

The problem of understanding how reality can be both continuous and discontinuous is simpler to understand if one changes perspective. Combining reason with intuition one can imagine what it would be like to not see light, but to be it. Light traveling at the speed of light would know no time, only space. A universal reality that is actually a dynamic holograph would make time and distance no longer empirical, merely phenomenological. The universe is an undivided whole. Time and distance is a human bias. The fundamental structure of the universe is a field and our bodies interpreters of it.
