**Description** Meropenem is a  $\beta$ -lactam antibiotic that belongs to the family of carbapenems, active against all bacteria, with the most significant antibacterial activity against gram-negative species. Meropenem is somewhat resistant to degradation by  $\beta$ -lactamases and is used to treat bacterial meningitis, skin infections, and febrile neutropenia. This compound inhibits bacterial cell wall synthesis by binding penicillin-binding proteins 2 and 3 (PBP2/3), preventing formation of peptidoglycan.
