

There is only one purpose for the existence of everything within our universe. It is to evolve into existence every object, force and relationship that can possibly exist as imperfect. This necessarily means that everything that has or could possibly have existed in the past, everything that does or could possibly exist in the present and everything that will or could possibly exist in the future is imperfect. This is demonstrated by the observation that everything in the past was changing, everything in the present is changing and everything in the future will be changing. We cannot sense perfection in our universe...everything here is imperfect and guaranteed to be individually unique. Two objects cannot simultaneously occupy the same position in space and time. Things are similar but not the same and that is the guarantee of existing within both space and time.

What established this singular purpose for existence within our universe and how was it done?

The purpose engine would have to be something that resulted in an evolving reality. It would be fueled by possibility. The thing created from nothingness would be the thing that in turn created possibility.

What can create possibility from nothingness? How could anything create the possibility for everything imperfect to exist from a single point of nothingness? These are unknown acts of an unknown agent.

Although the actual act of creation is unknown we can reasonably assume that the results are evident in our reality. There is a source of our evolving reality and it is still within our universe. It would create and define all of possible imperfect existence with a single unknowable act. But the result would be indirectly sensed by human experience. We experience the results of the creation of possibility.

Not being able to know the act of creation we have to look for what currently exists in our universe that is in an unaltered and unchanging state. It would also accommodate every possible consequence of evolved existence...including the creation of the abilities to create new possibilities within the present and future. The evolving human experience itself also creates new possibilities since human beings can design and create...including new objects, forces and relationships that in themselves can create new possibilities.

What demonstrates to human experience the ability to accommodate an infinite matrix of possible decisions, actions and consequences? What accommodates all of the possible consequences and in its magnitude measures all of the possibilities of something existing within our universe?

The thing that does not change but in itself creates the evolving possibility of the existence of everything that is imperfect is space. It accommodates all possible realities. It does not change within itself. It is the created source of a continuously changing and evolving reality.

The best way to understand an intuitive explanation for the existence of everything within our universe is to ask a simple question. Does it exist? This question is nonspecific. It is referencing every possible object, force or relationship that is imperfect.

If we have identified the created source for possibility we should be able to understand how to increase the potential for answering the question with yes it does exist. Assuming that the initial question is answered with no it does not exist how do we increase the potential for answering yes?

The question itself is meaningless if it remains nonspecific. To make it relevant and meaningful we have to make it specific. This requires the ability to communicate. Specificity also requires the ability to share common experiences. Not exact but similar experiences. Confirmation of the existence of anything requires an understanding of shared experiences.

As an example let us assume the question is does a cow exist within ten feet of where I am standing? At this point the question itself does not affect the possible answer. The ability to confirm that a cow does or does not exist within ten feet of the questioner is within the capabilities of the questioner. In this case we will assume that a cow does not exist within the reference of that moment of time and in that dimension of space.

How would we increase our chance to answer yes it does exist? First increase the referenced dimension of space. If the dimension or magnitude of space is increased to one hundred miles there is an increased chance of answering yes; especially if the original referenced location is in a farmer's field but not if the original referenced location is standing on a ship a thousand miles out on the ocean.

In the first example an increase in space demonstrates that magnitude of space observed increases the potential for the existence of a specific object. In the second example the potential was increased but the specific object does not exist. The object's existence is also obviously affected by the total environment within the referenced space.

There must be some possibility characteristic of space that accumulates as its magnitude increases. The characteristic somehow increases the possibility of existence of an imperfect object, force or relationship. This is where the aim and intention of existence is established and the how in it is completely unknown to human existence because chaos lies between the creation of space and the evolved existence of human experience. In the beginning space was created as a reason...to create the potential for the existence of everything that is imperfect. As the magnitude of space was expanded the potential increased.

Another characteristic in the environment that increases the potential for existence of everything that is imperfect is time. In the example instead of increasing the magnitude of space it is also possible to keep the initial magnitude of space constant. Keeping the initial magnitude of space and asking does a cow exist within ten feet of where I am standing in a farmer's field during the next year increases the possibility of answering yes. It would also increase the possibility of answering yes for the same question referencing standing on a ship a thousand miles out on the ocean. There is an additional complication with the realization that the ship is moving while the farmer's field is not. The importance of beginning with a relevant survival environment and being aware of it is obvious. If the question does anything exist within the reference of magnitude of space or time it is the observer/questioner that can answer it with sensory capabilities within human experience.

The initial purpose does not create life or human beings. It just creates the possibility for the existence of everything that is imperfect. Life and human beings are imperfect. They are an evolved result of the initial purpose for the creation of everything that is imperfect.

Anything that evolves into existence will evolve from the environment that contains it. Objects, forces and relationships within the environment will be interdependent. Life will be dependent on life for survival. Forces will be in balance with each other. A description of the environment will include the perception of order. Mathematics, physics and chemistry will be the concepts and the language used to communicate this order. They are all based on human experience. If human beings did not exist there would be no human sensory platform that could sense and predict events within the evolved environment that could possibly evolve human life. That reality is necessary to understand the environment that could contain human life.

No imperfect object, force or relationship exists by itself. They all have evolved from an environment of chaos. Everything existed as a possibility at the initial moment of creation. Some critical mass of possibility was created that resulted in objects, forces and relationships in mindless collision that created an environment that allowed survival. This evolved from the initial chaos of anything is possible. Anything had to evolve into an environment of imperfect interdependence.

If you go back in time and try to follow the trail of results that led into the future that is now the present you will discover that things become simpler and more foreign as you approach the ending barrier of chaos. The path to the origin of human experience eventually loses the familiar sight and presence of the human form. Our ancestors become unrecognizable. And eventually you will discover the barrier of chaos. Anything beyond will be totally incomprehensible...our origin is buried there. Mathematics, physics and chemistry will not lead us through the chaos of the creation event. They are human observations of the evolved order of survival. They are not fundamental observations of purpose. They are tools for enhancing the future of human experience.
