**Description** Angiotensin II (AT II) is a peptide produced from AT I by angiotensin-converting-enzyme (ACE). AT II binds the AT II type 1 (AT1) receptor, stimulating GPCRs in vascular smooth muscle cells and increasing intracellular  $\text{Ca}^{2+}$  levels; this results in contraction and vasoconstriction, increasing blood pressure. AT II also acts at the  $\text{Na}^{+}/\text{H}^{+}$  exchanger in the proximal tubules of the kidney. Here, AT II increases reabsorption of  $\text{Na}^{+}$  and  $\text{HCO}_3^{-}$  and excretion of  $\text{H}^{+}$ , increasing blood volume and pH and further increasing blood pressure.
