## Aspirin guidelines in diabetes

Diabetes is a diabetic disease. It also has diabetes mellitus. It is a long term health condition. There are three different types. Diabetes 1 occurs when the body does not produce any insulin. Insulin is needed to regulate blood sugar levels. Diabetes 2 occurs when the body does not produce enough insulin. Pregnancy related diabetes can affect women during pregnancy. High blood sugar levels lead to polyurea (often pissed), polydapasia (increased paise) and polyphegya (increased appetite). Diabetes is a condition where cells in the body are become insulin resistant. Insulin injection, a special diet, and exercise are used to treat diabetes 1, the other type is more common, and treatment with tablets, after special doses, and insulin injections may be needed, but there are no daily treatments. People with diabetes can reduce secondary health problems - eye complications, such as diabetes retinopathy, high blood pressure, foot complications, damage hearing and diabetes can increase many health risks. In addition, the body heals very slowly. Q: I have a history of high blood pressure for 3 years. And I felt weak, poor sense of this direction, and last month the unknown low spirit, with bad control over my blood pressure. So I went to see the doctor, and it made it out to be diabetes! OMG... I just got diabetes. How can this be?! Is there any possibility for treatment? What shall I do next? Is there any diabetes treatment instructions? A: First, you should be calm and pay attention to your fast blood sugar. Since you have high blood pressure before, you will have to take some exams to rule outside of heperlapapadia. In the long term, diabetes is a symmobile disorder, which may not have the current treatment. You can only manage it and avoid the exit of complications through comprehensive drug treatment, diet and exercise. You can refer to the suggestions listed below. 1. Diabetes education. A good knowledge of diabetes controls your blood sugar well and to avoid the complication of diabetes. 2. Physical exercise. This is one of the most effective and necessary methods. Some diabetic patients with overweight. Through physical exercise, they can get their weight back into control, which is conducive to diabetes management. 3. Diet control. Your daily meal and fruit should be in accordance with your weight and labor intensity. Do not stop . 4. Drug therapy. Choose the appropriate hepoglychimacone drug under the guidance of doctors. 5. Insulin therapy. Blood sugar should be controlled by insulin to type a diabetes. Insulin should be appropriate for type II diabetes. Related Questions: How to Control Diabetes Naturally? Is blood test reliable online? \* Materials do not intend to be an alternative to professional medical advice, diagnosis, or treatment. Always look for your doctor or other educated health advice With any question you may have about the medical condition. Status.
