

THE COMING-AND-GOING OF GALACTIC CONTENTS ;

Pardon me for bringing in my interests in the coming-and-going of galactic contents in our Universe, for I have got an unusual angle ---- this angle has slightly involved with a philosophical perspective !

1. The coming and going of galactic contents in our Universe :

I believe that all those galactic contents did come from one entry point into our Universe and has been busily traveling to an exit point that should be leading back to the originating universe. (I personally believe that those contents from the originating-universe are still coming into our Universe, non-stop).

Our Universe is an universe of emptiness and absolute coldness and the umbilically linked originating-universe is the home of pure energy ' things ' of absolute ' hotness ' that we have not yet identified and devised a proper scale to quantifying them ---- so let's just call them " PETs " (these PETs should be the final constituent matters to those sub-atomic particles as, hopefully, to be identified by institutions such as the LHC in Switzerland) and let's call this linked originating-universe our Umbilical Universe (UU).

Both universes are separated by unknown 3-dimensional partitions of unknown materials and built. But they are interlinked only at two points : the exit point of our Universe is the entry point into the UU ; and, the exit point of the UU is the entry point into our Universe.

2. A galaxy, its black hole and its stars :

Let's start with just one galaxy, our Galaxy, and one star, our Sun , as a starting point for discussion :

Why is it that a star like our Sun can continue to ' burn ' non-stop for billions of years without going into another phase of either supernova or red/brown/white dwarf ? Its size could matter ---- but my personal thinking, most importantly, because it has an **unlimited** supply of fuels. What kind of fuels are those ? I believe that they are those PETs ! So, the logical next question is where are all those PETs/fuels coming from ? My thinking is from the black hole at the center of our Galaxy.

How come ? Everything swallowed by a black hole has seemed to have disappeared into oblivion ? My thinking is that all those ' things ' swallowed by the black hole should have all their matters crushed (could be in stages) right back into their basic constituent matters ---- the PETs .

You see, when those PETs from the UU first entered into our Universe, our emptiness and absolute coldness must have ' frozen ' them (to a certain degree only, not totally. Because of those electrons whirling non-stop around the protons/neutrons, evidently are not frozen ---- they are very much ' alive/energized ') that enabled us to ' see/feel ' and measure them in various forms such as neutrons, protons, electrons, photons, various energy-rays and force fields, etc. ; plus, whatever basic, sub-atomic phenomena/matters that we have not yet identified/quantified.

I still believe that our human technology is not advanced enough to see and/or to quantify these PETs . Coming back to our own Galaxy, when those PETs exited from the black hole in their original

PETs form, we humans simply lost track of them (those observable/detectable, ejected X-rays, infrared flares, etc. could be just peripheral ' debris ').

Meaning that these ' freed ' PETs could be chilled and thrown out, at unmeasurably high velocity, in numerous linear forms and streamed into those millions of as yet continuously burning stars as ' fuels' (those PETs would be reconstituted back into sub-atomic particles and then atomic particles, before or after being injected into those actively ' burning ' stars), and kept the process going, indefinitely.

Picture this : one black hole would continuously crunching out PETs and feeding them to the over millions of stars within the same galaxy ; forming a continuous cycle until this galaxy could arrive at the exit point of our Universe and returns ' home ' to the Umbilical Universe (UU) ; where those PETs would be totally ' liberated ' into totally free PETs and be happily at home, in their own elements.

3. The Umbilical Universe (UU) :

This is the most far fetched place where nothing is known or thought about by us humans ; and in fact, I have not come across any one and anything concerning the UU (Please do enlighten me if I had missed out !). I personally have not indulged in any of my time in thinking about it, as yet.

Meaning, this is wide open territory for any and all creative astronomy-thinkers to run wild and be totally creative in their visions of an UU.

Yours truly,

Raymond Law,
Hong Kong
