system by turning it into a hot rod. Adding strobe lights that respond to windows, lighting fans, sound, or UV-responsive data cables, or building some kind of exhilarating case from scratch, is a visual modification. Visual tweaks include: Modders literally cut holes on the side of the computer case, bought sheets of transparent plastic like plexiglass and used it to create windows with the concave of the computer. Some modulation cuts simple squares, while others create surprisingly preferential and complex patterns. • Case interior lighting. From cold cathodes to LEDs, there are all kinds of lighting to add lighting inside the case, from blue light power supplies to shiny fans. • Colorful and UV-responsive components. Motherboard manufacturers and other component manufacturers now use circuit boards of different colors and bright, UV-reactive colors such as PCI and AGP slots and other sockets to accommodate the side of the stool. • Create custom cases. • Create custom cases. Modders build cases from all kinds of things. I saw cases built entirely with transparent plastic, or built into old stereo components, hamster cases, trillions or trees. And I even saw a caseless computer with parts on the wall. • Painting. Why settle in beige when you can remove your computer with bare hands and paint the case with any color you like? Modders paint solid colors, create stunning marble patterns, and perform amazing silk screen work. Modding goes mainstream it was a time when the side had to invent almost everything he needed. Water cooling must be manipulated to organize their pumps and tube networks; if you want a grille for a new case fan, cut the grille from the metal window screen. How things have changed. Today, building a modern system is as easy as going shopping (see sidebar: part shopping). You can secure pre-motorcycle cases of all shapes and sizes, from small, cubic, to amazing towers with amazing windows and front panels that look like alien heads from mini PC cases. Accessories are also easy to access. You no longer need to have your own joints to add light to the case. Lights are now available on molex connectors for standard PC power supplies. The water cooling system comes in the kit with everything you need to prepare. Fans can light up the lights in advance and use an amazing variety of fan grilles. Building a motorcycle PC is a simple matter of assembling these parts. Now, it depends on how you see it whether that is cheating. If you buy and assemble window cases, lighting fans, cold cathode lighting tubes and water cooling kits, you haven't really done anything motorcycle; However, we have created a system that looks and works much better than a typical office workstation. But for many hardcore PC enthusiasts, modding means doing it yourself. The best way to do this is to check out the modding website, and eventually sign up for the message board of modders, if you want to learn more about modding in an amazing Modding community. The modding community is a wonderful, burgeoning and friendly group that accepts amazing beginners unless you ask questions covered by dozens of previous threads. In addition to Extreme Tech, you can also find sites such as BitTech and Gide-on-Tech Modding. Push your PC up, calm down its hell, and make it look like a great piece of art. When the first project is over, it is hooked. Joel Durham Jr. is a freelance writer and editor. He is also a game columnist for Microsoft's Windows XP expert John, and soon wrote a book about building and optimizing PCs, including doll titles. Joel is cnet, senior technical editor of the Game Center, the dotcom bust of the accident. He has written hundreds of features, methods, news articles, columns and reviews focused on the technical aspects of the PC. Multimedia and games. Joel lives in upstate New York with his wife and children. Children.
