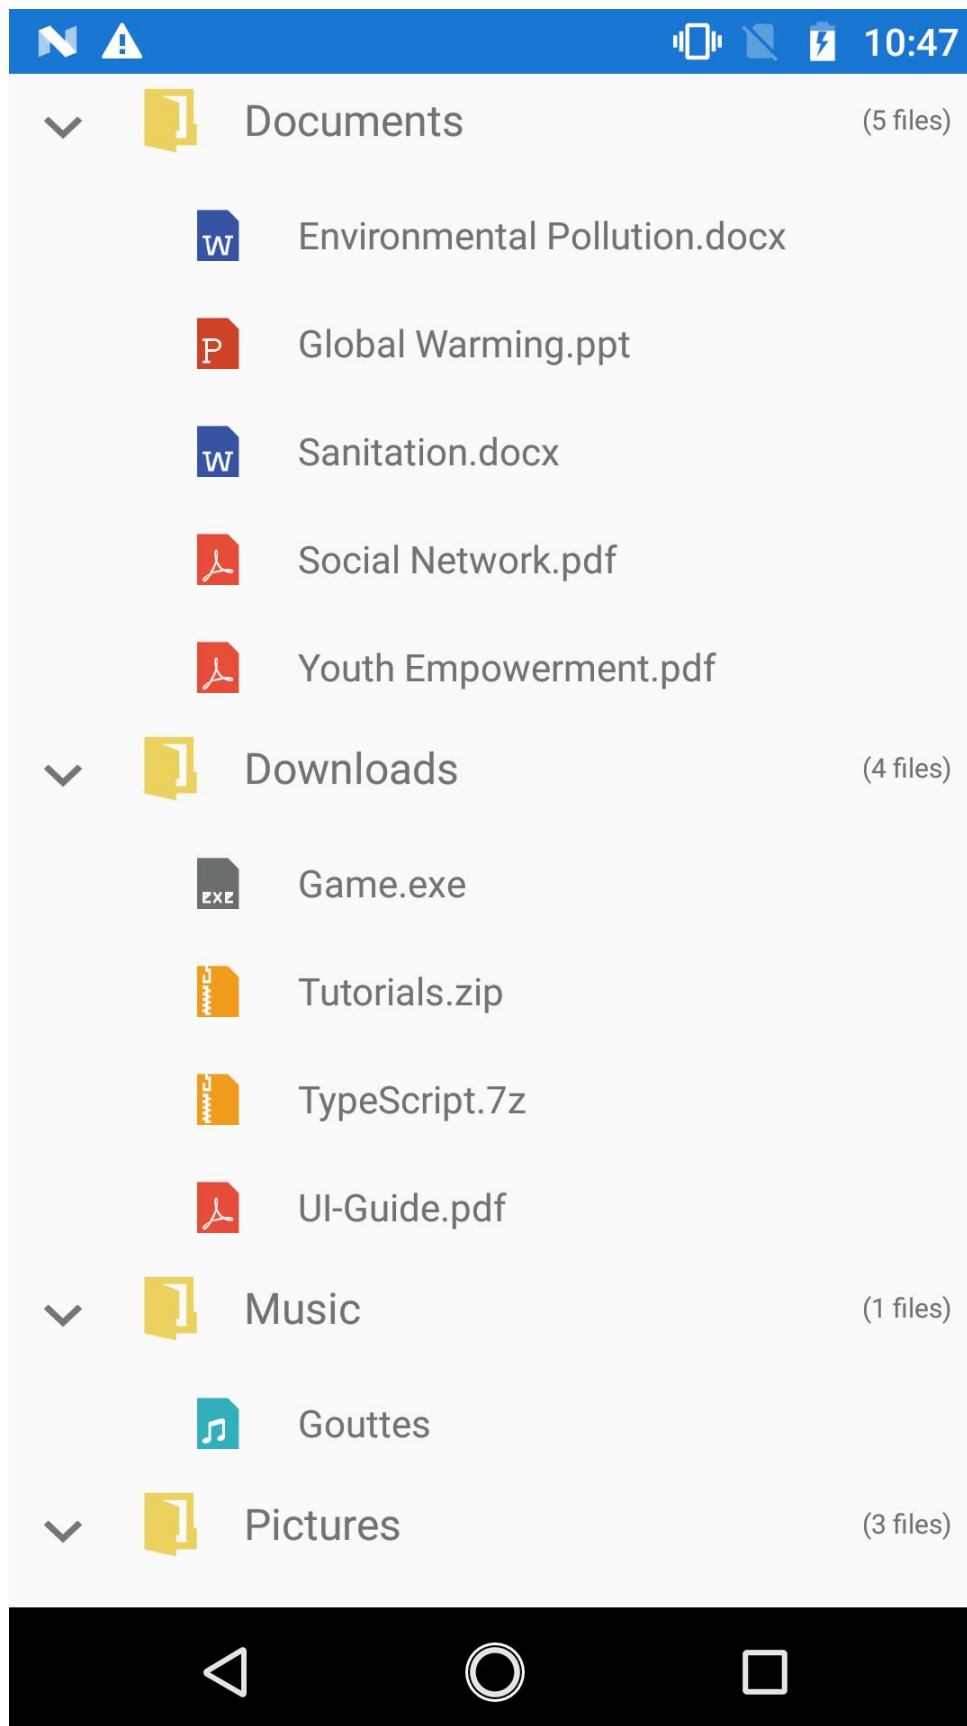

Following code example illustrates to load the different templates for treeview items using `DataTemplateSelector` based on different levels.

### XML

```
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:treeviewengine="clr-
namespace:Syncfusion.TreeView.Engine;assembly=Syncfusion.SfTreeView.XForms"
x:Class="TemplateSelector.MainPage"
xmlns:local="clr-namespace:TemplateSelector;assembly=TemplateSelector">
<ContentPage.Resources>
<ResourceDictionary>
<local:ItemTemplateSelector x:Key="ItemTemplateSelector" />
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView"
ItemTemplate="{StaticResource ItemTemplateSelector}"/>
</ContentPage.Content>
</ContentPage>
```

## C#

```
SfTreeView treeView = new SfTreeView();
treeView.ItemTemplate = new ItemTemplateSelector()
```

You can also download the entire source code of this demo from [here](#)

Similarly, you can provide `DataTemplateSelector` for [ExpanderTemplate](#) property.

### Indentation

The TreeView allows customizing the indent spacing of items by setting the [Indentation](#) property. The default value of this property is `40`. This property can be customized at runtime.

#### XML

```
<syncfusion:SfTreeView x:Name="treeView" Indentation="40">
```

#### C#

```
SfTreeView treeView = new SfTreeView();  
treeView.Indentation = 40;
```

### ExpanderWidth

The TreeView allows customizing the width of expander view by setting the [ExpanderWidth](#) property. The default value of this property is `40`. This property can be customized at runtime.

#### XML

```
<syncfusion:SfTreeView x:Name="treeView" ExpanderWidth="40">
```

#### C#

```
SfTreeView treeView = new SfTreeView();  
treeView.ExpanderWidth = 40;
```

### ExpanderPosition

The TreeView allows you change the position of expander view by setting the [ExpanderPosition](#) property. The default value of this property is `Start`. This property has following two positions:

- `Start`: Allows displaying the expander view at the start position.
- `End`: Allows displaying the expander view at the end position.

#### XML

```
<syncfusion:SfTreeView x:Name="treeView" ExpanderPosition="End">
```

#### C#

```
SfTreeView treeView = new SfTreeView();  
treeView.ExpanderPosition = ExpanderPosition.End;
```

### Level based styling

The TreeView allows you to customize the style of `TreeViewItem` based on different levels by using [IValueConverter](#).

#### XML

```
<ContentPage.Resources>
<ResourceDictionary>
<local:FontAttributeConverter x:Key="FontAttributeConverter"/>
</ResourceDictionary>
</ContentPage.Resources>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView"
ChildPropertyName="SubFolder"
AutoExpandMode="AllNodesExpanded"
ItemTemplateContextType="Node"
ExpanderWidth="0"
ItemsSource="{Binding Folders}">
<syncfusion:SfTreeView.ItemTemplate>
<DataTemplate>
<ViewCell>
<ViewCell.View>
<Label LineBreakMode="NoWrap"
Text="{Binding Content.FolderName}"
FontSize="Medium"
FontAttributes="{Binding Level, Converter={x:StaticResource
FontAttributeConverter}}"/>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfTreeView.ItemTemplate>
</syncfusion:SfTreeView>
</ContentPage.Content>
```

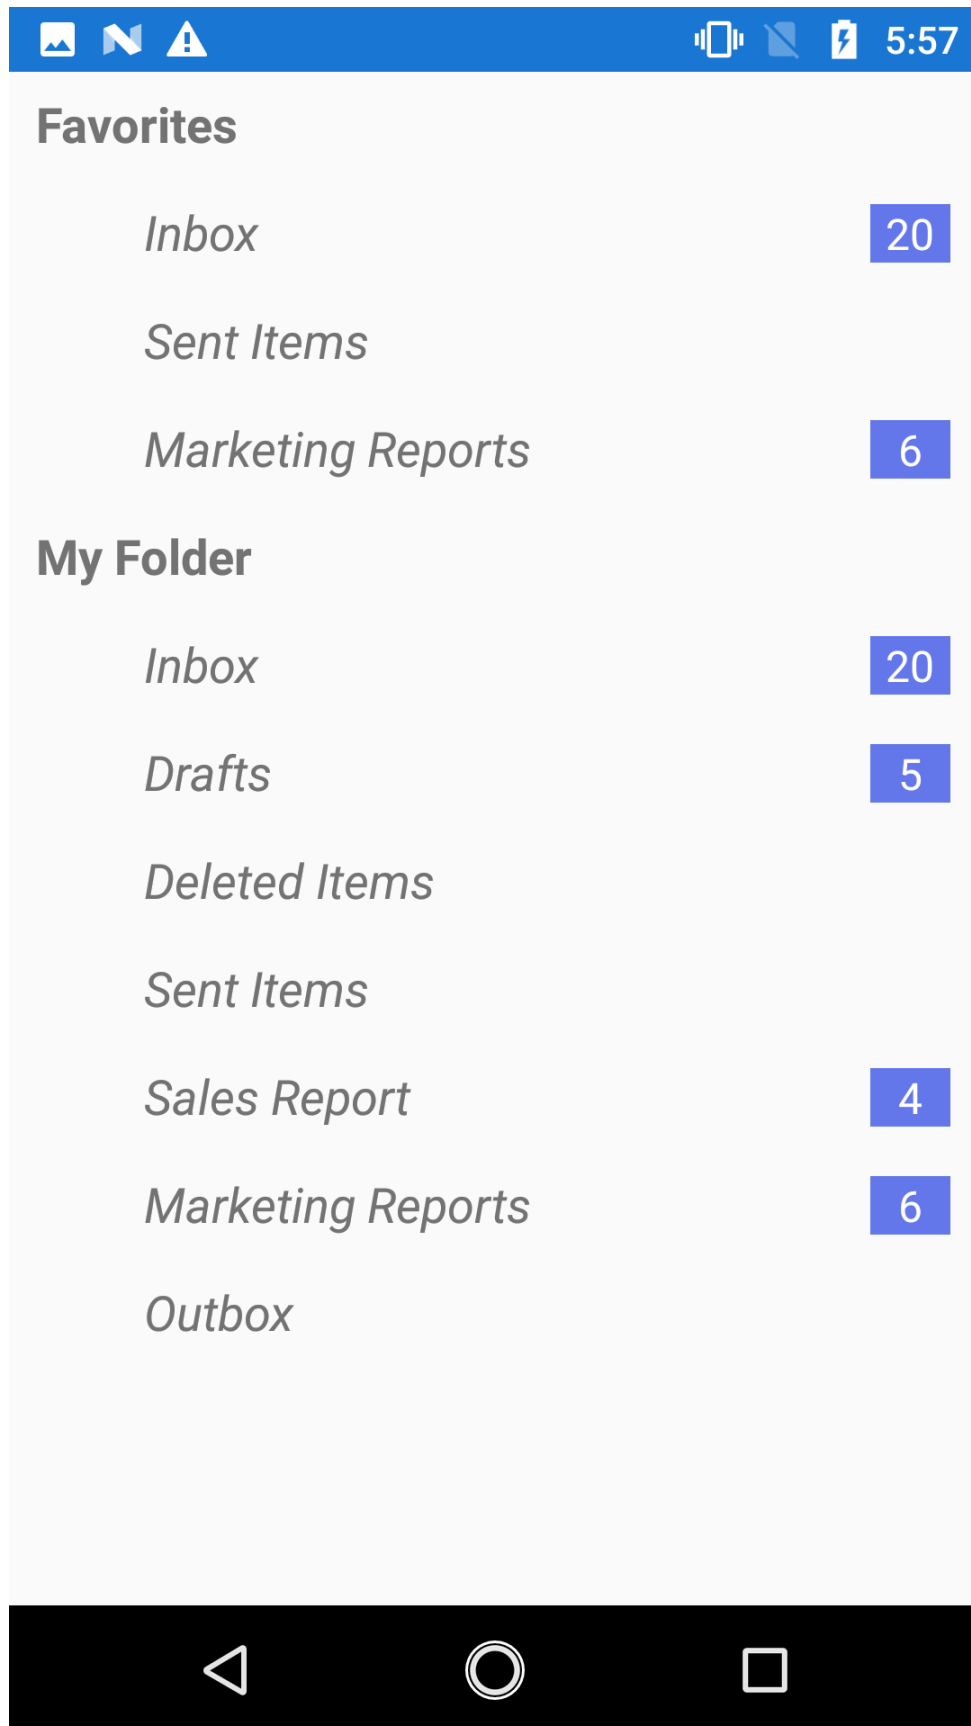

## C#

```
public class FontAttributeConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        var level = (int)value;
        return level == 0 ? FontAttributes.Bold : FontAttributes.Italic;
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        CultureInfo culture)
    {
        throw new NotImplementedException();
    }
}
```

Now, run the application to render the below output:

You can also download the entire source code of this demo from [here](#).

### Animation

The SfTreeView supports to animate expanding or collapsing the [TreeViewNode](#). To enable/disable the animation use [IsAnimationEnabled](#) property of SfTreeView.

**Note:** The default value of the IsAnimationEnabled property is false.

### XML

```
<syncfusion:SfTreeView x:Name="treeView" IsAnimationEnabled="true">
```

### C#

```
SfTreeView treeView = new SfTreeView();  
treeView.IsAnimationEnabled = true;
```

### Expand and Collapse

The TreeView allows you to expand and collapse the nodes either by user interaction on the nodes or by programmatically.

#### Expand Action Target

Expanding and Collapsing of nodes can be performed either by tapping the expander view or in both expander view and content view by setting the [ExpandActionTarget](#) property.

## XML

```
<syncfusion:SfTreeView x:Name="TreeView" ExpandActionTarget="Node"/>
```

## C#

```
// Expands by tapping both expander view and content view.  
treeView.ExpandActionTarget = ExpandActionTarget.Node;
```

### Auto Expand Mode

By default, the treeview items will be in collapsed state. You can define how the nodes to be expanded while loading the TreeView by using [AutoExpandMode](#) property.

The [AutoExpandMode](#) property is only applicable for bound mode. For Unbound mode you need to set [IsExpanded](#) property to [true](#) while creating the nodes, to be in expanded state while loading the TreeView.

- None : All items are collapsed when loaded.
- RootNodesExpanded : Expands only the root item when loaded.
- AllNodesExpanded : Expands all the items when loaded.

### Programmatic Expand and Collapse

TreeView allows programmatic expand and collapse based on the [TreeViewNode](#) and level by using following methods.

- [ExpandNode\(TreeViewNode item\)](#) - Method to expand the particular [TreeViewNode](#) passed to it.
- [CollapseNode\(TreeViewNode item\)](#) - Method to collapse the particular [TreeViewNode](#) passed to it.
- [ExpandNodes\(int level\)](#) - Method to expand the all items of level passed to it.
- [CollapseNodes\(int level\)](#) - Method to expand the all items of level passed to it.

## C#

```
// Expands all the nodes of root level '0'  
treeView.ExpandNodes(0);  
// Collapses all the nodes of root level '0'  
treeView.CollapseNodes(0);  
// Expand a particular node.  
treeView.ExpandNode(node);  
// Expand a particular node.  
treeView.CollapseNode(node);
```

### Expand and Collapse all the nodes

Expand and Collapse all the [TreeViewNode](#) programmatically at runtime by using the [SfTreeView.ExpandAll](#) method and [SfTreeView.CollapseAll](#) method.

## C#

```
//Expands all the nodes  
treeView.ExpandAll();
```

```
//Collapses all the nodes  
treeView.CollapseAll();
```

### Expand and Collapse using Keyboard

TreeView allows to expand and collapse the nodes by using right and left arrows keys. To expand a node, press the right arrow key and to collapse a node, press the left arrow key on the focused item.

### Events

TreeView exposes following events to handle expanding and collapsing of items.

- [NodeCollapsing](#) - It occurs when a node is being collapsed.
- [NodeExpanding](#) - It occurs when a node is being expanded.
- [NodeCollapsed](#) - It occurs when a node is collapsed.
- [NodeExpanded](#) - It occurs when a node is expanded.

The expanding and collapsing interactions can be handled with the help of `NodeCollapsing` and `NodeExpanding` events and expanded and collapsed interactions can be handled with help of `NodeCollapsed` and `NodeExpanded` events.

You can also achieve handle expand and collapse operation using `ExpandCommand` and `CollapseCommand`.

### Interactivity

This section explains about how to interact with `TreeView` and its items.

#### Interacting with TreeView items

##### Loaded event

The [Loaded](#) event is raised when the TreeView is loading in view for the first time.

### C#

```
treeView.Loaded += TreeView_Loaded;  
private void TreeView_Loaded(object sender, TreeViewLoadedEventArgs e)  
{  
    DisplayAlert("Message", "TreeView is Loaded", "Done");  
}
```

The `Loaded` event is used for the following use case:

- To scroll the desired item by using the [BringIntoView](#).

##### Tapped event

The [ItemTapped](#) event will be triggered whenever tapping the item. [ItemTappedEventArgs](#) has the following members which provides the information for `ItemTapped` event:

- `Node`: Gets the [TreeViewNode](#) and data associated with the tapped item as its arguments.
- `Position`: Gets the touch position in the tapped item.
- `Handled`: Gets or sets whether the event is handled or not.

**C#**

```
treeView.ItemTapped += TreeView_ItemTapped;
private void TreeView_ItemTapped(object sender, ItemTappedEventArgs e)
{
    DisplayAlert("Item Tapped", "TreeView item tapped", "Close");
}
```

*ItemDoubleTapped event*

The [ItemDoubleTapped](#) event will be triggered whenever double tapping the item. The [ItemDoubleTappedEventArgs](#) has the following members providing information for the [ItemDoubleTapped](#) event:

- **Node**: Gets the [TreeViewNode](#) and data associated with the double tapped item as its arguments.
- **Position**: Gets the touch position in the double tapped item.
- **Handled**: Gets or sets whether the event is handled or not.

**C#**

```
treeView.ItemDoubleTapped += TreeView_ItemDoubleTapped;
private void TreeView_ItemDoubleTapped(object sender,
ItemDoubleTappedEventArgs e)
{
    DisplayAlert("Item DoubleTapped", "TreeView item double tapped", "Close");
}
```

*ItemHolding event*

The [ItemHolding](#) event will be triggered whenever the item is long pressed.

[ItemHoldingEventArgs](#) has the following members which provides the information for [ItemHolding](#) event:

- **Node**: Gets the [TreeViewNode](#) and data associated with the hold item as its arguments.
- **Position**: Gets the touch position in the hold item.
- **Handled**: Gets or sets whether the event is handled or not.

**C#**

```
treeView.ItemHolding += TreeView_ItemHolding;
private void TreeView_ItemHolding(object sender, ItemHoldingEventArgs e)
{
    DisplayAlert("Item Hold", "TreeView item is holding", "Close");
}
```

## Scrolling

The TreeView provides various options to achieve programmatic scrolling. Please walkthrough the below section in detail to achieve the same.

### Bring Into View

The TreeView allows programmatic scrolling based on the data model and [TreeNode](#) by using the [BringIntoView](#) method.

#### C#

```
private void BringIntoView_Clicked(object sender, EventArgs e)
{
    var count= viewModel.ImageNodeInfo.Count;
    var data = viewModel.ImageNodeInfo[count-1];
    TreeView.BringIntoView(data);
}
```

You can also download the entire source code of this demo from [here](#).

The `BringIntoView` method comprises of other optional parameters to decide on the way in which the child item should come into view.

#### *Scroll to the child item with animation*

The second optional parameter `disableAnimation` in `BringIntoView` method decides whether the scrolling animation should be enabled or disabled when the child item comes into view. By default, the scrolling will be animated.

- If the parameter value is `true`, scrolling animation will be disabled.
- If the parameter value is `false`, scrolling animation will be enabled.

#### C#

```
private void BringIntoView_Clicked(object sender, EventArgs e)
{
    var count= viewModel.ImageNodeInfo.Count;
    var data = viewModel.ImageNodeInfo[count-1];
    // Here, the second optional parameter has been passed as true hence it will
    // disable the animation
    TreeView.BringIntoView(data, true);
}
```

#### *Scroll to the collapsed child item*

The third optional parameter `canExpand` in `BringIntoView` method decides whether we need to expand and show the collapsed node or not when item passed for `BringIntoView` method which is in collapsed state. By default, this parameter value will be `false`.

- If the parameter value is `true`, TreeView expands the collapsed node if it is collapsed and scroll to the specified item.
- If the parameter value is `false`, TreeView does not expand the collapsed node and only scroll for item which is not in collapsed state.

#### C#

```
private void BringIntoView_Clicked(object sender, EventArgs e)
{
    var count= viewModel.ImageNodeInfo.Count;
```

```
var data = viewModel.ImageNodeInfo[count-1];
TreeView.BringIntoView(data, false, true);
}
```

**Note:** We need to set the [NodePopulationMode](#) API value as `PopulationMode.Instant` for scrolling to the collapsed item in addition to the additional parameter passed to the `BringIntoView` method.

#### *Scroll the item into specified position*

The fourth optional parameter `scrollToPosition` in `BringIntoView` method allows to position the scrolled item in the view. The scrolled item can take either of the four positions as explained below. The default position is `Start`.

- **Start:** Scroll to make the node positioned at the start of the view.
- **MakeVisible:** Scroll to make a specified node visible in the view. If the specified node is already in view, scrolling will not occur.
- **Center:** Scroll to make the node positioned at the center of the view.
- **End:** Scroll to make the node positioned at the end of the view.

#### **C#**

```
private void BringIntoView_Clicked(object sender, EventArgs e)
{
    var count= viewModel.ImageNodeInfo.Count;
    var data = viewModel.ImageNodeInfo[count-1];
    // Scrolls to the data item to make visible in the view.
    treeView.BringIntoView(data, false, false, ScrollToPosition.MakeVisible);
}
```

#### Scrollbar Visibility

The TreeView provides an option to enable or disable the `Scrollbar` visibility by using the [IsScrollBarVisible](#) property. By default, the value will be true.

**Note:** Due to some restrictions in native ScrollView renderer in Xamarin.Forms, you cannot change the `IsScrollBarVisible` value at runtime. It can be defined only when initializing the TreeView.

#### **XML**

```
<syncfusion:SfTreeView x:Name="treeView" IsScrollBarVisible="False" />
```

#### **C#**

```
SfTreeView treeView = new SfTreeView();
treeView.IsScrollBarVisible=false;
```

#### Selection

This section explains how to perform selection and its related operations in the TreeView.

## UI Selection

The TreeView allows selecting the items either programmatically or touch interactions by setting the [SelectionMode](#) property value to other than **None**. The control has different selection modes to perform selection operations as listed as follows.

- **None**: Allows disabling the selection.
- **Single**: Allows selecting the single item only. When clicking on the selected item, selection not will not be cleared. This is the default value for **SelectionMode**.
- **SingleDeselect**: Allows selecting the single item only. When clicking on the selected item, selection gets cleared.
- **Multiple**: Allows selecting more than one item. Selection is not cleared when selecting more than one items. When clicking on the selected item, selection gets cleared.
- **Extended**: Allows to select the multiple items using the common key modifiers in **UWP** platform and for other platforms, it works as **Single** selection.

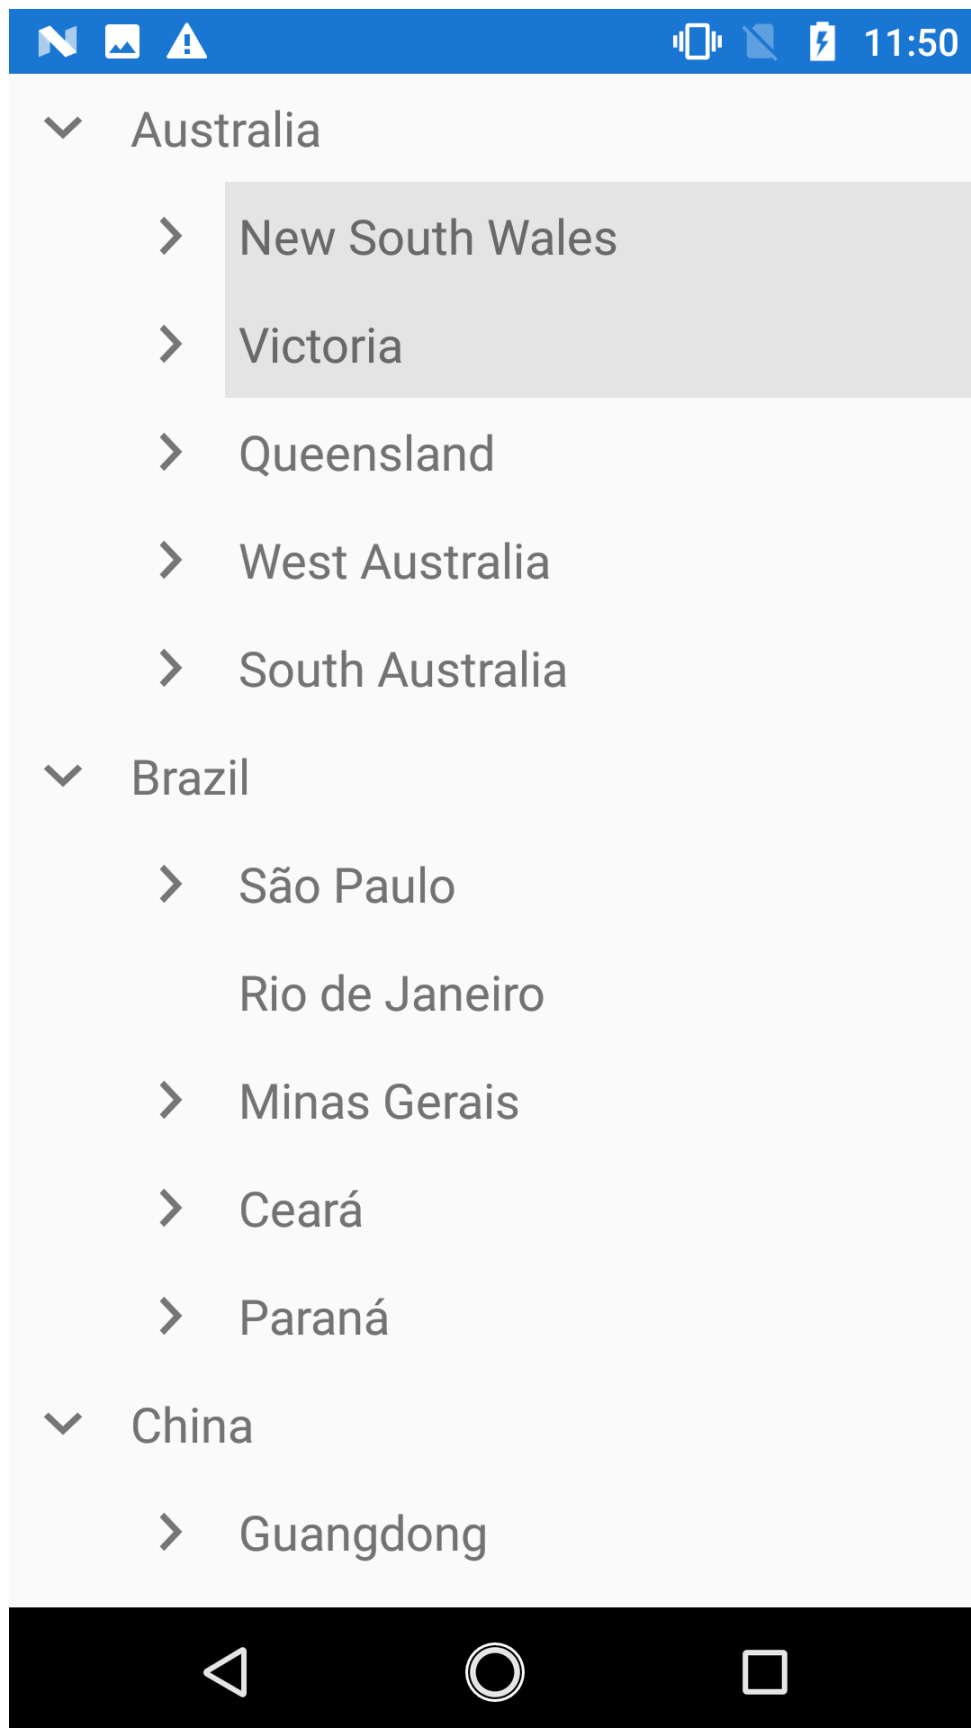

## XML

```
<syncfusion:SfTreeView x:Name="TreeView" SelectionMode="Multiple"/>
```

## C#

```
TreeView.SelectionMode = SelectionMode.Multiple;
```

### Programmatic Selection

When the [SelectionMode](#) is other than **None**, the item or items in the TreeView can be selected from the code by setting the [SelectedItem](#), or adding items to the [SelectedItems](#) property based on the [SelectionMode](#).

When the selection mode is **Single** or **SingleDeselect**, programmatically select an item by setting the underlying object to the [SelectedItem](#) property.

#### C#

```
treeView.SelectedItem = viewModel.CountriesInfo[2];
```

When the selection mode is **Multiple**, programmatically select more than one item by adding the underlying object to the [SelectedItems](#) property.

#### C#

```
treeView.SelectedItems.Add(viewModel.CountriesInfo[2]);  
treeView.SelectedItems.Add(viewModel.CountriesInfo[3]);
```

---

**Warning:** If an item is selected programmatically when [SelectionMode](#) is **None** and if multiple items are programmatically selected when [SelectionMode](#) is **Single** or **SingleDeselect**, then exception will be thrown internally.

---

### Selected items

#### *Gets selected Items*

The TreeView gets all the selected items through the [SelectedItems](#) property and gets the single item by using the [SelectedItem](#) property.

#### *Clear selected items*

The selected items can be cleared by calling the [SelectedItems.Clear\(\)](#) method.

#### C#

```
treeView.SelectedItems.Clear();
```

### *CurrentItem vs SelectedItem*

The TreeView gets the selected item by using the [SelectedItem](#) and [CurrentItem](#) properties. Both [SelectedItem](#) and [CurrentItem](#) returns the same data object when selecting single item. When selecting more than one item, the [SelectedItem](#) property returns the first selected item, and the [CurrentItem](#) property returns the last selected item.

### Selected item style

#### *Selection background*

The TreeView allows changing the selection background color for the selected items by using the [SelectionBackgroundColor](#) property. You can also change the selection background color at runtime.

#### *Selection foreground*

The TreeView allows changing the selection foreground color for the selected items by using the [SelectionForegroundColor](#) property. You can also change the selection foreground color at runtime.

---

**Note:** [SelectionForegroundColor](#) is applicable only for unbound mode.

---

## Events

### *SelectionChanging Event*

The [SelectionChanging](#) event is raised while selecting an item at the execution time. The [ItemSelectionChangingEventArgs](#) has the following members which provides the information for SelectionChanging event:

- [AddedItems](#): Gets collection of the underlying data objects where the selection is going to process.
- [RemovedItems](#): Gets collection of the underlying data objects where the selection is going to remove.

You can cancel the selection process within this event by setting the [ItemSelectionChangingEventArgs.Cancel](#) property to true.

### **C#**

```
treeView.SelectionChanging += TreeView_SelectionChanging;
private void TreeView_SelectionChanging(object sender,
ItemSelectionChangingEventArgs e)
{
    if (e.AddedItems.Count > 0 && e.AddedItems[0] == ViewModel.Items[0])
        e.Cancel = true;
}
```

### *SelectionChanged event*

The [SelectionChanged](#) event will occur once selection process has been completed for the selected item in the TreeView. The [ItemSelectionChangedEventArgs](#) has the following members which provides information for [SelectionChanged](#) event:

- [AddedItems](#): Gets collection of the underlying data objects where the selection has been processed.
- [RemovedItems](#): Gets collection of the underlying data objects where the selection has been removed.

### **C#**

```
treeView.SelectionChanged += TreeView_SelectionChanged;
private void TreeView_SelectionChanged(object sender,
ItemSelectionChangedEventArgs e)
{
    treeView.SelectedItems.Clear();
}
```

---

**Note:** [SelectionChanging](#) and [SelectionChanged](#) events will be triggered only on UI interactions.

---

## Key Navigation

The TreeView allows to select the items through keyboard interactions. Behavior of key navigation in UWP platform is explained as follows:

- When the [SelectionMode](#) is `Single` or `SingleDeselect`, the selected item is highlighted with [FocusBorderColor](#) around the item while key navigation.
- When the [SelectionMode](#) is `Multiple` or `Extended`, the [FocusBorderColor](#) will set to the [CurrentItem](#).

#### FocusBorderColor

The [FocusBorderColor](#) property is used to set the border color for the current focused item. For Android and iOS platform, the default color is `Color.Transparent` and for UWP platform, the default color is `Color.FromRgb(213, 213, 213)`.

#### FocusBorderThickness

The [FocusBorderThickness](#) property is used to set the border thickness for the current focused item. For Android and iOS platform, the default thickness is `0` and for UWP platform, the default thickness is `1`.

#### Limitation

- When a grid is loaded inside the [ItemTemplate](#) with background color, the [SelectionBackgroundColor](#) will not display. Because, it overlaps the [SelectionBackgroundColor](#). In this case, set the background color for the TreeView instead of grid in the [ItemTemplate](#).
- When the [TreeView](#) contains duplicated items in the collection, only the first item whose instance was created initially will be selected or deselected.

#### Checkbox

SfTreeView provides support for loading [CheckBox](#) in each node, and allows users to check/uncheck the corresponding node. So, you should add checkbox in the [ItemTemplate](#) of the [SfTreeView](#) and bind the [IsChecked](#) property of the [TreeViewNode](#).

#### Working with Checkbox in BoundMode

When you are populating treeview nodes from [ItemsSource](#), then you can get or set the checked items by using [CheckedItems](#) property.

SfTreeView supports to check multiple items through binding the [CheckedItems](#) property from view model with `ObservableCollection<object>` type.

**Note:** Set [ItemTemplateContextType](#) as `Node` to bind the [TreeViewNode.IsChecked](#) property to [CheckBox](#) in [ItemTemplate](#). To know more about [ItemTemplateContextType](#) click [here](#).

**Note:** TreeView process and sets [TreeViewNode.IsChecked](#) based on [CheckedItems](#) only when you are binding [ItemsSource](#).

#### XML

    img0,
    img1
};
video.Files = new ObservableCollection<File>
{
    video1,
    video2
};
nodeImageInfo.Add(doc);
nodeImageInfo.Add(download);
nodeImageInfo.Add(mp3);
nodeImageInfo.Add(pictures);
nodeImageInfo.Add(video);
checkedItems = new ObservableCollection<object>();
checkedItems.Add(doc);
```

```
checkedItems.Add(TypeScript);  
checkedItems.Add(uiGuide);  
checkedItems.Add(stone);  
checkedItems.Add(wind);  
checkedItems.Add(song);  
return nodeImageInfo;  
}  
}
```

You can download the entire source of this demo from [here](#)

#### Working with Checkbox in UnboundMode

You can directly set the checkbox state by setting the [TreeViewNode.IsChecked](#) property value while creating nodes.

**XML**

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"

### CheckBox State

SfTreeView process [IsChecked](#) property (checkbox state) of `TreeNode` based on [CheckBoxMode](#) property. [CheckBoxMode](#) defines how parent and child node's checkbox state updates when user check or un-check the node. By default, its value is `None`. Checkbox contains the following three states:

- **None**: Check and uncheck are updates only in the view, but it will not affect the **CheckedItems** collection.
- **Individual**: Checkbox state affect individual node only, and it does not affect the parent node or child nodes checkbox state or **IsChecked** property value.
- **Recursive**: Check and uncheck the node value affects the parent and child nodes checkbox state. For example, If parent nodes checkbox state is check/uncheck then the all of its child nodes checkbox state is check/uncheck. If all the child nodes are check/uncheck within the parent node, then parent node will be check/uncheck. If any of the child node is check, then the parent node will be in intermediate state.

### XML

```
<syncfusion:SfTreeView x:Name="TreeView" CheckBoxMode="Recursive"/>
```

### C#

```
TreeView.CheckBoxMode = CheckBoxMode.Recursive;
```

**Note:** In recursive mode, the parent nodes checkbox state or **IsChecked** property value is updated only in UI interaction.

### Get or Set Checked Items

#### Get or Set Checked Items in Bound Mode

You can get or set list of items to be checked or un-checked by using [CheckedItems](#) property.

When the [CheckBoxMode](#) is other than **None**, the individual **TreeNode** or collection of **TreeNode** can be checked from the code by setting the **CheckedItems**, or adding items to the **CheckedItems** property based on the **CheckBoxMode**.

**Note:** Programmatically adding or removing the node value not affects their parent and child nodes checkbox state.

### C#

```
treeView.CheckedItems.Add(viewModel.Folders[2]);
treeView.CheckedItems.Add(viewModel.Folders[3]);
```

#### Get or Set Checked Nodes in Unbound Mode

You can get the list of checked nodes by using [GetCheckedNodes](#) method. You can set checkbox state by setting [TreeNode.IsChecked](#) property.

### C#

```
treeView.GetCheckedNodes();
```

### Events

#### NodeChecked event

The [NodeChecked](#) event raised when checking and unchecking the checkbox at run time. The [NodeCheckedEventArgs](#) has the following members, which provide information for the **NodeChecked** event.

- **Node**: Gets the **TreeNode** and data associated with the checked item as its arguments.

**C#**

```
treeView.NodeChecked += TreeView_NodeChecked;
private void TreeView_NodeChecked(object sender,
Syncfusion.XForms.TreeView.NodeCheckedEventArgs e)
{
}
```

**Note:** **NodeChecked** event occurs only in UI interactions.

**MVVM**

This section explains about how to work with MVVM pattern in TreeView.

Binding properties in MVVM pattern

*Binding SelectedItem*

TreeView support to select the items through binding the [SelectedItem](#) property from view model by implementing the **INotifyPropertyChanged** interface that gives the call back notification to UI.

**XML**

```
<syncfusion:SfTreeView x:Name="treeView"
SelectedItem="{Binding SelectedPlace}"
ChildPropertyName="States"
ItemsSource="{Binding CountriesInfo}"/>
```

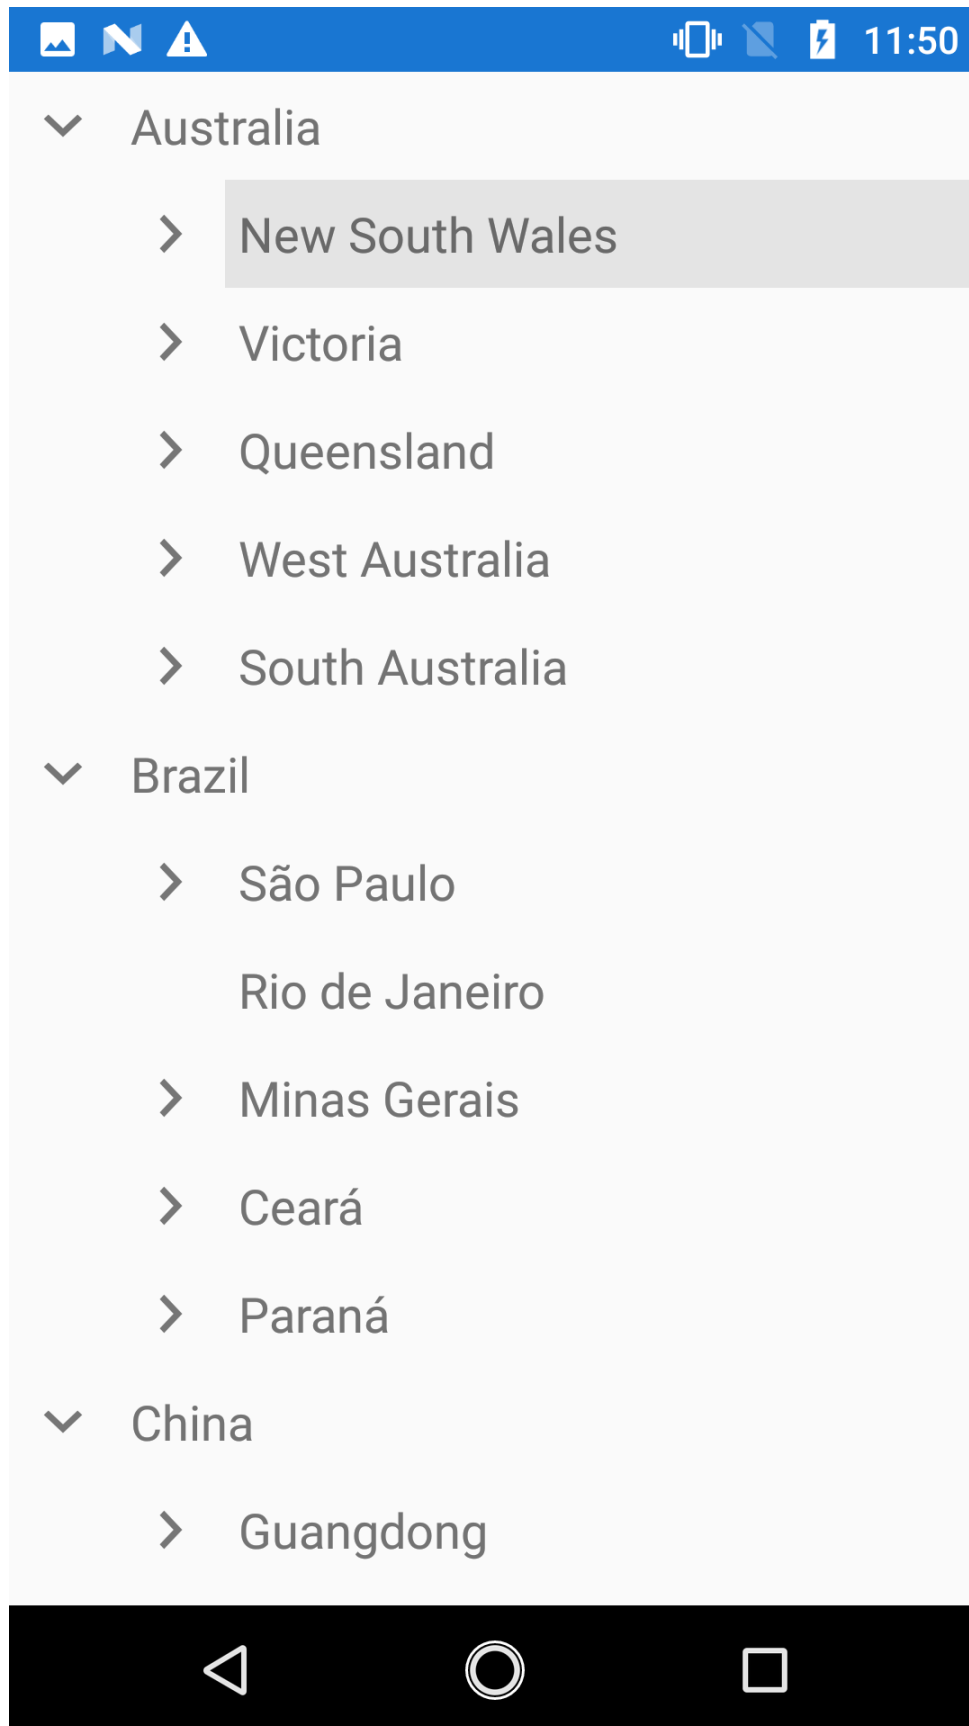

**C#**

```
treeView.SetBinding(SfTreeView.SelectedItemProperty, new
Binding("SelectedPlace", BindingMode.TwoWay));
```

**C#**

```
// CountriesViewModel.cs
public class CountriesViewModel
{
    public CountriesViewModel()
    {
        GenerateCountriesInfo();
    }
    public ObservableCollection<Countries> CountriesInfo { get; set; }
    public object SelectedPlace { get; set; }
    private void GenerateCountriesInfo()
    {
        var australia = new Countries() { Name = "Australia" };
        var _NSW = new Countries() { Name = "New South Wales" };
        var _Sydney = new Countries() { Name = "Sydney" };
        australia.States = new ObservableCollection<Countries>();
        australia.States.Add(_NSW);
        _NSW.States = new ObservableCollection<Countries>();
        _NSW.States.Add(_Sydney);
        var usa = new Countries() { Name = "United States of America" };
        var _California = new Countries() { Name = "California" };
```

```
var _LosAngeles = new Countries() { Name = "Los Angeles" };
usa.States = new ObservableCollection<Countries>();
usa.States.Add(_California);
_California.States = new ObservableCollection<Countries>();
_California.States.Add(_LosAngeles);
this.CountriesInfo = new ObservableCollection<Countries>();
CountriesInfo.Add(australia);
CountriesInfo.Add(usa);
SelectedPlace=_NSW
}
}
```

*Binding SelectedItems*

TreeView support to select multiple items through binding the [SelectedItems](#) property from view model with `ObservableCollection<object>` type.

**XML**

```
<syncfusion:SfTreeView x:Name="treeView"
SelectionMode="Multiple"
SelectedItems="{Binding SelectedCountries}"
ChildPropertyName="States"
ItemsSource="{Binding CountriesInfo}"/>
```

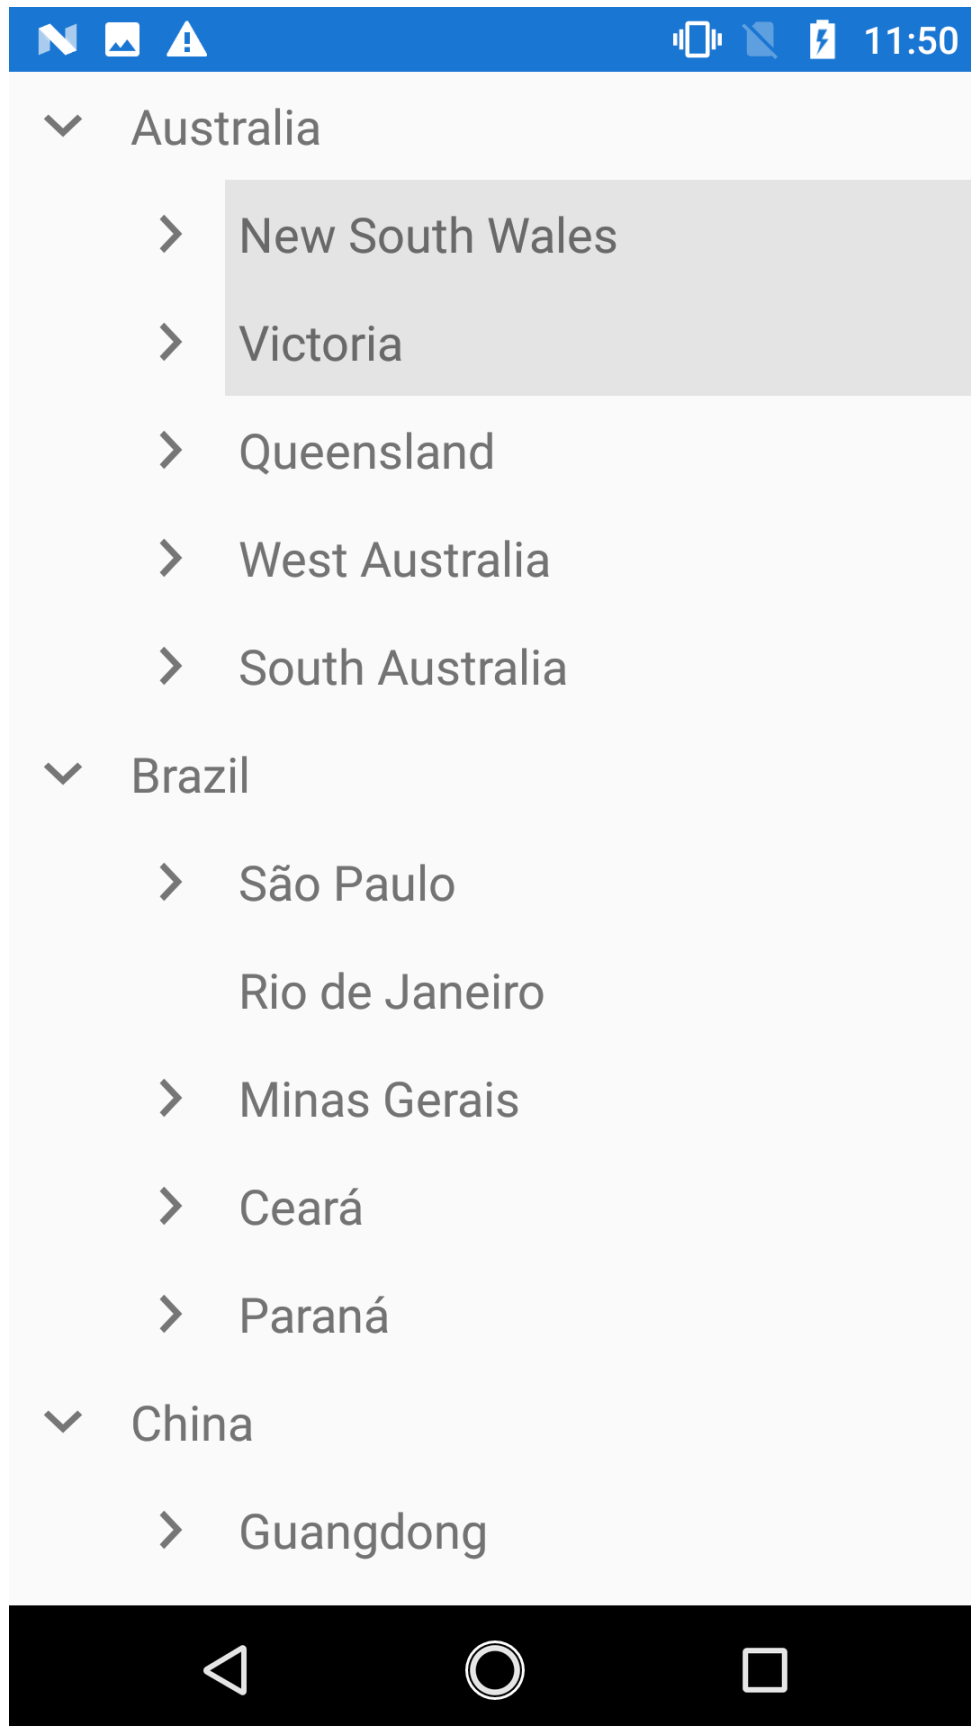

**C#**

```
treeView.SelectionMode = SelectionMode.Multiple;
treeView.SetBinding(SfTreeView.SelectedItemsProperty, new
Binding("SelectedCountries", BindingMode.TwoWay));
```

**C#**

```
// CountriesViewModel.cs
// CountriesViewModel.cs
public class CountriesViewModel
{
    public CountriesViewModel()
    {
        GenerateCountriesInfo();
    }
    public ObservableCollection<Countries> CountriesInfo { get; set; }
    public ObservableCollection<object> SelectedCountries { get; set; }
    private void GenerateCountriesInfo()
    {
        var australia = new Countries() { Name = "Australia" };
        var _NSW = new Countries() { Name = "New South Wales" };
        var _Sydney = new Countries() { Name = "Sydney" };
        var _Victoria = new Countries() { Name = "Victoria" };
        australia.States = new ObservableCollection<Countries>();
        australia.States.Add(_NSW);
        australia.States.Add(_Victoria);
        _NSW.States = new ObservableCollection<Countries>();
        _NSW.States.Add(_Sydney);
        var usa = new Countries() { Name = "United States of America" };
        var _California = new Countries() { Name = "California" };
        usa.States = new ObservableCollection<Countries>();
        usa.States.Add(_California);
        this.CountriesInfo = new ObservableCollection<Countries>();
        CountriesInfo.Add(australia);
        CountriesInfo.Add(usa);
        SelectedCountries = new ObservableCollection<object>();
        SelectedCountries.Add(_NSW);
        SelectedCountries.Add(_Victoria);
    }
}
```

You can download the entire sample [here](#).

## Commands

### *Tap command*

The [TapCommand](#) will be triggered whenever tapping the item and passing the [ItemTappedEventArgs](#) as parameter.

### **C#**

```
treeView.TapCommand = viewModel.TappedCommand;
public class CommandViewModel
{
    private Command<Object> tappedCommand;
    public Command<object> TappedCommand
    {
        get { return tappedCommand; }
        set { tappedCommand = value; }
    }
    public CommandViewModel()
    {
        TappedCommand = new Command<object>(TappedCommandMethod);
    }
    private void TappedCommandMethod(object obj)
    {
        App.Current.MainPage.DisplayAlert("Alert", (obj.AddedItems[0] as
        Countries).Name + " is Tapped", "OK");
    }
}
```

### *Hold command*

The [HoldCommand](#) will be triggered whenever an item is long pressed and passing the [ItemHoldingEventArgs](#) as parameter.

### **C#**

```
treeView.HoldCommand = viewModel.HoldingCommand;
public class CommandViewModel
{
    private Command<Object> holdingCommand;
    public Command<object> HoldingCommand
    {
        get { return holdingCommand; }
        set { holdingCommand = value; }
    }
    public CommandViewModel()
    {
        HoldingCommand = new Command<object>(HoldingCommandMethod);
    }
    private void HoldingCommandMethod(object obj)
    {
        App.Current.MainPage.DisplayAlert("Alert", (obj.AddedItems[0] as
        Countries).Name + " is Holding", "OK");
    }
}
```

### Expand command

The **ExpandCommand** will be triggered while expanding the node and passing the [TreeViewNode](#) as command parameter. TreeView expands the node based on the return value of **CanExecute** method implementation of **ExpandCommand**. If you return false, then expand action will be canceled. **Execute** method implementation of **ExpandCommand** will get called after expanding of node.

### XML

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Selection"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
x:Class="Selection.MainPage">
<ContentPage.BindingContext>
<local:CountriesViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView"
ExpandCommand="ExpandingCommand"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
/// <summary>
/// CommandViewModel class that implements
[Command] (https://docs.microsoft.com/en-
us/dotnet/api/xamarin.forms.command?view=xamarin-forms).
/// </summary>
public class CommandViewModel
{
    private Command<Object> expandingCommand;
    public Command<object> ExpandingCommand
    {
        get { return expandingCommand; }
        set { expandingCommand = value; }
    }
    public CommandViewModel()
    {
        ExpandingCommand = new Command<object>(ExpandCommandAction, CanExecute);
    }
    /// <summary>
    /// CanExecute method is called before expanding of node.
    /// </summary>
    /// <returns>Handle expand action by returning true or false. </returns>
    /// <param name="obj">TreeViewNode is passed as command parameter. </param>
    public bool CanExecute(object obj)
    {
        //You can also return false to cancel the expand action.
        return true;
    }
    /// <summary>
    /// Method gets called after expanding action performed.
    /// </summary>
```

```

/// <param name="obj">TreeNode is passed as command parameter. </param>
private void ExpandCommandAction(object obj)
{
    App.Current.MainPage.DisplayAlert("Alert", "TreeView node is expanded",
    "OK");
}
}

```

### Collapse command

The **CollapseCommand** will be triggered while collapsing the node and passing the **TreeNode** as command parameter. TreeView collapses the node based on the return value of **CanExecute** method implementation of **CollapseCommand**. If you return false, then collapse action will be canceled. **Execute** method implementation of **CollapseCommand** will get called after collapsing of node.

### XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:Selection"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
x:Class="Selection.MainPage">
<ContentPage.BindingContext>
<local:CountriesViewModel x:Name="viewModel"/>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView"
CollapseCommand="CollapsingCommand"/>
</ContentPage.Content>
</ContentPage>

```

### C#

```

/// <summary>
/// CommandViewModel class that implements
[Command] (https://docs.microsoft.com/en-
us/dotnet/api/xamarin.forms.command?view=xamarin-forms).
/// </summary>
public class CommandViewModel
{
    private Command<object> collapsingCommand;
    public Command<object> CollapsingCommand
    {
        get { return collapsingCommand; }
        set { collapsingCommand = value; }
    }
    public CommandViewModel()
    {
        CollapsingCommand = new Command<object>(CollapseCommandAction, CanExecute);
    }
    /// <summary>
    /// CanExecute method is called before collapsing of node.
    /// </summary>
    /// <returns>Handle collapse action by returning true or false. </returns>
    /// <param name="obj">TreeNode is passed as command parameter. </param>

```

```

public bool CanExecute(object obj)
{
    //You can also return false to cancel the collapse action.
    return true;
}
/// <summary>
/// Method gets called after collapsing action performed.
/// </summary>
/// <param name="obj">TreeNode is passed as command parameter. </param>
private void CollapseCommandAction(object obj)
{
    App.Current.MainPage.DisplayAlert("Alert", "TreeView node is collapsed",
    "OK");
}
}

```

### Event to command

The **TreeView** event can be converted into commands using [Behaviors](#). To achieve this, create a command in the ViewModel class and associate it to the TreeView event using **Behaviors**.

### XML

```

<syncfusion:SfTreeView x:Name="treeView"
SelectionMode="Multiple"
SelectedItems="{Binding SelectedCountries}"
ChildPropertyName="States"
ItemsSource="{Binding CountriesInfo}">
<syncfusion:SfTreeView.Behaviors>
<local:EventToCommandBehavior EventName="SelectionChanged" Command="{Binding
SelectionChangedCommand}"/>
</syncfusion:SfTreeView.Behaviors>
</syncfusion:SfTreeView>

```

### C#

```

public class CountriesViewModel : INotifyPropertyChanged
{
    public Command<ItemSelectedEventArgs> selectionChangedCommand;
    public CountriesViewModel()
    {
        SelectionChangedCommand = new
        Command<Syncfusion.XForms.TreeView.ItemSelectionChangedEventArgs>(OnSelectionChanged);
        GenerateCountriesInfo();
    }
    public ObservableCollection<Countries> CountriesInfo { get; set; }
    public ObservableCollection<object> SelectedCountries { get; set; }
    public Command<ItemSelectedEventArgs> SelectionChangedCommand
    {
        get { return selectionChangedCommand; }
        protected set { selectionChangedCommand = value; }
    }
    private void OnSelectionChanged(ItemSelectionChangedEventArgs obj)
    {

```

```

App.Current.MainPage.DisplayAlert("Alert", (obj.AddedItems[0] as
Countries).Name + " is selected", "OK");
}
public event PropertyChangedEventHandler PropertyChanged;
public void OnPropertyChanged(string name)
{
    if (this.PropertyChanged != null)
        this.PropertyChanged(this, new PropertyChangedEventArgs(name));
}
private void GenerateCountriesInfo()
{
    var australia = new Countries() { Name = "Australia" };
    var _NSW = new Countries() { Name = "New South Wales" };
    var _Victoria = new Countries() { Name = "Victoria" };
    australia.States = new ObservableCollection<Countries>();
    australia.States.Add(_NSW);
    australia.States.Add(_Victoria);
    var usa = new Countries() { Name = "United States of America" };
    var _California = new Countries() { Name = "California" };
    usa.States = new ObservableCollection<Countries>();
    usa.States.Add(_California);
    this.CountriesInfo = new ObservableCollection<Countries>();
    CountriesInfo.Add(australia);
    CountriesInfo.Add(usa);
}
}

```

You can download the example sample [here](#).

For more information regarding the event to command behavior in Xamarin.Forms, you can refer [this](#) link.

### Checkbox items binding in MVVM

SfTreeView support to check multiple items through binding the [CheckedItems](#) property from view model with `ObservableCollection<object>` type.

---

**Note:** TreeView process and sets [TreeViewNode.IsChecked](#) based on `CheckedItems` only when you are binding `ItemsSource`.

---

### XML

```

<syncfusion:SfTreeView
x:Name="TreeView"
CheckBoxMode="Recursive"
ItemsSource="{Binding Folders}"
CheckedItems="{Binding CheckedNodeInfo}"
ItemTemplateContextType="Node">
    <syncfusion:SfTreeView.ItemTemplate>
        <DataTemplate>
            <ViewCell>
                <ViewCell.View>
                    <Grid Padding="5">
                        <SfCheckBox:SfCheckBox
x:Name="CheckBox"
Text="{Binding Content.FileName}"
IsChecked="{Binding IsChecked, Mode=TwoWay}"/>

```

```

</Grid>
</ViewCell.View>
</ViewCell>
</DataTemplate>
</syncfusion:SfTreeView.ItemTemplate>
</syncfusion:SfTreeView>

```

## C#

```

public class ViewModel
{
    private ObservableCollection<object> checkedNodeInfo;
    public ObservableCollection<object> CheckedNodeInfo
    {
        get
        {
            return checkedNodeInfo;
        }
        set
        {
            this.checkedNodeInfo = value;
        }
    }
    public ViewModel()
    {
        var doc = new Folder() { FileName = "Documents" };
        checkedNodeInfo = new ObservableCollection<object>();
        checkedNodeInfo.Add(doc);
    }
}

```

You can download the entire source of this demo from [here](#). To know more about usage of checkbox, you can refer the documentation from [here](#).

## Load on demand

TreeView allows you to load child items only when they are requested using Load on-demand(Lazy load). It helps to load the child items from services when end-user expands the node. Initially populate the root [Nodes](#) by assigning [ItemsSource](#) and then when any node is expanded, child items can be loaded using [LoadOnDemandCommand](#). Load on-demand is applicable for bound mode only.

## XML

```

<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:local="clr-namespace:TreeView"
xmlns:sfTreeView="clr-namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"

}
}
```

**C#**

```
/// <summary>
/// Model
/// </summary>
```

```

public class MusicInfo : INotifyPropertyChanged
{
    public string itemName;
    public int id;
    public bool hasChildNodes;
    public string ItemName
    {
        get { return itemName; }
        set
        {
            itemName = value;
            OnPropertyChanged("ItemName");
        }
    }
    public int ID
    {
        get { return id; }
        set
        {
            id = value;
            OnPropertyChanged("ID");
        }
    }
    public bool HasChildNodes
    {
        get { return hasChildNodes; }
        set
        {
            hasChildNodes = value;
            OnPropertyChanged("HasChildNodes");
        }
    }
    public event PropertyChangedEventHandler PropertyChanged;
    private void OnPropertyChanged(string propertyName)
    {
        PropertyChanged?.Invoke(this, new PropertyChangedEventArgs(propertyName));
    }
}

```

---

**Note:** LoadOnDemandCommand receives [TreeViewNode](#) as command parameter by default.

---

### Handling expander visibility

TreeView shows the expander for a particular node based on return value of [CanExecute](#) method of [LoadOnDemandCommand](#). If CanExecute returns true, then expander icon is displayed for that node. If CanExecute returns false, then expander icon will not displayed for that node. CanExecute method gets called to decide the visibility of expander icon and before executing LoadOnDemandCommand.

### C#

```

/// <summary>
/// CanExecute method is called before expanding and initialization of node.
/// Returns whether the node has child nodes or not.
/// Based on return value of expander visibility of the node is handled.
/// </summary>

```

```

/// <param name="sender">TreeNode is passed as default parameter
</param>
/// <returns>Returns true, if the specified node has child items to load and
expander icon is displayed for that node, else returns false and icon is not
displayed.</returns>
private bool CanExecuteOnDemandLoading(object sender)
{
    var hasChildNodes = ((sender as TreeNode).Content as
    MusicInfo).HasChildNodes;
    if (hasChildNodes)
        return true;
    else
        return false;
}

```

### On-demand loading of child items

You can load child items for the node in [Execute](#) method of `LoadOnDemandCommand`. Execute method will get called when user expands the tree node. In `LoadOnDemand.Execute` method, you have can perform following operations,

- Show or hide busy indicator in the place of expander by setting [TreeNode.ShowExpanderAnimation](#) until the data fetched.
- Once data fetched, you can populate the child nodes by calling [TreeNode.PopulateChildNodes](#) method by passing the child items collection.
- When load on-demand command executes expanding operation will not be handled by `TreeView`. So, you have to set [TreeNode.IsExpanded](#) property to `true` to expand the tree node after populating child nodes.
- You can skip population of child items again and again when every time the node expands, based on [TreeNode.ChildNodes](#) count.

### C#

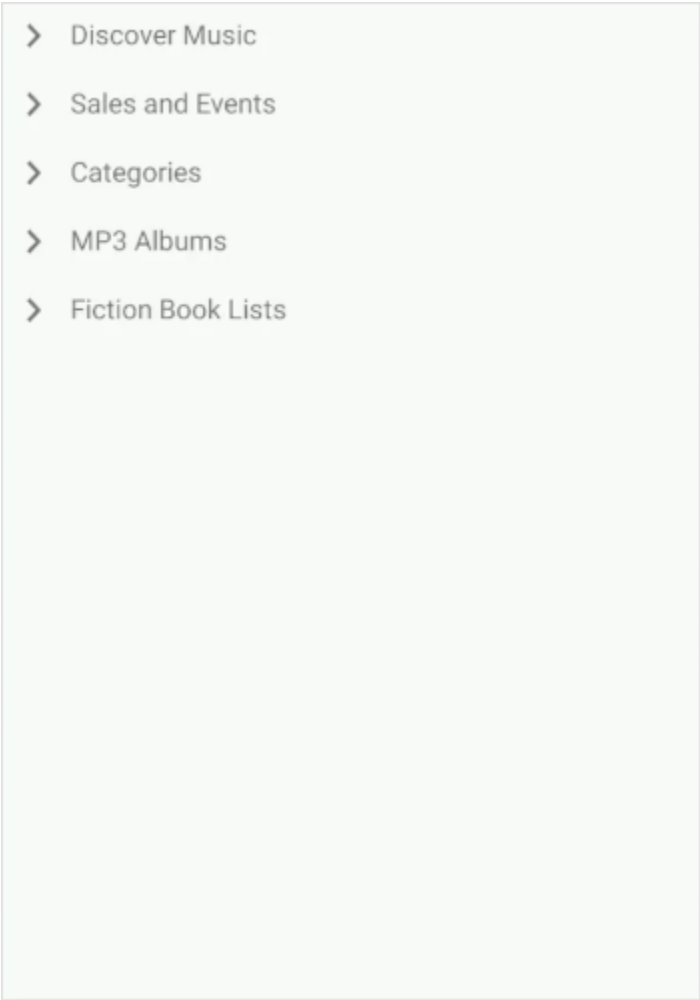

```

/// <summary>
/// Execute method is called when any item is requested for load-on-demand
items.
/// </summary>
/// <param name="obj">TreeNode is passed as default parameter </param>
private void ExecuteOnDemandLoading(object obj)
{
    var node = obj as TreeNode;
    // Skip the repeated population of child items when every time the node
expands.
    if (node.ChildNodes.Count > 0)
    {
        node.IsExpanded = true;
        return;
    }
    //Animation starts for expander to show progressing of load on demand
    node.ShowExpanderAnimation = true;
    MusicInfo musicInfo = node.Content as MusicInfo;
    Device.BeginInvokeOnMainThread(async () =>
    {
        await Task.Delay(2000);
    }
    )
}

```

```
//Fetching child items to add  
var items = GetSubMenu(musicInfo.ID);  
// Populating child items for the node in on-demand  
node.PopulateChildNodes(items);  
if (items.Count() > 0)  
//Expand the node after child items are added.  
node.IsExpanded = true;  
//Stop the animation after load on demand is executed, if animation not  
stopped, it remains still after execution of load on demand.  
node.ShowExpanderAnimation = false;  
});  
}
```

### Item Height Customization

The TreeView provides various options to customize the height of items. To achieve this customization, please walkthrough the below sections:

### Customize Item Height

The TreeView allows customizing the height of items by setting the [ItemHeight](#) property. The default value of this property is 40. This property can be customized at runtime.

#### XML

```
<syncfusion:SfTreeView x:Name="treeView" ItemHeight="40">
```

#### C#

```
SfTreeView treeView = new SfTreeView();
treeView.ItemHeight = 40;
```

### Customize Item height using 'QueryNodeSize' event

The TreeView allows customizing the height of the items using [QueryNodeSize](#) event. This event is raised whenever the item comes into view and triggered with [QueryNodeSizeEventArgs](#).

The [SfTreeView.QueryNodeSize](#) event provides the following arguments:

- [Node](#): This argument contains the [TreeViewNode](#) and data associated with it.
- [Height](#): This argument contains the default item height of the queried item and can be set with desired size.
- [Handled](#): Decides whether the specified or measured height can be set to the item or not. The default value is `false`. When this property is not set, the decided height will not set to the item.
- [GetActualNodeHeight](#): This method will return the measured height of the node item based on content loaded in it.

### Customize specific item height using custom value

The TreeView allows customizing the height of the specific item by setting the custom value directly to the [Height](#) argument which is available in [QueryNodeSizeEventArgs](#).

#### XML

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage">
  <ContentPage.BindingContext>
    <local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
  </ContentPage.BindingContext>
  <ContentPage.Content>
    <syncfusion:SfTreeView x:Name="treeView"
      QueryNodeSize="TreeView_QueryNodeSize"
      ChildPropertyName="SubFiles"
      ItemsSource="{Binding ImageNodeInfo}"/>
    </syncfusion:SfTreeView>
  </ContentPage.Content>
</ContentPage>
```

#### C#

```
public class MainPage : ContentPage
```

```

{
public MainPage()
{
InitializeComponent();
this.treeView.QueryNodeSize += TreeView_QueryNodeSize;
}
private void TreeView_QueryNodeSize(object sender, QueryNodeSizeEventArgs e)
{
if (e.Node.Level == 0)
{
//Returns speified item height for items.
e.Height = 200;
e.Handled = true;
}
}
}

```

#### Customize specific item height based on the content size

The TreeView allows adjusting height of items based on the content measured size while loaded by setting the **Height** argument with value returned from [QueryNodeSizeEventArgs.GetActualNodeHeight](#) method.

#### XML

```

<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage">
<ContentPage.BindingContext>
<local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView"
QueryNodeSize="TreeView_QueryNodeSize"
ChildPropertyName="SubFiles"
ItemsSource="{Binding ImageNodeInfo}"/>
</syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>

```

#### C#

```

public class MainPage : ContentPage
{
public MainPage()
{
InitializeComponent();
this.treeView.QueryNodeSize += TreeView_QueryNodeSize;
}
private void TreeView_QueryNodeSize(object sender, QueryNodeSizeEventArgs e)
{
if (e.Node.Level != 0)
{
// Returns item height based on the content loaded.

```

```
e.Height = e.GetActualNodeHeight();
e.Handled = true;
}
}
}
```

### Autofit item height on dynamic changes

The Treeview supports autofit the item based on dynamic change in item size. It is enabled by setting `NodeSizeMode` property to `NodeSizeMode.Dynamic`. The default value is `NodeSizeMode.None`.

- **None:** The item height does not autofit for dynamic changes.
- **Dynamic:** The item height responds for dynamic changes and the size is recalculated.

### XML

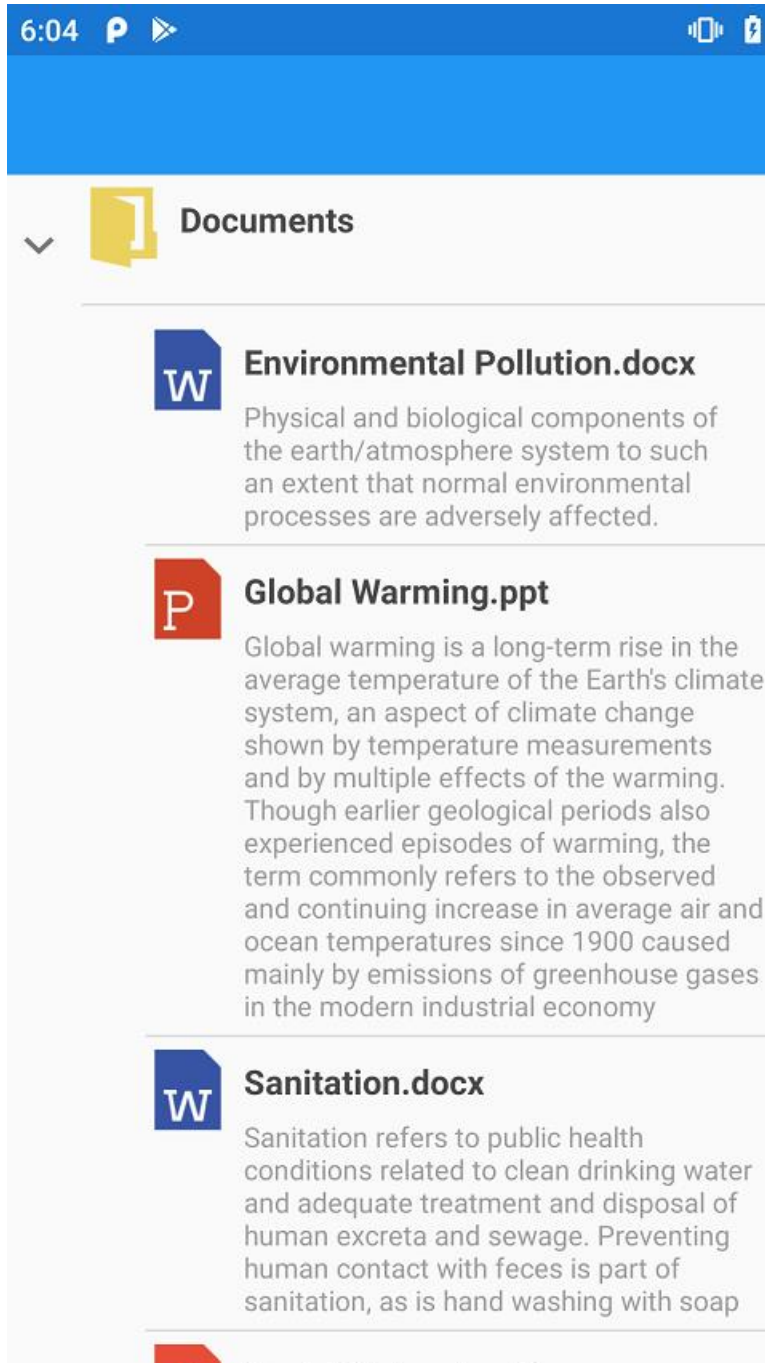

```
<?xml version="1.0" encoding="utf-8" ?>
<ContentPage xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms"
xmlns:local="clr-namespace:GettingStarted"
x:Class="GettingStarted.MainPage">
<ContentPage.BindingContext>
<local:FileManagerViewModel x:Name="viewModel"></local:FileManagerViewModel>
</ContentPage.BindingContext>
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView"
QueryNodeSize="TreeView_QueryNodeSize"
NodeSizeMode="Dynamic"
ChildPropertyName="SubFiles"
ItemsSource="{Binding ImageNodeInfo}"/>
</syncfusion:SfTreeView>
</ContentPage.Content>
</ContentPage>
```

### C#

```
public class MainPage : ContentPage
{
    public MainPage()
    {
        InitializeComponent();
        this.treeView.QueryNodeSize += TreeView_QueryNodeSize;
        this.treeView.NodeSizeMode = NodeSizeMode.Dynamic;
    }
    private void TreeView_QueryNodeSize(object sender, QueryNodeSizeEventArgs e)
    {
        if (e.Node.Level == 0)
        {
            //Returns speified item height for items.
            e.Height = 200;
            e.Handled = true;
        }
        else
        {
            // Returns item height based on the content loaded.
        }
    }
}
```

```
e.Height = e.GetActualNodeHeight();  
e.Handled = true;  
}  
}  
}
```

You can download the entire source code of this demo [here](#).

## Limitations

- Define the size of the image when loading image in the [SfTreeView.ItemTemplate](#). Because, it does not return actual measured size when measuring before item layout.

## Right to left(RTL)

TreeView supports to change the flow of text to the right-to-left direction by setting the [FlowDirection](#) to [RightToLeft](#). TreeView supports RTL in Xamarin.Forms version 3.0 and above.

**Note:** Specific platform setup is required to enable right-to-left localization. For platform settings you can refer [here](#).

### XML

```
<ContentPage xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms">
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView" FlowDirection="RightToLeft"/>
</ContentPage.Content>
</ContentPage>
```

### C#

```
treeView.FlowDirection = FlowDirection.RightToLeft;
```

TreeView also supports RTL when device's flow direction is changed, it is achieved by setting the [FlowDirection](#) to [Device.FlowDirection](#).

### XML

```
<ContentPage xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:syncfusion="clr-
namespace:Syncfusion.XForms.TreeView;assembly=Syncfusion.SfTreeView.XForms">
<ContentPage.Content>
<syncfusion:SfTreeView x:Name="treeView" FlowDirection="{x:Static
Device.FlowDirection}"/>
</ContentPage.Content>
</ContentPage>
```

### C#

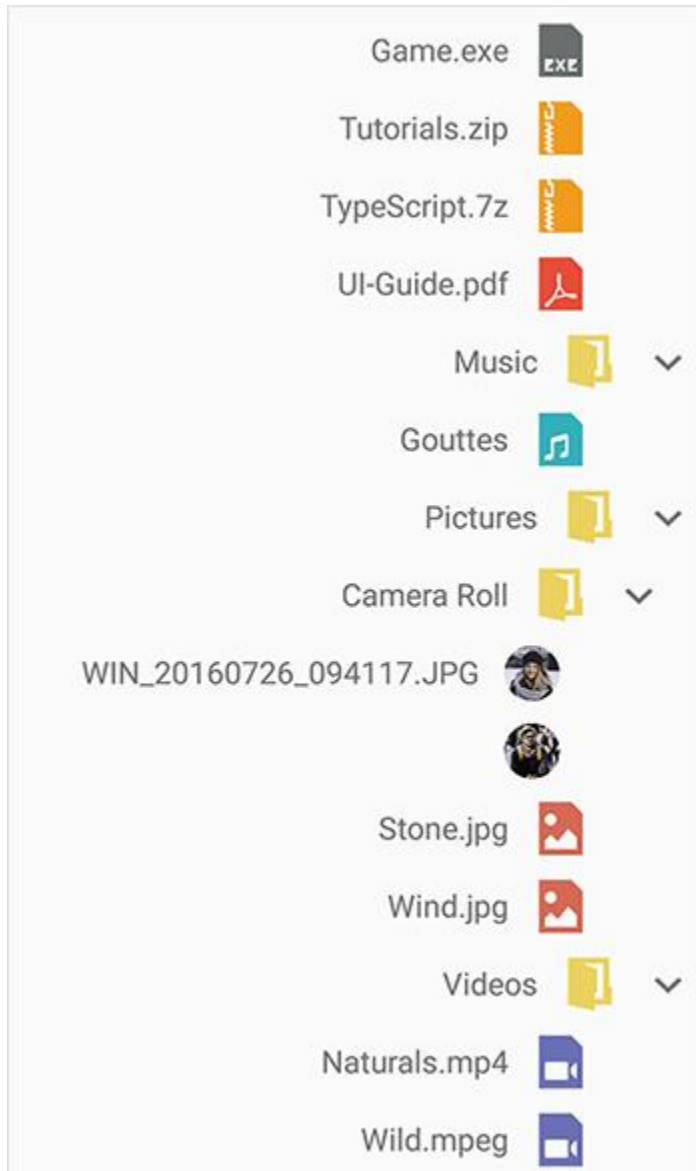

```
treeView.FlowDirection = Device.FlowDirection;
```

In UWP platform, the ScrollView is not changed when RTL is enabled (framework issue). To overcome this issue, set the [FlowDirection](#) property in constructor of [MainPage](#) in UWP renderer as demonstrated in the following code example.

### C#

```
public MainPage ()
{
...
}
```

```
SfTreeViewRenderer.Init();  
this.FlowDirection = FlowDirection.RightToLeft;  
LoadApplication (new App ());  
...  
}
```

You can download the entire [source code](#) here.

**Note:** When a label is loaded in the `ItemTemplate`, the right-to-left direction is not applied due to the framework issue. It has been reported to the Xamarin team; for more details about this, refer to this [link](#). To overcome this issue, set the `HorizontalOptions` to `StartAndExpand` in Label.

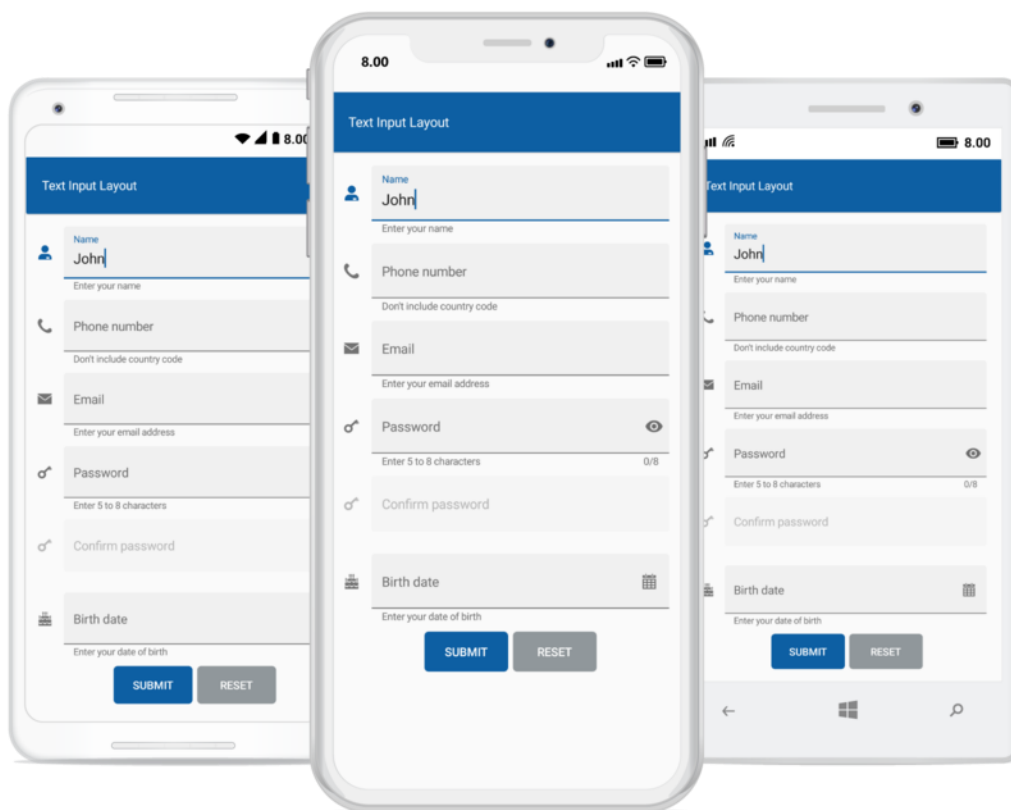

## Limitations

- When you use custom [ItemTemplate](#) in [TreeView](#), it does not respond to [FlowDirection](#) due to framework issue. To respond to [FlowDirection](#) changes, you need to set [FlowDirection](#) of [TreeView](#) to parent view of your custom [ItemTemplate](#).

## SfTextInputLayout

### Overview

The text input layout control for Xamarin.Forms adds decorative elements such as floating labels, icons, and assistive labels on the top of input views such as [SfMaskedEdit](#), [SfNumericTextBox](#), [Entry](#), and [Editor](#) controls.

### Key features

- Displays floating labels when the input view is focused.
- Displays error labels.
- Supports filled, outlined, and none container types.
- Provides RTL support.
- Provides options to reserve space for assistive labels.
- Provides options to customize the thickness of stroke width and corner radius.
- Provides options to customize padding around the input view.
- Provides options to customize the font family, font size, and font attributes for hint, error, helper text, and counter label.

- Displays leading and trailing icons.
- Displays help labels.
- Displays maximum character count.
- Toggles password visibility.

## Getting Started

This section explains the steps required to configure the text input layout control with floating label.

### Adding SfTextInputLayout reference

You can add SfTextInputLayout reference using one of the following methods:

#### Method 1: Adding SfTextInputLayout reference from nuget.org

Syncfusion Xamarin components are available in [nuget.org](https://nuget.org). To add SfTextInputLayout to your project, open the NuGet package manager in Visual Studio, search for [Syncfusion.Xamarin.Core](https://nuget.org/packages/Syncfusion.Xamarin.Core), and then install it.

![Add Packages](Getting-Started\_images/Adding SfTextInputLayout reference.png)

---

**Note:** Install the same version of SfTextInputLayout NuGet in all the projects.

---

#### Method 2: Adding SfTextInputLayout reference from toolbox

Syncfusion also provides Xamarin Toolbox. Using this toolbox, you can drag the SfTextInputLayout control to the XAML page. It will automatically install the required NuGet packages and add the namespace to the page. To install Syncfusion Xamarin Toolbox, refer to [Toolbox](#).

#### Method 3: Adding SfTextInputLayout assemblies manually from the installed location

If you prefer to manually reference the assemblies instead referencing from NuGet, add the following assemblies in respective projects.

Location : {Installed location}/{version}/Xamarin/lib

PCL	Syncfusion.Core.XForms.dll Syncfusion.Licensing.dll
Android	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.Android.dll Syncfusion.Licensing.dll
iOS	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.iOS.dll Syncfusion.Licensing.dll
UWP	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.UWP.dll Syncfusion.Licensing.dll
WPF	Syncfusion.Core.XForms.dll Syncfusion.Core.XForms.WPF.dll Syncfusion.Licensing.dll

---

**Note:** To know more about obtaining our components, refer to these links for [Mac](#) and [Windows](#).

---

---

**Information:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from the trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to [Syncfusion license key](#) to know about registering Syncfusion license key in your Xamarin application to use our components.

---

### Launching an application on each platform with text input layout

To use the text input layout inside an application, each platform application requires some additional configurations. The configurations vary from platform to platform and are discussed in the following sections:

---

**Note:** If you are adding the references from toolbox, below steps are not needed.

---

#### iOS

To launch the text input layout in iOS, call the `SfTextInputLayoutRenderer.Init()` method in the `FinishedLaunching` overridden method of the `AppDelegate` class after the `Xamarin.Forms` framework has been initialized and before the `LoadApplication` method is called as demonstrated in the following code sample.

#### C#

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();
    SfTextInputLayoutRenderer.Init();
    LoadApplication(new App());
    return base.FinishedLaunching(app, options);
}
```

#### Universal Windows Platform (UWP)

To deploy the text input layout in `Release` mode, initialize the core assemblies in the `App.xaml.cs` file in the UWP project as demonstrated in the following code samples.

#### C#

```
// In App.xaml.cs
protected override void OnLaunched(LaunchActivatedEventArgs e)
{
    ...
    if (rootFrame == null)
    {
        List<Assembly> assembliesToInclude = new List<Assembly>();
        assembliesToInclude.Add(typeof(SfTextInputLayoutRenderer).GetTypeInfo().Assembly);
        Xamarin.Forms.Forms.Init(e, assembliesToInclude);
    }
    ...
}
```

#### Android

Android platform does not require any additional configuration to render the text input layout control.

### Initializing text input layout

Import the [SfTextInputLayout](#) control namespace in respective page as demonstrated in the following code sample.

#### XML

```
xmlns:inputLayout="clr-namespace:Syncfusion.XForms.TextInputLayout;assembly=Syncfusion.Core.XForms"
```

#### C#

```
using Syncfusion.XForms.TextInputLayout;
```

Add any input view control such as [Entry](#), [Editor](#), [SfNumericTextBox](#), or [SfMaskedEdit](#), and add hint label (floating label).

#### XML

```
<inputLayout:SfTextInputLayout>  
<Entry />  
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.InputView = new Entry();
```

### Adding hint

Floating label for the text input layout can be added by setting the [Hint](#) property. Visibility of the hint can be collapsed by setting the [ShowHint](#) property to `false`. By default, this property is set to `true`.

#### XML

```
<inputLayout:SfTextInputLayout  
Hint="Name">  
<Entry />  
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.InputView = new Entry();
```

When focusing the input view, the hint label will be moved to the top position; it will be returned to the original position when proceeding further (on unfocused) without entering any value.

The default translate animation for the hint can be disabled by setting the [EnableHintAnimation](#) property to `false`. Instead translate animation in hint, you can use the alpha animation by setting the [EnableFloating](#) property to `false`.

Run the project, and check if you get following output to make sure that the project has been configured properly to add the text input layout control.

### Enabling password visibility toggle

The password visibility toggle is used to show or hide the visibility of characters in the input view added to the control. You can enable this toggle by setting the [EnablePasswordVisibilityToggle](#) property to true.

#### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
EnablePasswordVisibilityToggle="true">
<Entry Text="John" />
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.EnablePasswordVisibilityToggle = true;
inputLayout.InputView = new Entry() { Text = "John" };
```

---

**Note:** Password visibility toggle can be enabled only for [Entry](#) control.

---

You can find the complete getting started sample from this [link](#).

### Supported input views

Input views can be added to the text input layout control by setting the [InputView](#) property. To reduce the XAML syntax, [InputView](#) property is applied with [ContentPropertyAttribute](#).

## Entry

To enter a single line text input, add [Entry](#).

### XML

```
<inputLayout:SfTextInputLayout  
Hint="Name"  
HelperText="Enter your name">  
<Entry />  
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.HelperText = "Enter your name";  
inputLayout.InputView = new Entry();
```

## Editor

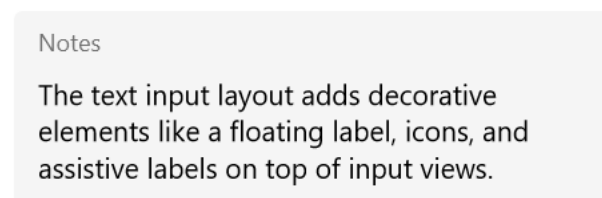

To enter multi-line text input, add [Editor](#), and then set the `AutoSize` property to `TextChanges`.

### XML

```
<inputLayout:SfTextInputLayout  
Hint="Notes">  
<Editor AutoSize="TextChanges" />  
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Notes";  
inputLayout.InputView = new Editor();
```

## Masked edit

To initialize the masked edit control and launch it in each platform, refer to the [getting started with masked edit](#) documentation.

### XML

```
<inputLayout:SfTextInputLayout
Hint="Card number"
HelperText="Required *">
<maskededit:SfMaskedEdit
Keyboard="Numeric"
Mask="0000 0000 0000 0000" />
</inputLayout:SfTextInputLayout>
```

## C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Card number";
inputLayout.HelperText = "Required *"
inputLayout.InputView = new SfMaskedEdit() { Keyboard = Keyboard.Numeric,
Mask = "0000 0000 0000 0000" };
```

Card number

6246 56\_\_ \_\_ \_\_

Required \*

## Numeric text box

To initialize the numeric text box control and launch it in each platform, refer to the [getting started with numeric text box](#) documentation.

## XML

```
<inputLayout:SfTextInputLayout
Hint="Amount"
HelperText="Required *">
<numericBox:SfNumericTextBox
Value="123.45"
FormatString="c" />
</inputLayout:SfTextInputLayout>
```

## C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Amount";
inputLayout.HelperText = "Required *"
inputLayout.InputView = new SfNumericTextBox() { Value = 123.45,
FormatString="c" };
```

Amount

\$2,904.50

Required \*

## Autocomplete

To initialize the Autocomplete control and launch it in each platform, refer to the [getting started with auto complete](#) documentation.

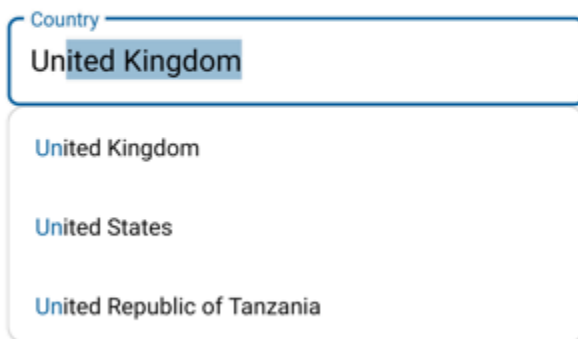

### XML

```
<inputLayout:SfTextInputLayout Hint="Country">
  <autocomplete:SfAutoComplete AutoCompleteMode="SuggestAppend">
    <autocomplete:SfAutoComplete.AutoCompleteSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> United Kingdom </x:String>
        <x:String> United States </x:String>
        <x:String> United Republic of Tanzania </x:String>
      </ListCollection:List>
    </autocomplete:SfAutoComplete.AutoCompleteSource>
  </autocomplete:SfAutoComplete>
</inputLayout:SfTextInputLayout>
```

### C#

```
var autoComplete = new SfAutoComplete();
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Country";
List<String> countryNames = new List<String>();
countryNames.Add("United Kingdom");
countryNames.Add("United States");
countryNames.Add("United Republic of Tanzania");
autoComplete.AutoCompleteMode = AutoCompleteMode.SuggestAppend;
autoComplete.DataSource = countryNames;
inputLayout.InputView = autoComplete;
```

Autocomplete

## Combo box

To initialize the ComboBox control and launch it in each platform, refer to the [getting started with combo box](#) documentation.

## XML

```
<inputLayout:SfTextInputLayout Hint="Country">
  <combobox:SfComboBox>
    <combobox:SfComboBox.ComboBoxSource>
      <ListCollection:List x:TypeArguments="x:String">
        <x:String> Afghanistan </x:String>
        <x:String> Akrotiri </x:String>
        <x:String> Albania </x:String>
      </ListCollection:List>
    </combobox:SfComboBox.ComboBoxSource>
  </combobox:SfComboBox>
</inputLayout:SfTextInputLayout>
```

## C#

```
var combobox = new SfComboBox();
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Country";
List<String> countryNames = new List<String>();
countryNames.Add("Afghanistan");
countryNames.Add("Akrotiri");
countryNames.Add("Albania");
combobox.DataSource = countryNames;
inputLayout.InputView = combobox;
```

**Note:** Entry and Editor are the only input views supported by [SfTextInputLayout](#) in WPF platform.

## Container type

Containers improve the discoverability of input view by creating a contrast between the input view and assistive elements.

### Filled

The background of the input view will be filled with container color, and its stroke (at the bottom edge) color and thickness will be changed based on its states. It can be enabled by setting the [ContainerType](#) property to [Filled](#).

#### XML

```
<inputLayout:SfTextInputLayout  
Hint="Name"  
ContainerType="Filled">  
<Entry Text="John" />  
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.ContainerType = ContainerType.Filled;  
inputLayout.InputView = new Entry() { Text = "John" };
```

### Outlined

When setting the [ContainerType](#) property to [Outlined](#), the container will be covered with a rounded-corner border.

#### XML

```
<inputLayout:SfTextInputLayout  
Hint="Name"  
ContainerType="Outlined">  
<Entry Text="John" />  
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.ContainerType = ContainerType.Outlined;  
inputLayout.InputView = new Entry() { Text = "John" };
```

#### *Customize the corner radius of the outline border*

When setting the [OutlineCornerRadius](#) property to double value, the corner radius of the container will be changed.

**XML**

```
<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="Outlined"
OutlineCornerRadius="8">
<Entry />
</inputLayout:SfTextInputLayout>
```

**C#**

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.OutlineCornerRadius = 8;
inputLayout.InputView = new Entry();
```

**NOTE**

It is applicable for the outline border when setting the container type to outlined.

*Custom Padding*

Spaces around the input view can be customized by setting the InputViewPadding property to [thickness](#) value.

**XML**

```
<inputLayout:SfTextInputLayout
Hint="Name"
InputViewPadding="5"
ContainerType="Outlined"
HelperText="Enter your name">
<Entry />
</inputLayout:SfTextInputLayout>
```

**C#**

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.InputViewPadding = new Thickness(5);
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.HelperText = "Enter your name";
inputLayout.InputView = new Entry();
```

## None

When setting the [ContainerType](#) property to [None](#), the container will have empty background and enough spacing.

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="None">
<Entry Text="John" />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.None;
inputLayout.InputView = new Entry() { Text = "John" };
```

## Adding custom icons

Any custom icons can be added to the leading edge or the trailing edge of input view in the text input layout control. The events and commands related to the custom icons should be handled at the application level.

Unicode or font icons for the labels can be displayed as icons.

**Note:** Refer to the following links to learn more about font icons:

- [How to create font icons using our metro studio and export as ttf?](#)
- [How to set font family for the custom fonts in labels?](#)

## Leading view

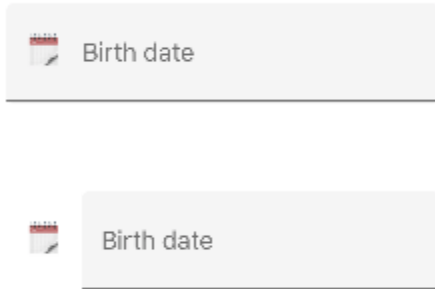

A label can be added as a leading icon for the input view by setting the [LeadingView](#) property. It can be positioned either inside or outside the container by setting the [LeadingViewPosition](#) property. By default, it is positioned [Outside](#).

### XML

```
<inputLayout:SfTextInputLayout
Hint="Birth date"
LeadingViewPosition="Inside" >
<Entry />
<inputLayout:SfTextInputLayout.LleadingView>
<Label
Text="&#x1F5D3;">
</Label>
</inputLayout:SfTextInputLayout.LleadingView>
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Birth date";
inputLayout.LeadingViewPosition = ViewPosition.Inside;
inputLayout.LeadingView = new Label() { Text = "\U0001F5D3" };
inputLayout.InputView = new Entry();
```

### Trailing view

A label can be added as a trailing icon for the input view by setting the [TrailingView](#) property. It can be positioned either inside or outside the container of input view by setting the [TrailingViewPosition](#) property. By default, it is positioned [Inside](#).

### XML

```
<inputLayout:SfTextInputLayout
Hint="Birth date"
TrailingViewPosition="Outside">
<Entry />
<inputLayout:SfTextInputLayout.TrailingView>
<Label
Text="&#x1F5D3;">
</Label>
</inputLayout:SfTextInputLayout.TrailingView>
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Birth date";
inputLayout.TrailingViewPosition = ViewPosition.Outside;
inputLayout.TrailingView = new Label() { Text = "\U0001F5D3" };
inputLayout.InputView = new Entry();
```

## Font Customization

You can customize the appearance (size, attributes, and family) of font by setting the `FontFamily`, `FontSize`, and `FontAttributes` properties of the `LabelStyle` property.

Refer to this [documentation](#) to configure the custom fonts in `Xamarin.Forms`.

## Hint

You can customize the font of [hint](#) label by setting the `FontFamily`, `FontSize`, and `FontAttributes` properties of `HintLabelStyle` in `SfTextInputLayout`.

## XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="Outlined"
CharMaxLength="3"
ShowCharCount="True"
HelperText="Enter your name">
<Entry />
<inputLayout:SfTextInputLayout.HintLabelStyle>
<inputLayout:LabelStyle FontSize="16">
<inputLayout:LabelStyle.FontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf#Lobster-Regular"
WinPhone="Assets/Fonts/Lobster-Regular.ttf#Lobster" />
</inputLayout:LabelStyle.FontFamily>
</inputLayout:LabelStyle>
</inputLayout:SfTextInputLayout.HintLabelStyle>
</inputLayout:SfTextInputLayout>
```

## C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.HelperText = "Enter your name";
inputLayout.CharMaxLength = 3;
inputLayout.ShowCharCount = true;
inputLayout.HintLabelStyle = new LabelStyle() { FontFamily =
Device.OnPlatform("Lobster-Regular", "Lobster-Regular.ttf#Lobster-Regular",
"Assets/Fonts/Lobster-Regular.ttf#Lobster"), FontSize = 16};
inputLayout.InputView = new Entry();
```

### Helper text

You can customize the font of [helper text](#) label by setting the FontFamily, FontSize, and FontAttributes properties of HelperLabelStyle in SfTextInputLayout.

#### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="Outlined"
CharMaxLength="3"
ShowCharCount="True"
HelperText="Enter your name">
<Entry />
<inputLayout:SfTextInputLayout.HelperLabelStyle>
<inputLayout:LabelStyle FontSize="12">
<inputLayout:LabelStyle.FontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf#Lobster-Regular"
WinPhone="Assets/Fonts/Lobster-Regular.ttf#Lobster" />
</inputLayout:LabelStyle.FontFamily>
</inputLayout:LabelStyle>
</inputLayout:SfTextInputLayout.HelperLabelStyle>
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.HelperText = "Enter your name";
inputLayout.CharMaxLength = 3;
inputLayout.ShowCharCount = true;
inputLayout.HelperLabelStyle = new LabelStyle() { FontFamily =
Device.OnPlatform("Lobster-Regular", "Lobster-Regular.ttf#Lobster-Regular",
"Assets/Fonts/Lobster-Regular.ttf#Lobster"), FontSize = 12};
inputLayout.InputView = new Entry();
```

### Error text

You can customize the font of [error text](#) label by setting the FontFamily, FontSize, and FontAttributes properties of ErrorLabelStyle in SfTextInputLayout.

#### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="Outlined"
CharMaxLength="3"
ShowCharCount="True"
HelperText="Enter your name"
HasError="True">
```

```

ErrorText="Enter valid name">
<Entry />
<inputLayout:SfTextInputLayout.ErrorLabelStyle>
<inputLayout:LabelStyle FontSize="12">
<inputLayout:LabelStyle.FontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf#Lobster-Regular"
WinPhone="Assets/Fonts/Lobster-Regular.ttf#Lobster" />
</inputLayout:LabelStyle.FontFamily>
</inputLayout:LabelStyle>
</inputLayout:SfTextInputLayout.ErrorLabelStyle>
</inputLayout:SfTextInputLayout>

```

## C#

```

var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.HelperText = "Enter your name";
inputLayout.CharMaxLength = 3;
inputLayout.ShowCharCount = true;
inputLayout.HasError = true;
inputLayout.ErrorText = "Enter valid name";
inputLayout.ErrorLabelStyle = new LabelStyle() { FontFamily =
Device.OnPlatform("Lobster-Regular", "Lobster-Regular.ttf#Lobster-Regular",
"Assets/Fonts/Lobster-Regular.ttf#Lobster"), FontSize = 12};
inputLayout.InputView = new Entry();

```

## Counter label

You can customize the font of [counter label](#) by setting the FontFamily, FontSize, and FontAttributes properties of CounterLabelStyle in SfTextInputLayout.

## XML

```

<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="Outlined"
CharMaxLength="3"
ShowCharCount="True"
HelperText="Enter your name">
<Entry />
<inputLayout:SfTextInputLayout.CounterLabelStyle>
<inputLayout:LabelStyle FontSize="12">
<inputLayout:LabelStyle.FontFamily>
<OnPlatform x:TypeArguments="x:String" iOS="Lobster-Regular"
Android="Lobster-Regular.ttf#Lobster-Regular"
WinPhone="Assets/Fonts/Lobster-Regular.ttf#Lobster" />
</inputLayout:LabelStyle.FontFamily>
</inputLayout:LabelStyle>
</inputLayout:SfTextInputLayout.CounterLabelStyle>

```

```
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.HelperText = "Enter your name";
inputLayout.CharMaxLength = 3;
inputLayout.ShowCharCount = true;
inputLayout.CounterLabelStyle = new LabelStyle() { FontFamily =
Device.OnPlatform("Lobster-Regular", "Lobster-Regular.ttf#Lobster-Regular",
"Assets/Fonts/Lobster-Regular.ttf#Lobster"), FontSize = 12};
inputLayout.InputView = new Entry();
```

### Adding assistive labels

Assistive labels provide additional information about text entered in the input view controls.

#### Helper text

Helper text conveys additional guidance about the input field such as how it will be used. It can be set using the [HelperText](#) property.

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
HelperText="Enter your name">
<Entry />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.HelperText = "Enter your name";
inputLayout.InputView = new Entry();
```

The visibility of the helper text can be disabled by setting the [ShowHelperText](#) property to false. By default, it is set to true.

### Error message

When the text input is not accepted, an error message will display instructions to fix it. Error messages will be displayed below the input line till entering the correct text. It can be set using the [ErrorText](#) property, but it will be displayed only when the [HasError](#) property is set to `true`.

#### XML

```
<inputLayout:SfTextInputLayout
Hint="Email"
HelperText="Enter your email address"
ErrorText="Invalid email"
HasError="true">
<Entry />
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Email";
inputLayout.HelperText = "Enter your email address";
inputLayout.ErrorText = "Invalid email";
inputLayout.HasError = true;
inputLayout.InputView = new Entry();
```

**Note:** Error validations should be done in the application level.

### Character counter

Character counter is used when you need to limit the characters. Character limit can be set using the [CharMaxLength](#) property. The character counter can be enabled by setting the [ShowCharCount](#) property to `true`.

#### XML

```
<inputLayout:SfTextInputLayout
Hint="Password"
ShowCharCount="true"
CharMaxLength="8"
HelperText="Enter 5 to 8 characters">
<Entry />
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Password";
inputLayout.CharMaxLength = 8;
```

```
inputLayout.ShowCharCount = true;  
inputLayout.HelperText = "Enter 5 to 8 characters";  
inputLayout.InputView = new Entry();
```

**Note:** When character count reaches the maximum character length, the error color will be applied to hint, border, and counter label.

#### Reserve spaces for assistive labels

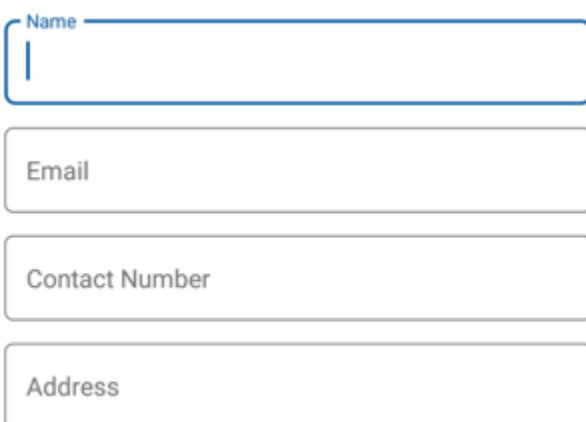

The reserved spaces for assistive labels can be removed by setting the [ReserveSpaceForAssistiveLabels](#) property to false.

#### XML

```
<inputLayout:SfTextInputLayout  
ContainerType="Outlined"  
Hint="Name"  
ReserveSpaceForAssistiveLabels="False">  
<Entry />  
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.ContainerType = ContainerType.Outlined;  
inputLayout.ReserveSpaceForAssistiveLabels = false;  
inputLayout.InputView = new Entry();
```

## States and Colors

Based on the states, the colors will be applied to the hint labels and borders. So, when the input view is in focused state, the focused color will be applied; it is similar to other states also. The current hint color or active color can be obtained from the [CurrentActiveColor](#) property.

**Note:** Since error is not a state, the error color will not be set to [CurrentActiveColor](#) when [HasError](#) property is set to true.

### Focused color

When the input view is focused, the [FocusedColor](#) property value will be applied to the hint label and border.

**Information:** Cursor color of the input view will be same as the [Accent](#) color of the application in each platform.

### XML

```
<inputLayout:SfTextInputLayout
Hint="User name"
FocusedColor="#00AFA0"
HelperText="Enter your name"
<Entry Text="John" />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "User name";
inputLayout.FocusedColor = Color.FromHex("#00AFA0");
inputLayout.ErrorText = "User name available";
inputLayout.InputView = new Entry() { Text = "John" };
```

### Unfocused color

When the input view is unfocused, the [UnfocusedColor](#) property value will be applied to the hint label and border.

**Note:** Thickness of the border will also vary between the focused and unfocused states.

### XML

```
<inputLayout:SfTextInputLayout
Hint="User name"
UnfocusedColor="Silver"
HelperText="User name available">
<Entry Text="John" />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "User name";
inputLayout.UnfocusedColor = Color.Silver;
inputLayout.ErrorText = "User name available";
inputLayout.InputView = new Entry() { Text = "John" };
```

### Error color

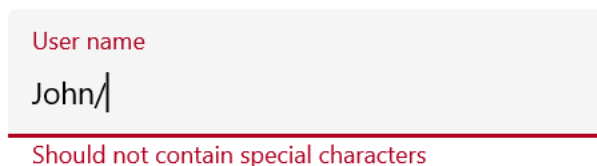

The error color can also be customized by setting the [ErrorColor](#) property.

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ErrorColor="#B00020"
ErrorText="Should not contain special characters"
HasError="true">
<Entry Text="John/" />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ErrorColor = Color.FromHex("#B00020");
inputLayout.ErrorText = "Should not contain special characters";
inputLayout.HasError = true;
inputLayout.InputView = new Entry() { Text = "John/" };
```

### Container color

The color of the container can be customized by setting the [ContainerBackgroundColor](#) property. It is applicable when the [ContainerType](#) property is set to [Filled](#) and [Outlined](#).

### Filled

The color of the container is customized when the [ContainerType](#) is [Filled](#).

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
FocusedColor="#0450C2"
ContainerType="Filled">
```

```
ContainerBackgroundColor="#E6EEF9">
<Entry Text="John" />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.FocusedColor = Color.FromHex("#0450C2");
inputLayout.ContainerBackgroundColor = Color.FromHex("#E6EEF9");
inputLayout.ContainerType = ContainerType.Filled;
inputLayout.InputView = new Entry() { Text = "John" };
```

### Outlined

The color of the container is customized when the [ContainerType](#) is [Outlined](#).

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
FocusedColor="#0450C2"
ContainerType="Outlined"
ContainerBackgroundColor="#E6EEF9">
<Entry Text="John" />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.FocusedColor = Color.FromHex("#0450C2");
inputLayout.ContainerBackgroundColor = Color.FromHex("#E6EEF9");
inputLayout.InputView = new Entry() { Text = "John" };
```

### Disabled state

The text input layout is disabled by setting the [IsEnabled](#) property to `false`. The color of the container and other UI elements will also be changed to the disabled state, but its color cannot be customized.

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
IsEnabled="false">
<Entry />
</inputLayout:SfTextInputLayout>
```

**C#**

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.IsEnabled = false;
inputLayout.InputView = new Entry();
```

## Right-to-Left

The `TextInputLayout` supports to change the flow of text to the right-to-left direction by setting the [FlowDirection](#) to `RightToLeft`.

**Note:** A specific platform setup is required to enable the right-to-left localization. For platform settings, refer to this [documentation](#).

**XML**

```
<ContentPage xmlns="http://xamarin.com/schemas/2014/forms"
xmlns:x="http://schemas.microsoft.com/winfx/2009/xaml"
xmlns:inputLayout="clr-namespace:Syncfusion.XForms.TextInputLayout;assembly=Syncfusion.Core.XForms"
x:Class="TextInputLayout.MainPage">
<StackLayout>
<inputLayout:SfTextInputLayout
x:Name="textInputLayout"
FlowDirection="RightToLeft"
ContainerType="Outlined"
Hint="اسم"
HelperText="أسمك أدخل" >
<Entry />
</inputLayout:SfTextInputLayout>
</StackLayout>
</ContentPage>
```

**C#**

```
textInputLayout.FlowDirection = FlowDirection.RightToLeft;
textInputLayout.ContainerType = ContainerType.Outlined;
textInputLayout.Hint = "اسم";
textInputLayout.HelperText = "أسمك أدخل";
textInputLayout.InputView = new Entry();
```

### Fixed hint position

Hint label for the text input layout is fixed always at the top position. This helps users make the hint label floating even when the input view is not focused. It can be enabled by setting the `IsHintAlwaysFloated` property.

#### NOTE

The default value of the `IsHintAlwaysFloated` is `false`.

#### Filled

The hint label position of the input view will be set always at the top for the [Filled](#) container type.

#### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
IsHintAlwaysFloated="true"
ContainerType="Filled"
HelperText="Enter your name">
<Entry />
</inputLayout:SfTextInputLayout>
```

#### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.IsHintAlwaysFloated = true;
inputLayout.ContainerType = ContainerType.Filled;
inputLayout.HelperText = "Enter your name";
inputLayout.InputView = new Entry();
```

#### Outlined

The hint label position of the input view will be set always at the top for the [Outlined](#) container type.

#### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
IsHintAlwaysFloated="true"
ContainerType="Outlined"
HelperText="Enter your name">
<Entry />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.IsHintAlwaysFloated = true;
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.HelperText = "Enter your name";
inputLayout.InputView = new Entry();
```

### None

The hint label position of the input view will be set always at the top for the [None](#) container type.

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
IsHintAlwaysFloated="true"
ContainerType="None"
HelperText="Enter your name">
<Entry />
</inputLayout:SfTextInputLayout>
```

### C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.IsHintAlwaysFloated = true;
inputLayout.ContainerType = ContainerType.None;
inputLayout.HelperText = "Enter your name";
inputLayout.InputView = new Entry();
```

### How to

#### Customize the thickness of stroke

The border stroke width (for [Outlined](#)) and line thickness (for [Filled](#) and [None](#)) can be customized based on the focus state of the input view by setting the [FocusedStrokeWidth](#) and [UnfocusedStrokeWidth](#) properties.

### XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="Outlined"
```

```
HelperText="Enter your name"
FocusedStrokeWidth="4"
UnfocusedStrokeWidth="2">
<Entry />
</inputLayout:SfTextInputLayout>
```

**C#**

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.HelperText = "Enter your name"
inputLayout.FocusedStrokeWidth = 4;
inputLayout.UnfocusedStrokeWidth = 2;
inputLayout.InputView = new Entry();
```

## Customize the font for input view

You can customize the font for the input view inside SfTextInputLayout using its properties.

- [Entry](#)
- [Editor](#)
- [SfMaskedEdit](#)
- [SfNumericTextBox](#)
- [SfAutoComplete](#)
- [SfComboBox](#)

## AutomationId

The text input layout control has built-in AutomationId for inner elements. To keep unique id for inner elements, AutomationId of inner elements are updated based on SfTextInputLayout's AutomationId. For example, if SfTextInputLayout's AutomationId is set as `sfTextInputLayout.AutomationId = "textInputLayout"`, then AutomationId of inner elements will be updated as follows.

Element	Element AutomationId	Qualified AutomationId
Password Toggle VisibleIcon	show password	textInputLayout show password
Password Toggle CollapsedIcon	hide password	textInputLayout hide password
DropDown Button	drop down	textInputLayout drop down

## Utilities

The Syncfusion Xamarin Extension provides quick access, so that you can easily create or configure the Syncfusion Xamarin projects. The Syncfusion Xamarin Extensions provides the following features.

- Syncfusion Project Template for Xamarin.Forms
- Syncfusion Toolbox for Xamarin.Forms

The Syncfusion Xamarin Visual Studio Extensions are installed along with the Essential Studio for Xamarin setup.

---

**Note:** \*Refer to the [installation guideline](#)\*.

---

## Project Template

Syncfusion provides the **Visual Studio Project Templates** for the Syncfusion Xamarin platform to easily create a Syncfusion Xamarin Application.

---

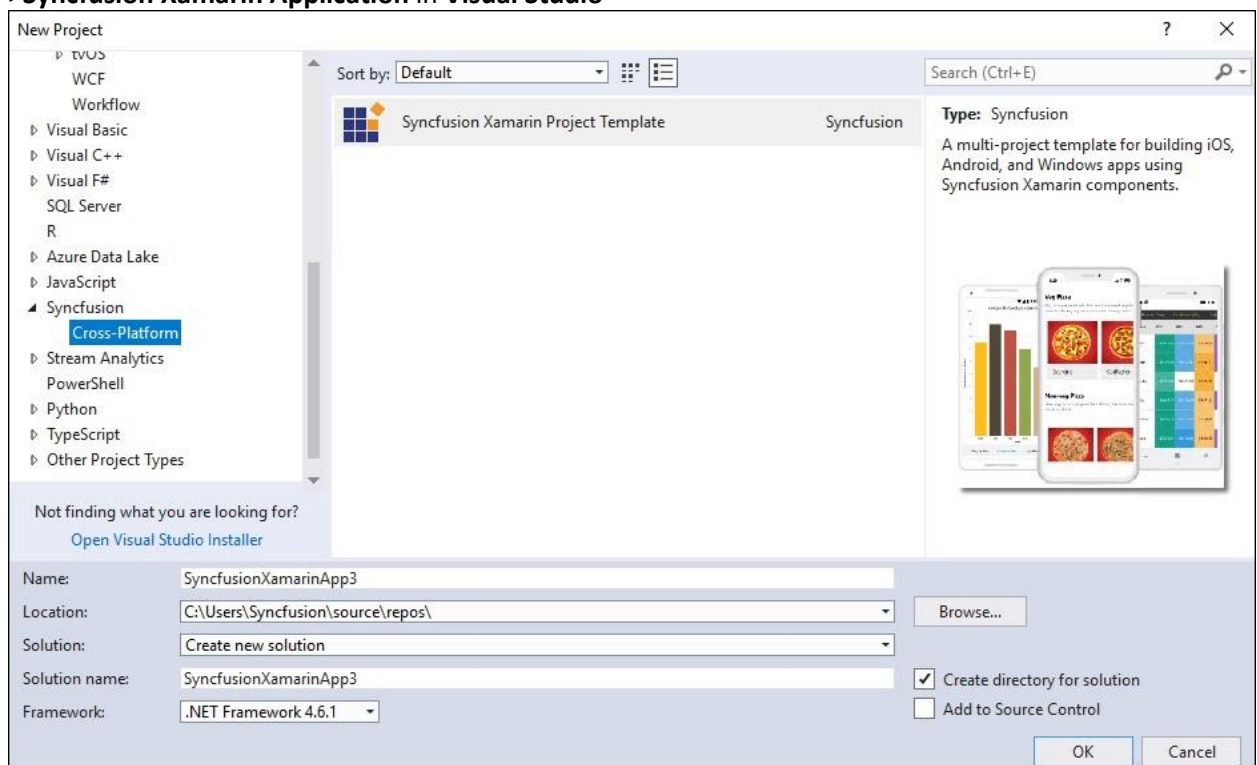

**Information:** Syncfusion Xamarin Project Templates are available from v16.2.0.41.

---

## Create Syncfusion Xamarin Application

The following steps direct you to create a **Syncfusion Xamarin Application** using **Visual Studio 2017**:

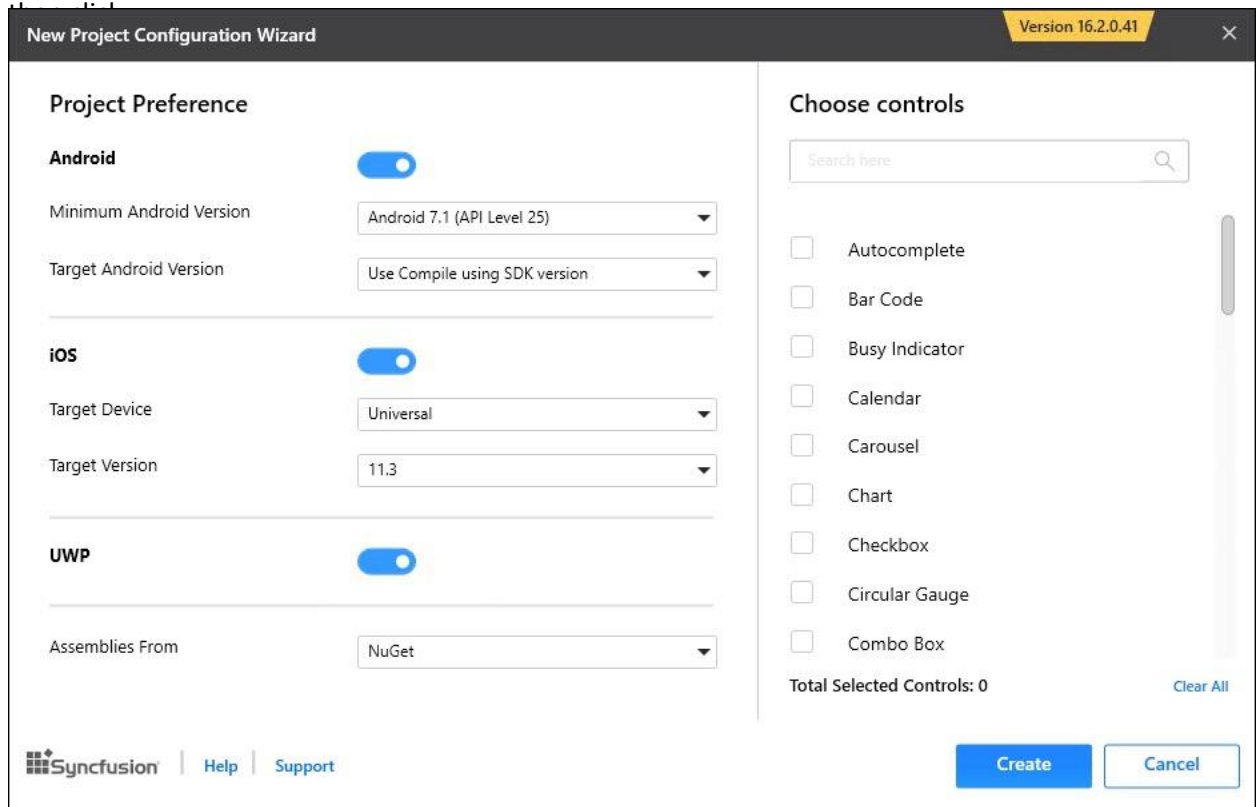

1. To create a **Syncfusion Xamarin project**, choose **New Project->Syncfusion-> Cross-Platform->Syncfusion Xamarin Application in Visual Studio**

2017.

![Add New Project Window](Syncfusion-Project-Templatesimages/Syncfusion-Project-Templatesimg1.jpeg)

2. Name the **Project**, choose the destination location, and set the Framework of the project, and

**OK.** The Project Configuration Wizard appears.

3. Choose the options to configure the Syncfusion Xamarin Application by using the following Project Configuration dialog.

#### Project Configuration:

Choose the required Project platforms: Android, iOS, and UWP.

![[New Project Configuration Wizard]](Syncfusion-Project-Templatesimages/Syncfusion-Project-Templatesimg2.jpeg)

**Assemblies From:** Specify where the Syncfusion Xamarin assemblies need to be loaded from: either NuGet or Installed Location.

---

**Note:** *Installed location option will be available only when the Syncfusion Xamarin setup has been installed.*

---

#### Android:

1. **Minimum Android Version:** Select the oldest Android version that you want to support your application. 2. **Target Android Version:** Select the version of Android to run your application.

#### iOS:

1. **Target Device:** Select the device of Xamarin.iOS Project, either Unified, iPhone/iPod, or iPad. 2. **Target Version:** Choose the version of Xamarin.iOS Project.

#### Choose controls

Choose the Syncfusion controls that need to be added to the created project.

4. Click **Create** and the Syncfusion Xamarin Application will be created.

---

**Note:** Choose any one of the project types and controls from the Project Configuration Wizard.

---

5. Required Syncfusion NuGet/Assemblies and configuration have been added to the project based on the control(s) chosen.

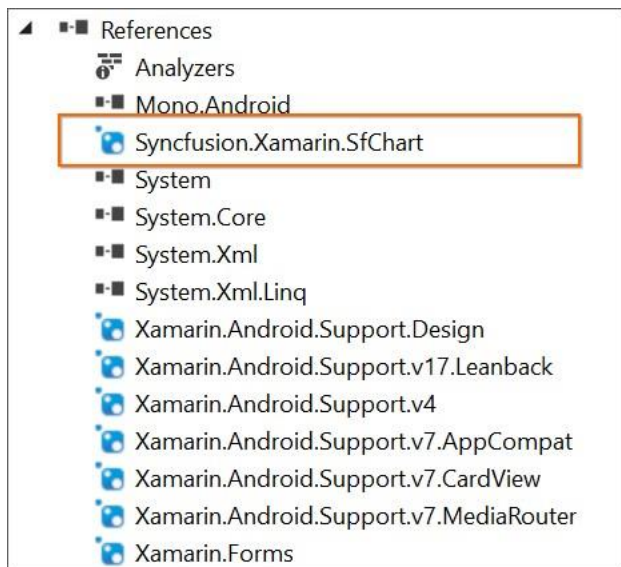

**Net Standard /PCL:**

![NuGet references in Net Standard /PCL](Syncfusion-Project-Templates

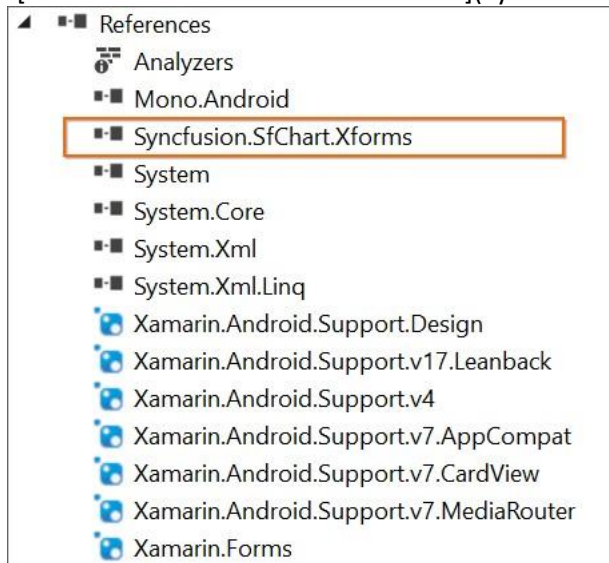

images/Syncfusion-Project-Templatesimg3.jpeg)

![Assembly references in Net Standard /PCL](Syncfusion-Project-Templatesimages/Syncfusion-Project-Templatesimg4.jpeg)

**Android:**

![NuGet references in XForms.Android](Syncfusion-Project-Templates

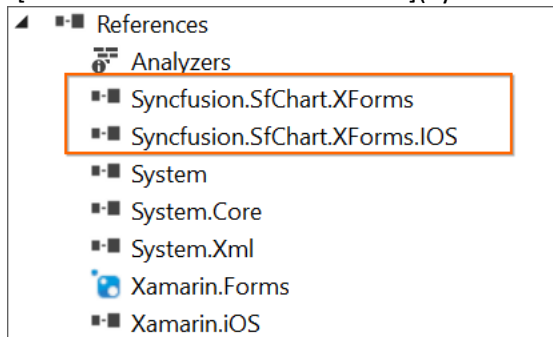

images/Syncfusion-Project-Templatesimg5.jpeg)

![Assembly references in XForms.Android](Syncfusion-Project-Templatesimages/Syncfusion-Project-Templatesimg6.jpeg)

iOS:

![NuGet references in XForms.iOS](Syncfusion-Project-Templates

images/Syncfusion-Project-Templatesimg7.jpeg)

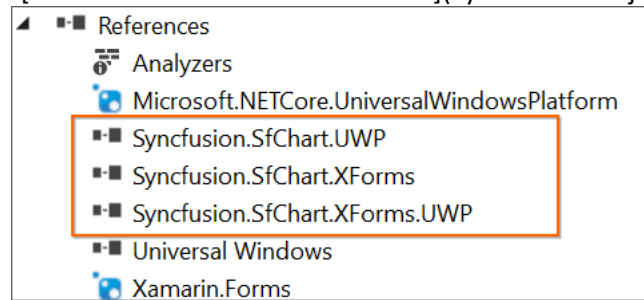

![Assembly references in XForms.iOS](Syncfusion-Project-Templatesimages/Syncfusion-Project-Templatesimg8.jpeg)

UWP:

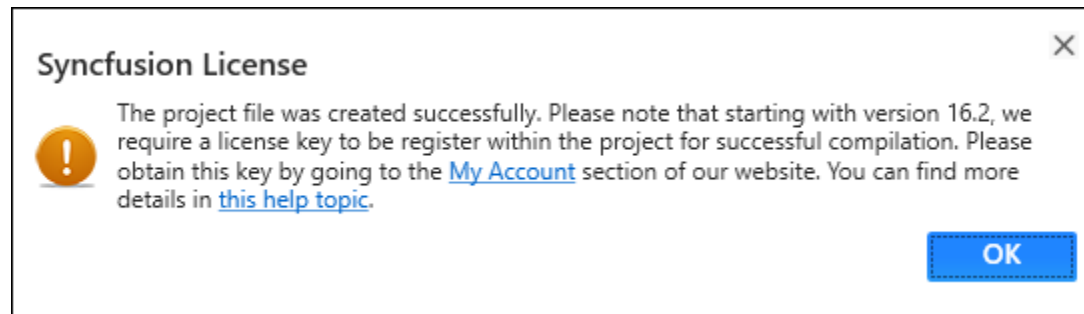

![NuGet references in XForms.UWP](Syncfusion-Project-Templates

images/Syncfusion-Project-Templatesimg9.jpeg)

![Assembly references in XForms.UWP](Syncfusion-Project-Templatesimages/Syncfusion-Project-Templatesimg10.jpeg)

6. Then, Syncfusion licensing registration required message box will be shown as follow, if you have installed the trial setup or NuGet packages since Syncfusion introduced the licensing system from 2018 Volume 2 (v16.2.0.41) Essential Studio release. Please navigate to the [help topic](#) which is shown in the licensing message box to generate and register the Syncfusion license key to your project. Refer to this [blog](#) post for understanding the licensing changes introduced in Essential Studio.

## Toolbox

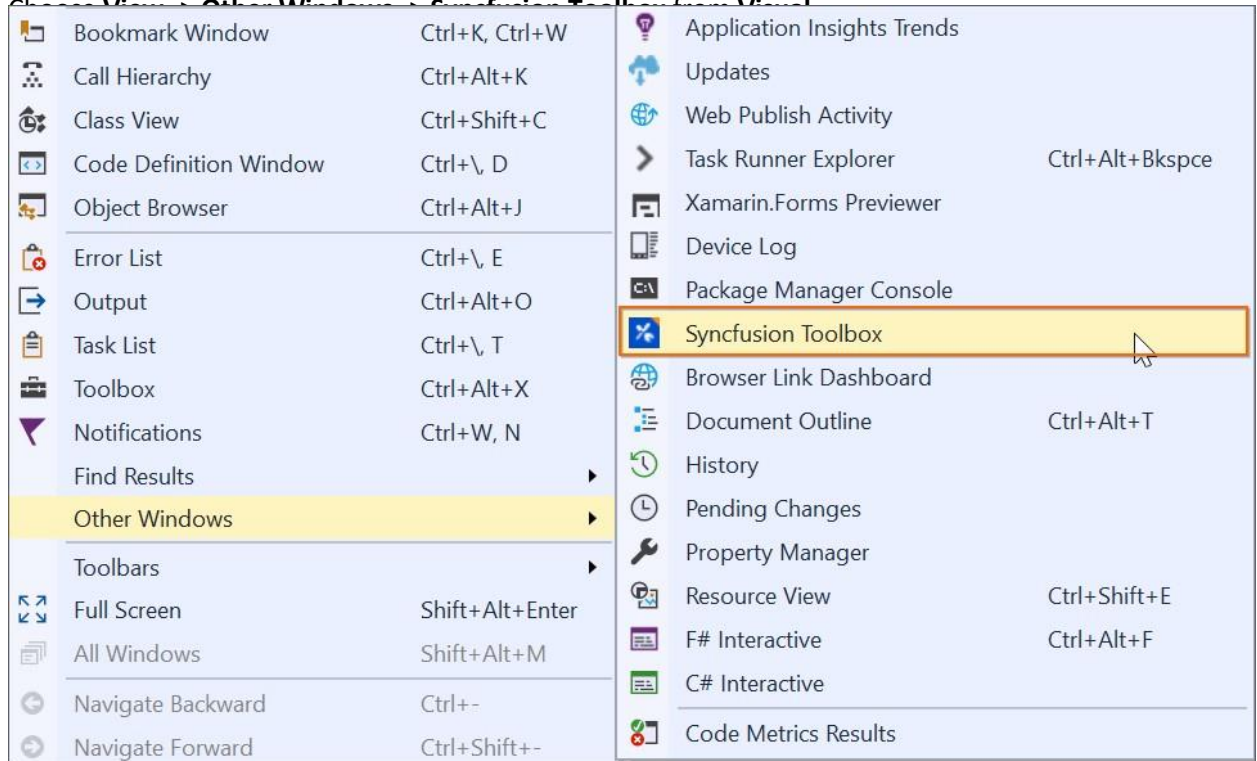

Syncfusion provides the **Visual Studio Toolbox** for the Syncfusion Xamarin platform to help add the Syncfusion Xamarin (Xamarin.Forms) controls in your project. It supports Microsoft Visual Studio 2015 and 2017. The Syncfusion Xamarin Toolbox enables easy drag and drop of Syncfusion controls without XAML coding in the Visual Studio designer.

**Information:** The Syncfusion Xamarin Toolbox is available from v16.2.0.41.

**Note:** \*Syncfusion Xamarin Toolbox will get installed when installed the Syncfusion Xamarin setup with Additional Settings (Configure Syncfusion Extensions in Visual Studio). In any case, if toolbox not installed, please run the [VSIX Installer utility](#) to configure it in Visual Studio.

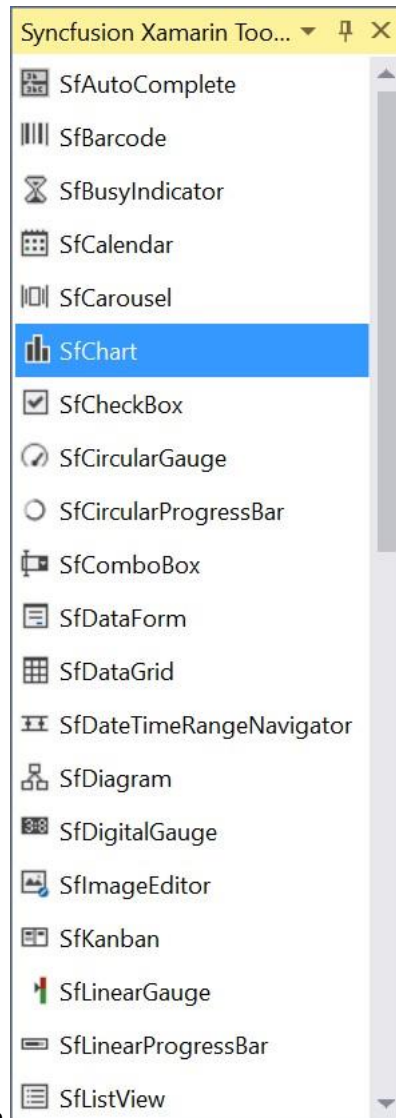

## Add Syncfusion Xamarin (Xamarin.Forms) Controls in your Project

Create the Xamarin or Syncfusion Xamarin project. The following steps direct you to add the Syncfusion controls through the Visual Studio Toolbox:

1. **View -> Other Windows -> Syncfusion Toolbox**

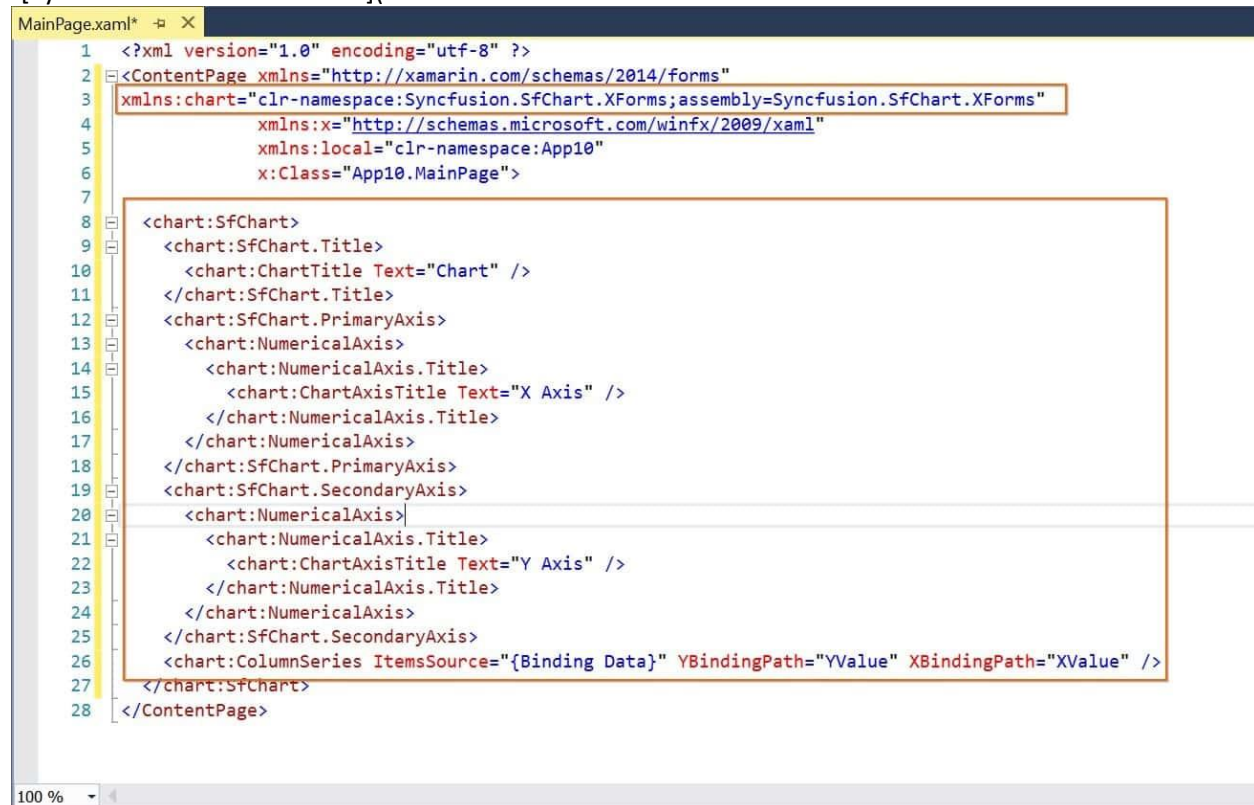

**Studio.**

![[Enable Syncfusion Xamarin Toolbox](Toolboximages/Toolboximg1.jpeg)]

2. Click **Syncfusion** **Toolbox** menu item, the Syncfusion Toolbox wizard has been appeared. The Syncfusion control will be enabled when opening the Xamarin.Forms designer page. There is no Syncfusion control appears till open the appropriate .xaml file from the Xamarin shared/.NET Standard /PCL project.

## ![Syncfusion Xamarin Toolbox](Toolbox

images/Toolboximg2.jpeg)

3. The required Syncfusion controls design (.xaml) snippet and namespace will be added by drag and drop the required control from the toolbox to the designer.

![Required Syncfusion control code snippet and namespace in design page](Toolbox\_images/Toolbox-img3.jpg)

Also, the required control Syncfusion Xamarin NuGet packages will be installed automatically when drag and drop the control to the designer to render the Syncfusion control.
